

Chapter 1

Chemical Arithmetic

Chemistry is basically an experimental science. In it we study physical and chemical properties of substance and measure it upto possibility. The results of measurement can be reported in two steps,

- (a) Arithmetic number, (b) Unit of measurement.

Every experimental measurement varies slightly from one another and involves some error or uncertainty depending upon the skill of person making the measurements and measuring instrument. The closeness of the set of values obtained from identical measurement called **precision** and a related term, refers to the closeness of a single measurement to its true value called **accuracy**.

Significant figures

In the measured value of a physical quantity, the digits about the correctness of which we are surplus the last digit which is doubtful, are called the significant figures. Number of significant figures in a physical quantity depends upon the least count of the instrument used for its measurement.

(1) **Common rules for counting significant figures** Following are some of the common rules for counting significant figures in a given expression

Rule 1. All non zero digits are significant.

Example : $x = 1234$ has four significant figures. Again $x = 189$ has only three significant figures.

Rule 2. All zeros occurring between two non zero digits are significant.

Example : $x = 1007$ has four significant figures. Again $x = 1.0809$ has five significant figures.

Rule 3. In a number less than one, all zeros to the right of decimal point and to the left of a non zero digit are not significant.

Example : $x = 0.0084$ has only two significant digits. Again, $x = 1.0084$ has five significant figures. This is on account of rule 2.

Rule 4. All zeros on the right of the last non zero digit in the decimal part are significant.

Example : $x = 0.00800$ has three significant figures 8, 0, 0. The zeros before 8 are not significant again 1.00 has three significant figures.

Rule 5. All zeros on the right of the non zero digit are not significant.

Example : $x = 1000$ has only one significant figure. Again $x = 378000$ has three significant figures.

Rule 6. All zeros on the right of the last non zero digit become significant, when they come from a measurement.

Example : Suppose distance between two stations is measured to be 3050 m. It has four significant figures. The same distance can be expressed as 3.050 km or 3.050×10^5 cm. In all these expressions, number of significant figures continues to be four. Thus we conclude that change in the units of measurement of a quantity does not change the number of significant figures. By changing the position of the decimal point, the number of significant digits in the results does not change. Larger the number of significant figures obtained in a measurement, greater is the accuracy of the measurement. The reverse is also true.

(2) **Rounding off** : While rounding off measurements, we use the following rules by convention

Rule 1. If the digit to be dropped is less than 5, then the preceding digit is left unchanged.

Example : $x = 7.82$ is rounded off to 7.8, again $x = 3.94$ is rounded off to 3.9.

Rule 2. If the digit to be dropped is more than 5, then the preceding digit is raised by one.

Example : $x = 6.87$ is rounded off to 6.9, again $x = 12.78$ is rounded off to 12.8.

Rule 3. If the digit to be dropped is 5 followed by digits other than zero, then the preceding digit is raised by one.

Example : $x = 16.351$ is rounded off to 16.4, again $x = 6.758$ is rounded off to 6.8.

Rule 4. If digit to be dropped is 5 or 5 followed by zeros, then preceding digit is left unchanged, if it is even.

Example : $x = 3.250$ becomes 3.2 on rounding off, again $x = 12.650$ becomes 12.6 on rounding off.

Rule 5. If digit to be dropped is 5 or 5 followed by zeros, then the preceding digit is raised by one, if it is odd.

Example : $x = 3.750$ is rounded off to 3.8, again $x = 16.150$ is rounded off to 16.2.

(3) Significant figure in calculation

(i) Addition and subtraction : In addition and subtraction the following points should be remembered

(a) Every quantity should be changed into same unit.

(b) If a quantity is expressed in the power of 10, then all the quantities should be changed into power of 10.

(c) The result obtained after addition or subtraction, the number of figure should be equal to that of least, after decimal point.

(ii) Multiplication and division

(a) The number of significant figures will be same if any number is multiplied by a constant.

(b) The product or division of two significant figures, will contain the significant figures equal to that of least.

Units for measurement

The chosen standard of measurement of a quantity which has essentially the same nature as that of the quantity is called the **unit** of the quantity. Following are the important types of system for unit,

(1) **C.G.S. System** : Length (*centimetre*), Mass (*gram*), Time (*second*)

(2) **M.K.S. System** : Length (*metre*), Mass (*kilogram*), Time (*second*)

(3) **F.P.S. System** : Length (*foot*), Mass (*pound*), Time (*second*)

(4) **S.I. System** : The 11th general conference of weights and measures (October 1960) adopted *International system of units*, popularly known as the *SI units*. The SI has *seven basic units* from which all other units are derived called *derived units*. The standard prefixes which helps to reduce the basic units are now widely used.

Dimensional analysis : The seven basic quantities lead to a number of derived quantities such as pressure, volume, force, density, speed etc. The units for such quantities can be obtained by defining the derived quantity in terms of the base quantities using the base units. For example, speed (velocity) is expressed in distance/time. So the unit is m/s or ms^{-1} . The unit of force (mass $\times$ acceleration) is $kg\ ms^{-2}$ and the unit for acceleration is ms^{-2} .

Table 1.1 Seven basic S.I. units

Length	Mass	Time	Temperature	Electric Current	Luminous Intensity	Amount of substance
metre (<i>m</i>)	Kilogram (<i>kg</i>)	Second (<i>s</i>)	Kelvin (<i>K</i>)	Ampere (<i>A</i>)	Candela (<i>Cd</i>)	Mole (<i>mol</i>)

Table 1.2 Derived Units

Physical quantity	Unit	Symbol
Area	square metre	m^2
Volume	cubic metre	m^3
Velocity	metre per second	ms^{-1}
Acceleration	metre per second square	ms^{-2}
Density	kilogram per cubic metre	$kg\ m^{-3}$
Molar mass	kilogram per mole	$kg\ mol^{-1}$
Molar volume	cubic metre per mole	$m^3\ mol^{-1}$
Molar concentration	mole per cubic metre	$mol\ m^{-3}$
Force	newton (<i>N</i>)	$kg\ m\ s^{-2}$
Pressure	pascal (<i>Pa</i>)	$N\ m^{-2}$
Energy work	joule (<i>J</i>)	$kg\ m^2\ s^{-2}$, Nm

Table 1.3 Standard prefixes use to reduce the basic units

Multiple	Prefix	Symbol	Submultiple	Prefix	Symbol
10^6	yotta	Y	10^{-1}	deci	d
10^9	zetta	Z	10^{-2}	centi	c
10^{12}	exa	E	10^{-3}	milli	m
10^{15}	peta	P	10^{-6}	micro	μ
10^{18}	tera	T	10^{-9}	nano	n

10 ⁹	giga	G	10 ⁻¹²	pico	p
10 ⁶	mega	M	10 ⁻¹⁵	femto	f
10 ³	kilo	k	10 ⁻¹⁸	atto	a
10 ²	hecto	h	10 ⁻²¹	zeto	z
10 ¹	deca	da	10 ⁻²⁴	yocto	y

Table 1.4 Conversion factors

1 m = 39.37 inch	1 cal = 4.184 J	1 e.s.u. = 3.3356×10^{-9} C	1 mole of a gas = 22.4 L at STP
1 inch = 2.54 cm	1 eV = 1.602×10^{-19} J	1 dyne = 10^{-5} N	1 mole a substance = N_A molecules
1 litre = 1000 mL	1 eV/atom = 96.5 kJ mol ⁻¹	1 atm = 101325 Pa	1 g atom = N_A atoms
1 gallon (US) = 3.79 L	1 amu = 931.5016 MeV	1 bar = 1×10^5 N m ⁻²	t (°F) = 9/5 t (°C) + 32
1 lb = 453.59237 g	1 kilo watt hour = 3600 kJ	1 litre atm = 101.3 J	1 g cm ⁻³ = 1000 kg m ⁻³
1 newton = 1 kg m s ⁻²	1 horse power = 746 watt	1 year = 3.1536×10^7 s	1 Å = 10^{-10} m
1 J = 1 Nm = 1 kg m ² s ⁻²	1 joule = 10^7 erg	1 debye (D) = 1×10^{-18} esu cm	1 nm = 10^{-9} m

Laws of chemical combination

Various chemical reactions take place according to the certain laws, known as the *Laws of chemical combination*.

(1) **Law of conservation of mass** : It was proposed by Lavoisier and verified by Landolt. According to this law, *Matter is neither created nor destroyed in the course of chemical reaction though it may change from one form to other*. The total mass of materials after a chemical reaction is same as the total mass before reaction.

(2) **Law of constant or definite proportion** : It was proposed by Proust. According to this law, *A pure chemical compound always contains the same elements combined together in the fixed ratio of their weights whatever its methods of preparation may be*.

(3) **Law of multiple proportion** : It was proposed by Dalton and verified by Berzelius. According to this law, *When two elements A and B combine to form more than one chemical compounds then different weights of A, which combine with a fixed weight of B, are in proportion of simple whole numbers*.

(4) **Law of equivalent proportion or law of reciprocal proportion** : It was proposed by Richter. According to this law, *The weights of the two or more elements which separately react with same weight of a third element are also the weights of these elements which react with each other or in simple multiple of them*.

(5) **Gay-Lussac's law** : It was proposed by Gay-Lussac and is applicable only for gases. According to this law, *When gases combine, they do so in volumes, which bear a simple ratio to each other and also to the product formed provided all gases are measured under similar conditions*. The Gay-Lussac's law, was based on experimental observation.

Important hypothesis

(1) **Atomic hypothesis** : Keeping in view various law of chemical combinations, a theoretical proof for the validity of different laws was given by John Dalton in the form of hypothesis called **Dalton's atomic hypothesis**. Postulates of Dalton's hypothesis is as follows,

(i) Each element is composed of extremely small particles called **atoms** which can take part in chemical combination.

(ii) All atoms of a given element are identical *i.e.*, atoms of a particular element are all alike but differ from atoms of other element.

(iii) Atoms of different elements possess different properties (including different masses).

(iv) Atoms are indestructible *i.e.*, atoms are neither created nor destroyed in chemical reactions.

(v) Atoms of elements take part to form molecules *i.e.*, compounds are formed when atoms of more than one element combine.

(vi) In a given compound, the relative number and kinds of atoms are constant.

(2) **Modern atomic hypothesis** : The main modifications made in Dalton's hypothesis as a result of new discoveries about atoms are,

(i) Atom is no longer considered to be indivisible.

(ii) Atoms of the same element may have different atomic weights. *e.g.*, isotopes of oxygen O^{16} , O^{17} , and O^{18} .

(iii) Atoms of different element may have same atomic weights. *e.g.*, isobars Ca^{40} and Ar^{40} .

(iv) *Atom is no longer indestructible. In many nuclear reactions, a certain mass of the nucleus is converted into energy in the form of α , β and γ rays.*

(v) Atoms may not always combine in simple whole number ratios. *e.g.*, in sucrose ($C_{12}H_{22}O_{11}$), the elements carbon, hydrogen and oxygen are present in the ratio of 12 : 22 : 11 and the ratio is not a simple whole number ratio.

(3) **Berzelius hypothesis** : "Equal volumes of all gases contain equal number of atoms under same conditions of temperature and pressure". When applied to law of combining volumes, this hypothesis predicts that atoms are divisible and hence it is contrary to Dalton's hypothesis.

(4) **Avogadro's hypothesis** : "Equal volumes of all gases under similar conditions of temperature and pressure contain equal number of molecules." Avogadro hypothesis has been found to explain as follows,

(i) Provides a method to determine the atomic weight of gaseous elements.

(ii) *Provides a relationship between vapour density (V.D.) and molecular masses of substances.*

$$\text{Molecular mass} = 2 \times \text{vapour density}$$

(iii) It helps in the determination of mass of fixed volume of a particular gas.

$$\text{Mass of 1 ml gas} = \text{V.D.} \times 0.0000897 \text{ gm.}$$

(iv) It also helps in the determination of molar volume at N.T.P.

$$\therefore \text{V.D.} \times 0.0000897 \text{ gm. gas has volume} = 1 \text{ ml}$$

$$\therefore 2 \times \text{V.D. (i.e., molecular mass) gm. has volume} = \frac{1 \times 2 \times \text{V.D.}}{\text{V.D.} \times 0.0000897} \text{ ml} = 22400 \text{ ml}$$

$\therefore$ Molar mass of a gas or its 1 mole occupies 22.4 L volume at S.T.P.

(v) It helps in determination of molecular formulae of gases and is very useful in gas analysis. By knowing the molecular volumes of reactants and products of reaction, molecular composition can be determined easily.

Atomic, Molecular and Equivalent masses

(i) **Atomic mass** : It is the average relative mass of atom of element as compared with an atom of carbon-12 isotope taken as 12.

$$\text{Atomic mass} = \frac{\text{Average mass of an atom}}{1/12 \times \text{Mass of an atom of } C^{12}}$$

Average atomic mass : If an element exists in two isotopes having atomic masses 'a' and 'b' in the ratio $m : n$, then average atomic mass = $\frac{(m \times a) + (n \times b)}{m + n}$. Since the atomic mass is a ratio, it has no units and is

expressed in *amu*, $1 \text{ amu} = 1.66 \times 10^{-24} \text{ g}$. One atomic mass unit (*amu*) is equal to $\frac{1}{12}$ th of the mass of an atom of carbon-12 isotope.

Gram atomic mass (GAM) : Atomic mass of an element expressed in grams is called *Gram atomic mass* or *gram atom* or *mole atom*.

$$(i) \text{ Number of gram atoms} = \frac{\text{Mass of an element}}{\text{GAM}}$$

$$(ii) \text{ Mass of an element in gm.} = \text{No. of gm. atom} \times \text{GAM}$$

$$(iii) \text{ Number of atoms in 1 GAM} = 6.02 \times 10^{23}$$

$$\therefore \text{ Number of atoms in a given substance}$$

$$= \text{No. of GAM} \times 6.02 \times 10^{23} = \frac{\text{Mass}}{\text{GAM}} \times 6.02 \times 10^{23}$$

$$(iv) \text{ Number of atoms in 1 gm of element} = \frac{6.02 \times 10^{23}}{\text{Atomic mass}}$$

$$(v) \text{ Mass of one atom of the element (in gm.)} = \frac{\text{GAM}}{6.02 \times 10^{23}}$$

Methods of determination of atomic mass

(i) **Dulong and Pettit's method** : According to Dulong and Pettit's law

$$\text{Atomic mass} \times \text{Specific heat} = 6.4 \text{ (approx.)}$$

$$\text{Atomic mass (approx.)} = \frac{6.4}{\text{Specific heat (in cal.)}}$$

This law is applicable to solid elements only except Be, B, C and Si because their specific heat is variable with temperature.

$$\text{Atomic mass} = \text{Equivalent mass} \times \text{Valency}$$

$$\text{Valency} = \frac{\text{Approximate atomic mass}}{\text{Equivalent mass}}$$

(ii) **Vapour density method** : It is suitable for elements whose chlorides are volatile.

$$\begin{aligned} \text{Valency of the element} &= \frac{\text{Molecular mass of chloride}}{\text{Equivalent mass of chloride}} \\ &= \frac{2 \times \text{Vapour density of chloride}}{\text{Equivalent mass of metal} + 35.5} \end{aligned}$$

$$\text{Atomic mass} = \text{Equivalent mass of metal} \times \text{Valency}$$

(iii) **Specific heat method** : It is suitable only for gases. The two types of specific heats of gases are C_p (at constant pressure) and C_v (at constant volume). Their ratio is known as γ whose value is constant (1.66 for monoatomic, 1.40 for diatomic and 1.33 for triatomic gases).

$$\text{Atomic mass of a gaseous element} = \frac{\text{Molecular mass}}{\text{Atomicity}}$$

(iv) **Isomorphism method** : It is based on law of isomorphism which states that compounds having identical crystal structure have similar constitution and chemical formulae.

$$\text{Example : } K_2SO_4, K_2CrO_4 \text{ and } K_2SeO_4$$

(valency of S, Cr, Se = 6),

(valency of Zn, Mg, Fe = 2).

(2) **Molecular mass** : Molecular mass of a molecule, of an element or a compound may be defined as a number which indicates how many times heavier is a molecule of that element or compound as compared with $\frac{1}{12}$ of the mass of an atom of carbon-12. Molecular mass is a ratio and hence has no units. It is expressed in *a.m.u.*

$$\text{Molecular mass} = \frac{\text{Mass of one molecule of the substance}}{1/12 \times \text{Mass of one atom of C-12}}$$

$$\text{Actual mass of one molecule} = \text{Mol. mass} \times 1.66 \times 10^{-24} \text{ gm.}$$

Molecular mass of a substance is the additive property and can be calculated by adding the atomic masses present in one molecule.

Gram molecular mass (GMM) and Gram molar volume : Molecular mass of an element or compound when expressed in *gm.* is called its gram molecular mass, gram molecule or mole molecule.

$$\text{Number of gm molecules} = \frac{\text{Mass of substances}}{\text{GMM}}$$

$$\text{Mass of substances in gm} = \text{No. of gm. molecules} \times \text{GMM}$$

Volume occupied by one mole of any gas at STP is called **Gram molar volume**. The value of gram molar volume is 22.4 litres. Volume of 1 mole of any gas at STP = 22.4 litres

Expression for mass and density

$$\text{Mass of 11.2L of any gas at STP} = \text{V.D. of that gas in gm.}$$

$$\text{Density of a gas at NTP} = \frac{\text{Mol. mass in gm.}}{22400 \text{ ml}}$$

Important generalisations

Number of atoms in a substance

$$= \text{Number of GMM} \times 6.02 \times 10^{23} \times \text{Atomicity}$$

Number of electrons in given substance

$$= \text{Number of GMM} \times 6.02 \times 10^{23} \times \text{Number of electrons}$$

Methods of determination of molecular mass

Following methods are used to determine molecular mass,

(i) **Diffusion method** (For gases) : The ratio of rates of diffusion of two gases is inversely proportional to the square root of their molecular masses.

$$\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}}$$

(ii) **Vapour density method** (For gases only) : Mass of a fixed volume of the vapour is compared with the mass of the same volume of hydrogen under same conditions. The ratio of these masses is called **Vapour density** or **Relative density**.

$$\text{Molecular mass} = 2 \times \text{Vapour density}$$

(iii) **Victor Meyer method** (For volatile liquids or solids)

It is based on Dalton's law of partial pressure and Avogadro's hypothesis (gram molar volume).

22400 ml of vapours of a substance = Molecular mass of that substance

(iv) **Colligative property method** (For non-volatile solids)

Discussed in colligative properties of solutions.

Average atomic mass and molecular mass

$$\bar{A} \text{ (Average atomic mass)} = \frac{\sum A_i X_i}{\sum X_{\text{total}}}$$

$$\bar{M} \text{ (Average molecular mass)} = \frac{\sum M_i X_i}{\sum X_{\text{total}}}$$

Where $A_1, A_2, A_3, \dots$ are atomic mass of species 1, 2, 3, ... etc. with % ratio as $X_1, X_2, X_3, \dots$ etc. Similar terms are for molecular masses.

(3) **Equivalent mass** : The number of parts by mass of a substance that combines with or displaces 1.008 parts by mass of hydrogen or 8.0 parts of oxygen or 35.5 parts of chlorine is called its *equivalent mass* (EM). On the other hand *quantity of a substance in grams numerically equal to its equivalent mass is called its gram equivalent mass (GEM) or gram equivalent*.

$$\text{Number of GEM} = \frac{\text{Mass of the substance in grams}}{\text{GEM of the substance}}$$

Expressions for equivalent mass (EM)

$$(i) \text{ EM of an element} = \frac{\text{Atomic mass}}{\text{Valency}}$$

$$(ii) \text{ EM of an acid} = \frac{\text{Molecular mass}}{\text{Basicity}}$$

(Basicity of acid is the number of replaceable hydrogen atoms in one molecule of the acid).

$$(iii) \text{ EM of a base} = \frac{\text{Molecular mass}}{\text{Acidity}}$$

(Acidity of a base is the number of replaceable -OH groups in one molecule of the base).

$$(iv) \text{ EM of a salt} = \frac{\text{Formula mass}}{\text{Total positive or negative charge}}$$

(v) EM of an oxidising agent

$$= \frac{\text{Formula mass}}{\text{Number of electrons gained per molecule or Total change in O.N.}}$$

Equivalent mass of common oxidising agent changes with the medium of the reaction.

Methods of determination of equivalent mass

(i) **Hydrogen displacement method** : The mass of metal which displaces 11200 ml of hydrogen at NTP from an acid, alkali or alcohol is the equivalent mass of the metal.

(a) Equivalent mass of metal

$$= \frac{\text{Mass of metal}}{\text{Mass of H}_2 \text{ displaced}} \times 1.008 = \frac{W}{M} \times 1.008 g$$

(b) Equivalent mass of metal

$$= \frac{\text{Mass of metal}}{\text{Vol. (ml) of H}_2 \text{ displaced at STP}} \times 11200 = \frac{W}{V} \times 11200$$

This method is useful for metals which can displace hydrogen from acids or can combine with hydrogen (Mg, Zn, Na, Ca etc.).

(ii) **Oxide formation method** : The mass of the element which combines with 8 grams of oxygen is the equivalent mass of the element.

$$(a) \text{ Equivalent mass of metal} = \frac{\text{Mass of metal}}{\text{Mass of oxygen}} \times 8$$

(b) Equivalent mass of metal

$$= \frac{\text{Mass of metal}}{\text{Vol. of O}_2 \text{ at S.T.P. in ml}} \times 5600$$

(iii) **Chloride formation method** : The mass of an element which reacts with 35.5 gm. of chlorine is the equivalent mass of that element.

$$(a) \text{ Equivalent mass of metal} = \frac{\text{Mass of metal}}{\text{Mass of chlorine}} \times 35.5$$

(b) Equivalent mass of metal

$$= \frac{\text{Mass of metal}}{\text{Vol. of Cl}_2 \text{ (in ml.) at STP}} \times 11200$$

(iv) **Neutralisation method** : (For acids and bases).

$$\text{Equivalent mass of acid (or base)} = \frac{W}{V \times N}$$

Where,

W = Mass of acid or base in gm.,

V = Vol. of base or acid in litre required for neutralisation

N is Normality of base or acid

(v) **Metal displacement method** : It is based on the fact that one gm. equivalent of a more electropositive metal displaces one gm equivalent of a less electropositive metal from its salt solution.

$$\frac{\text{Mass of metal added}}{\text{Mass of metal displaced}} = \frac{\text{Eq. mass of metal added}}{\text{Eq. mass of metal displaced}}$$

$$\frac{W_1}{W_2} = \frac{E_1}{E_2}$$

(vi) **Electrolytic method** : The quantity of substance that reacts at electrode when 1 faraday of electricity is passed is equal to its gram equivalent mass.

Gram equivalent mass = Electrochemical equivalent $\times$ 96500

The ratio of masses of two metals deposited by the same quantity of electricity will be in the ratio of their equivalent masses.

$$\frac{W_1}{W_2} = \frac{E_1}{E_2}$$

(vii) **Double decomposition method**

$$\frac{\text{Mass of compound } AB}{\text{Mass of compound } AD} = \frac{\text{Eq. mass of } A + \text{Eq. mass of } B}{\text{Eq. mass of } A + \text{Eq. mass of } D}$$

$$\text{or } \frac{\text{Mass of salt taken } (W_1)}{\text{Mass of ppt. obtained } (W_2)} = \frac{\text{Eq. mass of salt } (E_1)}{\text{Eq. mass of salt in ppt. } (E_2)}$$

(viii) **Conversion method** : When one compound of a metal is converted to another compound of the same metal, then

$$\frac{\text{Mass of compound I } (W_1)}{\text{Mass of compound II } (W_2)} = \frac{E + \text{Eq. mass of radical I}}{E + \text{Eq. mass of radical II}}$$

(E = Eq. mass of the metal)

(ix) **Volatile chloride method**

$$\text{Valency of metal} = \frac{2 \times \text{V.D. of Chloride}}{\text{Eq. mass of metal chloride}} = \frac{2 \times \text{V.D.}}{E + 35.5}$$

$$\therefore E = \frac{2 \times \text{V.D. of Chloride}}{\text{Valency}} - 35.5$$

(x) **Silver salt method** (For organic acids)

$$\text{Equivalent Mass of acid} = \frac{108 \times \text{Mass of silver salt}}{\text{Mass of Ag metal}} - 107$$

Molecular mass of acid = Equivalent mass of acid $\times$ Basicity

The mole concept

One mole of any substance contains a fixed number (6.022×10^{23}) of any type of particles (atoms or molecules or ions) and has a mass equal to the atomic or molecular weight, in grams. Thus it is correct to refer to a mole of helium, a mole of electrons, or a mole of Na^+ , meaning respectively *Avogadro's number* of atoms, electrons or ions.

$$\begin{aligned} \therefore \text{Number of moles} &= \frac{\text{Weight (grams)}}{\text{Weight of one mole (g/mole)}} \\ &= \frac{\text{Weight}}{\text{Atomic or molecular weight}} \end{aligned}$$

Percentage composition & Molecular formula

(1) **Percentage composition of a compound**

Percentage composition of the compound is the relative mass of each of the constituent element in 100 parts of it. If the molecular mass of a compound is M and B is the mass of an element in the molecule, then

$$\text{Percentage of element} = \frac{\text{Mass of element}}{\text{Molecular mass}} \times 100 = \frac{X}{M} \times 100$$

(2) **Determination of empirical formula** : The empirical formula of a molecule is determined using the % of elements present in it. Following method is adopted.

Element	% Relative no. of atoms = %/at. wt.	Simplest Ratio	Empirical Formula
---------	--	-------------------	----------------------

Relative no. of atoms : Divide the percentage of each element present in compound by its at. weight. This gives the relative no. of atoms of element in molecule.

Simplest ratio : Find out lowest value of relative no. of atoms and divide each value of relative no. of atoms by this value to estimate simplest ratio of elements.

If the simplest ratio obtained are not complete integers, multiply them by a common factor to get integer values of simplest ratio.

Empirical formula : Write all constituent atoms with their respective no. of atoms derived in simplest ratio. This gives empirical formula of compound.

Molecular formula : Molecular formula = $n \times$ empirical formula where 'n' is the whole no. obtained by

$$n = \frac{\text{molecular weight of compound}}{\text{empirical formula weight of compound}}$$

Chemical stoichiometry

Stoichiometry (pronounced "stoy-key om-e-tree") is the calculation of the quantities of reactants and products involved in a chemical reaction. That means quantitative calculations of chemical composition and reaction are referred to as stoichiometry.

Basically, this topic involves two types of calculations.

(a) Simple calculations (gravimetric analysis) and

(b) More complex calculations involving concentration and volume of solutions (volumetric analysis).

There is no borderline, which can distinguish the set of laws applicable to gravimetric and volumetric analysis. All the laws used in one are equally applicable to the other i.e., mole as well as equivalent concept. But in actual practise, the problems on gravimetric involves simpler reactions, thus mole concept is convenient to apply while volumetric reactions being complex and unknown (unknown simple means that it is not known to you, as it's not possible for you to remember all possible reactions), equivalent concept is easier to apply as it does not require the knowledge of balanced equation.

(1) **Gravimetric analysis** : In gravimetric analysis we relate the weights of two substances or a weight of a substance with a volume of a gas or volumes of two or more gases.

Problems Involving Mass-Mass Relationship

Proceed for solving such problems according to the following instructions,

(i) Write down the balanced equation to represent the chemical change.

(ii) Write the number of moles below the formula of the reactants and products. Also write the relative weights of the reactants and products (calculated from the respective molecular formula), below the respective formula.

(iii) Apply the unitary method to calculate the unknown factor (s).

Problems Involving Mass-Volume Relationship

For solving problems involving mass-volume relationship, proceed according to the following instructions,

(i) Write down the relevant balanced chemical equations (s).

(ii) Write the weights of various solid reactants and products.

(iii) Gases are usually expressed in terms of volumes. In case the volume of the gas is measured at room temperature and pressure (or under conditions other than N.T.P.), convert it into N.T.P. by applying gas equation.

(iv) Volume of a gas at any temperature and pressure can be converted into its weight and vice-versa with the help of the relation, by

$PV = \frac{g}{M} \times RT$ where g is weight of gas, M is mole. wt. of gas, R is gas constant.

Calculate the unknown factor by unitary method.

Problems Based on Volume-Volume Relationship

Such problems can be solved according to chemical equation as,

(i) Write down the relevant balanced chemical equation.

(ii) Write down the volume of reactants and products below the formula to each reactant and product with the help of the fact that 1gm molecule of every gaseous substance occupies 22.4 litres at N.T.P.

(iii) In case volume of the gas is measured under particular (or room) temperature, convert it to volume at NTP by using ideal gas equation.

Take the help of Avogadro's hypothesis "Equal volume of different gases under the similar conditions of temperature and pressure contain the same number of molecules".

(2) **Volumetric analysis** : It is a method which involves quantitative determination of the amount of any substance present in a solution through volume measurements. For the analysis a standard solution is required. (A solution which contains a known weight of the solute present in known volume of the solution is known as standard solution.)

To determine the strength of unknown solution with the help of known (standard) solution is known as titration. Different types of titrations are possible which are summarised as follows,

(i) **Redox titrations** : To determine the strength of oxidising agents or reducing agents by titration with the help of standard solution of reducing agents or oxidising agents.

Examples:

Similarly with $H_2C_2O_4$

(ii) **Acid-base titrations** : To determine the strength of acid or base with the help of standard solution of base or acid.

Example: $NaOH + HCl \rightarrow NaCl + H_2O$

and $NaOH + CH_3COOH \rightarrow CH_3COONa + H_2O$ etc.

(iii) **Iodometric titrations** : This is a simple titration involving free iodine. This involves the titration of iodine solution with known sodium thiosulphate solution whose normality is N . Let the volume of sodium thiosulphate is $V \text{ ml}$.

$$n = 2, n = 1$$

Equivalents of I_2 = Equivalent of $Na_2S_2O_3$

$$\therefore \text{Equivalents of } I_2 = N \times V \times 10^{-3}$$

$$\text{Moles of } I_2 = \frac{N \times V \times 10^{-3}}{2}$$

$$\text{Mass of free } I_2 \text{ in the solution} = \left[\frac{N \times V \times 10^{-3}}{2} \times 254 \right] g.$$

(iv) **Iodometric titrations** : This is an indirect method of estimation of iodine. An oxidising agent is made to react with excess of solid KI . The oxidising agent oxidises I^- to I_2 . This iodine is then made to react with $Na_2S_2O_3$ solution.

Oxidising Agent

Let the normality of $Na_2S_2O_3$ solution is N and the volume of thiosulphate consumed to $V \text{ ml}$.

Equivalent of A = Equivalent of I_2 = Equivalents of $Na_2S_2O_3$

Equivalents of I_2 liberated from $KI = N \times V \times 10^{-3}$

$$\text{Moles of } I_2 \text{ liberated from } KI = \frac{N \times V \times 10^{-3}}{2}$$

$$\text{Mass of } I_2 \text{ liberated from } KI = \left[\frac{N \times V \times 10^{-3}}{2} \times 254 \right] g.$$

(v) **Precipitation titrations** : To determine the anions like CN^- , AsO_3^{3-} , PO_4^{3-} , X^- etc, by precipitating with $AgNO_3$ provides examples of precipitation titrations.

End point and equivalence point : The point at which titration is stopped is known as end point, while the point at which the acid and base (or oxidising and reducing agents) have been added in equivalent quantities is known as equivalence point. Since the purpose of the indicator is to stop the titration close to the point at which the reacting substances were added in equivalent quantities, it is important that the equivalence point and the end point be as close as possible.

Normal solution : A solution containing one gram equivalent weight of the solute dissolved per litre is called a normal solution; e.g. when 40 g of $NaOH$ are present in one litre of $NaOH$ solution, the solution is known as normal (N) solution of $NaOH$. Similarly, a solution containing a fraction of gram equivalent weight of the

solute dissolved per litre is known as subnormal solution. For example, a solution of NaOH containing 20 g (1/2 of g eq. wt.) of NaOH dissolved per litre is a sub-normal solution. It is written as $N/2$ or 0.5 N solution.

Formula used in solving numerical problems on volumetric analysis

$$(1) \text{ Strength of solution} = \text{Amount of substance in g litre}^{-1}$$

$$(2) \text{ Strength of solution} = \text{Amount of substance in g moles litre}^{-1}$$

$$(3) \text{ Strength of solution} = \text{Normality} \times \text{Eq. wt. of the solute} \\ = \text{molarity} \times \text{Mol. wt. of solute}$$

$$(4) \text{ Molarity} = \frac{\text{Moles of solute}}{\text{Volume in litre}}$$

$$(5) \text{ Number of moles} = \frac{\text{Wt. in gm}}{\text{Mol. wt.}} = M \times V_{(inl)}$$

$$= \frac{\text{Volume in litres}}{22.4} \text{ at NTP (only for gases)}$$

$$(6) \text{ Number of millimoles} = \frac{\text{Wt. in gm} \times 1000}{\text{mol. wt.}}$$

$$= \text{Molarity} \times \text{Volume in ml.}$$

$$(7) \text{ Number of equivalents}$$

$$= \frac{\text{Wt. in gm}}{\text{Eq. wt.}} = x \times \text{No. of moles} \times \text{Normality} \times \text{Volume in litre}$$

$$(8) \text{ Number of milliequivalents (meq.)}$$

$$= \frac{\text{Wt. in gm} \times 1000}{\text{Eq. wt.}} = \text{normality} \times \text{Volume in ml.}$$

$$(9) \text{ Normality} = x \times \text{No. of millimoles}$$

$$= x \times \text{Molarity} = \frac{\text{Strength in gm litre}^{-1}}{\text{Eq. wt.}}$$

$$\text{where } x = \frac{\text{Mol. wt.}}{\text{Eq. wt.}}, x = \text{valency or change in oxi. Number.}$$

$$(10) \text{ Normality formula, } N_1 V_1 = N_2 V_2$$

$$(11) \% \text{ by weight} = \frac{\text{Wt. of solvent}}{\text{Wt. of solution}} \times 100$$

$$(12) \% \text{ by volume} = \frac{\text{Vol. of solvent}}{\text{Vol. of solution}} \times 100$$

$$(13) \% \text{ by strength} = \frac{\text{Vol. of solvent}}{\text{Vol. of solution}} \times 100$$

$$(14) \text{ Specific gravity}$$

$$= \frac{\text{Wt. of solution}}{\text{Vol. of solution}} = \text{Wt. of 1 ml. of solution}$$

$$(15) \text{ Formality} = \frac{\text{Wt. of ionic solute}}{\text{Formula Wt. of solute} \times V_{inl}}$$

$$(16) \text{ Mol. Wt.} = V.D \times 2 \text{ (For gases only)}$$

Limiting reagent or reactant

In many situations, an excess of one or more substance is available for chemical reaction. Some of these excess substances will therefore be left over when the reaction is complete; the reaction stops immediately as soon as one of the reactant is totally consumed.

The substance that is totally consumed in a reaction is called limiting reagent because it determines or limits the amount of product. The other reactant present in excess are called as excess reagents.

Let us consider a chemical reaction which is initiated by passing a spark through a reaction vessel containing 10 mole of H_2 and 7 mole of O_2 .

Moles before reaction	10	7	0
Moles after reaction	0	2	10

The reaction stops only after consumption of 5 moles of O_2 as no further amount of H_2 is left to react with unreacted O_2 . Thus H_2 is a *limiting reagent* in this reaction.

Tips & Tricks

- ✍ Law of conservation of mass does not hold good for nuclear reactions.
- ✍ Law of definite proportions do not hold good for non-stoichiometric compounds e.g., Wustite Fe_xO .
- ✍ Law of definite proportions, law of multiple proportions and law of reciprocal proportions do not hold good when same compounds is obtained by using different isotopes of the same element e.g. H_2O and D_2O .
- ✍ The term atom was introduced by Ostwald and the term molecule was introduced by Avogadro.
- ✍ The concept of element was introduced by Robert Boyle.
- ✍ The number of atoms present in a molecule of a gaseous element is called Atomicity.
- ✍ Both atomic mass and molecular mass are just ratios and hence have no units.
- ✍ 1 mol of H_2O # 22400 cc of H_2O (because it is a liquid). Instead, 1 mol of H_2O = 18cc of H_2O (because density of H_2O = 1 g/cc)
- ✍ 1 M H_2SO_4 = 2 N H_2SO_4 .
- ✍ Minimum molecular mass of a macromolecular substance can be calculated by analysing it for one of the minor components. Minimum molecular mass is obtained when it is supposed that one molecule of the macromolecule contains only one atom or molecule of the minor component.

Minimum molecular mass

$$= \frac{\text{Atomic/molecular mass of minor component}}{\text{Mass of minor component per gram of macromolecule}}$$

Ordinary Thinking Objective Questions

Significant figures, Units for measurement, Matter and Separation of mixture

- One fermi is [Haryana CEET 1994; DPMT 2004]
 - 10^{-13} cm
 - 10^{-15} cm
 - 10^{-10} cm
 - 10^{-12} cm
- A picometre is written as
 - 10^{-9} m
 - 10^{-10} m
 - 10^{-11} m
 - 10^{-12} m
- One atmosphere is equal to
 - 101.325 K pa
 - 1013.25 K pa
 - 10^5 Nm
 - None of these
- Dimensions of pressure are same as that of [CBSE PMT 1995]
 - Energy
 - Force
 - Energy per unit volume
 - Force per unit volume
- The prefix 10^{18} is [Kerala MEE 2002]
 - Giga
 - Nano
 - Mega
 - Exa
- Given the numbers : 161cm, 0.161cm, 0.0161 cm. The number of significant figures for the three numbers are [CBSE PMT 1998]
 - 3, 4 and 5 respectively
 - 3, 3 and 3 respectively
 - 3, 3 and 4 respectively
 - 3, 4 and 4 respectively
- Significant figures in 0.00051 are
 - 5
 - 3
 - 2
 - 4
- Which of the following halogen can be purified by sublimation
 - F_2
 - Cl_2
 - Br_2
 - I_2
- Difference in density is the basis of [Kerala MEE 2002]
 - Ultrafiltration
 - Molecular sieving
 - Gravity Separation
 - Molecular attraction
- Which of the following elements of matter would best convey that there is life on earth
 - Oxygen
 - Hydrogen
 - Carbon
 - Iron
- The compound which is added to table salt for maintaining proper health is
 - KCl
 - KBr
 - NaI
 - $MgBr_2$
- Which of the following contains only one element
 - Marble
 - Diamond
 - Glass
 - Sand
- In known elements, the maximum number is of [CPMT 1985]
 - Metals
 - Non-metals
 - Metalloids
 - None of these
- Which one of the following is not an element
 - Diamond
 - Graphite
 - Silica
 - Ozone
- A mixture of $ZnCl_2$ and $PbCl_2$ can be separated by [AFMC 1989]
 - Distillation
 - Crystallization
 - Sublimation
 - Adding acetic acid
- A mixture of methyl alcohol and acetone can be separated by
 - Distillation
 - Fractional distillation
 - Steam distillation
 - Distillation under reduced pressure
- In the final answer of the expression $\frac{(29.2 - 20.2)(1.79 \times 10^5)}{1.37}$. The number of significant figures is [CBSE PMT 1994]
 - 1
 - 2
 - 3
 - 4
- 81.4 g sample of ethyl alcohol contains 0.002 g of water. The amount of pure ethyl alcohol to the proper number of significant figures is
 - 81.398 g
 - 71.40 g
 - 91.4 g
 - 81 g
- The unit $J Pa^{-1}$ is equivalent to
 - m^3
 - cm^3
 - dm^3
 - None of these
- From the following masses, the one which is expressed nearest to the milligram is
 - 16 g
 - 16.4 g
 - 16.428 g
 - 16.4284 g
- The number of significant figures in 6.02×10^{23} is [Manipal PMT 2001]
 - 23
 - 3
 - 4
 - 26
- The prefix zepto stands for [DPMT 2004]
 - 10^9
 - 10^{-12}
 - 10^{-15}
 - 10^{-21}
- The significant figures in 3400 are [BHU 2004]
 - 2
 - 5
 - 6
 - 4
- The number of significant figures in 6.0023 are [Pb.CET 2001]
 - 5
 - 4
 - 3
 - 1
- Given $P = 0.0030m$, $Q = 2.40m$, $R = 3000m$, Significant figures in P, Q and R are respectively [Pb. CET 2002]
 - 2, 2, 1
 - 2, 3, 4
 - 4, 2, 1
 - 4, 2, 3

26. The number of significant figures in 60.0001 is [Pb. CET 2000]
 (a) 5 (b) 6
 (c) 3 (d) 2
27. A sample was weighted using two different balances. The result's were (i) 3.929 g (ii) 4.0 g. How would the weight of the sample be reported
 (a) 3.929 g (b) 3 g
 (c) 3.9 g (d) 3.93 g

Laws of chemical combination

- Which of the following pairs of substances illustrate the law of multiple proportions [CPMT 1972, 78]
 (a) CO and CO₂ (b) H₂O and D₂O
 (c) NaCl and NaBr (d) MgO and Mg(OH)₂
- 1.0 g of an oxide of A contained 0.5 g of A. 4.0 g of another oxide of A contained 1.6 g of A. The data indicate the law of
 (a) Reciprocal proportions (b) Constant proportions
 (c) Conservation of energy (d) Multiple proportions
- Among the following pairs of compounds, the one that illustrates the law of multiple proportions is
 (a) NH₃ and NCl₃ (b) H₂S and SO₂
 (c) CuO and Cu₂O (d) CS₂ and FeSO₄
- The percentage of copper and oxygen in samples of CuO obtained by different methods were found to be the same. This illustrates the law of [AMU 1982, 92]
 (a) Constant proportions (b) Conservation of mass
 (c) Multiple proportions (d) Reciprocal proportions
- Two samples of lead oxide were separately reduced to metallic lead by heating in a current of hydrogen. The weight of lead from one oxide was half the weight of lead obtained from the other oxide. The data illustrates [AMU 1983]
 (a) Law of reciprocal proportions
 (b) Law of constant proportions
 (c) Law of multiple proportions
 (d) Law of equivalent proportions
- Chemical equation is balanced according to the law of [AMU 1984]
 (a) Multiple proportion (b) Reciprocal proportion
 (c) Conservation of mass (d) Definite proportions
- Avogadro number is
 (a) Number of atoms in one gram of element
 (b) Number of millilitres which one mole of a gaseous substances occupies at NTP
 (c) Number of molecules present in one gram molecular mass of a substance
 (d) All of these
- Different proportions of oxygen in the various oxides of nitrogen prove the [MP PMT 1985]
 (a) Equivalent proportion (b) Multiple proportion
 (c) Constant proportion (d) Conservation of matter
- Two elements X and Y have atomic weights of 14 and 16. They form a series of compounds A, B, C, D and E in which the same amount of element X, Y is present in the ratio 1 : 2 : 3 : 4 : 5. If the compound A has 28 parts by weight of X and 16 parts by weight of Y, then the compound of C will have 28 parts weight of X and [NCERT 1971]
 (a) 32 parts by weight of Y (b) 48 parts by weight of Y
 (c) 64 parts by weight of Y (d) 80 parts by weight of Y
- Carbon and oxygen combine to form two oxides, carbon monoxide and carbon dioxide in which the ratio of the weights of carbon and oxygen is respectively 12 : 16 and 12 : 32. These figures illustrate the
 (a) Law of multiple proportions
 (b) Law of reciprocal proportions
 (c) Law of conservation of mass
 (d) Law of constant proportions
- A sample of calcium carbonate (CaCO₃) has the following percentage composition : Ca = 40%; C = 12%; O = 48%. If the law of constant proportions is true, then the weight of calcium in 4 g of a sample of calcium carbonate obtained from another source will be
 (a) 0.016 g (b) 0.16 g
 (c) 1.6 g (d) 16 g
- n g of substance X reacts with m g of substance Y to form p g of substance R and q g of substance S. This reaction can be represented as, X + Y = R + S. The relation which can be established in the amounts of the reactants and the products will be
 (a) n - m = p - q (b) n + m = p + q
 (c) n = m (d) p = q
- Which of the following is the best example of law of conservation of mass [NCERT 1975]
 (a) 12 g of carbon combines with 32 g of oxygen to form 44 g of CO₂
 (b) When 12 g of carbon is heated in a vacuum there is no change in mass
 (c) A sample of air increases in volume when heated at constant pressure but its mass remains unaltered
 (d) The weight of a piece of platinum is the same before and after heating in air
- The law of multiple proportions is illustrated by the two compounds [NCERT 1972]
 (a) Sodium chloride and sodium bromide
 (b) Ordinary water and heavy water
 (c) Caustic soda and caustic potash
 (d) Sulphur dioxide and sulphur trioxide
- In compound A, 1.00 g nitrogen unites with 0.57 g oxygen. In compound B, 2.00 g nitrogen combines with 2.24 g oxygen. In compound C, 3.00 g nitrogen combines with 5.11 g oxygen. These results obey the following law [CPMT 1971]
 (a) Law of constant proportion
 (b) Law of multiple proportion
 (c) Law of reciprocal proportion
 (d) Dalton's law of partial pressure

16. Hydrogen combines with oxygen to form H_2O in which 16 g of oxygen combine with 2 g of hydrogen. Hydrogen also combines with carbon to form CH_4 in which 2 g of hydrogen combine with 6 g of carbon. If carbon and oxygen combine together then they will do show in the ratio of
(a) 6 : 16 or 12 : 32 (b) 6 : 18
(c) 1 : 2 (d) 12 : 24
17. 2 g of hydrogen combine with 16 g of oxygen to form water and with 6 g of carbon to form methane. In carbon dioxide 12 g of carbon are combined with 32 g of oxygen. These figures illustrate the law of
(a) Multiple proportions (b) Constant proportions
(c) Reciprocal proportions (d) Conservation of mass
18. An element forms two oxides containing respectively 53.33 and 36.36 percent of oxygen. These figures illustrate the law of
(a) Conservation of mass (b) Constant proportions
(c) Reciprocal proportions (d) Multiple proportions
19. After a chemical reaction, the total mass of reactants and products [MP PMT 1989]
(a) Is always increased (b) Is always decreased
(c) Is not changed (d) Is always less or more
20. A sample of pure carbon dioxide, irrespective of its source contains 27.27% carbon and 72.73% oxygen. The data support [AIIMS 1992]
(a) Law of constant composition
(b) Law of conservation of mass
(c) Law of reciprocal proportions
(d) Law of multiple proportions
21. The law of definite proportions is not applicable to nitrogen oxide because [EAMCET 1981]
(a) Nitrogen atomic weight is not constant
(b) Nitrogen molecular weight is variable
(c) Nitrogen equivalent weight is variable
(d) Oxygen atomic weight is variable
22. Which one of the following pairs of compounds illustrates the law of multiple proportion [EAMCET 1989]
(a) H_2O , Na_2O (b) MgO , Na_2O
(c) Na_2O , BaO (d) $SnCl_2$, $SnCl_4$
4. 1 amu is equal to
(a) $\frac{1}{12}$ of C - 12 (b) $\frac{1}{14}$ of O - 16
(c) 1g of H_2 (d) 1.66×10^{-23} kg
5. Sulphur forms the chlorides S_2Cl_2 and SCl_2 . The equivalent mass of sulphur in SCl_2 is [EAMCET 1985; Pb. CET 2001]
(a) 8 g/mole (b) 16 g/mole
(c) 64.8 g/mole (d) 32 g/mole
6. The sulphate of a metal M contains 9.87% of M. This sulphate is isomorphous with $ZnSO_4 \cdot 7H_2O$. The atomic weight of M is [IIT 1991]
(a) 40.3 (b) 36.3
(c) 24.3 (d) 11.3
7. When 100 ml of 1 M NaOH solution and 10 ml of 10 N H_2SO_4 solution are mixed together, the resulting solution will be [DPMT 1982]
(a) Alkaline (b) Acidic
(c) Strongly acidic (d) Neutral
8. In chemical scale, the relative mass of the isotopic mixture of oxygen atoms (O^{16} , O^{17} , O^{18}) is assumed to be equal to [Bihar MADT 1981]
(a) 16.002 (b) 16.00
(c) 17.00 (d) 11.00
9. For preparing 0.1 N solution of a compound from its impure sample of which the percentage purity is known, the weight of the substance required will be [MP PET 1996]
(a) More than the theoretical weight
(b) Less than the theoretical weight
(c) Same as the theoretical weight
(d) None of these
10. 1 mol of CH_4 contains
(a) 6.02×10^{23} atoms of H
(b) 4 g atom of Hydrogen
(c) 1.81×10^{23} molecules of CH_4
(d) 3.0 g of carbon
11. In the reaction $2Na_2S_2O_3 + I_2 \rightarrow Na_2S_4O_6 + 2NaI$, the equivalent weight of $Na_2S_2O_3$ (mol. wt. = M) is equal to
(a) M (b) $M/2$
(c) $M/3$ (d) $M/4$
12. When potassium permanganate is titrated against ferrous ammonium sulphate, the equivalent weight of potassium permanganate is [CPMT 1988]
(a) Molecular weight / 10 (b) Molecular weight / 5
(c) Molecular weight / 2 (d) Molecular weight
13. Boron has two stable isotopes, ^{10}B (19%) and ^{11}B (81%). The atomic mass that should appear for boron in the periodic table is [CBSE PMT 1990]
(a) 10.8 (b) 10.2
(c) 11.2 (d) 10.0

Atomic, Molecular and Equivalent masses

1. Which property of an element is always a whole number [MP PMT 1986]
(a) Atomic weight (b) Equivalent weight
(c) Atomic number (d) Atomic volume
2. Which one of the following properties of an element is not variable [Bihar MADT 1981]
(a) Valency (b) Atomic weight
(c) Equivalent weight (d) All of these
3. The modern atomic weight scale is based on [MP PMT 2002]
(a) C^{12} (b) O^{16}
(c) H^1 (d) C^{13}

14. What is the concentration of nitrate ions if equal volumes of 0.1 M AgNO_3 and 0.1 M NaCl are mixed together
[CPMT 1983; NCERT 1985]
(a) 0.1 M (b) 0.2 M
(c) 0.05 M (d) 0.25 M
15. Total number of atoms represented by the compound $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ is [BHU 2005]
(a) 27 (b) 21
(c) 5 (d) 8
16. 74.5 g of a metallic chloride contain 35.5 g of chlorine. The equivalent weight of the metal is [CPMT 1986]
(a) 19.5 (b) 35.5
(c) 39.0 (d) 78.0
17. 7.5 grams of a gas occupy 5.8 litres of volume at STP the gas is
(a) NO (b) N_2O
(c) CO (d) CO_2
18. The number of atoms in 4.25 g of NH_3 is approximately [CBSE PMT 1999; MH CET 2003]
(a) 1×10^{23} (b) 2×10^{23}
(c) 4×10^{23} (d) 6×10^{23}
19. One litre of a gas at STP weight 1.16 g it can possible be [AMU 1992]
(a) C_2H_2 (b) CO
(c) O_2 (d) CH_4
20. The vapour density of a gas is 11.2. The volume occupied by 11.2 g of the gas at ATP will be [Bihar CET 1995]
(a) 11.2 L (b) 22.4 L
(c) 1 L (d) 44.8 L
21. Equivalent weight of crystalline oxalic acid is [MP PMT 1995]
(a) 30 (b) 63
(c) 53 (d) 45
22. The equivalent weight of an element is 4. Its chloride has a V.D 59.25. Then the valency of the element is [BHU 1997]
(a) 4 (b) 3
(c) 2 (d) 1
23. 1.25 g of a solid dibasic acid is completely neutralised by 25 ml of 0.25 molar $\text{Ba}(\text{OH})_2$ solution. Molecular mass of the acid is
(a) 100 (b) 150
(c) 120 (d) 200
24. The oxide of a metal has 32% oxygen. Its equivalent weight would be [MP PMT 1985]
(a) 34 (b) 32
(c) 17 (d) 8
25. The mass of a molecule of water is [Bihar CEE 1995]
(a) 3×10^{-26} kg (b) 3×10^{-25} kg
(c) 1.5×10^{-26} kg (d) 2.5×10^{-26} kg
26. 1.24 gm P is present in 2.2 gm
(a) P_4S_3 (b) P_2S_2
(c) PS_2 (d) P_2S_4
27. The atomic weights of two elements A and B are 40 and 80 respectively. If x g of A contains y atoms, how many atoms are present in 2x g of B
(a) $\frac{y}{2}$ (b) $\frac{y}{4}$
(c) y (d) 2y
28. Assuming fully decomposed, the volume of CO_2 released at STP on heating 9.85g of BaCO_3 (Atomic mass of Ba=137) will be [CBSE PMT 2000]
(a) 0.84 L (b) 2.24 L
(c) 4.06 L (d) 1.12 L
29. If N_A is Avogadro's number then number of valence electrons in 4.2 g of nitride ions (N^{3-})
(a) $2.4 N_A$ (b) $4.2 N_A$
(c) $1.6 N_A$ (d) $3.2 N_A$
30. The weight of 1×10^{22} molecules of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ is [IIT 1991]
(a) 41.59 g (b) 415.9 g
(c) 4.159 g (d) None of these
31. Rearrange the following (I to IV) in the order of increasing masses and choose the correct answer from (a), (b), (c) and (d) (Atomic mass: N=14, O=16, Cu=63).
I. 1 molecule of oxygen
II. 1 atom of nitrogen
III. 1×10^{-10} g molecular weight of oxygen
IV. 1×10^{-10} g atomic weight of copper
(a) II<I<III<IV (b) IV<III<II<I
(c) II<III<I<IV (d) III<IV<I<II
32. 1.520 g of the hydroxide of a metal on ignition gave 0.995 gm of oxide. The equivalent weight of metal is [DPMT 1984]
(a) 1.520 (b) 0.995
(c) 19.00 (d) 9.00
33. How much coulomb charge is present on 1g ion of N^{3-}
(a) 5.2×10^6 Coulomb (b) 2.894×10^5 Coulomb
(c) 6.6×10^6 Coulomb (d) 8.2×10^6 Coulomb
34. Ratio of C_p and C_v of a gas X is 1.4, the number of atom of the gas 'X' present in 11.2 litres of it at NTP will be [CBSE 1999]
(a) 6.02×10^{23} (b) 1.2×10^{23}
(c) 3.01×10^{23} (d) 2.01×10^{23}
35. If we consider that 1/6, in place of 1/12, mass of carbon atom is taken to be the relative atomic mass unit, the mass of one mole of a substance will [AIIEE 2005]
(a) Decrease twice
(b) Increase two fold
(c) Remain unchanged
(d) Be a function of the molecular mass of the substance

36. What should be the equivalent weight of phosphorous acid, if $P=31$; $O=16$; $H=1$
 (a) 82 (b) 41
 (c) 20.5 (d) None of these
37. The number of molecule at NTP in 1 ml of an ideal gas will be
 (a) 6×10^{23} (b) 2.69×10^{19}
 (c) 2.69×10^{23} (d) None of these
38. The specific heat of a metal is 0.16 its approximate atomic weight would be
 (a) 32 (b) 16
 (c) 40 (d) 64
39. The weight of a molecule of the compound $C_{60}H_{122}$ is
 [AIIMS 2000]
 (a) 1.4×10^{-21} g (b) 1.09×10^{-21} g
 (c) 5.025×10^{23} g (d) 16.023×10^{23} g
40. What is the weight of oxygen required for the complete combustion of 2.8 kg of ethylene [CBSE PMT 1989]
 (a) 2.8 kg (b) 6.4 kg
 (c) 9.6 kg (d) 96 kg
41. What volume of NH_3 gas at STP would be needed to prepare 100ml of 2.5 molal (2.5m) ammonium hydroxide solution
 (a) 0.056 litres (b) 0.56 litres
 (c) 5.6 litres (d) 11.2 litres
42. If the density of water is 1 g cm^{-3} then the volume occupied by one molecule of water is approximately [Pb. PMT 2004]
 (a) 18 cm^3 (b) 22400 cm^3
 (c) $6.02 \times 10^{-23} \text{ cm}^3$ (d) $3.0 \times 10^{-23} \text{ cm}^3$
43. Caffeine has a molecular weight of 194. If it contains 28.9% by mass of nitrogen, number of atoms of nitrogen in one molecule of caffeine is
 (a) 4 (b) 6
 (c) 2 (d) 3
44. A 400 mg iron capsule contains 100 mg of ferrous fumarate, $(CHCOO)_2Fe$. The percentage of iron present in it is approximately
 (a) 33% (b) 25%
 (c) 14% (d) 8%
45. The element whose a atom has mass of $10.86 \times 10^{-26} \text{ kg}$ is
 (a) Boron (b) Calcium
 (c) Silver (d) Zinc
46. The number of gram atoms of oxygen present in 0.3 gram mole of $(COOH)_2 \cdot 2H_2O$ is
 (a) 0.6 (b) 1.8
 (c) 1.2 (d) 3.6
47. A gaseous mixture contains CH_4 and C_2H_6 in equimolecular proportion. The weight of 2.24 litres of this mixture at NTP is
 (a) 4.6 g (b) 1.6 g
 (c) 2.3 g (d) 23 g
48. Vapour density of a metal chloride is 66. Its oxide contains 53% metal. The atomic weight of the metal is
 [Bihar MADT 1982]
 (a) 21 (b) 54
 (c) 27.06 (d) 2.086
49. One gram of hydrogen is found to combine with 80g of bromine one gram of calcium valency=2 combines with 4g of bromine the equivalent weight of calcium is
 (a) 10 (b) 20
 (c) 40 (d) 80
50. The equivalent weight of $MnSO_4$ is half its molecular weight when it is converted to [IIT 1988; CPMT 1994]
 (a) Mn_2O_3 (b) MnO_2
 (c) MnO_4 (d) MnO_4^{2-}
51. 100 mL of PH_3 on decomposition produced phosphorus and hydrogen. The change in volume is [MNR 1986]
 (a) 50 mL increase (b) 500 mL decrease
 (c) 900 mL decrease (d) Nil.
52. 12g of Mg (at. mass 24) on reacting completely with acid gives hydrogen gas, the volume of which at STP would be [CPMT 1978]
 (a) 22.4 L (b) 11.2 L
 (c) 44.8 L (d) 6.1 L
53. Which of the following has least mass [Pb. PET 1985]
 (a) 2 g atom of nitrogen (b) 3×10^{23} atoms of C
 (c) 1 mole of S (d) 7.0 g of Ag
54. How many mole of helium gas occupy 22.4 L at $0^\circ C$ at 1 atm. pressure [Kurukshetra CEE 1992; CET 1992]
 (a) 0.11 (b) 0.90
 (c) 1.0 (d) 1.11
55. Volume of a gas at STP is 1.12×10^{-7} cc. Calculate the number of molecules in it [BHU 1997]
 (a) 3.01×10^{20} (b) 3.01×10^{12}
 (c) 3.01×10^{23} (d) 3.01×10^{24}
56. 4.4 g of an unknown gas occupies 2.24L of volume at standard temperature and pressure. The gas may be [MP PMT 1995]
 (a) Carbon dioxide (b) Carbon monoxide
 (c) Oxygen (d) Sulphur dioxide
57. The number of moles of oxygen in 1 L of air containing 21% oxygen by volume, in standard conditions, is [CBSE PMT 1995; Pb. PMT 2004]
 (a) 0.186 mol (b) 0.21 mol
 (c) 2.10 mol (d) 0.0093 mol
58. The number of molecules in 8.96 L of a gas at $0^\circ C$ and 1 atmosphere pressure is approximately [BHU 1993]
 (a) 6.02×10^{23} (b) 12.04×10^{23}
 (c) 18.06×10^{23} (d) 24.08×10^{22}

59. The equivalent weight of a metal is 9 and vapour density of its chloride is 59.25. The atomic weight of metal is [Pb. CET 2002]
 (a) 23.9 (b) 27.3
 (c) 36.3 (d) 48.3
60. The molecular weight of a gas is 45. Its density at STP is [Pb. PMT 2004]
 (a) 22.4 (b) 11.2
 (c) 5.7 (d) 2.0
61. Equivalent weight of a bivalent metal is 37.2. The molecular weight of its chloride is [MH CET 2003]
 (a) 412.2 (b) 216
 (c) 145.4 (d) 108.2
62. On reduction with hydrogen, 3.6 g of an oxide of metal left 3.2 g of metal. If the vapour density of metal is 32, the simplest formula of the oxide would be [DPMT 2004]
 (a) MO (b) M_2O_3
 (c) M_2O (d) M_2O_5
63. The number of molecules in 4.25 g of ammonia are [Pb. CET 2000]
 (a) 0.5×10^{23} (b) 1.5×10^{23}
 (c) 3.5×10^{23} (d) 1.8×10^{32}
- (c) 6×10^{23} (d) 12×10^{23}
6. The volume occupied by 4.4 g of CO_2 at STP is [AFMC 1997, 2004; Pb. CET 1997, 2002]
 (a) 22.4 L (b) 2.24 L
 (c) 0.224 L (d) 0.1 L
7. The number of water molecules present in a drop of water (volume 0.0018 ml) at room temperature is [DCE 2000]
 (a) 6.023×10^{19} (b) 1.084×10^{18}
 (c) 4.84×10^{17} (d) 6.023×10^{23}
8. One mole of calcium phosphide on reaction with excess of water gives [IIT 1999]
 (a) One mole of phosphine
 (b) Two moles of phosphoric acid
 (c) Two moles of phosphine
 (d) One mole of phosphorus pentoxide
9. 19.7 kg of gold was recovered from a smuggler. How many atoms of gold were recovered ($Au = 197$) [Pb. CET 1985]
 (a) 100 (b) 6.02×10^{23}
 (c) 6.02×10^{24} (d) 6.02×10^{25}
10. The total number of protons in 10 g of calcium carbonate is ($N_0 = 6.023 \times 10^{23}$)
 (a) 1.5057×10^{24} (b) 2.0478×10^{24}
 (c) 3.0115×10^{24} (d) 4.0956×10^{24}
11. The number of molecules in 16 g of methane is
 (a) 3.0×10^{23} (b) 6.02×10^{23}
 (c) $\frac{16}{6.02} \times 10^{23}$ (d) $\frac{16}{3.0} \times 10^{23}$
12. Number of molecules in 100 ml of each of O_2 , NH_3 and CO_2 at STP are [Bihar MADT 1985]
 (a) In the order $CO_2 < O_2 < NH_3$
 (b) In the order $NH_3 < O_2 < CO_2$
 (c) The same
 (d) $NH_3 = CO_2 < O_2$
13. The molecular weight of hydrogen peroxide is 34. What is the unit of molecular weight [MP PMT 1986]
 (a) g (b) mol
 (c) $g \text{ mol}^{-1}$ (d) mol g^{-1}
14. The number of water molecules in 1 litre of water is [EAMCET 1990]
 (a) 18 (b) 18×1000
 (c) N_A (d) $55.55 N_A$
15. The number of electrons in a mole of hydrogen molecule is [CPMT 1987]
 (a) 6.02×10^{23} (b) 12.046×10^{23}
 (c) 3.0115×10^{23} (d) Indefinite
16. The numbers of moles of $BaCO_3$ which contain 1.5 moles of oxygen atoms is [EAMCET 1991]
 (a) 0.5 (b) 1
 (c) 3 (d) 6.02×10^{23}

The mole concept

1. Which one of the following pairs of gases contains the same number of molecules [EAMCET 1987]
 (a) 16 g of O_2 and 14 g of N_2
 (b) 8 g of O_2 and 22 g of CO_2
 (c) 28 g of N_2 and 22 g of CO_2
 (d) 32 g of O_2 and 32 g of N_2
2. Number of gm of oxygen in 32.2 g $Na_2SO_4 \cdot 10H_2O$ is [Haryana PMT 2000]
 (a) 20.8 (b) 22.4
 (c) 2.24 (d) 2.08
3. 250 ml of a sodium carbonate solution contains 2.65 grams of Na_2CO_3 . If 10 ml of this solution is diluted to one litre, what is the concentration of the resultant solution (mol. wt. of $Na_2CO_3 = 106$) [EAMCET 2001]
 (a) 0.1 M (b) 0.001 M
 (c) 0.01 M (d) 10^{-4} M
4. A molar solution is one that contains one mole of a solute in [IIT 1986]
 (a) 1000 g of the solvent (b) One litre of the solvent
 (c) One litre of the solution (d) 22.4 litres of the solution
5. The number of oxygen atoms in 4.4 g of CO_2 is approx. [CBSE PMT 1990]
 (a) 1.2×10^{23} (b) 6×10^{22}

17. Which of the following is Loschmidt number
(a) 6×10^{23} (b) 2.69×10^{19}
(c) 3×10^{23} (d) None of these
18. How many molecules are present in one gram of hydrogen
[AIIMS 1982]
(a) 6.02×10^{23} (b) 3.01×10^{23}
(c) 2.5×10^{23} (d) 1.5×10^{23}
19. The total number of gm-molecules of SO_2Cl_2 in 13.5 g of sulphuryl chloride is
[CPMT 1992]
(a) 0.1 (b) 0.2
(c) 0.3 (d) 0.4
20. The largest number of molecules is in
[BHU 1997]
(a) 34 g of water (b) 28 g of CO_2
(c) 46 g of CH_3OH (d) 54 g of N_2O_5
21. The number of moles of sodium oxide in 620 g of it is
[BHU 1992]
(a) 1 mol (b) 10 moles
(c) 18 moles (d) 100 moles
22. 2 g of oxygen contains number of atoms equal to that in
[BHU 1992]
(a) 0.5 g of hydrogen (b) 4 g of sulphur
(c) 7 g of nitrogen (d) 2.3 g of sodium
23. Molarity of liquid HCl with density equal to 1.17 g/cc is
[CBSE PMT 2001]
(a) 36.5 (b) 18.25
(c) 32.05 (d) 4.65
24. How many atoms are contained in one mole of sucrose ($\text{C}_{12}\text{H}_{22}\text{O}_{11}$)
[Pb. PMT 2002]
(a) $45 \times 6.02 \times 10^{23}$ atoms/mole
(b) $5 \times 6.62 \times 10^{23}$ atoms/mole
(c) $5 \times 6.02 \times 10^{23}$ atoms/mole
(d) None of these
25. The number of molecules of CO_2 present in 44 g of CO_2 is
[BCECE 2005]
(a) 6.0×10^{23} (b) 3×10^{23}
(c) 12×10^{23} (d) 3×10^{10}
26. A sample of phosphorus trichloride (PCl_3) contains 1.4 moles of the substance. How many atoms are there in the sample [Kerala PMT 2004]
(a) 4 (b) 5.6
(c) 8.431×10^{23} (d) 3.372×10^{24}
(e) 2.409×10^{24}
27. The number of sodium atoms in 2 moles of sodium ferrocyanide is
[BHU 2004]
(a) 12×10^{23} (b) 26×10^{23}
(c) 34×10^{23} (d) 48×10^{23}
- (a) 40 (b) 60
(c) 8 (d) 10
2. The percentage of nitrogen in urea is about [KCET 2001]
(a) 46 (b) 85
(c) 18 (d) 28
3. If two compounds have the same empirical formula but different molecular formula, they must have [MP PMT 1986]
(a) Different percentage composition
(b) Different molecular weights
(c) Same viscosity
(d) Same vapour density
4. A compound (80 g) on analysis gave $\text{C} = 24 \text{ g}$, $\text{H} = 4 \text{ g}$, $\text{O} = 32 \text{ g}$. Its empirical formula is [CPMT 1981]
(a) $\text{C}_2\text{H}_2\text{O}_2$ (b) $\text{C}_2\text{H}_2\text{O}$
(c) CH_2O_2 (d) CH_2O
5. The empirical formula of a compound is CH_2O . 0.0835 moles of the compound contains 1.0 g of hydrogen. Molecular formula of the compound is
(a) $\text{C}_2\text{H}_{12}\text{O}_6$ (b) $\text{C}_5\text{H}_{10}\text{O}_5$
(c) $\text{C}_4\text{H}_8\text{O}_8$ (d) $\text{C}_3\text{H}_6\text{O}_3$
6. The empirical formula of an acid is CH_2O_2 , the probable molecular formula of acid may be [AFMC 2000]
(a) CH_2O (b) CH_2O_2
(c) $\text{C}_2\text{H}_4\text{O}_2$ (d) $\text{C}_3\text{H}_6\text{O}_4$
7. In which of the following pairs of compounds the ratio of C, H and O is same
(a) Acetic acid and methyl alcohol
(b) Glucose and acetic acid
(c) Fructose and sucrose
(d) All of these

Chemical stoichiometry

1. How much of NaOH is required to neutralise 1500 cm^3 of 0.1 N HCl ($\text{Na} = 23$) [KCET 2001]
(a) 40 g (b) 4 g
(c) 6 g (d) 60 g
2. How much water should be added to 200 c.c of semi normal solution of NaOH to make it exactly deci normal [AFMC 1983]
(a) 200 cc (b) 400 cc
(c) 800 cc (d) 600 cc
3. 2.76 g of silver carbonate on being strongly heated yield a residue weighing [Pb. CET 2003]
(a) 2.16 g (b) 2.48 g
(c) 2.64 g (d) 2.32 g

Percentage composition & Molecular formula

1. The percentage of oxygen in NaOH is [CPMT 1979]

4. In the reaction, $4\text{NH}_3(\text{g}) + 5\text{O}_2(\text{g}) \rightarrow 4\text{NO}(\text{g}) + 6\text{H}_2\text{O}(\text{g})$, When 1 mole of ammonia and 1 mole of O_2 are made to react to completion
- 1.0 mole of H_2O is produced
 - 1.0 mole of NO will be produced
 - All the oxygen will be consumed
 - All the ammonia will be consumed
5. Haemoglobin contains 0.33% of iron by weight. The molecular weight of haemoglobin is approximately 67200. The number of iron atoms (At. wt. of $\text{Fe} = 56$) present in one molecule of haemoglobin is [CBSE PMT 1998]
- 6
 - 1
 - 4
 - 2
6. What quantity of ammonium sulphate is necessary for the production of NH_3 gas sufficient to neutralize a solution containing 292 g of HCl ? [$\text{HCl}=36.5$; $(\text{NH}_4)_2\text{SO}_4=132$; $\text{NH}_3=17$] [CPMT 1992]
- 272 g
 - 403 g
 - 528 g
 - 1056 g
7. The percentage of P_2O_5 in diammonium hydrogen phosphate $(\text{NH}_4)_2\text{HPO}_4$ is [CPMT 1992]
- 23.48
 - 46.96
 - 53.78
 - 71.00
8. If $1\frac{1}{2}$ moles of oxygen combine with Al to form Al_2O_3 the weight of Al used in the reaction is ($\text{Al}=27$) [EAMCET 1980]
- 27 g
 - 54 g
 - 49.5 g
 - 31 g
9. The percentage of Se in peroxidase anhydrous enzyme is 0.5% by weight (atomic weight=78.4). Then minimum molecular weight of peroxidase anhydrous enzyme is [CBSE PMT 2001]
- 1.568×10^4
 - 1.568×10^3
 - 15.68
 - 3.136×10^4
10. H_2 evolved at STP on complete reaction of 27 g of Aluminium with excess of aqueous NaOH would be [CPMT 1991]
- 22.4
 - 44.8
 - 67.2
 - 33.6 litres
11. What is the % of H_2O in $\text{Fe}(\text{CNS})_3 \cdot 3\text{H}_2\text{O}$
- 45
 - 30
 - 19
 - 25
12. What weight of SO_2 can be made by burning sulphur in 5.0 moles of oxygen
- 640 grams
 - 160 grams
 - 80 grams
 - 320 grams
13. What is the normality of a 1 M solution of H_3PO_4 [AIIMS 1982]
- 0.5 N
 - 1.0 N
 - 2.0 N
 - 3.0 N
14. Normality of 2M sulphuric acid is [AIIMS 1992]
- 2N
 - 4N
 - $\frac{N}{2}$
 - $\frac{N}{4}$
15. How many g of a dibasic acid (Mol. wt. = 200) should be present in 100 ml of its aqueous solution to give decinormal strength [AIIMS 1992]
- 1 g
 - 2 g
 - 10 g
 - 20 g
16. The solution of sulphuric acid contains 80% by weight H_2SO_4 . Specific gravity of this solution is 1.71. Its normality is about [CBSE 1991]
- 18.0
 - 27.9
 - 1.0
 - 10.0
17. Mohr's salt is dissolved in dil. H_2SO_4 instead of distilled water to
- Enhance the rate of dissolution
 - Prevent cationic hydrolysis
 - Increase the rate of ionisation
 - Increase its reducing strength
18. Acidified potassium permanganate solution is decolourised by
- Bleaching powder
 - White vitriol
 - Mohr's salt
 - Microcosmic salt
19. Approximate atomic weight of an element is 26.89. If its equivalent weight is 8.9, the exact atomic weight of element would be [DPMT 1984]
- 26.89
 - 8.9
 - 17.8
 - 26.7
20. Vapour density of a gas is 22. What is its molecular mass [AFMC 2000]
- 33
 - 22
 - 44
 - 11
21. Equivalent weight of KMnO_4 acting as an oxidant in acidic medium is [CPMT 1990; MP PET 1999]
- The same as its molecular weight
 - Half of its molecular weight
 - One-third of its molecular weight
 - One-fifth of its molecular weight
22. 0.16 g of dibasic acid required 25 ml of decinormal NaOH solution for complete neutralisation. The molecular weight of the acid will be [CPMT 1989]
- 32
 - 64
 - 128
 - 256

23. To neutralise 20 ml of $M/10$ sodium hydroxide, the volume of $M/20$ hydrochloric acid required is [CPMT 1992]
[Andhra MBBS 1980]
(a) 10 ml (b) 15 ml
(c) 20 ml (d) 40 ml
24. Hydrochloric acid solutions A and B have concentration of 0.5 N and 0.1 N respectively. The volume of solutions A and B required to make 2 litres of 0.2 N hydrochloric acid [KCET 1993]
(a) 0.5 l of A + 1.5 l of B
(b) 1.5 l of A + 0.5 l of B
(c) 1.0 l of A + 1.0 l of B
(d) 0.75 l of A + 1.25 l of B
25. 5 ml of N HCl, 20 ml of $N/2$ H_2SO_4 and 30 ml of $N/3$ HNO_3 are mixed together and volume made to one litre. The normality of the resulting solution is [MNR 1991]
(a) $N/5$ (b) $N/10$
(c) $N/20$ (d) $N/40$
26. Under similar conditions of pressure and temperature, 40 ml of slightly moist hydrogen chloride gas is mixed with 20 ml of ammonia gas, the final volume of gas at the same temperature and pressure will be [CBSE PMT 1993]
(a) 100 ml (b) 20 ml
(c) 40 ml (d) 60 ml
27. $KMnO_4$ reacts with oxalic acid according to the equation, $2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightarrow 2Mn^{2+} + 10CO_2 + 8H_2O$, here 20 ml of 0.1 M $KMnO_4$ is equivalent to [CBSE PMT 1996]
(a) 20 ml of 0.5 M $H_2C_2O_4$ (b) 50 ml of 0.1 M $H_2C_2O_4$
(c) 50 ml of 0.5 M $H_2C_2O_4$ (d) 20 ml of 0.1 M $H_2C_2O_4$
28. In order to prepare one litre normal solution of $KMnO_4$, how many grams of $KMnO_4$ are required if the solution is used in acidic medium for oxidation [MP PET 2002]
(a) 158 g (b) 31.6 g
(c) 790 g (d) 62 g
29. What is the concentration of nitrate ions if equal volumes of 0.1 M $AgNO_3$ and 0.1 M $NaCl$ are mixed together [NCERT 1981; CPMT 1983]
(a) 0.1 N (b) 0.2 M
(c) 0.05 M (d) 0.25 M
30. 30 ml of acid solution is neutralized by 15 ml of a 0.2 N base. The strength of acid solution is [CPMT 1986]
(a) 0.1 N (b) 0.15 N
(c) 0.3 N (d) 0.4 N
31. A solution containing Na_2CO_3 and $NaOH$ requires 300 ml of 0.1 N HCl using phenolphthalein as an indicator. Methyl orange is then added to the above titrated solution when a further 25 ml of 0.2 N HCl is required. The amount of $NaOH$ present in solution is ($NaOH = 40$, $Na_2CO_3 = 106$)
(a) 0.6 g (b) 1.0 g
(c) 1.5 g (d) 2.0 g
32. In the preceding question, the amount of Na_2CO_3 present in the solution is [CPMT 1992]
(a) 2.650 g (b) 1.060 g
(c) 0.530 g (d) 0.265 g
33. How many ml of 1 (M) H_2SO_4 is required to neutralise 10 ml of 1 (M) $NaOH$ solution [MP PET 1998; MNR 1982; MP PMT 1987]
(a) 2.5 (b) 5.0
(c) 10.0 (d) 20.0
34. Which of the following cannot give iodometric titrations [AIIMS 1997]
(a) Fe^{3+} (b) Cu^{2+}
(c) Pb^{2+} (d) Ag^+
35. $KMnO_4$ reacts with ferrous ammonium sulphate according to the equation $MnO_4^- + 5Fe^{2+} + 8H^+ \rightarrow Mn^{2+} + 5Fe^{3+} + 4H_2O$, here 10 ml of 0.1 M $KMnO_4$ is equivalent to [CPMT 1999]
(a) 20 ml of 0.1 M $FeSO_4$
(b) 30 ml of 0.1 M $FeSO_4$
(c) 40 ml of 0.1 M $FeSO_4$
(d) 50 ml of 0.1 M $FeSO_4$
36. $Ca(OH)_2 + H_3PO_4 \rightarrow CaHPO_4 + 2H_2O$ the equivalent weight of H_3PO_4 in the above reaction is [Pb. PMT 2004]
(a) 21 (b) 27
(c) 38 (d) 49
37. The mass of $BaCO_3$ produced when excess CO_2 is bubbled through a solution of 0.205 mol $Ba(OH)_2$ is [UPSEAT 2004]
(a) 81 g (b) 40.5 g
(c) 20.25 g (d) 162 g
38. The amount of water that should be added to 500 ml of 0.5 N solution of $NaOH$ to give a concentration of 10 mg per ml is
(a) 100 (b) 200
(c) 250 (d) 500
39. Number of moles of $KMnO_4$ required to oxidize one mole of $Fe(C_2O_4)$ in acidic medium is [Haryana CEE 1996]
(a) 0.6 (b) 0.167
(c) 0.2 (d) 0.4
40. A hydrocarbon contains 86% carbon, 488ml of the hydrocarbon weight 1.68 g at STP. Then the hydrocarbon is an

- (a) Alkane (b) Alkene (c) 18 g (d) 19 g
(c) Alkyne (d) Arene
41. The ratio of amounts of H_2S needed to precipitate all the metal ions from 100 ml of 1 M $AgNO_3$ and 100 ml of 1 M $CuSO_4$ will be
(a) 1:1 (b) 1:2
(c) 2:1 (d) None of these
42. An electric discharge is passed through a mixture containing 50 c.c. of O_2 and 50 c.c. of H_2 . The volume of the gases formed (i) at room temperature and (ii) at $110^\circ C$ will be
(a) (i) 25 c.c. (ii) 50 c.c. (b) (i) 50 c.c. (ii) 75 c.c.
(c) (i) 25 c.c. (ii) 75 c.c. (d) (i) 75 c.c. (ii) 75 c.c.
43. 100 ml of 0.1 N hypo decolourised iodine by the addition of x g of crystalline copper sulphate to excess of KI. The value of 'x' is (molecular wt. of $CuSO_4 \cdot 5H_2O$ is 250)
(a) 5.0 g (b) 1.25 g
(c) 2.5 g (d) 4 g
44. How many grams of caustic potash required to completely neutralise 12.6 gm HNO_3
(a) 22.4 KOH (b) 1.01 KOH
(c) 6.02 KOH (d) 11.2 KOH
45. If isobutane and n-butane are present in a gas, then how much oxygen should be required for complete combustion of 5 kg of this gas
(a) 17.9 kg (b) 9 kg
(c) 27 kg (d) 1.8 kg
46. 16.8 litre gas containing H_2 and O_2 is formed at NTP on electrolysis of water. What should be the weight of electrolysed water
(a) 5 g (b) 9 g
(c) 10 g (d) 12 g
47. On electrical decomposition of 150 ml dry and pure O_2 , 10% of O_2 gets changed to O, then the volume of gaseous mixture after reaction and volume of remaining gas left after passing in turpentine oil will be
(a) 145 ml (b) 149 ml
(c) 128 ml (d) 125 ml
48. What should be the weight of 50% HCl which reacts with 100 g of limestone
(a) 50% pure (b) 25% pure
(c) 10% pure (d) 8% pure
49. What should be the weight and moles of AgCl precipitate obtained on adding 500ml of 0.20 M HCl in 30 g of $AgNO_3$ solution? ($AgNO_3 = 170$)
(a) 14.35 g (b) 15 g
50. A solution of 10 ml $\frac{M}{10} FeSO_4$ was titrated with $KMnO_4$ solution in acidic medium. The amount of $KMnO_4$ used will be [CPMT 1984]
(a) 5 ml of 0.1 M (b) 10 ml of 1.1 M
(c) 10 ml of 0.5 M (d) 10 ml of 0.02 M
51. 1.12 ml of a gas is produced at STP by the action of 4.12 mg of alcohol, with methyl magnesium iodide. The molecular mass of alcohol is [Roorkee 1992; IIT 1993]
(a) 16.0 (b) 41.2
(c) 82.4 (d) 156.0
52. The simplest formula of a compound containing 50% of element X (atomic mass 10) and 50% of element Y (atomic mass 20) is [Roorkee 1994]
(a) XY (b) X_2Y
(c) XY_3 (d) X_2Y_3
53. A compound contains atoms of three elements in A, B and C. If the oxidation number of A is +2, B is +5 and that of C is -2, the possible formula of the compound is [CBSE PMT 2000]
(a) $A_3(BC_4)_2$
(b) $A_3(B_4C)_2$
(c) ABC_2
(d) $A_2(BC_3)_2$
54. What will be the volume of CO_2 at NTP obtained on heating 10 grams of (90% pure) limestone [Pb. CET 2001]
(a) 22.4 litre
(b) 2.016 litre
(c) 2.24 litre
(d) 20.16 litre
55. The ratio of the molar amounts of H_2S needed to precipitate the metal ions from 20mL each of 1M $Cd(NO_3)_2$ and 0.5M $CuSO_4$ is [CPMT 1997]
(a) 1 : 1
(b) 2 : 1
(c) 1 : 2
(d) Indefinite
56. 12g of Mg (at. mass 24) will react completely with acid to give [MNR 1985]
(a) One mole of H_2
(b) 1/2 mole of H_2
(c) 2/3 mole of O_2
(d) Both 1/2 mol of H_2 and 1/2 mol of O_2

57. 1.5 mol of O_2 combine with Mg to form oxide MgO . The mass of Mg (at. mass 24) that has combined is

[KCET 2001]

- (a) 72 g (b) 36 g
(c) 48 g (d) 24 g

58. 100 g $CaCO_3$ reacts with 1 litre 1 N HCl . On completion of reaction how much weight of CO_2 will be obtain

[Kerala CET 2005]

- (a) 5.5 g (b) 11 g
(c) 22 g (d) 33 g
(e) 44 g

Critical Thinking

Objective Questions

1. Mixture of sand and sulphur may best be separated by

[Kerala CET 2001]

- (a) Fractional crystallisation from aqueous solution
(b) Magnetic method
(c) Fractional distillation
(d) Dissolving in CS_2 and filtering

2. Irrespective of the source, pure sample of water always yields 88.89% mass of oxygen and 11.11% mass of hydrogen. This is explained by the law of

[Kerala CEE 2002]

- (a) Conservation of mass (b) Constant composition
(c) Multiple proportions (d) Constant volume

3. Zinc sulphate contains 22.65% of zinc and 43.9% of water of crystallization. If the law of constant proportions is true, then the weight of zinc required to produce 20 g of the crystals will be

- (a) 45.3 g (b) 4.53 g
(c) 0.453 g (d) 453 g

4. 10 dm^3 of N_2 gas and 10 dm^3 of gas X at the same temperature contain the same number of molecules. The gas X is

- (a) CO (b) CO_2
(c) H_2 (d) NO

5. The molar heat capacity of water at constant pressure is 75 $JK^{-1} mol^{-1}$. When 1.0 kJ of heat is supplied to 100 g of water which is free to expand, the increases in temperature of water is

- (a) 6.6 K (b) 1.2 K
(c) 2.4 K (d) 4.8 K

6. A compound possesses 8% sulphur by mass. The least molecular mass is

[AIIMS 2002]

- (a) 200 (b) 400
(c) 155 (d) 355

7. Which of the following contains maximum number of atoms

[JIPMER 2000]

- (a) 6.023×10^{21} molecules of CO_2

- (b) 22.4 L of CO_2 at STP

- (c) 0.44 g of CO_2

- (d) None of these

8. In a mole of water vapour at STP, the volume actually occupied or taken by the molecules (i.e., Avogadro's No. $\times$ Volume of one molecule) is

[Kerala EEE 2000]

- (a) Zero
(b) Less than 1% of 22.4 litres
(c) About 10% of the volume of container
(d) 1% to 2% of 22.4 litres
(e) Between 2% to 5% of 22.4 litres

9. If 10^{21} molecules are removed from 200mg of CO_2 , then the number of moles of CO_2 left are

[IIT 1983]

- (a) 2.85×10^{-3} (b) 28.8×10^{-3}
(c) 0.288×10^{-3} (d) 1.68×10^{-2}

10. The set of numerical coefficient that balances the equation $K_2CrO_4 + HCl \rightarrow K_2Cr_2O_7 + KCl + H_2O$ is

[Kerala CEE 2001]

- (a) 1, 1, 2, 2, 1 (b) 2, 2, 1, 1, 1
(c) 2, 1, 1, 2, 1 (d) 2, 2, 1, 2, 1

11. One litre hard water contains 12.00 mg Mg^{2+} milli equivalent of washing soda required to remove its hardness is

- (a) 1 (b) 12.15
(c) 1×10^{-3} (d) 12.15×10^{-3}

12. In standardization of $Na_2S_2O_3$ using $K_2Cr_2O_7$ by iodometry, the equivalent weight of $K_2Cr_2O_7$ is

[IIT 2000]

- (a) $MW / 2$ (b) $MW / 3$
(c) $MW / 6$ (d) $MW / 1$

13. 3.92 g of ferrous ammonium sulphate crystals are dissolved in 100 ml of water, 20 ml of this solution requires 18 ml of $KMnO_4$ during titration for complete oxidation. The weight of $KMnO_4$ present in one litre of the solution is

[Tamilnadu CET 2002]

- (a) 3.476 g (b) 12.38 g
(c) 34.76 g (d) 1.238 g

14. A 100 ml solution of 0.1 N HCl was titrated with 0.2 N $NaOH$ solution. The titration was discontinued after adding 30 ml of $NaOH$ solution. The remaining titration was completed by adding 0.25 N KOH solution. The volume of KOH required for completing the titration is

[DCE 1999]

- (a) 70 ml (b) 32 ml
(c) 35 ml (d) 16 ml

15. What volume of Hydrogen gas, at 273 K and 1 atm pressure will be consumed in obtaining 21.6 g of elemental boron (atomic mass = 10.8) from the reduction of boron trichloride by Hydrogen

[AIEEE 2003]

- (a) 22.4 L (b) 89.6 L
(c) 67.2 L (d) 44.8 L

16. The mass of 112 cm^3 of CH_4 gas at STP is

[Karnataka CET 2001]

- (a) 0.16 g (b) 0.8 g
(c) 0.08 g (d) 1.6 g
17. Complete combustion of 0.858 g of compound X gives 2.63 g of CO_2 and 1.28 g of H_2O . The lowest molecular mass X can have [Kerala MEE 2000]
(a) 43 g (b) 86 g
(c) 129 g (d) 172 g
18. In the following reaction, which choice has value twice that of the equivalent mass of the oxidising agent
 $\text{SO}_2 + \text{H}_2\text{O} \longrightarrow 3\text{S} + 2\text{H}_2\text{O}$ [DPMT 2000]
(a) 64 (b) 32
(c) 16 (d) 48

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Volume of a gas is inversely proportional to the number of moles of a gas.
Reason : The ratio by volume of gaseous reactants and products is in agreement with their mole ratio. [AIIMS 1995]
2. Assertion : Molecular weight of oxygen is 16.
Reason : Atomic weight of oxygen is 16. [AIIMS 1996]
3. Assertion : Atoms can neither be created nor destroyed.
Reason : Under similar condition of temperature and pressure, equal volume of gases does not contain equal number of atoms. [AIIMS 1994, 2002]
4. Assertion : One mole of SO_2 contains double the number of molecules present in one mole of O_2 .
Reason : Molecular weight of SO_2 is double to that of O_2 .
5. Assertion : 1.231 has three significant figures.
Reason : All numbers right to the decimal point are significant.
6. Assertion : 22.4 L of N_2 at NTP and 5.6 L O_2 at NTP contain equal number of molecules.

- Reason : Under similar conditions of temperature and pressure all gases contain equal number of molecules.
7. Assertion : One atomic mass unit (amu) is mass of an atom equal to exactly one-twelfth the mass of a carbon-12 atom.
Reason : Carbon-12 isotope was selected as standard.
8. Assertion : Molecular mass of A is $\frac{M}{4}$ if the molecular mass of B is M.
Reason : Vapour density of A four times that of B.
9. Assertion : Pure water obtained from different sources such as, river, well, spring, sea etc. always contains hydrogen and oxygen combined in the ratio 1 : 8 by mass.
Reason : A chemical compound always contains elements combined together in same proportion by mass, it was discovered by French chemist, Joseph Proust (1799).
10. Assertion : As mole is the basic chemical unit, the concentration of the dissolved solute is usually specified in terms of number of moles of solute.
Reason : The total number of molecules of reactants involved in a balanced chemical equation is known as molecularity of the reaction.
11. Assertion : A certain element X, forms three binary compounds with chlorine containing 59.68%, 68.95% and 74.75% chlorine respectively. These data illustrate the law of multiple proportions.
Reason : According to law of multiple proportions, the relative amounts of an element combining with some fixed amount of a second element in a series of compounds are the ratios of small whole numbers.
12. Assertion : Equivalent weight of Cu in CuO is 63.6 and in Cu_2O 31.8.
Reason : Equivalent weight of an element = $\frac{\text{Atomic weight of the element}}{\text{Valency of the element}}$
13. Assertion : Mass spectrometer is used for the determination of isotopes.
Reason : Isotopes are the atoms of same element differing in mass numbers.
14. Assertion : Gases combine in simple ratio of their volume but, not always.
Reason : Gases deviate from ideal behaviour.
15. Assertion : Isomorphous substances form crystals of same shape and can grow in saturated solution of each other.
Reason : They have similar constitution and chemical formulae.
16. Assertion : Atomicity of oxygen is 2.

Reason : 1 mole of an element contains 6.023×10^{23} atoms.

17. Assertion : 1 amu equals to 1.66×10^{-24} g.

Reason : 1.66×10^{-24} g equals to $\frac{1}{12}$ th of mass of a C^{12} atom.

AS Answers and Solutions

Significant figures, Units of measurement, Matter and Separation of mixture

4. (c) $\text{Pressure} = \frac{\text{Force}}{\text{Area}} = \frac{[MLT^{-2}]}{[L^2]} = [ML^{-1}T^{-2}]$
- $\text{Energy per unit volume} = \frac{[ML^2T^{-2}]}{[L^3]} = [ML^{-1}T^{-2}]$
17. (b) $\frac{(29.2 - 20.2)(1.79 \times 10^5)}{1.37} = \frac{9.0 \times 1.79 \times 10^5}{1.37}$
- Least precise terms i.e., 9.0 has only two significant figures. Hence, final answer will have two significant figures.
18. (a) Pure ethyl alcohol = $81.4 - 0.002 = 81.398$.
19. (a) JPa^{-1} ; Unit of work is *Joule* and unit of pressure is *Pascal*.
- Dimension of *Joule* i.e. work = $F \times L = MLT^{-2} \times L$
- $$= [ML^2T^{-2}]$$
- $$\frac{1}{Pa} = \frac{1}{\text{Pressure}} = \frac{1}{\frac{F}{A}} = \frac{1 \times A}{F} = [MLT^{-1}]$$
- So, $JPa^{-1} = [ML^2T^{-2}] = [L^2 \times L] = [L^3]$.
22. (d) 1 zepto = 10^{-21}
23. (a) As we know that all non zero unit are significant number. Therefore significant figure is 2.
24. (a) Number of significant figures in 6.0023 are 5 because all the zeroes stand between two non zero digit are counted towards significant figures.
25. (b) Given $P = 0.0030m$, $Q = 2.40m$ & $R = 3000m$ In $P(0.0030)$ initial zeros after the decimal point are not significant. Therefore, significant figures in $P(0.0030)$ are 2. Similarly in $Q(2.40)$ significant figures are 3 as in this case final zero is significant. In $R = (3000)$ all the zeroes are significant hence, in R significant figures are 4.
26. (b) All the zeroes between two non zero digit are significant. Hence in 60.0001 significant figures is 6.
27. (d) Round off the digit at 2nd position of decimal 3.929 = 3.93.

Laws of chemical combination

12. (b) $\begin{matrix} X & + & Y & \rightleftharpoons & R & + & S \\ ng & mg & & & pg & qg \end{matrix}$
- $n + m = p + q$ by law of conservation of mass.

Atomic, Molecular and Equivalent masses

6. (c) As the given sulphate is isomorphous with $ZnSO_4 \cdot 7H_2O$ its formula would be $MSO_4 \cdot 7H_2O$. m is the atomic weight of M , molecular weight of $MSO_4 \cdot 7H_2O$ = $m + 32 + 64 + 126 = m + 222$
- Hence % of M = $\frac{m}{m + 222} \times 100 = 9.87$ (given) or
- $100m = 9.87m + 222 \times 9.87$ or $90.13m = 222 \times 9.87$
- or $m = \frac{222 \times 9.87}{90.13} = 24.3$.
5. (b) The atomic weight of sulphur = 32
In SCl_2 valency of sulphur = 2
- So equivalent mass of sulphur = $\frac{32}{2} = 16$.

7. (d) For NaOH , $M = N$
 $N_1 V_1 = 100\text{ml} \times 1N = 100\text{ml}(N)$
 For H_2SO_4 , $N_2 V_2 = 10\text{ml} \times 10N = 100\text{ml}(N)$
 Hence, $N_1 V_1 = N_2 V_2$.
10. (b) 1 mole of CH_4 contains 4 mole of hydrogen atom i.e. 4g atom of hydrogen.
11. (a) $\text{Na}_2\text{SO}_3 + \text{I}_2 \rightarrow \text{Na}_2\text{S}_4\text{O}_6 + \text{NaI}$
 $n = 2 \times 0.5 = 1$
 $E = \frac{M}{n\text{-factor}} = \frac{M}{1} = M$
12. (b) $E = \frac{M}{5}$
13. (a) Atomic mass = $\frac{10 \times 19 + 81 \times 11}{100} = \frac{190 + 891}{100} = \frac{1081}{100} = 10.81$
14. (c) 0.1M AgNO_3 will react with 0.1M NaCl to form 0.1M NaNO_3 . But as the volume doubled, conc. of $\text{NO}_3^- = \frac{0.1}{2} = 0.05M$.
16. (c) wt. of metallic chloride = 74.5
 wt. of chlorine = 35.5
 $\therefore$ wt. of metal = $74.5 - 35.5 = 39$
 Equivalent weight of metal = $\frac{\text{weight of metal}}{\text{weight of chlorine}} \times 35.5$
 $= \frac{39}{35.5} \times 35.5 = 39$
17. (a) $\therefore$ 5.8L of gas has mass = 7.5gm
 $\therefore$ 22.4L " " " = $\frac{7.5}{5.8} \times 22.4 = 28.96$
 So molecular weight = 29
 So, molecular formula of compound is NO
18. (d) $\therefore$ 17gm NH_3 contains 6×10^{23} molecules of NH_3
 $\therefore$ 4.25gm NH_3 contains = $\frac{6 \times 10^{23}}{17} \times 4.25$
 $\therefore$ No. of atoms = $\frac{6 \times 10^{23} \times 4.25}{17} \times 4 = 6 \times 10^{23}$.
19. (a) $\therefore$ 1L of gas at S.T.P. weight 1.16g
 $\therefore$ 22.4 L of gas at S.T.P. weight = 22.4×1.16
 $= 25.984 \approx 26$
 This molecular weight indicates that given compound is C_2H_2 .
20. (a) Molecular weight = $2 \times V.D = 2 \times 11.2 = 22.4$
 $\therefore$ 22.4gm of gas occupies 22.4L at S.T.P.
 $\therefore$ 11.2gm of gas occupies $\frac{22.4}{22.4} \times 11.2 = 11.2L$.
21. (b) Equivalent weight = $\frac{\text{Molecular weight}}{\text{Valency}}$
 Molecular weight of $\begin{array}{c} \text{COOH} \\ | \\ \text{COOH} \end{array} \cdot 2\text{H}_2\text{O} = \frac{126}{2} = 63$.
22. (b) Valency of the element = $\frac{2 \times V.D}{E + 35.5} = \frac{2 \times 59.25}{4 + 35.5} = \frac{118.50}{39.5} = 3$.
23. (d) Molarity = $\frac{W(\text{gm}) \times 1000}{V(\text{ml}) \times \text{molecular weight}}$
 $0.25 = \frac{1.25 \times 1000}{25 \times \text{molecular weight}}$
 $\therefore$ Molecular weight = $\frac{1.25 \times 1000}{0.25 \times 25} = 200$.
24. (c) Let weight of metal oxide = 100gm
 Weight of oxygen = 32gm
 $\therefore$ weight of metal = $100 - 32 = 68\text{gm}$
 Equivalent weight of oxide = $\frac{\text{wt. of metal}}{\text{wt. of oxygen}} \times 8$
 $= \frac{68}{32} \times 8 = 17$.
25. (a) 6×10^{23} molecules has mass = 18gm
 1 molecules has mass = $\frac{18}{6 \times 10^{23}} = 3 \times 10^{-23}\text{gm}$
 $= 3 \times 10^{-26}\text{kg}$.
26. (a) Choice (a) is P_4S_3
 $\therefore \frac{31 \times 4}{(124)}\text{gm P}$ is present in 220gm P_4S_3
 $\therefore$ 1.24gm P is present in = $\frac{220}{124} \times 1.24 = 2.2\text{gm}$
27. (c) Number of moles of A = $\frac{x}{40}$
 Number of atoms of A = $\frac{x}{40} \times \text{Avogadro no.} = y$ (say)
 Or $x = \frac{40y}{\text{Avogadro no.}}$
 Number of moles of B = $\frac{2x}{80}$
 Number of atoms of B = $\frac{2x}{80} \times \text{Av. no.} = \frac{2}{80} \times \frac{40y}{\text{Av. no.}} \times \text{Av. no.} = y$
28. (d) $\text{BaCO}_3 \rightarrow \text{BaO} + \text{CO}_2 \uparrow$
 Molecular weight of $\text{BaCO}_3 = 137 + 12 + 3 \times 16 = 197$
 $\therefore$ 197gm produces 22.4L at S.T.P.
 $\therefore$ 9.85gm produces $\frac{22.4}{197} \times 9.85 = 1.12L$ at S.T.P.
29. (a) 14 gm N^{3-} ions have = $8N_A$ valence electrons

$$4.2 \text{ gm of } N^{3-} \text{ ions have } = \frac{8N_A \times 4.2}{14} = 2.4N_A$$

30. (c) [$\therefore$ Molecular weight of $CuSO_4 \cdot 5H_2O$
 $= 63.5 + 32 + 64 + 90 = 249.5$]

$$6 \times 10^{23} \text{ molecules has weight } = 249.5 \text{ gm}$$

$$1 \times 10^{22} \text{ molecules has weight } = \frac{249.5 \times 1 \times 10^{22}}{6 \times 10^{23}}$$

$$= 41.58 \times 10^{-1}$$

$$= 4.158$$

31. (a) (I) 1 molecule of oxygen

$$\therefore 6 \times 10^{23} \text{ molecule has mass } = 32 \text{ gm}$$

$$\therefore 1 \text{ molecule of } O_2 \text{ has mass } = \frac{32}{6 \times 10^{23}}$$

$$= 5.3 \times 10^{-23} \text{ gm}$$

- (II) 1 atom of nitrogen

$$\therefore 2 \times 6 \times 10^{23} \text{ atoms of } N_2 \text{ has mass } = 28 \text{ gm}$$

$$\therefore 1 \text{ atom of } N_2 \text{ has mass } = \frac{28}{2 \times 6 \times 10^{23}}$$

$$= 2.3 \times 10^{-23} \text{ gm}$$

- (III) $1 \times 10^{-10} \text{ g}$ molecular weight of oxygen

$$\text{g atomic weight} = 2 \times 1 \times 10^{-10} = 2 \times 10^{-10} \text{ g}$$

- (IV) $1 \times 10^{-10} \text{ g}$ atomic weight of copper

So, order of increasing masses $II < I < III < IV$.

32. (d) $\frac{\text{wt. of metal hydroxide}}{\text{wt. of metal oxide}} = \frac{EM + EOH^-}{EM + EO^-}$

$$= \frac{1.520}{0.995} = \frac{x + 17}{x + 8}$$

$$= 1.520x + 1.520 \times 8 = 0.995x + 0.995 \times 17$$

$$1.520x + 12.160 = 0.995x + 16.915$$

$$\text{or } 0.525x = 4.755$$

$$x = \frac{4.755}{0.525} = 9.$$

33. (b) One ion carries $3 \times 1.6 \times 10^{-19} \text{ coulomb}$

Then 1 gm ion N^{3-} (1 mole) carries

$$= 3 \times 1.6 \times 10^{-19} \times 6.02 \times 10^{23}$$

$$= 2.89 \times 10^5 \text{ coulomb}$$

34. (a) $\frac{C_p}{C_v} = 1.4$ so, given gas is diatomic

$$11.2 \text{ L} = 3.01 \times 10^{23} \text{ molecules}$$

$$\therefore \text{No. of atoms} = 3.01 \times 10^{23} \times 2 = 6.023 \times 10^{23} \text{ atoms}$$

36. (b) The acid is dibasic.

$$\text{Molecular weight of } H_3PO_3 = 3 + 31 + 48 = 82$$

$$\therefore \text{Equivalent weight} = \frac{\text{Molecular weight}}{\text{Basicity}} = \frac{82}{2} = 41.$$

37. (b) $\therefore 22400 \text{ ml at NTP has } 6.023 \times 10^{23} \text{ molecule}$

$$\therefore 1 \text{ ml at NTP has } = \frac{6.023 \times 10^{23}}{22400}$$

$$= 0.0002688 \times 10^{23} = 2.69 \times 10^{19}.$$

38. (c) Sp. heat $\times$ atomic wt. = 6.4

$$0.16 \times \text{atomic wt.} = 6.4$$

$$\text{Atomic wt.} = \frac{6.4}{0.16} = 40.$$

39. (a) Molecular weight of $C_{60}H_{122} = 12 \times 60 + 122 \times 1$
 $= 720 + 122 = 842$

$$\therefore 6 \times 10^{23} \text{ molecule } C_{60}H_{122} \text{ has mass } = 842 \text{ gm}$$

$$\therefore 1 \text{ molecule } C_{60}H_{122} \text{ has mass } \frac{842}{6 \times 10^{23}}$$

$$= 140.333 \times 10^{-23} \text{ gm} = 1.4 \times 10^{-21} \text{ gm}.$$

40. (b) $C_2H_4 + 2O_2 \rightarrow 2CO_2 + 2H_2O$

$$\therefore 28 \text{ gm } C_2H_4 \text{ requires } 64 \text{ gm oxygen}$$

$$\therefore 2.8 \times 10^3 \text{ gm } C_2H_4 \text{ requires } = \frac{64}{28} \times 2.8 \times 10^3 \text{ gm}$$

$$= 6.4 \times 10^3 \text{ gm} = 6.4 \text{ kg}.$$

41. (c) 2.5 molal NH_4OH means 2.5 moles of NH_3 in 1000g H_2O (1000cc of solution)

Hence, 100cc solution of NH_3 requires = 0.25 mole

$$= 0.25 \times 22.4 \text{ L} = 5.6 \text{ L}.$$

42. (d) $d = \frac{M}{V}$; $1 = \frac{M}{V}$ or $M = V$; $18 \text{ gm} = 18 \text{ ml}$

$$6 \times 10^{23} \text{ molecule of water has volume } = 18 \text{ cc}$$

$$1 \text{ molecule of water has volume } = \frac{18}{6 \times 10^{23}}$$

$$= 3 \times 10^{-23} \text{ cm}^3.$$

43. (a) 100gm caffeine has 28.9gm nitrogen

$$194 \text{ gm caffeine has } = \frac{28.9}{100} \times 194 = 56.06 \text{ gm}$$

$$\therefore \text{No. of atoms in caffeine} = \frac{56.06}{14} \approx 4.$$

44. (d) Molecular weight of $(CHCOO)_2Fe = 170$

Fe present in 100mg of $(CHCOO)_2Fe$

$$= \frac{56}{170} \times 100 \text{ mg} = 32.9 \text{ mg}$$

This is present in 400mg of capsule

$$\% \text{ of Fe in capsule} = \frac{32.9}{400} \times 100 = 8.2.$$

45. (d) 1 atom has mass = $10.86 \times 10^{-26} \text{ kg}$

$$= 10.86 \times 10^{-23} \text{ gm}$$

$$6.023 \times 10^{23} \text{ atoms has mass}$$

$$= 10.86 \times 10^{-23} \times 6.023 \times 10^{23} = 65.40 \text{ gm}$$

This is the atomic weight of Zn.

46. (b) $\therefore$ 1mole $(\text{COOH})_2 \cdot 2\text{H}_2\text{O}$ has 96gm oxygen
 $\therefore$ 0.3 mole $(\text{COOH})_2 \cdot 2\text{H}_2\text{O}$ has $96 \times 0.3 = 28.8 \text{ gm}$

$$\therefore \text{No. of gram atoms of oxygen} = \frac{28.8}{16} = 1.8$$

47. (c) Equimolecular proportion means both gases occupied equal

$$\text{volume} = \frac{2.24}{2} = 1.12 \text{ L}$$

For CH_4 :

$$22.4 \text{ L } \text{CH}_4 \text{ has mass} = 16 \text{ gm}$$

$$1.12 \text{ L } \text{CH}_4 \text{ has mass} = \frac{16}{22.4} \times 1.12 = 0.8 \text{ gm}$$

For C_2H_6

$$22.4 \text{ L } \text{C}_2\text{H}_6 \text{ has mass} = 30 \text{ gm}$$

$$1.12 \text{ L } \text{C}_2\text{H}_6 \text{ has mass} = \frac{30}{22.4} \times 1.12 = \frac{3.0}{2} \text{ gm} = 1.5 \text{ gm}$$

$$\text{Total mass} = 1.5 \text{ gm} + 0.8 \text{ gm} = 2.3 \text{ gm}$$

48. (c) Let wt. of metal oxide = 100 gm

$$\text{wt. of metal} = 53 \text{ gm}$$

$$\text{wt. of oxygen} = 47 \text{ gm}$$

$$\begin{aligned} \text{Equivalent weight of oxygen} &= \frac{\text{wt. of metal}}{\text{wt. of oxygen}} \times 8 \\ &= \frac{53}{47} \times 8 = 9.02 \end{aligned}$$

$$\text{Valency} = \frac{2 \times V.D}{E + 35.5} = \frac{2 \times 66}{9 + 35.5} = \frac{132}{44.5} = 2.96 \approx 3$$

$$\begin{aligned} \therefore \text{Atomic weight} &= \text{Equivalent weight} \times \text{Valency} \\ &= 9.02 \times 3 = 27.06 \end{aligned}$$

49. (b) One gram of hydrogen combines with 80 gm of bromine.

So, equivalent weight of bromine = 80 gm

$$\therefore 4 \text{ gm of bromine combines with } 1 \text{ gm of Ca}$$

$$\therefore 80 \text{ gm of bromine combines with} = \frac{1}{4} \times 80 = 20$$

50. (b) $\text{MnSO}_4 \rightarrow \text{MnO}_2$

$$\text{Change of valency} = 4 - 2 = 2$$

$$\therefore \text{Equivalent weight} = \frac{M}{2}$$

51. (a) $2\text{PH}_3 \rightarrow 2\text{P} + 3\text{H}_2$
 $\begin{matrix} 2\text{ml} & & 3\text{ml} \\ 100\text{ml} & & 150\text{ml} \end{matrix}$

$$\text{Increase in volume} = 150 \text{ ml} - 100 \text{ ml} = 50 \text{ ml increase}$$

52. (b) $\text{Mg} + 2\text{HCl} \rightarrow \text{MgCl}_2 + \text{H}_2$

$$\therefore 24 \text{ g Mg evolves } 22.4 \text{ L } \text{H}_2 \text{ at STP}$$

$$\therefore 12 \text{ g Mg evolves } \text{H}_2 \text{ at STP } \frac{22.4}{24} \times 12$$

$$= 11.2 \text{ L at STP}$$

53. (b) (a) 2gm atom of nitrogen = 28gm

$$(b) 6 \times 10^{23} \text{ atoms of C has mass} = 12 \text{ gm}$$

$$3 \times 10^{23} \text{ atoms of C has mass} = \frac{12 \times 3 \times 10^{23}}{6 \times 10^{23}} = 6 \text{ gm}$$

$$(c) 1 \text{ mole of S has mass} = 32 \text{ gm}$$

$$(d) 7.0 \text{ gm of Ag}$$

So, lowest mass = 6gm of C.

54. (c) 1mole of any gas at STP occupies 22.4 L

55. (b) $\therefore$ 22400 cc of gas at STP has 6×10^{23} molecules

$$\therefore 1.12 \times 10^{-7} \text{ of gas at STP has } \frac{6 \times 10^{23} \times 1.12 \times 10^{-7}}{22400}$$

$$= .03 \times 10^{14} = 3 \times 10^{12}$$

56. (a) $\therefore$ 22.4 L of gas has mass = 4.4 gm

$$\therefore 22.4 \text{ L of gas has mass} = \frac{4.4}{2.24} \times 22.4 = 44$$

So given gas is CO_2 because CO_2 has molecular mass-44.

57. (d) 1L of air = 210 cc O_2

$$22400 \text{ cc} = 1 \text{ mole}$$

$$210 \text{ cc} = \frac{1}{22400} \times 210 = 0.0093$$

58. (d) $\therefore$ 22.4 L of a gas at STP has no. of molecules

$$= 6.023 \times 10^{23}$$

$$\therefore 8.96 \text{ L of a gas at STP has no. of molecules}$$

$$= \frac{6.02 \times 10^{23} \times 8.96}{22.4} = 2.408 \times 10^{23} = 24.08 \times 10^{22}$$

59. (a) Given equivalent weight of metal = 9

Vapour density of metal chloride = 59.25

$$\therefore \text{molecular weight of metal chloride}$$

$$= 2 \times V.D = 2 \times 59.25 = 118.5$$

$$\therefore \text{valency of metal}$$

$$= \frac{\text{molecular weight of metal chloride}}{\text{equivalent weight of metal} + 35.5}$$

$$\text{Valency of metal} = \frac{118.5}{9 + 35.5} = \frac{118.5}{44.5} = 2.66$$

Therefore atomic weight of the metal

$$= \text{equivalent weight} \times \text{valency}$$

$$= 9 \times 2.66 = 23.9$$

60. (d) The density of gas = $\frac{\text{molecular wt. of metal}}{\text{volume}}$

$$= \frac{45}{22.4} = 2 \text{ g mlitre}^{-1}$$

61. (c) Equivalent weight of bivalent metal = 37.2

$$\therefore \text{Atomic weight of metal} = 37.2 \times 2 = 74.4$$

$$\therefore \text{Formula of chloride} = \text{MCl}_2$$

Hence, molecular weight of chloride

$$(\text{MCl}_2) = 74.4 + 2 \times 35.5 = 145.4$$

62. (c) As we know that

$$\text{Equivalent weight} = \frac{\text{weight of metal}}{\text{weight of oxygen}} \times 8$$

$$= \frac{32}{0.4} \times 8 = 64$$

$$\text{Vapour density} = \frac{\text{mol. wt}}{2}$$

$$\text{Mol. wt} = 2 \times V.D = 2 \times 32 = 64$$

$$\text{As we know that } n = \frac{\text{mol. wt}}{\text{eq. wt}} = \frac{64}{64} = 1$$

Suppose, the formula of metal oxide be M_2O_n . Hence the formula of metal oxide = M_2O .

63. (b) Molecular weight of NH_3 is 17

According to the mole concept

$$17 \text{ gm } NH_3 \text{ has molecules} = 6.02 \times 10^{23}$$

$$\therefore 1 \text{ gm } NH_3 \text{ has molecules} = \frac{6.02 \times 10^{23}}{17}$$

$$\therefore 4.25 \text{ gm } NH_3 \text{ has molecules}$$

$$= \frac{6.02 \times 10^{23} \times 4.25}{17} = 1.5 \times 10^{23} \text{ molecule}$$

The mole concept

1. (a) $16 \text{ g } O_2$ has no. of moles = $\frac{16}{32} = \frac{1}{2}$

$$14 \text{ g } N_2 \text{ has no. of moles} = \frac{14}{28} = \frac{1}{2}$$

No. of moles are same, so no. of molecules are same.

2. (b) $Na_2SO_4 \cdot 10H_2O = 2 \times 23 + 32 + 4 \times 16 + 10 \times 18$

$$= 46 + 32 + 64 + 180 = 322 \text{ gm}$$

$$322 \text{ gm } Na_2SO_4 \cdot 10H_2O \text{ contains} = 224 \text{ gm oxygen}$$

$$32.2 \text{ gm } Na_2SO_4 \cdot 10H_2O \text{ contains}$$

$$= \frac{32.2 \times 224}{322} = 22.4 \text{ gm}$$

3. (b) Molarity = $\frac{W(\text{gm}) \times 1000}{\text{molecular wt.} \times V(\text{ml})}$

$$= \frac{2.65 \times 1000}{106 \times 250} = 0.1M$$

$$10 \text{ ml of this solution is diluted to } 1000 \text{ ml } N_1V_1 = N_2V_2$$

$$10 \times 0.1 = 1000 \times x$$

$$x = \frac{0.1 \times 10}{1000} = 0.001M$$

4. (c) According to definition of molar solution $\rightarrow$ A molar solution is one that contains one mole of a solute in one litre of the solution.

5. (a) $44 \text{ g of } CO_2$ has $2 \times 6 \times 10^{23}$ atoms of oxygen

$$4.4 \text{ g of } CO_2 \text{ has} = \frac{12 \times 10^{23}}{44} \times 4.4$$

$$= 1.2 \times 10^{23} \text{ atoms.}$$

6. (b) $44 \text{ g } CO_2$ occupies 22.4 L at STP

$$4.4 \text{ g } CO_2 \text{ occupies} = \frac{22.4}{44} \times 4.4 = 2.24 \text{ L}$$

7. (a) Density = $\frac{\text{Mass}}{\text{Volume}}$; $1 = \frac{g}{\text{ml}}$ or $g = \text{ml}$

$$0.0018 \text{ ml} = 0.0018 \text{ gm}$$

$$\text{No. of moles} = \frac{\text{weight}}{\text{Molecular weight}} = \frac{0.0018}{18} = 1 \times 10^{-4}$$

$$\therefore \text{No. of water molecules} = 6.023 \times 10^{23} \times 1 \times 10^{-4} = 6.023 \times 10^{19}$$

8. (c) $Ca_3P_2 + 6H_2O \rightarrow 2PH_3 + 3Ca(OH)_2$

9. (d) Amount of gold = $19.7 \text{ kg} = 19.7 \times 1000 \text{ gm} = 19700 \text{ gm}$

$$\text{No. of moles} = \frac{19700}{197} = 100$$

$$\therefore \text{No. of atoms} = 100 \times 6.023 \times 10^{23} = 6.023 \times 10^{25} \text{ atoms}$$

10. (c) $\therefore 100 \text{ gm } CaCO_3 = 6.023 \times 10^{23} \text{ molecules}$

$$\therefore 10 \text{ gm } CaCO_3 = \frac{6.023 \times 10^{23}}{100} \times 10$$

$$= 6.023 \times 10^{22} \text{ molecule}$$

$$1 \text{ molecule of } CaCO_3 = 50 \text{ protons}$$

$$6.023 \times 10^{22} \text{ molecule of } CaCO_3 = 50 \times 6.023 \times 10^{22} = 3.0115 \times 10^{24}$$

11. (b) $16 \text{ gm of } CH_4 = 1 \text{ mole} = 6.023 \times 10^{23} \text{ molecules.}$

12. (c) According to avogadro's hypothesis equal volumes of all gases under similar conditions of temperature and pressure contains equal no. of molecules.

14. (d) $d = \frac{M}{V}$ (d = density, M = mass, V = volume)

$$\text{Since } d = 1$$

$$\text{So, } M = V$$

$$18 \text{ gm} = 18 \text{ ml}$$

$$18 \text{ ml} = N_1 \text{ molecules } (N_1 = \text{avogadro's no.})$$

$$1000 \text{ ml} = \frac{N_A}{18} \times 1000 = 55555 N_1$$

15. (a) This is fact.

16. (a) $\therefore 3 \text{ moles of oxygen is that in } 1 \text{ mole of } BaCO_3$

$$\therefore 1.5 \text{ moles of oxygen is that in mole of } BaCO_3$$

$$= \frac{1}{3} \times 1.5 = \frac{1}{2} = 0.5$$

17. (b) The no. of molecules present in 1 ml of gas at STP is known as Loschmidt number.

$$22400 \text{ ml of gas has total no. of molecules}$$

$$= 6.023 \times 10^{23}$$

$$1\text{ml of gas has total no. of molecules} = \frac{6.023 \times 10^{23}}{22400} = 2.69 \times 10^{19}.$$

18. (b) $\therefore 2\text{gm of hydrogen} = 6.02 \times 10^{23}$ molecules
 $\therefore 1\text{gm of hydrogen} = \frac{6.02 \times 10^{23}}{2} = 3.01 \times 10^{23}$ molecule.

19. (a) Molecular weight of SO_2Cl_2
 $= 32 + 32 + 2 \times 35.5 = 135\text{gm}$
 $\therefore 135\text{ gm of } \text{SO}_2\text{Cl}_2 = 1\text{gm molecule}$
 $\therefore 13.5\text{gm of } \text{SO}_2\text{Cl}_2 = \frac{1}{135} \times 13.5 = 0.1.$

20. (a) (a) 34gm of water
 $\therefore 18\text{gm } \text{H}_2\text{O} = 6.023 \times 10^{23}$ molecule
 $\therefore 34\text{gm } \text{H}_2\text{O} = \frac{6.023 \times 10^{23}}{18} \times 34 = 11.37 \times 10^{23}$ mole
 (b) $28\text{gm of } \text{CO}_2$
 $\therefore 44\text{gm } \text{CO}_2 = 6 \times 10^{23}$ molecules
 $\therefore 28\text{gm } \text{CO}_2 = \frac{6 \times 10^{23}}{44} \times 28 = 3.8 \times 10^{23}$
 (c) $46\text{gm of } \text{CH}_3\text{OH}$
 $\therefore 32\text{gm } \text{CH}_3\text{OH} = 6 \times 10^{23}$ molecules
 $\therefore 46\text{gm } \text{CH}_3\text{OH} = \frac{6 \times 10^{23}}{32} \times 46 = 8.625 \times 10^{23}$
 (d) $\therefore 108\text{gm of } \text{N}_2\text{O}_5 = 6 \times 10^{23}$ molecules
 $\therefore 54\text{gm of } \text{N}_2\text{O}_5 = \frac{6 \times 10^{23}}{108} \times 54 = 3 \times 10^{23}$ molecules.

21. (b) Sodium oxide $\rightarrow \text{Na}_2\text{O}$
 Molecular weight $= 46 + 16 = 62$
 $62\text{gm of } \text{Na}_2\text{O} = 1$ mole
 $620\text{gm of } \text{Na}_2\text{O} = 10$ mole.

22. (b) $2\text{gm of oxygen contains atom} = \frac{2}{16} = \frac{1}{8}$ mole
 also $4\text{g of sulphur} = \frac{4}{32} = \frac{1}{8}$ mole.

23. (c) Molarity = mole/litre
 $\therefore 1\text{cc contains } 1.17\text{gm}$
 $\therefore 1000\text{cc contains } 1170\text{gm}$

$$= \frac{1170}{36.5} = 32.05\text{mole/litre} \quad (\text{Mol. wt. of } \text{HCl} = 36.5)$$

24. (a) 1 mole of sucrose contains 6.023×10^{23} molecules
 $\therefore 1$ molecule of sucrose has 45 atoms
 $\therefore 6.023 \times 10^{23}$ molecule of sucrose has $45 \times 6.023 \times 10^{23}$ atoms/mole

25. (a) wt of $\text{CO}_2 = 44$
 mol wt of $\text{CO}_2 = 44$

$$\text{No. of molecule} = \frac{\text{wt. of } \text{CO}_2}{\text{mol wt of } \text{CO}_2} \times 6.02 \times 10^{23} = \frac{44}{44} \times 6.02 \times 10^{23} = 6.02 \times 10^{23}$$

26. (c) No. of atoms in one molecule
 $= \text{no. of moles} \times 6.022 \times 10^{23} = 1.4 \times 6.022 \times 10^{23} = 8.432 \times 10^{23}$

27. (d) As we know that four sodium atom are present in sodium ferrocyanide $[\text{Na}_4\text{Fe}(\text{CN})_6]$
 Hence, number of Na atoms = No. of moles $\times$ number of atom $\times$ Avogadro's number
 $2 \times 4 \times 6.023 \times 10^{23} = 48 \times 10^{23}$

Percentage composition & Molecular formula

- (a) $\therefore 40\text{gm NaOH}$ contains 16gm of oxygen
 $\therefore 100\text{gm of NaOH}$ contains $\frac{16}{40} \times 100 = 40\%$ oxygen.
- (a) Urea- $\text{NH}_2 - \text{CO} - \text{NH}_2$
 $\therefore 60\text{gm}$ of urea contains 28gm of nitrogen
 $\therefore 100\text{gm}$ of urea contains $\frac{28}{60} \times 100 = 46.66\%$.
- (b) Based on facts.
- (d) $\text{C} = 24\text{gm}$, $\text{H} = 4\text{gm}$, $\text{O} = 32\text{gm}$
 So, Molecular formula $= \text{C}_2\text{H}_4\text{O}_2$
 So, Empirical formula $= \text{CH}_2\text{O}$
 (Simplest formula).
- (a) $\therefore 0.0835$ mole of compound contains 1gm of hydrogen
 $\therefore 1\text{gm}$ mole of compound contain $= \frac{1}{0.0835} = 11.97 = 12\text{gm}$ of hydrogen.
 $12\text{ gm of } \text{H}_2$ is present in $\text{C}_2\text{H}_{12}\text{O}_6$
- (b) Empirical formula of an acid is CH_2O_2
 $(\text{Empirical formula})_n = \text{Molecular formula}$
 $n = \text{whole no. multiple i.e. } 1, 2, 3, 4, \dots$
 If $n = 1$ molecular formula CH_2O_2 .
- (b) Glucose - $\text{C}_6\text{H}_{12}\text{O}_6$
 Ratio of C, H and O $= 1 : 2 : 1$
 In acetic acid $\text{CH}_3 - \text{C}(=\text{O}) - \text{O} - \text{H}$
 Ratio of C, H and O $1 : 2 : 1$.

Chemical stoichiometry

1. (c) $N = \frac{W(\text{gm}) \times 1000}{V \times \text{Eq.wt.}}$
 $1500\text{ml of } 0.1\text{N HCl} = 150\text{ml (N)}$

$$1 = \frac{W(\text{gm}) \times 1000}{150 \times 40}, W(\text{gm}) = \frac{150 \times 40}{1000} = 6 \text{ gm}.$$

2. (c) $N_1 V_1 = N_2 V_2; \frac{1}{2} \times 200 = \frac{1}{10} \times V_2; V_2 = 1000 \text{ ml}$

Volume of water added = $1000 - 200 = 800 \text{ ml}$.

$$2 \times 276 \text{ gm} \quad 4 \times 108 \text{ gm}$$

$\therefore 2 \times 276 \text{ gm}$ of Ag_2CO_3 gives $4 \times 108 \text{ gm}$

$\therefore 1 \text{ gm}$ of Ag_2CO_3 gives $= \frac{4 \times 108}{2 \times 276}$

$\therefore 2.76 \text{ gm}$ of Ag_2CO_3 gives

$$\frac{4 \times 108 \times 2.76}{2 \times 276} = 2.16 \text{ gm}$$

4. (c)

$$t = 0 \quad 1 \quad 1 \quad 0 \quad 0$$

$$t = t \quad 1 - 4x \quad 1 - 5x \quad 4x \quad 6x$$

Oxygen is limiting reagent

So, $X = \frac{1}{5} = 0.2$ all oxygen consumed

Left $\text{NH}_3 = 1 - 4 \times 0.2 = 0.2$.

5. (c) $\therefore 100 \text{ gm Hb}$ contain $= 0.33 \text{ gm Fe}$

$\therefore 67200 \text{ gm Hb} = \frac{67200 \times 0.33}{100} \text{ gm Fe}$

$\text{gm atom of Fe} = \frac{672 \times 0.33}{56} = 4$.

6. (c) $(\text{NH}_4)_2\text{SO}_4 \equiv 2\text{NH}_3 \equiv \frac{2\text{HCl}}{2(36.5) = 73 \text{ gm}}$

$$73 \text{ g HCl} \equiv 132 \text{ g}(\text{NH}_4)_2\text{SO}_4$$

$$292 \text{ g HCl} = 528 \text{ g}(\text{NH}_4)_2\text{SO}_4$$

7. (c) $2(\text{NH}_4)_2\text{HPO}_4 \equiv \text{P}_2\text{O}_5$
 $2(36+1+31+64)=264 \quad 62+80=142$

% of $\text{P}_2\text{O}_5 = \frac{\text{wt. of } \text{P}_2\text{O}_5}{\text{wt of salt}} \times 100$

$$= \frac{142}{264} \times 100 = 53.78\%.$$

According to equation $\frac{3}{2}$ mole of O_2 combines with 2 mole

Al .

2 mole $\text{Al} = 54 \text{ gm}$

9. (a) $0.5 \text{ gm Se} \rightarrow 100 \text{ gm}$ peroxidase anhydrous enzyme

$$78.4 \text{ gm Se} \rightarrow \frac{100 \times 78.4}{0.5} = 1.568 \times 10^4$$

Minimum m.w. $\rightarrow$ molecule at least contain one selenium.

% of $\text{H}_2\text{O} = \frac{3 \times 18}{284} \times 100 = 19\%.$

15. (a) For Dibasic acid $E = \frac{M}{2} = \frac{200}{2} = 100$

$$N = \frac{W \times 1000}{E \times V(\text{in ml})}$$

$$\frac{1}{10} = \frac{W \times 1000}{100 \times 100} = W = 1 \text{ gm}.$$

16. (b) $N = \frac{10 \times \text{sp. gr. of the solution} \times \text{wt. \% of solute} \times \text{Mol. wt.}}{\text{Molecular wt. of solute} \times \text{Eq. wt.}}$

$$N = \frac{10 \times 1.71 \times 80 \times 98}{98 \times 49} = 27.9$$

Mohr-salt reducing agent $\text{KMnO}_4 / \text{H}^+ \rightarrow$ oxidising agent

19. (d) Atomic weight = Equivalent weight $\times$ Valency

$$= 8.9 \times 3 = 26.7 \left(\text{Valency} = \frac{26.89}{8.9} \approx 3 \right).$$

20. (c) $\text{MW} = 2 \times \text{V.D.} = 2 \times 22 = 44$.

$$\text{Eq. wt.} = \frac{\text{Mol. wt.}}{5}$$

$$\frac{W}{E} \times 1000 = \frac{1}{10} \times 25; \frac{0.16}{E} \times 1000 = \frac{25}{10}$$

$$M = 2 \times E = 2 \times 64 = 128.$$

$$N_1 V_1 = N_2 V_2; 20 \times \frac{1}{10} = \frac{1}{20} \times V; V = 40 \text{ ml}.$$

$$0.2 \times 2 = 0.5x + 0.1(2 - x)$$

$$0.4 = 0.5x + 0.2 - 0.1x$$

$$0.2 = 0.4x$$

$$x = \frac{1}{2}L = 0.5L$$

25. (d) $NV = N_1V_1 + N_2V_2 + N_3V_3$

$$N \times 1000 = 1 \times 5 + \frac{1}{2} \times 20 + \frac{1}{3} \times 30 = 5 + 10 + 10 = 25$$

$$N = 0.025 = \frac{N}{40}$$

Final volume = 20 ml.

27. (b) $KMnO_4$ Oxalic acid

$$\frac{M_1V_1}{n_1} = \frac{M_2V_2}{n_2}; \frac{20 \times 0.1}{2} = \frac{M_2V_2}{5}; M_2V_2 = 5.$$

28. (b) Acidic medium $E = \frac{M}{5} = \frac{158}{5} = 31.6 gm.$

29. (c) 0.1 M $AgNO_3$ will react with 0.1 M $NaCl$ to form 0.1 M $NaNO_3$. But as the volume is doubled, conc. of

$$NO_3^- = \frac{0.1}{2} = 0.05 M$$

30. (a) Acid base

$$N_1V_1 = N_2V_2; N_1 \times 30 = 0.2 \times 15; N_1 = 0.1 N$$

31. (b) (i) Phenolphthalein indicate partial neutralisation of $Na_2CO_3 \rightarrow NaHCO_3$

$$\text{Meq. of } Na_2CO_3 + \text{Meq. of } NaOH = \text{Meq. of } HCl$$

$$\frac{W}{E} \times 1000 + \frac{W}{E} \times 1000 = NV$$

$$(\text{Suppose } Na_2CO_3 = a gm, NaOH = b gm)$$

$$\frac{a}{106} \times 1000 + \frac{b}{40} \times 1000 = 300 \times 0.1 \dots (1)$$

(ii) Methyl orange indicate complete neutralisation $HCl \quad HCl$

$$N_1V_1 = N_2V_2, 25 \times 0.2 = 0.1 \times V_2 \text{ so } V_2 = 50 ml \text{ excess}$$

$$\therefore \frac{a}{53} \times 1000 + \frac{b}{40} \times 1000 = 350 \times 0.1 \dots (2)$$

$$\text{From (1) and (2) } b = 1 gm.$$

32. (c) From solution of (31)

$$\text{From equation (1)}$$

$$a = Na_2CO_3 = 0.53 gm.$$

33. (b) $(H_2SO_4) \frac{M_1V_1}{n_1} = \frac{M_2V_2}{n_2} (NaOH)$

$$\frac{1 \times V_1}{1} = \frac{1 \times 10}{2}; V_1 = 5 ml.$$

34. (c) Atom in highest oxidation state can oxidize iodide to liberate I_2 which is volumetrically measured by iodometric titration using hypo.

$$Pb^{+2} \rightarrow \text{Lowest oxidation state can not oxidise iodide to } I_2.$$

35. (d) $KMnO_4$ = Mohr salt

$$\frac{M_1V_1}{n_1} = \frac{M_2V_2}{n_2}; \frac{0.1 \times 10}{1} = \frac{M_2V_2}{5}; M_2V_2 = 5.$$

36. (d) The equivalent weight of $H_3PO_4 = \frac{\text{molecular weight}}{2}$

$$\therefore \text{mole wt of } H_3PO_4 = 3 + 31 + 64 = 98$$

$$\therefore \frac{98}{2} = 49$$

$$\text{Atomic wt. of } BaCO_3 = 137 + 12 + 16 \times 3 = 197$$

$$\text{No. of mole} = \frac{\text{wt. of substance}}{\text{mol wt.}}$$

$$\therefore 1 \text{ mole of } Ba(OH)_2 \text{ gives 1 mole of } BaCO_3$$

$$\therefore 205 \text{ mole of } Ba(OH)_2 \text{ will give } 205 \text{ mole of } BaCO_3$$

$$\therefore \text{wt. of } 0.205 \text{ mole of } BaCO_3 \text{ will be}$$

$$.205 \times 197 = 40.385 gm \approx 40.5 gm$$

38. (d) $N_1 = 0.5 N \rightarrow 10 mg \text{ per } mL$

$$N_2 = \frac{10 \times 10^{-3} gm}{40 \times 1} \times 1000 = 0.25 N$$

$$V_1 = 500 ml, \quad V_2 = ?$$

$$N_1V_1 = N_2V_2; 0.5 \times 500 = 0.25 \times V_2$$

$$V_2 = 1000 mL \text{ final volume water added} = 1000 - 500 = 500 mL$$

39. (a) eq. of $KMnO_4$ = eq. of $Fe(C_2O_4)$

$$x \times 5 = 1 \times 3$$

$$x = 0.6$$

40. (b)

Element	At.wt.	Mole	Ratio	Empirical formula
C=86%	12	7.1	1	CH
H=14%	1	14	2	Belongs to alkene C_nH_{2n}

$$\therefore 2 \text{ mole} \rightarrow 1 \text{ mole} \quad [100 \times 1 = 100 \text{ millimole}]$$

$$\therefore 100 \text{ millimole} \rightarrow 50 \text{ millimole } H_2S \text{ required}$$

$$\therefore 1 \text{ mole} \rightarrow 1 \text{ mole} \quad [100 \times 1 = 100 \text{ millimole}]$$

$$\therefore 100 \text{ millimole} \rightarrow 100 \text{ millimole } H_2S \text{ required}$$

$$\text{Ratio } \frac{50}{100} = \frac{1}{2}.$$

$$\begin{array}{cccc} t=0 & 50 ml & 50 ml & 0 \\ t=t & 50-2x & 50-x & 2x \\ & =0 & & 25 \text{ gases (50) liquid} \end{array}$$

In this case H_2 is limiting reagent

$$x = 25 ml$$

$$V_{\text{gas}} = 75 ml$$

$$t=t \quad 0 \quad 25 ml \quad 50 ml$$

$$= \frac{250 \times 0.1 \times 100}{100} = 2.5 \text{ gm}$$

$$\frac{12.6}{63} = 0.2 \text{ mole}; \text{HNO}_3 \equiv \text{KOH}$$

$$0.2 \text{ mole} \equiv 0.2 \text{ mole}$$

$$0.2 \times 56 = 11.2 \text{ gm.}$$

For 58 gm of C_4H_{10} 208 gm O_2 is required then for 5 kg of

$$\text{C}_4\text{H}_{10} \quad \text{O}_2 = \frac{5 \times 208}{58} = 17.9 \text{ kg}$$

$$2 \text{ mole } \text{H}_2 - 2 \text{ mole } \text{H}_2\text{O}$$

$$0.5 \text{ mole } \text{H}_2 - 0.5 \text{ mole } \text{H}_2\text{O} = 9 \text{ gm.}$$

$$30 \text{ ml } (\text{O}) \rightarrow 10 \text{ ml } \text{O}_3$$

$$x = \frac{150 \times 10}{100} = 15 \text{ ml}$$

$$V \text{ of } \text{O}_2 + V \text{ of } \text{O}_3 = 135 + 10 = 145 \text{ ml}$$

Turpentine oil absorb ozone.

$$\% \text{ Purity} = \frac{50}{100} \times 100 = 50\%.$$

$$\frac{30}{170} \quad \frac{500 \times 0.2}{1000}$$

$$100 \text{ g } \text{CaCO}_3 \text{ with } 1 \text{ N } \text{HCl} \text{ gives } 22 \text{ g } \text{CO}_2$$

Critical Thinking Questions

$$1 \text{ g of } \text{ZnSO}_4 \text{ crystals will be obtained from} = \frac{22.65}{100} \text{ g Zn}$$

$$20 \text{ g of } \text{ZnSO}_4 \text{ crystals obtained from} = \frac{22.65}{100} \times 20 = 4.53 \text{ g}$$

$$1 \text{ mole of } \text{N}_2 \text{ gas} = 2 \times 14 = 28 \text{ gm}$$

1 mole of CO gas = 12 + 16 = 28 gm

5. (c) Heat capacity of water per gram = $\frac{75}{18} = 4.17$

$$Q = mST$$

$$1000 = 100 \times 4.17 \times t$$

$$t = \frac{1000}{100 \times 4.17} = 2.4 \text{ K}$$

6. (b) $\therefore$ 8 gm sulphur is present in 100 gm of substance

$$\therefore 32 \text{ gm sulphur will present} = \frac{100}{8} \times 32 = 400.$$

7. (b) (a) 6.023×10^{23} molecules of CO_2

$$\text{No. of atoms} = 3 \times 6.023 \times 10^{21} = 18.069 \times 10^{21} \text{ atoms}$$

(b) 22.4 L of CO_2

$$\text{No. of atoms} = 6.023 \times 10^{23} \times 3 = 18.069 \times 10^{23} \text{ atoms}$$

(c) 0.44 gm of CO_2

$$\text{No. of moles} = \frac{0.44}{44} = \frac{1}{100} \times 6.023 \times 10^{23} \text{ moles}$$

$$= 6.023 \times 10^{21} \text{ moles} = 3 \times 6.023 \times 10^{21} \text{ atoms}$$

$$18.069 \times 10^{21} \text{ atoms}$$

8. (b) It is about 22.4 L.

9. (a) $200 \text{ mg of } \text{CO}_2 = 200 \times 10^{-3} = 0.2 \text{ gm}$

$$44 \text{ gm of } \text{CO}_2 = 6 \times 10^{23} \text{ molecules}$$

$$0.2 \text{ gm of } \text{CO}_2 = \frac{6 \times 10^{23}}{44} \times 0.2 = 0.0272 \times 10^{23}$$

$$= 2.72 \times 10^{21} \text{ molecule}$$

Now 10^{21} molecule are removed.

$$\text{So remaining molecules} = 2.72 \times 10^{21} - 10^{21}$$

$$= 10^{21}(2.72 - 1) = 1.72 \times 10^{21} \text{ molecules}$$

Now, 6.023×10^{23} molecules = 1 mole

$$1.72 \times 10^{21} \text{ molecules} = \frac{1 \times 1.72 \times 10^{21}}{6.023 \times 10^{23}} = 0.285 \times 10^{-2}$$

$$= 2.85 \times 10^{-3}.$$

11. (a) Meq of $\text{Mg}^{+2} \equiv \text{Meq of washing soda}$

$$\frac{W}{E} \times 1000 = \text{Mg}^{+2}; \text{EW} = \frac{24}{2} = 12$$

$$\frac{12 \times 10^{-3}}{12} \times 1000 = 1.$$

$$\text{Eq. wt.} = \frac{\text{Mol. wt.}}{6}$$

13. (a) KMnO_4 = Mohr salt

$$\frac{M_1 V_1}{1} = \frac{M_2 V_2}{5} = \left[\frac{W}{M \times V} \times 1000 \right] \times \frac{V_2}{5}$$

$$\left[\frac{W \times 1000}{58 \times 1000} \right] \times 18 = \frac{3.92 \times 1000}{392 \times 1000} \times \frac{20}{5} \quad W = 3.476 \text{ gm/L}$$

14. (d) Volume m of HCl neutralised by NaOH = (Caustic soda) = V_1

$$N_1 V_1 = N_2 V_2; 0.1 \times V_1 = 0.2 \times 30; V_1 = 60 \text{ ml}$$

$$V \text{ total } (\text{HCl}) = 100 \text{ ml}$$

$$\frac{V_1}{V_1} = \frac{60 \text{ ml}}{40 \text{ ml}}$$

40 ml 0.1N HCl is now neutralised by KOH (0.25N) $\rightarrow$

$$(\text{HCl}) \quad N_1 V_1 = N_2 V_2 (\text{KOH})$$

$$0.1 \times 40 = 0.25 \times V_2; \quad V_2 = 16 \text{ ml}.$$

$$\text{B} \equiv \frac{3}{2} \text{H}_2$$

$$1 \text{ mole} \equiv \frac{3}{2} \text{ mole}; 2 \text{ mole} - 3 \text{ mole}$$

$$V = 3 \times 22.4 = 67.2 \text{ L}.$$

16. (c) $n = \frac{W}{M} = \frac{V}{22400}; \quad \frac{W}{16} = \frac{112}{22400}; \quad W = 0.08 \text{ gm}.$

17. (a) $\%C = \frac{12}{44} \times \frac{W_{\text{CO}_2}}{W} \times 100 = \frac{12}{44} \times \frac{2.63}{0.858} \times 100 = 83.6\%$

$$\%H = \frac{2}{18} \times \frac{W_{\text{H}_2\text{O}}}{W} \times 100 = \frac{2}{18} \times \frac{1.28}{0.858} \times 100 = 16.4\%$$

	(a)	At. wt. (b)	a/b	Ratio	] $\times 3$ 7
C	83.6	12	6.96	1	
H	16.4	1	16.4	2.3	

$$\text{C}_3\text{H}_7 = 12 \times 3 + 7 = 43 \text{ gm}.$$

$$\text{EW} = \frac{M}{4} = \frac{64}{4} = 16; \quad \text{Twice } 16 \times 2 = 32$$

Assertion & Reason

1. (e) We know that from the reaction $\text{H}_2 + \text{Cl}_2 \rightarrow 2\text{HCl}$ that the ratio of the volume of gaseous reactants and products is in agreement with their molar ratio. The ratio of $\text{H}_2 : \text{Cl}_2 : \text{HCl}$ volumes is 1:1:2 which is the same as their molar ratio. Thus volume of gas is directly related to the number of moles. Therefore, the assertion is false but reason is true.

2. (e) We know that molecular weight of substance is calculated by adding the atomic weight of atoms present in one molecules. We also know that molecular weight of oxygen (O_2) = $2x$ (Atomic weight of oxygen) = $2 \times 16 = 32 \text{ a.m.u.}$ Atomic

weight of oxygen is 16, because it is 16 times heavier than $1/12$ of carbon atom. Therefore assertion is false but reason is true.

3. (c) According to Dalton's atomic theory atoms can neither be created nor destroyed and according to berzelius hypothesis, under similar condition of temperature and pressure equal volumes of all gases contain equal no. of atom. Therefore assertion is true but reason is false.

4. (e) One mole of any substance corresponding to 6.023×10^{23} entities is respective of its weight.

Molecular weight of $SO_2 = 32 + 2 \times 16 = 64 \text{ gm}$.

Molecular weight of $O_2 = 16 \times 2 = 32 \text{ gm}$.

$\therefore$ Molecular weight of SO_2 is double to that of O_2 .

5. (d) 1.231 has four significant figures all no. from left to right are counted, starting with the first digit that is not zero for calculating the no. of significant figure.

6. (d) Molar volume (at NTP) = 22.4 L

Now 22.4 L of N_2 = volume occupied by one mole of $N_2 = 28 \text{ gm} = 6.023 \times 10^{23}$ molecules.

Similarly, $O_2 = 2 \times 16 = 32 \text{ gm}$,

$32 \text{ gm} = 6.023 \times 10^{23}$ molecules = 22.4 L

$\therefore 22.4 \text{ L} = 6.023 \times 10^{23}$ or $5.6 \text{ L} = \frac{6.023 \times 10^{23} \times 5.6}{22.4}$

$$= \frac{1}{4} \times 6.023 \times 10^{23}$$

According to avagadro's hypothesis equal volume of all gases contain equal no. of molecules under similar condition of temperature and pressure.

7. (a) For universally accepted atomic mass unit in 1961, $C-12$ was selected as standard. However the new symbol used is ' u ' (unified mass) in place of amu .

8. (c) Vapour density of $B = \frac{M}{2}$,

Vapour density of $A = 4 \times \frac{M}{4} = 2M$

Molecular mass of $A = 2 \times 2M = 4M$.

9. (a) Pure water always contains hydrogen and oxygen in the ratio $1:8$ by mass. This is in accordance with the law of constant composition.

10. (b) The number of moles of a solute present in litre of solution is known is as molarity (M).

The total no. of molecules of reactants present in a balanced chemical equation is known as molecularity. For example,

$\therefore$ Molarity and molecularity are used in different sense.

11. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

12. (e) Equivalent wt. of Cu in $CuO = \frac{63.6}{2} = \frac{\text{At.wt.}}{\text{Valency}} = 31.8$

Equivalent wt. of Cu in $Cu_2O = \frac{63.6}{1} = 63.6$

(Valency of $Cu = 1$).

13. (e) Mass spectrometer is the instrument used for the determination of accurate atomic mass and the relative abundance of the isotopes.

14. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

15. (a) Example of isomorphous compounds are K_2SO_3 , K_2CrO_4 , K_2SeO_4 (valency of S , Cr , $Se = 6$) and $ZnSO_4 \cdot 7H_2O$, $MgSO_4 \cdot 7H_2O$, $FeSO_4 \cdot 7H_2O$ (valency of Zn , Mg , $Fe = 2$).

16. (b) No. of atoms present in a molecules of a gaseous element is called atomicity.

For example, O_2 has two atoms and hence its atomicity is 2.

17. (a) 12 gm of $C-12$ contain 6.023×10^{23} atom

$\therefore \frac{12}{6.023} \times 10^{-23} = 1.66 \times 10^{-24}$.

Chapter 2 Structure of atom

John Dalton 1808, believed that matter is made up of extremely minute indivisible particles, called *atom* which can take part in chemical reactions. These can neither be created nor be destroyed. However, modern researches have conclusively proved that atom is no longer an indivisible particle. Modern structure of atom is based on Rutherford's scattering experiment on atoms and on the concepts of quantization of energy.

Composition of atom

The works of J.J. Thomson and Ernst Rutherford actually laid the foundation of the modern picture of the atom. It is now believed that the atom consists of several *sub-atomic particles* like electron, proton, neutron, positron, neutrino, meson etc. Out of these particles, the electron, proton and the neutron are called *fundamental subatomic particles* and others are *non-fundamental particles*.

Electron (e)

(1) It was discovered by **J.J. Thomson** (1897) and is *negatively charged particle*. Electron is a component particle of cathode rays.

(2) Cathode rays were discovered by **William Crooke's & J.J. Thomson** (1880) using a cylindrical hard glass tube fitted with two metallic electrodes. The tube has a side tube with a stop cock. This tube was known as **discharge tube**. They passed electricity (10,000 V) through a discharge tube at very low pressure (10^{-2} to 10^{-3} mm Hg). Blue rays were emerged from the cathode. These rays were termed as **Cathode rays**.

(3) Properties of Cathode rays

- Cathode rays travel in straight line.
- Cathode rays produce mechanical effect, as they can rotate the wheel placed in their path.
- Cathode rays consist of negatively charged particles known as *electron*.
- Cathode rays travel with high speed approaching that of light (ranging between 10^{-9} to 10^{-11} cm/sec)
- Cathode rays can cause fluorescence.

- Cathode rays heat the object on which they fall due to transfer of kinetic energy to the object.
- When cathode rays fall on solids such as *Cu*, *X-rays* are produced.
- Cathode rays possess ionizing power *i.e.*, they ionize the gas through which they pass.
- The cathode rays produce scintillation on the photographic plates.
- They can penetrate through thin metallic sheets.
- The nature of these rays does not depend upon the nature of gas or the cathode material used in discharge tube.
- The e/m (charge to mass ratio) for cathode rays was found to

be the same as that for an e^- (-1.76×10^8 coulomb per gm). Thus, *the cathode rays are a stream of electrons*.

- According to *Einstein's theory of relativity*, mass of electron in motion is, $m' = \frac{\text{Rest mass of electron}(m)}{\sqrt{1 - (u/c)^2}}$

Where u = velocity of electron, c = velocity of light.

When $u=c$ then mass of moving electron $= \infty$.

Proton (H , H^+ , P)

(1) Proton was discovered by **Goldstein** and is positively charged particle. It is a component particle of anode rays.

(2) **Goldstein (1886)** used perforated cathode in the discharge tube and repeated Thomson's experiment and observed the formation of anode rays. These rays also termed as *positive* or *canal rays*.

(3) Properties of anode rays

- Anode rays travel in straight line.
- Anode rays are material particles.
- Anode rays are positively charged.

Table : 2.1 Comparison of mass, charge and specific charge of electron, proton and neutron

Name of constant	Unit	Electron(e)	Proton(p)	Neutron(n)
Mass (<i>m</i>)	Amu	0.000546	1.00728	1.00899
	Kg	9.109×10^{-31}	1.673×10^{-27}	1.675×10^{-27}
	Relative	1/1837	1	1
Charge(<i>e</i>)	Coulomb (C)	-1.602×10^{-19}	$+1.602 \times 10^{-19}$	Zero
	Esu	-4.8×10^{-10}	$+4.8 \times 10^{-10}$	Zero
	Relative	-1	+1	Zero
Specific charge (<i>e/m</i>)	C/g	1.76×10^8	9.58×10^7	Zero
Density	Gram / cc	2.17×10^{-17}	1.114×10^{14}	1.5×10^{-14}

- The atomic mass unit (amu) is 1/12 of the mass of an individual atom of ${}_6\text{C}^{12}$, i.e. $1.660 \times 10^{-27} \text{ kg}$.

Table : 2.2 Other non fundamental particles

Particle	Symbol	Nature	Charge esu $\times 10^{-10}$	Mass (amu)	Discovered by
Positron	$e^+, 1e^0, \beta^+$	+	+ 4.8029	0.0005486	Anderson (1932)
Neutrino	ν	0	0	< 0.00002	Pauli (1933) and Fermi (1934)
Anti-proton	p^-	-	- 4.8029	1.00787	Chamberlain Sugri (1956) and Weighland (1955)
Positive mu meson	μ^+	+	+ 4.8029	0.1152	Yukawa (1935)
Negative mu meson	μ^-	-	- 4.8029	0.1152	Anderson (1937)
Positive pi meson	π^+	+	+ 4.8029	0.1514	Powell (1947)
Negative pi meson	π^-	-	- 4.8029	0.1514	
Neutral pi meson	π^0	0	0	0.1454	

(iv) Anode rays may get deflected by external magnetic field.

(v) Anode rays also affect the photographic plate.

(vi) The *e/m* ratio of these rays is smaller than that of electrons.

(vii) Unlike cathode rays, their *e/m* value is dependent upon the nature of the gas taken in the tube. It is maximum when gas present in the tube is hydrogen.

(viii) These rays produce flashes of light on ZnS screen.

Neutron (*n*, *N*)

(i) Neutron was discovered by **James Chadwick** (1932) according to the following nuclear reaction,

(2) Neutron is an unstable particle. It decays as follows,

Atomic number, Mass number and Atomic species

(1) Atomic number or Nuclear charge

(i) The number of protons present in the nucleus of the atom is called **atomic number** (*Z*).

(ii) It was determined by **Moseley** as,

$$\sqrt{\nu} = a(Z - b) \text{ or } aZ - ab$$

Where, $\nu = X$ - ray's frequency

Z = atomic number of the metal a & b are constant.

(iii) Atomic number = Number of positive charge on nucleus = Number of protons in nucleus = Number of electrons in neutral atom.

(iv) Two different elements can never have identical atomic number.

(2) Mass number

Mass number (*A*) = Number of protons or Atomic number (*Z*) + Number of neutrons or Number of neutrons = $A - Z$.

(i) Since mass of a proton or a neutron is not a whole number (on atomic weight scale), weight is not necessarily a whole number.

(ii) The atom of an element *X* having mass number (*A*) and atomic number (*Z*) may be represented by a symbol, ${}_Z\text{X}^A$.

Table: 2.3 Different types of atomic species

Atomic species	Similarities	Differences	Examples
Isotopes	(i) Atomic No. (<i>Z</i>)	(i) Mass No. (<i>A</i>)	(i) ${}_1^1\text{H}, {}_1^2\text{H}, {}_1^3\text{H}$
(Soddy)	(ii) No. of protons	(ii) No. of neutrons

Electromagnetic radiations

(1) Light and other forms of radiant energy propagate without any medium in the space in the form of waves are known as *electromagnetic radiations*. These waves can be produced by a charged body moving in a magnetic field or a magnet in a electric field. e.g. α - rays, γ - rays, cosmic rays, ordinary light rays etc.

(2) Characteristics

- All electromagnetic radiations travel with the velocity of light.
- These consist of electric and magnetic fields components that oscillate in directions perpendicular to each other and perpendicular to the direction in which the wave is travelling.
- A wave is always characterized by the following five characteristics,
 - Wavelength** : The distance between two nearest crests or nearest troughs is called the wavelength. It is denoted by λ (lambda) and is

measured in terms of centimeter(cm), angstrom($\text{\AA}$), micron(μ) or nanometre (nm).

Fig. 2.2

$$1\text{\AA} = 10^{-8}\text{ cm} = 10^{-10}\text{ m}; 1\mu = 10^{-4}\text{ cm} = 10^{-6}\text{ m};$$

$$1\text{nm} = 10^{-7}\text{ cm} = 10^{-9}\text{ m}; 1\text{cm} = 10^8\text{\AA} = 10^4\mu = 10^7\text{nm}$$

(ii) **Frequency** : It is defined as the number of waves which pass through a point in one second. It is denoted by the symbol ν (nu) and is expressed in terms of cycles (or waves) per second (cps) or hertz (Hz).

$$\lambda\nu = \text{distance travelled in one second} = \text{velocity} = c$$

$$\nu = \frac{c}{\lambda}$$

(iii) **Velocity** : It is defined as the distance covered in one second by the wave. It is denoted by the letter 'c'. All electromagnetic waves travel with the same velocity, i.e., $3 \times 10^{10}\text{ cm/sec}$.

$$c = \lambda\nu = 3 \times 10^{10}\text{ cm/sec}$$

(iv) **Wave number** : This is the reciprocal of wavelength, i.e., the number of wavelengths per centimetre. It is denoted by the symbol $\bar{\nu}$ (nu bar). It is expressed in cm^{-1} or m^{-1} .

$$\bar{\nu} = \frac{1}{\lambda}$$

(v) **Amplitude** : It is defined as the height of the crest or depth of the trough of a wave. It is denoted by the letter 'A'. It determines the intensity of the radiation.

The arrangement of various types of electromagnetic radiations in the order of their increasing or decreasing wavelengths or frequencies is known as **electromagnetic spectrum**.

Table: 2.4

Name	Wavelength ($\text{\AA}$)	Frequency (Hz)
Radio wave	$3 \times 10^{14} - 3 \times 10^7$	$1 \times 10^5 - 1 \times 10^9$
Microwave	$3 \times 10^7 - 6 \times 10^6$	$1 \times 10^9 - 5 \times 10^{11}$
Infrared (IR)	$6 \times 10^6 - 7600$	$5 \times 10^{11} - 3.95 \times 10^{16}$
Visible	7600 – 3800	$3.95 \times 10^{16} - 7.9 \times 10^{14}$
Ultraviolet (UV)	3800 – 150	$7.9 \times 10^{14} - 2 \times 10^{16}$
X-Rays	150 – 0.1	$2 \times 10^{16} - 3 \times 10^{19}$
γ - Rays	0.1 – 0.01	$3 \times 10^{19} - 3 \times 10^{20}$
Cosmic Rays	0.01- zero	$3 \times 10^{20} - \text{infinity}$

Atomic spectrum - Hydrogen spectrum

Atomic spectrum

Spectrum is the impression produced on a photographic film when the radiation (s) of particular wavelength (s) is (are) analysed through a prism or diffraction grating.

Types of spectrum

(i) **Emission spectrum** : Spectrum produced by the emitted radiation is known as emission spectrum. This spectrum corresponds to the radiation emitted (energy evolved) when an excited electron returns back to the ground state.

(i) **Continuous spectrum** : When sunlight is passed through a prism, it gets dispersed into continuous bands of different colours. If the light of an

incandescent object resolved through prism or spectroscope, it also gives continuous spectrum of colours.

(ii) **Line spectrum** : If the radiation's obtained by the excitation of a substance are analysed with help of a spectroscope a series of thin bright lines of specific colours are obtained. There is dark space in between two consecutive lines. This type of spectrum is called line spectrum or atomic spectrum..

(2) **Absorption spectrum** : Spectrum produced by the absorbed radiations is called absorption spectrum.

Hydrogen spectrum

(1) Hydrogen spectrum is an example of line emission spectrum or atomic emission spectrum.

(2) When an electric discharge is passed through hydrogen gas at low pressure, a bluish light is emitted.

(3) This light shows discontinuous line spectrum of several isolated sharp lines through prism.

(4) All these lines of H-spectrum have Lyman, Balmer, Paschen, Barckett, Pfund and Humphrey series. These spectral series were named by the name of scientist discovered them.

(5) To evaluate wavelength of various H-lines Ritz introduced the following expression,

$$\bar{\nu} = \frac{1}{\lambda} = \frac{\nu}{c} = R \left[\frac{1}{n_1^2} - \frac{1}{n_2^2} \right]$$

Where R is universal constant known as Rydberg's constant its value is $109,678\text{ cm}^{-1}$.

Plum pudding model of Thomson

(i) He suggested that atom is a positively charged sphere having electrons embedded uniformly giving an overall picture of plum pudding.

Fig. 2.3

(2) This model failed to explain the line spectrum of an element and the scattering experiment of Rutherford.

Rutherford's nuclear model

(i) Rutherford carried out experiment on the bombardment of thin (10^{-4} mm) Au foil with high speed positively charged α - particles emitted from Ra and gave the following observations based on this experiment,

(i) Most of the α - particles passed without any deflection.

(ii) Some of them were deflected away from their path.

(iii) Only a few (one in about 10,000) were returned back to their original direction of propagation.

Fig. 2.4

(2) From the above observations he concluded that, an atom consists of

(i) **Nucleus** which is small in size but carries the entire mass i.e. contains all the neutrons and protons.

(ii) **Extra nuclear part** which contains electrons. This model was similar to the solar system.

(3) Properties of the nucleus

(i) Nucleus is a small, heavy, positively charged portion of the atom and located at the centre of the atom.

(ii) All the positive charge of atom (i.e. protons) are present in nucleus.

(iii) Nucleus contains neutrons and protons, and hence these particles collectively are also referred to as **nucleons**.

(iv) The **size** of nucleus is measured in **Fermi** (1 Fermi = 10^{-8} cm).

(v) The **radius** of nucleus is of the order of 1.5×10^{-13} cm. to 6.5×10^{-13} cm. i.e. 1.5 to 6.5 Fermi. Generally the radius of the nucleus (r_n) is given by the following relation,

$$r_n = r_o (= 1.4 \times 10^{-13} \text{ cm}) \times A^{1/3}$$

This exhibited that nucleus is 10^{-5} times small in size as compared to the total size of atom.

(vi) The **Volume** of the nucleus is about 10^{-39} cm³ and that of atom is 10^{-24} cm³, i.e., volume of the nucleus is 10^{-15} times that of an atom.

(vii) The **density** of the nucleus is of the order of 10^{15} g cm⁻³ or 10^8 tonnes cm⁻³ or 10^{12} kg/cc. If nucleus is spherical than,

$$\text{Density} = \frac{\text{mass of the nucleus}}{\text{volume of the nucleus}} = \frac{\text{mass number}}{6.023 \times 10^{23} \times \frac{4}{3} \pi r^3}$$

(4) Drawbacks of Rutherford's model

(i) It does not obey the **Maxwell theory of electrodynamics**, according to it "A small charged particle moving around an oppositely charged centre continuously loses its energy". If an electron does so, it should also continuously lose its energy and should set up spiral motion ultimately failing into the nucleus.

(ii) It could not explain the line spectra of H-atom and discontinuous spectrum nature.

Planck's quantum theory

When black body is heated, it emits thermal radiation's of different wavelengths or frequency. To explain these radiations, max planck put forward a theory known as planck's quantum theory.

(i) The radiant energy which is emitted or absorbed by the black body is not continuous but discontinuous in the form of small discrete packets of energy, each such packet of energy is called a '**quantum**'. In case of light, the quantum of energy is called a '**photon**'.

(ii) The energy of each quantum is directly proportional to the frequency (ν) of the radiation, i.e.

$$E \propto \nu \text{ or } E = h\nu = \frac{hc}{\lambda}$$

Where, h = Planck's constant = 6.62×10^{-34} erg. sec. or 6.62×10^{-34} Joules sec.

(iii) The total amount of energy emitted or absorbed by a body will be some whole number quanta. Hence $E = nh\nu$, where n is an integer.

Photoelectric effect

(1) When radiations with certain minimum frequency (ν_0) strike the surface of a metal, the electrons are ejected from the surface of the metal. This phenomenon is called **photoelectric effect** and the electrons emitted are called **photo-electrons**. The current constituted by photoelectrons is known as photoelectric current.

(2) The electrons are ejected only if the radiation striking the surface of the metal has at least a minimum frequency (ν_0) called **Threshold frequency**. The minimum potential at which the plate photoelectric current becomes zero is called **stopping potential**.

(3) The velocity or kinetic energy of the electron ejected depend upon the frequency of the incident radiation and is independent of its intensity.

(4) The number of photoelectrons ejected is proportional to the intensity of incident radiation.

(5) Einstein's photoelectric effect equation

According to Einstein,

Maximum kinetic energy of the ejected electron = absorbed energy – threshold energy

$$\frac{1}{2} m v_{\max}^2 = h\nu - h\nu_0 = hc \left[\frac{1}{\lambda} - \frac{1}{\lambda_0} \right]$$

Where, ν_0 and λ_0 are threshold frequency and threshold wavelength.

Bohr's atomic model

Bohr retained the essential features of the Rutherford model of the atom. However, in order to account for the stability of the atom he introduced the concept of the stationary orbits. The Bohr postulates are,

(1) An atom consists of positively charged nucleus responsible for almost the entire mass of the atom (This assumption is retention of Rutherford model).

(2) The electrons revolve around the nucleus in certain permitted circular orbits of definite radii.

(3) The permitted orbits are those for which the angular momentum of an electron is an integral multiple of $h/2\pi$ where h is the Planck's constant. If m is the mass and v is the velocity of the electron in a permitted orbit of radius r , then

$$L = mvr = \frac{nh}{2\pi}; n = 1, 2, 3, \dots, \infty$$

Where L is the orbital angular momentum and n is the number of orbit. The integer n is called the principal quantum number. This equation is known as the Bohr quantization postulate.

(4) When electrons move in permitted discrete orbits they do not radiate or lose energy. Such orbits are called stationary or non-radiating orbits. In this manner, Bohr overcame Rutherford's difficulty to account for the stability of the atom. Greater the distance of energy level from the nucleus, the more is the energy associated with it. The different energy levels were numbered as 1, 2, 3, 4 .. and called as $K, L, M, N, \dots$ etc.

(5) Ordinarily an electron continues to move in a particular stationary state or orbit. Such a state of atom is called ground state. When energy is given to the electron it jumps to any higher energy level and is said to be in the excited state. When the electron jumps from higher to lower energy state, the energy is radiated.

Advantages of Bohr's theory

(i) Bohr's theory satisfactorily explains the spectra of species having one electron, viz. hydrogen atom, He^+ , Li^{2+} etc.

(ii) **Calculation of radius of Bohr's orbit** : According to Bohr, radius of n^{th} orbit in which electron moves is

$$r_n = \left[\frac{h^2}{4\pi^2 m e^2 k} \right] \cdot \frac{n^2}{Z}$$

Where, n = Orbit number, m = Mass number $[9.1 \times 10^{-31} \text{ kg}]$, e = Charge on the electron $[1.6 \times 10^{-19}]$ Z = Atomic number of element, k = Coulombic constant $[9 \times 10^9 \text{ Nm}^2 \text{ C}^{-2}]$

After putting the values of m, e, k, h , we get.

$$r_n = \frac{n^2}{Z} \times 0.529 \text{ \AA}$$

(iii) Calculation of velocity of electron

$$V_n = \frac{2\pi e^2 Z k}{nh}, V_n = \left[\frac{Ze^2}{mr} \right]^{1/2}; V_n = \frac{2.188 \times 10^8 Z}{n} \text{ cm. sec}^{-1}$$

(iv) Calculation of energy of electron in Bohr's orbit

Total energy of electron = K.E. + P.E. of electron

$$= \frac{kZe^2}{2r} - \frac{kZe^2}{r} = -\frac{kZe^2}{2r}$$

Substituting of r , gives us $E = \frac{-2\pi^2 m Z^2 e^4 k^2}{n^2 h^2}$ Where, $n=1, 2, 3, \dots, \infty$

Putting the value of m, e, k, h, π we get

$$E = 21.8 \times 10^{-12} \times \frac{Z^2}{n^2} \text{ erg per atom}$$

$$= -21.8 \times 10^{-19} \times \frac{Z^2}{n^2} \text{ J per atom} (1 \text{ J} = 10^7 \text{ erg})$$

$$E = -13.6 \times \frac{Z^2}{n^2} \text{ eV per atom} (1 \text{ eV} = 1.6 \times 10^{-19} \text{ J})$$

$$= -13.6 \times \frac{Z^2}{n^2} \text{ k.cal/mole} (1 \text{ cal} = 4.18 \text{ J})$$

$$\text{or } \frac{-1312}{n^2} \text{ Z}^2 \text{ kJmol}^{-1}$$

When an electron jumps from an outer orbit (higher energy) n_2 to an inner orbit (lower energy) n_1 , then the energy emitted in form of radiation is given by

$$\Delta E = E_{n_2} - E_{n_1} = \frac{2\pi^2 k^2 m e^4 Z^2}{h^2} \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$$

$$\Rightarrow \Delta E = 13.6 Z^2 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right) \text{ eV / atom}$$

$$\text{As we know that } E = h \bar{\nu}, c = \nu \lambda \text{ and } \bar{\nu} = \frac{1}{\lambda} = \frac{\Delta E}{hc},$$

$$= \frac{2\pi^2 k^2 m e^4 Z^2}{ch^3} \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$$

$$\text{This can be represented as } \frac{1}{\lambda} = \bar{\nu} = R Z^2 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$$

$$\text{Where, } R = \frac{2\pi^2 k^2 m e^4}{ch^3}; R \text{ is known as Rydberg constant. Its}$$

value to be used is 109678 cm^{-1} .

The negative sign in the above equations shows that the electron and nucleus form a bound system, i.e., the electron is attracted towards the nucleus. Thus, if electron is to be taken away from the nucleus, energy has to be supplied. The energy of the electron in $n=1$ orbit is called the ground state energy; that in the $n=2$ orbit is called the first excited state energy, etc. When $n=\infty$ then $E=0$ which corresponds to ionized atom i.e., the electron and nucleus are infinitely separated $H \rightarrow H^+ + e^-$ (ionization).

(6) **Spectral evidence for quantisation** (Explanation for hydrogen spectrum on the basis of Bohr atomic model)

(i) The light absorbed or emitted as a result of an electron changing orbits produces characteristic absorption or emission spectra which can be recorded on the photographic plates as a series of lines, the optical spectrum of hydrogen consists of several series of lines called **Lyman, Balmer, Paschen, Brackett, Pfund** and **Humphrey**. These spectral series were named by the name of scientist who discovered them.

(ii) To evaluate wavelength of various H-lines Ritz introduced the following expression,

$$\bar{\nu} = \frac{1}{\lambda} = \frac{\nu}{c} = R \left[\frac{1}{n_1^2} - \frac{1}{n_2^2} \right]$$

$$\text{Where, } R \text{ is } = \frac{2\pi^2 m e^4}{ch^3} = \text{Rydberg's constant}$$

It's theoretical value = $109,737 \text{ cm}^{-1}$ and It's experimental value = $109,677.581 \text{ cm}^{-1}$

This remarkable agreement between the theoretical and experimental value was great achievement of the Bohr model.

(iii) Although H-atom consists of only one electron yet its spectra consist of many spectral lines.

(iv) *Comparative study of important spectral series of Hydrogen is shown in following table.*

(v) If an electron from n excited state comes to various energy states, the maximum spectral lines obtained will be $= \frac{n(n-1)}{2}$. n = principal quantum number.

As $n=6$ then total number of spectral lines = $\frac{6(6-1)}{2} = \frac{30}{2} = 15$.

(vi) Thus, at least for the hydrogen atom, the Bohr theory accurately describes the origin of atomic spectral lines.

(7) Failure of Bohr model

(i) Bohr theory was very successful in predicting and accounting the energies of line spectra of hydrogen i.e. one electron system. It could not explain the line spectra of atoms containing more than one electron.

(ii) This theory could not explain the presence of multiple spectral lines.

(iii) This theory could not explain the splitting of spectral lines in magnetic field (Zeeman effect) and in electric field (Stark effect). The intensity of these spectral lines was also not explained by the Bohr atomic model.

(iv) This theory was unable to explain of dual nature of matter as explained on the basis of De broglies concept.

(v) This theory could not explain uncertainty principle. (vi) No conclusion was given for the concept of quantisation of energy.

Table: 2.5

S.No.	Spectral series	Lies in the region	Transition $n_2 > n_1$	$\lambda_{\max} = \frac{n_1^2 n_2^2}{(n_2^2 - n_1^2)R}$	$\lambda_{\min} = \frac{n_1^2}{R}$	$\frac{\lambda_{\max}}{\lambda_{\min}} = \frac{n_2^2}{n_2^2 - n_1^2}$
(1)	Lyman series	Ultraviolet region	$n_1 = 1$ $n_2 = 2, 3, 4, \dots \infty$	$n_1 = 1$ and $n_2 = 2$ $\lambda_{\max} = \frac{4}{3R}$	$n_1 = 1$ and $n_2 = \infty$ $\lambda_{\min} = \frac{1}{R}$	$\frac{4}{3}$
(2)	Balmer series	Visible region	$n_1 = 2$ $n_2 = 3, 4, 5, \dots \infty$	$n_1 = 2$ and $n_2 = 3$ $\lambda_{\max} = \frac{36}{5R}$	$n_1 = 2$ and $n_2 = \infty$ $\lambda_{\min} = \frac{4}{R}$	$\frac{9}{5}$
(3)	Paschen series	Infra red region	$n_1 = 3$ $n_2 = 4, 5, 6, \dots \infty$	$n_1 = 3$ and $n_2 = 4$ $\lambda_{\max} = \frac{144}{7R}$	$n_1 = 3$ and $n_2 = \infty$ $\lambda_{\min} = \frac{9}{R}$	$\frac{16}{7}$
(4)	Brackett series	Infra red region	$n_1 = 4$ $n_2 = 5, 6, 7, \dots \infty$	$n_1 = 4$ and $n_2 = 5$ $\lambda_{\max} = \frac{16 \times 25}{9R}$	$n_1 = 4$ and $n_2 = \infty$ $\lambda_{\min} = \frac{16}{R}$	$\frac{25}{9}$
(5)	Pfund series	Infra red region	$n_1 = 5$ $n_2 = 6, 7, 8, \dots \infty$	$n_1 = 5$ and $n_2 = 6$ $\lambda_{\max} = \frac{25 \times 36}{11R}$	$n_1 = 5$ and $n_2 = \infty$ $\lambda_{\min} = \frac{25}{R}$	$\frac{36}{11}$
(6)	Humphrey series	Far infrared region	$n_1 = 6$ $n_2 = 7, 8, \dots \infty$	$n_1 = 6$ and $n_2 = 7$ $\lambda_{\max} = \frac{36 \times 49}{13R}$	$n_1 = 6$ and $n_2 = \infty$ $\lambda_{\min} = \frac{36}{R}$	$\frac{49}{13}$

Bohr-Sommerfeld's model

It is an extension of Bohr's model. The electrons in an atom revolve around the nuclei in elliptical orbit. The circular path is a special case of ellipse. Association of elliptical orbits with circular orbit explains the fine line spectrum of atoms.

Dual nature of electron

(1) In 1924, the French physicist, **Louis de Broglie** suggested that if light has both particle and wave like nature, the similar duality must be true for matter. Thus an electron, behaves both as a material particle and as a wave.

(2) This presented a new wave mechanical theory of matter. According to this theory, small particles like electrons when in motion possess wave properties.

(3) According to de-broglie, the wavelength associated with a particle of mass m , moving with velocity v is given by the relation

$$\lambda = \frac{h}{mv}, \text{ where } h = \text{Planck's constant.}$$

(4) This can be derived as follows according to Planck's equation,

$$E = h\nu = \frac{h.c}{\lambda} \quad \left(\because \nu = \frac{c}{\lambda} \right)$$

energy of photon (on the basis of Einstein's mass energy relationship), $E = mc^2$

$$\text{Equating both } \frac{hc}{\lambda} = mc^2 \text{ or } \lambda = \frac{h}{mc} \text{ which is same as de-}$$

Broglie relation. ($\because mc = p$)

(5) This was experimentally verified by **Davisson and Germer** by observing diffraction effects with an electron beam. Let the electron is accelerated with a potential of V then the Kinetic energy is

$$\frac{1}{2}mv^2 = eV; \quad m^2v^2 = 2eVm$$

$$mv = \sqrt{2eVm} = P; \quad \lambda = \frac{h}{\sqrt{2eVm}}$$

(6) If Bohr's theory is associated with de-Broglie's equation then wave length of an electron can be determined in bohr's orbit and relate it with circumference and multiply with a whole number

$$2\pi r = n\lambda \text{ or } \lambda = \frac{2\pi r}{n}$$

$$\text{From de-Broglie equation, } \lambda = \frac{h}{mv}.$$

$$\text{Thus } \frac{h}{mv} = \frac{2\pi r}{n} \text{ or } mvr = \frac{nh}{2\pi}$$

(7) The de-Broglie equation is applicable to all material objects but it has significance only in case of microscopic particles. Since, we come across macroscopic objects in our everyday life, de-broglie relationship has no significance in everyday life.

Heisenberg's uncertainty principle

This principle states "It is impossible to specify at any given moment both the position and momentum (velocity) of an electron".

$$\text{Mathematically it is represented as, } \Delta x \cdot \Delta p \geq \frac{h}{4\pi}$$

Where Δx = uncertainty in position of the particle,
 Δp = uncertainty in the momentum of the particle

$$\text{Now since } \Delta p = m \Delta v$$

$$\text{So equation becomes, } \Delta x \cdot m \Delta v \geq \frac{h}{4\pi} \text{ or } \Delta x \times \Delta v \geq \frac{h}{4\pi m}$$

In terms of uncertainty in energy, ΔE and uncertainty in time Δt , this principle is written as, $\Delta E \cdot \Delta t \geq \frac{h}{4\pi}$

Schrödinger wave equation

(1) Schrodinger wave equation is given by **Erwin Schrödinger** in 1926 and based on dual nature of electron.

(2) In it electron is described as a three dimensional wave in the electric field of a positively charged nucleus.

(3) The probability of finding an electron at any point around the nucleus can be determined by the help of Schrodinger wave equation which is,

$$\frac{\partial^2 \Psi}{\partial x^2} + \frac{\partial^2 \Psi}{\partial y^2} + \frac{\partial^2 \Psi}{\partial z^2} + \frac{8\pi^2 m}{h^2} (E - V) \Psi = 0$$

Where x, y and z are the 3 space co-ordinates, m = mass of electron, h = Planck's constant, E = Total energy, V = potential energy of electron, Ψ = amplitude of wave also called as wave function, ∂ = for an infinitesimal change.

(4) The Schrodinger wave equation can also be written as,

$$\nabla^2 \Psi + \frac{8\pi^2 m}{h^2} (E - V) \Psi = 0$$

Where ∇ = laplacian operator.

(5) **Physical significance of Ψ and Ψ^2**

(i) The wave function Ψ represents the amplitude of the electron wave. The amplitude Ψ is thus a function of space co-ordinates and time i.e. $\Psi = \Psi(x, y, z, \dots, \text{times})$

(ii) For a single particle, the square of the wave function (Ψ^2) at any point is proportional to the probability of finding the particle at that point.

(iii) If Ψ^2 is maximum then probability of finding e^- is maximum around nucleus and the place where probability of finding e^- is maximum is called *electron density*, electron cloud or an atomic orbital. It is different from the Bohr's orbit.

(iv) The solution of this equation provides a set of number called *quantum numbers* which describe specific or definite energy state of the electron in atom and information about the shapes and orientations of the most probable distribution of electrons around the nucleus.

Radial probability distribution curves : Radial probability is $R = 4\pi r^2 dr \psi^2$. The plots of R distance from nucleus as follows

Fig. 2.5

Quantum numbers

Each orbital in an atom is specified by a set of three quantum numbers (n, l, m) and each electron is designated by a set of four quantum numbers (n, l, m and s).

(1) **Principle quantum number (n)**

(i) It was proposed by *Bohr* and denoted by ' n '.

(ii) It determines the average distance between electron and nucleus, means it denotes the size of atom.

(iii) It determines the energy of the electron in an orbit where electron is present.

(iv) The maximum number of an electron in an orbit represented by this quantum number as $2n^2$. No energy shell in atoms of known elements possess more than 32 electrons.

(v) It gives the information of orbit $K, L, M, N, \dots$.

(vi) Angular momentum can also be calculated using principle quantum number

(2) **Azimuthal quantum number (l)**

(i) Azimuthal quantum number is also known as angular quantum number. Proposed by *Sommerfeld* and denoted by ' l '.

(ii) It determines the number of sub shells or sublevels to which the electron belongs.

(iii) It tells about the shape of subshells.

(iv) It also expresses the energies of subshells $s < p < d < f$ (increasing energy).

(v) The value of $l = (n - 1)$ always. Where ' n ' is the number of principle shell.

(vi) Value of l	=	0	1	2	3.....(n-1)
Name of subshell	=	s	p	d	f
Shape of subshell	=	Spherical	Dumbbell	Double dumbbell	Complex

(vii) It represent the orbital angular momentum. Which is equal to

$$\frac{h}{2\pi} \sqrt{l(l+1)}$$

(viii) The maximum number of electrons in subshell = $2(2l+1)$

s – subshell → 2 electrons d – subshell → 10 electrons

p – subshell → 6 electrons f – subshell → 14 electrons.

(ix) For a given value of ' n ' the total values of ' l ' is always equal to the value of ' n '.

(3) Magnetic quantum number (m)

(i) It was proposed by Zeeman and denoted by ' m '.

(ii) It gives the number of permitted orientation of subshells.

(iii) The value of m varies from $-l$ to $+l$ through zero.

(iv) It tells about the splitting of spectral lines in the magnetic field i.e. this quantum number proves the Zeeman effect.

(v) For a given value of ' n ' the total value of ' m ' is equal to n^2 .

(vi) For a given value of ' l ' the total value of ' m ' is equal to $(2l+1)$.

(vii) *Degenerate orbitals* : Orbitals having the same energy are known as degenerate orbitals. e.g. for p subshell p_x p_y p_z

(viii) The number of degenerate orbitals of s subshell = 0.

(4) Spin quantum numbers (s)

(i) It was proposed by Goldshmidt & Ulen Back and denoted by the symbol of ' s '.

(ii) The value of ' s ' is $+1/2$ and $-1/2$, which signifies the spin or rotation or direction of electron on it's axis during movement.

(iii) The spin may be clockwise or anticlockwise.

(iv) It represents the value of spin angular momentum is equal to $\frac{h}{2\pi} \sqrt{s(s+1)}$.

(v) Maximum spin of an atom = $1/2 \times \text{number of unpaired electron}$.

(vi) This quantum number is not the result of solution of schrodinger equation as solved for H -atom.

Table : 2.6 Distribution of electrons among the quantum levels

n	l	m	Designation of orbitals	Number of Orbitals in the subshell
1	0	0	1s	1
2	0	0	2s	1
2	1	-1, 0, +1	2p	3
3	0	0	3s	1
3	1	-1, 0, +1	3p	3
3	2	-2, -1, 0, +1, +2	3d	5
4	0	0	4s	1
4	1	-1, 0, +1	4p	3
4	2	-2, -1, 0, +1, +2	4d	5
4	3	-3, -2, -1, 0, +1, +2, +3	4f	7

Shape of orbitals

(1) Shape of ' s ' orbital

(i) For ' s ' orbital $l=0$ & $m=0$ so ' s ' orbital have only one unidirectional orientation i.e. the probability of finding the electrons is same in all directions.

(ii) The size and energy of ' s ' orbital with increasing ' n ' will be $1s < 2s < 3s < 4s$.

(iii) s -orbitals known as radial node or modal surface. But there is no radial node for 1s orbital since it is starting from the nucleus.

Fig. 2.6

(2) Shape of ' p ' orbitals

(i) For ' p ' orbital $l=1$, & $m=+1, 0, -1$ means there are three ' p ' orbitals, which is symbolised as p_x, p_y, p_z .

(ii) Shape of ' p ' orbital is dumb bell in which the two lobes on opposite side separated by the nodal plane.

(iii) p -orbital has directional properties.

Fig. 2.7

(3) Shape of 'd' orbital

(i) For the 'd' orbital $l=2$ then the values of ' m ' are $-2, -1, 0, +1, +2$.

It shows that the 'd' orbitals has five orbitals as $d_{xy}, d_{yz}, d_{zx}, d_{x^2-y^2}, d_{z^2}$.

(ii) Each 'd' orbital identical in shape, size and energy.

(iii) The shape of d orbital is double dumb bell.

(iv) It has directional properties.

Fig. 2.8

(4) Shape of 'f' orbital

(i) For the 'f' orbital $l=3$ then the values of ' m ' are $-3, -2, -1, 0, +1, +2, +3$. It shows that the 'f' orbitals have seven orientation as $f_{x(x^2-y^2)}, f_{y(x^2-y^2)}, f_{z(x^2-y^2)}, f_{xyz}, f_{z^3}, f_{yz^2}$ and f_{xz^2} .

(ii) The 'f' orbital is complicated in shape.

Rules for filling of electrons in various orbitals

The atom is built up by filling electrons in various orbitals according to the following rules,

(1) Aufbau's principle

This principle states that the electrons are added one by one to the various orbitals in order of their increasing energy starting with the orbital of lowest energy. The increasing order of energy of various orbitals is

$$1s < 2s < 2p < 3s < 3p < 4s < 3d < 4p < 5s < 4d < 5p < 6s < 4f < 5d < 6p < 7s < 5f < 6d < 7p \dots$$

(2) $(n+l)$ Rule

In neutral isolated atom, the lower the value of $(n+l)$ for an orbital, lower is its energy. However, if the two different types of orbitals have the same value of $(n+l)$, the orbitals with lower value of n has lower energy.

(3) Pauli's exclusion principle

According to this principle "no two electrons in an atom will have same value of all the four quantum numbers".

If one electron in an atom has the quantum numbers $n=1, l=0, m=0$ and $s=+1/2$, no other electron can have the same four quantum numbers. In other words, we cannot place two electrons with the same value of s in a $1s$ orbital.

The orbital diagram  does not represent a possible arrangement of electrons

Because there are only two possible values of s , an orbital can hold not more than two electrons.

(4) Hund's Rule of maximum multiplicity

This rule deals with the filling of electrons in the orbitals having equal energy (degenerate orbitals). According to this rule,

"Electron pairing in p , d and f orbitals cannot occur until each orbitals of a given subshell contains one electron each or is singly occupied".

This is due to the fact that electrons being identical in charge, repel each other when present in the same orbital. This repulsion can however be minimised if two electrons move as far apart as possible by occupying different degenerate orbitals. All the unpaired electrons in a degenerate set of orbitals will have same spin.

As we now know the Hund's rule, let us see how the three electrons are arranged in p orbitals.

The important point to be remembered is that all the singly occupied orbitals should have electrons with parallel spins i.e. in the same direction either-clockwise or anticlockwise.

**Electronic configurations of elements**

On the basis of the electronic configuration principles the electronic configuration of various elements are given in the following table :

The above method of writing the electronic configurations is quite cumbersome. Hence, usually the electronic configuration of the atom of any element is simply represented by the notation.

**Some Unexpected Electronic Configuration**

Some of the exceptions are important though, because they occur with common elements, notably chromium and copper.

Cu has 29 electrons. Its expected electronic configuration is $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^9$ but in reality the configuration is $1s^2 2s^2 2p^6 3s^2 3p^6 4s^1 3d^{10}$ as this configuration is more stable. Similarly Cr has the configuration of $1s^2 2s^2 2p^6 3s^2 3p^6 4s^1 3d^5$ instead of $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^4$.

Factors responsible for the extra stability of half-filled and completely filled subshells,

(i) **Symmetrical distribution** : It is well known fact that symmetry leads to stability. Thus the electronic configuration in which all the orbitals of the same subshell are either completely filled or are exactly half filled are more stable because of symmetrical distribution of electrons.

(ii) **Exchange energy** : The electrons with parallel spins present in the degenerate orbitals tend to exchange their position. The energy released during this exchange is called exchange energy. The number of exchanges that can take place is maximum when the degenerate orbitals (orbitals of same subshell having equal energy) are exactly half-filled or completely. As a result, the exchange energy is maximum and so is the stability.

Tips & Tricks

✍ All lines in the visible region are of Balmer series but reverse is not true i.e., all Balmer lines will not fall in visible region.

✍ A part of an atom up to penultimate shell is a kernel or atomic core.

✍ If the energy supplied to hydrogen atom is less than 13.6 eV it will emit or absorb only those quanta which can take it to a certain higher energy level i.e., all those photons having energy less than or more than a particular energy level will not be absorbed by hydrogen atom, but if energy supplied to hydrogen atom is more than 13.6 eV then all photons are absorbed and excess energy appears as kinetic energy of emitted photo electron.

✍ No. of nodes in any orbital $= (n - l - 1)$

✍ No. of nodal planes in an orbital $= l$

✍ The d orbital which does not have four lobes is d_{z^2}

✍ The d orbital whose lobes lie along the axis is $d_{x^2-y^2}$

✍ Spin angular momentum $= \sqrt{s(s+1)} \frac{h}{2\pi}$

✍ Total spin $= \pm \frac{n}{2}$; where n is no. of unpaired e^-

✍ Magnetic moment $= \sqrt{n(n+2)}$ B.M. (Bohr magneton) of n unpaired e^-

✍ Ion with unpaired electron in d or f orbital will be coloured.

✍ Exception of E.C. are $Cr(24)$, $Cu(29)$, $Mo(42)$, $Ag(47)$, $W(74)$, $Au(79)$.

✍ No. of waves $n = \frac{2\pi r}{\lambda}$ (where $\lambda = \frac{h}{mv}$)

✍ No. of revolutions of e^- per second is $= \frac{v}{2\pi r}$.

✍ The solution of Schrodinger wave equation gives principal, azimuthal and magnetic quantum numbers but not the spin quantum number.

✍ In the Rydberg formula, when $n_2 = \infty$ the line produced is called the limiting line of that series.

✍ Among various forms of visible light, violet colour has shortest wavelength, highest frequency and highest energy.

✍ Red coloured light has largest wavelength, least frequency and lowest energy in visible light.

✍ Elements give line spectra. The line spectrum is characteristic of the excited atom producing it. No two elements have identical line spectrum.

✍ The line spectrum results from the emission of radiations from the atoms of the elements and is therefore called as atomic spectrum.

✍ Atoms give line spectra (known as atomic spectrum) and the molecules give band spectra (known as molecular spectrum).

✍ The negative potential at which the photoelectric current becomes zero is called cut off potential or stopping potential.

✍ When energy or frequency of scattered ray is lesser than the incident ray, it is known as Compton effect.

✍ The instrument used to record solar spectrum is called spectrometer or spectrograph developed by Bunsen and Kirchhoff in 1859.

✍ The intensities of spectral lines decrease with increase in the value of n . For example, the intensity of first Lyman line ($2 \rightarrow 1$) is greater than second line ($3 \rightarrow 1$) and so on.

✍ In Balmer series of hydrogen spectrum the first line ($3 \rightarrow 2$) is also known as L_α line. The second line ($4 \rightarrow 2$) is L_β line. The line from infinity energy shell is called limiting line.

Ordinary Thinking

Objective Questions

Discovery and Properties of anode, cathode rays neutron and Nuclear structure

- A neutral atom (Atomic no. > 1) consists of
[CPMT 1982]
(a) Only protons
(b) Neutrons + protons
(c) Neutrons + electrons
(d) Neutron + proton + electron
- The nucleus of the atom consists of
[CPMT 1973, 74, 78, 83, 84; MADT Bihar 1980; DPMT 1982, 85; MP PMT 1999]
(a) Proton and neutron
(b) Proton and electron
(c) Neutron and electron
(d) Proton, neutron and electron
- The size of nucleus is of the order of
[CPMT 1982; MP PMT 1991]
(a) $10^{-12} m$ (b) $10^{-8} m$
(c) $10^{-15} m$ (d) $10^{-10} m$
- Positive ions are formed from the neutral atom by the
[CPMT 1976]
(a) Increase of nuclear charge
(b) Gain of protons
(c) Loss of electrons
(d) Loss of protons
- The electron is
[DPMT 1982; MADT Bihar 1980]
(a) α -ray particle (b) β -ray particle
(c) Hydrogen ion (d) Positron
- Who discovered neutron
[IIT 1982; BITS 1988; CPMT 1977; NCERT 1974; MP PMT 1992; MP PET 2002]

- (a) James Chadwick (b) William Crooks
(c) J.J. Thomson (d) Rutherford

7. The ratio of charge and mass would be greater for

[BHU 2005]

- (a) Proton (b) Electron
(c) Neutron (d) Alpha

8. Magnitude of $K.E.$ in an orbit is equal to [BCECE 2005]
 - (a) Half of the potential energy
 - (b) Twice of the potential energy
 - (c) One fourth of the potential energy
 - (d) None of these
9. The density of neutrons is of the order [NCERT 1980]
 - (a) 10^3 kg/cc
 - (b) 10^6 kg/cc
 - (c) 10^9 kg/cc
 - (d) 10^{11} kg/cc
10. The discovery of neutron becomes very late because [CPMT 1987; AIIMS 1998]
 - (a) Neutrons are present in nucleus
 - (b) Neutrons are highly unstable particles
 - (c) Neutrons are chargeless
 - (d) Neutrons do not move
11. The fundamental particles present in the nucleus of an atom are
 - (a) Alpha particles and electrons
 - (b) Neutrons and protons
 - (c) Neutrons and electrons
 - (d) Electrons, neutrons and protons
12. The order of density in nucleus is [NCERT 1981, CPMT 1981, 2003]
 - (a) 10^8 kg/cc
 - (b) 10^{-8} kg/cc
 - (c) 10^{-9} kg/cc
 - (d) 10^{12} kg/cc
13. Cathode rays are [JIPMER 1991; NCERT 1976]
 - (a) Protons
 - (b) Electrons
 - (c) Neutrons
 - (d) α -particles
14. Number of neutron in C^{12} is [BCECE 2005]
 - (a) 6
 - (b) 7
 - (c) 8
 - (d) 9
15. Heaviest particle is [DPMT 1983; MP PET 1999]
 - (a) Meson
 - (b) Neutron
 - (c) Proton
 - (d) Electron
16. Penetration power of proton is [BHU 1985; CPMT 1982, 88]
 - (a) More than electron
 - (b) Less than electron
 - (c) More than neutron
 - (d) None
17. An elementary particle is [CPMT 1973]
 - (a) An element present in a compound
 - (b) An atom present in an element
 - (c) A sub-atomic particle
 - (d) A fragment of an atom
18. The nucleus of helium contains [CPMT 1972; DPMT 1982]
 - (a) Four protons
 - (b) Four neutrons
 - (c) Two neutrons and two protons
 - (d) Four protons and two electrons
19. Which is correct statement about proton [CPMT 1979; MPPMT 1985; NCERT 1985; MP PET 1999]
 - (a) Proton is nucleus of deuterium
 - (b) Proton is ionized hydrogen molecule
 - (c) Proton is ionized hydrogen atom
 - (d) Proton is α -particle
20. Cathode rays are made up of [AMU 1983]
 - (a) Positively charged particles
 - (b) Negatively charged particles
 - (c) Neutral particles
 - (d) None of these
21. Anode rays were discovered by [DPMT 1985]
 - (a) Goldstein
 - (b) J. Stoney
 - (c) Rutherford
 - (d) J.J. Thomson
22. The radius of an atom is of the order of [AMU 1982; IIT 1985; MP PMT 1995]
 - (a) 10^{-10} cm
 - (b) 10^{-13} cm
 - (c) 10^{-15} cm
 - (d) 10^{-8} cm
23. Neutron possesses [CPMT 1982]
 - (a) Positive charge
 - (b) Negative charge
 - (c) No charge
 - (d) All are correct
24. Neutron is a fundamental particle carrying [CPMT 1990]
 - (a) A charge of +1 unit and a mass of 1 unit
 - (b) No charge and a mass of 1 unit
 - (c) No charge and no mass
 - (d) A charge of -1 and a mass of 1 unit
25. Cathode rays have [CPMT 1982]
 - (a) Mass only
 - (b) Charge only
 - (c) No mass and charge
 - (d) Mass and charge both
26. The size of nucleus is measured in [EAMCET 1988; CPMT 1994]
 - (a) amu
 - (b) Angstrom
 - (c) Fermi
 - (d) cm
27. Which phrase would be incorrect to use [AMU (Engg.) 1999]
 - (a) A molecular of a compound
 - (b) A molecule of an element
 - (c) An atom of an element
 - (d) None of these
28. Which one of the following pairs is not correctly matched [MP PET 2002]
 - (a) Rutherford-Proton
 - (b) J.J. Thomson-Electron
 - (c) J.H. Chadwick-Neutron
 - (d) Bohr-Isotope
29. Proton was discovered by [AFMC 2004]
 - (a) Chadwick
 - (b) Thomson
 - (c) Goldstein
 - (d) Bohr
30. The minimum real charge on any particle which can exist is [RPMT 2000]
 - (a) $1.6 \times 10^{-19} \text{ Coulomb}$
 - (b) $1.6 \times 10^{-10} \text{ Coulomb}$

- (c) 4.8×10^{-10} Coulomb (d) Zero
31. The nature of anode rays depends upon [MP PET 2004]
(a) Nature of electrode (b) Nature of residual gas
(c) Nature of discharge tube (d) All the above
32. One would expect proton to have very large [Pb. CET 2004]
(a) Ionization potential (b) Radius
(c) Charge (d) Hydration energy
33. The mass of a mol of proton and electron is
(a) $6.023 \times 10^{23} g$ (b) 1.008g and 0.55mg
(c) $9.1 \times 10^{-28} kg$ (d) 2gm
34. The average distance of an electron in an atom from its nucleus is of the order of [MP PET 1996]
(a) $10^6 m$ (b) $10^{-6} m$
(c) $10^{-10} m$ (d) $10^{-15} m$
35. The mass of 1 mole of electrons is [Pb. CET 2004]
(a) $9.1 \times 10^{-28} g$ (b) 1.008mg
(c) 0.55mg (d) $9.1 \times 10^{-27} g$
36. The ratio of specific charge of a proton and an α -particle is [MP PET 1999]
(a) 2 : 1 (b) 1 : 2
(c) 1 : 4 (d) 1 : 1
37. Ratio of masses of proton and electron is [BHU 1998]
(a) Infinite (b) 1.8×10^3
(c) 1.8 (d) None of these
38. Splitting of signals is caused by [Pb. PMT 2000]
(a) Proton (b) Neutron
(c) Positron (d) Electron
39. The proton and neutron are collectively called as [MP PET 2001]
(a) Deuteron (b) Positron
(c) Meson (d) Nucleon
40. Which of the following has the same mass as that of an electron [AFMC 2002]
(a) Photon (b) Neutron
(c) Positron (d) Proton
41. What is the ratio of mass of an electron to the mass of a proton [UPSEAT 2004]
(a) 1 : 2 (b) 1 : 1
(c) 1 : 1837 (d) 1 : 3
- (a) Atomic weight (b) Atomic number
(c) Equivalent weight (d) Electron affinity
2. The nucleus of the element having atomic number 25 and atomic weight 55 will contain [CPMT 1986; MP PMT 1987]
(a) 25 protons and 30 neutrons
(b) 25 neutrons and 30 protons
(c) 55 protons
(d) 55 neutrons
3. If W is atomic weight and N is the atomic number of an element, then [CPMT 1971, 80, 89]
(a) Number of $e^{-1} = W - N$
(b) Number of ${}_0n^1 = W - N$
(c) Number of ${}_1H^1 = W - N$
(d) Number of ${}_0n^1 = N$
4. The total number of neutrons in dipositive zinc ions with mass number 70 is [IIT 1979; Bihar MEE 1997]
(a) 34 (b) 40
(c) 36 (d) 38
5. Which of the following are isoelectronic with one another [NCERT 1983; EAMCET 1989]
(a) Na^+ and Ne (b) K^+ and O
(c) Ne and O (d) Na^+ and K^+
6. The number of electrons in one molecule of CO_2 are [IIT 1979; MP PMT 1994; RPMT 1999]
(a) 22 (b) 44
(c) 66 (d) 88
7. Chlorine atom differs from chloride ion in the number of [NCERT 1972; MP PMT 1995]
(a) Proton (b) Neutron
(c) Electrons (d) Protons and electrons
8. CO has same electrons as or the ion that is isoelectronic with CO is [CPMT 1984; IIT 1982; EAMCET 1990; CBSE PMT 1997]
(a) N_2^+ (b) CN^-
(c) O_2^+ (d) O_2^-
9. The mass of an atom is constituted mainly by [DPMT 1984, 91; AFMC 1990]
(a) Neutron and neutrino (b) Neutron and electron
(c) Neutron and proton (d) Proton and electron
10. The atomic number of an element represents [CPMT 1983; CBSE PMT 1990; NCERT 1973; AMU 1984]
(a) Number of neutrons in the nucleus
(b) Number of protons in the nucleus
(c) Atomic weight of element
(d) Valency of element
11. An atom has 26 electrons and its atomic weight is 56. The number of neutrons in the nucleus of the atom will be [CPMT 1980]
(a) 26 (b) 30
(c) 36 (d) 56
12. The most probable radius (in pm) for finding the electron in He^+ is [AIIMS 2005]

Atomic number, Mass number, Atomic species

1. The number of electrons in an atom of an element is equal to its [BHU 1979]

- (a) 0.0 (b) 52.9
(c) 26.5 (d) 105.8
13. The number of unpaired electrons in the Fe^{2+} ion is [MP PET 1989; KCET 2000]
(a) 0 (b) 4
(c) 6 (d) 3
14. A sodium cation has different number of electrons from
(a) O^{2-} (b) F^-
(c) Li^+ (d) Al^{+3}
15. An atom which has lost one electron would be [CPMT 1986]
(a) Negatively charged
(b) Positively charged
(c) Electrically neutral
(d) Carry double positive charge
16. Number of electrons in the outermost orbit of the element of atomic number 15 is [CPMT 1988, 93]
(a) 1 (b) 3
(c) 5 (d) 7
17. The atomic weight of an element is double its atomic number. If there are four electrons in $2p$ orbital, the element is [AMU 1983]
(a) C (b) N
(c) O (d) Ca
18. An atom has the electronic configuration of $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^5$. Its atomic weight is 80. Its atomic number and the number of neutrons in its nucleus shall be [MP PMT 1987]
(a) 35 and 45 (b) 45 and 35
(c) 40 and 40 (d) 30 and 50
19. Which of the following particles has more electrons than neutrons
(a) C (b) F^-
(c) O^{2-} (d) Al^{+3}
20. Compared with an atom of atomic weight 12 and atomic number 6, the atom of atomic weight 13 and atomic number 6 [NCERT 1971]
(a) Contains more neutrons (b) Contains more electrons
(c) Contains more protons (d) Is a different element
21. In the nucleus of ${}_{20}Ca^{40}$ there are [CPMT 1990; EAMCET 1991]
(a) 40 protons and 20 electrons
(b) 20 protons and 40 electrons
(c) 20 protons and 20 neutrons
(d) 20 protons and 40 neutrons
22. Na^+ ion is isoelectronic with [CPMT 1990]
(a) Li^+ (b) Mg^{+2}
(c) Ca^{+2} (d) Ba^{+2}
23. Ca has atomic no. 20 and atomic weight 40. Which of the following statements is not correct about Ca atom [MP PET 1993]
(a) The number of electrons is same as the number of neutrons
(b) The number of nucleons is double of the number of electrons
(c) The number of protons is half of the number of neutrons
(d) The number of nucleons is double of the atomic number
24. Pick out the isoelectronic structures from the following [IIT 1993]
 CH_3^+ I H_3O^+ II NH_3 III CH_3^- IV
(a) I and II (b) I and IV
(c) I and III (d) II, III and IV
25. Number of electrons in $-CONH_2$ is [AMU 1988]
(a) 22 (b) 24
(c) 20 (d) 28
26. The atomic number of an element having the valency shell electronic configuration $4s^2 4p^6$ is [MP PMT 1991]
(a) 35 (b) 36
(c) 37 (d) 38
27. The present atomic weight scale is based on [EAMCET 1988; MP PMT 2002]
(a) C^{12} (b) O^{16}
(c) H^1 (d) C^{13}
28. Isoelectronic species are [EAMCET 1989]
(a) K^+, Cl^- (b) Na^+, Cl^-
(c) Na, Ar (d) Na^+, Ar
29. If the atomic weight of an element is 23 times that of the lightest element and it has 11 protons, then it contains [EAMCET 1986; AFMC 1989]
(a) 11 protons, 23 neutrons, 11 electrons
(b) 11 protons, 11 neutrons, 11 electrons
(c) 11 protons, 12 neutrons, 11 electrons
(d) 11 protons, 11 neutrons, 23 electrons
30. Which of the following oxides of nitrogen is isoelectronic with CO_2 [CBSE PMT 1990]
(a) NO_2 (b) N_2O
(c) NO (d) N_2O_2
31. The ratio between the neutrons in C and Si with respect to atomic masses 12 and 28 is
(a) 2 : 3 (b) 3 : 2
(c) 3 : 7 (d) 7 : 3
32. The atomic number of an element is always equal to [MP PMT 1994]
(a) Atomic weight divided by 2
(b) Number of neutrons in the nucleus
(c) Weight of the nucleus
(d) Electrical charge of the nucleus
33. Which of the following is isoelectronic with carbon atom [MP PMT 1994; UPSEAT 2000]
(a) Na^+ (b) Al^{3+}
(c) O^{2-} (d) N^+
34. CO_2 is isostructural with [IIT 1986; MP PMT 1986, 94, 95]
(a) $SnCl_2$ (b) SO_2

- (c) $HgCl_2$ (d) All the above
35. The hydride ions (H^-) are isoelectronic with
[AFMC 1995; Bihar MEE 1997]
(a) Li (b) He^+
(c) He (d) Be
36. The number of electrons in the nucleus of C^{12} is
[AFMC 1995]
(a) 6 (b) 12
(c) 0 (d) 3
37. An element has electronic configuration 2, 8, 18, 1. If its atomic weight is 63, then how many neutrons will be present in its nucleus
(a) 30 (b) 32
(c) 34 (d) 33
38. The nucleus of the element ${}_{21}E^{45}$ contains
(a) 45 protons and 21 neutrons
(b) 21 protons and 24 neutrons
(c) 21 protons and 45 neutrons
(d) 24 protons and 21 neutrons
39. Neutrons are found in atoms of all elements except in
[MP PMT 1997]
(a) Chlorine (b) Oxygen
(c) Argon (d) Hydrogen
40. The mass number of an anion, X^{3-} , is 14. If there are ten electrons in the anion, the number of neutrons in the nucleus of atom, X_2 of the element will be
[MP PMT 1999]
(a) 10 (b) 14
(c) 7 (d) 5
41. Which of the following are isoelectronic species
 $I = CH_3^+, II = NH_2^-, III = NH_4^+, IV = NH_3$ [CPMT 1999]
(a) I, II, III (b) II, III, IV
(c) I, II, IV (d) I and II
42. The charge on the atom containing 17 protons, 18 neutrons and 18 electrons is
[AIIMS 1996]
(a) +1 (b) -2
(c) -1 (d) Zero
43. Number of unpaired electrons in inert gas is [CPMT 1996]
(a) Zero (b) 8
(c) 4 (d) 18
44. In neutral atom, which particles are equivalent
[RPMT 1997]
(a) p^+, e^+ (b) e^-, e^+
(c) e^-, p^+ (d) p^+, n^0
45. Nuclei tend to have more neutrons than protons at high mass numbers because [Roorkee Qualifying 1998]
(a) Neutrons are neutral particles
(b) Neutrons have more mass than protons
(c) More neutrons minimize the coulomb repulsion
(d) Neutrons decrease the binding energy
46. Which one of the following is not isoelectronic with O^{2-}
[CBSE PMT 1994]
(a) N^{3-} (b) F^-
(c) Tl^+ (d) Na^+
47. The number of electrons in $[{}_{19}K]^{-1}$ is
[CPMT 1997; AFMC 1999]
(a) 19 (b) 20
(c) 18 (d) 40
48. The number of electrons and neutrons of an element is 18 and 20 respectively. Its mass number is
[CPMT 1997; Pb. PMT 1999; MP PMT 1999]
(a) 17 (b) 37
(c) 2 (d) 38
49. Number of protons, neutrons and electrons in the element ${}_{89}^{231}Y$ is
[AFMC 1997]
(a) 89, 231, 89 (b) 89, 89, 242
(c) 89, 142, 89 (d) 89, 71, 89
50. Be^{2+} is isoelectronic with [EAMCET 1998]
(a) Mg^{2+} (b) Na^+
(c) Li^+ (d) H^+
51. An isostere is [UPSEAT 1999]
(a) NO_2^- and O_3 (b) NO_2^- and PO_4^{3-}
(c) CO_2, N_2O, NO_3^- (d) ClO_4^- and OCN^-
52. Nitrogen atom has an atomic number of 7 and oxygen has an atomic number 8. The total number of electrons in a nitrate ion will be
[Pb. PMT 2000]
(a) 8 (b) 16
(c) 32 (d) 64
53. If molecular mass and atomic mass of sulphur are 256 and 32 respectively, its atomicity is [RPET 2000]
(a) 2 (b) 8
(c) 4 (d) 16
54. The nitride ion in lithium nitride is composed of
[KCET 2000]
(a) 7 protons + 10 electrons
(b) 10 protons + 10 electrons
(c) 7 protons + 7 protons
(d) 10 protons + 7 electrons
55. The atomic number of an element is 17. The number of orbitals containing electron pairs in its valence shell is
[CPMT 2001]
(a) Eight (b) Six
(c) Three (d) Two
56. The atomic number of an element is 35 and mass number is 81. The number of electrons in the outer most shell is
[UPSEAT 2001]
(a) 7 (b) 6
(c) 5 (d) 3
57. Which of the following is not isoelectronic [MP PET 2002]
(a) Na^+ (b) Mg^{2+}
(c) O^{2-} (d) Cl^-
58. The charge of an electron is $-1.6 \times 10^{-19} C$. The value of free charge on Li^+ ion will be
[AFMC 2002; KCET (Engg.) 2002]
(a) $3.6 \times 10^{-19} C$ (b) $1 \times 10^{-19} C$
(c) $1.6 \times 10^{-19} C$ (d) $2.6 \times 10^{-19} C$
59. Iso-electronic species is [RPMT 2002]
(a) F^-, O^{2-} (b) F^-, O

- (c) F^- , O^+ (d) F^- , O^{+2}
60. An element have atomic weight 40 and it's electronic configuration is $1s^2 2s^2 2p^6 3s^2 3p^6$. Then its atomic number and number of neutrons will be [RPMT 2002]
(a) 18 and 22 (b) 22 and 18
(c) 26 and 20 (d) 40 and 18
61. The nucleus of tritium contains [MP PMT 2002]
(a) 1 proton + 1 neutron (b) 1 proton + 3 neutron
(c) 1 proton + 0 neutron (d) 1 proton + 2 neutron
62. Which one of the following groupings represents a collection of isoelectronic species [AIEEE 2003]
(a) Na^+ , Ca^{2+} , Mg^{2+} (b) N^{3-} , F^- , Na^+
(c) Be , Al^{3+} , Cl^- (d) Ca^{2+} , Cs^+ , Br
63. Which of the following are isoelectronic and isostructural NO_3^- , CO_3^{2-} , ClO_3^- , SO_3 [IIT Screening 2003]
(a) NO_3^- , CO_3^{2-} (b) SO_3 , NO_3^-
(c) ClO_3^- , CO_3^{2-} (d) CO_3^{2-} , SO_3
64. The number of electrons in Cl^- ion is [MP PMT 2003]
(a) 19 (b) 20
(c) 18 (d) 35
65. The number of neutron in tritium is [CPMT 2003]
(a) 1 (b) 2
(c) 3 (d) 0
66. Tritium is the isotope of [CPMT 2003]
(a) Hydrogen (b) Oxygen
(c) Carbon (d) Sulphur
67. The atomic number of an element is 35. What is the total number of electrons present in all the p -orbitals of the ground state atom of that element [EAMCET (Engg.) 2003]
(a) 6 (b) 11
(c) 17 (d) 23
68. The nucleus of an element contain 9 protons. Its valency would be
(a) 1 (b) 3
(c) 2 (d) 5
69. The compound in which cation is isoelectronic with anion is [UPSEAT 2004]
(a) $NaCl$ (b) CsF
(c) NaI (d) K_2S
70. Which among the following species have the same number of electrons in its outermost as well as penultimate shell [DCE 2004]
(a) Mg^{2+} (b) O^{2-}
(c) F^- (d) Ca^{2+}
71. Six protons are found in the nucleus of [CPMT 1977, 80, 81; NCERT 1975, 78]
(a) Boron (b) Lithium
(c) Carbon (d) Helium
72. The nitrogen atom has 7 protons and 7 electrons, the nitride ion (N^{3-}) will have [NCERT 1977]
(a) 7 protons and 10 electrons

- (b) 4 protons and 7 electrons
(c) 4 protons and 10 electrons
(d) 10 protons and 7 electrons

73. Number of neutrons in heavy hydrogen atom is [MP PMT 1986]
(a) 0 (b) 1
(c) 2 (d) 3
74. Which of the following is always a whole number [CPMT 1976, 81, 86]
(a) Atomic weight (b) Atomic radii
(c) Equivalent weight (d) Atomic number

Atomic models and Planck's quantum theory

1. Rutherford's experiment on scattering of particles showed for the first time that the atom has [IIT 1981; NCERT 1981; CMC Vellore 1991; CPMT 1984; Kurukshetra CEE 1998]
(a) Electrons (b) Protons
(c) Nucleus (d) Neutrons
2. Rutherford's scattering experiment is related to the size of the [IIT 1983; MADT Bihar 1995; BHU 1995]
(a) Nucleus (b) Atom
(c) Electron (d) Neutron
3. Rutherford's alpha particle scattering experiment eventually led to the conclusion that [IIT 1986; RPMT 2002]
(a) Mass and energy are related
(b) Electrons occupy space around the nucleus
(c) Neutrons are buried deep in the nucleus
(d) The point of impact with matter can be precisely determined
4. Bohr's model can explain [IIT 1985]
(a) The spectrum of hydrogen atom only
(b) Spectrum of atom or ion containing one electron only
(c) The spectrum of hydrogen molecule
(d) The solar spectrum
5. When atoms are bombarded with alpha particles, only a few in million suffer deflection, others pass out undeflected. This is because [MNR 1979; NCERT 1980; AFMC 1980]
(a) The force of repulsion on the moving alpha particle is small
(b) The force of attraction on the alpha particle to the oppositely charged electrons is very small
(c) There is only one nucleus and large number of electrons
(d) The nucleus occupies much smaller volume compared to the volume of the atom
6. Positronium consists of an electron and a positron (a particle which has the same mass as an electron, but opposite charge) orbiting round their common centre of

- mass. Calculate the value of the Rydberg constant for this system.
- (a) $R_{\infty} / 4$ (b) $R_{\infty} / 2$
(c) $2R_{\infty}$ (d) R_{∞}
7. When α -particles are sent through a thin metal foil, most of them go straight through the foil because (one or more are correct) [IIT 1984]
(a) Alpha particles are much heavier than electrons
(b) Alpha particles are positively charged
(c) Most part of the atom is empty space
(d) Alpha particles move with high velocity
8. When an electron jumps from L to K shell [CPMT 1983]
(a) Energy is absorbed
(b) Energy is released
(c) Energy is sometimes absorbed and sometimes released
(d) Energy is neither absorbed nor released
9. When beryllium is bombarded with α -particles, extremely penetrating radiations which cannot be deflected by electrical or magnetic field are given out. These are [CPMT 1983]
(a) A beam of protons (b) α -rays
(c) A beam of neutrons (d) X-rays
10. Which one of the following is not the characteristic of Planck's quantum theory of radiation [AIIMS 1991]
(a) The energy is not absorbed or emitted in whole number or multiple of quantum
(b) Radiation is associated with energy
(c) Radiation energy is not emitted or absorbed continuously but in the form of small packets called quanta
(d) This magnitude of energy associated with a quantum is proportional to the frequency
11. The spectrum of He is expected to be similar to [AIIMS 1980, 91; DPMT 1983; MP PMT 2002]
(a) H (b) Li^+
(c) Na (d) He^+
12. Energy of orbit [DPMT 1984, 91]
(a) Increases as we move away from nucleus
(b) Decreases as we move away from nucleus
(c) Remains same as we move away from nucleus
(d) None of these
13. Bohr model of an atom could not account for
(a) Emission spectrum
(b) Absorption spectrum
(c) Line spectrum of hydrogen
(d) Fine spectrum
14. Existence of positively charged nucleus was established by [CBSE PMT 1991]
(a) Positive ray analysis
(b) α -ray scattering experiments
(c) X-ray analysis
(d) Discharge tube experiments
15. Electron occupies the available orbital singly before pairing in any one orbital occurs, it is [CBSE PMT 1991]
(a) Pauli's exclusion principle
(b) Hund's Rule
(c) Heisenberg's principle
(b) Prout's hypothesis
16. The wavelength of a spectral line for an electronic transition is inversely related to [IIT 1988]
(a) The number of electrons undergoing the transition
(b) The nuclear charge of the atom
(c) The difference in the energy of the energy levels involved in the transition
(d) The velocity of the electron undergoing the transition
17. When an electron drops from a higher energy level to a low energy level, then [AMU 1985]
(a) Energy is emitted
(b) Energy is absorbed
(c) Atomic number increases
(d) Atomic number decreases
18. Davisson and Germer's experiment showed that [MADT Bihar 1983]
(a) β -particles are electrons
(b) Electrons come from nucleus
(c) Electrons show wave nature
(d) None of the above
19. When an electron jumps from lower to higher orbit, its energy [MADT Bihar 1982]
(a) Increases (b) Decreases
(c) Remains the same (d) None of these
20. Experimental evidence for the existence of the atomic nucleus comes from [CBSE PMT 1989]
(a) Millikan's oil drop experiment
(b) Atomic emission spectroscopy
(c) The magnetic bending of cathode rays
(d) Alpha scattering by a thin metal foil
21. Which of the following statements does not form part of Bohr's model of the hydrogen atom [CBSE PMT 1989]
(a) Energy of the electrons in the orbit is quantized
(b) The electron in the orbit nearest the nucleus has the lowest energy
(c) Electrons revolve in different orbits around the nucleus
(d) The position and velocity of the electrons in the orbit cannot be determined simultaneously
22. When β -particles are sent through a thin metal foil, most of them go straight through the foil as [EAMCET 1983]
(a) β -particles are much heavier than electrons
(b) β -particles are positively charged
(c) Most part of the atom is empty space

- (d) β -particles move with high velocity
23. The energy of second Bohr orbit of the hydrogen atom is -328 kJ mol^{-1} , hence the energy of fourth Bohr orbit would be [CBSE PMT 2005]
 (a) -41 kJ mol^{-1} (b) $-1312 \text{ kJ mol}^{-1}$
 (c) -164 kJ mol^{-1} (d) -82 kJ mol^{-1}
24. When an electron revolves in a stationary orbit then [MP PET 1994]
 (a) It absorbs energy
 (b) It gains kinetic energy
 (c) It emits radiation
 (d) Its energy remains constant
25. A moving particle may have wave motion, if
 (a) Its mass is very high
 (b) Its velocity is negligible
 (c) Its mass is negligible
 (d) Its mass is very high and velocity is negligible
26. The postulate of Bohr theory that electrons jump from one orbit to the other, rather than flow is according to
 (a) The quantisation concept
 (b) The wave nature of electron
 (c) The probability expression for electron
 (d) Heisenberg uncertainty principle
27. The frequency of an electromagnetic radiation is $2 \times 10^6 \text{ Hz}$. What is its wavelength in metres (Velocity of light $= 3 \times 10^8 \text{ ms}^{-1}$)
 (a) 6.0×10^{14} (b) 1.5×10^4
 (c) 1.5×10^2 (d) 0.66×10^{-2}
28. What is the packet of energy called [AFMC 2005]
 (a) Electron (b) Photon
 (c) Positron (d) Proton
29. The energy of an electron in n^{th} orbit of hydrogen atom is [MP PET 1999]
 (a) $\frac{13.6}{n^4} \text{ eV}$ (b) $\frac{13.6}{n^3} \text{ eV}$
 (c) $\frac{13.6}{n^2} \text{ eV}$ (d) $\frac{13.6}{n} \text{ eV}$
30. If wavelength of photon is $2.2 \times 10^{-11} \text{ m}$, $h = 6.6 \times 10^{-34} \text{ J-sec}$, then momentum of photon is [MP PET 1999]
 (a) $3 \times 10^{-23} \text{ kg ms}^{-1}$ (b) $3.33 \times 10^{22} \text{ kg ms}^{-1}$
 (c) $1.452 \times 10^{-44} \text{ kg ms}^{-1}$ (d) $6.89 \times 10^{43} \text{ kg ms}^{-1}$
31. The expression for Bohr's radius of an atom is [MP PMT 1999]
 (a) $r = \frac{n^2 h^2}{4\pi^2 m e^4 z^2}$ (b) $r = \frac{n^2 h^2}{4\pi^2 m e^2 z}$
 (c) $r = \frac{n^2 h^2}{4\pi^2 m e^2 z^2}$ (d) $r = \frac{n^2 h^2}{4\pi^2 m^2 e^2 z^2}$
32. The energy of an electron revolving in n^{th} Bohr's orbit of an atom is given by the expression [MP PMT 1999]
 (a) $E_n = -\frac{2\pi^2 m^4 e^2 z^2}{n^2 h^2}$ (b) $E_n = -\frac{2\pi^2 m e^2 z^2}{n^2 h^2}$
 (c) $E_n = -\frac{2\pi^2 m e^4 z^2}{n^2 h^2}$ (d) $E_n = -\frac{2\pi m^2 e^2 z^4}{n^2 h^2}$
33. Who modified Bohr's theory by introducing elliptical orbits for electron path [CBSE PMT 1999; AFMC 2003]
 (a) Hund (b) Thomson
 (c) Rutherford (d) Sommerfeld
34. Bohr's radius can have [DPMT 1996]
 (a) Discrete values (b) +ve values
 (c) -ve values (d) Fractional values
35. The first use of quantum theory to explain the structure of atom was made by [IIT 1997; CPMT 2001; J&K CET 2005]
 (a) Heisenberg (b) Bohr
 (c) Planck (d) Einstein
36. An electronic transition from 1s orbital of an atom causes [JIPMER 1997]
 (a) Absorption of energy
 (b) Release of energy
 (c) Both release or absorption of energy
 (d) Unpredictable
37. In an element going away from nucleus, the energy of particle [RPMT 1997]
 (a) Decreases (b) Not changing
 (c) Increases (d) None of these
38. The α -particle scattering experiment of Rutherford concluded that [Orissa JEE 1997]
 (a) The nucleus is made up of protons and neutrons
 (b) The number of electrons is exactly equal to number of protons in atom
 (c) The positive charge of the atom is concentrated in a very small space
 (d) Electrons occupy discrete energy levels
39. Wavelength associated with electron motion [BHU 1998]
 (a) Increases with increase in speed of electron
 (b) Remains same irrespective of speed of electron
 (c) Decreases with increase in speed of e^-
 (d) Is zero
40. The element used by Rutherford in his famous scattering experiment was [KCET 1998]
 (a) Gold (b) Tin
 (c) Silver (d) Lead
41. If electron falls from $n = 3$ to $n = 2$, then emitted energy is [AFMC 1997; MP PET 2003]
 (a) 10.2 eV (b) 12.09 eV
 (c) 1.9 eV (d) 0.65 eV
42. The radius of the nucleus is related to the mass number A by
 (a) $R = R_0 A^{1/2}$ (b) $R = R_0 A$
 (c) $R = R_0 A^2$ (d) $R = R_0 A^{1/3}$
43. The specific charge of proton is $9.6 \times 10^6 \text{ C kg}^{-1}$ then for an α -particle it will be [MH CET 1999]

- (a) $38.4 \times 10^7 \text{ C kg}^{-1}$ (b) $19.2 \times 10^7 \text{ C kg}^{-1}$
(c) $2.4 \times 10^7 \text{ C kg}^{-1}$ (d) $4.8 \times 10^7 \text{ C kg}^{-1}$
44. In hydrogen spectrum the different lines of Lyman series are present is [UPSEAT 1999]
(a) UV field (b) IR field
(c) Visible field (d) Far IR field
45. Which one of the following is considered as the main postulate of Bohr's model of atom [AMU 2000]
(a) Protons are present in the nucleus
(b) Electrons are revolving around the nucleus
(c) Centrifugal force produced due to the revolving electrons balances the force of attraction between the electron and the protons
(d) Angular momentum of electron is an integral multiple of $\frac{h}{2\pi}$
46. The electronic energy levels of the hydrogen atom in the Bohr's theory are called [AMU 2000]
(a) Rydberg levels (b) Orbits
(c) Ground states (d) Orbitals
47. The energy of a photon is calculated by [Pb. PMT 2000]
(a) $E = h\nu$ (b) $h = E\nu$
(c) $h = \frac{E}{\nu}$ (d) $E = \frac{h}{\nu}$
48. Visible range of hydrogen spectrum will contain the following series [RPET 2000]
(a) Pfund (b) Lyman
(c) Balmer (d) Brackett
49. Radius of the first Bohr's orbit of hydrogen atom is [RPET 2000]
(a) 1.06 Å (b) 0.22 Å
(c) 0.28 Å (d) 0.53 Å
50. In Balmer series of hydrogen atom spectrum which electronic transition causes third line [MP PMT 2000]
(a) Fifth Bohr orbit to second one
(b) Fifth Bohr orbit to first one
(c) Fourth Bohr orbit to second one
(d) Fourth Bohr orbit to first one
51. Energy of electron of hydrogen atom in second Bohr orbit is [MP PMT 2000]
(a) $-5.44 \times 10^{-19} \text{ J}$ (b) $-5.44 \times 10^{-19} \text{ kJ}$
(c) $-5.44 \times 10^{-19} \text{ cal}$ (d) $-5.44 \times 10^{-19} \text{ eV}$
52. If change in energy (ΔE) = $3 \times 10^{-8} \text{ J}$, $h = 6.64 \times 10^{-34} \text{ J-s}$ and $c = 3 \times 10^8 \text{ m/s}$, then wavelength of the light is [CBSE PMT 2000]
(a) $6.36 \times 10^3 \text{ Å}$ (b) $6.36 \times 10^5 \text{ Å}$
(c) $6.64 \times 10^{-8} \text{ Å}$ (d) $6.36 \times 10^{18} \text{ Å}$
53. The radius of first Bohr's orbit for hydrogen is 0.53 Å. The radius of third Bohr's orbit would be [MP PMT 2001]
(a) 0.79 Å (b) 1.59 Å
(c) 3.18 Å (d) 4.77 Å
54. Rutherford's α -particle scattering experiment proved that atom has [MP PMT 2001]
(a) Electrons (b) Neutron
(c) Nucleus (d) Orbitals
55. Wavelength of spectral line emitted is inversely proportional to
(a) Radius (b) Energy
(c) Velocity (d) Quantum number
56. The energy of a radiation of wavelength 8000 Å is E_1 and energy of a radiation of wavelength 16000 Å is E_2 . What is the relation between these two [Kerala CET 2005]
(a) $E_1 = 6E_2$ (b) $E_1 = 2E_2$
(c) $E_1 = 4E_2$ (d) $E_1 = 1/2 E_2$
(e) $E_1 = E_2$
57. The formation of energy bonds in solids are in accordance with [DCE 2001]
(a) Heisenberg's uncertainty principle
(b) Bohr's theory
(c) Ohm's law
(d) Rutherford's atomic model
58. The frequency of yellow light having wavelength 600 nm is [MP PET 2002]
(a) $5.0 \times 10^{14} \text{ Hz}$ (b) $2.5 \times 10^7 \text{ Hz}$
(c) $5.0 \times 10^7 \text{ Hz}$ (d) $2.5 \times 10^{14} \text{ Hz}$
59. The value of the energy for the first excited state of hydrogen atom will be [MP PET 2002]
(a) -13.6 eV (b) -3.40 eV
(c) -1.51 eV (d) -0.85 eV
60. Bohr model of atom is contradicted by [MP PMT 2002]
(a) Pauli's exclusion principle
(b) Planck quantum theory
(c) Heisenberg uncertainty principle
(d) All of these
61. Which of the following is not true in Rutherford's nuclear model of atom [Orissa JEE 2002]
(a) Protons and neutrons are present inside nucleus
(b) Volume of nucleus is very small as compared to volume of atom
(c) The number of protons and neutrons are always equal
(d) The number of electrons and protons are always equal
62. The emission spectrum of hydrogen is found to satisfy the expression for the energy change. ΔE (in joules) such that $\Delta E = 2.18 \times 10^{-18} \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right) \text{ J}$ where $n_1 = 1, 2, 3, \dots$ and $n_2 = 2, 3, 4, \dots$. The spectral lines correspond to Paschen series to [UPSEAT 2002]
(a) $n_1 = 1$ and $n_2 = 2, 3, 4$
(b) $n_1 = 3$ and $n_2 = 4, 5, 6$
(c) $n_1 = 1$ and $n_2 = 3, 4, 5$
(d) $n_1 = 2$ and $n_2 = 3, 4, 5$
(e) $n_1 = 1$ and $n_2 = \text{infinity}$

63. The ratio between kinetic energy and the total energy of the electrons of hydrogen atom according to Bohr's model is
[Pb. PMT 2002]
(a) 2 : 1 (b) 1 : 1
(c) 1 : -1 (d) 1 : 2
64. Energy of the electron in Hydrogen atom is given by
[AMU (Engg.) 2002]
(a) $E_n = -\frac{131.38}{n^2} \text{ kJ mol}^{-1}$ (b) $E_n = -\frac{131.33}{n} \text{ kJ mol}^{-1}$
(c) $E_n = -\frac{1313.3}{n^2} \text{ kJ mol}^{-1}$ (d) $E_n = -\frac{313.13}{n^2} \text{ kJ mol}^{-1}$
65. Ratio of radii of second and first Bohr orbits of H atom
[BHU 2003]
(a) 2 (b) 4
(c) 3 (d) 5
66. The frequency corresponding to transition $n = 2$ to $n = 1$ in hydrogen atom is
[MP PET 2003]
(a) $15.66 \times 10^{10} \text{ Hz}$ (b) $24.66 \times 10^{14} \text{ Hz}$
(c) $30.57 \times 10^{14} \text{ Hz}$ (d) $40.57 \times 10^{24} \text{ Hz}$
67. The mass of a photon with a wavelength equal to $1.54 \times 10^{-8} \text{ cm}$ is
[Pb. PMT 2004]
(a) $0.8268 \times 10^{-34} \text{ kg}$ (b) $1.2876 \times 10^{-33} \text{ kg}$
(c) $1.4285 \times 10^{-32} \text{ kg}$ (d) $1.8884 \times 10^{-32} \text{ kg}$
68. Splitting of spectral lines under the influence of magnetic field is called
[MP PET 2004]
(a) Zeeman effect (b) Stark effect
(c) Photoelectric effect (d) None of these
69. The radius of electron in the first excited state of hydrogen atom is
[MP PMT 2004]
(a) a_0 (b) $4a_0$
(c) $2a_0$ (d) $8a_0$
70. The ratio of area covered by second orbital to the first orbital is
[AFMC 2004]
(a) 1 : 2 (b) 1 : 16
(c) 8 : 1 (d) 16 : 1
71. Time taken for an electron to complete one revolution in the Bohr orbit of hydrogen atom is [Kerala PMT 2004]
(a) $\frac{4\pi^2 m r^2}{nh}$ (b) $\frac{nh}{4\pi^2 m r}$
(c) $\frac{nh}{4\pi^2 m r^2}$ (d) $\frac{h}{2\pi m r}$
72. The radius of which of the following orbit is same as that of the first Bohr's orbit of hydrogen atom
[IIT Screening 2004]
(a) $\text{He}^+ (n = 2)$ (b) $\text{Li}^{2+} (n = 2)$
(c) $\text{Li}^{2+} (n = 3)$ (d) $\text{Be}^{3+} (n = 2)$
73. The frequency of radiation emitted when the electron falls from $n = 4$ to $n = 1$ in a hydrogen atom will be (Given ionization energy of $\text{H} = 2.18 \times 10^{-18} \text{ J atom}^{-1}$ and $h = 6.625 \times 10^{-34} \text{ Js}$)
[CBSE PMT 2004]
(a) $3.08 \times 10^{15} \text{ s}^{-1}$ (b) $2.00 \times 10^{15} \text{ s}^{-1}$
(c) $1.54 \times 10^{15} \text{ s}^{-1}$ (d) $1.03 \times 10^{15} \text{ s}^{-1}$
74. The wavelength of the radiation emitted, when in a hydrogen atom electron falls from infinity to stationary state 1, would be (Rydberg constant $= 1.097 \times 10^7 \text{ m}^{-1}$)
[AIEEE 2004]
(a) 406 nm (b) 192 nm
(c) 91 nm (d) $9.1 \times 10^{-8} \text{ nm}$
75. In Bohr's model, atomic radius of the first orbit is γ , the radius of the 3rd orbit, is [MP PET 1997; Pb. CET 2001]
(a) $\gamma/3$ (b) γ
(c) 3γ (d) 9γ
76. According to Bohr's principle, the relation between principle quantum number (n) and radius of orbit is [BHU 2004]
(a) $r \propto n$ (b) $r \propto n^2$
(c) $r \propto \frac{1}{n}$ (d) $r \propto \frac{1}{n^2}$
77. The ionisation potential of a hydrogen atom is -13.6 eV . What will be the energy of the atom corresponding to $n = 2$
[Pb. CET 2000]
(a) -3.4 eV (b) -6.8 eV
(c) -1.7 eV (d) -2.7 eV
78. The energy of electron in hydrogen atom in its ground state is -13.6 eV . The energy of the level corresponding to the quantum number equal to 5 is [Pb. CET 2002]
(a) -0.54 eV (b) -0.85 eV
(c) -0.64 eV (d) -0.40 eV
79. The positive charge of an atom is [AFMC 2002]
(a) Spread all over the atom
(b) Distributed around the nucleus
(c) Concentrated at the nucleus
(d) All of these
80. A metal surface is exposed to solar radiations [DPMT 2005]
(a) The emitted electrons have energy less than a maximum value of energy depending upon frequency of incident radiations
(b) The emitted electrons have energy less than maximum value of energy depending upon intensity of incident radiation
(c) The emitted electrons have zero energy
(d) The emitted electrons have energy equal to energy of photos of incident light
81. Which of the following transitions have minimum wavelength [DPMT 2005]
(a) $n_4 \rightarrow n_1$ (b) $n_2 \rightarrow n_1$
(c) $n_4 \rightarrow n_2$ (d) $n_3 \rightarrow n_1$

Dual nature of electron

1. De broglie equation describes the relationship of wavelength associated with the motion of an electron and its [MP PMT 1986]
(a) Mass (b) Energy
(c) Momentum (d) Charge
2. The wave nature of an electron was first given by [CMC Vellore 1991; Pb. PMT 1998; CPMT 2004]
(a) De-Broglie (b) Heisenberg
(c) Mosley (d) Sommerfield

3. Among the following for which one mathematical expression $\lambda = \frac{h}{p}$ stands
(a) De Broglie equation (b) Einstein equation
(c) Uncertainty equation (d) Bohr equation
4. Which one of the following explains light both as a stream of particles and as wave motion
[AIIMS 1983; IIT 1992; UPSEAT 2003]
(a) Diffraction (b) $\lambda = h/p$
(c) Interference (d) Photoelectric effect
5. In which one of the following pairs of experimental observations and phenomenon does the experimental observation correctly account for phenomenon
Experimental observation Phenomenon
(a) X-ray spectra Charge on the nucleus
(b) α -particle scattering Quantized electron orbit
(c) Emission spectra The quantization of energy
(d) The photoelectric effect The nuclear atom
6. Which of the following expressions gives the de-Broglie relationship [MP PMT 1996, 2004; MP PET/PMT 1998]
(a) $h = \frac{\lambda}{mv}$ (b) $\lambda = \frac{h}{mv}$
(c) $\lambda = \frac{m}{hv}$ (d) $\lambda = \frac{v}{mh}$
7. de-Broglie equation is
[MP PMT 1999; CET Pune 1998]
(a) $n\lambda = 2d \sin \theta$ (b) $E = hv$
(c) $E = mc^2$ (d) $\lambda = \frac{h}{mv}$
8. The de-Broglie wavelength of a particle with mass 1 gm and velocity 100 m/sec is [CBSE PMT 1999; EAMCET 1997; AFMC 1999; AIIMS 2000]
(a) $6.63 \times 10^{-33} m$ (b) $6.63 \times 10^{-34} m$
(c) $6.63 \times 10^{-35} m$ (d) $6.65 \times 10^{-35} m$
9. Minimum de-Broglie wavelength is associated with [RPMT 1999]
(a) Electron (b) Proton
(c) CO_2 molecule (d) SO_2 molecule
10. The de-Broglie wavelength associated with a material particle is [JIPMER 2000]
(a) Directly proportional to its energy
(b) Directly proportional to momentum
(c) Inversely proportional to its energy
(d) Inversely proportional to momentum
11. An electron has kinetic energy $2.8 \times 10^{-23} J$. de-Broglie wavelength will be nearly
($m_e = 9.1 \times 10^{-31} kg$) [MP PET 2000]
(a) $9.28 \times 10^{-4} m$ (b) $9.28 \times 10^{-7} m$
(c) $9.28 \times 10^{-8} m$ (d) $9.28 \times 10^{-10} m$
12. What will be de-Broglie wavelength of an electron moving with a velocity of $1.2 \times 10^5 ms^{-1}$ [MP PET 2000]
(a) 6.068×10^{-9} (b) 3.133×10^{-37}
(c) 6.626×10^{-9} (d) 6.018×10^{-7}
13. The de-Broglie wavelength associated with a particle of mass $10^{-6} kg$ moving with a velocity of $10 ms^{-1}$, is [AIIMS 2001]
(a) $6.63 \times 10^{-22} m$ (b) $6.63 \times 10^{-29} m$
(c) $6.63 \times 10^{-31} m$ (d) $6.63 \times 10^{-34} m$
14. What is the de-Broglie wavelength associated with the hydrogen electron in its third orbit [AMU (Engg.) 2002]
(a) $9.96 \times 10^{-10} cm$ (b) $9.96 \times 10^{-8} cm$
(c) $9.96 \times 10^4 cm$ (d) $9.96 \times 10^8 cm$
15. If the velocity of hydrogen molecule is $5 \times 10^4 cm sec^{-1}$, then its de-Broglie wavelength is [MP PMT 2003]
(a) 2 Å (b) 4 Å
(c) 8 Å (d) 100 Å
16. A 200 g golf ball is moving with a speed of 5 m per hour. The associated wave length is ($h = 6.625 \times 10^{-34} J \cdot sec$) [MP PET 2003]
(a) $10^{-10} m$ (b) $10^{-20} m$
(c) $10^{-30} m$ (d) $10^{-40} m$
17. A cricket ball of 0.5 kg is moving with a velocity of 100 m/sec. The wavelength associated with its motion is [DCE 2004]
(a) 1/100 cm (b) $6.6 \times 10^{-34} m$
(c) $1.32 \times 10^{-35} m$ (d) $6.6 \times 10^{-28} m$
18. Dual nature of particles was proposed by [DCE 2004]
(a) Heisenberg (b) Lowry
(c) de-Broglie (d) Schrodinger
19. Calculate de-Broglie wavelength of an electron travelling at 1% of the speed of light [DPMT 2004]
(a) 2.73×10^{-24} (b) 2.42×10^{-10}
(c) 242.2×10^{10} (d) None of these
20. Which is the correct relationship between wavelength and momentum of particles [Pb. PMT 2000]
(a) $\lambda = \frac{h}{p}$ (b) $\pi = \frac{h}{p}$
(c) $p = \frac{h}{\lambda}$ (d) $h = \frac{p}{\lambda}$
21. The de-Broglie equation applies [MP PMT 2004]
(a) To electrons only
(b) To neutrons only
(c) To protons only
(d) All the material object in motion

Uncertainty principle and Schrodinger wave equation

1. The uncertainty principle was enunciated by [NCERT 1975; Bihar MEE 1997]
(a) Einstein (b) Heisenberg
(c) Rutherford (d) Pauli
2. According to heisenberg uncertainty principle [AMU 1990; BCECE 2005]
(a) $E = mc^2$ (b) $\Delta x \times \Delta p \geq \frac{h}{4\pi}$

- (c) $\lambda = \frac{h}{p}$ (d) $\Delta x \times \Delta p = \frac{h}{6\pi}$
3. "The position and velocity of a small particle like electron cannot be simultaneously determined." This statement is [NCERT 1979; BHU 1981, 87]
 (a) Heisenberg uncertainty principle
 (b) Principle of de Broglie's wave nature of electron
 (c) Pauli's exclusion principle
 (d) Aufbau's principle
4. In Heisenberg's uncertainty equation $\Delta x \times \Delta p \geq \frac{h}{4\pi}$; Δp stands for
 (a) Uncertainty in energy
 (b) Uncertainty in velocity
 (c) Uncertainty in momentum
 (d) Uncertainty in mass
5. Which one is not the correct relation in the following
 (a) $h = \frac{E}{\nu}$ (b) $E = mc^2$
 (c) $\Delta x \times \Delta p = \frac{h}{4\pi}$ (d) $\lambda = \frac{h}{mv}$
6. The maximum probability of finding an electron in the d_{xy} orbital is [MP PET 1996]
 (a) Along the x-axis
 (b) Along the y-axis
 (c) At an angle of 45° from the x and y-axes
 (d) At an angle of 90° from the x and y-axes
7. Simultaneous determination of exact position and momentum of an electron is [BHU 1979]
 (a) Possible
 (b) Impossible
 (c) Sometimes possible sometimes impossible
 (d) None of the above
8. If uncertainty in the position of an electron is zero, the uncertainty in its momentum would be [CPMT 1988]
 (a) Zero (b) $< \frac{h}{2\lambda}$
 (c) $> \frac{h}{2\lambda}$ (d) Infinite
9. The possibility of finding an electron in an orbital was conceived by [MP PMT 1994]
 (a) Rutherford (b) Bohr
 (c) Heisenberg (d) Schrodinger
10. Uncertainty principle gave the concept of
 (a) Probability
 (b) An orbital
 (c) Physical meaning of Ψ the Ψ^2
 (d) All the above
11. The uncertainty principle and the concept of wave nature of matter was proposed by and respectively [MP PET 1997]
 (a) Heisenberg, de Broglie (b) de-Broglie, Heisenberg
 (c) Heisenberg, Planck (d) Planck, Heisenberg
12. The uncertainty in momentum of an electron is $1 \times 10^{-5} \text{ kg} \cdot \text{m} / \text{s}$. The uncertainty in its position will be ($h = 6.62 \times 10^{-34} \text{ kg} \cdot \text{m}^2 / \text{s}$) [AFMC 1998; CBSE PMT 1999; JIPMER 2002]
 (a) $1.05 \times 10^{-28} \text{ m}$ (b) $1.05 \times 10^{-26} \text{ m}$
 (c) $5.27 \times 10^{-30} \text{ m}$ (d) $5.25 \times 10^{-28} \text{ m}$
13. The uncertainty in the position of a moving bullet of mass 10 gm is 10^{-5} m . Calculate the uncertainty in its velocity [DCE 1999]
 (a) $5.2 \times 10^{-28} \text{ m} / \text{sec}$ (b) $3.0 \times 10^{-28} \text{ m} / \text{sec}$
 (c) $5.2 \times 10^{-22} \text{ m} / \text{sec}$ (d) $3 \times 10^{-22} \text{ m} / \text{sec}$
14. The equation $\Delta x \cdot \Delta p \geq \frac{h}{4\pi}$ shows [MP PET 2000]
 (a) de-Broglie relation
 (b) Heisenberg's uncertainty principle
 (c) Aufbau principle
 (d) Hund's rule
15. Which quantum number is not related with Schrodinger equation [RPMT 2002]
 (a) Principal (b) Azimuthal
 (c) Magnetic (d) Spin
16. Uncertainty in position of a 0.25 g particle is 10^{-5} . Uncertainty of velocity is ($h = 6.6 \times 10^{-34} \text{ Js}$) [AIEEE 2002]
 (a) 1.2×10^{34} (b) 2.1×10^{-29}
 (c) 1.6×10^{-20} (d) 1.7×10^{-9}
17. The uncertainty in momentum of an electron is $1 \times 10^{-5} \text{ kg} \cdot \text{m} / \text{s}$. The uncertainty in its position will be ($h = 6.63 \times 10^{-34} \text{ Js}$) [Pb. CET 2000]
 (a) $5.28 \times 10^{-30} \text{ m}$ (b) $5.25 \times 10^{-28} \text{ m}$
 (c) $1.05 \times 10^{-26} \text{ m}$ (d) $2.715 \times 10^{-30} \text{ m}$
18. According to Heisenberg's uncertainty principle, the product of uncertainties in position and velocities for an electron of mass $9.1 \times 10^{-31} \text{ kg}$ is
 (a) $2.8 \times 10^{-3} \text{ m}^2 \text{ s}^{-1}$ (b) $3.8 \times 10^{-5} \text{ m}^2 \text{ s}^{-1}$
 (c) $5.8 \times 10^{-5} \text{ m}^2 \text{ s}^{-1}$ (d) $6.8 \times 10^{-6} \text{ m}^2 \text{ s}^{-1}$
19. For an electron if the uncertainty in velocity is Δv , the uncertainty in its position (Δx) is given by [DPMT 2005]
 (a) $\frac{hm}{4\pi\Delta v}$ (b) $\frac{4\pi}{hm\Delta v}$
 (c) $\frac{h}{4\pi m\Delta v}$ (d) $\frac{4\pi m}{h \cdot \Delta v}$
20. Orbital is [DPMT 2005]
 (a) Circular path around the nucleus in which the electron revolves
 (b) Space around the nucleus where the probability of finding the electron is maximum
 (c) Amplitude of electrons wave
 (d) None of these

and Shape of orbitals

1. Be's 4th electron will have four quantum numbers [MNR 1985]

	n	l	m	s
(a)	1	0	0	$+1/2$
(b)	1	1	$+1$	$+1/2$
(c)	2	0	0	$-1/2$
(d)	2	1	0	$+1/2$

2. The quantum number which specifies the location of an electron as well as energy is [DPMT 1983]

- (a) Principal quantum number
(b) Azimuthal quantum number
(c) Spin quantum number
(d) Magnetic quantum number

3. The shape of an orbital is given by the quantum number [NCERT 1984; MP PMT 1996]

- (a) n (b) l
(c) m (d) s

4. In a given atom no two electrons can have the same values for all the four quantum numbers. This is called

[BHU 1979; AMU 1983; EAMCET 1980, 83;

MADT Bihar 1980; CPMT 1986, 90, 92; NCERT 1978, 84; RPMT 1997; CBSE PMT 1991; MP PET 1986, 99]

- (a) Hund's rule
(b) Aufbau's principle
(c) Uncertainty principle
(d) Pauli's exclusion principle

5. Nitrogen has the electronic configuration $1s^2, 2s^2 2p_x^1 2p_y^1 2p_z^1$ and not $1s^2, 2s^2 2p_x^2 2p_y^1 2p_z^0$ which is determined by

[DPMT 1982, 83, 89; MP PMT/PET 1988; EAMCET 1988]

- (a) Aufbau's principle (b) Pauli's exclusion principle

- (c) Hund's rule (d) Uncertainty principle

6. Which one of the following configuration represents a noble gas

[DPMT 1984]

- (a) $1s^2, 2s^2 2p^6, 3s^2$ (b) $1s^2, 2s^2 2p^6, 3s^1$
(c) $1s^2, 2s^2 2p^6$ (d) $1s^2, 2s^2 sp^6, 3s^2 3p^6, 4s^2$

7. The electronic configuration of silver atom in ground state is

[CPMT 1984, 93]

- (a) $[Kr]3d^{10} 4s^1$ (b) $[Xe]4f^{14} 5d^{10} 6s^1$
(c) $[Kr]4d^{10} 5s^1$ (d) $[Kr]4d^9 5s^2$

8. Principal, azimuthal and magnetic quantum numbers are respectively related to [CPMT 1988; AIIMS 1999]

- (a) Size, shape and orientation
(b) Shape, size and orientation
(c) Size, orientation and shape
(d) None of the above

9. Correct set of four quantum numbers for valence electron of rubidium ($Z = 37$) is

[IIT 1984; JIPMER 1999; UPSEAT 2003]

- (a) $5, 0, 0, +\frac{1}{2}$ (b) $5, 1, 0, +\frac{1}{2}$

- (c) $5, 1, 1, +\frac{1}{2}$ (d) $6, 0, 0, +\frac{1}{2}$

10. The correct ground state electronic configuration of chromium atom is [IIT 1989, 94; MP PMT 1993; EAMCET 1997; ISM Dhanbad 1994; AFMC 1997; Bihar MEE 1996; MP PET 1995, 97; CPMT 1999; Kerala PMT 2003]

- (a) $[Ar]3d^5 4s^1$ (b) $[Ar]3d^4 4s^2$
(c) $[Ar]3d^6 4s^0$ (d) $[Ar]4d^5 4s^1$

11. $2p$ orbitals have [NCERT 1981; MP PMT 1993, 97]

- (a) $n = 1, l = 2$ (b) $n = 1, l = 0$
(c) $n = 2, l = 1$ (d) $n = 2, l = 0$

12. Electronic configuration of H^- is [CPMT 1985]

- (a) $1s^0$ (b) $1s^1$
(c) $1s^2$ (d) $1s^1 2s^1$

13. The quantum numbers for the outermost electron of an element are given below as $n = 2, l = 0, m = 0, s = +\frac{1}{2}$. The atoms is [EAMCET 1978]

- (a) Lithium (b) Beryllium
(c) Hydrogen (d) Boron

14. Principal quantum number of an atom represents [EAMCET 1979; IIT 1983; MNR 1990; UPSEAT 2000, 02]

- (a) Size of the orbital
(b) Spin angular momentum
(c) Orbital angular momentum
(d) Space orientation of the orbital

15. An element has the electronic configuration $1s^2, 2s^2 2p^6, 3s^2 3p^2$. Its valency electrons are [NCERT 1973]

- (a) 6 (b) 2
(c) 3 (d) 4

16. The magnetic quantum number specifies [MNR 1986; BHU 1982; CPMT 1989, 94; CPMT 1983, 89, 93; NCERT 1973; MP PMT 1989; MP PET 1999; AFMC 1999; AMU (Engg.) 1999]

- (a) Size of orbitals (b) Shape of orbitals
(c) Orientation of orbitals (d) Nuclear stability

17. Which of the following sets of quantum numbers represent an impossible arrangement [IIT 1986; MP PET 1995]

	n	l	m	m_s
(a)	3	2	-2	$(+)\frac{1}{2}$
(b)	4	0	0	$(-)\frac{1}{2}$
(c)	3	2	-3	$(+)\frac{1}{2}$
(d)	5	3	0	$(-)\frac{1}{2}$

18. If $n = 3$, then the value of ' l ' which is incorrect [CPMT 1994]

- (a) 0 (b) 1
(c) 2 (d) 3

19. Which orbital is dumb-bell shaped [MP PMT 1986; MP PET/PMT 1998]

- (a) s -orbital (b) p -orbital
(c) d -orbital (d) f -orbital
20. The total number of unpaired electrons in d -orbitals of atoms of element of atomic number 29 is [CPMT 1983]
(a) 10 (b) 1
(c) 0 (d) 5
21. The shape of $2p$ orbital is [CPMT 1983; NCERT 1979]
(a) Spherical (b) Ellipsoidal
(c) Dumb-bell (d) Pyramidal
22. The magnetic quantum number for an electron when the value of principal quantum number is 2 can have [CPMT 1984]
(a) 3 values (b) 2 values
(c) 9 values (d) 6 values
23. Which one is the correct outer configuration of chromium [AIIMS 1980, 91; BHU 1995]
(a) $\uparrow \uparrow \uparrow \uparrow \uparrow \uparrow$ (b) $\uparrow \downarrow \uparrow \uparrow \uparrow \uparrow$
(c) $\uparrow \uparrow \uparrow \uparrow \uparrow \uparrow$ (d) $\uparrow \downarrow \uparrow \uparrow \uparrow \uparrow$
24. The following has zero valency [DPMT 1991]
(a) Sodium (b) Beryllium
(c) Aluminium (d) Krypton
25. The number of electrons in the valence shell of calcium is [IIT 1975]
(a) 6 (b) 8
(c) 2 (d) 4
26. The valence electron in the carbon atom are [MNR 1982]
(a) 0 (b) 2
(c) 4 (d) 6
27. For the dumb-bell shaped orbital, the value of l is [CPMT 1987, 2003]
(a) 3 (b) 1
(c) 0 (d) 2
28. Chromium has the electronic configuration $4s^1 3d^5$ rather than $4s^2 3d^4$ because
(a) $4s$ and $3d$ have the same energy
(b) $4s$ has a higher energy than $3d$
(c) $4s^1$ is more stable than $4s^2$
(d) $4s^1 3d^5$ half-filled is more stable than $4s^2 3d^4$
29. The electronic configuration of calcium ion (Ca^{2+}) is [CMC Vellore 1991]
(a) $1s^2, 2s^2 2p^6, 3s^2 3p^6, 4s^2$
(b) $1s^2, 2s^2 sp^6, 3s^2 3p^6, 4s^1$
(c) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^2$
(d) $1s^2, 2s^2 sp^6, 3s^2 3p^6 3d^5$
(e) $1s^2, 2s^2 2p^6, 3s^2 3p^6, 4s^0$
30. The structure of external most shell of inert gases is [JIPMER 1991]
(a) $s^2 p^3$ (b) $s^2 p^6$
(c) $s^1 p^2$ (d) $d^{10} s^2$
31. The two electrons in K sub-shell will differ in [MNR 1988; UPSEAT 1999, 2000; Kerala PMT 2003]
(a) Principal quantum number
(b) Azimuthal quantum number
(c) Magnetic quantum number
(d) Spin quantum number
32. A completely filled d -orbital (d^{10}) [MNR 1987]
(a) Spherically symmetrical
(b) Has octahedral symmetry
(c) Has tetrahedral symmetry
(d) Depends on the atom
33. If magnetic quantum number of a given atom represented by -3 , then what will be its principal quantum number [BHU 2005]
(a) 2 (b) 3
(c) 4 (d) 5
34. The total number of orbitals in an energy level designated by principal quantum number n is equal to [AIIMS 1997; J&K CET 2005]
(a) $2n$ (b) $2n^2$
(c) n (d) n^2
35. The number of orbitals in the fourth principal quantum number will be
(a) 4 (b) 8
(c) 12 (d) 16
36. Which set of quantum numbers are not possible from the following
(a) $n = 3, l = 2, m = 0, s = -\frac{1}{2}$
(b) $n = 3, l = 2, m = -2, s = -\frac{1}{2}$
(c) $n = 3, l = 3, m = -3, s = -\frac{1}{2}$
(d) $n = 3, l = 0, m = 0, s = -\frac{1}{2}$
37. The four quantum number for the valence shell electron or last electron of sodium ($Z = 11$) is [MP PMT 1999]
(a) $n = 2, l = 1, m = -1, s = -\frac{1}{2}$
(b) $n = 3, l = 0, m = 0, s = +\frac{1}{2}$
(c) $n = 3, l = 2, m = -2, s = -\frac{1}{2}$
(d) $n = 3, l = 2, m = 2, s = +\frac{1}{2}$
38. The explanation for the presence of three unpaired electrons in the nitrogen atom can be given by [NCERT 1979; RPMT 1999; DCE 1999, 2002; CPMT 2001; MP PMT 2002; Pb. PMT / CET 2002]
(a) Pauli's exclusion principle
(b) Hund's rule
(c) Aufbau's principle
(d) Uncertainty principle
39. The maximum energy is present in any electron at
(a) Nucleus
(b) Ground state
(c) First excited state

- (d) Infinite distance from the nucleus
40. The electron density between $1s$ and $2s$ orbital is
(a) High (b) Low
(c) Zero (d) None of these
41. For ns orbital, the magnetic quantum number has value
(a) 2 (b) 4
(c) -1 (d) 0
42. The maximum number of electrons that can be accommodated in the M^{th} shell is
(a) 2 (b) 8
(c) 18 (d) 32
43. For a given value of quantum number l , the number of allowed values of m is given by
(a) $l+2$ (b) $2l+2$
(c) $2l+1$ (d) $l+1$
44. The number of radial nodes of $3s$ and $2p$ orbitals are respectively. [IIT-JEE 2005]
(a) 2, 0 (b) 0, 2
(c) 1, 2 (d) 2, 1
45. Which of the sub-shell is circular
(a) $4s$ (b) $4f$
(c) $4p$ (d) $4d$
46. Which electronic configuration for oxygen is correct according to Hund's rule of multiplicity
(a) $1s^2, 2s^2 2p_x^2 2p_y^1 2p_z^1$ (b) $1s^2, 2s^2 2p_x^2 2p_y^2 2p_z^0$
(c) $1s^2, 2s^2 2p_x^3 2p_y^1 2p_z^0$ (d) None of these
47. If value of azimuthal quantum number l is 2, then total possible values of magnetic quantum number will be
(a) 7 (b) 5
(c) 3 (d) 2
48. The type of orbitals present in Fe is
(a) s (b) s and p
(c) s, p and d (d) s, p, d and f
49. The shape of d_{xy} orbital will be
(a) Circular (b) Dumb-bell
(c) Double dumb-bell (d) Trigonal
50. In any atom which sub-shell will have the highest energy in the following
(a) $3p$ (b) $3d$
(c) $4s$ (d) $3s$
51. Which electronic configuration is not observing the $(n+l)$ rule
(a) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^1, 4s^2$
(b) $1s^2, 2s^2 sp^6, 3s^2 3p^6 3d^7, 4s^2$
(c) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^5, 4s^1$
(d) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^8, 4s^2$
52. The four quantum numbers of the outermost orbital of K (atomic no. = 19) are [MP PET 1993, 94]
(a) $n = 2, l = 0, m = 0, s = +\frac{1}{2}$
(b) $n = 4, l = 0, m = 0, s = +\frac{1}{2}$
(c) $n = 3, l = 1, m = 1, s = +\frac{1}{2}$
(d) $n = 4, l = 2, m = -1, s = +\frac{1}{2}$
53. The angular momentum of an electron depends on
(a) Principal quantum number
(b) Azimuthal quantum number
(c) Magnetic quantum number
(d) All of these
54. The electronic configuration of copper ($_{29}Cu$) is [DPMT 1983; BHU 1980; AFMC 1981; CBSE PMT 1991; MP PMT 1995]
(a) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^9, 4s^2$
(b) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^1$
(c) $1s^2, 2s^2 2p^6, 3s^2 3p^6, 4s^2 4p^6$
(d) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}$
55. The number of orbitals in $2p$ sub-shell is [NCERT 1973; MP PMT 1996]
(a) 6 (b) 2
(c) 3 (d) 4
56. The number of orbitals in d sub-shell is [MNR 1981]
(a) 1 (b) 3
(c) 5 (d) 7
57. A sub-shell $l = 2$ can take how many electrons [NCERT 1973, 78]
(a) 3 (b) 10
(c) 5 (d) 6
58. Pauli's exclusion principle states that [MNR 1983; AMU 1984]
(a) Two electrons in the same atom can have the same energy
(b) Two electrons in the same atom cannot have the same spin
(c) The electrons tend to occupy different orbitals as far as possible
(d) Electrons tend to occupy lower energy orbitals preferentially
(e) None of the above
59. For d electrons, the azimuthal quantum number is [MNR 1983; CPMT 1984]
(a) 0 (b) 1
(c) 2 (d) 3
60. For p -orbital, the magnetic quantum number has value
(a) 2 (b) 4, -4
(c) -1, 0, +1 (d) 0
61. For $n = 3$ energy level, the number of possible orbitals (all kinds) are [BHU 1981; CPMT 1985; MP PMT 1995]
(a) 1 (b) 3
(c) 4 (d) 9

62 Structure of atom

62. Which of the following ions is not having the configuration of neon
(a) F^- (b) Mg^{+2}
(c) Na^+ (d) Cl^-
63. Elements upto atomic number 103 have been synthesized and studied. If a newly discovered element is found to have an atomic number 106, its electronic configuration will be
[AIIMS 1980]
(a) $[Rn]5f^{14}, 6d^4, 7s^2$ (b) $[Rn]5f^{14}, 6d^1, 7s^2, 7p^3$
(c) $[Rn]5f^{14}, 6d^6, 7s^0$ (d) $[Rn]5f^{14}, 6d^5, 7s^1$
64. Ions which have the same electronic configuration are those of
(a) Lithium and sodium (b) Sodium and potassium
(c) Potassium and calcium (d) Oxygen and chlorine
65. When the azimuthal quantum number has a value of $l = 0$, the shape of the orbital is [MP PET 1995]
(a) Rectangular (b) Spherical
(c) Dumbbell (d) Unsymmetrical
66. The magnetic quantum number for valency electrons of sodium is [CPMT 1988; MH CET 1999]
(a) 3 (b) 2
(c) 1 (d) 0
67. The electronic configuration of an element with atomic number 7 i.e. nitrogen atom is [CPMT 1982, 84, 87]
(a) $1s^2, 2s^1, 2p_x^3$ (b) $1s^2, 2s^2, 2p_x^2, 2p_y^1$
(c) $1s^2, 2s^2, 2p_x^1, 2p_y^1, 2p_z^1$ (d) $1s^2, 2s^2, 2p_x^1, 2p_y^2$
68. In a multi-electron atom, which of the following orbitals described by the three quantum members will have the same energy in the absence of magnetic and electric fields [AIEEE 2005]
(1) $n = 1, l = 0, m = 0$ (2) $n = 2, l = 0, m = 0$
(3) $n = 2, l = 1, m = 1$ (4) $n = 3, l = 2, m = 0$
(5) $n = 3, l = 2, m = 0$
(a) (1) and (2) (b) (2) and (3)
(c) (3) and (4) (d) (4) and (5)
69. Which of the following represents the electronic configuration of an element with atomic number 17 [AMU 1982]
(a) $1s^2, 2s^2, 2p^6, 3s^1, 3p^6$ (b) $1s^2, 2s^2, 2p^6, 3s^2, 3p^4, 4s^1$
(c) $1s^2, 2s^2, 2p^6, 3s^2, 3p^5$ (d) $1s^2, 2s^2, 2p^6, 3s^1, 3p^4, 4s^2$
70. The shape of s -orbital is [NCERT 1978I]
(a) Pyramidal (b) Spherical
(c) Tetrahedral (d) Dumb-bell shaped
71. When $3d$ orbital is complete, the new electron will enter the [EAMCET 1980; MP PMT 1995]
(a) $4p$ -orbital (b) $4f$ -orbital
(c) $4s$ -orbital (d) $4d$ -orbital
72. In a potassium atom, electronic energy levels are in the following order [EAMCET 1979; DPMT 1991]
(a) $4s > 3d$ (b) $4s > 4p$
(c) $4s < 3d$ (d) $4s < 3p$
73. Fe (atomic number = 26) atom has the electronic arrangement [NCERT 1974; MNR 1980]
(a) 2, 8, 8, 8 (b) 2, 8, 16
(c) 2, 8, 14, 2 (d) 2, 8, 12, 4
74. Cu^{2+} will have the following electronic configuration [MP PMT 1985]
(a) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}$
(b) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^9, 4s^1$
(c) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^9$
(d) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^1$
75. Which one is the electronic configuration of Fe^{+2} [MA DT Bihar 1982; AIIMS 1989]
(a) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^6$
(b) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^4, 4s^2$
(c) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^5, 4s^1$
(d) None of these
76. How many electrons can be fit into the orbitals that comprise the 3rd quantum shell $n = 3$ [MP PMT 1986, 87; Orissa JEE 1997]
(a) 2 (b) 8
(c) 18 (d) 32
77. Which element is represented by the following electronic configuration [MP PMT 1987]
- | | | | | |
|----|----|----|----|---|
| | | 2p | | |
| | 2s | ↑↓ | ↑↓ | ↑ |
| 1s | ↑↓ | | | |
| ↑↓ | | | | |
- (a) Nitrogen (b) Oxygen
(c) Fluorine (d) Neon
78. If the value of azimuthal quantum number is 3, the possible values of magnetic quantum number would be [MP PMT 1987; RPMT 1999; AFMC 2002; KCET 2002]
(a) 0, 1, 2, 3 (b) 0, -1, -2, -3
(c) 0, ± 1 , ± 2 , ± 3 (d) ± 1 , ± 2 , ± 3
79. Krypton ($_{36}Kr$) has the electronic configuration ($_{18}Ar$) $4s^2, 3d^{10}, 4p^6$. The 37th electron will go into which one of the following sub-levels [CBSE PMT 1989; CPMT 1989; EAMCET 1991]
(a) $4f$ (b) $4d$
(c) $3p$ (d) $5s$
80. If an electron has spin quantum number of $+\frac{1}{2}$ and a magnetic quantum number of -1 , it cannot be presented in an [CBSE PMT 1989; UPSEAT 2001]

- (a) d -orbital (b) f -orbital
(c) p -orbital (d) s -orbital
81. The azimuthal quantum number is related to [BHU 1987, 95]
(a) Size (b) Shape
(c) Orientation (d) Spin
82. The total number of electrons that can be accommodated in all the orbitals having principal quantum number 2 and azimuthal quantum number 1 is [CPMT 1971, 89, 91]
(a) 2 (b) 4
(c) 6 (d) 8
83. Electronic configuration of C is [CPMT 1975]
(a) $1s^2, 2s^2 2p^2$ (b) $1s^2, 2s^2 2p^3$
(c) $1s^2, 2s^2$ (d) $1s^2, 2s^2 2p^6$
84. There is no difference between a $2p$ and a $3p$ orbital regarding [BHU 1981]
(a) Shape (b) Size
(c) Energy (d) Value of n
85. The electronic configuration of chromium is [MP PMT 1993; MP PET 1995; BHU 2001; BCECE 2005]
(a) $[Ne]3s^2 3p^6 3d^4, 4s^2$ (b) $[Ne]3s^2 3p^6 3d^5, 4s^1$
(c) $[Ne]3s^2 3p^6, 4s^2 4p^4$ (d) $[Ne]3s^2 3p^6 3d^1, 4s^2 4p^3$
86. The shape of p -orbital is [MP PMT 1993]
(a) Elliptical (b) Spherical
(c) Dumb-bell (d) Complex geometrical
87. The electronic configuration (outermost) of Mn^{+2} ion (atomic number of $Mn = 25$) in its ground state is [MP PET 1993]
(a) $3d^5, 4s^0$ (b) $3d^4, 4s^1$
(c) $3d^3, 4s^2$ (d) $3d^2, 4s^2 4p^2$
88. The principal quantum number represents [CPMT 1991]
(a) Shape of an orbital
(b) Distance of electron from nucleus
(c) Number of electrons in an orbit
(d) Number of orbitals in an orbit
89. When the azimuthal quantum number has a value of $l = 1$, the shape of the orbital is [MP PET 1993]
(a) Unsymmetrical (b) Spherically symmetrical
(c) Dumb-bell (d) Complicated
90. How many electrons can be accommodated in a sub-shell for which $n = 3, l = 1$ [CBSE PMT 1990]
(a) 8 (b) 6
(c) 18 (d) 32
91. For azimuthal quantum number $l = 3$, the maximum number of electrons will be [CBSE PMT 1991; EAMCET 1991; RPMT 2002; CBSE PMT 2002]
(a) 2 (b) 6
(c) 0 (d) 14
92. An ion has 18 electrons in the outermost shell, it is [CBSE PMT 1990]
(a) Cu^+ (b) Th^{4+}
(c) Cs^+ (d) K^+
93. The order of filling of electrons in the orbitals of an atom will be
(a) $3d, 4s, 4p, 4d, 5s$ (b) $4s, 3d, 4p, 5s, 4d$
(c) $5s, 4p, 3d, 4d, 5s$ (d) $3d, 4p, 4s, 4d, 5s$
94. The quantum number which may be designated by s, p, d and f instead of number is BHU 1980]
(a) n (b) l
(c) m_l (d) m_s
95. Which of the following represents the correct sets of the four quantum numbers of a $4d$ electron [MNR 1992; UPSEAT 2001; J&KCET 2005]
(a) $4, 3, 2, \frac{1}{2}$ (b) $4, 2, 1, 0$
(c) $4, 3, -2, +\frac{1}{2}$ (d) $4, 2, 1, -\frac{1}{2}$
96. Which of the following statements is not correct for an electron that has the quantum numbers $n = 4$ and $m = 2$ [MNR 1993]
(a) The electron may have the quantum number $s = +\frac{1}{2}$
(b) The electron may have the quantum number $l = 2$
(c) The electron may have the quantum number $l = 3$
(d) The electron may have the quantum number $l = 0, 1, 2, 3$
97. The set of quantum numbers not applicable for an electron in an atom is [MNR 1994]
(a) $n = 1, l = 1, m_l = 1, m_s = +1/2$
(b) $n = 1, l = 0, m_l = 0, m_s = +1/2$
(c) $n = 1, l = 0, m_l = 0, m_s = -1/2$
(d) $n = 2, l = 0, m_l = 0, m_s = +1/2$
98. Correct configuration of Fe^{+3} [26] is [CPMT 1994; BHU 1995; KCET 1992]
(a) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^5$
(b) $1s^2, 2s^2 sp^6, 3s^2 3p^6 3d^3, 4s^2$
(c) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^6, 4s^2$
(d) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^5, 4s^1$
99. Azimuthal quantum number for last electron of Na atom is [BHU 1995]
(a) 1 (b) 2
(c) 3 (d) 0
100. A $3p$ orbital has [IIT 1995]
(a) Two spherical nodes
(b) Two non-spherical nodes
(c) One spherical and one non-spherical nodes
(d) One spherical and two non-spherical nodes
101. All electrons on the $4p$ sub-shell must be characterized by the quantum number(s) [MP PET 1996]
(a) $n = 4, m = 0, s = \pm \frac{1}{2}$ (b) $l = 1$

(c) $l = 0, s = \pm \frac{1}{2}$

(d) $s = \pm \frac{1}{2}$

102. The electronic configuration of the element of atomic number 27 is

- (a) $1s^2, 2s^2 2p^6, 3s^2 3p^6, 4s(\uparrow\downarrow) 4p(\uparrow\downarrow)(\uparrow\downarrow)(\uparrow\downarrow) 5s(\uparrow)$
 (b) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d(\uparrow\downarrow)(\uparrow\downarrow)(\uparrow\downarrow), 4s(\uparrow\downarrow) 4p(\uparrow)$
 (c) $1s^2, 2s^2 2p^6, 3s^2 3p^6, 3d(\uparrow\downarrow)(\uparrow\downarrow)(\uparrow\downarrow)(\uparrow\downarrow), 4s(\uparrow)$
 (d) $1s^2, 2s^2 2p^6, 3s^2 3p^6, 3d(\uparrow\downarrow)(\uparrow\downarrow)(\uparrow)(\uparrow)(\uparrow) 4s(\uparrow\downarrow)$

103. When the value of the principal quantum number n is 3, the permitted values of the azimuthal quantum numbers l and the magnetic quantum numbers m , are

- | l | m |
|-------|-------------------|
| 0 | 0 |
| (a) 1 | +1, 0, -1 |
| 2 | +2, +1, 0, -1, -2 |
| 1 | 1 |
| (b) 2 | +2, 1, -1 |
| 3 | +3, +2, 1, -2, -3 |
| 0 | 0 |
| (c) 1 | 1, 2, 3 |
| 2 | +3, +2, 1, -2, -3 |
| 1 | 0, 1 |
| (d) 2 | 0, 1, 2 |
| 3 | 0, 1, 2, 3 |

104. The number of possible spatial orientations of an electron in an atom is given by its

- (a) Spin quantum number
 (b) Spin angular momentum
 (c) Magnetic quantum number
 (d) Orbital angular momentum

105. Which of the following sets of orbitals may degenerate

- (a) $2s, 2p_x, 2p_y$ (b) $3s, 3p_x, 3d_{xy}$
 (c) $1s, 2s, 3s$ (d) $2p_x, 2p_y, 2p_z$

106. The set of quantum numbers $n = 3, l = 0, m = 0, s = -1/2$ belongs to the element

- (a) Mg (b) Na
 (c) Ne (d) F

107. An electron has principal quantum number 3. The number of its (i) sub-shells and (ii) orbitals would be respectively

[MP PET 1997]

- (a) 3 and 5 (b) 3 and 7
 (c) 3 and 9 (d) 2 and 5

108. What is the electronic configuration of Cu^{2+} ($Z = 29$) of least position [MP PET/PMT 1998; MP PET 2001]

- (a) $[\text{Ar}]4s^1 3d^8$ (b) $[\text{Ar}]4s^2 3d^{10} 4p^1$
 (c) $[\text{Ar}]4s^1 3d^{10}$ (d) $[\text{Ar}]3d^9$

109. The correct electronic configuration of Ti ($Z = 22$) atom is [MP PMT 1999]

- (a) $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^2$
 (b) $1s^2 2s^2 2p^6 3s^2 3p^6 3d^4$

(c) $1s^2 2s^2 2p^6 3s^2 3p^6 3d^4$

(d) $1s^2 2s^2 2p^6 3s^2 3p^6 4s^1 3d^3$

110. Which of the following configuration is correct for iron [CBSE PMT 1999]

- (a) $1s^2 2s^2 2p^6 3s^2 3p^6 3d^5$
 (b) $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^5$
 (c) $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^7$
 (d) $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^6$

111. Which of the following set of quantum numbers belong to highest energy [CPMT 1999]

- (a) $n = 4, l = 0, m = 0, s = +\frac{1}{2}$
 (b) $n = 3, l = 0, m = 0, s = +\frac{1}{2}$
 (c) $n = 3, l = 1, m = 1, s = +\frac{1}{2}$
 (d) $n = 3, l = 2, m = 1, s = +\frac{1}{2}$

112. Which quantum number will determine the shape of the subshell [CPMT 1999; Pb. PMT 1998]

- (a) Principal quantum number
 (b) Azimuthal quantum number
 (c) Magnetic quantum number
 (d) Spin quantum number

113. For the $n = 2$ energy level, how many orbitals of all kinds are possible [Bihar CEE 1995]

- (a) 2 (b) 3
 (c) 4 (d) 5

114. Which one is in the ground state [DPMT 1996]

- (a) 
 (b) 
 (c) 
 (d) 

115. When the principal quantum number ($n = 3$), the possible values of azimuthal quantum number (l) is [Bihar MEE 1996; KCET 2000]

- (a) 0, 1, 2, 3 (b) 0, 1, 2
 (c) -2, -1, 0, 1, 2 (d) 1, 2, 3
 (e) 0, 1

116. Which statement is not correct for $n = 5, m = 3$ [CPMT 1996]

- (a) $l = 4$ (b) $l = 0, 1, 3; s = +\frac{1}{2}$

- (c) $l = 3$ (d) All are correct
- 117.** $1s^2 2s^2 2p^6 3s^1$ shows configuration of [CPMT 1996]
 (a) Al^{3+} in ground state (b) Ne in excited state
 (c) Mg^+ in excited state (d) None of these
- 118.** Five valence electrons of p^{15} are labelled as
- | | | | |
|------|------|---|---|
| AB | X | Y | Z |
| $3s$ | $3p$ | | |
- If the spin quantum of B and Z is $+\frac{1}{2}$, the group of electrons with three of the quantum number same are [JIPMER 1997]
 (a) AB, XYZ, BY (b) AB
 (c) XYZ, AZ (d) AB, XYZ
- 119.** Electronic configuration of Sc^{21} is [BHU 1997]
 (a) $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^1$
 (b) $1s^2 2s^2 2p^6 3s^2 3p^6 4s^1 3d^2$
 (c) $1s^2 2s^2 2p^6 3s^2 3p^6 4s^0 3d^3$
 (d) $1s^2 2s^2 2p^6 3s^2 3p^2 4s^2 3d^2$
- 120.** If $n+l=6$, then total possible number of subshells would be [RPMT 1997]
 (a) 3 (b) 4
 (c) 2 (d) 5
- 121.** An electron having the quantum numbers $n=4, l=3, m=0, s=-\frac{1}{2}$ would be in the orbital [Orissa JEE 1997]
 (a) $3s$ (b) $3p$
 (c) $4d$ (d) $4f$
- 122.** Which of the following sets of quantum numbers is not allowed [Orissa JEE 1997]
 (a) $n=1, l=0, m=0, s=+\frac{1}{2}$
 (b) $n=1, l=1, m=0, s=-\frac{1}{2}$
 (c) $n=2, l=1, m=1, s=+\frac{1}{2}$
 (d) $n=2, l=1, m=0, s=-\frac{1}{2}$
- 123.** For which of the following sets of four quantum numbers, an electron will have the highest energy [CBSE PMT 1994]
- | n | l | m | s |
|-------|-----|-----|----------------|
| (a) 3 | 2 | 1 | $+\frac{1}{2}$ |
| (b) 4 | 2 | 1 | $+\frac{1}{2}$ |
| (c) 4 | 1 | 0 | $-\frac{1}{2}$ |
| (d) 5 | 0 | 0 | $-\frac{1}{2}$ |
- 124.** The electronic configuration of gadolinium (atomic no. 64) is
 (a) $[Xe]4s^8 5d^9 6s^2$ (b) $[Xe]4s^7 5d^1 6s^2$
- (c) $[Xe]4s^3 5d^5 6s^2$ (d) $[Xe]4f^6 5d^2 6s^2$
- 125.** An e^- has magnetic quantum number as -3 , what is its principal quantum number [BHU 1998]
 (a) 1 (b) 2
 (c) 3 (d) 4
- 126.** The number of quantum numbers required to describe an electron in an atom completely is [CET Pune 1998]
 (a) 1 (b) 2
 (c) 3 (d) 4
- 127.** The electronic configuration $1s^2 2s^2 2p_x^1 2p_y^1 2p_z^1$ [A FMC 1997; Pb. PMT 1999; CBSE PMT 2001; AIIMS 2001]
 (a) Oxygen (b) Nitrogen
 (c) Hydrogen (d) Fluorine
- 128.** Which one of the following set of quantum numbers is not possible for $4p$ electron [EAMCET 1998]
 (a) $n=4, l=1, m=-1, s=+\frac{1}{2}$
 (b) $n=4, l=1, m=0, s=+\frac{1}{2}$
 (c) $n=4, l=1, m=2, s=+\frac{1}{2}$
 (d) $n=4, l=1, m=-1, s=+\frac{1}{2}$
- 129.** Which of the following orbital is not possible [RPMT 1999]
 (a) $3f$ (b) $4f$
 (c) $5f$ (d) $6f$
- 130.** Which set of quantum numbers for an electron of an atom is not possible [RPMT; DCE 1999]
 (a) $n=1, l=0, m=0, s=+1/2$
 (b) $n=1, l=1, m=1, s=+1/2$
 (c) $n=1, l=0, m=0, s=-1/2$
 (d) $n=2, l=1, m=-1, s=+1/2$
- 131.** Electronic configuration of ferric ion is [RPET 2000]
 (a) $[Ar]3d^5$ (b) $[Ar]3d^7$
 (c) $[Ar]3d^3$ (d) $[Ar]3d^8$
- 132.** What is the maximum number of electrons which can be accommodated in an atom in which the highest principal quantum number value is 4 [MP PMT 2000]
 (a) 10 (b) 18
 (c) 32 (d) 54
- 133.** Which of the following electronic configurations is not possible [CPMT 2000]
 (a) $1s^2 2s^2$ (b) $1s^2 2s^2 2p^6$
 (c) $3d^{10} 4s^2 4p^2$ (d) $1s^2 2s^2 2p^2 3s^1$
- 134.** The electronic configuration of an element is $1s^2 2s^2 2p^6 3s^2 3p^6 3d^5 4s^1$. This represents its [IIT Screening 2000]
 (a) Excited state (b) Ground state
 (c) Cationic form (d) Anionic form
- 135.** Which of the following set of quantum numbers is possible [CBSE PMT 1997]
 (a) $n=1, l=0, m=0, s=+\frac{1}{2}$ (b) $n=1, l=1, m=0, s=+\frac{1}{2}$
 (c) $n=2, l=1, m=1, s=+\frac{1}{2}$ (d) $n=2, l=1, m=0, s=-\frac{1}{2}$
- [AIIMS 2001]

- (a) $n = 3; l = 2; m = 2$ and $s = +\frac{1}{2}$
 (b) $n = 3; l = 4; m = 0$ and $s = -\frac{1}{2}$
 (c) $n = 4; l = 0; m = 2$ and $s = +\frac{1}{2}$
 (d) $n = 4; l = 4; m = 3$ and $s = +\frac{1}{2}$
- 136.** Which of the following set of quantum number is not valid [AIIMS 2001]
 (a) $n = 1, l = 2$ (b) $3 = 2, m = 1$
 (c) $m = 3, l = 0$ (d) $3 = 4, l = 2$
- 137.** Which one pair of atoms or ions will have same configuration [JIPMER 2001]
 (a) F^+ and Ne (b) Li^+ and He^-
 (c) Cl^- and Ar (d) Na and K
- 138.** Which of the following sets of quantum number is not possible [MP PET 2001]
 (a) $n = 3; l = +2; m = 0; s = +\frac{1}{2}$
 (b) $n = 3; l = 0; m = 0; s = -\frac{1}{2}$
 (c) $n = 3; l = 0; m = -1; s = +\frac{1}{2}$
 (d) $n = 3; l = 1; m = 0; s = -\frac{1}{2}$
- 139.** Which of the following set of quantum numbers is correct for the 19th electron of chromium [DCE 2001]
- | | n | l | m | s |
|-----|-----|-----|-----|-------|
| (a) | 3 | 0 | 0 | $1/2$ |
| (b) | 3 | 2 | -2 | $1/2$ |
| (c) | 4 | 0 | 0 | $1/2$ |
| (d) | 4 | 1 | -1 | $1/2$ |
- 140.** When the value of azimuthal quantum number is 3, magnetic quantum number can have values [DPMT 2001]
 (a) $+1, 0, -1$
 (b) $+2, +1, 0, -1, -2$
 (c) $-3, -2, -1, -0, +1, +2, +3$
 (d) $+1, -1$
- 141.** The quantum numbers $n = 2, l = 1$ represent [AFMC 2002]
 (a) 1s orbital (b) 2s orbital
 (c) 2p orbital (d) 3d orbital
- 142.** The magnetic quantum number of valence electron of sodium (Na) is [RPMT 2002]
 (a) 3 (b) 2
 (c) 1 (d) 0
- 143.** Azimuthal quantum number defines [AIIMS 2002]
 (a) e/m ratio of electron
 (b) Spin of electron
 (c) Angular momentum of electron
 (d) Magnetic momentum of electron
- 144.** Quantum numbers of an atom can be defined on the basis of [AIIMS 2002]
 (a) Hund's rule
 (b) Aufbau's principle
 (c) Pauli's exclusion principle
 (d) Heisenberg's uncertainty principle
- 145.** Which of the following has maximum energy [AIIMS 2002]
- (a) $3s \quad 3p \quad 3d$

- (b) $3s \quad 3p \quad 3d$

- (c) $3s \quad 3p \quad 3d$

- (d) $3s \quad 3p \quad 3d$

- 146.** The total magnetic quantum numbers for d-orbital is given by
 (a) 2 (b) $0, \pm 1, \pm 2$
 (c) $0, 1, 2$ (d) 5
- 147.** The outer electronic structure $3s^2 3p^5$ is possessed by [Pb. PMT 2002; Pb. CET 2001]
 (a) Cl (b) O
 (c) Ar (d) Br
- 148.** Which of the following set of quantum number is not possible [Pb. PMT 2002]
- | | n | l | m_1 | m_2 |
|-----|-----|-----|-------|--------|
| (a) | 3 | 2 | 1 | $+1/2$ |
| (b) | 3 | 2 | 1 | $-1/2$ |
| (c) | 3 | 2 | 1 | 0 |
| (d) | 5 | 2 | -1 | $+1/2$ |
- 149.** The configuration $1s^2, 2s^2 2p^5, 3s^1$ shows [Pb. PMT 2002]
 (a) Excited state of O_2^-
 (b) Excited state of neon
 (c) Excited state of fluorine
 (d) Ground state of fluorine atom
- 150.** The quantum number 'm' of a free gaseous atom is associated with [AIIMS 2003]
 (a) The effective volume of the orbital
 (b) The shape of the orbital
 (c) The spatial orientation of the orbital
 (d) The energy of the orbital in the absence of a magnetic field
- 151.** Correct statement is [BHU 2003]
 (a) $K = 4s^1, Cr = 3d^4 4s^2, Cu = 3d^{10} 4s^2$
 (b) $K = 4s^2, Cr = 3d^4 4s^2, Cu = 3d^{10} 4s^2$
 (c) $K = 4s^2, Cr = 3d^5 4s^1, Cu = 3d^{10} 4s^2$
 (d) $K = 4s^1, Cr = 3d^5 4s^1, Cu = 3d^{10} 4s^1$
- 152.** Number of orbitals in h sub-shell is [BHU 2003]
 (a) 11 (b) 15

- (c) 17 (d) 19
- 153.** Electronic configuration $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^5, 4s^1$ represents [CPMT 2003]
 (a) Ground state (b) Excited state
 (c) Anionic state (d) All of these
- 154.** Which of the following sets is possible for quantum numbers [RPET 2003]
 (a) $n = 4, l = 3, m = -2, s = 0$
 (b) $n = 4, l = 4, m = +2, s = -\frac{1}{2}$
 (c) $n = 4, l = 4, m = -2, s = +\frac{1}{2}$
 (d) $n = 4, l = 3, m = -2, s = +\frac{1}{2}$
- 155.** For principle quantum number $n = 4$ the total number of orbitals having $l = 3$ [AIIMS 2004]
 (a) 3 (b) 7
 (c) 5 (d) 9
- 156.** The number of $2p$ electrons having spin quantum number $s = -1/2$ are [KCET 2004]
 (a) 6 (b) 0
 (c) 2 (d) 3
- 157.** Which of the following sets of quantum numbers is correct for an electron in $4f$ orbital [AIEEE 2004]
 (a) $n = 4, l = 3, m = +1, s = +\frac{1}{2}$
 (b) $n = 4, l = 4, m = -4, s = -\frac{1}{2}$
 (c) $n = 4, l = 3, m = +4, s = +\frac{1}{2}$
 (d) $n = 3, l = 2, m = -2, s = +\frac{1}{2}$
- 158.** Consider the ground state of ($Z = 24$). The numbers of electrons with the azimuthal quantum numbers, $l = 1$ and 2 are, respectively [AIEEE 2004]
 (a) 16 and 4 (b) 12 and 5
 (c) 12 and 4 (d) 16 and 5
- 159.** The four quantum numbers of the valence electron of potassium are [DPMT 2004]
 (a) 4, 1, 0 and $\frac{1}{2}$ (b) 4, 0, 1 and $\frac{1}{2}$
 (c) 4, 0, 0 and $+\frac{1}{2}$ (d) 4, 1, 1 and $\frac{1}{2}$
- 160.** Which of the following electronic configuration is not possible according to Hund's rule
 (a) $1s^2 2s^2$ (b) $1s^2 2s^1$
 (c) $1s^2 2s^2 2p_x^1 2p_y^1 2p_z^1$ (d) $1s^2 2s^2 2p_x^2$
 (e) $1s^2 2s^2 2p_x^2 2p_y^1 2p_z^1$
- 161.** The ground state term symbol for an electronic state is governed by [UPSEAT 2004]
 (a) Heisenberg's principle
 (b) Hund's rule
 (c) Aufbau principle
 (d) Pauli exclusion principle
- 162.** The electronic configuration of element with atomic number 24 is [Pb. CET 2004]
 (a) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^4, 4s^2$
 (b) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}$
 (c) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^6$
 (d) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^5 4s^1$
- 163.** The maximum number of electrons in p -orbital with $n = 5, m = 1$ is [Pb. CET 2003]
 (a) 6 (b) 2
 (c) 14 (d) 10
- 164.** Number of two electron can have the same v values of quantum numbers [UPSEAT 2004]
 (a) One (b) Two
 (c) Three (d) Four
- 165.** The number of orbitals present in the shell with $n = 4$ is [UPSEAT 2004]
 (a) 16 (b) 8
 (c) 18 (d) 32
- 166.** Which of the following electronic configuration is not possible [MHCET 2003]
 (a) $1s^2 2s^2$ (b) $1s^2, 2s^2 2p^6$
 (c) $[Ar] 3d^{10}, 4s^2 4p^2$ (d) $1s^2, 2s^2 2p^2, 3s^1$
- 167.** p_x orbital can accommodate [MNR 1990; IIT 1983; MADT Bihar 1995; BCECE 2005]
 (a) 4 electrons
 (b) 6 electrons
 (c) 2 electrons with parallel spins
 (d) 2 electrons with opposite spins
- 168.** The maximum number of electrons that can be accommodated in ' f ' sub shell is [CPMT 1983, 84; MP PET/PMT 1988; BITS 1988]
 (a) 2 (b) 8
 (c) 32 (d) 14
- 169.** The number of electrons which can be accommodated in an orbital is [DPMT 1981; AFMC 1988]
 (a) One (b) Two
 (c) Three (d) Four
- 170.** The number of electrons in the atom which has 20 protons in the nucleus [CPMT 1981, 93; CBSE PMT 1989]
 (a) 20 (b) 10
 (c) 13 (d) 40
- 171.** The maximum number of electrons accommodated in $5f$ orbitals are [MP PET 1996]
 (a) 5 (b) 10
 (c) 14 (d) 18
- 172.** The maximum number of electrons in an atom with $l = 2$ and $n = 3$ is [MP PET/PMT 1998]

- (a) 2 (b) 6
(c) 12 (d) 10
- 173.** The configuration $1s^2 2s^2 2p^5 3s^1$ shows [AIIMS 1997]
(a) Ground state of fluorine atom
(b) Excited state of fluorine atom
(c) Excited state of neon atom
(d) Excited state of ion O_2^-
- 174.** For sodium atom the number of electrons with $m = 0$ will be [RPMT 1999]
(a) 2 (b) 7
(c) 9 (d) 8
- 175.** The number of electrons that can be accommodated in dz^2 orbital is [Kurukshetra CEE 2002]
(a) 10 (b) 1
(c) 4 (d) 2
- 176.** Number of unpaired electrons in $1s^2 2s^2 2p^3$ is [CPMT 1982; MP PMT 1987; BHU 1987; CBSE PMT 1990; CET Pune 1998; AIIMS 2000]
(a) 2 (b) 0
(c) 3 (d) 1
- 177.** Total number of unpaired electrons in an atom of atomic number 29 is [CPMT 1984, 93]
(a) 1 (b) 3
(c) 4 (d) 2
- 178.** The number of unpaired electrons in $1s^2, 2s^2 2p^4$ is [NCERT 1984; CPMT 1991; MP PMT 1996, 2002]
(a) 4 (b) 2
(c) 0 (d) 1
- 179.** The maximum number of electrons that can be accommodated in a $3d$ subshell is
(a) 2 (b) 10
(c) 6 (d) 14
- 180.** The maximum number of electrons which each sub-shell can occupy is [Pb. CET 1989]
(a) $2n^2$ (b) $2n$
(c) $2(2l+1)$ (d) $(2l+1)$
- 181.** Number of unpaired electrons in the ground state of beryllium atom is
(a) 2 (b) 1
(c) 0 (d) All the above
- 182.** How many unpaired electrons are present in Ni^{2+} cation (atomic number = 28) [IIT 1981; MNR 1984; MP PMT 1995; Kerala PMT 2003]
(a) 0 (b) 2
(c) 4 (d) 6
- 183.** The number of unpaired electrons in an O_2 molecule is [MNR 1983]
(a) 0 (b) 1
(c) 2 (d) 3
- 184.** The number of unpaired electrons in a chromic ion Cr^{3+} (atomic number = 24) is [MNR 1986; CPMT 1992]
(a) 6 (b) 4
(c) 3 (d) 1
- 185.** $3d^{10} 4s^0$ electronic configuration exhibits by
(a) Zn^{++} (b) Cu^{++}
(c) Cd^{++} (d) Hg^{++}
- 186.** Which of the following metal ions will have maximum number of unpaired electrons [CPMT 1996]
(a) Fe^{+2} (b) Co^{+2}
(c) Ni^{+2} (d) Mn^{+2}
- 187.** Which of the metal ion will have highest number of unpaired electrons
(a) Cu^+ (b) Fe^{2+}
(c) Fe^{3+} (d) Co^{2+}
- 188.** The maximum number of unpaired electron can be present in d orbitals are
(a) 1 (b) 3
(c) 5 (d) 7
- 189.** The molecule having one unpaired electron is
(a) NO (b) CO
(c) CN^- (d) O_2
- 190.** A filled or half-filled set of p or d -orbitals is spherically symmetric. Point out the species which has spherical symmetry [NCERT 1983]
(a) Na (b) C
(c) Cl^- (d) Fe
- 191.** The atom of the element having atomic number 14 should have [AMU 1984]
(a) One unpaired electron (b) Two unpaired electrons
(c) Three unpaired electrons (d) Four unpaired electrons
- 192.** An atom has 2 electrons in K shell, 8 electrons in L shell and 6 electrons in M shell. The number of s -electrons present in that element is [CPMT 1989]
(a) 6 (b) 5
(c) 7 (d) 10
- 193.** The number of unpaired electrons in carbon atom in excited state is [MNR 1987]
(a) One (b) Two
(c) Three (d) Four
- 194.** Maximum number of electrons present in ' N ' shell is [EAMCET 1984]
(a) 18 (b) 32
(c) 2 (d) 8
- 195.** The number of d electrons in Fe^{+2} (atomic number of $Fe = 26$) is not equal to that of the [MNR 1993]
(a) p -electrons in Ne (At. No. = 10)
(b) s -electrons in Mg (At. No. = 12)
(c) d -electrons in Fe
(d) p -electrons in Cl^- (At. No. of $Cl = 17$)
- 196.** A transition metal X has a configuration $[Ar]3d^4$ in its +3 oxidation state. Its atomic number is [EAMCET 1990]
(a) 25 (b) 26
(c) 22 (d) 19

197. The total number of electrons present in all the p -orbitals of bromine are [MP PET 1994]
 (a) Five (b) Eighteen
 (c) Seventeen (d) Thirty five
198. Which of the following has the maximum number of unpaired electrons [IIT 1996]
 (a) Mg^{2+} (b) Ti^{3+}
 (c) V^{3+} (d) Fe^{2+}
199. Which of the following has more unpaired d -electrons [CBSE PMT 1999]
 (a) Zn^{+} (b) Fe^{2+}
 (c) N^{3+} (d) Cu^{+}
200. Maximum electrons in a d -orbital are [CPMT 1999]
 (a) 2 (b) 10
 (c) 6 (d) 14
201. The number of unpaired electrons in Fe^{3+} ($Z = 26$) are [KCET 2000]
 (a) 5 (b) 6
 (c) 3 (d) 4
202. How many unpaired electrons are present in cobalt [Co] metal [RPMT 2002]
 (a) 2 (b) 3
 (c) 4 (d) 7
203. The number of unpaired electrons in nitrogen is [Pb. CET 2002]
 (a) 1 (b) 3
 (c) 2 (d) None of these
204. Which of the following has the least energy
 (a) $2p$ (b) $3p$
 (c) $2s$ (d) $4d$
205. Pauli's exclusion principle states that [CPMT 1983, 84]
 (a) Nucleus of an atom contains no negative charge
 (b) Electrons move in circular orbits around the nucleus
 (c) Electrons occupy orbitals of lowest energy
 (d) All the four quantum numbers of two electrons in an atom cannot be equal
206. For the energy levels in an atom, which one of the following statements is correct [AIIMS 1983]
 (a) There are seven principal electron energy levels
 (b) The second principal energy level can have four sub-energy levels and contains a maximum of eight electrons
 (c) The M energy level can have maximum of 32 electrons
 (d) The $4s$ sub-energy level is at a higher energy than the $3d$ sub-energy level
207. The statements [AIIMS 1982]
 (i) In filling a group of orbitals of equal energy, it is energetically preferable to assign electrons to empty orbitals rather than pair them into a particular orbital.
 (ii) When two electrons are placed in two different orbitals, energy is lower if the spins are parallel.
 (a) Aufbau principle
 (b) Hund's rule
 (c) Pauli's exclusion principle
 (d) Uncertainty principle
208. According to Aufbau's principle, which of the three $4d$, $5p$ and $5s$ will be filled with electrons first [MADT Bihar 1999]
 (a) $4d$
 (b) $5p$
 (c) $5s$
 (d) $4d$ and $5s$ will be filled simultaneously
209. The energy of an electron of $2p_y$ orbital is [AMU 1984]
 (a) Greater than that of $2p_x$ orbital
 (b) Less than that of $2p_x$ orbital
 (c) Equal to that of $2s$ orbital
 (d) Same as that of $2p_z$ orbital
210. Which of the following principles/rules limits the maximum number of electrons in an orbital to two [CBSE PMT 1999]
 (a) Aufbau principle
 (b) Pauli's exclusion principle
 (c) Hund's rule of maximum multiplicity
 (d) Heisenberg's uncertainty principle
211. The electrons would go to lower energy levels first and then to higher energy levels according to which of the following [BHU 1990; MP PMT 1993]
 (a) Aufbau principle
 (b) Pauli's exclusion principle
 (c) Hund's rule of maximum multiplicity
 (d) Heisenberg's uncertainty principle
212. Energy of atomic orbitals in a particular shell is in the order [AFMC 1990]
 (a) $s < p < d < f$ (b) $s > p > d > f$
 (c) $p < d < f < s$ (d) $f > d > s > p$
213. Aufbau principle is not satisfied by [MP PMT 1997]
 (a) Cr and Cl (b) Cu and Ag
 (c) Cr and Mg (d) Cu and Na
214. Which of the following explains the sequence of filling the electrons in different shells [AIIMS 1998; BHU 1999]
 (a) Hund's rule (b) Octet rule
 (c) Aufbau principle (d) All of these
215. Aufbau principle is obeyed in which of the following electronic configurations [AFMC 1999]
 (a) $1s^2 2s^2 2p^6$ (b) $1s^2 3p^3 3s^2$
 (c) $1s^2 3s^2 3p^6$ (d) $1s^2 2s^2 3s^2$
216. Following Hund's rule which element contains six unpaired electron [RPET 2000]
 (a) Fe (b) Co
 (c) Ni (d) Cr
217. Electron enters the sub-shell for which $(n + l)$ value is minimum. This is enunciated as [RPMT 2000]
 (a) Hund's rule
 (b) Aufbau principle
 (c) Heisenberg uncertainty principle
 (d) Pauli's exclusion principle

- 218.** The atomic orbitals are progressively filled in order of increasing energy. This principle is called as [MP PET 2001]
 (a) Hund's rule (b) Aufbau principle
 (c) Exclusion principle (d) de-Broglie rule
- 219.** The correct order of increasing energy of atomic orbitals is [MP PET 2002]
 (a) $5p < 4f < 6s < 5d$ (b) $5p < 6s < 4f < 5d$
 (c) $4f < 5p < 5d < 6s$ (d) $5p < 5d < 4f < 6s$
- 220.** The orbital with maximum energy is [CPMT 2002]
 (a) $3d$ (b) $5p$
 (c) $4s$ (d) $6d$
- 221.** p -orbitals of an atom in presence of magnetic field are [Pb. PMT 2002]
 (a) Two fold degenerate (b) Non degenerate
 (c) Three fold degenerate (d) None of these
- 222.** Orbital angular momentum for a d -electron is [MP PET 2003]
 (a) $\frac{6h}{2\pi}$ (b) $\frac{\sqrt{6}h}{2\pi}$
 (c) $\frac{12h}{2\pi}$ (d) $\frac{\sqrt{12}h}{2\pi}$
- 223.** Number of nodal centres for $2s$ orbital [RPET 2003]
 (a) 1 (b) 0
 (c) 4 (d) 3
- 224.** The orbital angular momentum of an electron in $2s$ -orbital is
 (a) $\frac{1}{2} \frac{h}{2\pi}$ (b) $\frac{h}{2\pi}$
 (c) $\sqrt{2} \frac{h}{2\pi}$ (d) Zero
- 225.** The maximum number of electrons present in an orbit $l = 3$, is [Pb. PMT 2004]
 (a) 6 (b) 8
 (c) 10 (d) 14
- 226.** Number of unpaired electrons in Mn^{4+} is [DPMT 2005]
 (a) 3 (b) 5
 (c) 6 (d) 4
- 227.** Which of the following sequence is correct as per Aufbau principle [DPMT 2005]
 (a) $3s < 3d < 4s < 4p$ (b) $1s < 2p < 4s < 3d$
 (c) $2s < 5s < 4p < 5d$ (d) $2s < 2p < 3d < 3p$
- 228.** Electronic configuration of deuterium atom is [J&K CET 2005]
 (a) $1s^1$ (b) $2s^2$
 (c) $2s^1$ (d) $1s^2$
- (a) F^- (b) Oxygen atom
 (c) Mg (d) N^-
- 2.** Atoms consists of protons, neutrons and electrons. If the mass of neutrons and electrons were made half and two times respectively to their actual masses, then the atomic mass of ${}_6C^{12}$ [NCERT 1982]
 (a) Will remain approximately the same
 (b) Will become approximately two times
 (c) Will remain approximately half
 (d) Will be reduced by 25%
- 3.** The increasing order (lowest first) for the values of e/m (charge/mass) for [IIT 1984]
 (a) e, p, n, α (b) n, p, e, α
 (c) n, p, α, e (d) n, α, p, e
- 4.** The electronic configuration of a dipositive metal M^{2+} is 2, 8, 14 and its atomic weight is 56 a.m.u. The number of neutrons in its nuclei would be [MNR 1984, 89; Kerala PMT 1999]
 (a) 30 (b) 32
 (c) 34 (d) 42
- 5.** The ratio of the energy of a photon of $2000\text{\AA}$ wavelength radiation to that of $4000\text{\AA}$ radiation is [IIT 1986; DCE 2000; JIPMER 2000]
 (a) $1/4$ (b) 4
 (c) $1/2$ (d) 2
- 6.** Discovery of the nucleus of an atom was due to the experiment carried out by [CPMT 1983; MP PET 1983]
 (a) Bohr (b) Mosley
 (c) Rutherford (d) Thomson
- 7.** In a Bohr's model of atom when an electron jumps from $n = 1$ to $n = 3$, how much energy will be emitted or absorbed [CBSE PMT 1996]
 (a) $2.15 \times 10^{-11} \text{ erg}$ (b) $0.1911 \times 10^{-10} \text{ erg}$
 (c) $2.389 \times 10^{-12} \text{ erg}$ (d) $0.239 \times 10^{-10} \text{ erg}$
- 8.** The nucleus of an atom can be assumed to be spherical. The radius of the nucleus of mass number A is given by $1.25 \times 10^{-13} \times A^{1/3} \text{ cm}$. Radius of atom is one $\text{\AA}$. If the mass number is 64, then the fraction of the atomic volume that is occupied by the nucleus is [NCERT 1983]
 (a) 1.0×10^{-3} (b) 5.0×10^{-5}
 (c) 2.5×10^{-2} (d) 1.25×10^{-13}
- 9.** The energy of an electron in the first Bohr orbit of H atom is -13.6 eV . The possible energy value(s) of the excited state(s) for electrons in Bohr orbits to hydrogen is(are) [IIT 1998; Orissa JEE 2005]
 (a) -3.4 eV (b) -4.2 eV
 (c) -6.8 eV (d) $+6.8 \text{ eV}$
- 10.** The energy of the electron in the first orbit of He^+ is $-871.6 \times 10^{-20} \text{ J}$. The energy of the electron in the first orbit of hydrogen would be [Roorkee Qualifying 1998]
 (a) $-871.6 \times 10^{-20} \text{ J}$ (b) $-435.8 \times 10^{-20} \text{ J}$

Critical Thinking

Objective Questions

- 1.** Which of the following atoms and ions are isoelectronic i.e. have the same number of electrons with the neon atom [NCERT 1978]

- (c) $-217.9 \times 10^{-20} \text{ J}$ (d) $-108.9 \times 10^{-20} \text{ J}$
11. The total number of valence electrons in 4.2 gm of N_3^- ion is (N_A is the Avogadro's number) [CBSE PMT 1994]
 (a) $1.6 N_A$ (b) $3.2 N_A$
 (c) $2.1 N_A$ (d) $4.2 N_A$
12. The Bohr orbit radius for the hydrogen atom ($n = 1$) is approximately $0.530 \text{ \AA}$. The radius for the first excited state ($n = 2$) orbit is [CBSE PMT 1998; BHU 1999]
 (a) $0.13 \text{ \AA}$ (b) $1.06 \text{ \AA}$
 (c) $4.77 \text{ \AA}$ (d) $2.12 \text{ \AA}$
13. The frequency of a wave of light is $12 \times 10^{14} \text{ s}^{-1}$. The wave number associated with this light is [Pb. PMT 1999]
 (a) $5 \times 10^{-7} \text{ m}$ (b) $4 \times 10^{-8} \text{ cm}^{-1}$
 (c) $2 \times 10^{-7} \text{ m}^{-1}$ (d) $4 \times 10^4 \text{ cm}^{-1}$
14. The series limit for Balmer series of H -spectra is [AMU (Engg.) 1999]
 (a) 3800 (b) 4200
 (c) 3646 (d) 4000
15. The ionization energy of hydrogen atom is -13.6 eV . The energy required to excite the electron in a hydrogen atom from the ground state to the first excited state is (Avogadro's constant = 6.022×10^{23}) [BHU 1999]
 (a) $1.69 \times 10^{-20} \text{ J}$ (b) $1.69 \times 10^{-23} \text{ J}$
 (c) $1.69 \times 10^{23} \text{ J}$ (d) $1.69 \times 10^{25} \text{ J}$
16. The energy required to dislodge electron from excited isolated H -atom, $IE_1 = 13.6 \text{ eV}$ is [DCE 2000]
 (a) $= 13.6 \text{ eV}$ (b) $> 13.6 \text{ eV}$
 (c) < 13.6 and $> 3.4 \text{ eV}$ (d) $\leq 3.4 \text{ eV}$
17. The number of nodal planes in a p_x is [IIT Screening 2000]
 (a) One (b) Two
 (c) Three (d) Zero
18. The third line in Balmer series corresponds to an electronic transition between which Bohr's orbits in hydrogen [MP PMT 2001]
 (a) $5 \rightarrow 3$ (b) $5 \rightarrow 2$
 (c) $4 \rightarrow 3$ (d) $4 \rightarrow 2$
19. Which of the following has maximum number of unpaired electron (atomic number of Fe 26) [MP PMT 2001]
 (a) Fe (b) $Fe(II)$
 (c) $Fe(III)$ (d) $Fe(IV)$
20. The frequency of one of the lines in Paschen series of hydrogen atom is $2.340 \times 10^{11} \text{ Hz}$. The quantum number n_2 which produces this transition is [DPMT 2001]
 (a) 6 (b) 5
 (c) 4 (d) 3

21. Which of the following electron transition in a hydrogen atom will require the largest amount of energy [UPSEAT 1999, 2000, 01]
 (a) From $n = 1$ to $n = 2$ (b) From $n = 2$ to $n = 3$
 (c) From $n = \infty$ to $n = 1$ (d) From $n = 3$ to $n = 5$
22. In Bohr series of lines of hydrogen spectrum, the third line from the red end corresponds to which one of the following inter-orbit jumps of the electron for Bohr orbits in an atom of hydrogen [AIEEE 2003]
 (a) $3 \rightarrow 2$ (b) $5 \rightarrow 2$
 (c) $4 \rightarrow 1$ (d) $2 \rightarrow 5$
23. The value of Planck's constant is $6.63 \times 10^{-34} \text{ Js}$. The velocity of light is $3.0 \times 10^8 \text{ ms}^{-1}$. Which value is closest to the wavelength in nanometres of a quantum of light with frequency of $8 \times 10^{15} \text{ s}^{-1}$ [CBSE PMT 2003]
 (a) 3×10^7 (b) 2×10^{-25}
 (c) 5×10^{-18} (d) 4×10^1
24. As electron moves away from the nucleus, its potential energy [UPSEAT 2003]
 (a) Increases (b) Decreases
 (c) Remains constant (d) None of these

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

1. Assertion : The position of an electron can be determined exactly with the help of an electron microscope.
 Reason : The product of uncertainty in the measurement of its momentum and the uncertainty in the measurement of the position cannot be less than a finite limit. [NDA 1999]
2. Assertion : A spectral line will be seen for a $2p_x - 2p_y$ transition.
 Reason : Energy is released in the form of wave of light when the electron drops from $2p_x - 2p_y$ orbital. [AIIMS 1996]
3. Assertion : The cation energy of an electron is largely determined by its principal quantum number.
 Reason : The principal quantum number n is a measure of the most probable distance of finding the electron around the nucleus. [AIIMS 1996]

4. Assertion : Nuclide $^{30}\text{Al}_{13}$ is less stable than $^{40}\text{Ca}_{20}$
Reason : Nuclides having odd number of protons and neutrons are generally unstable
[IIT 1998]
5. Assertion : The atoms of different elements having same mass number but different atomic number are known as isobars
Reason : The sum of protons and neutrons, in the isobars is always different [AIIMS 2000]
6. Assertion : Two electrons in an atom can have the same values of four quantum numbers.
Reason : Two electrons in an atom can be present in the same shell, sub-shell and orbital and have the same spin [AIIMS 2001]
7. Assertion : The value of n for a line in Balmer series of hydrogen spectrum having the highest wave length is 4 and 6.
Reason : For Balmer series of hydrogen spectrum, the value $n_1 = 2$ and $n_2 = 3, 4, 5$.
[AIIMS 1992]
8. Assertion : Absorption spectrum consists of some bright lines separated by dark spaces.
Reason : Emission spectrum consists of dark lines.
[AIIMS 2002]
9. Assertion : A resonance hybrid is always more stable than any of its canonical structures.
Reason : This stability is due to delocalization of electrons. [AIIMS 1999]
10. Assertion : Cathode rays do not travel in straight lines.
Reason : Cathode rays penetrate through thick sheets [AIIMS 1996]
11. Assertion : Electrons revolving around the nucleus do not fall into the nucleus because of centrifugal force.
Reason : Revolving electrons are planetary electrons.
[AIIMS 1994]
12. Assertion : Threshold frequency is a characteristic for a metal.
Reason : Threshold frequency is a maximum frequency required for the ejection of electron from the metal surface.
13. Assertion : The radius of the first orbit of hydrogen atom is $0.529\text{\AA}$.
Reason : Radius for each circular orbit (r_n) = $0.529\text{\AA} (n^2 / Z)$, where $n = 1, 2, 3$ and Z = atomic number.
14. Assertion : $3d_{z^2}$ orbital is spherically symmetrical.
Reason : $3d_{z^2}$ orbital is the only d -orbital which is spherical in shape.
15. Assertion : Spin quantum number can have the value $+1/2$ or $-1/2$.
Reason : (+) sign here signifies the wave function.
16. Assertion : Total number of orbitals associated with principal quantum number $n = 3$ is 6.
Reason : Number of orbitals in a shell equals to $2n$.
17. Assertion : Energy of the orbitals increases as $1s < 2s = 2p < 3s = 3p < 3d < 4s = 4p = 4d = 4f < \dots$
Reason : Energy of the electron depends completely on principal quantum number.
18. Assertion : Splitting of the spectral lines in the presence of magnetic field is known as Stark effect.
Reason : Line spectrum is simplest for hydrogen atom.
19. Assertion : Thomson's atomic model is known as 'raisin pudding' model.
Reason : The atom is visualized as a pudding of positive charge with electrons (raisins) embedded in it.
20. Assertion : Atomic orbital in an atom is designated by n, l, m_l and m_s .
Reason : These are helpful in designating electron present in an orbital.
21. Assertion : The transition of electrons $n_3 \rightarrow n_2$ in H atom will emit greater energy than $n_4 \rightarrow n_3$.
Reason : n_3 and n_2 are closer to nucleus than n_4 .
22. Assertion : Cathode rays are a stream of α -particles.
Reason : They are generated under high pressure and high voltage.
23. Assertion : In case of isoelectronic ions the ionic size increases with the increase in atomic number.
Reason : The greater the attraction of nucleus, greater is the ionic radius.

AS Answers and Solutions

Discovery and Properties of anode, cathode rays neutron and Nuclear structure

- (d) Neutrons and protons in the nucleus and electrons in the extranuclear region.
- (a) It consists of proton and neutron and these are also known as nucleones.
- (c) Radius of nucleus $\simeq 10^{-15}m$.
- (c) Positive ions are formed from the neutral atom by the loss of electrons.
- (b) The β -ray particle constitute electrons.
- (a) James Chadwick discovered neutron (${}_0n^1$).
- (b) Charge/mass for

$$n = 0, \alpha = \frac{2}{4}, p = \frac{1}{1} \text{ and } e = \frac{1}{1/1837}$$
- (d) The density of neutrons is of the order $10^{11}kg/cc$.

- (c) This is because chargeless particles do not undergo any deflection in electric or magnetic field.
- (b) Neutron and proton found in nucleus.
- (b) Cathode rays are made up of negatively charged particles (electrons) which are deflected by both the electric and magnetic fields.
- (b) Mass of neutron is greater than that of proton, meson and electron.
 Mass of neutron = mass of proton + mass of electron
- (b) Proton is 1837 (approx 1800) times heavier than an electron. Penetration power $\propto \frac{1}{\text{mass}}$
- (c) Nucleus of helium is ${}_2He^4$ mean 2 neutrons and 2 protons.
- (c) Proton is the nucleus of H – atom (H – atom devoid of its electron).
- (b) Cathode rays are made up of negatively charged particles (electrons, e^-)
- (c) Size of nucleus is measured in *Fermi* (1 Fermi = $10^{-15}m$).
- (b) A molecule of an element is a incorrect statement. The correct statement is “an element of a molecule”.

29. (c) Proton is represented by p having charge +1 discovered in 1888 by Goldstein.
31. (b) The nature of anode rays depends upon the nature of residual gas.
32. (d) H^+ (proton) will have very large hydration energy due to its very small ionic size
Hydration energy $\propto \frac{1}{\text{Size}}$
33. (b) Mass of a proton $= 1.673 \times 10^{-24} \text{ g}$
 $\therefore$ Mass of one mole of proton
 $= 9.1 \times 10^{-24} \times 6.02 \times 10^{23} = 10.07 \times 10^{-1} = 1.008 \text{ g}$
Mass of a electron $= 9.1 \times 10^{-28} \text{ g}$
 $\therefore$ Mass of one mole of electron
 $= 9.1 \times 10^{-28} \times 6.02 \times 10^{23} = 54.78 \times 10^{-5} \text{ g} = 0.55 \text{ mg}$.
35. (c) One mole of electron $= 6.023 \times 10^{23}$ electron
Mass of one electron $= 9.1 \times 10^{-31} \text{ gm}$
Mass of one mole of electrons
 $= 6.023 \times 10^{23} \times 9.1 \times 10^{-31} \text{ gm} = 5.48 \times 10^{-4} \text{ gm}$
 $= 5.48 \times 10^{-4} \times 1000 \text{ mg} = 0.548 \text{ mg} \approx 0.55 \text{ mg}$.
36. (a) Charge on proton $= +1$ unit, charge on α particle $= +2$ units, 2 : 1.
37. (b) $m_p / m_e \approx 1837 \approx 1.8 \times 10^3$.
38. (a) Splitting of signals is caused by protons attached to adjacent carbon provided these are not equivalent to the absorbing proton.
39. (d) Nucleus consists of proton and neutron both are called as nucleon.
40. (c) Positron ($+1e^0$) has the same mass as that of an electron ($-1e^0$).
41. (c) Electron $\frac{1}{1837}$ time lighter than proton so their mass ratio will be 1 : 1837
12. (c) Most probable radius $= a_0 / Z$
where $a_0 = 52.9 \text{ pm}$. For helium ion, $Z = 2$.
 $r_{\infty} = \frac{52.9}{2} = 26.45 \text{ pm}$.
13. (b) Four unpaired electron are present in the Fe^{2+} ion
 $Fe_{26}^{2+} = [Ar] 3d^6, 4s^0$
14. (c) Na^+ has 10 electron and Li^+ has 2 electron so these are different number of electron from each other.
16. (c) $P_{15} = 2, 8, 5$
17. (c) ${}_8O = 1s^2 2s^2 2p^4$
18. (a) ${}_{35}Br^{80} = 1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^2 4p^5$
 $A = 80, Z = 35, N = ?$
 $N = A - Z = 80 - 35 = 45$
atomic number (Proton) is 35 and no. of neutron is 45.
19. (c) ${}^{16}_8O^{--}$ have more electrons than neutron
 $p = 8, e = 10, n = 8$.
20. (a) ${}_6A^{12}$ and ${}_6X^{13}$ both are isotopes but have different no. of neutrons.
 ${}_6A^{12}$, For A have $p = 6, e = 6$ and $n = 6$ and
 ${}_6X^{13}$, For B have $p = 6, e = 6$ and $n = 7$
21. (c) $P = 20$, mass no. (A) $= 40$
 $N = A - P = 40 - 20 = 20$
 $P = N = 20$.
22. (b) Electrons in $Na^+ = 11 - 1 = 10$
Electrons in $Mg^{2+} = 12 - 2 = 10$
23. (c) ${}_{20}Ca^{40}$ has 20 proton, 20 neutron.
24. (d) $CH_3^+ = 6 + 3 - 1 = 8e^-$,
 $H_3O^+ = 3 + 8 - 1 = 10e^-$,
 $NH_3 = 7 + 3 = 10e^-$, $CH_3^- = 6 + 3 + 1 = 10e^-$
25. (b) $-CONH_2 = 6 + 8 + 7 + 2 + 1$ (from other atom to form covalent bond) $= 24$.
26. (b) Complete $E.C. = [Ar] 3d^{10} 4s^2 4p^6$.
Hence no. of $e^- =$ no. of protons $= 36 = Z$.
28. (a) $K^+ = 1s^2 2s^2 2p^6 3s^2 3p^6$
 $Cl^- = 1s^2 2s^2 2p^6 3s^2 3p^6$.
29. (c) Mass no. $\approx$ At. Wt.
Mass no. $=$ no. of protons $+$ no. of neutrons
At. no. $=$ no. of protons.
30. (b) $N_2O = 14 + 8 = 22$
 $CO_2 = 6 + 16 = 22$.
31. (c) Neutron in ${}^{12}_6C = 6$, Neutrons in ${}^{28}_{14}Si = 14$
Ratio $= 6 : 14 = 3 : 7$.
33. (d) $N_7 = 1s^2 2s^2 2p^3$
 $N^+ = 1s^2 2s^2 2p^2$

Atomic number, Mass number, Atomic species

1. (b) The number of electrons in an atom is equal to its atomic number i.e. number of protons.
2. (a) No. of protons $=$ Atomic no. $= 25$ and no. of neutron $= 55 - 25 = 30$.
3. (b) No. of neutrons $=$ mass number $-$ no. of protons. $= W - N$.
4. (b) ${}_{30}Zn^{70}, Zn^{2+}$ has No. of Neutrons $= 70 - 30 = 40$.
5. (a) Na^+ and Ne are isoelectronic which contain 10 electrons.
6. (a) One molecule of CO_2 have 22 electrons.
7. (c) Cl and Cl^- differs in number of electrons. Cl has $17e^-$ while Cl^- has $18e^-$.
8. (b) CO and CN^- are isoelectronic.
 $CO = 6 + 8 = 14$ and $CN^- = 6 + 7 + 1 = 14$.
9. (c) Mass of an atom is due to nucleus (neutron + proton).
10. (b) Atomic number is defined as the number of protons in the nucleus.
11. (b) ${}_{26}X^{56} \quad A = P + N = Z + N = E + N$
 $N = A - E = 56 - 26 = 30$

$$C = 1s^2 2s^2 2p^2.$$

34. (c) $O = C = O$, linear structure 180° angle
 $Cl - Hg - Cl$, linear structure 180° angle.
35. (c) $H^- = 1s^2$ and $He^+ = 1s^2$.
36. (c) In the nucleus of an atom only proton and neutrons are present.
37. (c) Cu_{29}^{63} Number of neutrons = atomic mass – atomic number = $63 - 29 = 34$.
38. (b) 21 Protons and 24 Neutrons are present in nucleus and element is Sc.
40. (c) ${}_7X^{14}$, $n = 14 - 7 = 7$
42. (c) Cl^- have 17 proton, 18 neutron and 18 electron.
43. (a) Number of unpaired electrons in inert gas is zero because they have full filled orbitals.
44. (c) Electrons and Protons are same in neutral atom.
48. (d) No. of proton and no. of electron = $18[Ar_{18}^{36}]$ and No. of neutron = 20
 Mass number = $P + N = 18 + 20 = 38$.
49. (c) In Xe_{89}^{231} number of protons and electrons is 89 and No. of neutrons = $A - Z = 231 - 89 = 142$.
51. (a) NO_2^- and O_3 are isostere. The number of atoms in these (= 3) and number of electrons (24) are same.
52. (c) Number of electrons in nitrogen = 7 and number of electron in oxygen = 8 we know that formula of nitrate ion is NO_3^- we also know that number of electron = $(1 \times \text{Number of electrons in nitrogen}) + (3 \times \text{number of electrons in oxygen}) + 1$
 $= (1 \times 7) + (3 \times 8) + 1 = 32$.
53. (b) Atomicity = $\frac{\text{Molecular mass}}{\text{Atomic mass}} = \frac{256}{32} = 8 = S_8$.
54. (a) In case of N^{3-} , $p = 7$ and $c = 10$
55. (c) Chlorine $Cl_{17} = [Ne]$
- $$\begin{array}{c} 3s \qquad \qquad 3p \\ \boxed{\uparrow\downarrow} \quad \boxed{\uparrow\downarrow} \quad \boxed{\uparrow\downarrow} \quad \boxed{\uparrow} \end{array}$$
56. (a) Bromine consists of outer most electronic configuration $[Ar] 3d^{10} 4s^2 4p^5$.
57. (d) $Na^+ = 1s^2 2s^2 2p^6$
 $Mg = 1s^2 2s^2 2p^6$
 $O^{2-} = 1s^2 2s^2 2p^6$
 $Cl^- = 1s^2 2s^2 2p^6 3s^2 3p^6$
60. (a) Ar_{18}^{40} = atomic number 18 and no. of Neutron in case of Ar_{22}
 Neutron = Atomic mass – Atomic number
 $= 40 - 18 = 22$
61. (d) Nucleus of tritium contain $[H_1^3]$
 $p = 1$, $e = 1$, $n = 2$

62. (b) N^{3-} , F^- and Na^+ (These three ions have $e^- = 10$, hence they are isoelectronic)
63. (a) NO_3^- and CO_3^{2-} consist of same electron and show same isostructural.
64. (c) Atomic number of chlorine 17 and in Cl^- ion total no. of electron = 18.
65. (b) Tritium (H_1^3) has one proton and two neutron.
67. (c) $X_{35} = 1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^{10} 4s^2 4p^5$
 Total no. of e^- is all p -orbitals = $6 + 6 + 5 = 17$.
68. (a) Since its nucleus contain 9 proton so its. atomic number is 9 and its electronic configuration is 2, 7. So it require one more electron to complete its octet. Hence its valency is 1.
69. (d) K_2S formed by K^+ and S^{2-} ion. We know that atomic number of K is 19 and in K^+ ion its atomic number would be 18 similarly atomic number of S is 16 and in form S^{2-} ion its atomic number would be 18 so the K^+ and S^{2-} are isoelectronic with each other in K_2S .
70. (d) ${}_{20}Ca = 2, 8, 8, 2$
 $Ca^{2+} = 2, 8, 8$
 Hence, Ca^{2+} has 8 electrons each in outermost and penultimate shell.
71. (c) Atomic no. of $C = 6$ so the number of protons in the nucleus = 6
72. (a) No. of $P = Z = 7$; No. of electrons in $N^{3-} = 7 + 3 = 10$.
73. (b) Heavy hydrogen is ${}_1^2D$. Number of neutrons = 1
74. (d) Atomic number is always whole number.

Atomic models and Planck's quantum theory

2. (a) The central part consisting whole of the positive charge and most of the mass caused by nucleus, is extremely small in size compared to the size of the atom.
3. (b) Electrons in an atom occupy the extra nuclear region.
4. (b) According to the Bohr model atoms or ions contain one electron.
5. (d) The nucleus occupies much smaller volume compared to the volume of the atom.
7. (c) α -particles pass through because most part of the atom is empty.
8. (b) An electron jumps from L to K shell energy is released.
9. (c) Neutron is a chargeless particles, so it does not deflected by electric or magnetic field.
10. (a) Energy is always absorbed or emitted in whole number or multiples of quantum.
11. (b) Both He and Li^+ contain 2 electrons each.
18. (c) During the experimental verification of de-Broglie equation, Davisson and Germer confirmed wave nature of electron.
19. (a) Increases due to absorption of energy and it shows absorption spectra.
20. (d) Rutherford α -Scattering experiment.
21. (d) It represents Heisenberg's uncertainty principle.
23. (d) $\frac{E_4}{E_2} = \frac{2^2}{4^2} = \frac{4}{16} = \frac{1}{4}$; $E_4 = \frac{E_2}{4} = \frac{-328}{4} = -82 \text{ kJ/mol}$.
27. (c) When $c = \nu \times \lambda$ then $\lambda = \frac{c}{\nu} = \frac{3 \times 10^8}{2 \times 10^6} = 1.5 \times 10^2 \text{ m}$

28. (b) According to quantum theory of radiation, a hot body emits radiant energy not continuously but discontinuously in the form of small packets of energy called quanta or photons.
30. (a) $p = \frac{h}{\lambda} = \frac{6.6 \times 10^{-34}}{2.2 \times 10^{-11}} = 3 \times 10^{-23} \text{ kgms}^{-1}$
34. (b) Bohr's radius = $\frac{n^2 h^2}{4\pi^2 m e^2 Z}$. Which is a positive quantity.
40. (a) Gold used by Rutherford in scattering experiment.
41. (c) $\Delta E = E_3 - E_2 = 13.6 \left[\frac{1}{(2)^2} - \frac{1}{(3)^2} \right] = 1.9 \text{ eV}$
42. (d) $R = R_0 (= 1.4 \times 10^{-13} \text{ cm}) \times A^{1/3}$
43. (d) $\left(\frac{q}{m} \right)_\alpha = \frac{1}{2} \left(\frac{q}{m} \right)_p = \frac{1}{2} \times 9.6 \times 10^7 = 4.8 \times 10^7 \text{ C kg}^{-1}$
44. (a) According to Hydrogen spectrum series.
45. (d) The electron can move only in these circular orbits where the angular momentum is a whole number multiple of $\frac{h}{2\pi}$ or it is quantised.
46. (b) Generally electron moving in orbits according to Bohr's principle.
47. (a) According to the planck's law that energy of a photon is directly proportional to its frequency i.e. $E = h\nu$
49. (d) Bohr's radius of the hydrogen atom
 $r = \frac{n^2 \times 0.529 \text{ \AA}}{Z}$; where Z = Atomic number,
 n = Number of orbitals
51. (a) $E = -\frac{2.172 \times 10^{-18}}{n^2} = -\frac{2.172 \times 10^{-18}}{2^2}$
 $= -5.42 \times 10^{-19} \text{ J}.$
52. (c) $\Delta E = \frac{hc}{\lambda}$ or $\lambda = \frac{hc}{\Delta E}$
 $= \frac{6.64 \times 10^{-34} \times 3 \times 10^8}{3 \times 10^{-8}} = 6.64 \times 10^{-8} \text{ \AA}$
53. (d) $r_n = r_1 \times n^2$
 $r_3 = 0.53 \times 3^2 = 0.53 \times 9 = 4.77 \text{ \AA}$
54. (c) According to Rutherford an atom consists of nucleus which is small in size but carries the entire mass ($P^+ N$).
55. (b) Wavelength of spectral line emitted is inversely proportional to energy $\lambda \propto \frac{1}{E}$.
56. (b) $E \propto \frac{1}{\lambda}$; $E_1 = \frac{1}{8000}$; $E_2 = \frac{1}{16000}$
 $\frac{E_1}{E_2} = \frac{16000}{8000} = 2 \Rightarrow E_1 = 2E_2$
58. (a) $\nu = \frac{c}{\lambda} = \frac{3 \times 10^8 \text{ ms}^{-1}}{600 \times 10^{-9} \text{ m}} = 5.0 \times 10^{14} \text{ Hz}.$
59. (b) $E = \frac{-13.6}{n^2} \text{ eV} = \frac{-13.6}{2^2} = \frac{-13.6}{4} = -3.40 \text{ eV}$
65. (b) Bohr radius = $\frac{r_2}{r_1} = \frac{(2)^2}{(1)^2} = 4.$
66. (b) $\nu = \frac{1}{\lambda} = R \left[\frac{1}{n_1^2} - \frac{1}{n_2^2} \right] = 109678 \left[\frac{1}{1} - \frac{1}{4} \right] = 82258.5$
 $\lambda = 1.21567 \times 10^{-5} \text{ cm}$ or $\lambda = 12.1567 \times 10^{-6} \text{ cm}$
 $= 12.1567 \times 10^{-8} \text{ m}$
 $\nu = \frac{c}{\lambda} = \frac{3 \times 10^8}{12.1567 \times 10^{-8}} = 24.66 \times 10^{14} \text{ Hz}.$
67. (c) We know that $\lambda = \frac{h}{mv}$; $\therefore m = \frac{h}{m\lambda}$
The velocity of photon (ν) = $3 \times 10^8 \text{ m sec}^{-1}$
 $\lambda = 1.54 \times 10^{-8} \text{ cm} = 1.54 \times 10^{-10} \text{ meter}$
 $\therefore m = \frac{6.626 \times 10^{-34} \text{ Js}}{1.54 \times 10^{-10} \text{ m} \times 3 \times 10^8 \text{ m sec}^{-1}}$
 $= 1.4285 \times 10^{-32} \text{ kg}.$
68. (a) The splitting of spectral line by the magnetic field is called Zeeman effect.
69. (b) $r \propto n^2$ (excited state $n = 2$)
 $r = 4a_0$
70. (d) $r_n \propto n^2$; $A_n \propto n^4$
 $\frac{A_2}{A_1} = \frac{n_2^4}{n_1^4} = \frac{2^4}{1^4} = \frac{16}{1} = 16:1$
71. (a) It will take $\frac{4\pi^2 mr^2}{nh}$
72. (d) $r_H = 0.529 \frac{n^2}{Z} \text{ \AA}$
For hydrogen; $n = 1$ and $Z = 1$ therefore
 $r_H = 0.529 \text{ \AA}$
For Be^{3+} ; $Z = 4$ and $n = 2$ Therefore
 $r_{\text{Be}^{3+}} = \frac{0.529 \times 2^2}{4} = 0.529 \text{ \AA}.$
73. (a) $E_{\text{ionisation}} = E_\infty - E_n = \frac{13.6 Z_{\text{eff}}^2}{n^2} \text{ eV}$
 $= \left[\frac{13.6 Z^2}{n_2^2} - \frac{13.6 Z^2}{n_1^2} \right]$
 $E = h\nu = \frac{13.6 \times 1^2}{(1)^2} - \frac{13.6 \times 1^2}{(4)^2}$; $h\nu = 13.6 - 0.85$
 $\therefore h = 6.625 \times 10^{-34}$
 $\nu = \frac{13.6 - 0.85}{6.625 \times 10^{-34}} \times 1.6 \times 10^{-19} = 3.08 \times 10^{15} \text{ s}^{-1}.$
74. (c) $\frac{1}{\lambda} = R \left[\frac{1}{n_1^2} - \frac{1}{n_2^2} \right]$
 $\frac{1}{\lambda} = 1.097 \times 10^7 \text{ m}^{-1} \left[\frac{1}{1^2} - \frac{1}{\infty^2} \right]$
 $\therefore \lambda = 91 \times 10^{-9} \text{ m}$
We know $10^{-9} = 1 \text{ nm}$ So $\lambda = 91 \text{ nm}$
75. (d) $r \propto n^2$
For Ist orbit $\gamma = 1$
For IIIrd orbit = $\gamma \propto 3^2 = 9$
So it will 9γ .
76. (b) Bohr suggest a formulae to calculate the radius and energy of each orbit and gave the following formulae

$$r_n = \frac{n^2 h^2}{4\pi^2 m e^4 Z}$$

Where except n^2 , all other unit are constant so $r_n \propto n^2$.

77. (a) Energy of an electron $E = \frac{-E_0}{n^2}$

For energy level ($n = 2$)

$$E = -\frac{13.6}{(2)^2} = \frac{-13.6}{4} = -3.4 \text{ eV}.$$

78. (a) Energy of ground stage (E_0) = -13.6 eV and energy level = 5

$$E_5 = \frac{-13.6}{n^2} \text{ eV} = \frac{-13.6}{5^2} = \frac{-13.6}{25} = -0.54 \text{ eV}.$$

79. (c) Positive charge of an atom is present in nucleus.

81. (a) For $n_4 \rightarrow n_1$, greater transition, greater the energy difference, lesser will be the wavelength.

Dual nature of electron

1. (c) According to de-Broglie equation $\lambda = \frac{h}{mv}$ or $\frac{h}{p}$ or $\frac{h}{mc}$.

4. (b) $\lambda = \frac{h}{p}$ or $\frac{h}{mv}$ or $\frac{h}{mc}$ de-Broglie equation.

5. (c) Emission spectra of different λ accounts for quantisation of energy.

6. (b) According to de-Broglie equation

$$\lambda = \frac{h}{mv}, p = mv, \lambda = \frac{h}{p}, \lambda = \frac{h}{mc}$$

7. (d) According to de-Broglie $\left(\lambda = \frac{h}{mv} \right)$.

8. (a) $\lambda = \frac{h}{mv} = \frac{6.63 \times 10^{-34}}{10^{-3} \times 100} = 6.63 \times 10^{-33} \text{ m}$

9. (d) $\lambda = \frac{h}{mv}$. For same velocity $\lambda \propto \frac{1}{m}$.

SO_2 molecule has least wavelength because their molecular mass is high.

10. (d) de-Broglie equation is $\lambda = \frac{h}{p}$.

11. (c) Formula for de-Broglie wavelength is

$$\lambda = \frac{h}{p} \text{ or } \lambda = \frac{h}{mv} \Rightarrow eV = \frac{1}{2}mv^2 \text{ or } v = \sqrt{\frac{2eV}{m}}$$

$$\lambda = \frac{h}{\sqrt{2meV}} = \frac{6.62 \times 10^{-34}}{\sqrt{2 \times 9.1 \times 10^{-31} \times 2.8 \times 10^{-23}}}$$

$$\lambda = 9.28 \times 10^{-8} \text{ meter}.$$

12. (c) $\lambda = \frac{h}{p}, p = mv$

$$\lambda = \frac{h}{mv} = \frac{6.62 \times 10^{-34}}{9.1 \times 10^{-31} \times 1.2 \times 10^5}$$

$$\lambda = 6.626 \times 10^{-9} \text{ m}.$$

13. (b) Mass of the particle (m) = 10^{-6} kg and velocity of the particle (v) = 10 ms^{-1}

$$\lambda = \frac{h}{mv} = \frac{6.63 \times 10^{-34}}{10^{-6} \times 10} = 6.63 \times 10^{-29} \text{ m}$$

15. (b) According to de-Broglie

$$\lambda = \frac{h}{mv} = \frac{6.62 \times 10^{-20} \text{ erg.sec}}{2} \times \frac{5 \times 10^4 \text{ cm/sec}}{6.023 \times 10^{23}}$$

$$= \frac{6.62 \times 10^{-27} \times 6.023 \times 10^{23}}{2 \times 5 \times 10^4} \text{ cm} = 4 \times 10^{-8} \text{ cm} = 4 \text{ \AA}.$$

16. (c) $\lambda = \frac{h}{mv} = \frac{6.625 \times 10^{-34}}{0.2 \text{ kg} \times \frac{5}{60 \times 60 \text{ ms}^{-1}}} = 10^{-30} \text{ m}.$

17. (c) From de Broglie equation

$$\lambda = \frac{h}{mv} = \frac{6.62 \times 10^{-34}}{0.5 \times 100} = 1.32 \times 10^{-35} \text{ m}.$$

18. (c) Dual nature of particle was proposed by de-broglie who gave the following equation for the wavelength.

$$\lambda = \frac{h}{mv}$$

19. (b) One percent of the speed of light is

$$v = \left(\frac{1}{100} \right) (3.00 \times 10^8 \text{ ms}^{-1}) = 3.00 \times 10^6 \text{ ms}^{-1}$$

$$\text{Momentum of the electron } (p) = m v$$

$$= (9.11 \times 10^{-31} \text{ kg})(3.00 \times 10^6 \text{ ms}^{-1})$$

$$= 2.73 \times 10^{-24} \text{ kg ms}^{-1}$$

The de-broglie wavelength of this electron is

$$\lambda = \frac{h}{p} = \frac{6.626 \times 10^{-34}}{2.73 \times 10^{-24} \text{ kgms}^{-1}}$$

$$\lambda = 2.424 \times 10^{-10} \text{ m}.$$

20. (a) We know that the correct relationship between wavelength and momentum is $\lambda = \frac{h}{p}$. Which is given by de-Broglie.

21. (d) De-broglie equation applies to all the material object in motion.

Uncertainty principle and Schrodinger wave equation

1. (b) The uncertainty principle was enunciated by Heisenberg.

2. (b) According to uncertainty principle, the product of uncertainties of the position and momentum, is $\Delta x \times \Delta p \geq h/4\pi$.

5. (c) $\Delta x \times \Delta p = \frac{h}{4\pi}$ is not the correct relation. But correct

$$\text{Heisenberg's uncertainty equation is } \Delta x \times \Delta p \geq \frac{h}{4\pi}.$$

7. (b) According to the Heisenberg's uncertainty principle momentum and exact position of an electron can not be determined simultaneously.

8. (d) $\Delta x \cdot \Delta p \geq \frac{h}{4\pi}$, if $\Delta x = 0$ then $\Delta p = \infty$.

12. (c) According to $\Delta x \times \Delta p = \frac{h}{4\pi}$

$$\Delta x = \frac{h}{\Delta p \times 4\pi} = \frac{6.62 \times 10^{-34}}{1 \times 10^{-5} \times 4 \times 3.14} = 5.27 \times 10^{-30} \text{ m}.$$

13. (a) Uncertainty of moving bullet velocity

$$\Delta v = \frac{h}{4\pi \times m \times \Delta v} = \frac{6.625 \times 10^{-34}}{4 \times 3.14 \times 0.01 \times 10^{-5}}$$

$$= 5.2 \times 10^{-28} \text{ m/sec.}$$
14. (b) $\Delta x \cdot \Delta p \geq \frac{h}{4\pi}$ This equation shows Heisenberg's uncertainty principle. According to this principle the product of uncertainty in position and momentum of particle is greater than equal to $\frac{h}{4\pi}$.
15. (d) Spin quantum number does not related with Schrodinger equation because they always show $+1/2, -1/2$ value.
16. (b) According to $\Delta x \times m \times \Delta v = \frac{h}{4\pi}$; $\Delta v = \frac{h}{\Delta x \times m \times 4\pi}$

$$= \frac{6.6 \times 10^{-34}}{10^{-5} \times 0.25 \times 3.14 \times 4} = 2.1 \times 10^{-29} \text{ m/s}$$
17. (a) Uncertainty in position $\Delta x = \frac{h}{4\pi \times \Delta p}$

$$= \frac{6.63 \times 10^{-34}}{4 \times 3.14 \times (1 \times 10^{-5})} = 5.28 \times 10^{-30} \text{ m.}$$
18. (c) Given that mass of electron $= 9.1 \times 10^{-31} \text{ kg}$
 Planck's constant $= 6.63 \times 10^{-34} \text{ kg m}^2 \text{ s}^{-1}$
 By using $\Delta x \times \Delta p = \frac{h}{4\pi}$; $\Delta x \times \Delta v \times m = \frac{h}{4\pi}$
 where : Δx = uncertainty in position
 Δv = uncertainty in velocity

$$\Delta x \times \Delta v = \frac{h}{4\pi \times m}$$

$$= \frac{6.63 \times 10^{-34}}{4 \times 3.14 \times 9.1 \times 10^{-31}} = 5.8 \times 10^{-5} \text{ m}^2 \text{ s}^{-1}.$$
10. (a) $3d$ subshell filled with 5 electrons (half-filled) is more stable than that filled with 4 electrons. $1, 4s$ electrons jumps into $3d$ subshell for more stability.
11. (c) In $2p$ – orbital, 2 denotes principal quantum number (n) and p denotes azimuthal quantum number ($l = 1$).
12. (c) Electronic configuration of H^- is $1s^2$. It has 2 electrons in extra nuclear space.
13. (a) The electronic configuration must be $1s^2 2s^1$. Hence, the element is lithium ($z = 3$).
14. (a) Principal quantum no. tells about the size of the orbital.
15. (d) An element has the electronic configuration $1s^2, 2s^2 2p^6, 3s^2 3p^2$, (Si). It's valency electrons are four.
16. (c) The magnetic quantum number specifies orientation of orbitals.
17. (c) If $l = 2, m \neq -3$. $= (-e \text{ to } +e)$.
18. (d) If $n = 3$ then $l = 0, 1, 2$ but not 3.
20. (c) Atomic number of Cu is $29 = (Ar) 4s^1 3d^{10}$.
21. (c) The shape of $2p$ orbital is dumb-bell.
22. (a) When the value of $n = 2$, then $l = 1$ and the value of $m = -1, 0, +1$ i.e. 3 values.
23. (c) $Cr_{24} = (Ar) 3d^5 4s^1$ electronic configuration because half filled orbital are more stable than other orbitals.
24. (d) Kr has zero valency because it contains 8 electrons in outermost shell.
25. (c) 2 electron in the valence shell of calcium $Ca_{20} = (2, 8, 8, 2)$.
27. (b) Value of $l = 1$ means the orbital is p (dumb-bell shape).
28. (d) Cr has $[Ar] 4s^1 3d^5$ electronic configuration because half filled orbital are more stable than other orbitals.
31. (d) The two electrons will have opposite spins.
33. (c) If $m = -3$, then $l = 3$, for this value n must be 4.
34. (d) No. of electrons $= 2n^2$ hence no. of orbital $= \frac{2n^2}{2} = n^2$.
35. (d) No. of electrons $= 2n^2$ hence no. of orbital $= \frac{2n^2}{2} = n^2$.
36. (c) If $n = 3$ then $l = 0$ to $n-1$ & $m = -l$ to $+l$
37. (b) $Na_{11} = 2, 8, 1 = 1s^2, 2s^2 2p^6, 3s^1$
 $n = 3, l = 0, m = 0, s = +1/2$
38. (b) Hund's rule states that pairing of electrons in the orbitals of a subshell (orbitals of equal energy) starts when each of them is singly filled.
39. (d) As a result of attraction, some energy is released. So at infinite distance from the nucleus energy of any electron will be maximum. For bringing electrons from ∞ to the orbital of any atom some work has to be done by electrons hence it will lose its energy for doing that work.
40. (c) This space is called nodal space where there is no possibility of presence of electrons.
41. (d) For s orbital $l = 0$ $m = 0$.
42. (c) For M^{th} shell, $n = 3$; so maximum no. of electrons in M^{th} shell $= 2n^2 = 2 \times 3^2 = 18$.

Quantum number, Electronic configuration and Shape of orbitals

3. (b) The shape of an orbital is given by azimuthal quantum number ' l '.
5. (c) Hund's rule states that pairing of electrons in the orbitals of a subshell (orbitals of equal energy) starts when each of them is singly filled.
6. (c) $1s^2, 2s^2, 2p^6$ represents a noble gas electronic configuration.
7. (c) The electronic configuration of Ag in ground state is $[Kr] 4d^{10} 5s^1$.
8. (a) n, l and m are related to size, shape and orientation respectively.
9. (a) Electronic configuration of $Rb_{(37)}$ is

$$1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^2 4p^6 5s^1$$

 So for the valence shell electron ($5s^1$)

$$n = 5, l = 0, m = 0, s = +\frac{1}{2}$$

43. (c) $m = -l$ to $+l$ including zero.
44. (a) Number of radial nodes $= (n - l - 1)$
For $3s$: $n = 3, l = 0$
(Number of radial node $= 2$)
For $2p$: $n = 2, l = 1$
(Number of radial node $= 0$)
45. (a) It consists only s orbital which is circular.
46. (a) Hund's rule states that pairing of electrons in the orbitals of a subshell (orbitals of equal energy) starts when each of them is singly filled.
47. (b) If value of l is 2 then $m = -2, -1, 0, +1, +2$. $m = -l$ to $+l$ including zero.
(5 values of magnetic quantum number)
48. (c) s, p, d orbitals present in Fe
 $Fe_{26} = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^2, 3d^6$
50. (b) According to Aufbau rule.
51. (c) $3d$ subshell filled with 5 electrons (half-filled) is more stable than that filled with 4 electrons. $1, 4s$ electrons jumps into $3d$ subshell for more stability.
52. (b) $K_{19} = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^1$
for $4s^1$ electrons.
 $n = 4, l = 0, m = 0$ and $s = +\frac{1}{2}$.
54. (b) $3d$ subshell filled with 5 electrons (half-filled) is more stable than that filled with 4 electrons. $1, 4s$ electrons jumps into $3d$ subshell for more stability.
55. (c) It has 3 orbitals p_x, p_y, p_z .
57. (b) If $l = 2$ then it must be d orbital which can have 10 electrons.
59. (c) for d orbital $l = 2$.
60. (c) $m = -l$ to $+l$ including zero.
61. (d) When $n = 3$ shell, the orbitals are $n^2 = 3^2 = 9$.
No. of electrons $= 2n^2$
Hence no. of orbital $= \frac{2n^2}{2} = n^2$.
62. (d) Configuration of $Ne = 1s^2, 2s^2, 2p^6$
 $F^- = 1s^2, 2s^2, 2p^6$
 $Na^+ = 1s^2, 2s^2, 2p^6$
 $Mg^{++} = 1s^2, 2s^2, 2p^6$
 $Cl^- = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6$.
63. (d) $Unh_{106} = [Rn]5f^{14}, 6d^5, 7s^1$
64. (c) K^+ and Ca^{++} have the same electronic configuration $(1s^2, 2s^2, 2p^6, 3s^2, 3p^6)$
65. (b) For s -orbital, $l = 0$.
66. (d) $3s^1$ is valency electrons of Na for this
 $n = 3, l = 0, m = 0, s = +\frac{1}{2}$
67. (c) ${}_7N = 1s^2, 2s^2, 2p_x^1, 2p_y^1, 2p_z^1$. Hund's rule states that pairing of electrons in the orbitals of a subshell (orbitals of equal energy) starts when each of them is singly filled.
68. (d) (4) and (5) belong to d -orbital which are of same energy.
69. (c) Atomic no. 17 is of chlorine.
70. (b) The s -orbital has spherical shape due to its non-directional nature.
71. (a) According to the Aufbau's principle the new electron will enter in those orbital which have least energy. So here $4p$ -orbital has least energy then the others.
72. (c) According to Aufbau's principle.
73. (c) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^2, 3d^6 = 2, 8, 14, 2$.
74. (c) Ground state of $Cu^{29} = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^1$
 $Cu^{2+} = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^9$.
76. (c) No. of electrons in 3^{rd} shell $= 2n^2 = 2(3)^2 = 18$
77. (c) $F_9 = 1s^2, 2s^2, 2p^5$
78. (c) When $l = 3$ then
 $m = -3, -2, -1, 0, +1, +2, +3$. $m = -l$ to $+l$ including zero.
80. (d) $m = -1$ is not possible for s orbital ($l = 0$).
84. (a) Both $2p$ and $3p$ -orbitals have dumb-bell shape.
85. (b) $3d$ subshell filled with 5 electrons (half-filled) is more stable than that filled with 4 electrons. $1, 4s$ electrons jumps into $3d$ subshell for more stability.
86. (c) The shape of $2p$ orbital is dumb-bell.
87. (a) ${}_{25}Mn = [Ar]3d^5, 4s^2 \xrightarrow{-2 \text{ electrons}} Mn^{2+} = [Ar] 3d^5, 4s^0$
89. (c) For p -orbital, $l = 1$ means dumb-bell shape.
91. (d) $l = 3$ means f subshell maximum number of e in f subshell $= 14$.
93. (b) As per Aufbau principle.
94. (b) $l = 0$ is s , $l = 1$ is p and $l = 2$ is d and so on hence s, p, d may be used in state of no..
95. (d) For $4d, n = 4, l = 2, m = -2, -1, 0, +1, +2, s = +\frac{1}{2}$.
96. (d) m cannot be greater than $l (= 0, 1)$.
97. (a) For $n = 1, l = 0$.
99. (d) $Na_{11} = 1s^2, 2s^2, 2p^6, 3s^1$
 $n = 3, l = 0, m = 0$ and $s = +\frac{1}{2}$.
102. (d) According to Aufbau's rule.
105. (d) $2p_x, 2p_y, 2p_z$ sets of orbital is degenerate.
106. (a) Mg_{12} have $1s^2, 2s^2, 2p^6, 3s^2$ electronic configuration
 $n = 3, l = 0, m = 0, s = -\frac{1}{2}$.

107. (c) The principle quantum number $n = 3$. Then azimuthal quantum number $l = 3$ and number of orbitals $= n^2 = 3^2 = 9$. 3 and 9
108. (d) ${}_{29}\text{Cu} = [\text{Ar}]3d^{10}4s^1$, $\text{Cu}^{2+} = [\text{Ar}]3d^9.4s^0$.
Ground state of $\text{Cu}^{29} = 1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^1$
 $\text{Cu}^{2+} = 1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^9$.
110. (d) $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^6$ it shows electronic configuration of Iron.
111. (d) Orbitals are 4s, 3s, 3p and 3d. Out of these 3d has highest energy.
113. (c) For the $n = 2$ energy level orbitals of all kinds are possible $2^n, 2^2 = 4$.
114. (b) $n = 2$ than no. of orbitals $= n^2, 2^2 = 4$
118. (b) For both A & B electrons $s = -1/2$ & $+1/2$ respectively, $n = 3, l = 0, m = 0$
119. (a) According to Aufbau's rule.
120. (a) Possible number of subshells would be (6s, 5p, 4d).
121. (d) For f orbital $l = 3$.
123. (b) 4d-orbital have highest energy in given data.
125. (d) If $m = -3, l = 3$ and $n = 4$.
127. (b) $\text{N}_7^{14} = 1s^2 2s^2 2p_x^1 2p_y^1 2p_z^1$.
128. (c) m can't be greater than l .
130. (b) $n = 1$ and $m = 1$ not possible for s-orbitals.
131. (a) $\text{Fe}_{26} = [\text{Ar}]3d^6 4s^2$
 $\text{Fe}^{3+} = [\text{Ar}]3d^5 4s^0$.
132. (c) Maximum number of electron $= 2n^2$ (where $n = 4$) $= 2 \times 4^2 = 32$.
133. (d) When 2p orbital is completely filled then electron enter in the 3s. The capacity of 2p orbital containing e^- is 6. So $1s^2, 2s^2 2p^2 3s^1$ is a wrong electronic configuration the write is $1s^2 2s^2 2p^3$.
134. (b) This electronic configuration is Cr (chromium element) in the ground state
 $= 1s^2 2s^2 2p^6 3s^2 3p^6 3d^5 4s^1$
137. (c) No. of electron are same (18) in Cl^- and Ar.
138. (c) For s-subshell $l = 0$ then should be $m = 0$.
139. (c) 19⁺ electron of chromium is $4s^1$
 $n = 4, l = 0, m = 0, s = +\frac{1}{2}$
140. (c) The value of m is $-l$ to l including zero so for $l = 3, m$ would be $-3, -2, -1, 0, +1, +2, +3$.
141. (c) $l = 1$ is for p orbital.
142. (d) Magnetic quantum number of sodium ($3s^1$) final electron is $m = 0$.
143. (c) Generally azimuthal quantum number defines angular momentum.
146. (d) $m = (2l + 1)$ for d orbital $l = 2$ $m = (2 \times 2 + 1) = 5$.
147. (a) The atomic number of chlorine is 17 its configuration is $1s^2 2s^2 2p^6 3s^2 3p^5$
148. (c)
- | n | l | m_1 | m_2 |
|-----|-----|-------|-------|
| 3 | 2 | 1 | 0 |
- This set (c) is not possible because spin quantum number values $= \pm \frac{1}{2}$.
149. (b) The ground state of neon is $1s^2 2s^2 2p^6$ on excitation an electron from 2p jumps to 3s orbital. The excited neon configuration is $1s^2 2s^2 2p^5 3s^1$.
152. (a)
- | s | p | d | f | g | h |
|---------|---|---|---|---|---|
| $l = 0$ | 1 | 2 | 3 | 4 | 5 |
- Number of orbitals $= 5 \times 2 + 1 = 11$
153. (a) It is the ground state configuration of chromium.
155. (b) $n = 4 \rightarrow 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^2, 4p^6, 4d^{10}, 4f^{14}$
So $l = (n - 1) = 4 - 1 = 3$ which is f orbit contain 7 orbital.
156. (d) 2p have contain maximum 6 electron out of which there are 3 are of $+1/2$ spin and 3 are of $-1/2$ spin
- | | | | | |
|----------------------|----------------------|----------------------|------------|--------------|
| $\uparrow\downarrow$ | $\uparrow\downarrow$ | $\uparrow\downarrow$ | $\uparrow$ | $\downarrow$ |
| $+1/2$ | $+1/2$ | $+1/2$ | $+1/2$ | $-1/2$ |
157. (a) For 4f orbital electron, $n = 4$
 $l = 3$ (Because 0, 1, 2, 3)
s, p, d, f
 $m = +3, +2, +1, 0, -1, -2, -3$
 $s = +1/2$
158. (b) ${}_{24}\text{Cr} \rightarrow 1s^2, 2s^2, 2p_x^6, 3s^2, 3p_y^6, 3d^5, 4s^1$
 $l=1$ $l=1$ $l=2$
(We know that for p the value of $l = 1$ and for d, $l = 2$)
For $l = 1$ total number of electron = 12
For $l = 2$ total number of electron = 5.
159. (c) Atomic number of potassium is 19 and hence electronic configuration will be $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^1$
Hence for $4s^1$ electron value of Quantum number are
Principal quantum number $n = 4$
Azimuthal quantum number $l = 0$
Magnetic quantum number $m = 0$
Spin quantum number $s = +1/2$
160. (d) According to Hund's rule electron first fill in unpaired form in vacant orbital then fill in paired form to stabilized the molecule by which $1s^2, 2s^2, 2p_x^2$ is not possible. According to Hund's rule. Because $2p_x, p_y, p_z$ have the same energy level so electron first fill in unpaired form not in paired form so it should be $1s^2, 2s^2, 2p_x^1, 2p_y^1$.
161. (c) It is governed by Aufbau principle.
162. (d) The electronic configuration of atomic number
 $24 = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^5, 4s^1$
163. (b) The maximum number of electron in any orbital is 2.

164. (c) According to Pauli principle 2 electrons do not have the same value of all four quantum numbers. They have maximum same value are 3.

165. (a) Number of orbitals $= n^2 = 4^2 = 16$.

166. (d) We know from the Aufbau principle, that $2p$ orbital will be filled before $3s$ orbital. Therefore, the electronic configuration $1s^2, 2s^2, 2p^2, 3s^1$ is not possible.

167. (d) Each orbital may have two electrons with opposite spin.

168. (d) Maximum no. of electrons in a subshell $= 2(2l + 1)$ for f -subshell, $l = 3$ so 14 electrons accommodated in f -subshell.

169. (b) Each orbital has at least two electrons.

170. (a) Nucleus of 20 protons atom having 20 electrons.

174. (b) For $m = 0$, electron must be in s -orbital.

176. (c) In this type of electronic configuration the number of unpaired electrons are 3.

177. (a) Atomic number of Cu is 29 so number of unpaired electrons is 1

181. (c) $\text{Be}_4 = 1s^2, 2s^2 =$ (Ground state)

Number of unpaired electrons in the ground state of Beryllium atom is zero.

182. (b) Two unpaired electrons are present in

$\text{Ni}^{++} (z = 28)$ cation

183. (c) $\text{O}_2 = 1s^2 2s^2 2p^6 3s^2 3p^4$

184. (c) $\text{Cr}_{24} = (\text{Ar}) 3d^5 4s^1$ but $\text{Cr}_{24}^{3+} = (\text{Ar}) 3d^3 4s^0$

185. (a) $\text{Zn}_{30} = [\text{Ar}] 3d^{10} 4s^2$

186. (d) Mn^{+2} ion will have five (maximum) unpaired electrons

187. (c) Fe^{3+} ion will have five (maximum) unpaired electrons.

190. (c) Due to full filled d -orbital Cl^- has spherical symmetry.

191. (b) Atomic number 14 leaving 2 unpaired electrons

192. (a) Shell $K, L, M = 1s^2 2s^2 2p^6 3s^2 3p^4$

Hence the number of s electron is 6 in that element.

193. (d) $\text{C}_6 = 1s^2, 2s^2 2p^2$ (Ground state)

In excited state no. of unpaired electron is 4.

194. (b) Max. no. of electrons in N -shell ($n = 4$)

$$= 2n^2 = 2 \times 4^2 = 32$$

195. (d) ${}_{26}\text{Fe} = [\text{Ar}] 3d^6, 4s^2$

Number of d -electrons = 6

Number of p -electrons = 6.

196. (a) Electrons in the atom $= 18 + 4 + 3 = 25$ i.e. $Z = 25$.

197. (c) The atomic number of bromine is 35 and the electronic configuration of Br is

total electron present in p -orbitals of Br is -

$$2p^6 + 3p^6 + 4p^5 = 17.$$

198. (d) Fe^{2+} has $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^6$ configuration with 4 unpaired electrons.

199. (b) $\text{Fe}^{2+} [\text{Ar}] 3d^6 4s^0$

Fe^{2+} consist of maximum 4 unpaired electrons.

201. (a) $\text{Fe}^{3+} (z = 26)$

Total no. of unpaired electron = 5

202. (b) $\text{Co}_{27} = [\text{Ar}] 3d^7 4s^2$

3 unpaired electrons are present in cobalt metal.

203. (b) According to Hund's rule, the pairing of electrons will not occur in any orbital of a subshell unit and unless, all the available of it have one electron each.

Electronic configuration of

Hence it has 3 unpaired electrons in $2p$ -orbital.

204. (c) $2s$ orbital has minimum energy and generally electron filling increases order of energy according to the Aufbau's principle.

205. (d) According to Pauli's exclusion principle no two electrons in the same atom can have all the set of four quantum numbers identical.
206. (b) The second principal shell contains four orbitals viz $2s, 2p_x, 2p_y$ and $2p_z$.
207. (b) Follow Hund's multiplicity rules.
208. (c) According to the Aufbau's principle, electron will be first enters in those orbital which have least energy. So decreasing order of energy is $5p > 4d > 5s$.
210. (b) No two electrons in an atom can have identical set of all the four quantum numbers.
212. (a) In particular shell, the energy of atomic orbital increases with the value of l .
214. (c) Aufbau principle explains the sequence of filling of orbitals in increasing order of energy.
215. (a) According to Aufbau principle electron are filling increasing order of energy. Therefore the electronic configuration $1s^2 2s^2 2p^6$ obeys Aufbau principle.

216. (d) Electronic configuration of the Cr_{24} is $[Ar]4s^1 3d^5$ or

217. (b) According to the Aufbau principle electron filling minimum to higher energy level.
219. (b) According to Aufbau principle electron are filled in various atomic orbital in the increasing order of energy
 $1s < 2s < 2p < 3s < 3p < 4s < 3d < 4p < 5s < 4d < 5p < 6s < 4f < 5d < 6p < 7s$.
220. (d) According to Aufbau's rule.
222. (b) We know that for d -electron $l = 2$.

$$\mu = \sqrt{l(l+1)} \frac{h}{2\pi}; \quad \mu = \sqrt{2(2+1)} \frac{h}{2\pi}$$

$$\mu = \sqrt{2(2+1)} \frac{h}{2\pi}; \quad \mu = \sqrt{6} \frac{h}{2\pi}.$$

223. (a) Number of nodal centre for $2s$ orbitals $(n-1) = 2-1 = 1$.

224. (d) Since s -orbital have $l = 0$

$$\text{Angular momentum} = \sqrt{l(l+1)} \times \frac{h}{2\pi} = 0 \times \frac{h}{2\pi} = 0.$$

225. (d) Azimuthal quantum number (l) = 3 shows the presence of f orbit, which contain seven orbitals and each orbital have 2 electrons. Hence $7 \times 2 = 14$ electrons.

227. (b) According to Aufbau principle.

228. (a) Atomic number of deuterium = 1; ${}_1D^2 \rightarrow 1s^1$

Critical Thinking Questions

1. (a) F^- have the same number of electrons with the neon atom.
2. (d) No change by doubling mass of electrons however by reducing mass of neutron to half total atomic mass becomes $6+3$ instead of $6+6$. Thus reduced by 25%.

3. (d) $\frac{e}{m}$ for (i) neutron $= \frac{0}{1} = 0$

$$(ii) \alpha - \text{particle} = \frac{2}{4} = 0.5$$

$$(iii) \text{Proton} = \frac{1}{1} = 1$$

$$(iv) \text{electron} = \frac{1}{1/1837} = 1837.$$

4. (a) Metal is ${}_{56}M^{2+}(2,8,14)$ than $n = A - Z$
 $= 56 - 26 = 30.$

5. (d) $E = h\nu = h \frac{c}{\lambda}$ i.e. $E \propto \frac{1}{\lambda}$

$$\frac{E_1}{E_2} = \frac{\lambda_2}{\lambda_1} = \frac{4000}{2000} = 2.$$

6. (c) Rutherford discovered nucleus.

7. (b) According to Bohr's model $\Delta E = E_1 - E_3$

$$= 2.179 \times 10^{-11} - \frac{2.179 \times 10^{-11}}{9}$$

$$= \frac{8}{9} \times 2.179 \times 10^{-11} = 1.91 \times 10^{-11} = 0.191 \times 10^{-10} \text{ erg}$$

Since electron is going from $n = 1$ to $n = 3$ hence energy is absorbed.

8. (d) Radius of nucleus $= 1.25 \times 10^{-13} \times A^{1/3} \text{ cm}$

$$= 1.25 \times 10^{-13} \times 64^{1/3} = 5 \times 10^{-13} \text{ cm}$$

$$\text{Radius of atom} = 1 \text{ \AA} = 10^{-8} \text{ cm}.$$

$$\frac{\text{Volume of nucleus}}{\text{Volume of atom}} = \frac{(4/3)\pi (5 \times 10^{-13})^3}{(4/3)\pi (10^{-8})^3}$$

$$= 1.25 \times 10^{-13}.$$

9. (a) Values of energy in the excited state $= -\frac{13.6}{n^2} \text{ eV}$
 $= \frac{-13.6}{4} = -3.4 \text{ eV}$ in which $n = 2, 3, 4$ etc.

10. (c) $E_{1\text{He}^+} = E_{1\text{H}} \times Z^2$
 $-871.6 \times 10^{-20} = E_{1\text{H}} \times 4$
 $E_{1\text{H}} = -217.9 \times 10^{-20} \text{ J}$

11. (a) $42g$ of N_3^- ions have $16 N_A$ valence electrons $4.2g$ of N_3^- ion have $= \frac{16 N_A}{42} \times 4.2 = 1.6 N_A$.

12. (d) I^{st} excited state means $n = 2$
 $r = r_0 \times 2^2 = 0.53 \times 4 = 2.12 \text{ \AA}$

13. (d) Frequency $\nu = 12 \times 10^{14} \text{ s}^{-1}$ and velocity of light $c = 3 \times 10^{10} \text{ cm s}^{-1}$. We know that the wave number $\bar{\nu} = \frac{\nu}{c} = \frac{12 \times 10^{14}}{3 \times 10^{10}} = 4 \times 10^4 \text{ cm}^{-1}$

14. (c) The last line in any series is called series limit. Series limit for Balmer series is $3646 \text{ \AA}$.

15. (b) $E = \frac{-13.6}{n^2} = \frac{-13.6}{4} = -3.4 \text{ eV}$

84 Structure of atom

We know that energy required for excitation $\Delta E = E_2 - E_1$
 $= -3.4 - (-13.6) = 10.2 \text{ eV}$

Therefore energy required for excitation of electron per atom
 $= \frac{10.2}{6.02 \times 10^{23}} = 1.69 \times 10^{-23} \text{ J}$

17. (a) The number of nodal plane are present in a p_x is one or no. of nodal place = l
 for p_x orbital $l = 1$

18. (b) In Balmer series of hydrogen atomic spectrum which electronic transition causes third line $O \rightarrow L$, $n_2 = 5 \rightarrow n_1 = 2$

20. (b)
$$\frac{1}{\lambda} = R_H \left[\frac{1}{n_1^2} - \frac{1}{n_2^2} \right]$$

$$= \frac{1}{\lambda} = R_H \left[\frac{1}{3^2} - \frac{1}{n_2^2} \right] = n_2 = 3 \text{ for Paschen series.}$$

21. (a)
$$E \propto \left[\frac{1}{n_2^2} - \frac{1}{n_1^2} \right]$$

23. (d)
$$\lambda = \frac{c}{\nu} = \frac{3 \times 10^8}{8 \times 10^{15}} = 3.75 \times 10^{-8}$$

$$= 3.75 \times 10^{-8} \times 10^9 \text{ nm} = 4 \times 10^1 \text{ nm}.$$

Assertion & Reason

1. (d) The assertion is false but the reason is true exact position and exact momentum of an electron can never be determined as according to Heisenberg's uncertainty principle even with the help of electron microscope because when e^- beam of electron microscope strikes the target e^- of atom, the impact causes the change in velocity of e^- thus attempt to locate the e^- changes ultimately, the momentum & position of e^- .

$$\Delta x \cdot \Delta p \geq \frac{h}{4\pi} \approx 0.57 \text{ ergssec/gm.}$$

2. (d) Both assertion and reason are false. $2p_x$ and $2p_y$ orbitals are degenerate orbitals, i.e., they are of equal energy and hence no possibility of transition of electron.
3. (a) We know that principal quantum number represent the main energy level or energy shell. Since each energy level is associated with a definite amount of energy, this quantum number determines to a large extent the energy of an electron. It also determines the average distance of an electron around the nucleus. Therefore both Assertion and Reason are true and the Reason is a correct explanation of the Assertion.
4. (a) It is observed that a nucleus which is made up of even number of nucleons (No. of n & p) is more stable than nuclei which consist of odd number of nucleons. If number of neutron or proton is equal to some numbers i.e., 2, 8, 20, 50, 82 or 126 (which are called magic numbers), then these possess extra stability.
5. (c) The assertion that the isobars are the atoms of different elements having same mass number but different atomic number, is correct but reason is false because atomic mass is sum of number of neutron and protons which should be same for isobars.

6. (d) We know from the Pauli exclusion principle, that two electrons in the same atom can not have same value of all four quantum numbers. This means each electron in an atom has only one set of values for n, l, m and s . Therefore both the Assertion and Reason are false.

7. (e) We know that the line in Balmer series of hydrogen spectrum the highest wavelength or lowest energy is between $n_1 = 2$ and $n_2 = 3$. And for Balmer series of hydrogen spectrum, the value of $n_1 = 2$ and $n_2 = 3, 4, 5$. Therefore the Assertion is false but the Reason is true.

8. (d) We know that Absorption spectrum is produced when white light is passed through a substance and transmitted light is analysed by a spectrograph. The dark spaces corresponds to the light radiation absorbed by the substance. And emission spectrum is produced by analysing the radiant energy emitted by an excited substance by a spectrograph. Thus discontinuous spectra consisting of a series of sharp lines and separated by dark bands are obtained. Therefore both the Assertion and Reason are false.

9. (a) We know that a resonance hybrid or the actual molecule is always more stable than any of its canonical structures which is also called hypothetical or imaginary structures. This stability is due to delocalization of electrons and is measured in terms of resonance energy or delocalization energy, it is defined as the difference in internal energy of the resonance hybrid and the most stable canonical structure. Therefore both the Assertion and Reason are true and the Reason is a correct explanation of the Assertion.

10. (e) We know that cathode rays cast shadows of solid objects placed in their path. During experiment performed on these rays, fluorescence (flash of light) is observed in the region, outside the shadow. This shows that cathode rays travel in straight lines. We also know that cathode rays penetrate through a thin sheet of metals but are stopped by thick sheets. Therefore both Assertion and Reason are false.

11. (b) We know that electrons are revolving around the nucleus at high speed in circular paths. The centrifugal force (which arises due to rotation of electrons) acting outwards, balances the electrostatic force of attraction (which arises due to attraction between electrons and nucleus). This prevents the electron from falling into the nucleus. We also know that Rutherford's model of atom is comparable to the "solar system". The nucleus represents the sun whereas revolving electrons represent the planets revolving around the sun. Thus revolving electron are also called planetary electrons. Therefore both Assertion and Reason are true but Reason is not a correct explanation of Assertion.

12. (c) Assertion is true but Reason is false. Threshold frequency is a minimum frequency required for the emission of electrons from the metal surface.

13. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

Radius,
$$r = \frac{n^2 h^2}{4\pi^2 m Z} = \frac{n^2}{Z} \times 0.529 \text{ \AA} \cdot r_n$$
 also increases indicating a greater separation between the orbit and the nucleus.

14. (d) Both assertion and Reason are false. Only s -orbital is spherically symmetrical. Shape of different d orbitals is as below.

15. (c) Assertion is true but reason is false. Spin angular momentum of the electron, a vector quantity, can have two orientations (represented by $+$ and $-$ sign) relative to a chosen axis. These two orientations are distinguished by the spin quantum number

m_s equals to $+\frac{1}{2}$ or $-\frac{1}{2}$. These are called the two spin

states of the electron and are normally represented by the two arrows $\uparrow$ (spin up) and $\downarrow$ (spin down) respectively.

16. (d) Both assertion and reason are false. Total number of orbitals associated with Principal quantum number $n = 3$ is 9. One $3s$ orbital + three $3p$ orbital + five $3d$ orbitals. $\therefore$ Therefore there are a total number of nine orbitals. Number of orbitals in a shell equals to n^2 .
17. (c) Assertion is true but reason is false. The order $1s < 2s = 2p < 3s = 3p = 3d < \dots$ is true for the energy of an electron in a hydrogen atom and is solely determined by Principal quantum number. For multielectron system energy also depends on azimuthal quantum number. The stability of an electron in a multi electron atom is the net result of the attraction between the electron and the nucleus and the repulsion between the electron and the rest of the electron present. Energies of different subshell (azimuthal quantum number) present within the same principal shell are found to be in order of $s < p < d < f$.
18. (e) Assertion is false but reason is true. Splitting of the spectral lines in the presence of a magnetic field is known as Zeeman effect or in electric field it is known as Stark effect. The splitting of spectral lines is due to different orientations which the orbitals can have in the presence of magnetic field.
19. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
20. (e) Assertion is false but reason is true. Atomic orbital is designated by n, l and m_l while state of an electron in an atom is specified by four quantum numbers n, l, m_l and m_s .
21. (b) Both assertion and reason are true but reason is not the correct explanation of assertion. The difference between the energies of adjacent energy levels decreases as we move away from the nucleus. Thus in H atom

$$E_2 - E_1 > E_3 - E_2 > E_4 - E_3 \dots\dots$$
22. (d) Both assertion and reason are false. Cathode rays are stream of electrons. They are generated through gases at low pressure and high voltage.
23. (d) Both assertion and reason are false. In case of isoelectronic, i.e., ions, having the same number of electrons and different nuclear charge, the size decreases with increase in atomic number.

Ion	At. No.	No. of electrons	Ionic radii
Na^+	11	10	0.95 Å
Mg^{2+}	12	10	0.65 Å
Al^{3+}	13	10	0.50 Å

Structure of atom

Self Evaluation Test - 2

1. The correct set of quantum numbers for the unpaired electron of chlorine atom is [IIT 1989; MP PET 2004]

$n \quad l \quad m$

- (a) 2 1 0
(b) 2 1 1
(c) 3 1 1
(d) 3 0 0
2. The orbital diagram in which the Aufbau's principle is violated is

$2s \quad 2p_x \quad 2p_y \quad 2p_z$

- (a) $\uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow$
(b) $\uparrow \quad \uparrow\downarrow \quad \uparrow \quad \uparrow$
(c) $\uparrow\downarrow \quad \uparrow \quad \uparrow \quad \uparrow$
(d) $\uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow$
3. The mass of neutron is nearly [MNR 1988; UPSEAT 1999, 2000, 02]

- (a) 10^{-23} kg (b) 10^{-24} kg
(c) 10^{-26} kg (d) 10^{-27} kg

4. Which electronic level would allow the hydrogen atom to absorb a photon but not to emit a photon [IIT 1984; CPMT 1997]

- (a) 3s (b) 2p
(c) 2s (d) 1s

5. Which of the following is not correct for electron distribution in the ground state [AIIMS 1982]

- $4s \quad 3d$
- (a) Co(Ar) $\uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow \quad \uparrow \quad \uparrow$
(b) Ni(Ar) $\uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow \quad \uparrow$
(c) Cu(Ar) $\uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow$
(d) Zn(Ar) $\uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow \quad \uparrow\downarrow$

6. If electron, hydrogen, helium and neon nuclei are all moving with the velocity of light, then the wavelengths associated with these particles are in the order [MP PET 1993]

- (a) Electron > hydrogen > helium > neon
(b) Electron > helium > hydrogen > neon
(c) Electron < hydrogen < helium < neon
(d) Neon < hydrogen < helium < electron

7. From the given sets of quantum numbers the one that is inconsistent with the theory is [IIT Screening 1994]

- (a) $n = 3; l = 2; m = -3; s = +1/2$
(b) $n = 4; l = 3; m = 3; s = +1/2$

- (c) $n = 2; l = 1; m = 0; s = -1/2$

- (d) $n = 4; l = 3; m = 2; s = +1/2$

8. The uncertainty in the position of an electron (mass = $9.1 \times 10^{-28} \text{ g}$) moving with a velocity of $3.0 \times 10^4 \text{ cm s}^{-1}$ accurate upto 0.001% will be

(Use $\frac{h}{4\pi m \Delta x \Delta v}$ in the uncertainty expression, where [IIT 1988; AMU 1999]

$h = 6.626 \times 10^{-27} \text{ erg s}$) [CBSE PMT 1995]

- (a) 1.92 cm (b) 7.68 cm
(c) 5.76 cm (d) 3.84 cm

9. The orbital angular momentum of an electron in s orbital is [IIT 1996; AIEEE 2003; MP PET 2004]

- (a) $+\frac{1}{2} \cdot \frac{h}{2\pi}$ (b) Zero
(c) $\frac{h}{2\pi}$ (d) $\sqrt{2} \cdot \frac{h}{2\pi}$

10. Values of the four quantum numbers for the last electron in the atom are $n = 4, l = 1, m = +1$ and $s = -1/2$. Atomic number of the atom will be

- (a) 22 (b) 32
(c) 33 (d) 36

11. The atomic weight of an element is 39. The number of neutrons in its nucleus is one more than the number of protons. The number of protons, neutrons and electrons respectively in its atom would be [MP PMT 1997]

- (a) 19, 20, 19 (b) 19, 19, 20
(c) 20, 19, 19 (d) 20, 19, 20

12. The electrons identified by quantum numbers n and l (i) $n = 4, l = 1$ (ii) $n = 4, l = 0$ (iii) $n = 3, l = 2$ (iv) $n = 3, l = 1$ can be placed in order of increasing energy from the lowest to highest, as [IIT 1999]

- (a) (iv) < (ii) < (iii) < (i)
(b) (ii) < (iv) < (i) < (iii)
(c) (i) < (iii) < (ii) < (iv)
(d) (iii) < (i) < (iv) < (ii)

13. Ground state electronic configuration of nitrogen atom can be represented by [IIT 1999]

- (a)

$\uparrow\downarrow$	$\uparrow\downarrow$	$\uparrow$	$\uparrow$	$\uparrow$
----------------------	----------------------	------------	------------	------------

(b)

$\uparrow\downarrow$	$\uparrow\downarrow$	$\uparrow$	$\downarrow$	$\uparrow$
----------------------	----------------------	------------	--------------	------------

(c)

$\uparrow\downarrow$	$\uparrow\downarrow$	$\uparrow$	$\downarrow$	$\downarrow$
----------------------	----------------------	------------	--------------	--------------

14. Which of the following statements (s) is (are) correct

[IIT 1998]

- (a) The electronic configuration of Cr is $[Ar]3d^5 4s^1$ (Atomic no. of $Cr = 24$)
 (b) The magnetic quantum number may have a negative value
 (c) In silver atom, 23 electrons have a spin of one type and 24 of the opposite type (Atomic no. of $Ag = 47$)
 (d) The oxidation state of nitrogen in HN_3 is -3

15. The position of both an electron and a helium atom is known within $1.0nm$ and the momentum of the electron is known within $50 \times 10^{-26} kg ms^{-1}$. The minimum uncertainty in the measurement of the momentum of the helium atom is

[CBSE PMT 1998; AIIMS 2001]

- (a) $50 kg ms^{-1}$ (b) $60 kg ms^{-1}$
 (c) $80 \times 10^{-26} kg ms^{-1}$ (d) $50 \times 10^{-26} kg ms^{-1}$

16. Which of the following pair of orbitals posses two nodal planes

- (a) $p_{xy}, d_{x^2-y^2}$ (b) d_{xy}, d_{zx}
 (c) p_{xy}, d_{zx} (d) $d_{z^2}, d_{x^2-y^2}$

17. The number of atoms in $0.004 g$ of magnesium are

[AFMC 2000]

- (a) 4×10^{20} (b) 8×10^{20}

- (c) 10^{20} (d) 6.02×10^{20}

18. Which of the following have the same number of unpaired electrons in ' d ' orbitals [Roorklee 2000]

- (a) Cr (b) Mn
 (c) Fe (d) Co

19. The quantum numbers $+1/2$ and $-1/2$ for the electron spin represent [IIT Screening 2001]

- (a) Rotation of the electron in clockwise and anticlockwise direction respectively
 (b) Rotation of the electron in anticlockwise and clockwise direction respectively
 (c) Magnetic moment of the electron pointing up and down respectively
 (d) Two quantum mechanical spin states which have no classical analogue

20. The de-Broglie wavelength of a tennis ball of mass $60 g$ moving with a velocity of $10 metres$ per second is approximately

- (a) $10^{-33} metres$ (b) $10^{-31} metres$
 (c) $10^{-16} metres$ (d) $10^{-25} metres$

21. Which of the following are isoelectronic and isostructural [IIT Screening 2003]

- (a) $NO_3^-, CO_3^{2-}, ClO_3^-, SO_3$ [RPMT 2000]
 (b) SO_3, NO_3^-
 (c) ClO_3^-, CO_3^{2-} (d) CO_3^{2-}, SO_3

22. The total number of electrons present in all the s -orbitals, all the p -orbitals and all the d -orbitals of cesium ion are respectively

- (a) 8, 26, 10 (b) 10, 24, 20
 (c) 8, 22, 24 (d) 12, 20, 22

AS Answers and Solutions

(SET -2)

1. (c) Electronic configuration of Cl is

So for the unpaired electron ($3p_z^1$) :

$$n = 3, l = 1, m = 1, S = +\frac{1}{2}$$

2. (b) According to Aufbau principle the orbitals of lower energy ($2s$) should be fully filled before the filling of orbital of higher energy starts.
3. (d) Mass of neutron $= 1.675 \times 10^{-27} \text{ kg}$.
4. (d) $1s$ -orbital is of lowest energy. Absorption of photon can raise the electron in higher energy state but emission is not possible.
5. (c) The correct electronic configuration
- $\text{Cu}_{29} = [\text{Ar}], 4s^1 3d^{10}$
- | | | | | | |
|------------|----------------------|----------------------|----------------------|----------------------|----------------------|
| $\uparrow$ | $\uparrow\downarrow$ | $\uparrow\downarrow$ | $\uparrow\downarrow$ | $\uparrow\downarrow$ | $\uparrow\downarrow$ |
|------------|----------------------|----------------------|----------------------|----------------------|----------------------|
6. (a) $\lambda \propto \frac{1}{m}, m_e < m_H < m_{\text{He}} < m_{\text{Ne}}$.
7. (a) When $l = 2, m \neq -3$.
8. (a) $\Delta p = m \times \Delta v$
- $$\Delta p = 9.1 \times 10^{-28} \times 3.0 \times 10^4 \times \frac{0.001}{100}$$
- $$\Delta p = 2.73 \times 10^{-24}$$
- Hence $\Delta x = \frac{h}{\Delta p \times 4\pi} = \frac{6.626 \times 10^{-27}}{2.73 \times 10^{-28} \times 4 \times 3.14}$
- $$\Delta x = 1.92 \text{ cm}.$$
9. (b) For $2s$ orbital, $l = 0$; azimuthal quantum number is not show angular momentum for the $2s$ orbitals.
- Angular momentum $= \sqrt{l(l+1)} \frac{h}{2\pi} = 0$.
10. (d) Atomic number is 36 and element is Kr .
11. (a) $K_{19}^{39}, P = 19, E = 19, N = 20$
12. (a) (i) $4p$ (ii) $4s$ (iii) $3d$ (iv) $3p$ order of increasing energy is $3p < 4s < 3d < 4p$.
13. (a,d) According to Hund's principle.
14. (a,b,c) The oxidation state of nitrogen in HN_3 is $-\frac{1}{3}$.
- $$\text{HN}_3: 1 + 3x = 0 \Rightarrow 3x = -1 \text{ or } x = \frac{-1}{3}$$
15. (d) The product of uncertainties in the position and the momentum of a sub atomic particle $= h/4\pi$. Since Δx is same for electron and helium so Δp must be same for both the particle i.e. $50 \times 10^{-26} \text{ kg ms}^{-1}$ (given).
16. (b) d_{xy} and d_{zx} has two nodal planes.
17. (c) No. of atoms in magnesium $= \frac{0.004}{24} \times 6.023 \times 10^{23} = 10$.
18. (a,b,c) Cr, Mn and Fe^{3+} have 5 unpaired electron in d -orbitals.
- $${}_{24}\text{Cr} = 3d^5 4s^1 = 5$$
- $${}_{25}\text{Mn} = 3d^5 4s^2 = 5$$
- $${}_{26}\text{Fe}^{3+} = 3d^5 4s^0 = 5$$
19. (a,d) Both statement are correct.
20. (a) $\lambda = \frac{h}{mv} = \frac{6.63 \times 10^{-34}}{60 \times 10^{-3} \times 10} = 10^{-33} \text{ m}$
21. (a) NO_3^- and CO_3^{2-} consist of same electron and show same isostructural.
22. (b) $(\text{Cs}_{35}) = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^2, 4p^6, 4d^{10}, 5s^2, 5p^6, 6s^1$
- $$\text{Cs}^+ = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^2, 4p^6, 4d^{10}, 5s^2, 5p^6$$
- Total no. of e^- in s -orbitals $= 10$
- Total no. of e^- in p -orbitals $= 24$
- Total no. of e^- in d -orbitals $= 20$

Chapter 3 Chemical Bonding

Atoms of different elements *excepting* noble gases do not have complete octet so they combine with other atoms to form chemical bond. The force which holds the atoms or ions together within the molecule is called a **chemical bond** and the process of their combination is called **Chemical Bonding**. It depends on the valency of atoms.

Cause and Modes of chemical combination

Chemical bonding takes place due to *acquire a state of minimum energy and maximum stability* and to *convert atoms into molecule to acquire stable configuration of the nearest noble gas*. We divide atoms into three classes,

- (1) Electropositive elements which give up one or more electrons easily. They have low ionisation potentials.
- (2) Electronegative elements, which can gain electrons. They have higher value of electronegativity.
- (3) Elements which have little tendency to lose or gain electrons.

Different types of bonds are formed from these types of atoms.

Atoms involved	Type
$A + B$	Electrovalent
$B + B$	Covalent
$A + A$	Metallic
Electrons deficient molecule or ion (Lewis acid) and electrons rich molecule or ion (Lewis base)	Coordinate
H and electronegative element (F, N, O)	Hydrogen

Electrovalent bond

An electrovalent bond is formed when a metal atom transfers one or more electrons to a non-metal atom.

Some other examples are: MgCl , CaCl , MgO , NaS , CaH , AlF , NaH , KH , K_2O , KI , RbCl , NaBr , CaH etc.

(1) Conditions for formation of electrovalent bond

- (i) The atom which changes into cation (+ive ion) should possess 1, 2 or 3 valency electrons. The other atom which changes into anion (–ve ion) should possess 5, 6 or 7 electrons in the valency shell.
- (ii) A high difference of electronegativity (about 2) of the two atoms is necessary for the formation of an electrovalent bond. *Electrovalent bond is not possible between similar atoms.*
- (iii) *There must be overall decrease in energy i.e., energy must be released. For this an atom should have low value of **ionisation potential** and the other atom should have high value of **electron affinity**.*
- (iv) *Higher the lattice energy, greater will be the case of forming an ionic compound. The amount of energy released when free ions combine together to form one mole of a crystal is called **lattice energy (U)**.* Lattice energy = $\frac{K}{r^+ + r^-}$;
 $r^+ + r^-$ is internuclear distance.

The energy changes involved in the formation of ionic compounds from their constituent elements can be studied with the help of a thermochemical cycle called **Born Haber cycle**.

According to Hess's law of constant heat summation, heat of formation of an ionic solid is net resultant of the above changes.

$$\Delta H_f = \Delta H_{\text{Subl.}} + \frac{1}{2}\Delta H_{\text{diss.}} + IE - EA - U$$

(2) Characteristics of electrovalent compounds

(i) Electrovalent compounds are generally crystalline in nature. The constituent ions are arranged in a regular way in their lattice.

(ii) Electrovalent compounds possess high melting and boiling points. Order of melting and boiling points in halides of sodium and oxides of II^+ group elements is as,

(iii) Electrovalent compounds are hard and brittle in nature.

(iv) Electrovalent solids do not conduct electricity. While electrovalent compounds in the molten state or in solution conduct electricity.

(v) Electrovalent compounds are fairly soluble in polar solvents and insoluble in non-polar solvents.

(vi) The electrovalent bonds are non-rigid and non-directional. Thus these compound do not show space isomerism e.g. geometrical or optical isomerism.

(vii) Electrovalent compounds furnish ions in solution. *The chemical reaction of these compounds are known as ionic reactions, which are fast.*

(viii) Electrovalent compounds show isomorphism.

(ix) Cooling curve of an ionic compound is not smooth, it has two break points corresponding to time of solidification.

(x) Ionic compounds show variable electrovalency due to unstability of core and inert pair effect.

Covalent bond

Covalent bond was first proposed by **Lewis** in 1916. *The bond formed between the two atoms by mutual sharing of electrons so as to complete their octets or duplets (in case of elements having only one shell) is called **covalent bond or covalent linkage**.* A covalent bond between two similar atoms is non-polar covalent bond while it is polar between two different atom having different electronegativities. Covalent bond may be single, double or a triple bond. We explain covalent bond formation by Lewis octet rule.

Chlorine atom has seven electrons in the valency shell. In the formation of chlorine molecule, each chlorine atom contributes one electron and the pair of electrons is shared between two atoms. both the atoms acquire stable configuration of argon.

Some other examples are : $\text{H}_2\text{S}, \text{NH}_3, \text{HCN}, \text{PCl}_3, \text{PH}_3, \text{C}_2\text{H}_2, \text{H}_2, \text{C}_2\text{H}_4, \text{SnCl}_4, \text{FeCl}_3, \text{BH}_3$, graphite, BeCl_2 etc.

(1) Conditions for formation of covalent bond

(i) The combining atoms should be short by 1, 2 or 3 electrons in the valency shell in comparison to stable noble gas configuration.

(ii) Electronegativity difference between the two atoms should be zero or very small.

(iii) The approach of the atoms towards one another should be accompanied by decrease of energy.

(2) Characteristics of covalent compounds

(i) These exist as gases or liquids under the normal conditions of temperature and pressure. Some covalent compounds exist as soft solids.

(ii) Diamond, Carborandum (SiC), Silica (SiO_2), AlN etc. have giant three dimensional network structures; therefore have exceptionally high melting points otherwise these compounds have relatively low melting and boiling points.

(iii) In general covalent substances are bad conductor of electricity. Polar covalent compounds like HCl in solution conduct electricity. Graphite can conduct electricity in solid state since electrons can pass from one layer to the other.

(iv) These compounds are generally insoluble in polar solvent like water but soluble in non-polar solvents like benzene etc. some covalent compounds like alcohol, dissolve in water due to hydrogen bonding.

(v) The covalent bond is rigid and directional. These compounds, thus show isomerism (structural and space).

(vi) Covalent substances show molecular reactions. The reaction rates are usually low.

(vii) *The number of electrons contributed by an atom of the element for sharing with other atoms is called **covalency** of the element.* Covalency = $8 - [\text{Number of the group to which element belongs}]$. *The variable covalency of an element is equal to the total number of unpaired electrons in s, p and d-orbitals of its valency shell.*

The element such as $\text{P}, \text{S}, \text{Cl}, \text{Br}, \text{I}$ have vacant d-orbitals in their valency shell. These elements show variable covalency by increasing the number of unpaired electrons under excited conditions. The electrons from paired orbitals get excited to vacant d-orbitals of the same shell.

Four elements, H, N, O and F do not possess d-orbitals in their valency shell. Thus, such an excitation is not possible and variable valency is not shown by these elements. This is reason that NCl_4 exists while NCl_5 does not.

(3) **The Lewis theory** : The tendency of atoms to achieve eight electrons in their outermost shell is known as lewis octet rule.

Lewis symbol for the representative elements are given in the following table,

	1	2	13	14	15	16	17
Group	IA	IIA	IIIA	IVA	VA	VIA	VIIA
Lewis symbol	$\times$	$\bullet \times$	$\cdot \times \cdot$	$\cdot \times \cdot$	$\cdot \times \cdot$	$\cdot \times \cdot$	$\cdot \times \cdot$

(4) **Failure of octet rule** : There are several stable molecules known in which the octet rule is violated i.e., atoms in these molecules have number of electrons in the valency shell either short of octet or more than octet.

$\text{BeF}_2, \text{BF}_3, \text{AlH}_3$ are electron- deficient (Octet incomplete) hence are Lewis acid.

In PCl_5 , P has 10 electrons in valency shell while in SF_6 , S has 12 electrons in valence shell. **Sugden** introduced singlet linkage in which one electron is donated (Instead of one pair of electrons) to the electron deficient atom so that octet rule is not violated. This singlet is represented as $(\rightarrow)$. Thus, PCl_5 and SF_6 have structures as,

(5) **Construction of structures for molecules and poly atomic ions** : The following method is applicable to species in which the octet rule is not violated.

(i) Determine the total number of valence electrons in all the atoms present, including the net charge on the species (n).

(ii) Determine $n = [2 \times (\text{number of H atoms}) + 8 \times (\text{number of other atoms})]$.

(iii) Determine the number of bonding electrons, n , which equals $n_1 - n_2$. No. of bonds equals $n/2$.

(iv) Determine the number of non-bonding electrons, n , which equals $n_1 - n_2$. No. of lone pairs equals $n/2$.

(v) Knowing the central atom (you'll need to know some chemistry here, math will not help!), arrange and distribute other atoms and $n/2$ bonds. Then complete octets using $n/2$ lone pairs.

(vi) Determine the 'formal charge' on each atom.

(vii) Formal Charge = [valence electrons in atom] - (no. of bonds) - (no. of unshared electrons)]

(viii) Other aspects like resonance etc. can now be incorporated.

Illustrative examples

(i) CO_3^{2-} ; $n_1 = 4 + (6 \times 3) + 2 = 24$ [2 added for net charge]

$n_2 = (2 \times 0) + (8 \times 4) = 32$ (no. H atom, 4 other atoms ('C' and 3

'O'))

$n_3 = 32 - 24 = 8$, hence $8/2 = 4$ bonds

$n_4 = 24 - 8 = 16$, hence 8 lone pairs.

Since carbon is the central atom, 3 oxygen atoms are to be arranged around it, thus,

Hence, we get $\begin{array}{c} \text{O} \\ | \\ \text{O} - \text{C} = \text{O} \end{array}$. Now, arrange lone pairs to complete

(ii) CO_2 ; $n_1 = 4 + (6 \times 2) = 16$

$n_2 = (2 \times 0) + (8 \times 3) = 24$

$n_3 = 24 - 16 = 8$, hence 4 bonds

$n_4 = 16 - 8 = 8$, hence 4 lone-pairs

Since C is the central atom, the two oxygen atoms are around to be arranged it thus the structure would be; $\text{O} - \text{C} - \text{O}$, but total no. of bonds = 4

Thus, $\text{O} = \text{C} = \text{O}$. After arrangement of lone pairs to complete

octets, we get, $\begin{array}{c} \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \end{array} \text{O} = \begin{array}{c} \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \end{array} \text{C} = \begin{array}{c} \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \end{array} \text{O} :$ and thus final structure is $\begin{array}{c} \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \end{array} \text{O} = \begin{array}{c} \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \end{array} \text{C} = \begin{array}{c} \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \\ \cdot\cdot \end{array} \text{O} :$

Co-ordinate covalent or Dative bond

This is a special type of covalent bond where the shared pair of electrons are contributed by one species only but shared by both. The atom which contributes the electrons is called the **donor** (Lewis base) while the other which only shares the electron pair is known as **acceptor** (Lewis acid).

This bond is usually represented by an arrow ($\rightarrow$) pointing from donor to the acceptor atom.

BF_3 molecule, boron is short of two electrons. So to complete its octet, it shares the lone pair of nitrogen in ammonia forming a dative bond.

Examples : CO , NO , HO , NO , NO , NO , HNO , NO_3^- , SO , SO ,

HSO_3 , SO_4^{2-} , SO_2^{2-} , H_3PO_4 , $\text{H}_4\text{P}_2\text{O}_7$, H_3PO_3 , Al_2Cl_6 (Anhydrous) O_3 , SO_2Cl_2 , SOCl_2 , HIO_3 , HClO_4 , HClO_3 , CH_3NC , N_2H_5^+ , CH_3NO_2 , NH_4^+ , $[\text{Cu}(\text{NH}_3)_4]^{2+}$ etc.

Characteristics of co-ordinate covalent compound

(1) Their melting and boiling points are higher than purely covalent compounds and lower than purely ionic compounds.

(2) These are sparingly soluble in polar solvent like water but readily soluble in non-polar solvents.

(3) Like covalent compounds, these are also bad conductors of electricity. Their solutions or fused masses do not allow the passage to electricity.

(4) The bond is rigid and directional. Thus, coordinate compounds show isomerism.

Dipole moment

"The product of magnitude of negative or positive charge (q) and the distance (d) between the centres of positive and negative charge is called dipole moment".

μ = Electric charge $\times$ bond length

As q is in the order of 10^{-18} esu and d is in the order of 10^{-8} cm, μ is in the order of 10^{-18} esu cm. Dipole moment is measured in "Debye" (D) unit. $1D = 10^{-18}$ esu cm = 3.33×10^{-30} coulomb metre (In S.I. unit).

Dipole moment is indicated by an arrow having a symbol ($\rightarrow$) pointing towards the negative end. Dipole moment has both magnitude and direction and therefore it is a vector quantity.

Symmetrical polyatomic molecules are not polar so they do not have any value of dipole moment.

$\mu = 0$ due to symmetry

Unsymmetrical polyatomic molecules always have net value of dipole moment, thus such molecules are polar in nature. H_2O , CH_3Cl , NH_3 , etc are polar molecules as they have some positive values of dipole moments.

(1) Dipole moment is an important factor in determining the geometry of molecules.

Table : 3.1 Molecular geometry and dipole moment

General formula	Molecular geometry	Dipole moment	Example
AX	Linear	May be non zero	HF , HCl
AX_2	Linear Bent or V-shape	Zero Non zero	CO_2 , CS_2 H_2O , NO_2
AX_3	Triangular planar Pyramidal T-shape	Zero Non zero Non zero	BF_3 NH_3 , PCl_3 ClF_3
AX_4	Tetrahedral	Zero	CH_4 , CCl_4

AX_5	Square planar	Zero	XeF_4
	See saw	Non zero	$SF_4, TeCl_4$
AX_6	Trigonal bipyramidal	Zero	PCl_5
	Square pyramidal	Non zero	$BrCl_5$
AX_7	Octahedral	Zero	SF_6
	Distorted octahedral	Non zero	XeF_6
AX_7	Pentagonal bipyramidal	Zero	IF_7

(2) Every ionic compound having some percentage of covalent character according to Fajan's rule. The percentage of ionic character in compound having some covalent character can be calculated by the following equation.

$$\text{The \% ionic character} = \frac{\text{Observed } \mu}{\text{Theoretical } \mu} \times 100.$$

(3) The trans isomer usually possesses either zero dipole moment or very low value in comparison to *cis*-form

Fajan's rule

The magnitude of polarization or increased covalent character depends upon a number of factors. These factors are,

(1) **Small size of cation** : Smaller size of cation greater is its polarizing power i.e. greater will be the covalent nature of the bond.

(2) **Large size of anion** : Larger the size of anion greater is its polarizing power i.e. greater will be the covalent nature of the bond.

(3) **Large charge on either of the two ions** : As the charge on the ion increases, the electrostatic attraction of the cation for the outer electrons of the anion also increases with the result its ability for forming the covalent bond increases.

(4) **Electronic configuration of the cation** : For the two ions of the same size and charge, one with a pseudo noble gas configuration (i.e. 18 electrons in the outermost shell) will be more polarizing than a cation with noble gas configuration (i.e., 8 electron in outer most shell).

Valence bond theory or VBT

It was developed by Heitler and London in 1927 and modified by Pauling and Slater in 1931.

(1) To form a covalent bond, two atoms must come close to each other so that orbitals of one overlaps with the other.

(2) Orbitals having unpaired electrons of anti spin overlaps with each other.

(3) After overlapping a new localized bond orbital is formed which has maximum probability of finding electrons.

(4) Covalent bond is formed due to electrostatic attraction between radii and the accumulated electrons cloud and by attraction between spins of anti spin electrons.

(5) Greater is the overlapping, lesser will be the bond length, more will be attraction and more will be bond energy and the stability of bond will also be high.

(6) The extent of overlapping depends upon: Nature of orbitals involved in overlapping, and nature of overlapping.

(7) More closer the valence shells are to the nucleus, more will be the overlapping and the bond energy will also be high.

(8) Between two sub shells of same energy level, the sub shell more directionally concentrated shows more overlapping. Bond energy : $2s-2s < 2s-2p < 2p-2p$

(9) *s*-orbitals are spherically symmetrical and thus show only head on overlapping. On the other hand, *p*-orbitals are directionally concentrated and thus show either head on overlapping or lateral overlapping. Overlapping of different type gives sigma (σ) and pi (π) bond.

Sigma (σ) bond	Pi (π) bond
It results from the end to end overlapping of two <i>s</i> -orbitals or two <i>p</i> -orbitals or one <i>s</i> and one <i>p</i> -orbital.	It result from the sidewise (lateral) overlapping of two <i>p</i> -orbitals.
Stronger	Less strong
Bond energy 80 <i>kcal</i> s	Bond energy 65 <i>kcal</i> s
More stable	Less stable
Less reactive	More reactive
Can exist independently	Always exist along with a σ -bond
The electron cloud is symmetrical about the internuclear axis.	The electron cloud is above and below the plane of internuclear axis.

Hybridization

The concept of hybridization was introduced by Pauling and Slater. Hybridization is defined as the intermixing of dissimilar orbitals of the same atom but having slightly different energies to form same number of new orbitals of equal energies and identical shapes. The new orbitals so formed are known as **hybrid orbitals**.

Characteristics of hybridization

(1) Only orbitals of almost similar energies and belonging to the same atom or ion undergoes hybridization.

(2) Hybridization takes place only in orbitals, electrons are not involved in it.

(3) The number of hybrid orbitals produced is equal to the number of pure orbitals, mixed during hybridization.

(4) In the excited state, the number of unpaired electrons must correspond to the oxidation state of the central atom in the molecule.

(5) Both half filled orbitals or fully filled orbitals of equivalent energy can involve in hybridization.

(6) Hybrid orbitals form only sigma bonds.

(7) Orbitals involved in π bond formation do not participate in hybridization.

(8) Hybridization never takes place in an isolated atom but it occurs only at the time of bond formation.

(9) The hybrid orbitals are distributed in space as apart as possible resulting in a definite geometry of molecule.

(10) Hybridized orbitals provide efficient overlapping than overlapping by pure *s*, *p* and *d*-orbitals.

(11) Hybridized orbitals possess lower energy.

How to determine type of hybridization : The structure of any molecule can be predicted on the basis of hybridization which in turn can be known by the following general formulation,

$$H = \frac{1}{2}(V + M - C + A)$$

Where H = Number of orbitals involved in hybridization viz. 2, 3, 4, 5, 6 and 7, hence nature of hybridization will be sp , sp , sp , spd , spd , spd respectively.

V = Number electrons in valence shell of the central atom,

M = Number of monovalent atom

C = Charge on cation,

A = Charge on anion

Resonance

The phenomenon of resonance was put forward by **Heisenberg** to explain the properties of certain molecules.

In case of certain molecules, a single Lewis structure cannot explain all the properties of the molecule. The molecule is then supposed to have many structures, each of which can explain most of the properties of the molecule but none can explain all the properties of the molecule. The actual structure is in between of all these contributing structures and is called **resonance hybrid** and the different individual structures are called **resonating structures** or **canonical forms**. This phenomenon is called **resonance**.

To illustrate this, consider a molecule of ozone O_3 . Its structure can be written as

As a resonance hybrid of above two structures (a) and (b). For simplicity, ozone may be represented by structure (c), which shows the resonance hybrid having equal bonds between single and double.

Resonance is shown by benzene, toluene, O_3 , allenes ($>C=C=C<$), CO , CO_2 , CO_3^{2-} , SO_2 , NO , NO_2 , while it is not shown by H_2O , H_2O_2 , NH_3 , CH_4 , SiO_2 .

As a result of resonance, the bond lengths of single and double bond in a molecule become equal e.g. $O-O$ bond lengths in ozone or $C-O$ bond lengths in CO_3^{2-} ion.

The resonance hybrid has lower energy and hence greater stability than any of the contributing structures.

Greater is the number of canonical forms especially with nearly same energy, greater is the stability of the molecule.

Difference between the energy of resonance hybrid and that of the most stable of the resonating structures (having least energy) is called resonance energy. Thus,

Resonance energy = Energy of resonance hybrid – Energy of the most stable of resonating structure.

In the case of molecules or ions having resonance, the bond order changes and is calculated as follows,

$$\text{Bond order} = \frac{\text{Total no. of bonds between two atoms in all the structures}}{\text{Total no. of resonating structures}}$$

$$\text{Bond order} = \frac{\text{double bond} + \text{single bond}}{2} = \frac{2+1}{2} = 1.5$$

In carbonate ion

$$\text{Bond order} = \frac{2+1+1}{3} = 1.33$$

Bond characteristics

(1) Bond length

“The average distance between the centre of the nuclei of the two bonded atoms is called bond length”.

It is expressed in terms of Angstrom ($1 \text{ \AA} = 10^{-10} \text{ m}$) or picometer ($1 \text{ pm} = 10^{-12} \text{ m}$).

In an ionic compound, the bond length is the sum of their ionic radii ($d = r_+ + r_-$) and in a covalent compound, it is the sum of their covalent radii (e.g., for HCl , $d = r_H + r_{Cl}$).

Factors affecting bond length

(i) The bond length increases with increase in the size of the atoms. For example, bond length of $H-X$ are in the order, $HI > HBr > HCl > HF$.

(ii) The bond length decreases with the multiplicity of the bond. Thus, bond length of carbon-carbon bonds are in the order, $C \equiv C < C = C < C - C$.

(iii) As an s-orbital is smaller in size, greater the s-character shorter is the hybrid orbital and hence shorter is the bond length.

For example, $sp^3 C-H > sp^2 C-H > sp C-H$

(iv) Polar bond length is usually smaller than the theoretical non-polar bond length.

(2) Bond energy

“The amount of energy required to break one mole of bonds of a particular type so as to separate them into gaseous atoms is called **bond dissociation energy** or simply **bond energy**”. Greater is the bond energy, stronger is the bond. Bond energy is usually expressed in kJ mol^{-1} .

Factors affecting bond energy

(i) Greater the size of the atom, greater is the bond length and less is the bond dissociation energy i.e. less is the bond strength.

(ii) For the bond between the two similar atoms, greater is the multiplicity of the bond, greater is the bond dissociation energy.

(iii) Greater the number of lone pairs of electrons present on the bonded atoms, greater is the repulsion between the atoms and hence less is the bond dissociation energy.

(iv) The bond energy increases as the hybrid orbitals have greater amount of s orbital contribution. Thus, bond energy decreases in the following order, $sp > sp^2 > sp^3$

(v) Greater the electronegativity difference, greater is the bond polarity and hence greater will be the bond strength i.e., bond energy, $H-F > H-Cl > H-Br > H-I$,

(vi) Among halogens $Cl - Cl > F - F > Br - Br > I - I$, (Decreasing order of bond energy) Resonance increases bond energy.

(3) Bond angle

In case of molecules made up of three or more atoms, the average angle between the bonded orbitals (i.e., between the two covalent bonds) is known as bond angle θ .

Factors affecting bond angle

(i) Repulsion between atoms or groups attached to the central atom may increase or decrease the bond angle.

(ii) In hybridisation as the s character of the s hybrid bond increases, the bond angle increases.

Bond type	sp	sp^2	sp^3
Bond angle	$109^\circ 28'$	120°	180°

(iii) By increasing lone pair of electron, bond angle decreases approximately by 2.5%.

	CH_4	NH_3	H_2O
Bond angle	109°	107°	105°

(iv) If the electronegativity of the central atom decreases, bond angle decreases.

	H_2O	H_2S	H_2Se	H_2Te
Bond angle	104.5°	92.2°	91.2°	89.5°

In case the central atom remains the same, bond angle increases with the decrease in electronegativity of the surrounding atom.

	PCl_3	PBr_3	PI_3	$AsCl_3$	$AsBr_3$	AsI_3
Bond angle	100°	101.5°	102°	98.4°	100.5°	101°

Valence shell electron pair repulsion theory (VSEPR)

The basic concept of the theory was suggested by **Sidgwick** and **Powell** (1940). It provides useful idea for predicting shapes and geometries of molecules. The concept tells that, the arrangement of bonds around the central atom depends upon the repulsion's operating between electron pairs (bonded or non bonded) around the central atom. **Gillespie** and **Nyholm** developed this concept as VSEPR theory.

The main postulates of VSEPR theory are

(1) For polyatomic molecules containing 3 or more atoms, one of the atoms is called the central atom to which other atoms are linked.

(2) The geometry of a molecule depends upon the total number of valence shell electron pairs (bonded or not bonded) present around the central atom and their repulsion due to relative sizes and shapes.

(3) If the central atom is surrounded by bond pairs only. It gives the symmetrical shape to the molecule.

(4) If the central atom is surrounded by lone pairs (lp) as well as bond pairs (bp) of e^- then the molecule has a distorted geometry.

(5) The relative order of repulsion between electron pairs is as follows : $lp - lp > lp - bp > bp - bp$.

A lone pair is concentrated around the central atom while a bond pair is pulled out between two bonded atoms. As such repulsion becomes greater when a lone pair is involved.

Table : 3.2 Geometry of Molecules/Ions having bond pair as well as lone pair of electrons

Type of mole-cule	No. of bond pairs of electron	No. of lone pairs of electrons	Hybridization	Bond angle	Expected geometry	Actual geometry	Examples
AX_3	2	1	sp^2	$< 120^\circ$	Trigonal planar	V-shape, Bent, Angular	$SO_2, SnCl, NO$
AX_4	2	2	sp^3	$< 109^\circ 28'$	Tetrahedral	V-shape, Angular	$H_2O, H_2S, SCl_2, OF_2, NH_3, ClO_2$
AX_4	3	1	sp^3	$< 109^\circ 28'$	Tetrahedral	Pyramidal	$NH_3, NF_3, PCl_3, PH_3, AsH_3, ClO_2, H_2O$
AX_5	4	1	sp^3d	$< 109^\circ 28'$	Trigonal bipyramidal	Irregular tetrahedron	$SF_4, SCl_4, TeCl_4$
AX_5	3	2	sp^3d	90°	Trigonal bipyramidal	T-shaped	ICl_3, IF_3, ClF_3
AX_5	2	3	sp^3d	180°	Trigonal bipyramidal	Linear	XeF_2, I_2, ICl_2
AX_6	5	1	sp^3d^2	$< 90^\circ$	Octahedral	Square pyramidal	ICl_5, BrF_5, IF_5
AX_6	4	2	sp^3d^2	—	Octahedral	Square planar	XeF_4, ICl_4
AX_6	6	1	sp^3d^3	—	Pentagonal pyramidal	Distorted octahedral	XeF_6

Molecular orbital theory or MOT

Molecular orbital theory was given by **Hund** and **Mulliken** in 1932.

The main ideas of this theory are,

(1) When two atomic orbitals combine or overlap, they lose their identity and form new orbitals. The new orbitals thus formed are called **molecular orbitals**.

(2) Molecular orbitals are the energy states of a molecule in which the electrons of the molecule are filled just as atomic orbitals are the energy states of an atom in which the electrons of the atom are filled.

(3) In terms of probability distribution, a molecular orbital gives the electron probability distribution around a group of nuclei just as an atomic orbital gives the electron probability distribution around the single nucleus.

(4) Only those atomic orbitals can combine to form molecular orbitals which have comparable energies and proper orientation.

(5) The number of molecular orbitals formed is equal to the number of combining atomic orbitals.

(6) When two atomic orbitals combine, they form two new orbitals called bonding molecular orbital and antibonding molecular orbital.

(7) The bonding molecular orbital has lower energy and hence greater stability than the corresponding antibonding molecular orbital.

(8) The bonding molecular orbitals are represented by σ, π etc, whereas the corresponding antibonding molecular orbitals are represented by σ^*, π^* etc.

(9) The shapes of the molecular orbitals formed depend upon the type of combining atomic orbitals.

(10) The filling of molecular orbitals in a molecule takes place in accordance with **Aufbau principle**, **Pauli's exclusion principle** and **Hund's rule**. The general order of increasing energy among the molecular orbitals formed by the elements of second period and hydrogen and their general electronic configurations are given below.

(11) Electrons are filled in the increasing energy of the *MO* which is in order

Molecular orbital energy level diagram
(Applicable for elements with $Z > 7$)

Hydrogen bonding

In 1920, **Latimer** and **Rodebush** introduced the idea of "hydrogen bond".

For the formation of *H*-bonding the molecule should contain an atom of high electronegativity such as *F*, *O* or *N* bonded to hydrogen atom and the size of the electronegative atom should be quite small.

Types of hydrogen bonding

(1) **Intermolecular hydrogen bond** : Intermolecular hydrogen bond is formed between two different molecules of the same or different substances.

(i) Hydrogen bond between the molecules of hydrogen fluoride.

Increasing energy (for electrons > 14)

Increasing energy (for electrons ≤ 14)

(12) Number of bonds between two atoms is called **bond order** and is given by

$$\text{Bond order} = \left(\frac{N_B - N_A}{2} \right)$$

where N_B = number of electrons in bonding *MO*.

N_A = number of electrons in antibonding *MO*.

For a stable molecule/ion, $N_B > N_A$

(13) $\text{Bond order} \propto \text{Stability of molecule} \propto \text{Dissociation energy} \propto \frac{1}{\text{Bond length}}$

(14) If all the electrons in a molecule are paired then the substance is a diamagnetic on the other hand if there are unpaired electrons in the molecule, then the substance is paramagnetic. More the number of unpaired electron in the molecule greater is the paramagnetism of the substance.

Molecular orbital energy level diagram obtained by the overlap of $2s$ and $2p_z$ atomic orbitals after mixing
(Applicable for elements with $Z < 7$)

(ii) Hydrogen bond in alcohol and water molecules

(2) **Intramolecular hydrogen bond** (Chelation)

Intramolecular hydrogen bond is formed between the hydrogen atom and the highly electronegative atom (*F*, *O* or *N*) present in the same molecule. Intramolecular hydrogen bond results in the cyclisation of the molecules and prevents their association. Consequently, the effect of intramolecular hydrogen bond on the physical properties is negligible.

For example : Intramolecular hydrogen bonds are present in molecules such as *o*-nitrophenol, *o*-nitrobenzoic acid, etc.

The extent of both intramolecular and intermolecular hydrogen bonding depends on temperature.

Effects of hydrogen bonding

Hydrogen bond helps in explaining the abnormal physical properties in several cases. Some of the properties affected by H-bond are given below,

(1) **Dissociation** : In aqueous solution, hydrogen fluoride dissociates and gives the difluoride ion (HF_2^-) instead of fluoride ion (F^-). This is due to H-bonding in HF. This explains the existence of KHF_2 . H-bond formed is usually longer than the covalent bond present in the molecule (e.g. in H_2O , $\text{O}-\text{H}$ bond = $0.99 \text{ \AA}$ but H-bond = $1.77 \text{ \AA}$).

(2) **Association** : The molecules of carboxylic acids exist as dimers because of the hydrogen bonding. The molecular masses of such compounds are found to be double than those calculated from their simple formulae. For example, molecular mass of acetic acid is found to be 120.

(3) **High melting and boiling point** : The compounds having hydrogen bonding show abnormally high melting and boiling points.

The high melting points and boiling points of the compounds (H_2O , HF and NH_3) containing hydrogen bonds is due to the fact that some extra energy is needed to break these bonds.

(4) **Solubility** : The compound which can form hydrogen bonds with the covalent molecules are soluble in such solvents. For example, lower alcohols are soluble in water because of the hydrogen bonding which can take place between water and alcohol molecules as shown below,

The intermolecular hydrogen bonding increases solubility of the compound in water while, the intramolecular hydrogen bonding decreases.

Due to chelation, $-\text{OH}$ group is not available to form hydrogen bond with water hence it is sparingly soluble in water.

$-\text{OH}$ group available to form hydrogen bond with water, hence it is completely soluble in water.

(5) As the compounds involving hydrogen bonding between different molecules (intermolecular hydrogen bonding) have higher boiling points, so they are less volatile.

(6) The substances which contain hydrogen bonding have higher viscosity and high surface tension.

(7) **Explanation of lower density of ice than water and maximum density of water at 277K** : In case of solid ice, the hydrogen bonding gives rise to a cage like structure of water molecules as shown in following figure. As a matter of fact, each water molecule is linked tetrahedrally to four other water molecules. Due to this structure ice has lower density than water at 273K. That is why ice floats on water. On heating, the hydrogen bonds start collapsing, obviously the molecules are not so closely packed as they are in the liquid state and thus the molecules start coming together resulting in the decrease of volume and hence increase of density. This goes on upto 277K. After 277 K, the increase in volume due to expansion of the liquid water becomes much more than the decrease in volume due to breaking of H-bonds. Thus, after 277K, there is net increase of volume on heating which means decrease in density. Hence density of water is maximum 277K.

Cage like structure of H_2O in the ice

Tips & Tricks

- ✍ A chemical bond is expected to be formed when the energy of the aggregate formed is about 40 *kJ mole*⁻¹ lower than the separate particles.
- ✍ Formation of a chemical bond is always an exothermic process.
- ✍ Lattice energies of bi-bivalent solids > bi-univalent solids > uni-univalent solids. For example, lattice energy of $Mg^{2+}O^{2-}$ (3932 *kJ mole*⁻¹) > $Ca^{2+}(F^-)_2$ (2581 *kJ mole*⁻¹) > Li^+F^- (1034 *kJ mole*⁻¹).
- ✍ When co-ordination number increases, the coulombic forces of attraction increases and hence stability increases.
- ✍ Ionic solids have negative vapour pressure.
- ✍ As a general rule, atomic crystals are formed by the lighter elements of the middle columns of the periodic table.
- ✍ $FeCl_3$ is more covalent than $FeCl_2$ because polarising power of Fe^{3+} is more than that of Fe^{2+} . Similarly $SnCl_4$ is more covalent than $SnCl_2$.
- ✍ Boron forms the maximum number of electron deficient compounds than any other elements in the periodic table.
- ✍ Roughly each lone pair decreases the bond angle by 2.5°.
- ✍ Greater the number of the lone pairs at the two bonding atoms, greater is the repulsion between them and weaker is the bond.
- ✍ The actual number of *s*- and *p*-electrons present in the outermost shell of the element is called maximum covalency of that atom.
- ✍ The hydrogen bonds are tetrahedral in their directions and not planar.
- ✍ The hydrogen bond is stronger in HF and persists even in vapour state. Such bonds account for the fact that gaseous hydrogen fluoride is largely polymerised into the molecular species $H_2F_2, H_3F_3, H_4F_4, H_5F_5$ and H_6F_6 .
- ✍ Hydrogen bonding is strongest when the bonded structure is stabilised by resonance.
- ✍ Critical temperature of water is higher than that of O_2 because H_2O molecule has dipole moment.

Ordinary Thinking

Objective Questions

Electrovalent bonding

1. Which forms a crystal of $NaCl$ [CPMT 1972; NCERT 1976; DPMT 1996]
 - (a) $NaCl$ molecules
 - (b) Na^+ and Cl^- ions
 - (c) Na and Cl atoms
 - (d) None of the above
2. When sodium and chlorine reacts then [NCERT 1973]
 - (a) Energy is released and ionic bond is formed
 - (b) Energy is released and a covalent bond is formed
 - (c) Energy is absorbed and ionic bond is formed
 - (d) Energy is absorbed and covalent bond is formed
3. Which one is least ionic in the following compounds [CPMT 1976; BHU 1998]
 - (a) $AgCl$
 - (b) KCl
 - (c) $BaCl_2$
 - (d) $CaCl_2$
4. The electronic configuration of four elements L, P, Q and R are given in brackets
 $L(1s^2, 2s^2 2p^4); Q(1s^2, 2s^2 2p^6, 3s^2 3p^5)$
 $P(1s^2, 2s^2 2p^6, 3s^1); R(1s^2, 2s^2 2p^6, 3s^2)$
 The formulae of ionic compounds that can be formed between these elements are [NCERT 1983]
 - (a) L_2P, RL, PQ and R_2Q
 - (b) LP, RL, PQ and RQ
 - (c) P_2L, RL, PQ and RQ_2
 - (d) LP, R_2L, P_2Q and RQ
5. Electrovalent compound's [MP PMT 1984]
 - (a) Melting points are low
 - (b) Boiling points are low
 - (c) Conduct current in fused state
 - (d) Insoluble in polar solvent
6. A electrovalent compound is made up of [CPMT 1978, 81; MNR 1979]
 - (a) Electrically charged molecules
 - (b) Neutral molecules
 - (c) Neutral atoms
 - (d) Electrically charged atoms or group of atoms
7. Electrovalent bond formation depends on
 - (a) Ionization energy
 - (b) Electron affinity
 - (c) Lattice energy
 - (d) All the three above
8. In the following which substance will have highest boiling point [NCERT 1973; MP PMT 1987]
 - (a) He
 - (b) CsF
 - (c) NH_3
 - (d) $CHCl_3$
9. An atom of sodium loses one electron and chlorine atom accepts one electron. This results the formation of sodium chloride molecule. This type of molecule will be
 - (a) Coordinate
 - (b) Covalent
 - (c) Electrovalent
 - (d) Metallic bond
10. Formula of a metallic oxide is MO . The formula of its phosphate will be [CPMT 1986, 93]
 - (a) $M_2(PO_4)_2$
 - (b) $M(PO_4)$
 - (c) M_2PO_4
 - (d) $M_3(PO_4)_2$
11. From the following which group of elements easily forms cation
 - (a) F, Cl, Br
 - (b) Li, Na, K
 - (c) O, S, Se
 - (d) N, P, As
12. Which type of compounds show high melting and boiling points
 - (a) Electrovalent compounds
 - (b) Covalent compounds

- (c) Coordinate compounds
(d) All the three types of compounds have equal melting and boiling points
13. Lattice energy of an ionic compound depends upon [AIEEE 2005]
(a) Charge on the ion only
(b) Size of the ion only
(c) Packing of ions only
(d) Charge on the ion and size of the ion
14. In the given bonds which one is most ionic [EAMCET 1980]
(a) $\text{Cs}-\text{Cl}$ (b) $\text{Al}-\text{Cl}$
(c) $\text{C}-\text{Cl}$ (d) $\text{H}-\text{Cl}$
15. Element x is strongly electropositive and y is strongly electronegative. Both element are univalent, the compounds formed from their combination will be [IIT 1980]
(a) x^+y^- (b) x^-y^+
(c) $x-y$ (d) $x \rightarrow y$
16. In the formation of NaCl from Na and Cl [CPMT 1985]
(a) Sodium and chlorine both give electrons
(b) Sodium and chlorine both accept electrons
(c) Sodium loses electron and chlorine accepts electron
(d) Sodium accepts electron and chlorine loses electron
17. Which of the following is an electrovalent linkage [CPMT 1974; DPMT 1984, 91; AFMC 1988]
(a) CH_4 (b) MgCl_2
(c) SiCl_4 (d) BF_3
18. Electrovalent compounds do not have [CPMT 1991]
(a) High M.P. and Low B.P. (b) High dielectric constant
(c) High M.P. and High B.P. (d) High polarity
19. Many ionic crystals dissolve in water because [NCERT 1982]
(a) Water is an amphiprotic solvent
(b) Water is a high boiling liquid
(c) The process is accompanied by a positive heat of solution
(d) Water decreases the interionic attraction in the crystal lattice due to solvation
20. The electronic structure of four elements A, B, C, D are
(A) $1s^2$ (B) $1s^2, 2s^2 2p^2$
(C) $1s^2, 2s^2 2p^5$ (D) $1s^2, 2s^2 2p^6$
The tendency to form electrovalent bond is largest in [MNR 1987, 95]
(a) A (b) B
(c) C (d) D
21. Chloride of metal is MCl_2 . The formula of its phosphate will be
(a) M_2PO_4 (b) $\text{M}_3(\text{PO}_4)_2$
(c) $\text{M}_2(\text{PO}_4)_3$ (d) MPO_4
22. The phosphate of a metal has the formula MPO_4 . The formula of its nitrate will be [CPMT 1971; MP PMT 1996]
(a) MNO_3 (b) $\text{M}_2(\text{NO}_3)_2$
(c) $\text{M}(\text{NO}_3)_2$ (d) $\text{M}(\text{NO}_3)_3$
23. In the transition of Zn atoms to Zn^{++} ions there is a decrease in the [CPMT 1972]
(a) Number of valency electrons
(b) Atomic weight
(c) Atomic number
(d) Equivalent weight
24. Phosphate of a metal M has the formula $\text{M}_3(\text{PO}_4)_2$. The formula for its sulphate would be [CPMT 1973; MP PMT 1996]
(a) MSO_4 (b) $\text{M}(\text{SO}_4)_2$
(c) $\text{M}_2(\text{SO}_4)_3$ (d) $\text{M}_3(\text{SO}_4)_2$
25. The molecular formula of chloride of a metal M is MCl_3 . The formula of its carbonate would be [CPMT 1987]
(a) MCO_3 (b) $\text{M}_2(\text{CO}_3)_3$
(c) M_2CO_3 (d) $\text{M}(\text{CO}_3)_2$
26. Sodium chloride easily dissolves in water. This is because [NCERT 1972; BHU 1973]
(a) It is a covalent compound
(b) Salt reacts with water
(c) It is a white substance
(d) Its ions are easily solvated
27. When NaCl is dissolved in water the sodium ion becomes [NCERT 1974; CPMT 1989; MP PMT 1999]
(a) Oxidized (b) Reduced
(c) Hydrolysed (d) Hydrated
28. Solid NaCl is a bad conductor of electricity since [AFMC 1980]
(a) In solid NaCl there are no ions
(b) Solid NaCl is covalent
(c) In solid NaCl there is no motion of ions
(d) In solid NaCl there are no electrons
29. Favourable conditions for electrovalency are
(a) Low charge on ions, large cation, small anion
(b) High charge on ions, small cation, large anion
(c) High charge on ions, large cation, small anion
(d) Low charge on ions, small cation, large anion
30. The sulphate of a metal has the formula $\text{M}_2(\text{SO}_4)_3$. The formula for its phosphate will be [DPMT 1982; CPMT 1972; MP PMT 1995]
(a) $\text{M}(\text{HPO}_4)_2$ (b) $\text{M}_3(\text{PO}_4)_2$
(c) $\text{M}_2(\text{PO}_4)_3$ (d) MPO_4
31. Ionic bonds are usually formed by combination of elements with [CBSE PMT 1999]
(a) High ionisation potential and low electron affinity
(b) Low ionisation potential and high electron affinity
(c) High ionisation potential and high electron affinity
(d) Low ionisation potential and low electron affinity
32. Molten sodium chloride conducts electricity due to the presence of
(a) Free electrons
(b) Free ions
(c) Free molecules
(d) Atoms of sodium and chlorine

33. The phosphate of a metal has the formula $MHPO_4$. The formula of its chloride would be
[NCERT 1974; CPMT 1977]
(a) MCl (b) MCl_2
(c) MCl_3 (d) M_2Cl_3
34. A number of ionic compounds e.g. $AgCl$, CaF_2 , $BaSO_4$ are insoluble in water. This is because [NCERT 1984]
(a) Ionic compounds do not dissolve in water
(b) Water has a high dielectric constant
(c) Water is not a good ionizing solvent
(d) These molecules have exceptionally high alternative forces in the lattice
35. What is the nature of chemical bonding between Cs and F
[MP PMT 1987; CPMT 1976]
(a) Covalent (b) Ionic
(c) Coordinate (d) Metallic
36. Which one of the following compound is ionic [MNR 1985]
(a) KCl (b) CH_4
(c) Diamond (d) H_2
37. Which of the following compound has electrovalent linkage [CPMT 1983, 84, 93]
(a) CH_3Cl (b) $NaCl$
(c) CH_4 (d) Cl_2
38. An ionic compound is generally a [MADT Bihar 1981]
(a) Good electrolyte (b) Weak electrolyte
(c) Non-electrolyte (d) Neutral
39. What metals combine with non-metals, the metal atom tends to
(a) Lose electrons
(b) Gain electrons
(c) Remain electrically neutral
(d) None of these
40. Chemical formula for calcium pyrophosphate is $Ca_2P_2O_7$. The formula for ferric pyrophosphate will be [NCERT 1977]
(a) $Fe_3(P_2O_7)_3$ (b) $Fe_4P_4O_{14}$
(c) $Fe_4(P_2O_7)_3$ (d) Fe_3PO_4
41. Among the bonds formed by a chlorine atom with atoms of hydrogen, chlorine, sodium and carbon, the strongest bond is formed between [EAMCET 1988; MP PMT 1993]
(a) $H-Cl$ (b) $Cl-Cl$
(c) $Na-Cl$ (d) $C-Cl$
42. Which of the following is least soluble [CPMT 1989]
(a) BeF_2 (b) SrF_2
(c) CaF_2 (d) MgF_2
43. Which of the following halides has maximum melting point
(a) $NaCl$ (b) $NaBr$
(c) NaI (d) NaF
44. The high melting point and insolubility in organic solvents of sulphuric acid are due to its structure. [IIT 1994]
(a) Simple ionic (b) Bipolar ionic
(c) Cubic (d) Hexagonal
45. Out of the following, which compound will have electrovalent bonding
(a) Ammonia (b) Water
(c) Calcium chloride (d) Chloromethane
46. The force which holds atoms together in an electrovalent bond is
(a) Vander Waal's force
(b) Dipole attraction force
(c) Electrostatic force of attraction
(d) All the above
47. The main reaction during electrovalent bond formation is
(a) Redox reaction (b) Substitution reaction
(c) Addition reaction (d) Elimination reaction
48. Electrovalent compounds are [CPMT 1996]
(a) Good conductor of electricity
(b) Polar in nature
(c) Low M.P. and low B.P.
(d) Easily available
49. Ionic compounds do not have [RPMT 1997]
(a) Hard and brittle nature
(b) High melting and boiling point
(c) Directional properties
(d) Soluble in polar solvents
50. Highest melting point would be of [RPMT 1999]
(a) He (b) $CsCl$
(c) NH_3 (d) $CHCl_3$
51. What is the effect of more electronegative atom on the strength of ionic bond [AMU 1999]
(a) Decreases (b) Increases
(c) Decreases slowly (d) Remains the same
52. An element X with the electronic configuration $1s^2, 2s^2 2p^6, 3s^2$ would be expected to form the chloride with the formula
(a) XCl_3 (b) XCl_2
(c) XCl (d) X_2Cl
53. Two element have electronegativity of 1.2 and 3.0. Bond formed between them would be [CPMT 1982; DCE 2000]
(a) Ionic (b) Polar covalent
(c) Co-ordinate (d) Metallic
54. Which of the following is least ionic [MP PET 2002]
(a) C_2H_5Cl (b) KCl
(c) $BaCl_2$ (d) $C_6H_5N^+H_3Cl^-$
55. Which type of bonding exists in Li_2O and CaF_2 respectively [RPET 2000]
(a) Ionic, ionic (b) Ionic, covalent
(c) Covalent, ionic (d) Coordinate, ionic
56. An atom with atomic number 20 is most likely to combine chemically with the atom whose atomic number is [BHU 2000]
(a) 11 (b) 14
(c) 16 (d) 10
57. Bond formed in crystal by anion and cation is [CBSE PMT 2000]
(a) Ionic (b) Metallic

- (c) Covalent (d) Dipole
58. Atoms or group of atoms which are electrically charged are known
(a) Anions (b) Cations
(c) Ions (d) Atoms
59. Which one is the strongest bond [Pb. PMT 2001]
(a) $Br-F$ (b) $F-F$
(c) $Cl-F$ (d) $Br-Cl$
60. The interionic attraction depends on interaction of [Kerala CET (Med.) 2002]
(a) Solute-Solute (b) Solvent-Solvent
(c) The charges (d) Molecular properties
61. Which of the following compounds is ionic [UPSEAT 2002]
(a) KI (b) CH_4
(c) Diamond (d) H_2
62. Which of the following pairs of species has same electronic configuration [UPSEAT 2002]
(a) Zn^{2+} and Ni^{2+} (b) Co^{+3} and Ni^{4+}
(c) Co^{2+} and Ni^{2+} (d) Ti^{4+} and V^{3+}
63. The energy that opposes dissolution of a solvent is [CPMT 2002]
(a) Hydration energy (b) Lattice energy
(c) Internal energy (d) Bond energy
64. Which of the following has highest melting point [RPET 2003]
(a) $BeCl_2$ (b) $MgCl_2$
(c) $CaCl_2$ (d) $BaCl_2$
65. Which of the following statements is not true for ionic compounds [RPET 2003]
(a) High melting point
(b) Least lattice energy
(c) Least solubility in organic compounds
(d) Soluble in water
66. Electrolytes are compound containing [MADT Bihar 1981]
(a) Electrovalent bond (b) Covalent bond
(c) Coordinate bond (d) Hydrogen bond
67. Which of the following hydrides are ionic [Roorkee 1999]
(a) CaH_2 (b) BaH_2
(c) SrH_2 (d) BeH_2
68. Which of the following conduct electricity in the fused state [Roorkee 2000]
(a) $BeCl_2$ (b) $MgCl_2$
(c) $SrCl_2$ (d) $BaCl_2$
- (c) 6 (d) 10
3. The electronic configuration of four elements are given in brackets
 $L(1s^2, 2s^2 2p^1)$ $M(1s^2, 2s^2 2p^5)$
 $Q(1s^2, 2s^2 2p^6, 3s^1)$ $R(1s^2, 2s^2 2p^2)$
The element that would most readily form a diatomic molecule is [NCERT 1983]
(a) Q (b) M
(c) R (d) L
4. In covalency [CPMT 1974, 76, 78, 81; AFMC 1982]
(a) Electrons are transferred
(b) Electrons are equally shared
(c) The electron of one atom are shared between two atoms
(d) None of the above
5. Which compound is highest covalent
(a) $LiCl$ (b) LiF
(c) $LiBr$ (d) LiI
6. The nature of bonding in graphite is [DPMT 1986; CPMT 1986]
(a) Covalent (b) Ionic
(c) Metallic (d) Coordinate
7. Which of the following substances has giant covalent structure [DPMT 1985, 86; NCERT 1975]
(a) Iodine crystal (b) Solid CO_2
(c) Silica (d) White phosphorus
8. With which of the given pairs CO resembles [BHU 2005]
(a) $HgCl, CH_4$ (b) $HgCl, SnCl_4$
(c) CH_4, NO (d) NO, NO_2
9. The electron pair which forms a bond between two similar non-metallic atoms will be [IIT 1986]
(a) Dissimilar shared between the two
(b) By complete transfer from one atom to other
(c) In a similar spin condition
(d) Equally shared in between the two
10. For the formation of covalent bond, the difference in the value of electronegativities should be [EAMCET 1982]
(a) Equal to or less than 1.7 (b) More than 1.7
(c) 1.7 or more (d) None of these
11. Which type of bond is formed between similar atoms
(a) Ionic (b) Covalent
(c) Coordinate (d) Metallic
12. Covalent compounds are generally in water [CPMT 1987]
(a) Soluble (b) Insoluble
(c) Dissociated (d) Hydrolysed
13. Which one is the electron deficient compound [AIIMS 1982]
(a) ICl (b) NH_3
(c) BCl_3 (d) PCl_3
14. Which among the following elements has the tendency to form covalent compounds
(a) Ba (b) Be
(c) Mg (d) Ca
15. Silicon has 4 electrons in the outermost orbit. In forming the bonds
(a) It gains electrons (b) It loses electrons
(c) It shares electrons (d) None of these
16. Which of the following occurs when two hydrogen atoms bond with each others
(a) Potential energy is lowered
(b) Kinetic energy is lowered

Covalent bonding

1. The valency of sulphur in sulphuric acid is [NCERT 1974]
(a) 2 (b) 4
(c) 6 (d) 8
2. The number of electrons involved in the bond formation of N_2 molecule [IIT 1980; CPMT 1983, 84, 85; CBSE PMT 1992]
(a) 2 (b) 4

- (c) Electronic motion ceases
(d) Energy is absorbed
17. A bond with maximum covalent character between non-metallic elements is formed [NCERT 1982]
(a) Between identical atoms
(b) Between chemically similar atoms
(c) Between atoms of widely different electronegativities
(d) Between atoms of the same size
18. Amongst the following covalent bonding is found in [CPMT 1973]
(a) Sodium chloride (b) Magnesium chloride
(c) Water (d) Brass
19. Indicate the nature of bonding in diamond [EAMCET 1980; BHU 1996; KCET 2000]
(a) Covalent (b) Ionic
(c) Coordinate (d) Hydrogen
20. Octet rule is not valid for the molecule [IIT 1979; MP PMT 1995]
(a) CO_2 (b) H_2O
(c) CO (d) O_2
21. Which of the following compounds are covalent [IIT 1980; MLNR 1982]
(a) H_2 (b) CaO
(c) KCl (d) Na_2S
22. Indicate the nature of bonding in CCl_4 and CaH_2 [NCERT 1973]
(a) Covalent in CCl_4 and electrovalent in CaH_2
(b) Electrovalent in both CCl_4 and CaH_2
(c) Covalent in both CCl_4 and CaH_2
(d) Electrovalent in CCl_4 and covalent in CaH_2
23. If the atomic number of element X is 7, the best electron dot symbol for the element is [NCERT 1973; CPMT 2003]
(a) $X \cdot$ (b) $\cdot X \cdot$
(c) $\cdot \ddot{X} :$ (d) $:\ddot{X} \cdot$
24. Which is the most covalent [AFMC 1982]
(a) $C-O$ (b) $C-Br$
(c) $C-S$ (d) $C-F$
25. The covalent compound HCl has the ionic character as [EAMCET 1980]
(a) The electronegativity of hydrogen is greater than that of chlorine
(b) The electronegativity of hydrogen is equal to that of chlorine
(c) The electronegativity of chlorine is greater than that of hydrogen
(d) Hydrogen and chlorine are gases
26. The correct sequence of increasing covalent character is represented by [CBSE PMT 2005]
(a) $LiCl < NaCl < BeCl_2$ (b) $BeCl_2 < NaCl < LiCl$
(c) $NaCl < LiCl < BeCl_2$ (d) $BeCl_2 < LiCl < NaCl$
27. Bond energy of covalent $O-H$ bond in water is [EAMCET 1982]
(a) Greater than bond energy of $H-H$ bond
(b) Equal to bond energy of $H-H$ bond
(c) Less than bond energy of $H-H$ bond
(d) None of these
28. Solid CH_4 is [DPMT 1983]
(a) Molecular solid (b) Ionic solid
(c) Pseudo solid (d) Does not exist
29. A covalent bond is likely to be formed between two elements which
(a) Have similar electronegativities
(b) Have low ionization energies
(c) Have low melting points
(d) Form ions with a small charge
30. The bond between two identical non-metal atoms has a pair of electrons [CPMT 1986]
(a) Unequally shared between the two
(b) Transferred fully from one atom to another
(c) With identical spins
(d) Equally shared between them
31. The valency of phosphorus in H_3PO_4 is [DPMT 1984]
(a) 2 (b) 5
(c) 4 (d) 1
32. Which of the following substances has covalent bonding [AMU 1985]
(a) Germanium (b) Sodium chloride
(c) Solid neon (d) Copper
33. The covalency of nitrogen in HNO_3 is [CPMT 1987]
(a) 0 (b) 3
(c) 4 (d) 5
34. Hydrogen chloride molecule contains a [CPMT 1984]
(a) Covalent bond (b) Double bond
(c) Coordinate bond (d) Electrovalent bond
35. As compared to covalent compounds, electrovalent compounds generally have [CPMT 1990, 94; MP PMT 1997]
(a) Low melting points and low boiling points
(b) Low melting points and high boiling points
(c) High melting points and low boiling points
(d) High melting points and high boiling points
36. The interatomic distances in H_2 and Cl_2 molecules are 74 and 198 pm respectively. The bond length of HCl is [MP PET 1993]
(a) 272 pm (b) 136 pm
(c) 124 pm (d) 248 pm
37. On analysis, a certain compound was found to contain iodine and oxygen in the ratio of 254 gm of iodine and 80 gm of oxygen.

The atomic mass of iodine is 127 and that of oxygen is 16. Which of the following is the formula of the compound

- (a) IO (b) I_2O
(c) I_5O_2 (d) I_2O_5

38. Ionic and covalent bonds are present in

[CBSE PMT 1990; MNR 1990; KCET 2000; UPSEAT 2001]

- (a) CCl_4 (b) $CaCl_2$
(c) NH_4Cl (d) H_2O

39. Highest covalent character is found in [EAMCET 1992]

- (a) CaF_2 (b) $CaCl_2$
(c) $CaBr_2$ (d) CaI_2

40. Among the following which property is commonly exhibited by a covalent compound [MP PET 1994]

- (a) High solubility in water
(b) High electrical conductance
(c) Low boiling point
(d) High melting point

41. Atoms in the water molecule are linked by [MP PAT 1996]

- (a) Electrovalent bond
(b) Covalent bond
(c) Coordinate covalent bond
(d) Odd electron bond

42. Which is the correct electron dot structure of N_2O molecule

[MP PET 1996]

- (a) $:N = N = \ddot{O}$ (b) $:N \equiv N^+ - \ddot{O}^-$
(c) $\ddot{N} = \ddot{N} = \ddot{O}$ (d) $:N = N = \ddot{O}:$

43. A covalent bond between two atoms is formed by which of the following [MP PMT 1996]

- (a) Electron nuclear attraction
(b) Electron sharing
(c) Electron transfer
(d) Electrostatic attraction

44. The electronic configuration of a metal M is $1s^2, 2s^2 2p^6, 3s^1$. The formula of its oxides will be

[MP PET/PMT 1998]

- (a) MO (b) M_2O
(c) M_2O_3 (d) MO_2

45. Which of the following statements regarding covalent bond is not true [MP PET/PMT 1998]

- (a) The electrons are shared between atoms
(b) The bond is non-directional
(c) The strength of the bond depends upon the extent of overlapping
(d) The bond formed may or may not be polar

46. If the electronic configuration of $M = 2, 8, 3$ and that of $A = 2, 8, 7$, the formula of the compound is

[Bihar MEE 1996]

- (a) MA_3 (b) MA_2
(c) M_2A (d) MA_3

(e) M_3A

[CPMT 1981]

47. The table shown below gives the bond dissociation energies (E_{diss}) for single covalent bonds of carbon (C) atoms with element A, B, C and D. Which element has the smallest atoms [CBSE PMT 1994]

Bond	$E_{diss} (kJ mol^{-1})$
$C-A$	240
$C-B$	328
$C-C$	276
$C-D$	485

- (a) A (b) B
(c) C (d) D

48. If a molecule X_2 has a triple bond, then X will have the electronic configuration [CET Pune 1998]

- (a) $1s^2 2s^2 2p^5$ (b) $1s^2 2s^2 2p^3$
(c) $1s^2 2s^1$ (d) $1s^2 2s^2 2p^1$

49. Which of the following compounds does not follow the octet rule for electron distribution [CET Pune 1998]

- (a) PCl_5 (b) PCl_3
(c) H_2O (d) PH_3

50. The valency of $A = 3$ and $B = 2$, then the compound is

[Bihar MEE 1997]

- (a) A_2B_3 (b) A_3B_2
(c) A_3B_3 (d) A_2B_2
(e) None of these

51. The number of electrons shared by each outermost shell of N_2 is

- (a) 2 (b) 3
(c) 4 (d) 5

52. Which of the following substances when dissolved in water will give a solution that does not conduct electricity

[JIPMER 1999]

- (a) Hydrogen chloride (b) Potassium hydroxide
(c) Sodium acetate (d) Urea

53. Which of the following atoms has minimum covalent radius

[DPMT 2000]

- (a) B (b) C
(c) N (d) Si

54. Boron form covalent compound due to [Pb. PMT 2000]

- (a) Small size (b) Higher ionization energy
(c) Lower ionization energy (d) Both (a) and (b)

55. Two elements X and Y have following electron configurations

$$X = 1s^2, 2s^2 2p^6, 3s^2 3p^6, 4s^2$$

$$\text{and } Y = 1s^2, 2s^2 2p^6, 3s^2 3p^6$$

The compound formed by combination of X and Y is

[DPMT 2001]

- (a) XY_5 (b) X_2Y_5
(c) X_5Y_3 (d) XY_2

56. Covalent compounds have low melting point because

[KCET 2002]

- (a) Covalent bond is less exothermic
(b) Covalent molecules have definite shape
(c) Covalent bond is weaker than ionic bond

- (d) Covalent molecules are held by weak Vander Waal's force of attraction
57. p and n -type of semiconductors are formed due to [UPSEAT 2002]
 (a) Covalent bonds (b) Metallic bonds
 (c) Ionic bonds (d) Co-ordinate bond
58. Which of the following is Lewis acid [RPET 2003]
 (a) BF_3 (b) NH_3
 (c) PH_3 (d) SO_2
59. Among the species : CO_2 , CH_3COO^- , CO , CO_3^{2-} , $HCHO$ which has the weakest carbon-oxygen bond [Kerala PMT 2004]
 (a) CO_2 (b) CH_3COO^-
 (c) CO (d) CO_3^{2-}
 (e) $HCHO$
60. Valency of sulphur in $Na_2S_2O_3$ is [DPMT 1984]
 (a) Two (b) Three
 (c) Four (d) Six
61. The acid having $O-O$ bond is [IIT JEE Screening 2004]
 (a) $H_2S_2O_3$ (b) $H_2S_2O_6$
 (c) $H_2S_2O_8$ (d) $H_2S_4O_6$
62. The following salt shows maximum covalent character [UPSEAT 2004]
 (a) $AlCl_3$ (b) $MgCl_2$
 (c) $CsCl$ (d) $LaCl_3$
63. Which type of bond is present in H_2S molecule [MHCET 2003; Pb CET 2001]
 (a) Ionic bond (b) Covalent bond
 (c) Co-ordinate (d) All of three
64. H_2S is more acidic than H_2O , due to [BVP 2004]
 (a) O is more electronegative than S
 (b) $O-H$ bond is stronger than $S-H$ bond
 (c) $O-H$ bond is weaker than $S-H$ bond
 (d) None of these
65. Which of the following has covalent bond [AFMC 1988; DCE 2004]
 (a) Na_2S (b) $AlCl_3$
 (c) NaH (d) $MgCl_2$
66. The following element forms a molecule with eight its own weight atoms [MHCET 2004]
 (a) Si (b) S
 (c) Cl (d) P
67. In H_2O_2 , the two oxygen atoms have
 (a) Electrovalent bond (b) Covalent bond
 (c) Coordinate bond (d) No bond
68. Carbon has a valency of 2 in CO and 4 in CO_2 and CH_4 . Its valency in acetylene (C_2H_2) is [NCERT 1971]
 (a) 1 (b) 2
 (c) 3 (d) 4
69. Number of electrons in the valence orbit of nitrogen in an ammonia molecule are
 (a) 8 (b) 5
 (c) 6 (d) 7
70. Hydrogen atoms are held together to form hydrogen molecules by
 (a) Hydrogen bond (b) Ionic bond
 (c) Covalent bond (d) Dative bond
71. Strongest bond is [AFMC 1987]
 (a) $C-C$ (b) $C-H$
 (c) $C-N$ (d) $C-O$
72. The major binding force of diamond, silicon and quartz is [Kerala CET (Med.) 2002]
 (a) Electrostatic force (b) Electrical attraction
 (c) Co-valent bond force (d) Non-covalent bond force
73. Multiple covalent bonds exist in a molecule of [NCERT 1973]
 (a) H_2 (b) F_2
 (c) C_2H_4 (d) N_2
74. Which of the following does not obey the octet rule [EAMCET 1993]
 (a) CO (b) NH_3
 (c) H_2O (d) PCl_5
75. Which of the following statements is correct for covalent bond
 (a) Electrons are shared between two atoms
 (b) It may be polar or non-polar
 (c) Direction is non-polar
 (d) Valency electrons are attracted
76. Among CaH_2 , NH_3 , NaH and B_2H_6 , which are covalent hydride [Orissa JEE 2005]
 (a) NH_3 and B_2H_6 (b) NaH and CaH_2
 (c) NaH and NH_3 (d) CaH_2 and B_2H_6

Co-ordinate or Dative bonding

1. Which species has the maximum number of lone pair of electrons on the central atom? [IIT 2005]
 (a) $[ClO]^-$ (b) XeF_4
 (c) SF_6 (d) $[I]^-$
2. A simple example of a coordinate covalent bond is exhibited by
 (a) C_2H_2 (b) H_2SO_4
 (c) NH_3 (d) HCl
3. The bond that exists between NH_3 and BF_3 is called [AFMC 1982; MP PMT 1985; MNR 1994; KCET 2000; MP PET 2001; UPSEAT 2001]
 (a) Electrovalent (b) Covalent
 (c) Coordinate (d) Hydrogen
4. Which of the following does not have a coordinate bond [MADT Bihar 1984]
 (a) SO_2 (b) HNO_3
 (c) H_2SO_3 (d) HNO_2
5. Coordinate covalent compounds are formed by [CPMT 1990, 94]
 (a) Transfer of electrons (b) Sharing of electrons
 (c) Donation of electrons (d) None of these process
6. In the coordinate valency [CPMT 1989]
 (a) Electrons are equally shared by the atoms
 (b) Electrons of one atom are shared with two atoms
 (c) Hydrogen bond is formed

- (d) None of the above
7. Which of the following contains a coordinate covalent bond [MNR 1990; IIT 1986]
- (a) N_2O_5 (b) $BaCl_2$
(c) HCl (d) H_2O
8. A coordinate bond is formed when an atom in a molecule has
- (a) Electric charge on it
(b) All its valency electrons shared
(c) A single unshared electron
(d) One or more unshared electron pair
9. Which has a coordinate bond [RPMT 1997]
- (a) SO_3^{2-} (b) CH_4
(c) CO_2 (d) NH_3
10. The compound containing co-ordinate bond is [AFMC 1999; Pb. CET 2002]
- (a) O_3 (b) SO_3
(c) H_2SO_4 (d) All of these
11. The number of dative bonds in sulphuric acid molecules is [MP PET 2002]
- (a) 0 (b) 1
(c) 2 (d) 4
12. Which of the following compounds has coordinate (dative) bond
- (a) CH_3NC (b) CH_3OH
(c) CH_3Cl (d) NH_3
13. The structure of orthophosphoric acid is [KCET 2003]
- (a) $\begin{array}{c} O \\ \uparrow \\ H-O-P-O-H \\ | \\ O \\ | \\ H \end{array}$ (b) $\begin{array}{c} H \\ | \\ O \leftarrow P-O-H \\ | \\ O \\ | \\ H \end{array}$
(c) $\begin{array}{c} H \\ | \\ O \leftarrow P-O-H \\ | \\ H \end{array}$ (d) $\begin{array}{c} O \\ \uparrow \\ H-O-P=O \end{array}$
14. What is the nature of the bond between B and O in $(C_2H_5)_2OBH_3$ [Orissa JEE 2003]
- (a) Covalent (b) Co-ordinate covalent
(c) Ionic bond (d) Banana shaped bond
15. Sulphuric acid provides a example of [Kerala CET (Med.) 2002]
- (a) Co-ordinate bonds
(b) Non-covalent compound
(c) Covalent and co-ordinate bond
(d) Non-covalent ion
- (a) BF_3 (b) CCl_4
(c) $BeCl_2$ (d) All of these
3. Which molecule has the largest dipole moment [CPMT 1991]
- (a) HI
(c) HBr (d) HF
4. The unequal sharing of bonded pair of electrons between two atoms in a molecule causes [EAMCET 1986]
- (a) Dipole
(b) Radical formation
(c) Covalent bond
(d) Decomposition of molecule
5. Which of the following will show least dipole character [NCERT 1975; Kurukshetra CEE 1998]
- (a) Water (b) Ethanol
(c) Ethane (d) Ether
6. Which of the following molecules will show dipole moment [NCERT 1972, 74; DPMT 1985]
- (a) Methane (b) Carbon tetrachloride
(c) Chloroform (d) Carbon dioxide
7. Which of the following compounds possesses the dipole moment [NCERT 1978; EAMCET 2003]
- (a) Water (b) Boron trifluoride
(c) Benzene (d) Carbon tetrachloride
8. Which bond angle θ would result in the maximum dipole moment for the triatomic molecule YXY [AIIMS 1980]
- (a) $\theta = 90^\circ$ (b) $\theta = 120^\circ$
(c) $\theta = 150^\circ$ (d) $\theta = 180^\circ$
9. Which of the following would have a permanent dipole moment [CBSE PMT 2000]
- (a) BF_3 (b) SiF_4
(c) SF_4 (d) XeF_4
10. Carbon tetrachloride has no net dipole moment because of [IIT 1982, 83; MP PMT 1985, 91; EAMCET 1988; AMU 1999]
- (a) Its planar structure
(b) Its regular tetrahedral structure
(c) Similar sizes of carbon and chlorine atoms
(d) Similar electron affinities of carbon and chlorine
11. The molecule which has the largest dipole moment amongst the following [MNR 1983]
- (a) CH_4 (b) $CHCl_3$
(c) CCl_4 (d) CHI_3
12. Positive dipole moment is present in [MNR 1986; MP PET 2000]
- (a) CCl_4 (b) C_6H_6
(c) BF_3 (d) HF
13. The polarity of a covalent bond between two atoms depends upon
- (a) Atomic size (b) Electronegativity
(c) Ionic size (d) None of the above
14. Pick out the molecule which has zero dipole moment [CPMT 1989; EAMCET 1993; MP PMT 1999]
- (a) NH_3 (b) H_2O
(c) BCl_3 (d) SO_2

Dipole moment

1. Which molecules has zero dipole moment [AIIMS 1980, 82, 91; Roorkee 2000; MH CET 2001]
- (a) H_2O (b) CO_2
(c) HF (d) HBr
2. In the following which one have zero dipole moment

15. Zero dipole moment is present in [DPMT 1986; IIT 1987]
 (a) NH_3 (b) H_2O
 (c) *cis* 1, 2-dichloroethene (d) *trans* 1, 2-dichloroethene
16. Which of the following is the most polar [AFMC 1988]
 (a) CCl_4 (b) $CHCl_3$
 (c) CH_3OH (d) CH_3Cl
17. Which one has minimum (nearly zero) dipole moment [IIT Screening 1994; CBSE PMT 1996]
 (a) Butene-1 (b) *cis* butene-2
 (c) *trans* butene-2 (d) 2-methyl-1-propene
18. Which one of the following is having zero dipole moment [RPMT 1997; EAMCET 1988; MNR 1991]
 (a) CCl_4 (b) CH_3Cl
 (c) CH_3F (d) $CHCl_3$
19. Which of the following molecules does not possess a permanent dipole moment [CBSE PMT 1994]
 (a) H_2S (b) SO_2
 (c) CS_2 (d) SO_3
20. Which of the following has zero dipole moment [CPMT 1997; AFMC 1998; CBSE PMT 2001]
 (a) CH_2Cl_2 (b) CH_4
 (c) NH_3 (d) PH_3
21. Fluorine is more electronegative than either boron or phosphorus. What conclusion can be drawn from the fact that BF_3 has no dipole moment but PF_3 does [Pb. PMT 1998]
 (a) BF_3 is not spherically symmetrical but PF_3 is
 (b) BF_3 molecule must be linear
 (c) The atomic radius of P is larger than the atomic radius of B
 (d) The BF_3 molecule must be planar triangular
22. Which molecule does not show zero dipole moment [RPET 1997, 99]
 (a) BF_3 (b) NH_3
 (c) CCl_4 (d) CH_4
23. The dipole moment of HBr is $1.6 \times 10^{-30} \text{ cm}$ and interatomic spacing is $1\text{\AA}$. The % ionic character of HBr is [MP PMT 2000]
 (a) 7 (b) 10
 (c) 15 (d) 27
24. Non-polar solvent is [RPET 2000]
 (a) Dimethyl sulphoxide (b) Carbon tetrachloride
 (c) Ammonia (d) Ethyl alcohol
25. Which shows the least dipole moment [UPSEAT 2001; DPMT 1982]
 (a) CCl_4 (b) $CHCl_3$
 (c) CH_3CH_2OH (d) CH_3COCH_3
26. Which molecule has zero dipole moment [UPSEAT 2001]
 (a) H_2O (b) AgI
 (c) $PbSO_4$ (d) HBr
27. The dipole moment is zero for the molecule [IIT 1989; MP PMT 2002]
 (a) Ammonia (b) Boron trifluoride
 (c) Sulphur dioxide (d) Water
28. N_2 is less reactive than CN^- due to [UPSEAT 2003]
 (a) Presence of more electrons in orbitals
 (b) Absence of dipole moment
 (c) Difference in spin quantum no
 (d) None of these
29. In a polar molecule, the ionic charge is $4.8 \times 10^{-10} \text{ e.s.u.}$. If the inter ionic distance is one $\text{\AA}$ unit, then the dipole moment is
 (a) 41.8 debye (b) 4.18 debye
 (c) 4.8 debye (d) 0.48 debye
30. Which of the following is a polar compound [Pb. CET 2000]
 (a) HCl (b) H_2Se
 (c) CH_4 (d) HI
31. Which of the following has no dipole moment [DCE 2002]
 (a) CO_2 (b) SO_3
 (c) O_3 (d) H_2O
32. Which of the following is non-polar [DCE 2002]
 (a) PCl_5 (b) PCl_3
 (c) SF_6 (d) IF_7
33. Identify the non-polar molecule in the set of compounds given : HCl, HF, H_2, HBr [UPSEAT 2004]
 (a) H_2 (b) HCl
 (c) HF, HBr (d) HBr
34. Dipole moment is shown by [IIT 1986]
 (a) 1, 4-dichlorobenzene
 (b) *cis* 1, 2-dichloroethene
 (c) *trans* 1, 2-dichloroethene
 (d) *trans* 1, 2-dichloro-2-pentene
35. If HCl molecule is completely polarized, so expected value of dipole moment is 6.12D (deby), but experimental value of dipole moment is 1.03D. Calculate the percentage ionic character [Kerala CET 2005]
 (a) 17 (b) 83
 (c) 50 (d) Zero
 (e) 90

Polarisation and Fajan's rule

1. BF_3 and NF_3 both molecules are covalent, but BF_3 is non-polar and NF_3 is polar. Its reason is [CPMT 1989; NCERT 1980]
 (a) In uncombined state boron is metal and nitrogen is gas
 (b) $B-F$ bond has no dipole moment whereas $N-F$ bond has dipole moment
 (c) The size of boron atom is smaller than nitrogen
 (d) BF_3 is planar whereas NF_3 is pyramidal
2. Which one is polar molecule among the following
 (a) CO_2 (b) CCl_4

- (c) H_2O (d) CH_4
3. If the electron pair forming a bond between two atoms A and B is not in the centre, then the bond is [AIIMS 1984]
 (a) Single bond (b) Polar bond
 (c) Non-polar bond (d) π bond
4. Which of the following liquids is not deflected by a non-uniform electrostatic field [NCERT 1978]
 (a) Water (b) Chloroform
 (c) Nitrobenzene (d) Hexane
5. Which of the following is non-polar [EAMCET 1983]
 (a) H_2S (b) $NaCl$
 (c) Cl_2 (d) H_2SO_4
6. Polarization is the distortion of the shape of an anion by an adjacently placed cation. Which of the following statements is correct [NCERT 1982]
 (a) Maximum polarization is brought about by a cation of high charge
 (b) Minimum polarization is brought about by a cation of low radius
 (c) A large cation is likely to bring about a large degree of polarization
 (d) A small anion is likely to undergo a large degree of polarization
7. The bonds between P atoms and Cl atoms in PCl_5 are likely to be [MP PMT 1987]
 (a) Ionic with no covalent character
 (b) Covalent with some ionic character
 (c) Covalent with no ionic character
 (d) Ionic with some metallic character
8. Two electrons of one atom A and two electrons of another atom B are utilized to form a compound AB . This is an example of
 (a) Polar covalent bond (b) Non-polar covalent bond
 (c) Polar bond (d) Dative bond
9. In which of the following molecule is the covalent bond most polar [AMU 1985; MP PET 2001]
 (a) HI (b) HBr
 (c) HCl (d) H_2
10. Amongst ClF_3 , BF_3 and NH_3 molecules the one with non-planar geometry is [MP PMT 1999]
 (a) ClF_3 (b) NH_3
 (c) BF_3 (d) None of these
11. Which of the following possesses highest melting point [CPMT 1999]
 (a) Chlorobenzene (b) o -dichlorobenzene
 (c) m -dichlorobenzene (d) p -dichlorobenzene
12. The polar molecule among the following is [Orissa JEE 1997]
 (a) CCl_4 (b) CO_2
 (c) CH_2Cl_2 (d) $CH_2 = CH_2$
13. Which of the following have both polar and non-polar bonds
 (a) C_2H_6 (b) NH_4Cl
 (c) HCl (d) $AlCl_3$
14. Which of the following has a high polarising power [CET Pune 1998]
 (a) Mg^{2+} (b) Al^{3+}
- (c) Na^+ (d) Ca^{2+}
15. Maximum covalent character is associated with the compound [RPMT 1999]
 (a) NaI (b) MgI_2
 (c) $AlCl_3$ (d) AlI_3
16. Polarizability of halide ions increases in the order [DCE 1999]
 (a) F^-, I^-, Br^-, Cl^- (b) Cl^-, Br^-, I^-, F^-
 (c) I^-, Br^-, Cl^-, F^- (d) F^-, Cl^-, Br^-, I^-
17. According to Fajan's rule, covalent bond is favoured by [AIIMS 1999]
 (a) Large cation and small anion
 (b) Large cation and large anion
 (c) Small cation and large anion
 (d) Small cation and small anion
18. Which of the following statements is correct [AMU 1999]
 (a) SF_4 is polar and non-reactive
 (b) SF_6 is non-polar and very reactive
 (c) SF_6 is a strong fluorinating agent
 (d) SF_4 is prepared by fluorinating SCl_2 with NaF
19. Choose the correct statement [RPMT 2000]
 (a) Amino polarisation is more pronounced by highly charged cation
 (b) Small cation has minimum capacity to polarise an anion.
 (c) Small anion has maximum polarizability
 (d) None of these
20. The ICl molecule is [DPMT 2001]
 (a) Purely electrovalent
 (b) Purely covalent
 (c) Polar with negative end on iodine
 (d) Polar with negative end on chlorine
21. Which of the following is a polar compound [AIIMS 2001]
 (a) HF (b) HCl
 (c) HNO_3 (d) H_2SO_4
22. Which of the following has zero dipole moment [MP PMT 2002]
 (a) ClF (b) PCl_3
 (c) SiF_4 (d) $CFCl_3$
23. Which of the following compounds has least dipole moment [RPET 2003]
 (a) PH_3 (b) $CHCl_3$
 (c) NH_3 (d) BF_3
24. Pauling's electronegativity values for elements are useful in predicting [UPSEAT 2004]
 (a) Polarity of bonds in molecules
 (b) Position of elements in electrochemical series
 (c) Co-ordination number
 (d) Dipole moment of various molecules
25. Amongst $LiCl$, $RbCl$, $BeCl_2$ and $MgCl_2$ the compounds with the greatest and the least ionic character, respectively, are [UPSEAT 2002]
 (a) $LiCl$ and $RbCl$ (b) $RbCl$ and $BeCl_2$
 (c) $RbCl$ and $MgCl_2$ (d) $MgCl_2$ and $BeCl_2$
26. Bond polarity of diatomic molecule is because of [UPSEAT 2002]

- (a) Difference in electron affinities of the two atoms
 (b) Difference in electronegativities of the two atoms
 (c) Difference in ionisation potential
 (d) All of these

Overlapping- σ and π bonds

- Triple bond in ethyne is formed from
 [MP PMT 1990; NCERT 1979; EAMCET 1978; AMU 1985; CPMT 1988; MADT Bihar 1982; MH CET 2000]
 (a) Three sigma bonds
 (b) Three pi bonds
 (c) One sigma and two pi bonds
 (d) Two sigma and one pi bond
- The bond in the formation of fluorine molecule will be
 [MP PMT 1987]
 (a) Due to $s-s$ overlapping
 (b) Due to $s-p$ overlapping
 (c) Due to $p-p$ overlapping
 (d) Due to hybridization
- Which type of overlapping results the formation of a π bond
 [DPMT 1981]
 (a) Axial overlapping of $s-s$ orbitals
 (b) Lateral overlapping of $p-p$ orbitals
 (c) Axial overlapping of $p-p$ orbitals
 (d) Axial overlapping of $s-p$ orbitals
- The number and type of bonds between two carbon atoms in calcium carbide are
 [AIEEE 2005]
 (a) One sigma, one pi (b) One sigma, two pi
 (c) Two sigma, one pi (d) Two sigma, two pi
- In a double bond connecting two atoms, there is a sharing of
 [CPMT 1977, 80, 81; NCERT 1975; Bihar MEE 1980; MP PET 1999]
 (a) 2 electrons (b) 1 electron
 (c) 4 electrons (d) All electrons
- Strongest bond is
 [DPMT 1990]
 (a) $C-C$ (b) $C=C$
 (c) $C \equiv C$ (d) All are equally strong
- π bond is formed
 [JIPMER 2002]
 (a) By overlapping of atomic orbitals on the axis of nuclei
 (b) By mutual sharing of pi electron
 (c) By sidewise overlapping of half filled p -orbitals
 (d) By overlapping of s -orbitals with p -orbitals
- The double bond between the two carbon atoms in ethylene consists of
 [NCERT 1981; EAMCET 1979]
 (a) Two sigma bonds at right angles to each other
 (b) One sigma bond and one pi bond
 (c) Two pi bonds at right angles to each other
 (d) Two pi bonds at an angle of 60° to each other
- In the series ethane, ethylene and acetylene, the $C-H$ bond energy is
 [NCERT 1977]
 (a) The same in all the three compounds
 (b) Greatest in ethane
 (c) Greatest in ethylene
 (d) Greatest in acetylene
- In a sigma bond
 (a) Sidewise as well as end to end overlap of orbitals take place

- (b) Sidewise overlap of orbitals takes place
 (c) End to end overlap of orbitals takes place
 (d) None of the above

- The number of sigma and pi bonds in 1-butene-3-yne are
 [IIT 1989]
 (a) 5 sigma and 5 pi (b) 7 sigma and 3 pi
 (c) 8 sigma and 2 pi (d) 6 sigma and 4 pi
- The most acidic compound among the following is
 [MP PET 1993]
 (a) CH_3CH_2OH (b) C_6H_5OH
 (c) CH_3COOH (d) $CH_3CH_2CH_2OH$
- Which of the following is not correct
 [CBSE PMT 1990]
 (a) A sigma bond is weaker than π bond
 (b) A sigma bond is stronger than π bond
 (c) A double bond is stronger than a single bond
 (d) A double bond is shorter than a single bond
- Strongest bond formed, when atomic orbitals
 (a) Maximum overlap (b) Minimum overlap
 (c) Overlapping not done (d) None of them
- The $p-p$ orbital overlapping is present in the following molecule
 (a) Hydrogen (b) Hydrogen bromide
 (c) Hydrogen chloride (d) Chlorine
- In N_2 molecule, the atoms are bonded by
 [MP PET 1996; UPSEAT 2001]
 (a) One σ , Two π (b) One σ , One π
 (c) Two σ , One π (d) Three σ bonds
- In which of following there exists a $p\pi-d\pi$ bonding
 [AFMC 2001]
 (a) Diamond (b) Graphite
 (c) Dimethyl amine (d) Trisilylamine
- Number of bonds in SO_2
 [DCE 2001]
 (a) Two σ and two π
 (b) Two σ and one π
 (c) Two σ , two π and one lone pair
 (d) None of these
- Which of the following has $p\pi-d\pi$ bonding
 [CBSE 2002]
 (a) NO_3^- (b) CO_3^{2-}
 (c) BO_3^{3-} (d) SO_3^{2-}
- Number of sigma bonds in P_4O_{10} is
 [AIEEE 2002]
 (a) 6 (b) 7
 (c) 17 (d) 16

Hybridisation

- Which molecule is not linear
 [CPMT 1994]
 (a) BeF_2 (b) BeH_2
 (c) CO_2 (d) H_2O
- The bond angle in water molecule is nearly or Directed bonds in water forms an angle of
 [NCERT 1980; EAMCET 1981; MNR 1983, 85; AIIMS 1982; CPMT 1989; MP PET 1994, 96; MP PET/PMT 1998]
 (a) 120° (b) 180°

- (c) $109^{\circ}28'$ (d) $104^{\circ}30'$
3. The central atom in a molecule is in sp^2 hybrid state. The shape of molecule will be [MP PMT 1987; CBSE PMT 1989]
 (a) Pyramidal (b) Tetrahedral
 (c) Octahedral (d) Trigonal planar
4. Which molecule is linear [MP PMT 1984; IIT 1982, 88; EAMCET 1993; CBSE PMT 1992; MP PET 1995; RPMT 1997]
 (a) NO_2 (b) ClO_2
 (c) CO_2 (d) H_2S
5. Which of the following molecules has trigonal planar geometry [CBSE PMT 2005]
 (a) IF_3 (b) PCl_3
 (c) NH_3 (d) BF_3
6. A sp^3 hybridized orbital contains [DPMT 1984; BHU 1985; CPMT 1976]
 (a) $\frac{1}{4}$ s - character (b) $\frac{1}{2}$ s - character
 (c) $\frac{2}{3}$ s - character (d) $\frac{3}{4}$ s - character
7. Structure of ammonia is [MP PMT 1987, 89, 91; CPMT 1975, 82; RPMT 1999; JIPMER 2002]
 (a) Trigonal (b) Tetrahedral
 (c) Pyramidal (d) Trigonal pyramidal
8. The bond angle in ethylene is [CPMT 1987]
 (a) 180° (b) 120°
 (c) 109° (d) 90°
9. Compound formed by sp^3d hybridization will have structure [BHU 1982; RPMT 1999]
 (a) Planar (b) Pyramidal
 (c) Angular (d) Trigonal bipyramidal
10. Which of the following formula does not correctly represent the bonding capacity of the atom involved [CBSE PMT 1990]
- (a) $\left[\begin{array}{c} H \\ | \\ H - P - H \\ | \\ H \end{array} \right]$ (b)
- (c) (d)
11. Which of the following statement is not correct [AIIMS 1983]
 (a) Hybridization is the mixing of atomic orbitals prior to their combining into molecular orbitals
 (b) sp^2 hybrid orbitals are formed from two p atomic orbitals and one s atomic orbital
 (c) d^2sp^3 hybrid orbitals are directed towards the corners of a regular octahedron
 (d) dsp^3 hybrid orbitals are all at 90° to one another
12. The mode of hybridisation of carbon in CO_2 is [CPMT 1991]
 (a) sp (b) sp^2
 (c) sp^3 (d) None of these
13. In which of the following the central atom does not use sp^3 hybrid orbitals in its bonding [MNR 1992]
 (a) BeF_3^- (b) OH_3^+
 (c) NH_2^- (d) NF_3
14. XeF_2 involves hybridisation [DPMT 1990]
 (a) sp^3 (b) sp^3d
 (c) sp^3d^2 (d) None of these
15. Which of the following hybridisation results in non-planar orbitals
 (a) sp^3 (b) dsp^2
 (c) sp^2 (d) sp
16. Octahedral molecular shape exists in hybridisation [DPMT 1990]
 (a) sp^3d (b) sp^3d^2
 (c) sp^3d^3 (d) None of these
17. The electronic structure of molecule OF_2 is a hybrid of
 (a) sp (b) sp^2
 (c) sp^3 (d) sd^3
18. Percentage of s-character in sp^3 hybrid orbital is
 (a) 25 (b) 50
 (c) 66 (d) 75
19. Shape of XeF_4 molecule is [BHU 1987; AFMC 1992; CET Pune 1998; Roorkee Qualifying 1998; DCE 2002]
 (a) Linear (b) Pyramidal
 (c) Tetrahedral (d) Square planar
20. For which of the following hybridisation the bond angle is maximum
 (a) sp^2 (b) sp
 (c) sp^3 (d) dsp^2
21. The $C-H$ bond distance is the longest in [MNR 1990]
 (a) C_2H_2 (b) C_2H_4
 (c) $C_2H_4Br_2$ (d) C_6H_6
22. The nature of hybridization in CH_2Cl-CH_2Cl for carbon is
 (a) sp (b) sp^2
 (c) sp^3 (d) sp^2d
23. Shape of methane molecule is [MNR 1983]
 (a) Tetrahedral (b) Pyramidal
 (c) Octahedral (d) Square planar
24. Which one amongst the following possesses an sp hybridized carbon in its structure [CBSE PMT 1989]
 (a) $CH_2 = C.Cl - CH = CH_2$

- (b) $C.Cl_2 = C.Cl_2$
 (c) $CH_2 = C = CH_2$
 (d) $CH_2 = CH - CH = CH_2$
25. Which of the following is the correct electronic formula of chlorine molecule [CPMT 1971]
 (a) $:\ddot{Cl}:\ddot{Cl}:$ (b) $:\ddot{Cl}^-::\ddot{Cl}^+:$
 (c) $:\ddot{Cl}:\ddot{Cl}:$ (d) $:\ddot{Cl}::\ddot{Cl}:$
26. In XeF_4 hybridization is
 (a) sp^3d^2 (b) sp^3
 (c) sp^3d (d) sp^2d
27. In $HCHO$, 'C' has hybridization [AIIMS 1987]
 (a) sp (b) sp^2
 (c) sp^3 (d) All the above
28. Which has the shortest C - C bond length [NCERT 1982; CPMT 1989]
 (a) C_2H_5OH (b) C_2H_6
 (c) C_2H_2 (d) C_2H_4
29. The hybridization of Ag in the linear complex $[Ag(NH_3)_2]^+$ is
 (a) dsp^2 (b) sp
 (c) sp^2 (d) sp^3
30. Experiment shows that H_2O has a dipole moment while CO_2 has not. Point out the structures which best illustrate these facts [DPMT 1984; NCERT 1983; CPMT 1984]
 (a) $O = C = O$; $H \begin{array}{c} \diagup O \diagdown \\ \diagdown \end{array} H$ (b) $O = C = O$; $H - O - H$
 (c) $\begin{array}{c} \diagup \\ O \\ \diagdown \end{array} C \begin{array}{c} \diagdown \\ O \\ \diagup \end{array}$; $H - H - O$ (d) $\begin{array}{c} O \\ || \\ C=O \end{array}$; $\begin{array}{c} H \\ | \\ O-H \end{array}$
31. Which species do not have sp^3 hybridization [DPMT 1985]
 (a) Ammonia (b) Methane
 (c) Water (d) Carbon dioxide
32. As compared to pure atomic orbitals, hybrid orbitals have
 (a) Low energy (b) Same energy
 (c) High energy (d) None of these
33. The compound 1, 2-butadiene has [IIT 1983; MP PMT 1996]
 (a) Only sp hybridized carbon atoms
 (b) Only sp^2 hybridized carbon atoms
 (c) Both sp and sp^2 hybridized carbon atoms
 (d) sp , sp^2 and sp^3 hybridized carbon atoms
34. The number of unpaired electrons in O_2 molecule is [MNR 1983; Kerala PET 2002]
 (a) 0 (b) 1
 (c) 2 (d) 3
35. In the following molecule, the two carbon atoms marked by asterisk (*) possess the following type of hybridized orbitals [NCERT 1984]
 $H_3C - C^* \equiv C^* - CH_3$
 (a) sp^3 orbital (b) sp^2 orbital
 (c) sp orbital (d) s orbital
36. The bond angle in carbon tetrachloride is approximately [MNR 1981; MP PMT 1987]
 (a) 90° (b) 109°
 (c) 120° (d) 180°
37. When two pairs of electrons are shared, bond is [MNR 1979]
 (a) Single covalent bond (b) Double covalent bond
 (c) Dative bond (d) Triple bond
38. The nature of hybridization in the NH_3 molecule is [EAMCET 1982]
 (a) sp (b) sp^2
 (c) sp^3 (d) sp^3d
39. Which one of the following compounds has bond angle as nearly 90° [MP PMT 1985]
 (a) NH_3 (b) H_2S
 (c) H_2O (d) CH_4
40. In ethene, the bond angle(s) is/are [CPMT 1985; BHU 1981] [CPMT 1976; AMU 1984; MP PMT 1985]
 (a) $109^\circ 28'$ (b) 120°
 (c) 180° (d) Different
41. Structure formula of H_2O_2 is [CPMT 1993]
 (a) $\begin{array}{c} H \\ \diagup \\ O \rightarrow O \\ \diagdown \\ H \end{array}$
 (b) $H - O - O - H$ (straight line)
 (c) $\begin{array}{c} H' \\ | \\ O - O \\ | \\ H \end{array}$
 (d) $\begin{array}{c} H' \\ | \\ O - O \\ | \\ H \end{array}$
- Where $\angle H - O - O = \angle O - O - H' = 101.5^\circ$ and all the four atoms are in the same plane
- (d) $\begin{array}{c} H' \\ | \\ O - O \\ | \\ H \end{array}$
- Where $\angle H - O - O = \angle O - O - H' = 97^\circ$ and the angle between $H - O - O$ plane and $O - O - H'$ plane is 101°
42. Number of shared electrons in between carbon-carbon atoms in ethylene molecule is [MADT Bihar 1983]
 (a) 2 (b) 4
 (c) 6 (d) 3
43. The structural formula of a compound is $CH_3 - CH = C = CH_2$. The type of hybridization at the four carbons from left to right are [CBSE PMT 1989]
 (a) sp^2 , sp , sp^2 , sp^3 (b) sp^2 , sp^3 , sp^2 , sp

- (c) sp^3, sp^2, sp, sp^2 (d) sp^3, sp^2, sp^2, sp^2
44. Acetate ion contains [AMU 1983]
 (a) One C, O single bond and one C, O double bond
 (b) Two C, O single bonds
 (c) Two C, O double bonds
 (d) None of the above
45. The two carbon atoms in acetylene are [AMU 1984; MADT Bihar 1982]
 (a) sp^3 hybridized (b) sp^2 hybridized
 (c) sp hybridized (d) Unhybridized
46. Among the following compounds which is planar in shape [AMU 1992]
 (a) Methane (b) Acetylene
 (c) Benzene (d) Isobutene
47. In methane the bond angle is [AMU 1983]
 (a) 180° (b) 90°
 (c) 120° (d) 109°
48. The angle between sp^2 orbitals in ethylene is [BHU 1987, 95; AMU 1985]
 (a) 90° (b) 120°
 (c) 180° (d) 109.5°
49. The species in which the central atom uses sp^2 hybrid orbitals in its bonding is [IIT 1988]
 (a) PH_3 (b) NH_3
 (c) H_3C^+ (d) SbH_3
50. Carbon atoms in diamond are bonded to each other in a configuration [CPMT 1981]
 (a) Tetrahedral (b) Planar
 (c) Linear (d) Octahedral
51. Which of the following molecules can central atom said to adopt sp^2 hybridization [CBSE PMT 1989; MP PET 1994]
 (a) BeF_2 (b) BCl_3
 (c) C_2H_2 (d) NH_3
52. In $[Cu(NH_3)_4]SO_4$, ; Cu has following hybridization [AIIMS 1988; UPSEAT 2001]
 (a) dsp^2 (b) sp^3
 (c) sp^2 (d) sp^3d^2
53. The hybridization of carbon atoms in C – C single bond of $HC \equiv C - CH = CH_2$ is [IIT 1991; MP PET 1995]
 (a) $sp^3 - sp^3$ (b) $sp^2 - sp^3$
 (c) $sp - sp^2$ (d) $sp^3 - sp$
54. The compound in which C^* uses sp^3 hybrids for bond formation is [IIT 1989]
 (a) $HCOOH^+$ (b) $(NH_2)_2CO^+$
 (c) $(NH_3)_3COH^+ HgCl_2$ (d) CH_3CHO^+
55. In diborane, the $H - B - H$ bond angle is 120° . The hybridization of boron is likely to be [BHU 1981; CBSE PMT 1999]
 (a) sp (b) sp^2
 (c) sp^3 (d) dsp^2
56. The number of shared pairs of electrons in propane is [BHU 1981]
 (a) 2 (b) 4
 (c) 6 (d) 10
57. s-character in sp hybridised orbitals are
 (a) $\frac{1}{3}$ (b) $\frac{1}{2}$
 (c) $\frac{1}{4}$ (d) $\frac{2}{3}$
58. The two types of bonds present in B_2H_6 are covalent and [IIT 1994]
 (a) Three centre bond (b) Hydrogen bond
 (c) Two centre bond (d) None of the above
59. In the compound $CH_3 \odot OCl$, which type of orbitals have been used by the circled carbon in bond formation [MP PET 1994]
 (a) sp^3 (b) sp^2
 (c) sp (d) p
60. The correct order of the O – O bond length in O_2 , H_2O_2 and O_3 is [CBSE PMT 1995]
 (a) $O_2 > O_3 > H_2O_2$ (b) $O_3 > H_2O_2 > O_2$
 (c) $H_2O_2 > O_3 > O_2$ (d) $O_2 > H_2O_2 > O_3$
61. The structure of PF_5 molecule is [AFMC 1995; JIPMER 2001]
 (a) Tetrahedral (b) Trigonal bipyramidal
 (c) Square planar (d) Pentagonal bipyramidal
62. Which of the following hybridisation has maximum s-characters
 (a) sp^3 (b) sp^2
 (c) sp (d) None of these
63. The PCl_5 molecule is a result of the hybridisation of [MP PET 1995; DCE 2000; MP PMT 2002]
 (a) sp^2d^2 (b) sp^3d
 (c) sp^3d (d) sp^2d^3
64. Hybridisation involves [MP PMT 1996]
 (a) Addition of an electron pair
 (b) Mixing up of atomic orbitals
 (c) Removal of an electron pair
 (d) Separation of orbitals
65. The geometry of sulphur trioxide molecule is
 (a) Tetrahedral (b) Trigonal planar
 (c) Pyramidal (d) Square planar
66. The shapes of BCl_3 , PCl_3 and ICl_3 molecules are all
 (a) Triangular (b) Pyramidal
 (c) T – shaped (d) All above are incorrect
67. In benzene molecule all C – C bond lengths are equal because

- (a) All carbon atoms are equivalent
(b) All carbon atoms are sp^2 hybridised
(c) All $C - C$ bonds in benzene, have same order
(d) All $C - C$ bonds are single covalent bond
68. Which one is false in the following statements [MP PET 1997]
(a) Each carbon in ethylene is in sp^2 hybridisation
(b) Each carbon in acetylene is in sp^3 hybridisation
(c) Each carbon in benzene is in sp^2 hybridisation
(d) Each carbon in ethane is in sp^3 hybridisation
69. Out of the following hybrid orbitals, the one which forms the bond at angle 120° , is [MP PMT 1997]
(a) d^2sp^3 (b) sp^3
(c) sp^2 (d) sp
70. As the p -character increases, the bond angle in hybrid orbitals formed by s and atomic orbitals [MP PMT 1997]
(a) Decreases (b) Increases
(c) Doubles (d) Remains unchanged
71. sp^3 hybridization leads to which shape of the molecule [MP PET/PMT 1998]
(a) Tetrahedron (b) Octahedron
(c) Linear (d) Plane triangle
72. Which of the following will be octahedral [MP PET 1999]
(a) SF_6 (b) BF_4^-
(c) PCl_5 (d) BO_3^{3-}
73. The hybrid orbitals used by central atoms in $BeCl_2$, BCl_3 and CCl_4 molecules are respectively [MP PMT 1999]
(a) sp^2 , sp^3 and sp (b) sp , sp^2 and sp^3
(c) sp^3 , sp and sp^2 (d) sp^2 , sp and sp^3
74. The structure of H_2O_2 is [CBSE PMT 1999; AFMC 2003]
(a) Planar (b) Non-planar
(c) Spherical (d) Linear
75. Which of the following is isoelectronic as well as has same structure as that of N_2O [CPMT 1999]
(a) N_3H (b) H_2O
(c) NO_2 (d) CO_2
76. CCl_4 has the hybridisation [DPMT 1996]
(a) sp^3d (b) dsp^2
(c) sp (d) sp^3
77. Compound having planar symmetry is [DPMT 1996]
(a) H_2SO_4 (b) H_2O
(c) HNO_3 (d) CCl_4
78. Which of the following compounds is not linear [CPMT 1996]
(a) $SnCl_2$ (b) HCl
(c) CO_2 (d) $HgCl_2$
79. Which one of the following statements is true for ammonium ion
(a) All bonds are ionic
(b) All bonds are coordinate covalent
(c) H atoms are situated at the corners of a square
(d) H atoms are situated at the corners of a tetrahedron
80. The bond angle in sp^2 hybridisation is [RPMT 1997]
(a) 180° (b) 120°
(c) 90° (d) $109^\circ 2'$
81. The correct order towards bond angle is [RPMT 1997]
(a) $sp < sp^2 < sp^3$
(b) $sp^2 < sp < sp^3$
(c) $sp^3 < sp^2 < sp$
(d) Bond angle does not depend on hybridisation
82. The geometry and the type of hybrid orbital present about the central atom in BF_3 is [IIT 1998; BHU 2001]
(a) Linear, sp (b) Trigonal planar, sp^2
(c) Tetrahedral, sp^3 (d) Pyramidal, sp^3
83. In graphite, electrons are [CBSE PMT 1997]
(a) Localised on every third C atom
(b) Present in antibonding orbital
(c) Localised on each C atom
(d) Spread out between the structure
84. The ammonium ion is [CET Pune 1998]
(a) Tetrahedral (b) Trigonal pyramidal
(c) Square planar (d) Square pyramidal
85. In sp hybridisation, shape is [Bihar MEE 1997]
(a) Angular (b) Tetrahedral
(c) Bipyramidal (d) Linear
(e) None of these
86. When the hybridisation state of carbon atom changes from sp^3 to sp^2 to sp , the angle between the hybridised orbitals [AIIMS 1998]
(a) Decreases gradually (b) Increases gradually
(c) Decreases considerably (d) All of these
87. The structure and hybridisation of $Si(CH_3)_4$ is [CBSE PMT 1996]
(a) Bent, sp (b) Trigonal, sp^2
(c) Octahedral, sp^3d (d) Tetrahedral, sp^3
88. The type of hybridisation of boron in diborane is [BHU 1999]
(a) sp -hybridisation (b) sp^2 -hybridisation
(c) sp^3 -hybridisation (d) sp^3d^2 -hybridisation
89. Which compound does not possess linear geometry

- (a) $CH_2 = CH_2$ (b) $HC \equiv CH$
(c) $BeCl_2$ (d) CO_2
90. Which of the following molecule does not show tetrahedral shape [RPET 1999]
(a) CCl_4 (b) $SiCl_4$
(c) SF_4 (d) CF_4
91. Pyramidal shape would be of [RPET 1999]
(a) NO_3^- (b) H_2O
(c) H_3O^+ (d) NH_4^+
92. What is the correct mode of hybridization of the central atom in the following compounds : NO_2^+ , SF_4 , PF_6^- [AMU 1999]
(a) sp^2 , sp^3 , d^2sp^3 (b) sp^3 , sp^3d^2 , sp^3d^2
(c) sp , sp^3d , sp^3d^2 (d) sp , sp^2 , sp^3
93. The hybridization in PF_3 is [DCE 2000]
(a) sp^3 (b) sp^2
(c) dsp^3 (d) d^2sp^3
94. Which of the following molecule is linear [MP PMT 2000]
(a) SO_2 (b) NO_2^+
(c) NO_2^- (d) SCl_2
95. The geometry of the molecule with sp^3d^2 hybridised central atom is [NCERT 1981; AFMC 1982; RPMT 2000]
(a) Square planar (b) Trigonal bipyramidal
(c) Octahedral (d) Square pyramidal
96. The bond angle in PH_3 is [RPMT 2000]
(a) Much less than NH_3
(b) Equal to that of NH_3
(c) Much greater than NH_3
(d) Slightly greater than NH_3
97. Which of the following has tetrahedral structure [CPMT 2000]
(a) CO_3^{2-} (b) NH_4^+
(c) $K_4[Fe(CN)_6]$ (d) None of these
98. The single, double and triple bond lengths of carbon in carbon dioxide are respectively [AIIMS 2000]
(a) 1.15, 1.22 and 1.10 Å (b) 1.22, 1.15 and 1.10 Å
(c) 1.10, 1.15 and 1.22 Å (d) 1.15, 1.10 and 1.22 Å
99. Shape of BF_3 molecule is [CPMT 2000; Pb. CET 2002]
(a) Linear (b) Planar
(c) Tetrahedral (d) Square pyramidal
100. In the complex $[SbF_5]^{2-}$, sp^3d hybridization is present. Geometry of the complex is [Pb. PMT 2000]
(a) Square (b) Square pyramidal
(c) Square bipyramidal (d) Tetrahedral
101. The bond angle is minimum in [Pb. PMT 2001; MP PET 2003; UPSEAT 2004]
(a) H_2Te (b) H_2Se
(c) H_2O (d) H_2S
102. The correct order of hybridization of the central atom in the following species NH_3 , $[PtCl_4]^{2-}$, PCl_5 and BCl_3 is [IIT Screening 2001; BHU 2005]
(a) dsp^2 , dsp^3 , sp^2 and sp^3 (b) sp^3 , dsp^2 , dsp^3 , sp^2
(c) dsp^2 , sp^2 , sp^3 , dsp^3 (d) dsp^2 , sp^3 , sp^2 , dsp^3
103. Which of the following pairs has same structure [BHU 2001]
(a) PH_3 and BCl_3 (b) SO_2 and NH_3
(c) PCl_5 and SF_6 (d) NH_4^+ and SO_4^{2-}
104. The smallest bond angle is found in [AIIMS 2001]
(a) IF_7 (b) CH_4
(c) BeF_2 (d) BF_3
105. Which of the following is not linear [DCE 2001]
(a) CO_2 (b) ClO_2
(c) I_3^- (d) None of these
106. Which of the following is not tetrahedral [MP PMT 2001]
(a) SCl_4 (b) SO_4^{2-}
(c) $Ni(CO)_4$ (d) $NiCl_4^{2-}$
107. As the s-character of hybridisation orbital increases, the bond angle [BHU 2002]
(a) Increases (b) Decreases
(c) Becomes zero (d) Does not change
108. The shape of IF_7 molecule is [AFMC 2002; MHCET 2003]
(a) Octahedral (b) Pentagonal bipyramidal
(c) Trigonal bipyramidal (d) Tetrahedral
109. A completely filled d orbital (d^{10}) [UPSEAT 2002]
(a) Spherically symmetrical
(b) Has octahedral symmetry
(c) Has tetrahedral symmetry
(d) Depends on the atom
110. Which has sp^3 hybridization of central atom [UPSEAT 2002]
(a) PCl_3 (b) SO_3
(c) BF_3 (d) NO_3^-
111. In which of the following species is the interatomic bond angle is $109^\circ 28'$ [AIEEE 2002]
(a) NH_3 , $(BF_4)^{-1}$ (b) $(NH_4)^+$, BF_3
(c) NH_3 , BF_4 (d) $(NH_2)^{-1}$, BF_3
112. A square planar complex is formed by hybridisation of which atomic orbitals [AIEEE 2002]
(a) s , p_x , p_y , d_{yz} (b) s , p_x , p_y , $d_{x^2-y^2}$
(c) s , p_x , p_y , d_{z^2} (d) s , p_y , p_z , d_{xy}
113. In benzene, all the six C – C bonds have the same length because of [MP PET 2002]
(a) Tautomerism (b) sp^2 hybridisation

- (c) Isomerism (d) Inductive effect
114. The bond energies of $H-H$ and $Cl-Cl$ are 430 kJ mol^{-1} and 242 kJ mol^{-1} respectively, ΔH_f for HCl is 91 kJ mol^{-1} . The bond energy of HCl will be [MP PET 2003]
(a) 427 kJ (b) 766 kJ
(c) 285 kJ (d) 245 kJ
115. Which of the following has dsp^2 hybridization [MP PET 2003]
(a) $NiCl_4^{2-}$ (b) SCl_4
(c) NH_4^+ (d) $PtCl_4^{2-}$
116. Which one of the following is a planar molecule [EAMCET 2003]
(a) NH_3 (b) H_3O^+
(c) BCl_3 (d) PCl_3
117. Which one of the following is a correct set with respect to molecule, hybridisation and shape [EAMCET 2003]
(a) $BeCl_2$, sp^2 , linear
(b) $BeCl_2$, sp^2 , triangular planar
(c) BCl_3 , sp^2 , triangular planar
(d) BCl_3 , sp^3 , tetrahedral
118. Which of the following compounds doesn't have linear structure [RPET 1997, 2003]
(a) CO_2 (b) SO_2
(c) $BeCl_2$ (d) C_2H_2
119. Which of the following bonds require the largest amount of bond energy to dissociate the atom concerned [UPSEAT 2003]
(a) $H-H$ bond in H_2 (b) $C-C$ bond in CH_4
(c) $N \equiv N$ bond in N_2 (d) $O=O$ bond in O_2
(e) $C-C$ bond in ethane
120. The percentage s -character of the hybrid orbitals in methane, ethene and ethyne are respectively [KCET 2003]
(a) 25, 33, 50 (b) 25, 50, 75
(c) 50, 75, 100 (d) 10, 20, 40
121. Arrange the hydro-acids of halogens in increasing order of acidity
(a) $HF < HCl < HBr < HI$ (b) $HI < HBr < HCl < HF$
(c) $HF < HBr < HI < HCl$ (d) $HF < HI < HBr < HCl$
122. Which one has sp^2 -hybridisation [MP PMT 2004]
(a) CO_2 (b) N_2O
(c) SO_2 (d) CO
123. Among the following compounds the one that is polar and has central atom with sp^2 -hybridization is [MP PMT 2004; IIT 1997]
(a) H_2CO_3 (b) BF_3
(c) SiF_4 (d) $HClO_2$
124. The molecule which is pyramid shape is [MP PMT 2004; EAMCET 1985; IIT 1989]
(a) PCl_3 (b) CO_3^{2-}
(c) SO_3 (d) NO_3^-
125. Which of the following has a linear structure [MP PMT 2004]
(a) CCl_4 (b) C_2H_2
(c) SO_2 (d) C_2H_4
126. In a regular octahedral molecule, MX_6 , the number $X-M-X$ bonds at 180° is [CBSE PMT 2004]
(a) Six (b) Four
(c) Three (d) Two
127. sp^3d^2 hybrid orbitals are [MP PET 2004]
(a) Linear bipyramidal (b) Pentagonal
(c) Trigonal bipyramidal (d) Octahedral
128. In an octahedral structure, the pair of d orbitals involved in d^2sp^3 hybridization is [CBSE PMT 2004]
(a) d_{x^2}, d_{xz} (b) d_{xy}, d_{yz}
(c) $d_{x^2-y^2}, d_{z^2}$ (d) $d_{xz}, d_{x^2-y^2}$
129. The correct order of bond angles (smallest first) in H_2S, NH_3, BF_3 and SiH_4 is [AIEEE 2004]
(a) $H_2S < NH_3 < SiH_4 < BF_3$
(b) $NH_3 < H_2S < SiH_4 < BF_3$
(c) $H_2S < SiH_4 < NH_3 < BF_3$
(d) $H_2S < NH_3 < BF_3 < SiH_4$
130. Which one of the following has the regular tetrahedral structure
(a) BF_4^- (b) SF_4
(c) XeF_4 (d) $[Ni(CN)_4]^{2-}$
(Atomic no. : $B = 5, S = 16, Ni = 28, Xe = 54$)
131. The states of hybridization of boron and oxygen atoms in boric acid (H_3BO_3) are respectively [AIEEE 2004]
(a) sp^3 and sp^2 (b) sp^2 and sp^3
(c) sp^2 and sp^2 (d) sp^3 and sp^3
132. The hybridisation in BF_3 molecule is [Pb. PMT 2004]
(a) sp (b) sp^2
(c) sp^3 [Orissa JEE 2003] (d) sp^3d
133. Among the compounds, BF_3, NCl_3, H_2S, SF_4 and $BeCl_2$, identify the ones in which the central atom has the same type of hybridisation [Kerala PMT 2004]
(a) BF_3 and NCl_3 (b) H_2S and $BeCl_2$
(c) BF_3, NCl_3 and H_2S (d) SF_4 and $BeCl_2$
(e) NCl_3 and H_2S
134. The molecule of CO_2 has 180° bond angle. It can be explained on the basis of [AFMC 2004]
(a) sp^3 hybridisation (b) sp^2 hybridisation
(c) sp hybridisation (d) d^2sp^3 hybridisation
135. sp^3 hybridisation is found in [Pb. CET 2003; Orissa JEE 2005]

- (a) CO_3^{2-} (b) BF_3 (c) d^2sp^3 or sp^3d^2 (d) d^3sp^2 or d^2sp^3
- (c) NO_3^- (d) NH_3
136. Which set hybridisation is correct for the following compounds [Pb. CET 2003]
 NO_2 , SF_4 , PF_6^-
 (a) sp , sp^2 , sp^3
 (b) sp , sp^3d , sp^3d^2
 (c) sp^2 , sp^3 , d^2sp^3
 (d) sp^3 , sp^3d^2 , sp^3d^2
137. The state of hybridisation of B in BCl_3 is [Pb. CET 2000; BHU 2004]
 (a) sp (b) sp^2
 (c) sp^3 (d) sp^2d^2
138. The hybrid state of sulphur in SO_3 molecule is [DCE 2004]
 (a) sp^3d (b) sp^3
 (c) sp^3d^2 (d) sp^2
139. Which of the following molecules has pyramidal shape [DCE 2004; J&K CET 2005]
 (a) PCl_3 (b) SO_3
 (c) CO_3^{2-} (d) NO_3^-
140. The hybridization of IF_7 is [Pb. CET 2001]
 (a) sp^3d^3 (b) sp^2d
 (c) d^2sp^3 (d) sp^3
141. In which compound, the hydrogen bonding is the strongest in its liquid phase [Pb. CET 2001]
 (a) HF (b) HI
 (c) CH_4 (d) PH_3
142. Geometry of ammonia molecule and the hybridization of nitrogen involved in it are [MH CET 2004]
 (a) sp^3 -hybridization and tetrahedral geometry
 (b) sp^3 -hybridization and distorted tetrahedral geometry
 (c) sp^2 -hybridization and triangular geometry
 (d) None of these
143. Be in $BeCl_2$ undergoes [MH CET 2004]
 (a) Diagonal hybridization
 (b) Trigonal hybridization
 (c) Tetrahedral hybridization
 (d) No hybridization
144. Which of the following is non-linear molecule [DCE 2003]
 (a) CO_3 (b) CO_2
 (c) CS_2 (d) $BeCl_2$
145. The trigonal bipyramidal geometry results from the hybridisation [UPSEAT 2004]
 (a) dsp^3 or sp^3d (b) dsp^2 or sp^2d
146. The valency of carbon is four. On what principle it can be explained in a better way
 (a) Resonance (b) Hybridization
 (c) Electron transfer (d) None of the above
147. Hybridization is due to the overlapping of [MADT Bihar 1983]
 (a) Orbitals of different energy levels
 (b) Orbitals of different energy content
 (c) Orbitals of same energy content
 (d) None of the above
148. If a molecule MX_3 has zero dipole moment, the sigma bonding orbital used by M are [IIT 1981; MP PMT 1994; Kerala PMT 2004]
 (a) sp^3d - hybrid (b) sp - hybrid
 (c) sp^3d^2 - hybrid (d) sp^2 - hybrid
149. The linear structure is assumed by [IIT 1991]
 (a) $SnCl_2$ (b) NCO^-
 (c) CS_2 (d) NO_2^+
150. Hybridisation of central atom in NF_3 is [Orissa JEE 2005]
 (a) sp^3 (b) sp
 (c) sp^2 (d) dsp^2
151. The pair having similar geometry is [J&K CET 2005]
 (a) PCl_3 , NH_3 (b) $BeCl_2$, H_2O
 (c) CH_4 , CCl_4 (d) IF_5 , PF_5
152. The d-orbital involved in sp^3d hybridisation is [J&K CET 2005]
 (a) $d_{x^2-y^2}$ (b) d_{xy}
 (c) d_{z^2} (d) d_{zx}

Resonance

1. Which one in the following is not the resonance structure of CO_2
 (a) $O=C=O$ (b) $^-O-C\equiv O^+$
 (c) $^+O\equiv C-O^-$ (d) $O\equiv C=O$
2. Which of the following molecule contains one pair of non-bonding electrons
 (a) CH_4 (b) NH_3
 (c) H_2O (d) HF
3. Resonance is due to [NCERT 1981; Kurukshetra CEE 1998]
 (a) Delocalization of σ electrons
 (b) Delocalization of π electrons
 (c) Migration of H atoms
 (d) Migration of protons
4. Resonating structures have different [AMU 1983]
 (a) Atomic arrangements (b) Electronic arrangements
 (c) Functional groups (d) Alkyl groups

In the cyanide ion, the formal negative charge is on

[AMU 1984]

- (a) C
(b) N
(c) Both C and N
(d) Resonate between C and N
6. Which does not show resonance [CPMT 1990]
(a) Benzene (b) Aniline
(c) Ethyl amine (d) Toluene
7. The enolic form of acetone contains [IIT 1990; Bihar MEE 1997]
(a) 9 sigma bonds, 1 pi bond and 2 lone pairs
(b) 8 sigma bonds, 2 pi bonds and 2 lone pairs
(c) 10 sigma bonds, 1 pi bond and 1 lone pair
(d) 9 sigma bonds, 2 pi bonds and 1 lone pair
8. Point out incorrect statement about resonance [MP PET 1997]
(a) Resonance structures should have equal energy
(b) In resonance structures, the constituent atoms should be in the same position
(c) In resonance structures, there should not be the same number of electron pairs
(d) Resonance structures should differ only in the location of electrons around the constituent atoms
9. The number of possible resonance structures for CO_3^{2-} is [MP PMT 2000]
(a) 2 (b) 3
(c) 6 (d) 9
10. Resonance hybrid of nitrate ion is [RPET 2000]
(a) $^{-1/2}O \cdots N \cdots O^{-1/2}$ (b) $^{-2/3}O \cdots N \cdots O^{-2/3}$
 $\begin{array}{c} \vdots \\ \vdots \\ O^{-1/2} \end{array}$ $\begin{array}{c} \vdots \\ \vdots \\ O^{-2/3} \end{array}$
(c) $^{-1/3}O \cdots N \cdots O^{-1/3}$ (d) $^{-2/3}O \cdots N^+ \cdots O^{-2/3}$
 $\begin{array}{c} \vdots \\ \vdots \\ O^{-1/3} \end{array}$ $\begin{array}{c} \vdots \\ \vdots \\ O^{-2/3} \end{array}$
11. CO_3^{2-} anion has which of the following characteristics [Roorkee 1999]
(a) Bonds of unequal length
(b) sp^2 hybridization of C atom
(c) Resonance stabilization
(d) Same bond angles
- (c) PF_3 (d) NH_3
4. Which has the least bond angle [NCERT 1973; DPMT 1990; CBSE PMT 1990; UPSEAT 2003]
(a) NH_3 (b) BeF_2
(c) H_2O (d) CH_4
5. In compound X , all the bond angles are exactly $109^\circ 28'$, X is
(a) Chloromethane (b) Iodoform
(c) Carbon tetrachloride (d) Chloroform
6. The shape of SO_4^{2-} ion is [CPMT 1982; DPMT 1983, 84, 96; Bihar MEE 1997]
(a) Square planar (b) Tetrahedral
(c) Trigonal bipyramidal (d) Hexagonal
7. Which of the following molecules has one lone pair of electrons on the central atom [EAMCET 1980; AMU 1982; MNR 1989]
(a) H_2O (b) NH_3
(c) CH_4 (d) PCl_5
8. Of the following compounds, the one having a linear structure is [NCERT 1981; C
MP PMT 1985; AIIMS 1996]
(a) NH_2 (b) CH_4
(c) C_2H_2 (d) H_2O
9. XeF_6 is
(a) Octahedral (b) Distorted octahedral
(c) Planar (d) Tetrahedral
10. Which has maximum bond angle [CPMT 1993]
(a) CHF_3
(b) $CHCl_3$
(c) $CHBr_3$
(d) All have maximum bond angle
11. Of the following species the one having a square planar structure is [NCERT 1981; MP PMT 1994]
(a) NH_4^+ (b) BF_4^-
(c) XeF_4 (d) SCl_4
12. In which of the following is the angle between the two covalent bonds greatest [NCERT 1975; AMU 1982; MNR 1987; IIT 1981; CPMT 1988; MP PMT 1994]
(a) CO_2 (b) CH_4
(c) NH_3 (d) H_2O
13. As the s -character of hybridized orbital decreases, the bond angle
(a) Decreases (b) Increases
(c) Does not change (d) Becomes zero
14. XeF_2 molecule is [BHU 1982]
(a) Linear (b) Triangular planar
(c) Pyramidal (d) Square planar
15. Of the following sets which one does NOT contain isoelectronic species [AIEEE 2005]
(a) PO_4^{3-} , SO_4^{2-} , ClO_4^- (b) CN^- , N_2 , C_2^{2-}
(c) SO_3^{2-} , CO_3^{2-} , NO_3^- (d) BO_3^{3-} , CO_3^{2-} , NO_3^-
16. A molecule which contains unpaired electrons is

VSEPR Theory

1. The structure of $[Cu(H_2O)_4]^{++}$ ion is [NCERT 1983; MP PMT 1983]
(a) Square planar (b) Tetrahedral
(c) Distorted rectangle (d) Octahedral
2. The bond angle in PH_3 would be expected to be close to
(a) 90° (b) 105°
(c) 109° (d) 120°
3. In which molecule are all atoms coplanar [MP PMT 1994]
(a) CH_4 (b) BF_3
4. PF_3 (d) NH_3
4. Which has the least bond angle [NCERT 1973; DPMT 1990; CBSE PMT 1990; UPSEAT 2003]
(a) NH_3 (b) BeF_2
(c) H_2O (d) CH_4
5. In compound X , all the bond angles are exactly $109^\circ 28'$, X is
(a) Chloromethane (b) Iodoform
(c) Carbon tetrachloride (d) Chloroform
6. The shape of SO_4^{2-} ion is [CPMT 1982; DPMT 1983, 84, 96; Bihar MEE 1997]
(a) Square planar (b) Tetrahedral
(c) Trigonal bipyramidal (d) Hexagonal
7. Which of the following molecules has one lone pair of electrons on the central atom [EAMCET 1980; AMU 1982; MNR 1989]
(a) H_2O (b) NH_3
(c) CH_4 (d) PCl_5
8. Of the following compounds, the one having a linear structure is [NCERT 1981; C
MP PMT 1985; AIIMS 1996]
(a) NH_2 (b) CH_4
(c) C_2H_2 (d) H_2O
9. XeF_6 is
(a) Octahedral (b) Distorted octahedral
(c) Planar (d) Tetrahedral
10. Which has maximum bond angle [CPMT 1993]
(a) CHF_3
(b) $CHCl_3$
(c) $CHBr_3$
(d) All have maximum bond angle
11. Of the following species the one having a square planar structure is [NCERT 1981; MP PMT 1994]
(a) NH_4^+ (b) BF_4^-
(c) XeF_4 (d) SCl_4
12. In which of the following is the angle between the two covalent bonds greatest [NCERT 1975; AMU 1982; MNR 1987; IIT 1981; CPMT 1988; MP PMT 1994]
(a) CO_2 (b) CH_4
(c) NH_3 (d) H_2O
13. As the s -character of hybridized orbital decreases, the bond angle
(a) Decreases (b) Increases
(c) Does not change (d) Becomes zero
14. XeF_2 molecule is [BHU 1982]
(a) Linear (b) Triangular planar
(c) Pyramidal (d) Square planar
15. Of the following sets which one does NOT contain isoelectronic species [AIEEE 2005]
(a) PO_4^{3-} , SO_4^{2-} , ClO_4^- (b) CN^- , N_2 , C_2^{2-}
(c) SO_3^{2-} , CO_3^{2-} , NO_3^- (d) BO_3^{3-} , CO_3^{2-} , NO_3^-
16. A molecule which contains unpaired electrons is

[NCERT 1982]

- (a) Carbon monoxide (b) Molecular nitrogen
(c) Molecular oxygen (d) Hydrogen peroxide

17. H_2O is [MADT Bihar 1983]

- (a) A linear triatomic molecule
(b) A bent (angular) triatomic molecule
(c) Both of these
(d) None of these

18. Bond angle between two hybrid orbitals is 105° . % s-orbital character of hybrid orbital is [MP PMT 1986]

- (a) Between 20 – 21% (b) Between 19 – 20%
(c) Between 21 – 22% (d) Between 22 – 23%

19. The bond angle between $H-O-H$ in ice is closest to [CPMT 1989; UPSEAT 2002]

- (a) $120^\circ 28'$ (b) 60°
(c) 90° (d) 105°

20. Which of the following molecules does not have a linear arrangement of atoms [CBSE PMT 1989]

- (a) H_2S (b) C_2H_2
(c) BeH_2 (d) CO_2

21. BCl_3 is a planar molecule while NCl_3 is pyramidal, because

- (a) BCl_3 has no lone pair of electrons but NCl_3 has a lone pair of electrons
(b) $B-Cl$ bond is more polar than $N-Cl$ bond
(c) Nitrogen atom is smaller than boron atom
(d) $N-Cl$ bond is more covalent than $B-Cl$ bond

22. The isoelectronic pair is [AIIMS 2005]

- (a) Cl_2O, ICl_2^- (b) ICl_2^-, ClO_2
(c) IF_2^+, I_3^- (d) ClO_2^-, ClF_2^+

23. According to VSEPR theory, the most probable shape of the molecule having 4 electron pairs in the outer shell of the central atom is [MP PET 1996, 2001]

- (a) Linear (b) Tetrahedral
(c) Hexahedral (d) Octahedral

24. The molecular shapes of SF_4 , CF_4 and XeF_4 are

[AIEEE 2005]

- (a) The same with 2, 0 and 1 lone pairs of electrons on the central atom, respectively
(b) The same with 1, 1 and 1 lone pair of electrons on the central atoms, respectively
(c) Different with 0, 1 and 2 lone pairs of electrons on the central atom, respectively
(d) Different with 1, 0 and 2 lone pairs of electrons on the central atom, respectively

25. Which of the following species is planar [JIPMER 1997]

- (a) CO_3^{2-} (b) NH_2
(c) PCl_3 (d) None of these

26. The shape of CH_3^+ species is [RPET 1999]

- (a) Tetrahedral (b) Square planar
(c) Trigonal planar (d) Linear

27. Which of the following is the correct reducing order of bond-angle

- (a) $NH_3 < CH_4 < C_2H_2 < H_2O$

28. Which compound has bond angle nearly to 90°

[Pb. PMT 2001]

- (a) H_2O (b) H_2S
(c) NH_3 (d) CH_4

29. A lone pair of electrons in an atom implies [KCET 2002]

- (a) A pair of valence electrons not involved in bonding
(b) A pair of electrons involved in bonding
(c) A pair of electrons
(d) A pair of valence electrons

30. The bond angle of water is 104.5° due to [CPMT 2002]

- (a) Repulsion between lone pair and bond pair
(b) sp^3 hybridization of O
(c) Bonding of H_2O
(d) Higher electronegativity of O

31. The correct sequence of decrease in the bond angle of the following hydrides is [MP PET 2002]

- (a) $NH_3 > PH_3 > AsH_3 > SbH_3$
(b) $NH_3 > AsH_3 > PH_3 > SbH_3$
(c) $SbH_3 > AsH_3 > PH_3 > NH_3$
(d) $PH_3 > NH_3 > AsH_3 > SbH_3$

32. Central atom of the following compound has one lone pair of electrons and three bond pairs of electrons [JIPMER 2002]

- (a) H_2S (b) $AlCl_3$
(c) NH_3 (d) BF_3

33. Among KO_2 , AlO_2^- , BaO_2 and NO_2^+ unpaired electron is present in [MP PET 2003]

- (a) NO_2^+ and BaO_2 (b) KO_2 and AlO_2^-
(c) KO_2 only (d) BaO_2 only

34. True order of bond angle is [RPET 2003]

- (a) $H_2O > H_2S > H_2Se > H_2Te$
(b) $H_2Te > H_2Se > H_2S > H_2O$
(c) $H_2S > H_2O > H_2Se > H_2Te$
(d) $H_2O > H_2S > H_2Te > H_2Se$

35. Which of the following has not a lone pair over the central atom

- (a) NH_3 (b) PH_3
(c) BF_3 (d) PCl_3

36. In BrF_3 molecule, the lone pairs occupy equatorial positions to minimize [CBSE PMT 2004]

- (a) Lone pair- lone pair repulsion and lone pair-bond pair repulsion
(b) Lone pair- lone pair repulsion only
(c) Lone pair- bond pair repulsion only
(d) Bond pair- bond pair repulsion only

37. H_2O is dipolar, whereas BeF_2 is not. It is because

[BHU 2000]

[CBSE PMT 1989; 2004]

- (a) H_2O is linear and BeF_2 is angular

- (b) H_2O is angular and BeF_2 is linear
 (c) The electronegativity of F is greater than that of O
 (d) H_2O involves hydrogen bonding whereas BeF_2 is a discrete molecule
38. Maximum bond angle is present in [BVP 2004]
 (a) BCl_3 (b) BBr_3
 (c) BF_3 (d) Same for all
39. The shape of a molecule of NH_3 , in which central atoms contains lone pair of electron, is [MHCET 2003]
 (a) Tetrahedral (b) Planar trigonal
 (c) Square planar (d) Pyramidal
40. The largest bond angle is in [DCE 2002; MNR 1984]
 (a) AsH_3 (b) NH_3
 (c) H_2O (d) PH_3
41. The bond angle in ammonia molecule is [EAMCET 1980]
 (a) $91^\circ 8'$ (b) $93^\circ 3'$
 (c) $106^\circ 45'$ (d) $109^\circ 28'$
42. Which of the following gives correct arrangement of compounds involved based on their bond strength [BHU 2005]
 (a) $HF > HCl > HBr > HI$
 (b) $HI > HBr > HCl > HF$
 (c) $HF > HBr > HCl > HI$
 (d) $HCl > HF > HBr > HI$
43. Which one has a pyramidal structure [CBSE PMT 1990]
 (a) CH_4 (b) NH_3
 (c) H_2O (d) CO_2
44. Among the following the pair in which the two species are not isostructural is [CBSE PMT 2004]
 (a) BH_4^- and NH_4^+ (b) PF_6^- and SF_6
 (c) SiF_4 and SF_4 (d) IO_3^- and XeO_3
45. The maximum number of 90° angles between bond pair-bond pair of electrons is observed in [AIEEE 2004]
 (a) dsp^2 hybridization (b) sp^3d hybridization
 (c) dsp^3 hybridization (d) sp^3d^2 hybridization
- (a) O_2 (b) O_2^{-2}
 (c) O_2^{+1} (d) O_2^{-1}
5. The bond order is maximum in [AIIMS 1983, 85; CBSE PMT 1994; MP PET 2002]
 (a) O_2 (b) O_2^{-1}
 (c) O_2^{+1} (d) O_2^{-2}
6. Which of the following compounds of boron does not exist in the free form
 (a) BCl_3 (b) BF_3
 (c) BBr_3 (d) BH_3
7. Molecular orbital theory was developed mainly by [BHU 1987; Pb. CET 2003]
 (a) Pauling (b) Pauling and Slater
 (c) Mulliken (d) Thomson
8. The bond order of a molecule is given by [NCERT 1984]
 (a) The difference between the number of electrons in bonding and antibonding orbitals
 (b) Total number of electrons in bonding and antibonding orbitals
 (c) Twice the difference between the number of electrons in bonding and antibonding electrons
 (d) Half the difference between the number of electrons in bonding and antibonding electrons
9. Oxygen molecule is paramagnetic because [NCERT 1984; IIT 1984]
 (a) Bonding electrons are more than antibonding electrons
 (b) Contains unpaired electrons
 (c) Bonding electrons are less than antibonding electrons
 (d) Bonding electrons are equal to antibonding electrons
10. Which one is paramagnetic from the following [IIT 1989; CBSE PMT 1995]
 (a) O_2^- (b) NO
 (c) Both (a) and (b) (d) CN^-
11. The bond order in N_2^+ ion is [Pb. CET 2004]
 (a) 1 (b) 2
 (c) 2.5 (d) 3
12. Out of the following which has smallest bond length [RPMT 1997]
 (a) O_2 (b) O_2^+
 (c) O_2^- (d) O_2^{2-}
13. Which of the following molecule is paramagnetic [CPMT 1980; RPET 1999; MP PMT 1999; RPMT 2000]
 (a) Chlorine (b) Nitrogen
 (c) Oxygen (d) Hydrogen
14. Which molecule has the highest bond order
 (a) N_2 (b) Li_2
 (c) He_2 (d) O_2
15. The molecular electronic configuration of H_2^- ion is
 (a) $(\sigma 1s)^2$ (b) $(\sigma 1s)^2(\sigma^* 1s)^2$
 (c) $(\sigma 1s)^2(\sigma^* 1s)^1$ (d) $(\sigma 1s)^3$
16. The paramagnetic nature of oxygen molecule is best explained on the basis of [BHU 1996]
 (a) Valence bond theory (b) Resonance

Molecular orbital theory

1. Bond order is a concept in the molecular orbital theory. It depends on the number of electrons in the bonding and antibonding orbitals. Which of the following statements is true about it? The bond order [AIIMS 1980]
 (a) Can have a negative quantity
 (b) Has always an integral value
 (c) Can assume any positive or integral or fractional value including zero
 (d) Is a non zero quantity
2. The bond order of NO molecule is [MP PET 1996]
 (a) 1 (b) 2
 (c) 2.5 (d) 3
3. When two atomic orbitals combine they form
 (a) One molecular orbital (b) Two molecular orbital
 (c) Three molecular orbital (d) Four molecular orbital
4. Which of the following species is the least stable

- (c) Molecular orbital theory (d) Hybridization
17. In which case the bond length is minimum between carbon and nitrogen
(a) CH_3NH_2 (b) $C_6H_5CH=NOH$
(c) CH_3CONH_2 (d) CH_3CN
18. Which one of the following species is diamagnetic in nature
[AIEEE 2005]
(a) He_2^+ (b) H_2
(c) H_2^+ (d) H_2^-
19. Which one of the following oxides is expected exhibit paramagnetic behaviour
[CBSE PMT 2005]
(a) CO_2 (b) SO_2
(c) ClO_2 (d) SiO_2
20. The bond order in N_2 molecule is
[CBSE 1995; Pb. PMT 1999; MP PET 1997]
(a) 1 (b) 2
(c) 3 (d) 4
21. Which one is paramagnetic and has the bond order $1/2$
[NCERT 1983]
(a) O_2 (b) N_2
(c) F_2 (d) H_2^+
22. When two atoms of chlorine combine to form one molecule of chlorine gas, the energy of the molecule
[AMU 1982]
(a) Greater than that of separate atoms
(b) Equal to that of separate atoms
(c) Lower than that of separate atoms
(d) None of the above statement is correct
23. An atom of an element A has three electrons in its outermost shell and that of B has six electrons in the outermost shell. The formula of the compound between these two will be
[CPMT 1974, 84; RPMT 1999]
(a) A_3B_4 (b) A_2B_3
(c) A_3B_2 (d) A_2B
24. The bond order of individual carbon-carbon bonds in benzene is
(a) One (b) Two
(c) Between 1 and 2 (d) One and two alternately
25. PCl_5 exists but NCl_5 does not because
[EAMCET 1977; MP PET/PMT 1988]
(a) Nitrogen has no vacant d-orbitals
(b) NCl_5 is unstable
(c) Nitrogen atom is much smaller
(d) Nitrogen is highly inert
26. Paramagnetism is exhibited by molecules
[NCERT 1979; MP PET 2002]
(a) Not attracted into a magnetic field
(b) Containing only paired electrons
(c) Carrying a positive charge
(d) Containing unpaired electrons
27. Which one of the following is paramagnetic
[DPMT 1985]
(a) H_2O (b) NO_2
(c) SO_2 (d) CO_2
28. The energy of a $2p$ orbital except hydrogen atom is
[AMU 1983]
(a) Less than that of $2s$ orbital
(b) More than that of $2s$ orbital
(c) Equal to that of $2s$ orbital
(d) Double that of $2s$ orbital
29. In the electronic structure of acetic acid, there are
[AMU 1983]
(a) 16 shared and 8 unshared electrons
(b) 8 shared and 16 unshared electrons
(c) 12 shared and 12 unshared electrons
(d) 18 shared and 6 unshared electrons
30. Which of the following does not exist on the basis of molecular orbital theory
[AFMC 1990; MP PMT 1996]
(a) H_2^+ (b) He_2^+
(c) He_2 (d) Li_2
31. In P_4O_{10} , the number of oxygen atoms attached to each phosphorus atom is
[IIT 1995]
(a) 2 (b) 3
(c) 4 (d) 2.5
32. Of the following statements which one is correct
(a) Oxygen and nitric oxide molecules are both paramagnetic because both contain unpaired electrons
(b) Oxygen and nitric oxide molecules are both diamagnetic because both contain no unpaired electrons
(c) Oxygen is paramagnetic because it contains unpaired electrons, while nitric oxide is diamagnetic because it contains no unpaired electrons
(d) Oxygen is diamagnetic because it contains no unpaired electrons, while nitric oxide is paramagnetic because it contains an unpaired electron
33. According to the molecular orbital theory, the bond order in C_2 molecule is
(a) 0 (b) 1
(c) 2 (d) 3
34. The molecular orbital configuration of a diatomic molecule is
[IIT 1980]
 $\sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \sigma 2p_x^2 \begin{cases} \pi 2p_y^2 \\ \pi 2p_z^2 \end{cases}$
- Its bond order is
(a) 3 (b) 2.5
(c) 2 (d) 1
35. The difference in energy between the molecular orbital formed and the combining atomic orbitals is called
(a) Bond energy (b) Activation energy
(c) Stabilization energy (d) Destabilization energy
36. According to molecular orbital theory, the paramagnetism of O_2 molecule is due to presence of
[MP PMT 1997]
(a) Unpaired electrons in the bonding σ molecular orbital
(b) Unpaired electrons in the antibonding σ molecular orbital
(c) Unpaired electron in the bonding π molecular orbital
(d) Unpaired electrons in the antibonding π molecular orbital
37. The bond order in O_2^+ is
[MP PET 1999; BHU 2001]
(a) 2 (b) 2.5
(c) 1.5 (d) 3

38. Which of the following is paramagnetic [MP PET 1999]
 (a) O_2 (b) CN^-
 (c) CO (d) NO^+
39. If N_x is the number of bonding orbitals of an atom and N_y is the number of antibonding orbitals, then the molecule/atom will be stable if [DPMT 1996]
 (a) $N_x > N_y$ (b) $N_x = N_y$
 (c) $N_x < N_y$ (d) $N_x \leq N_y$
40. Which of the following molecular orbitals has two nodal planes
 (a) $\sigma 2s$ (b) $\pi 2p_y$
 (c) $\pi^* 2p_y$ (d) $\sigma^* 2p_x$
41. The number of nodal planes 'd' orbital has [KCET 1996]
 (a) Zero (b) One
 (c) Two (d) Three
42. Atomic number of an element is 26. The element shows [CPMT 1996]
 (a) Ferromagnetism (b) Diamagnetism
 (c) Paramagnetism (d) None of these
43. What is correct sequence of bond order [BHU 1997]
 (a) $O_2^+ > O_2^- > O_2$ (b) $O_2^+ > O_2 > O_2^-$
 (c) $O_2 > O_2^- > O_2^+$ (d) $O_2^- > O_2^+ > O_2$
44. Which bond is strongest [RPMT 1997]
 (a) $F-F$ (b) $Br-F$
 (c) $Cl-F$ (d) $I-F$
45. Which of the following is not paramagnetic [AIIMS 1997]
 (a) S^{-2} (b) N_2^-
 (c) O_2^- (d) NO
46. Which one of the following molecules is paramagnetic [Pb. PMT 1998]
 (a) CO_2 (b) SO_2
 (c) NO (d) H_2O
47. N_2 and O_2 are converted into monoanions N_2^- and O_2^- respectively, which of the following statements is wrong [CBSE PMT 1997]
 (a) In N_2 , the $N-N$ bond weakens
 (b) In O_2 , the $O-O$ bond order increases
 (c) In O_2 , bond length increases
 (d) N_2^- becomes diamagnetic
48. With increasing bond order, stability of a bond [CET Pune 1998]
 (a) Remains unaltered (b) Decreases
 (c) Increases (d) None of these
49. Which is not paramagnetic [DCE 1999, 2000]
 (a) O_2 (b) O_2^+
 (c) O_2^{2-} (d) O_2^-
50. The number of antibonding electron pairs in O_2^{2-} molecular ion on the basis of molecular orbital theory is [Pb. PMT 2000]
 (a) 4 (b) 3
 (c) 2 (d) 5
51. The bond order of He_2^+ molecule ion is [Pb. PMT 2000; Pb CET 2001]
 (a) 1 (b) 2
 (c) $\frac{1}{2}$ (d) $\frac{1}{4}$
52. Which of the following exhibit paramagnetism [DPMT 2000]
 (a) ClO_2 (b) ClO_2^-
 (c) NO_2 (d) NO
53. In which of the following pairs the two molecules have identical bond order [MP PMT 2000]
 (a) N_2, O_2^{2+} (b) N_2, O_2^-
 (c) N_2^-, O_2 (d) O_2^+, N_2
54. The bond order is not three for [MP PMT 2001]
 (a) N_2^+ (b) O_2^{2+}
 (c) N_2 (d) NO^+
55. In H_2O_2 molecule, the angle between the two $O-H$ planes is
 (a) 90° (b) 101°
 (c) 103° (d) 105°
56. Which of the following molecule has highest bond energy [AIIMS 2002]
 (a) $F-F$ (b) $C-C$
 (c) $N-N$ (d) $O-O$
57. Which of the following species would be expected paramagnetic
 (a) Copper crystals (b) Cu^+
 (c) Cu^{++} (d) H_2
58. Which of the following is correct for N_2 triple bond [CPMT 2002]
 (a) $3s$ (b) $1p, 2s$
 (c) $2p, 1s$ (d) $3p$
59. In which of the following pairs molecules have bond order three and are isoelectronics [MP PET 2003]
 (a) CN^-, CO (b) NO^+, CO^+
 (c) CN^-, O_2^+ (d) CO, O_2^+
60. Which of the following is paramagnetic [MP PET 2003]
 (a) O_2^+ (b) CN^-
 (c) CO (d) N_2
61. How many bonding electron pairs are there in white phosphorous
 (a) 6 (b) 12
 (c) 4 (d) 8
62. The atomicity of phosphorus is X and the $\hat{P}\hat{P}\hat{P}$ bond angle in the molecule is Y . What are X and Y [EAMCET 2003]
 (a) $X = 4, Y = 90^\circ$ (b) $X = 4, Y = 60^\circ$
 (c) $X = 3, Y = 120^\circ$ (d) $X = 2, Y = 180^\circ$

63. From elementary molecular orbital theory we can give the electronic configuration of the singly positive nitrogen molecular ion N_2^+ as
- $\sigma(1s)^2 \sigma^*(1s)^2 \sigma(2s)^2 \sigma^*(2s)^2 \pi(2p)^4 \sigma(2p)^1$
 - $\sigma(1s)^2 \sigma^*(1s)^2 \sigma(2s)^2 \sigma^*(2s)^2 \sigma(2p)^1 \pi(2p)^3$
 - $\sigma(1s)^2 \sigma^*(1s)^2 \sigma(2s)^2 \sigma^*(2p)^2 \pi(2p)^4$
 - $\sigma(1s)^2 \sigma^*(1s)^2 \sigma(2s)^2 \sigma^*(2s)^2 \sigma(2p)^2 \pi(2p)^2$
64. The paramagnetic property of the oxygen molecule due to the presence of unpaired electrons present in [Kerala PMT 2004]
- $(\sigma 2p_x)^1$ and $(\sigma^* 2p_x)^1$
 - $(\sigma 2p_x)^1$ and $(\pi 2p_y)^1$
 - $(\pi^* 2p_y)^1$ and $(\pi^* 2p_z)^1$
 - $(\pi^* 2p_y)^1$ and $(\pi 2p_y)^1$
 - $(\pi^* 2p_z)^1$ and $(\pi 2p_z)^1$
65. In PO_4^{3-} ion, the formal charge on each oxygen atom and $P-O$ bond order respectively are [DPMT 2004]
- 0.75, 1.25
 - 0.75, 1.0
 - 0.75, 0.6
 - 3, 1.25
66. The bond order in CO_3^{2-} ion between $C-O$ is [Pb. PMT 2004]
- Zero
 - 0.88
 - 1.33
 - 2
67. The bond order of O_2^+ is the same as in [CPMT 2004]
- N_2^+
 - CN^-
 - CO
 - NO^+
68. Bond order of O_2 is [DPMT 2004]
- 2
 - 1.5
 - 3
 - 3.5
69. The total number of electron that takes part in forming bonds in N_2 is [MP PET 2004]
- 2
 - 4
 - 6
 - 10
70. The bond length the species O_2 , O_2^+ and O_2^- are in the order of
- $O_2^+ > O_2 > O_2^-$
 - $O_2^+ > O_2^- > O_2$
 - $O_2 > O_2^+ > O_2^-$
 - $O_2^- > O_2 > O_2^+$
71. According to molecular orbital theory which of the following statement about the magnetic character and bond order is correct regarding O_2^+ [IIT JEE Screening 2004]
- Paramagnetic and bond order $< O_2$
 - Paramagnetic and bond order $> O_2$
 - Dimagnetic and bond order $< O_2$
 - Dimagnetic and bond order $> O_2$
72. The bond order in NO is 2.5 while that in NO^+ is 3. Which of the following statements is true for these two species [AIEEE 2004]
- Bond length in NO^+ is equal to that in NO
 - Bond length in NO is greater than in NO^+
 - Bond length in NO^+ is greater than in NO [UPSEAT 2003]
 - Bond length is unpredictable
73. Which of the following is diamagnetic [BVP 2004]
- Oxygen molecule
 - Boron molecule
 - N_2^+
 - None
74. Bond energies in NO , NO^+ and NO^- are such as [Pb. CET 2004]
- $NO^- > NO > NO^+$
 - $NO > NO^- > NO^+$
 - $NO^+ > NO > NO^-$
 - $NO^+ > NO^- > NO$
75. Which of the following is paramagnetic [UPSEAT 2004]
- B_2
 - C_2
 - N_2
 - F_2
76. The paramagnetic molecule at ground state among the following is [UPSEAT 2004]
- H_2
 - O_2
 - N_2
 - CO
77. Which has the highest bond energy [DCE 2002]
- F_2
 - Cl_2
 - Br_2
 - I_2
78. In O_2^- , O_2 and O_2^{2-} molecular species, the total number of antibonding electrons respectively are [DCE 2003]
- 7, 6, 8
 - 1, 0, 2
 - 6, 6, 6
 - 8, 6, 8
79. Which of the following is not paramagnetic [DCE 2002]
- O_2
 - O_2^{2+}
 - O_2^{2-}
 - O_2^-
80. Which of the following species have maximum number of unpaired electrons [AIIMS 1983]
- O_2
 - O_2^+
 - O_2^-
 - O_2^{2-}
81. The correct order in which the $O-O$ bond length increases in the following is [BHU 2000; CBSE PMT 2005]
- $H_2O_2 < O_2 < O_3$
 - $O_2 < H_2O_2 < O_3$
 - $O_2 < O_3 < H_2O_2$
 - $O_3 < H_2O_2 < O_2$
82. Correct order of bond length is [MP PET 2004; Orissa JEE 2005]
- $CO_3^{2-} > CO_2 > CO$
 - $CO_2 > CO > CO_3^{2-}$
 - $CO > CO_2 > CO_3^{2-}$
 - None of these
83. Which of the following is paramagnetic [DPMT 2005]
- N_2
 - C_2
 - N_2^+
 - O_2^{2-}
84. Among the following molecules which one have smallest bond angle [Orissa JEE 2005]
- NH_3
 - PH_3
 - H_2O
 - H_2S

Hydrogen bonding

1. In the following which bond will be responsible for maximum value of hydrogen bond
- $O-H$
 - $N-H$

- (c) $S-H$ (d) $F-H$
2. In which of the following hydrogen bond is present
(a) H_2 (b) Ice
(c) Sulphur (d) Hydrocarbon
3. In the following which has highest boiling point
[MP PMT 1989; RPMT 1997]
(a) HI (b) HF
(c) HBr (d) HCl
4. Which contains hydrogen bond [MP PMT 1989]
(a) HF (b) HCl
(c) HBr (d) HI
5. Contrary to other hydrogen halides, hydrogen fluoride is a liquid because [MP PMT 1990; AMU 1983; EAMCET 1980]
(a) Size of F atom is small
(b) HF is a weak acid
(c) HF molecule are hydrogen bonded
(d) Fluorine is highly reactive
6. In the following which species does not contain sp^3 hybridization
(a) NH_3 (b) CH_4
(c) H_2O (d) CO_2
7. As a result of sp hybridization, we get [IIT 1984]
(a) Two mutual perpendicular orbitals
(b) Two orbitals at 180°
(c) Four orbitals in tetrahedral directions
(d) Three orbitals in the same plane
8. The reason for exceptionally high boiling point of water is [DPMT 1986; NCERT 1976; AMU 1984; EAMCET 1979; MP PMT 1993; AIIMS 1996; KCET 2001; CPMT 2003]
(a) Its high specific heat
(b) Its high dielectric constant
(c) Low ionization of water molecules
(d) Hydrogen bonding in the molecules of water
9. Which concept best explains that *o*-nitrophenol is more volatile than *p*-nitrophenol [AIIMS 1980, 82; Kurukshetra CEE 1998; MP PET 2002]
(a) Resonance (b) Hyperconjugation
(c) Hydrogen bonding (d) Steric hindrance
10. Which contains strongest $H-H$ bond [IIT 1986; MP PET 1997, 2003; UPSEAT 2001, 03]
(a) $O-H \cdots S$ (b) $S-H \cdots O$
(c) $F-H \cdots F$ (d) $F-H \cdots O$
11. Which of the following compound can form hydrogen bonds [NCERT 1978; MP PMT 1997]
(a) CH_4 (b) $NaCl$
(c) $CHCl_3$ (d) H_2O
12. Of the following hydrides which has the lowest boiling point [CBSE PMT 1987]
(a) NH_3 (b) PH_3
(c) SbH_3 (d) AsH_3
13. The pairs of bases in DNA are held together by [NCERT 1978; DPMT 1985; CBSE PMT 1992]
(a) Hydrogen bonds (b) Ionic bonds
(c) Phosphate groups (d) Deoxyribose groups
14. Water has high heat of vaporisation due to [AFMC 1982]
(a) Covalent bonding (b) $H-H$ bonding
(c) Ionic bonding (d) None of the above
15. In which of the following compounds does hydrogen bonding occur
(a) SiH_4 (b) LiH
(c) HI (d) NH_3
16. Which among the following compounds does not show hydrogen bonding [MP PMT 1989]
(a) Chloroform (b) Ethyl alcohol
(c) Acetic acid (d) Ethyl ether
17. Acetic acid exists as dimer in benzene due to [CPMT 1982]
(a) Condensation reaction
(b) Hydrogen bonding [DPMT 1985]
(c) Presence of carboxyl group
(d) Presence of hydrogen atom at α -carbon
18. Which one among the following does not have the hydrogen bond [UPSEAT 2001]
(a) Phenol (b) Liquid NH_3
(c) Water (d) Liquid HCl
19. The bond that determines the secondary structure of a protein is [NCERT 1984; MP PMT 1993; KCET 2001]
(a) Coordinate bond (b) Covalent bond
(c) Hydrogen bond (d) Ionic bond
20. HCl is a gas but HF is a low boiling liquid. This is because [NCERT 1984; MP PMT 2001]
(a) $H-F$ bond is strong
(b) $H-F$ bond is weak
(c) Molecules aggregate because of hydrogen bonding
(d) HF is a weak acid
21. The relatively high boiling point of HF is due to [NCERT 1984]
(a) Hydrogen bonding
(b) Covalent bonding
(c) Unshared electron pair on F
(d) Being a halogen acid
22. Water is liquid due to [MADT Bihar 1983]
(a) Hydrogen bonding (b) Covalent bond
(c) Ionic bond (d) Vander Waals forces
23. The maximum possible number of hydrogen bonds in which an H_2O molecule can participate is [MP PMT 1986; MNR 1991; IIT 1992; MP PET 1999]
(a) 1 (b) 2
(c) 3 (d) 4
24. Hydrogen bonding is maximum in [IIT 1987; MP PMT 1991; MP PET 1993, 2001; MNR 1995; CPMT 1999; KCET (Med.) 2002]
(a) Ethanol (b) Diethyl ether

- (c) Ethyl chloride (d) Triethyl amine
25. The hydrogen bond is strongest in [BHU 1987; CBSE PMT 1990, 92]
- (a) Water (b) Ammonia
(c) Hydrogen fluoride (d) Acetic acid
26. The high boiling point of ethanol (78.2°C) compared to dimethyl ether (-23.6°C), though both having the same molecular formulae $\text{C}_6\text{H}_6\text{O}$, is due to [MP PMT 1993]
- (a) Hydrogen bonding
(b) Ionic bonding
(c) Coordinate covalent bonding
(d) Resonance
27. Methanol and ethanol are miscible in water due to [CPMT 1989]
- (a) Covalent character
(b) Hydrogen bonding character
(c) Oxygen bonding character
(d) None of these
28. B.P. of H_2O (100°C) and H_2S (-42°C) explained by
- (a) Vander Waal's forces (b) Covalent bond
(c) Hydrogen bond (d) Ionic bond
29. Strength of hydrogen bond is intermediate between [DPMT 1991]
- (a) Vander Waal and covalent
(b) Ionic and covalent
(c) Ionic and metallic
(d) Metallic and covalent
30. In which of the following compounds intramolecular hydrogen bond is present [MP PET 1994]
- (a) Ethyl alcohol (b) Water
(c) Salicylaldehyde (d) Hydrogen sulphide
31. Hydrogen bonding is formed in compounds containing hydrogen and [MP PET 1995]
- (a) Highly electronegative atoms
(b) Highly electropositive atoms
(c) Metal atoms with d -orbitals occupied
(d) Metalloids
32. Which of the following compounds in liquid state does not have hydrogen bonding [MP PMT 1996]
- (a) H_2O (b) HF
(c) NH_3 (d) C_6H_6
33. Compounds showing hydrogen bonding among HF , NH_3 , H_2S and PH_3 are
- (a) Only HF , NH_3 and PH_3
(b) Only HF and NH_3
(c) Only NH_3 , H_2S and PH_3
(d) All the four
34. The high density of water compared to ice is due to [CBSE PMT 1997; BHU 1999; AFMC 2001]
- (a) Hydrogen bonding interactions
(b) Dipole-dipole interactions
(c) Dipole-induced dipole interactions
(d) Induced dipole-induced dipole interactions
35. Ethanol and dimethyl ether form a pair of functional isomers. The boiling point of ethanol is higher than that of dimethyl ether due to the presence of [AIIMS 1998]
- (a) Hydrogen bonding in ethanol
(b) Hydrogen bonding in dimethyl ether
(c) CH_3 group in ethanol
(d) CH_3 group in dimethyl ether
36. Which of the following hydrogen bonds are strongest in vapour phase [AMU 1999]
- (a) $\text{HF} \cdots \text{HF}$ (b) $\text{HF} \cdots \text{HCl}$
(c) $\text{HCl} \cdots \text{HCl}$ (d) $\text{HF} \cdots \text{HI}$
37. Which of the following shows hydrogen bonding [CPMT 2000]
- (a) NH_3 (b) P
(c) As (d) Sb
38. The boiling point of a compound is raised by [DPMT 2001]
- (a) Intramolecular hydrogen bonding
(b) Intermolecular hydrogen bonding
(c) Covalent bonding
(d) Ionic covalent
39. The boiling point of water is exceptionally high because [KCET 2001]
- (a) Water molecule is linear
(b) Water molecule is not linear
(c) There is covalent bond between H and O
(d) Water molecules associate due to hydrogen bonding
40. NH_3 has a much higher boiling point than PH_3 because [UPSEAT 2002; MNR 1994]
- (a) NH_3 has a larger molecular weight
(b) NH_3 undergoes umbrella inversion
(c) NH_3 forms hydrogen bond
(d) NH_3 contains ionic bonds whereas PH_3 contains covalent bonds
41. Which one has the highest boiling point [MP PET 2002]
- (a) Acetone (b) Ethyl alcohol
(c) Diethyl ether (d) Chloroform
42. Which of the following compounds has the highest boiling point
- (a) HCl (b) HBr
(c) H_2SO_4 (d) HNO_3
43. Which of the following has minimum melting point [UPSEAT 2003]
- (a) CsF (b) HCl
(c) HF (d) LiF
44. Hydrogen bond energy is equal to [UPSEAT 2003]
- (a) $3 - 7 \text{ cal}$ (b) $30 - 70 \text{ cal}$
(c) $3 - 10 \text{ kcal}$ (d) $30 - 70 \text{ kcal}$
45. H_2O is a liquid while H_2S is gas due to [BHU 2003]
- (a) Covalent bonding
(b) Molecular attraction
(c) $\text{H} - \text{bonding}$
(d) $\text{H} - \text{bonding}$ and molecular attraction

46. H – bonding is maximum in [BHU 2003]
 (a) C_6H_5OH (b) C_6H_5COOH
 (c) CH_3CH_2OH (d) CH_3COCH_3
47. Select the compound from the following which dissolves in water
 (a) CCl_4 (b) CS_2
 (c) $CHCl_3$ (d) C_2H_5OH
48. When two ice cubes are pressed over each other, they unit to form one cube. Which of the following force is responsible for holding them together [NCERT 1978]
 (a) Vander Waal's forces
 (b) Hydrogen bond formation
 (c) Covalent attraction
 (d) Dipole–dipole attraction
49. Which is the weakest among the following types of bond [NCERT 1979; MADT Bihar 1984]
 (a) Ionic bond (b) Metallic bond
 (c) Covalent bond (d) Hydrogen bond
50. H -bond is not present in [BCECE 2005]
 (a) Water (b) Glycerol
 (c) Hydrogen fluoride (d) Hydrogen Sulphide
8. In melting, the structure of solid [CPMT 1982]
 (a) Remains unchanged (b) Changes
 (c) Becomes compact (d) None of the above
9. Which of the following has the highest melting point [CPMT 1994]
 (a) Pb (b) Diamond
 (c) Fe (d) Na
10. In the formation of a molecule by an atom [AFMC 1995]
 (a) Attractive forces operate
 (b) Repulsive forces operate
 (c) Both attractive and repulsive forces operate
 (d) None of these
11. Which has weakest bond [RPMT 1997]
 (a) Diamond (b) Neon (Solid)
 (c) KCl (d) Ice
12. Which of the following exhibits the weakest intermolecular forces [AIIMS 1999; B]
 (a) He (b) HCl
 (c) NH_3 (d) H_2O
13. Glycerol has strong intermolecular bonding therefore it is [RPET 2000]
 (a) Sweet (b) Reactive
 (c) Explosive (d) Viscous
14. Among the following the weakest one is [Pb. PMT 2004; CPMT 2002]
 (a) Metallic bond (b) Ionic bond
 (c) Van der Waal's force (d) Covalent bond
15. Lattice energy of alkali metal chlorides follows the order [DPMT 2004]
 (a) $LiCl > NaCl > KCl > RbCl > CsCl$
 (b) $CsCl > NaCl > KCl > RbCl > LiCl$
 (c) $LiCl > CsCl > NaCl > KCl > RbCl$
 (d) $NaCl > LiCl > KCl > RbCl > CsCl$
16. In the following which molecule or ion possesses electrovalent, covalent and co-ordinate bond at the same time
 (a) HCl (b) NH_4^+
 (c) Cl^- (d) H_2O_2
17. Both ionic and covalent bond is present in the following [MNR 1986; MP PMT 2004]
 (a) CH_4 (b) KCl
 (c) SO_2 (d) $NaOH$
18. The formation of a chemical bond is accompanied by [MP PET 1995]
 (a) Decrease in energy
 (b) Increase in energy
 (c) Neither increase nor decrease in energy
 (d) None of these
19. Chemical bond implies [KCET 2002]

Types of bonding and Forces in solid

1. In a crystal cations and anions are held together by [EAMCET 1982]
 (a) Electrons (b) Electrostatic forces
 (c) Nuclear forces (d) Covalent bonds
2. In the following metals which one has lowest probable interatomic forces [MP PMT 1990]
 (a) Copper (b) Silver
 (c) Zinc (d) Mercury
3. In solid argon, the atoms are held together by [NCERT 1981; MP PET 1995]
 (a) Ionic bonds (b) Hydrogen bonds
 (c) Vander Waals forces (d) Hydrophobic forces
4. Which one is the highest melting halide [AIIMS 1980]
 (a) $NaCl$ (b) $NaBr$
 (c) NaF (d) NaI
5. The enhanced force of cohesion in metals is due to [NCERT 1972]
 (a) The covalent linkages between atoms
 (b) The electrovalent linkages between atoms
 (c) The lack of exchange of valency electrons
 (d) The exchange energy of mobile electrons
6. Which one of the following substances consists of small discrete molecules [CPMT 1987]
 (a) $NaCl$ (b) Graphite
 (c) Copper (d) Dry ice
7. Which of the following does not apply to metallic bond [CBSE PMT 1989]

[UPSEAT 2001]

- (a) Attraction
(b) Repulsion
(c) Neither attraction nor repulsion
(d) Both (a) and (b)
20. Which of the following statements is true [AIEEE 2002]
(a) HF is less polar than HBr
(b) Absolutely pure water does not contain any ions
(c) Chemical bond formation take place when forces of attraction overcome the forces of repulsion
(d) In covalency transference of electron takes place
21. Which of the following statements is true about $[Cu(NH_3)_4]SO_4$
(a) It has coordinate and covalent bonds
(b) It has only coordinate bonds
(c) It has only electrovalent bonds
(d) It has electrovalent, covalent and coordinate bonds
22. Blue vitriol has
(a) Ionic bond (b) Coordinate bond
(c) Hydrogen bond (d) All the above
23. The number of ionic, covalent and coordinate bonds in NH_4Cl are respectively [MP PMT 1999]
(a) 1, 3 and 1 (b) 1, 3 and 2
(c) 1, 2 and 3 (d) 1, 1 and 3
24. Covalent molecules are usually held in a crystal structure by [MP PET 1995]
(a) Dipole-dipole attraction
(b) Electrostatic attraction
(c) Hydrogen bonds
(d) Vander Waal's attraction
- (a) $N_2H_5^+$ (b) $BaCl_2$
(c) HCl (d) H_2O
6. Which combination is best explained by the co-ordinate covalent bond [JIPMER 2001; CBSE PMT 1990]
(a) $H^+ + H_2O$ (b) $Cl + Cl$
(c) $Mg + \frac{1}{2}O_2$ (d) $H_2 + I_2$
7. Arrange the following compounds in order of increasing dipole moment. [CPMT 1988]
(I) Toluene (II) m -dichlorobenzene
(III) o -dichlorobenzene (IV) p -dichlorobenzene [IIT 1996]
(a) $I < IV < II < III$ (b) $IV < I < II < III$
(c) $IV < I < III < II$ (d) $IV < II < I < III$
8. The correct order of dipole moment is [Roorkee 1999]
(a) $CH_4 < NF_3 < NH_3 < H_2O$
(b) $NF_3 < CH_4 < NH_3 < H_2O$
(c) $NH_3 < NF_3 < CH_4 < H_2O$
(d) $H_2O < NH_3 < NF_3 < CH_4$
9. Which of the following has the highest dipole moment [AIIMS 2002]

Critical Thinking

Objective Questions

1. The values of electronegativity of atoms A and B are 1.20 and 4.0 respectively. The percentage of ionic character of $A - B$ bond is
(a) 50 % (b) 43 %
(c) 55.3 % (d) 72.24%
2. O_2^{2-} is the symbol of ion [EAMCET 2003]
(a) Oxide (b) Superoxide
(c) Peroxide (d) Monoxide
3. The number of electrons that are paired in oxygen molecule is
(a) 7 (b) 8
(c) 14 (d) 16
4. When N_2 goes to N_2^+ , the $N - N$ bond distance and when O_2 goes to O_2^+ , the $O - O$ bond distance [IIT 1996]
(a) Decrease, increase (b) Increase, decrease
(c) Increase, increase (d) None of these
5. Which of the following contains a coordinate covalent bond
10. Which of the following arrangement of molecules is correct on the basis of their dipole moments [AIIMS 2002]
(a) $BF_3 > NF_3 > NH_3$ (b) $NF_3 > BF_3 > NH_3$
(c) $NH_3 > BF_3 > NF_3$ (d) $NH_3 > NF_3 > BF_3$ [MP PET 2003]
11. The type of hybrid orbitals used by the chlorine atom in ClO_2^- is
(a) sp^3 (b) sp^2
(c) sp (d) None of these
12. Among the following species, identify the isostructural pairs, NF_3 , NO_3^- , BF_3 , H_3O^+ , HN_3 [IIT 1996]
(a) $[NF_3, NO_3^-]$ and $[BF_3, H_3O^+]$ [IIT 1995]
(b) $[NF_3, HN_3]$ and $[NO_3^-, BF_3]$
(c) $[NF_3, H_3O^+]$ and $[NO_3^-, BF_3]$
(d) $[NF_3, H_3O^+]$ and $[HN_3, BF_3]$
13. In the compound $CH_2 = CH - CH_2 - CH_2 - C \equiv CH$, the $C_2 - C_3$ bond is of the type [IIT 1999]
(a) $sp - sp^2$ (b) $sp^3 - sp^3$

- (c) $sp - sp^3$ (d) $sp^2 - sp^3$
14. The correct order of increasing $C - O$ bond length of CO , CO_3^{2-} , CO_2 is [IIT 1999]
- (a) $CO_3^{2-} < CO_2 < CO$ (b) $CO_2 < CO_3^{2-} < CO$
- (c) $CO < CO_3^{2-} < CO_2$ (d) $CO < CO_2 < CO_3^{2-}$
15. In the dichromate dianion [IIT 1999]
- (a) 4 $Cr - O$ bonds are equivalent
- (b) 6 $Cr - O$ bonds are equivalent
- (c) All $Cr - O$ bonds are equivalent
- (d) All $Cr - O$ bonds are non-equivalent
16. Bond length of ethane (I), ethene (II), acetylene (III) and benzene (IV) follows the order [CPMT 1999]
- (a) $I > II > III > IV$ (b) $I > II > IV > III$
- (c) $I > IV > II > III$ (d) $III > IV > II > I$
17. Hybridisation state of chlorine in ClF_3 is [RPET 1999]
- (a) sp^3 (b) sp^3d
- (c) sp^3d^2 (d) sp^3d^3
18. Molecular shapes of SF_4 , CF_4 and XeF_4 are [IIT Screening 2000]
- (a) The same with 2, 0 and 1 lone pairs of electrons respectively
- (b) The same, with 1, 1 and 1 lone pairs of electrons respectively
- (c) Different, with 0, 1 and 2 lone pairs of electrons respectively
- (d) Different, with 1, 0 and 2 lone pairs of electrons respectively
19. Structure of IF_4^+ and hybridization of iodine in this structure are [UPSEAT 2001]
- (a) sp^3d , Linear
- (b) sp^3d^2 , T-shaped
- (c) sp^3d , Irregular tetrahedral
- (d) sp^3d^2 , Octahedral
20. In which of the following the central atom does not use sp hybrid orbitals in its bonding [UPSEAT 2001, 02]
- (a) BeF_3^- (b) OH_3^+
- (c) NH_2^- (d) NF_3
21. The magnetic moment of $K_3[Fe(CN)_6]$ is found to be 1.7 B.M. How many unpaired electron (s) is/are present per molecule
- (a) 1 (b) 2
- (c) 3 (d) 4
22. N_2 and O_2 are converted into monocations N_2^+ and O_2^+ respectively. Which is wrong [CBSE PMT 1997]
- (a) In N_2 , the $N - N$ bond weakens
- (b) In O_2 , the $O - O$ bond order increases
- (c) In O_2 , paramagnetism decreases
- (d) N_2^+ becomes diamagnetic
23. The common features among the species CN^- , CO and NO^+ are [IIT Screening 2001]
- (a) Bond order three and isoelectronic
- (b) Bond order three and weak field ligands
- (c) Bond order two and π -acceptors
- (d) Isoelectronic and weak field ligands
24. The number of $S - S$ bonds in sulphur trioxide trimer S_3O_9 is
- (a) Three (b) Two
- (c) One (d) Zero
25. Strongest intermolecular hydrogen bond is present in the following molecules pairs [IIT 1981; DCE 2000]
- (a) SiH_4 and SiF_4
- (b) $CH_3 - \overset{\overset{O}{||}}{C} - CH_3$ and $CHCl_3$
- (c) $H - \overset{\overset{O}{||}}{C} - OH$ and $CH_3 - \overset{\overset{O}{||}}{C} - OH$
- (d) H_2O and H_2O_2
26. A compound contains atoms X , Y , Z . The oxidation number of X is +2, Y is +5 and Z is -2. Therefore, a possible formula of the compound is [CPMT 1988]
- (a) XYZ_2 (b) $X_2(YZ_3)_2$
- (c) $X_3(YZ_4)_2$ (d) $X_3(Y_4Z)_2$
27. Bonds present in $CuSO_4 \cdot 5H_2O$ is [IIT 1983; DCE 2001]
- (a) Electrovalent and covalent
- (b) Electrovalent and coordinate
- (c) Electrovalent, covalent and coordinate
- (d) Covalent and coordinate
28. The ionization of hydrogen atom would give rise to [UPSEAT 2001]
- (a) Hybrid ion (b) Hydronium ion
- (c) Proton (d) Hydroxyl ion
29. Which can be described as a molecule with residual bonding capacity [JIPMER 2000]
- (a) $BeCl_2$ (b) $NaCl$
- (c) CH_4 (d) N_2

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
- (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
- (c) If assertion is true but reason is false.
- (d) If the assertion and reason both are false.
- (e) If assertion is false but reason is true.

1. Assertion : Water is a good solvent for ionic compounds but poor one for covalent compounds.
- Reason : Hydration energy of ions releases sufficient energy to overcome lattice energy and break hydrogen bonds in water, while covalent bonded compounds interact so weakly that even Vander

- Wall's forces between molecules of covalent compounds cannot be broken. [AIIMS 1996]
2. Assertion : The atoms in a covalent molecule are said to share electrons, yet some covalent molecules are polar.
Reason : In a polar covalent molecule, the shared electrons spend more time on the average near one of the atoms. [AIIMS 1996]
3. Assertion : Diborane is electron deficient
Reason : There are not enough valence electrons to form the expected number of covalent bonds [AIIMS 2001]
4. Assertion : A resonance hybrid is always more stable than any of its canonical structures
Reason : This stability is due to delocalization of electrons [AIIMS 1999]
5. Assertion : All $F-S-F$ angle in SF_4 greater than 90° but less than 180°
Reason : The lone pair-bond pair repulsion is weaker than bond pair-bond pair repulsion [AIIMS 2004]
6. Assertion : The electronic structure of O_3 is 
Reason :  structure is not allowed because octet around cannot be expanded. [IIT 1998]
7. Assertion : Bond order can assume any value number including zero
Reason : Higher the bond order, shorter is bond length and greater is bond energy [AIIMS 1999]
8. Assertion : Ortho nitrophenol molecules are associated due to the presence of intermolecular hydrogen bonding while paranitrophenol involves intramolecular, hydrogen bonding
Reason : Ortho nitrophenol is more volatile than the para nitrophenol [AIIMS 1999]
9. Assertion : Nitrogen molecule diamagnetic.
Reason : N_2 molecule have unpaired electrons.
10. Assertion : Ice is less dense than liquid water.
Reason : There are vacant spaces between hydrogen bonded water molecules in ice.
11. Assertion : Water is liquid but H_2S is a gas.
Reason : Oxygen is paramagnetic.
12. Assertion : Iodine is more soluble in water than in carbon tetrachloride.
Reason : Iodine is a polar compound.
13. Assertion : o and p -nitrophenols can be separated by steam distillation.
Reason : o -nitrophenol have intramolecular hydrogen bonding while p -nitrophenol exists as associated molecules.
14. Assertion : The fluorine has lower reactivity.
Reason : $F-F$ bond has low bond dissociation energy.
15. Assertion : σ is strong while π is a weak bond.
Reason : Atoms rotate freely about π bond.
16. Assertion : The crystal structure gets stabilized even though the sum of electron gain enthalpy and ionization enthalpy is positive.
Reason : Energy is absorbed during the formation of crystal lattice.
17. Assertion : Order of lattice energy for same halides are as $LiX > NaX > KX$.
Reason : Size of alkaline - earth metal increases from Li to K .
18. Assertion : Born-Haber cycle is based on Hess's law.
Reason : Lattice enthalpy can be calculated by Born-Haber cycle.
19. Assertion : Bond energy has order like $C-C < C=C < C\equiv C$.
Reason : Bond energy increases with increase in bond order.
20. Assertion : Electron affinity refers to an isolated atom's attraction for an additional electron while electronegativity is the ability of an element to attract electrons towards itself in a shared pair of electrons.
Reason : Electron affinity is a relative number and electronegativity is experimentally measurable.
21. Assertion : Geometry of SF_4 molecule can be termed as distorted tetrahedron, a folded square or see saw.
Reason : Four fluorine atoms surround or form bond with sulphur molecule.
22. Assertion : BF_3 has greater dipole moment than H_2S .
Reason : Fluorine is more electronegative than sulphur.
23. Assertion : The bond between two identical nonmetal atoms has a pair of electrons with identical spin.
Reason : Electrons are transferred fully from one atom to another.
24. Assertion : B molecule is diamagnetic.
Reason : The highest occupied molecular orbital is of σ type. [AIIMS 2005]
25. Assertion : The nearly tetrahedral arrangement of the orbitals about the oxygen atom allows each water molecule to form hydrogen bonds with as many as four neighbouring water molecules.
Reason : In ice each molecule forms four hydrogen bonds as each molecule is fixed in the space.
26. Assertion : The bond order of helium is always zero.
Reason : The number of electrons in bonding molecular orbital and antibonding molecular orbital is equal.

AS Answers and Solutions

Electrovalent bonding

1. (b) NaCl is ionic crystal so it is formed by Na^+ and Cl^- ions.
2. (a) Bond formation is always exothermic. Compounds of sodium are ionic.
3. (a) According to Fajan's rule ionic character is less.
4. (c) Valencies of L , Q , P and R is -2 , -1 , $+1$ and $+2$ respectively so they will form P_2L , RL , PQ and RQ_2 .
5. (c) Electrovalent compounds are good conductor of heat and electricity in molten state or in aqueous solution.
7. (d) Electrovalent bond formation depends on ionization energy of cation, electron affinity of anion and on lattice energy.
8. (b) Because CsF is electrovalent compound.
9. (c) NaCl is formed by electrovalent bonding.
10. (d) Valency of metal is $+2$ by formula MO so its phosphate would be $\text{M}_3(\text{PO}_4)_2$ because valency of $[\text{PO}_4]$ is -3 .
11. (b) Li , Na and K are alkali metals with low ionization energy and one electron in their outermost shell so they will form cation easily.
12. (a) Melting point and boiling point of electrovalent compounds are high due to strong electrostatic force of attraction between the ions.
13. (d) The value of lattice energy depends on the charges present on the two ions and distance between them. It shall be high if charges are high and ionic radii are small.
14. (a) Cs is more electropositive.
15. (a) X loses electron, Y gains it.
16. (c) Formation of NaCl occurs by Na_{ion}^+ and Cl_{ion}^- .
17. (b) MgCl_2 has electrovalent linkage because magnesium is electropositive metal while chlorine is electronegative.
18. (a) Electrovalent compounds generally have high m.pt and high b.pt due to stronger coulombic forces of attractions.
19. (d) Water is a polar solvent so it decreases the interionic attraction in the crystal lattice due to solvation.
20. (c) Element C has electronic structure $1s^2, 2s^2 2p^5$, it requires only one electron to complete its octet and it will form anion so it will form electrovalent bond.
21. (b) Since the chloride of a metal is MCl_2 therefore metal ' M ' must be divalent i.e. M^{2+} . As a result the formula of its phosphate is $\text{M}_3(\text{PO}_4)_2$.
22. (d) In MPO_4 the oxidation state of M is $+3$. Hence, the formula of nitrate is $\text{M}(\text{NO}_3)_3$.
23. (a) Ion is formed by gaining or losing electrons. To form cation electron are lost from the valency shell, so Zn atoms to Zn^{++} ions there is a decrease in the no. of valency electron.
24. (a) $\text{M}_3(\text{PO}_4)_2$ means M is divalent so formula of its sulphate is MSO_4 .
25. (b) As the molecular formula of chloride of a metal M is MCl_3 , it is trivalent so formula of its carbonate will be $\text{M}_2(\text{CO}_3)_3$.
26. (d) Sodium chloride is electrovalent compound so it dissolves in water which is a polar solvent.
27. (d) When sodium chloride is dissolved in water, the sodium ion is hydrated.
30. (d) Yet the formula of sulphate of a metal (M) is $\text{M}_2(\text{SO}_4)_3$, it is M^{3+} ion so formula of its phosphate would be MPO_4 .
32. (b) Molten sodium chloride conducts electricity due to the presence of free ions.
33. (b) The phosphate of a metal has the formula MHPO_4 it means metal is divalent so its chloride would be MCl_2 .
34. (d)
35. (b) Cs is highly electropositive while F is highly electronegative so they will form ionic bond.
37. (b) Na is highly electropositive while Cl is highly electronegative so they will form ionic bond.
38. (a) Ionic compounds are good conductors of heat and electricity so they are good electrolyte.
39. (a) Metal tends to lose electrons due to low ionization energy.
40. (c) As the formula of calcium pyrophosphate is $\text{Ca}_2\text{P}_2\text{O}_7$ means valency of pyrophosphate radical is -4 so formula of ferric pyrophosphate is $\text{Fe}_4(\text{P}_2\text{O}_7)_3$.
41. (c) $M-X$ bond is a strongest bond so between $\text{Na}-\text{Cl}$ is a strongest bond.
42. (b) The solubility order is : $\text{BeF}_2 > \text{MgF}_2 > \text{CaF}_2 > \text{SrF}_2$ so SrF_2 is least soluble.
43. (d) NaF has maximum melting point, melting point decreases of sodium halide with increase in size of halide their bond energy get lower.
44. (b) Sulphanilic acids have bipolar structure so their melting point is high and insoluble in organic solvents.
45. (c) CaCl_2 will have electrovalent bonding because calcium is electropositive metal while chlorine is electronegative so they will combined with electrovalent bond.
47. (a) Electrovalent bond is formed by losing electrons from one atom and gaining electron by other atom i.e. redox reaction.
48. (b) Electrovalent compound are polar in nature because they are formed by ions.
50. (b) CsCl has ionic bonding.
51. (b) As soon as the electronegativity increases, ionic bond strength increases.
52. (b) This X element is a second group element so its chloride will be XCl_2 .
53. (a) When electronegativity difference is from 1.7 to 3.0. This bond is called as ionic bond.
54. (a) Ethyl chloride is an organic compound so it will be covalent.
55. (a) Lithium oxide and calcium fluoride show ionic characters.
57. (a) Generally cation and anion form ionic bond.
58. (c) Those atoms which contain $+ve$ and $-ve$ sign are known as ion.
59. (a) Generally $\text{Br}-\text{F}$ contain maximum electronegativity difference compare to other compound.
61. (a) Due to greater electronegativity difference.

62. (b) $Co^{3+} = 3d^6 4s^0$,

$$Ni^{4+} = 3d^6 4s^0,$$

64. (d) $BaCl_2$ contain higher ionic character.

66. (a) Electrolytes are compound which get dissociated into their ion in water so it contains electrovalent bond.

67. (abc) CaH_2, BaH_2, SrH_2 are ionic hydride.

68. (bcd) Generally $MgCl_2, SrCl_2, BaCl_2$ are ionic compounds so they conduct electricity in fused state.

Covalent bonding

2. (c) In N_2 molecule each Nitrogen atom contribute $3e^-$ so total no. of electron's are 6.

3. (b) Non-metals readily form diatomic molecules by sharing of electrons. Element $M(1s^2 2s^2 2p^5)$ has seven electrons in its valence shell and thus needs one more electron to complete its octet. Therefore, two atoms share one electron each to form a diatomic molecule (M_2)

5. (d) Covalent character depend on the size of cation and anion.

6. (a) In graphite all carbon atoms are sp^2 -hybridised and have covalent bond.

7. (c) Silica has tendency to form long chain covalent structure such as carbon so it has giant covalent structure.

8. (a) All have linear structure.

9. (d) Similar atoms form covalent bond.

10. (a) Covalent bond forms when electronegativity difference of two atom is equal to 1.7 or less than 1.7

11. (b) Similar atoms form covalent bond.

12. (b) Water is a polar solvent while covalent compounds are non-polar so they usually insoluble in water.

13. (c) BCl_3 is electron deficient compound because it has only '6' electrons after forming bond.

14. (b) Due to its small size and 2 electrons in s -orbital Be forms covalent compound.

18. (c) H_2O will formed by covalent bonding.

21. (a) Two identical atoms are joined with covalent bond so H_2 will be covalent.

23. (c) Element 'X' has atomic no. 7 so its electronic configuration will be 2, 5. So its electron dot symbol would be $\cdot\dot{X}\cdot$.

24. (c) $C-S$ will be most covalent. Covalent character depend on the size of cation and anion.

25. (c) HCl has ionic character yet it has covalent compound because electronegativity of chlorine is greater than that of hydrogen.

26. (c) Order of polarising power $Be^{++} > Li^+ > Na^+$
Hence order of covalent character $BeCl_2 > LiCl > NaCl$.

31. (b) Valency of phosphorus in H_3PO_4 is supposed 'x' then $3 + x - 8 = 0, x - 5 = 0, x = 5$.

33. (d) $(+1) + x + 3(-2) = 0 \Rightarrow 1 + x - 6 = 0 \Rightarrow x = 6 - 1 = 5$.

34. (a) HCl molecule has covalent bond.

35. (d) Electrovalent compounds have high melting point and high boiling point.

36. (b) Middle length of $H_2 = 74 pm$

$$\text{Length of } H = \frac{74}{2} = 37 pm$$

$$\text{Middle length of } Cl_2 = 198 pm$$

$$\text{Length of } Cl = \frac{198}{2} = 99 pm$$

$$\begin{aligned} \text{Bond length of } HCl &= \text{Length of } H + \text{Length of } Cl \\ &= 37 + 99 = 136 pm \end{aligned}$$

37. (d) Compound has 254 gm of I_2 means $\frac{254}{127} = 2$ mole, while

80 gm O_2 means $\frac{80}{16} = 5$ mole so they will form compound I_2O_5 .

38. (c) NH_4Cl has covalent as well as ionic bond.

39. (d) Covalent character increases when we come down a group so CaI_2 will have highest covalent character.

41. (b) In water molecule three atom are linked by covalent bond.

42. (b) $:N \equiv N^+ - \ddot{O}:^-$ or $N \equiv N \rightarrow O$.

44. (b) The electronic configuration of $Na(Z=11)$ is $1s^2, 2s^2 2p^6, 3s^1$. The oxide of Na is Na_2O .

45. (b) Covalent bond is directional.

47. (d) Bond dissociation energy decreases with increase in size. So D is smallest.

48. (b) Molecule X is nitrogen because nitrogen molecule has triple bond. It's configuration will be $1s^2, 2s^2 2p^3$.

49. (a) PCl_5 does not follow octet rule, it has 10 electrons in its valence shell.

50. (a) The compound will be A_2B_3 (By criss cross rule).

51. (b) Each nitrogen share 3 electrons to form triple bond.

52. (d) Urea solution does not conduct electricity because it is a covalent compound.

54. (d) Due to the small size and higher ionization energy, boron forms covalent compound.

58. (a) BF_3 contain 6 electron so it is lewis acid.

59. (d) Among the given species. The bond dissociation energy of $C-O$ bond is minimum in case of CO_3^{2-} by which

$C-O$ bond become more weaker in CO_3^{2-} or the bond order of CO_3^{2-} (1.33) is minimum so the bond become weaker.

60. (a) Valency of $Na_2S_2O_3$ is supposed to be x , then
 $2 + 2x + (-6) = 0$, $2x - 4 = 0$, $x = 2$.

62. (a) Among the given choice Al is least electropositive therefore, the bond between Al and Cl will be least ionic or most covalent or the difference in electronegativity of two atom is less than 1.8.
63. (b) Electronic configuration of $_{16}S^{32} = 1s^2, 2s^2, 2p^6, 3s^2, 3p^4$. In the last orbit it has only 6 electron. So it require 2 electron to complete its octet, therefore it share 2 electron with two hydrogen atom and forms 2 covalent bond with it.
64. (b) The acidity of hydrides of VI group elements increase from top to bottom as the bond strength $X-H$ decrease from top to bottom

65. (b) We know that Al^{+3} cation is smaller than Na^+ (because of greater nuclear charge) According to Fajan's rule, small cation polarise anion upto greater extent. Hence Al^{3+} polarise Cl^- ion upto greater extent, therefore $AlCl_3$ has covalent bond between Al and Cl atoms.

66. (b) Sulphur has the second highest catenation property after carbon. Its molecule has eight atom bonded together (i.e. S_8)

67. (b) H_2O_2 has open book structure.

69. (b) The electronic configuration of nitrogen is
 ${}_7N = 1s^2, 2s^2, 2p^3$

It has 5 electrons in valency shell, hence in ammonia molecule it complete its octet by sharing of three electron with three H atom, therefore it has 8 electrons in its valence shell in ammonia molecule

71. (c) Multiple bonds have more bond energy so $C \equiv N$ will be the strongest.
72. (c) Diamond, silicon and quartz molecule bounded by covalent bond.
73. (cd) C_2H_4 and N_2 has multiple bonds.
74. (ad) CO has only 6 electrons while PCl_5 has 10 electrons after sharing so both don't follow octet rule.
76. (a) Among these, NaH and CaH_2 are ionic hydrides and B_2H_6 and NH_3 are covalent hydrides.

Co-ordinate or Dative bonding

1. (d)

2. (b) H_2SO_4 has co-ordinate covalent bond.

3. (c) NH_3 has lone pair of electron while BF_3 is electron deficient compound so they form a co-ordinate bond.
 $NF_3 \rightarrow BF_3$

4. (d) HNO_2 does not have co-ordinate bond. Structure is
 $H-O-N=O$.

7. (a) Structure of N_2O_5 is $O=\overset{\downarrow}{N}-O-\overset{\downarrow}{N}=O$.

9. (a) SO_3^{2-} has one coordinate bond. $^-O-\overset{\downarrow}{S}-O^-$

10. (d) Co-ordinate bond is a special type of covalent bond which is formed by sharing of electrons between two atoms, where both the electrons of the shared pair are contributed by one atom. Since this type of sharing of electrons exists in O_3 , SO_3 and H_2SO_4 . Therefore all these contains coordinate bond.

12. (a) $CH_3N \equiv C$ contain dative bond.

13. (a) H_3PO_4 is orthophosphoric acid.

15. (c) Sulphuric acid contain, covalent and co-ordinate bond.

Dipole moment

1. (b) CO_2 is a symmetrical molecule so its dipole moment is zero.
2. (d) These all have zero dipole moment.
3. (d) HF has largest dipole moment because electronegativity difference of both is high so it is highly polar.
5. (c) Due to its symmetrical structure.
6. (c) Chloroform has 3 chlorine atom and one hydrogen atom attached to the carbon so it is polarised and it will show dipole moment.
8. (a) The dipole moment of two dipoles inclined at an angle θ is given by the equation $\mu = \sqrt{X^2 + Y^2 + 2XY \cos \theta}$
 $\cos 90^\circ = 0$. Since the angle increases from $90 - 180$, the value of $\cos \theta$ becomes more and more $-ve$ and hence resultant decreases. Thus, dipole moment is maximum when $\theta = 90^\circ$.

9. (c) Due to distorted tetrahedral geometry SF_4 has permanent dipole moment

10. (b) CCl_4 has no net dipole moment because of its regular tetrahedral structure.
12. (d) HF is polar due to difference of electronegativity of hydrogen and fluorine so it shows positive dipole moment.
14. (c) BCl_3 has zero dipole moment because of its trigonal planar geometry.
16. (c) Dipole moment of CH_3OH is maximum in it.
20. (b) CH_4 have regular tetrahedron so its dipole moment is zero.
22. (b) Ammonia have some dipole moment.
23. (b) Charge of $e^- = 1.6 \times 10^{-19}$
Dipole moment of $HBr = 1.6 \times 10^{-30}$
Inter atomic spacing $= 1\text{\AA} = 1 \times 10^{-10} m$
% of ionic character in
- $$HBr = \frac{\text{dipole moment of } HBr \times 100}{\text{interspace distance} \times q}$$
- $$= \frac{1.6 \times 10^{-30}}{1.6 \times 10^{-19} \times 10^{-10}} \times 100$$
- $$= 10^{-30} \times 10^{29} \times 100 = 10^{-1} \times 100 = 0.1 \times 100 = 10\%$$
25. (a) Carbon tetrachloride has a zero dipole moment because of its regular tetrahedral structure.
27. (b) BF_3 has zero dipole moment.
29. (c) Given ionic charge $= 4.8 \times 10^{-10}$ e.s.u. and ionic distance $= 1\text{\AA} = 10^{-8} cm$ we know that dipole moment = ionic charge $\times$ ionic distance $= 4.8 \times 10^{-10} \times 10^{-8}$
 $= 4.8 \times 10^{-18}$ e.s.u. per cm $= 4.8$ debye.
30. (a) Higher is the difference in electronegativity of two covalently bonded atoms, higher is the polarity. In HCl there is high difference in the electronegativity of H and Cl atom so it is a polar compound.
31. (a) Linear molecular has zero dipole moment CO_2 has linear structure so it does not have the dipole moment $O=C=O$.
32. (c) SF_6 is symmetrical and hence non polar because its net dipole moment is zero.
33. (a) Polarity create due to the difference in electronegativity of both atom in a molecule except H_2 all other molecule have the different atom so they will have the polarity while H_2 will be non polar.
34. (bd) *cis* isomer shows dipole moment while that of *trans* is zero or very low value. *Trans* 1, 2 di-chloro-2-pentene will also show dipole moment due to unsymmetry.
35. (a) % of ionic character

$$= \frac{\text{Experimental value of dipole moment}}{\text{Expected value of dipole moment}}$$

$$= \frac{1.03}{6.12} \times 100 = 16.83\% \approx 17\%$$

Polarisation and Fajan's rule

- (d) BF_3 is planar while NF_3 is pyramidal due to the presence of lone pair of electron on nitrogen in NF_3 .
- (c) H_2O is a polar molecule due to electronegativity difference of hydrogen and oxygen.
- (b) When electronegativity difference is more between two joined atoms then covalent bond becomes polar and electron pair forming a bond don't remain in the centre.
- (d) Hexane has symmetrical structure so does not have polarity.
- (c) When two identical atoms form a bond, bond is non-polar.
- (a) According to Fajan's rule, polarisation of anion is influenced by charge and size of cation more is the charge on cation, more is polarisation of anion.
- (a) When two atoms shares two electrons it is an example of covalent bond. This covalent bond may be polar or may be non-polar depends on the electronegativity difference. In given example formula is AB . So it is polar.
- (c) HCl is most polar due to high electronegativity of Cl .
- (b) NH_3 has sp^3 hybridised central atom so it is non planar.
- (d) *p*-dichloro benzene have highest melting point.
- (b) NH_4Cl has both types of bonds polar and non polar

- (b) Greater the charge of cation more will be its polarising power (according to Fajan's rule).
- (d) AlI_3 Aluminium triiodide shows covalent character. According to Fajan's rule.
- (d) As the size of anion increases, polarity character increases.
- (d) Due to the electronegativity difference.
- (a) We know that greater the difference in electronegativity of two atoms forming a covalent bond. More is its polar nature. In HF there is a much difference in the electronegatives of hydrogen and fluorine. Therefore (HF) is a polar compound.
- (c) Silicon tetrafluoride has a centre of symmetry.
- (d) BF_3 have zero dipole moment.
- (b) According to Fajan's rule largest cation and smallest anion form ionic bond.
- (b) Polarity character is due to the difference in electronegativity of two atoms or molecule.

Overlapping- σ and π bonds

- (c)
- (c) In fluorine molecule formation *p-p* orbitals take part in bond formation.

3. (b) π -bond is formed by lateral overlapping of unhybridised p - p orbitals.

5. (c) In a double bond connecting two atom sharing of 4 electrons take place as in $\text{H}_2\text{C}=\text{CH}_2$.

6. (c) $\text{C}\equiv\text{C}$ is a multiple bond so it is strongest.

9. (d) As the bond order increases, $\text{C}-\text{H}$ bond energy also increases so it will be greatest in acetylene because its B.O. is 3.

17. (d) We know that trisilylamine is sp^2 -hybridized therefore $p\pi-d\pi$ bonding is possible due to the availability of vacant d -orbitals with silicon.

19. (d) $\text{:}\ddot{\text{O}}=\text{S}=\ddot{\text{O}}\text{:}$ 5 atoms has 12 electrons in its outermost shell. One $(\text{S}-\text{O})\pi$ bond will be $(p-p)$ π bond while two $(\text{S}-\text{O})\pi$ bond will be $(p-d)$ π bond.

20. (d) Structure of P_4O_{10} is

Each phosphorus is attached to 4 oxygen atoms.

Hybridisation

1. (d) H_2O is not linear because oxygen is sp^3 hybridised in H_2O .

4. (c) CO_2 has sp -hybridization and is linear.

5. (d) $\text{No. of } e \text{ pair} = 3 + \frac{1}{2}[3 - 3] = 0$

$\text{No. of } e \text{ pair} = 3 + 0$

$\text{No. of atom bonded to the central atom} = 3$

In case of 3, 3 geometry is Trigonal planar.

6. (a) In sp^3 -hybridisation each sp^3 hybridised orbital has $1/4$ s -character.

8. (b) In ethylene both Carbon atoms are sp^2 -hybridised so 120° .

9. (d) Structure of sp^3d hybridized compound is Trigonal bipyramidal.

10. (d) In $\text{H}-\text{C}=\overset{\text{O}}{\underset{*}{\text{C}}}-\text{O}-\text{H}$ the asterisked carbon has a valency of

5 and hence this formula is not correct.

11. (d) dsp^3 hybrid orbitals have bond angles $120^\circ, 90^\circ$.

13. (a) In BeF_3^- , Be is not sp^3 -hybridised it is sp^2 hybridised.

17. (c) In molecule OF_2 oxygen is sp^3 hybridised.

18. (a) In sp^3 hybrid orbitals s -character is $1/4$ means 25%.

19. (d) XeF_4 molecule has 'Xe' sp^3d^2 hybridised and its shape is square planar.

20. (b) The bond angle is maximum for sp hybridisation because two sp hybridised orbitals lies at angle of 180° .

21. (c) $\text{C}_2\text{H}_4\text{Br}_2$ has all single bonds so $\text{C}-\text{H}$ bond distance is the largest.

23. (a) In methane molecule C is sp^3 hybridised so its shape will be tetrahedral.

24. (c) In compound $\text{}^3\text{CH}_2 = \overset{2}{\text{C}} = \overset{1}{\text{CH}_2}$ the second carbon sp -hybridised.

25. (a) $\text{:}\ddot{\text{Cl}}\text{:}\ddot{\text{Cl}}\text{:}$ is the correct electronic formula of Cl_2 molecule because each chlorine has 7 electrons in its valence shell.

26. (a) XeF_4 has sp^3d^2 hybridisation, its shape is square planar.

27. (b) In HCHO , carbon is sp^2 hybridized

28. (c) Because of the triple bond, the carbon-carbon bond distance in ethyne is shortest.

29. (b) The hybridisation of Ag in complex $[\text{Ag}(\text{NH}_3)_2]^+$ will be sp because it is a Linear complex.

30. (a) Structure of CO_2 is linear $\text{O}=\text{C}=\text{O}$ while that of H_2O is $\text{H}-\overset{\text{O}}{\text{C}}-\text{H}$ i.e. bent structure so in CO_2 resultant dipole moment is zero while that of H_2O has some value.

31. (d) CO_2 is not sp^3 hybridised, it is sp hybridised.

32. (a) As compare to pure atomic orbitals, hybrid orbitals have low energy.
33. (d) $\overset{sp^2}{CH_2} = \overset{sp}{C} = \overset{sp^2}{CH} - \overset{sp^3}{CH_3}$ 1, 2-butadiene.
36. (b) CCl_4 is sp^3 hybridised so bond angle will be approximately 109° .
40. (b) Ethene has sp^2 hybridised carbon so bond angles are 120° .
44. (a) Acetate ion is $CH_3 - \overset{\text{O}}{\underset{\text{O}^-}{\text{C}}}$ i.e. one C-O single bond and one C=O double bond.
46. (c) Benzene has all carbons sp^2 hybridised and planar in shape.
47. (d) In methane C is sp^3 hybridized and bond angle is 109° .
56. (d) $\begin{array}{ccccc} & H & H & H & \\ & | & | & | & \\ H & - C & - C & - C & - H \\ & | & | & | & \\ & H & H & H & \end{array}$
There are 10 shared pairs of electrons.
58. (a) The diborane molecule has two types of B-H bond :
(i) B-H_t - It is a normal covalent bond.
(ii) B-H_b - It is a three centred bond.
-
61. (b) PF_5 involves sp^3d hybridization and hence has trigonal bipyramidal structure.
62. (c) s -character in $sp = \frac{1}{2} \times 100 = 50\%$
 s -character in $sp^2 = \frac{1}{3} \times 100 = 33.3\%$
 s -character in $sp^3 = \frac{1}{4} \times 100 = 25\%$
Hence, maximum s -character is found in sp -hybridisation.
63. (b) The molecule of PCl_5 has sp^3d hybridisation, structure is trigonal bipyramidal.
64. (b) Merging (mixing) of dissimilar orbitals of different energies to form new orbitals is known as hybridisation and the new orbital formed are known as hybrid orbitals. They have similar energy.
65. (b) In SO_3 sulphur is sp^2 hybridized so its shape will be trigonal planar.
66. (a) These all are triangular with sp^2 hybridization.
67. (c) Bond length depends upon bond order and in benzene all C-C bonds have same bond order.
68. (b) In C_2H_2 each carbon has sp -hybridization
 $\overset{sp}{H} - \overset{sp}{C} \equiv C - \overset{sp}{H}$
70. (a) As p -character increases the bond angle decreases.
In sp - p -character $\frac{1}{2}$, bond angle - 180°
In sp^2 - p -character $\frac{2}{3}$, bond angle - 120°
In sp^3 - p -character $\frac{3}{4}$, bond angle - 109°
71. (a) sp^3 -hybridization called tetrahedral because it provides tetrahedral shape to the molecule.
72. (a) S-atom in SF_6 has sp^3d^2 hybridisation. So, the structure of SF_6 will be octahedral.
74. (b) Structure of H_2O_2 is non-planar. It has open book structure.
75. (d) Structure of N_2O is similar to CO_2 both have linear structure.
78. (a) $SnCl_2$ is V-shaped.
79. (d) In NH_4^+ nitrogen is sp^3 hybridised so 4 hydrogen situated at the corners of a tetrahedron.
81. (c) Increasing order of bond angle is $\underset{109^\circ}{sp^3} < \underset{120^\circ}{sp^2} < \underset{180^\circ}{sp}$.
84. (a) NH_4^+ has sp^3 -hybridized nitrogen so its shape is tetrahedral.
86. (b) Bond angle increases with change in hybridisation in following order $sp^3 < sp^2 < sp$.
88. (c) In Diborane boron shows sp^3 -hybridization.
89. (a) Alkene does not show linear structure but it has planar structure due to sp^2 -hybridisation.
90. (c) Generally SF_4 consist of 10 electrons, 4 bonding electron pair and one lone pair of electron, hence it shows sp^3d hybridization.
92. (c) Atom/Ion Hybridisation
 NO_2^+ sp
 SF_4 sp^3d with one lone pair of electron
 PF_6^- sp^3d^2
93. (a) PF_3 consist of three bonding pair electrons and one lone pair of electron hence it shows sp^3 -hybridization.
94. (b) NO_2^+ shows sp -hybridization. So its shape is linear.
95. (c) Generally octahedral compound show sp^3d^2 -hybridization.
96. (a) In fifth group hydride bond angle decreases from top to bottom
 $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$.
97. (b) Generally NH_4^+ shows sp^3 hybridization.
98. (b) We know that single, double and triple bond lengths of carbon in carbon dioxide are $1.22 \text{ \AA}$, $1.15 \text{ \AA}$ and $1.10 \text{ \AA}$ respectively.
99. (b) It shows sp^2 -hybridization so it is planar.
101. (a) Bond angle of hydrides decreases down the group.

102. (b) Hybridization of N in NH_3 is sp^3 that of Pt in $[PtCl_4]^{2-}$ is dsp^2 that P in PCl_5 is sp^3d and that of B in BCl_3 is sp^2 .

103. (d) NH_4^+ and SO_4^{2-} both show sp^3 -hybridization and tetrahedral structure.

104. (a) It is shows sp^3d^3 -hybridization. Hence the bond angle is about 72° .

107. (a) s -character increases with increase in bond angle.

Hybridization	$s\%$	Angle
sp	50	180°
sp^2	33.3	120°
sp^3	25	109.28°
sp^3d^1	20	90° and 120°

108. (b) IF_7 molecule show sp^3d^3 -hybridization.

110. (a) PCl_3 contain three bonding and one lone pair electron. Hence shows sp^3 -hybridization.

111. (a) Ammonia and $(BF_4)^{-1}$ shows sp^3 -hybridization.

112. (b) For square planar geometry hybridization is dsp^2 involving s, p_x, p_y and $d_{x^2-y^2}$ orbital.

113. (b) All carbon atoms of benzene consist of alternate single and double bond and show sp^2 hybridization.

116. (c) BCl_3 molecule show sp^2 -hybridization and planar structure.

117. (c) BCl_3 Boron trichloride molecule show sp^2 -hybridization and trigonal planar structure.

118. (b) SO_2 molecule shows sp^2 -hybridization and bent structure.

119. (c) Due to multiple bonding in N_2 molecule.

120. (a) % of s -character in

$$CH_4 = \frac{100}{4} = 25, \quad C_2H_4 = \frac{100}{3} = 33, \quad (sp^3) \quad (sp^2)$$

$$C_2H_2 = \frac{100}{2} = 50 \quad (sp)$$

121. (a) Acidic character increases when we come down a group, so HI is the strongest acid.

122. (c) SO_2 has sp^2 hybridization have the V shape structure ($<120^\circ$) due to 2 lone pair of electron over S atom. CO_2 and N_2O have the sp hybridization.

123. (a) In H_2CO_3 and BF_3 central atom are in sp^2 hybridization but in H_2CO_3 due to the ionic character of $O-H$ bond it will be polar (High electronegativity of oxygen).

124. (a) Due to sp^3 hybridization and presence of lone pair of electron on p atom PCl_3 are of pyramidal shape like that of NH_3 .

125. (b) There is sp hybridization in C_2H_2 so it has the linear structure.

126. (c) In octahedral molecule six hybrid orbitals directed towards the corner of a regular octahedron with a bond angle of 90° .

according to this geometry, the number of $X-M-X$ bond at 180° must be three.

127. (d) sp^3d^2 hybrid orbital have octahedral shape

128. (c) In the formation of d^2sp^3 hybrid orbitals two $(n-1)d$ orbitals of e.g., set [i.e., $(n-1)dz^2$ and $(n-1)d_{x^2-y^2}$ orbitals] one ns and three np [np_x, np_y and np_z] orbitals combine together and form six d^2sp^3 hybrid orbitals.

129. (c) The correct order of bond angle (Smallest first) is

$$92.6^\circ < 107^\circ < 109^\circ 28' < 120^\circ$$

130. (a)

Square planar

Regular tetrahedral

See saw shaped

Square planar

131. (b)

132. (b) In the formation of BF_3 molecule, one s and $2p$ orbital hybridise. Therefore it is sp^2 hybridization.

133. (e) In NCl_3 and H_2S the central atom of both (N and S) are in sp^3 hybridization state

while in BF_3 and NCl_3 central atoms are in sp^2 and sp^3 hybridization respectively. In H_2S and $BeCl_2$ central atom are in sp^3 and sp^2 hybridization. In BF_3 , NCl_3 & H_2S central atom are in sp^2 , sp^3 & sp^3 hybridization and in the central atom are in sp^3 and sp hybridization.

134. (c) $C_{\text{ground state}} = 2s^2, 2p_x^1 p_y^1$; $C_{\text{excited state}} = 2s^1, 2p_x^1 p_y^1 p_z^1$
 $O_{\text{ground state}} = 2s^2, 2p_x^2 p_y^1 p_z^1$

In the formation of CO_2 molecule, hybridization of orbitals of carbon occur only to a limited extent involving only one s and one p orbitals there is thus sp hybridisation of valence shell orbitals of the carbon atom resulting in the formation of two sp hybrid orbitals.

135. (d) In NH_3 , N undergoes sp^3 hybridization. Due to the presence of one lone pair, it is pyramidal in shape.

136. (b) NO_2 SF_4 PF_6^-
 sp sp^3d sp^3d^2

137. (b) The configuration of ${}_5B = 1s^2, 2s^2, 2p^1$

138. (d) In SO_3 molecule, S atom remains sp^2 hybrid, hence it has trigonal planar structure

139. (a) In PCl_3 molecule, phosphorous is sp^3 - hybridised but due to presence of lone pair of electron, it has pyramidal structure

140. (a) The electronic configuration of

$I = [Xe] 5s^2, 5p^5$ hence

I_7 shows sp^3d^2 hybridization. So, its structure is pentagonal bipyramidal.

141. (a) Compound containing highly electronegative element (F , O , N) attached to an electropositive element (H) show hydrogen bonding. Fluorine (F) is highly electronegative and has smaller size. So hydrogen fluoride shows the strongest hydrogen bonding in the liquid phase.

142. (b) In the ammonia molecule N atom is sp^3 - hybridized but due to the presence of one lone pair of e^- (i.e. due to greater $L_p - b_p$ repulsion) it has distorted tetrahedral (or pyramidal) geometry.

143. (a) ${}_4Be \rightarrow 1s^2, 2s^2, 2p^0$

144. (a) Except CO_3 other choice CO_2 , CS_2 and $BeCl_2$ have sp -hybridization and shows the linear structure while CO_3 have sp^3 hybridization and show the non linear structure because sp^3 generate tetrahedral structure.

145. (a) dsp^3 or sp^3d hybridization exhibit trigonal bipyramidal geometry e.g., PCl_5

146. (b) Carbon has only two unpaired electrons by its configuration but hybridization is a concept by which we can explain its valency 4.

147. (c) Hybridization is due to overlapping of orbitals of same energy content.

- 34.** (a) Bond angle decreases from H_2O to H_2Te .

26. (c) It shows sp^2 -hybridization and show trigonal planar structure.

35. (c) BF_3 does not contain lone pair of electron.

36. (b)

Bent T-shaped geometry in which both lone pairs occupy the equatorial position of the trigonal bipyramidal here

$(l_p - l_p)$ repulsion = 0

$(l_p - b_p)$ repulsion = 4 and

$(b_p - b_p)$ repulsion = 2

37. (b) The overall value of the dipole moment of a polar molecule depends on its geometry and shape *i.e.*, vectorial addition of dipole moment of the constituent bonds water has angular structure with bond angle 105° as it has dipole moment. However BeF_2 is a linear molecule since dipole moment summation of all the bonds present in the molecule cancel each other.

38. (d) BCl_3 , BBr_3 and BF_3 , all of these have same structure *i.e.* trigonal planar (sp^2 hybridization) Hence bond angle is same for all of them (*i.e.*, equal to 120°)

39. (d) We know that molecule of (NH_3) has maximum repulsion due to lone pair of electron. Its shape is pyramidal and is sp^3 hybridization.

40. (b)

As the electronegativity of central atom decreases bond angle is decreases

$\therefore NH_3$ has largest bond angle.

41. (c) In NH_3 , sp^3 -hybridization is present but bond angle is $106^\circ 45'$ because Nitrogen has lone pair of electron according to VSEPR theory due to $bp-lp$ repulsion bond angle decreases from $109^\circ 45'$ to $106^\circ 45'$.

42. (a) Bond strength decreases as the size of the halogen increases from F to I .

43. (b) NH_3 has pyramidal structure, yet nitrogen is sp^3 hybridised. This is due to the presence of lone pair of electron.

44. (c) SiF_4 has symmetrical tetrahedral shape which is due to sp^3 hybridization of the central sulphur atom in its excited state configuration. SF_4 has distorted tetrahedral or See-Saw geometry which arise due to sp^3d hybridization of central sulphur atom and due to the presence of lone pair of electron in one of the equatorial hybrid orbital.

45. (d)

dsp^2 hybridization
(Four 90° angles between bond pair and bond pair)

sp^3d hybridization
(Six 90° angle between bond pair and bond pair)

sp^3d^2 hybridization
(Twelve 90° angle between bond pair and bond pair)

Molecular orbital theory

2. (c) $B.O. = \frac{\text{No. of bonding } e^- - \text{No. of antibonding } e^-}{2}$

$$= \frac{8-3}{2} = \frac{5}{2} = 2.5.$$

3. (b) One bonding M.O. and one anti-bonding M.O.

4. (b) O_2^{2-} is least stable.

5. (c) B.O. of O_2 is 2, B.O. of O_2^{-1} is 1.5, B.O. of O_2^{+1} is 2.5 and of O_2^{2-} is 1.

6. (d) Hydride of boron does not exist in BH_3 form. It is stable as its dimer di borane (B_2H_6).

10. (c) $O_2^- (2 \times 8 + 1 = 17)$ has odd number of electrons and hence it is paramagnetic. All the remaining molecules/ions, *i.e.*,

$CN^- (6 + 7 + 1 = 14)$ diamagnetic

$NO (7 + 8 = 15)$ has odd number of electrons and hence it is paramagnetic.

11. (c) $B.O. = \frac{\text{No. of } N_b - \text{No. of } N_a}{2} = \frac{5}{2} = 2.5.$

12. (b) Bond order of O_2^+ is highest so its bond length is smallest.

13. (c) Oxygen is paramagnetic due to the presence of two unpaired electron :

$$O_2 = \sigma(1s)^2 \sigma^*(1s)^2 \sigma(2s)^2 \sigma^*(2s)^2$$

$$\sigma(2p_x)^2 \pi(2p_y)^2 \pi(2p_x)^2 \pi^*(2p_y)^1 \pi^*(2p_z)^1$$

17. (d) In CH_3CN bond order between C and N is 3 so its bond length is minimum.

18. (b)

	He_2^+	H_2	H_2^+	H_2^-
$\sigma(1s)$	$\uparrow\downarrow$	$\uparrow\downarrow$	$\uparrow$	$\uparrow\downarrow$
$\sigma^*(1s)$	$\uparrow$	—	—	$\uparrow$
B.O.	$\frac{1}{2}$	1	$\frac{1}{2}$	$\frac{1}{2}$
Magnetic nature	P	D	P	P

(P = Paramagnetic, D = Diamagnetic)

19. (c) Due to unpaired e^- ClO_2 is paramagnetic.

20. (c) The Bond order in N_2 molecule is 3, $N \equiv N$ Here,
 $N_b = 2 + 4 + 2 = 8$ and $N_a = 2$
 $\therefore B.O. = (8 - 2)/2 = 3.$

21. (d) H_2^+ has the bond order $\frac{1}{2}$, it has only one electron so it will be paramagnetic.

22. (c) When bond forms between two atom then their energy get lower than that of separate atoms because bond formation is an exothermic process.

23. (b) Valency of A is 3 while that of B is 2 so according to Criss Cross rule the formula of the compound between these two will be A_2B_3 .

24. (c) Due to resonance bond order of $C-C$ bonds in benzene is between 1 and 2.

25. (a) Nitrogen does not have vacant 'd-orbitals' so it can't have +5 oxidation state i.e. the reason PCl_5 exists but NCl_5 does not.
26. (d) Molecules having unpaired electrons show paramagnetism.
27. (b) NO_2 has unpaired electrons so it would be paramagnetic.
30. (c) Helium molecule does not exist as bond order of $He_2 = 0$.
31. (c) Structure of P_4O_{10} is

Each phosphorus is attached to 4 oxygen atoms.

33. (c) B.O. of carbon = $\frac{N_b - N_a}{2} = \frac{8 - 4}{2} = 2$.
34. (a) B.O. = $\frac{N_b - N_a}{2} = \frac{10 - 4}{2} = 3$.
37. (b) B.O. = $\frac{N_b - N_a}{2} = \frac{8 - 3}{2} = \frac{5}{2} = 2.5$.
38. (a) Electronic configuration of O_2 is
 $O_2 = \sigma(1s)^2 \sigma^*(1s)^2 \sigma(2s)^2 \sigma^*(2s)^2 \sigma(2p_x)^2 \pi(2p_y)^2 \pi(2p_z)^2 \pi^*(2p_y)^1 \pi^*(2p_z)^1$
 The molecule has two unpaired electrons. So, it is paramagnetic.
40. (c) $\pi^* 2p_y$ has two nodal planes.
42. (a) Element with atomic number 26 is Fe. It is a ferromagnetic.
43. (b) Correct Sequence of bond order is
 $O_2^+ > O_2 > O_2^{2-}$
 B.O. = 2.5 2 1.5
44. (a) Due to small bond length.
45. (a) S^{-2} has all paired electrons so it is diamagnetic.
46. (c) NO has 15 electrons.
47. (b) In the conversion of O_2 into O_2^- bond order decreases.
49. (c) O_2^{2-} does not have any unpaired electron so it is diamagnetic.
50. (a) O_2^{2-} consists of four antibonding electron pairs [1s and 2s have two antibonding and $2p_x 2p_y$ have two antibonding electron pairs].
51. (c) The electron's distribution in molecular orbitals is $1s^2, 2s^1$
 B.O. = $\frac{2 - 1}{2} = \frac{1}{2} = 0.5$.
52. (b) ClO_2^- has all paired electrons hence it does not show paramagnetism.
53. (a) B.O. = $\frac{1}{2}[N_b - N_a]$
 $N_2 = \frac{1}{2}[10 - 4] = \frac{6}{2} = 3$; $O_2^{2+} = \frac{1}{2}[10 - 4] = \frac{6}{2} = 3$.
54. (a) B.O. for $N_2^+ = \frac{1}{2}[N_b - N_a] = \frac{1}{2}[9 - 4] = \frac{5}{2} = 2.5$.

55. (a) H_2O_2 contains bond angle between two $O-H$ planes about 90° .
56. (c) Nitrogen molecule has highest bond energy due to presence of triple bond.
57. (c) $Cu^{2+} = [Ar_{18}] 3d^9 4s^0$ it has one unpaired electron so it is paramagnetic.
59. (a) $CN^- = 14$ electrons; $CO = 14$ electrons
 B.O. = $\frac{1}{2}[10 - 4] = \frac{6}{2} = 3$.
60. (a) B.O. = $\frac{1}{2}[10 - 5] = \frac{5}{2} = 2.5$, paramagnetic
61. (a)
64. (c) The paramagnetic property in oxygen came through unpaired electron which can be explained by molecular orbital theory.

65. (a) Bond order = $\frac{\text{Total number of bonds between atoms} - \text{Total number of antibonding electrons}}{2}$
 $= \frac{5}{4} = 1.25$
66. (c) We know that carbonate ion has following resonating structures
-
- Bond order = $\frac{\text{Total number of bonds between atoms}}{\text{Total number of resonating structures}}$
 $= \frac{1 + 1 + 2}{3} = \frac{4}{3} = 1.33$.
67. (a) $O_2^+(15e^-) = K : K^* (\sigma 2s)^2 (\sigma^* 2s)^2 (\sigma 2p_x)^2 (\pi 2p_y)^2 (\pi 2p_z)^2 (\pi^* 2p_y)^1 (\pi^* 2p_z)^0$
 Hence, bond order = $\frac{1}{2}(10 - 5) = 2.5$
 $N_2^+(13e^-) = KK^* (\sigma 2s)^2 (\sigma^* 2s)^2 (\sigma 2p_x)^2 (\pi 2p_y)^2 (\pi 2p_z)^1$
 Hence, bond order = $\frac{1}{2}(9 - 4) = 2.5$.
68. (a) Electronic configuration of O_2 is

$$O_2 = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\sigma 2s)^2 (\sigma 2p_z)^2$$

$$(\pi 2p_x^2 \equiv \pi 2p_y^2) (\pi^* 2p_x^1 \equiv \pi^* 2p_y^1)$$

$$\text{Hence bond order} = \frac{1}{2} [N_b - N_a] = \frac{1}{2} [10 - 6] = 2.$$

69. (c) Nitrogen form triple bond $N \equiv N$

In which 6 electron take part.

70. (a) As bond order increase bond length decrease the bond order of species are

$$= \frac{\text{number of bonding electron} - \text{Number of a.b. electron}}{2}$$

$$\text{For } O_2 = \frac{10 - 6}{2} = 2;$$

$$O_2^+ = \frac{10 - 5}{2} = 2.5$$

$$O_2^- = \frac{10 - 7}{2} = 1.5$$

So, bond order $O_2^+ > O_2 > O_2^-$ and bond length are $O_2^+ > O_2 > O_2^-$.

71. (b) $O_2 : \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_x^2 \left\{ \begin{array}{l} \pi 2p_y^2 \\ \pi 2p_z^2 \end{array} \right\} \left\{ \begin{array}{l} \pi^* 2p_y^1 \\ \pi^* 2p_z^1 \end{array} \right\}$

$$\text{Bond order} = \frac{10 - 6}{2} = 2.0$$

(Two unpaired electrons in antibonding molecular orbital)

$$O_2^+ : \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_x^2 \left\{ \begin{array}{l} \pi 2p_y^2 \\ \pi 2p_z^2 \end{array} \right\} \left\{ \begin{array}{l} \pi^* 2p_y^1 \\ \pi^* 2p_z^0 \end{array} \right\}$$

$$\text{Bond order} = \frac{10 - 5}{2} = 2.5$$

(One unpaired electron in antibonding molecular orbital so it is paramagnetic)

72. (b) Higher the bond order, shorter will be the bond length, thus NO^+ having the higher bond order that is 3 as compared to NO having bond order 2 so NO^+ has shorter bond length.

73. (d) Oxygen molecule (O_2) boron molecule (B_2) and N_2^+ ion, all of them have unpaired electron, hence they all are paramagnetic.

74. (c) Bond order of NO^+ , NO and NO^- are 3, 2.5 and 2 respectively, bond energy $\propto$ bond order

75. (a) Paramagnetic property arise through unpaired electron. B_2 molecule have the unpaired electron so it show paramagnetism.

$$B_2 \rightarrow \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \pi 2p_x^1 = \pi 2p_y^1$$

(2 unpaired electron)

$$C_2 \rightarrow \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \pi 2p_x^2, \pi 2p_y^2$$

(No unpaired electron)

$$N_2 \rightarrow \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \sigma 2p_x^2, \pi 2p_y^2, \pi 2p_z^2$$

(No unpaired electron)

$$F_2 \rightarrow \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \sigma 2p_x^2, \pi 2p_y^2, \pi 2p_z^2$$

(No unpaired electron)

$$\pi^* 2p_y^2, \pi^* 2p_z^2$$

So only B_2 exist unpaired electron and show the paramagnetism.

76. (b) $O_2 \rightarrow \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 \left\{ \begin{array}{l} \pi 2p_y^2 \\ \pi 2p_z^2 \end{array} \right\} \left\{ \begin{array}{l} \pi^* 2p_y^1 \\ \pi^* 2p_z^1 \end{array} \right\}$

So two unpaired electron found in O_2 at ground stage by which it shows paramagnetism.

77. (b) Due to greater electron affinity Cl_2 has the highest bond energy.

78. (a) Molecular orbital electronic configuration of these species are :

$$O_2^-(17e^-) = \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \sigma 2p_x^2, \pi 2p_y^2,$$

$$\pi 2p_z^2, \pi^* 2p_y^2, \pi^* 2p_z^1$$

$$O_2(16e^-) = \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \sigma 2p_x^2, \pi 2p_y^2,$$

$$\pi 2p_z^2, \pi^* 2p_y^1, \pi^* 2p_z^1$$

$$O_2^{2-}(18e^-) = \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \sigma 2p_x^2, \pi 2p_y^2,$$

$$\pi 2p_z^2, \pi^* 2p_y^2, \pi^* 2p_z^2$$

Hence number of antibonding electrons are 7, 6, and 8 respectively.

79. (c) Species with unpaired electrons is paramagnetic O_2 has 2 unpaired electrons, O_2^- has one unpaired, O_2^{2-} has zero unpaired electrons, O_2^+ has one unpaired.

80. (a) O_2 has 2 unpaired electron while O_2^+ and O_2^- has one each unpaired electrons while O_2^{2+} does not have any unpaired electron.

81. (c) $H-O-O-H, O \leftarrow O=O, O=O$

Due to resonance in O_3 $O-O$ bond length will be in b/w $O=O$ and $O-O$.

82. (a) From valency bond theory, bond order in CO , i.e. $:\bar{C} \equiv \bar{O}:$ is 3, that of $O=C=O$ is 2 while that of CO_3^{2-} ion is 1.33. Since the bond length increases as the bond order decreases, i.e. $CO < CO_2 < CO_3^{2-}$.

83. (c) $N_2 : KK\sigma(2s)^2 \sigma^*(2s)^2 \pi(2p_x)^2 \pi(2p_y)^2 \sigma(2p_z)^2$ (diamagnetic)

$$C_2 : KK\sigma(2s)^2 \sigma^*(2s)^2 \pi(2p_x)^2 \pi(2p_y)^2$$

(diamagnetic)

$$N_2^+ : KK\sigma(2s)^2 \sigma^*(2s)^2 \pi(2p_x)^2 \pi(2p_y)^2 \sigma(2p_z)^2$$

(paramagnetic)

$$O_2^{2-} : KK\sigma(2s)^2 \sigma^*(2s)^2 \sigma(2p_z)^2 \pi(2p_x)^2 \pi(2p_y)^2$$

$\pi^*(2p_x)^2 \pi^*(2p_y)^2$ (diamagnetic)

84. (d) $NH_3 = 107^\circ, PH_3 = 93^\circ, H_2O = 104.5^\circ$
 $H_2Se = 91^\circ, H_2S = 92.5^\circ$

Hydrogen bonding

1. (d) Hydrogen bonding will be maximum in $F-H$ bond due to greater electronegativity difference.
2. (b) Ice has hydrogen bonding.
3. (b) $H-F$ has highest boiling point because it has hydrogen bonding.
6. (d) CO_2 is sp -hybridised
7. (b) sp -hybridization gives two orbitals at 180° with Linear structure.
8. (d) Hydrogen bonding increases the boiling point of compound.
9. (c) o -Nitrophenol has intramolecular hydrogen bonding but p -Nitrophenol has intermolecular hydrogen bonding so boiling point of p -Nitrophenol is more than o -Nitrophenol.
10. (c) The strongest hydrogen bond is in hydrogen fluoride because the power of hydrogen bond $\propto$ electronegativity of atom and

$$\text{electronegativity} \propto \frac{1}{\text{atomic size}}$$

So fluorine has maximum electronegativity and minimum atomic size.
11. (d) H_2O can form hydrogen bonds rest CH_4 and $CHCl_3$ are organic compound having no oxygen while $NaCl$ has itself intraionic attraction in the molecule.
12. (b) PH_3 has the lowest boiling point because it does not form Hydrogen bond.
14. (b) Hydrogen bonding increases heat of vaporisation.
15. (d) Only NH_3 forms H-bonds.
22. (a) Water molecule has hydrogen bonding so molecules get dissociated so it is liquid.
23. (d) In case of water, five water molecules are attached together through four hydrogen bonding.
25. (c) Hydrogen bond is strongest in hydrogen fluoride.
28. (c) Boiling point of H_2O is more than that of H_2S because H_2O forms hydrogen bonding while H_2S does not.
30. (c)  Interamolecular H -bonding.
31. (a) Hydrogen bond is formed when hydrogen is attached with the atom which is highly electronegative and having small radius.
34. (a) Water is dense than ice because of hydrogen bonding interaction and structure of ice.
35. (a) Ethanol have hydrogen bonding so its boiling point is higher than its isomer dimethyl ether.
36. (a) A compound having maximum electronegative element will form strong Hydrogen bond.
37. (a) Due to electronegativity difference of N_2 and H_2 , NH_3 form hydrogen bond.
38. (b) Intermolecular hydrogen bonding compound contain more b.p. compare to intramolecular hydrogen bonding compound.
39. (d) Water molecule contain hydrogen bonding.
40. (c) It contain intermolecular hydrogen bonding.
41. (b) Ethyl alcohol has a intermolecular hydrogen bond.
43. (b) HCl contain weak covalent bond.
45. (c) Due to intermolecular hydrogen bonding water molecules come close to each other and exist in liquid state.
46. (b) Due to greater resonance stabilization.

47. (d) C_2H_5OH will dissolve in water because it forms hydrogen bond with water molecule.
48. (b) In ice cube all molecules are held by inter molecular hydrogen bond.
49. (d) Hydrogen bonding is developed due to inter atomic attraction so it is the weakest.

Types of bonding and Forces in solid

1. (b) In electrovalent crystal has cation and anion are attached by electrostatic forces.
2. (d) Mercury has very weak interatomic forces so it remains in liquid state.
3. (c) The melting and boiling points of argon is low hence, in solid argon atoms are held together by weak Vander Waal's forces.
4. (c) NaF is the strongest ionic crystal so its melting point would be highest.
9. (b) Diamond is the hardest substance it's melting point would be highest.
10. (c) Bond is formed by attractive and repulsive forces of both the atoms.
12. (a) Generally zero group elements are linked by the Vander Waal's force. Hence these show weakest intermolecular forces.
13. (d) Glycerol has a three OH group hence it is viscous in nature.
14. (c) Vander waal's forces is the weakest force of attraction.
16. (b) NH_4^+ contain all three types of bond in its structure

$$\left[\begin{array}{c} H \\ | \\ H - N \rightarrow H \\ | \\ H \end{array} \right]^+$$
17. (d) In $NaOH$ covalent bond is present in $O-H$ bond while ionic bond is formed between OH^- and Na^+ .
18. (a) Bond formation is an exothermic reaction so there is decrease in energy of product.
22. (d) Blue vitriol is $CuSO_4 \cdot 5H_2O$ and it has all types of bonds.

23. (a) $\left[\begin{array}{c} H \\ | \\ H - N \rightarrow H \\ | \\ H \end{array} \right]^+ Cl^-$
 Ionic bond = 1, Covalent bond = 3
 Co-ordinate bond = 1.

Critical Thinking Questions

1. (d) We know that ionic characters

$$= 16[E_A - E_B] + 3.5 \times [E_A - E_B]^2$$
 or ionic characters = 72.24%
3. (c) Configuration of O_2 molecule is

$$[\sigma(1s)^2 \sigma^*(1s)^2 \sigma(2s)^2 \sigma^*(2s)^2 \pi(2p_x)^2 \pi(2p_y)^2 \sigma(2p_z)^2 \pi^*(2p_x)^1 \pi^*(2p_y)^1]$$
 No. of pair are 7 so total no. of paired electrons are 14.
6. (a) $\begin{array}{c} \cdot\cdot \\ H - O : + H^+ \rightarrow H - \overset{\cdot\cdot}{O} \rightarrow H \\ | \qquad \qquad | \\ H \qquad \qquad H \end{array}$
7. (b) The correct order of increasing dipole moment is

p-dichlorobenzene < Toluene < *m*-dichlorobenzene < *o*-dichlorobenzene.

8. (a) The dipole moment of $CH_4 = 0D$, $NF_3 = 0.2D$, $NH_3 = 1.47D$ and $H_2O = 1.85D$. Therefore the correct order of the dipole moment is $CH_4 < NF_3 < NH_3 < H_2O$.
10. (d) Ammonia molecule is more basic than nitrogen trifluoride and Boron trifluoride because ammonia molecule easily gives lone pair of electron.
11. (a) Chlorine atom in ClO_2^- is sp^3 hybridised but its shape is angular.
12. (c) $[NF_3]$ and $[H_3O^+]$ are pyramidal while $[NO_3^-]$ and $[BF_3]$ are planar. Hence answer (c) is correct.
13. (d) $CH_2 = \underset{\substack{sp^2 \\ \text{hybridised}}}{CH} - \underset{\substack{sp^3 \\ \text{hybridised}}}{CH_2} - C \equiv CH$
14. (d) B.O. in CO i.e., $\overset{+}{C} \equiv \overset{-}{O} :$ is 3, that of $O = C = O$ is 2 while that of CO_3^{2-} ion is 1.33. Since the bond length increases as the bond order decreases i.e. $CO < CO_2 < CO_3^{2-}$. Thus option (d) is correct.
15. (b) Dichromate dianion has following structure

6, $Cr-O$ bonds are equivalent.

17. (b) ClF_3 is a $[AB_3]$ type of molecule because it consists of three bonding pair and two lone pair of electrons hence this compound shows sp^3d hybridization.
20. (a) BeF_3^- does not show sp^3 -hybridization because this compound is not formed.
21. (a) $K_3[Fe(CN)_6]$

$$Fe_{26} = 4s^2 3d^6$$

$$Fe^{3+} = 3d^5 4s^0$$

Unpaired electron

d^2sp^3 -hybridization

22. (d) N_2^+ has one unpaired electron so it would be paramagnetic.
23. (a) Each of the species has 14 electron so isoelectronic and shows bond order 3.

$$B.O. = \frac{1}{2}[N_b - N_a] = \frac{1}{2}[10 - 4] = \frac{6}{2} = 3.$$

24. (d)

Trimer of SO_3 .

27. (c) $CuSO_4 \cdot 5H_2O$ has electrovalent, covalent and coordinate bonds.

Assertion & Reason

1. (a) Solubility in water depends on hydration energy and lattice energy.
2. (a) Polarity in covalent bond developed due to shifting of electrons towards one of the bonded atoms.
5. (c) SiF_4 have sp^3 hybridization & shape of regular tetrahedral where the bond angle of $F-S-F$ are found 109.5° which is greater than 90° but less than 180° . Repulsion sequence are $Lp-Lp > Lp-Bp > Bp-Bp$ so assertion are true but the reason are false.
9. (c) N_2 molecule is diamagnetic. The diamagnetic character is due to the presence of paired electron N_2 molecule does not contain any unpaired electron. Thus, assertion is correct but the reason is false.
10. (a) It is correct that during formation of ice from water there are vacant spaces between hydrogen bonded molecules of ice. Ice has a cage like structure. Due to this reason ice is less dense than liquid water. hence both assertion & reason are true & reason are the correct explanation of assertion.
11. (b) Water is liquid while H_2S is gas because oxygen is of small size & more electronegative in comparison to sulphur. Hence water molecules exist as associated molecules to form liquid state due to hydrogen bonding H_2S does not have hydrogen bonding & can't associated hence it is gas.
12. (d) Iodine is more soluble in CCl_4 than in H_2O because iodine is non polar & thus it dissolves in CCl_4 because like dissolves like.
13. (a) *o* & *p*-nitrophenols can be separated by steam distillation because *o*-nitrophenol is steam volatile. Here, both assertion & reason are correct & reason is correct explanation of assertion.
14. (e) Fluorine is highly reactive $F-F$ bond has low bond dissociation energy. Here assertion is false but reason is true.
15. (c) It is true that sigma (σ) bond is stronger than pi (π) bond but the reason that there is free rotation of atoms is false.
16. (c) Energy is released in the formation of the crystal lattice. It is qualitative measure of the stability of an ionic compound so assertion is true & reason are false.
17. (c) Li, Na & K are alkali metals & not alkaline earth metal so, size of alkali metal increases So. Assertion is true & reason are false.
18. (b) Hess's law states that the enthalpy of a reaction is the same, whether it takes place in a single step or in more than one step. In born haber cycle the formation of an ionic compound may occur either by direct combination of the element or by a stepwise process involving vaporization of elements, conversion of the gaseous atoms into ions & the combination of the gaseous ions to form the ionic solid.

19. (a) With increase in bond order, bond length decreases & hence bond energy increases so both assertion & reason are true & reason are the correct explanation of assertion.
20. (c) Electron affinity is experimentally measurable while electronegativity is a relative number so assertion is true but reason are false.
21. (b) Assertion & reason both are correct but reason is not the correct explanation of assertion sulphur has five electrons pairs whose arrangement should be trigonal bipyramidal according to VSEPR theory. Two structure are possible

(a)
Lone pair in the axial position (three l.p - b.p repulsion at 90°)

(b)
Lone pair in the equatorial position (two L.p - b.p repulsion)

22. (e) BF_3 has zero dipole moment because of its structure.

H_2S has two lone pairs on sulphur atom & hence. It has irregular shape.

Thus it possess dipole moment. So assertion is false but reason are true.

23. (d) Both assertion & reason are false because pairs of electron will have different spins. Electrons are equally shared between them.
24. (d) In B_2 , total number of electrons = 10
 $B_2 \rightarrow \sigma(1s) \cdot \sigma^*(1s) \sigma(2s) \cdot \sigma^*(2s) \sigma(2p) \pi(2p)$
 Presence of unpaired electron shows the paramagnetic nature.
 The highest occupied molecular orbital is of π -type.
25. (a) Both assertion & reason are true & reason is the correct explanation of the assertion because. At any given instant, at room temperature each water molecules forms hydrogen bonds with other water molecules. The H_2O molecules are in continuous motion. So hydrogen bonds are constantly & rapidly broken & formed. In ice H_2O molecules are however fixed in the space lattice.
26. (a) Both assertion & reason are true & reason is the correct explanation of assertion, because helium molecule is formed by linking two helium atoms. both have $1s$ orbitals. These will combine to form two molecular orbitals $\sigma(1s)$ & $\sigma^*(1s)$ four available electrons are accommodated as $\sigma(1s)^2$ & $\sigma^*(1s)^2$.

Chemical Bonding

Self Evaluation Test - 3

- Nature of the bond formed between two elements depends on the
 - Oxidation potential
 - Electronegativity
 - Ionization potential
 - Electron affinity
- Two elements X and Y have following electronic configurations
 $X = 1s^2, 2s^2 2p^6, 3s^2 3p^6, 4s^2$ and
 $Y = 1s^2, 2s^2 2p^6, 3s^2 3p^5$. The expected compound formed by combination of X and Y is [BHU 1990]
 - XY_2
 - X_5Y_2
 - X_2Y_5
 - XY_5
- Electricity do not pass through ionic compounds
 - In solution
 - In solid state
 - In melted state
 - None of these
- From the following which compound on heating readily sublimates
 - $NaCl$
 - $MgCl_2$
 - $BaCl_2$
 - $AlCl_3$
- Which one in the following contains ionic as well as covalent bond [IIT 1979; CPMT 1983; DPMT 1983]
 - CH_4
 - H_2
 - KCN
 - KCl
- The solution of sugar in water contains [NCERT 1972; MP PET 2000]
 - Free atoms
 - Free molecules
 - Free ions
 - Free atoms and free molecules
- In which of the following reactions, there is no change in the valency [NCERT 1974; CPMT 1971, 78]
 - $4KClO_3 \rightarrow 3KClO_4 + KCl$
 - $SO_2 + 2H_2S \rightarrow 2H_2O + 3S$
 - $BaO_2 + H_2SO_4 \rightarrow BaSO_4 + H_2O_2$
 - $2BaO + O_2 \rightarrow 2BaO_2$
- The octet rule is not followed in [BHU 1981]
 - F_2
 - NaF
 - CaF_2
 - BF_3
- Sodium chloride is an ionic compound whereas hydrogen chloride is a gas because [KCET 2002]
 - Sodium is reactive
 - Covalent bond is weaker than ionic bond
 - Hydrogen chloride is a gas
 - Covalent bond is stronger than ionic bond
- Which one of the following molecules has a coordinate bond
 - NH_4Cl
 - $AlCl_3$
 - $NaCl$
 - Cl_2
- Co-ordinate bond is absent in [RPMT 2002]
 - BH_4^-
 - CO_3^{2-}
 - H_3O^+
 - NH_4^+
- The dipole moment of chlorobenzene is 1.73 D. The dipole moment of p -dichlorobenzene is expected to be [CPMT 1991]
 - 3.46 D
 - 0.00 D
 - 1.73 D
 - 1.00 D
- Polarization of electrons in acrolein may be written as [IIT 1988]
 - $\delta^- C H_2 = CH - \overset{\delta^+}{C} H = O$

 (a) Glycerine
 (b) Water
 (c) Hydrogen sulphide
 (d) Hydrogen fluoride
31. The bonds in $K_4[Fe(CN)_6]$ are [EAMCET 1991]
 (a) All ionic
 (b) All covalent
 (c) Ionic and covalent
 (d) Ionic, covalent and coordinate covalent
32. In which of the following ionic, covalent and coordinate bonds are present [UPSEAT 2002]
 (a) Water
 (b) Ammonia [CPMT 1988]
 (c) Sodium cyanide
 (d) Potassium bromide

AS Answers and Solutions

(SET -3)

1. (b) If the two elements have similar electronegativities, the bond between them will be covalent, while a large difference in electronegativities leads to an ionic bond.
2. (a) From electronic configuration valencies of X and Y are +2 and -1 respectively so formula of compound is XY_2 .
3. (b) Ionic compounds can't pass electricity in solid state because they don't have mobile ion in solid state.
4. (d) $AlCl_3$ sublimes readily on heating.
5. (c) Structure of KCN is $[K^+(C \equiv \ddot{N})^-]$.

6. (b) Sugar is an organic compound which is covalently bonded so in water it remains as free molecules.
7. (c) In the reaction $\overset{+2}{Ba}O_2 + \overset{+6}{H_2}SO_4 \rightarrow \overset{+2}{Ba}\overset{+6}{SO_4} + H_2O$ valency is not changing.
8. (d) BF_3 does not have octet, it has only six electrons so it is electron deficient compound.
9. (b) $NaCl$ is a ionic compound because it consists of more electronegativity difference compare to HCl .
10. (a) NH_4Cl has a coordinate bond besides covalent and ionic

11. (b) $\text{O}=\text{C}=\text{O}$ has covalent bonds only.
12. (b) Due to symmetry dipole moment of *p*-dichloro benzene is zero.
13. (d)
14. (d) CCl_4 has zero dipole moment because of symmetric tetrahedral structure. CH_3Cl has slightly higher dipole moment which is equal to $1.86D$. Now CH_3Cl has less electronegativity than CH_2Cl_2 . But CH_2Cl_2 has greater dipole moment than CHCl_3 .

15. (a) More the difference in electronegativity of atoms. Bond between them will be more polar.
16. (d) $C-F$ bond has the most polar character due to difference of their electronegativity.
17. (a) H_2S has angular geometry and have some value of dipole moment.

- 9 π and 9 σ bonds.
19. (d) H_3O^+ has sp^3 hybridization and its shape is triangular pyramidal due to lone pair on oxygen.
20. (c) SO_2 molecule has sp^2 hybridisation.

22. (a) In N_2O molecule $N \equiv N - O$ structure is most contributed.
23. (b) The shape of NO_2^+ , NO_3^- and NH_4^+ are linear trigonal planar and tetrahedral respectively. Thus the hybridization of atomic orbitals of nitrogen in these species are sp , sp^2 and sp^3 respectively.
24. (a) NO has one unpaired electron with Nitrogen.

25. (b) $\begin{array}{c} \text{---} O - \ddot{Cl} - O \\ | \\ O \end{array}$

26. (b) Bond energy of Cl_2 is highest among all halogen molecule.
Bond energies of F_2 , Cl_2 , Br_2 , I_2 are 37, 58, 46 and 36 $Kcal\ mol^{-1}$ respectively.

27. (c) O_2^{2-} have bond order one

$$\text{B.O.} = \frac{1}{2}[10 - 8] = \frac{2}{2} = 1.$$

28. (b) Electron lost from antibonding π orbital.
29. (a) In ice each water molecule forms four hydrogen bond through which each water molecule is tetrahedrally attached with other water molecule.

30. (c) Hydrogen bonding is present in molecules which have F , O , or N atoms.

- 31.** (d) Structure of $K_4[Fe(CN)_6]$ is

- 32.** (c) Sodium cyanide contain ionic, covalent and coordinate bond.

Chapter 4

Solution & Colligative properties

"A solution is a mixture in which substances are intermixed so intimately that they can not be observed as separate components". The dispersed phase or the substance which is to be dissolved is called **solute**, while the dispersion medium in which the solute is dispersed to get a homogenous mixture is called the **solvent**.

Solubility

"Solubility of a substance may be defined as the amount of solute dissolved in 100gms of a solvent to form a saturated solution at a given temperature". A **saturated solution** is a solution which contains at a given temperature as much solute as it can hold in presence of dissolving solvent. Any solution may contain less solute than would be necessary to saturate it. Such a solution is known as **unsaturated solution**. When the solution contains more solute than would be necessary to saturate it then it is termed as **supersaturated solution**.

Kinds of solutions

All the three states of matter (gas, liquid or solid) may behave either as solvent or solute. Depending on the state of solute or solvent, mainly there may be following nine types of binary solutions.

Solvent	Solute	Example
Gas	Gas	Mixture of gases, air.
Gas	Liquid	Water vapours in air, mist.
Gas	Solid	Sublimation of a solid into a gas, smoke.
Liquid	Gas	CO ₂ gas dissolved in water (aerated drinks).
Liquid	Liquid	Mixture of miscible liquids, e.g., alcohol in water.
Liquid	Solid	Salt in water, sugar in water.
Solid	Gas	Adsorption of gases over metals; hydrogen over palladium.
Solid	Liquid	Mercury in zinc, mercury in gold, CuSO ₄ ·5H ₂ O.
Solid	Solid	Homogeneous mixture of two or more metals (alloys), e.g., copper in gold, zinc in copper.

Among these solutions the most significant type of solutions are those which are in liquid phase and may be categorised as, (1) Solid in liquid solutions, (2) Liquid in liquid solutions and (3) Gas in liquid solutions.

Methods of expressing concentration of solution

Concentration of solution is the amount of solute dissolved in a known amount of the solvent or solution. The concentration of solution can be expressed in various ways as discussed below,

(i) **Percentage** : It refers to the amount of the solute per 100 parts of the solution. It can also be called as parts per hundred (*pph*). It can be expressed by any of following four methods,

(i) **Weight to weight percent**

$$\% \text{ w/w} = \frac{\text{Wt. of solute}}{\text{Wt. of solution}} \times 100$$

Example : 10% Na₂CO₃ solution w/w means 10g of Na₂CO₃ is dissolved in 100g of the solution. (It means 10g Na₂CO₃ is dissolved in 90g of H₂O)

(ii) **Weight to volume percent**

$$\% \text{ w/v} = \frac{\text{Wt. of solute}}{\text{Volume of solution}} \times 100$$

Example : 10% Na₂CO₃ (w/v) means 10g Na₂CO₃ is dissolved in 100 cc of solution.

(iii) **Volume to volume percent**

$$\% \text{ v/v} = \frac{\text{Vol. of solute}}{\text{Vol. of solution}} \times 100$$

Example : 10% ethanol (v/v) means 10 cc of ethanol dissolved in 100 cc of solution.

(iv) **Volume to weight percent**

$$\% \text{ v/w} = \frac{\text{Vol. of solute}}{\text{Wt. of solution}} \times 100$$

Example : 10% ethanol (v/w) means 10 cc of ethanol dissolved in 100g of solution.

(2) **Parts per million (ppm) and parts per billion (ppb)** : When a solute is present in trace quantities, it is convenient to express the concentration in parts per million and parts per billion. It is the number of parts of solute per million (10⁶) or per billion (10⁹) parts of the solution. It is independent of the temperature.

$$\text{ppm} = \frac{\text{mass of solute component}}{\text{Total mass of solution}} \times 10^6$$

$$ppb = \frac{\text{mass of solute component}}{\text{Total mass of solution}} \times 10^9$$

(3) **Strength** : The strength of solution is defined as the amount of solute in grams present in one *litre* (or dm^3) of the solution. It is expressed in *g/litre* or (g/dm^3) .

$$\text{Strength} = \frac{\text{Mass of solute in grams}}{\text{Volume of solution in litres}}$$

(4) **Normality (N)** : It is defined as the number of gram equivalents (equivalent weight in grams) of a solute present per *litre* of the solution. Unit of normality is gram equivalents *litre*. Normality changes with temperature since it involves volume. When a solution is diluted X times, its normality also decreases by X times. Solutions in term of normality generally expressed as,

N = Normal solution; $5N$ = Penta normal,

$10N$ = Deca normal; $N/2$ = semi normal

$N/10$ = Deci normal; $N/5$ = Penti normal

$N/100$ or $0.01N$ = centinormal,

$N/1000$ or $0.001N$ = millinormal

Mathematically normality can be calculated by following formulas,

$$(i) \text{ Normality (N)} = \frac{\text{Number of g.eq. of solute}}{\text{Volume of solution (l)}}$$

$$(ii) N = \frac{\text{Weight of solute in g.}}{\text{g.eq. weight of solute} \times \text{Volume of solution (l)}}$$

$$(iii) N = \frac{\text{Wt. of solute per litre of solution}}{\text{g eq. wt. of solute}}$$

$$(iv) N = \frac{\text{Wt. of solute}}{\text{g.eq. wt. of solute}} \times \frac{1000}{\text{Vol. of solution in ml}}$$

$$(v) N = \frac{\text{Percent of solute} \times 10}{\text{g eq. wt. of solute}},$$

$$(vi) N = \frac{\text{Strength in } g\ l^{-1} \text{ of solution}}{\text{g eq. wt. of solute}}$$

$$(vii) N = \frac{\text{Wt\%} \times \text{density} \times 10}{\text{Eq. wt.}}$$

(viii) If volume V_1 and normality N_1 is so changed that new normality and volume N_2 and V_2 then,

$$N_1 V_1 = N_2 V_2 \text{ (Normality equation)}$$

(ix) When two solutions of the same solute are mixed then normality of mixture (N) is

$$N = \frac{N_1 V_1 + N_2 V_2}{V_1 + V_2}$$

(x) Vol. of water to be added i.e., $(V_2 - V_1)$ to get a solution of normality N_2 from V_1 ml of normality N_1

$$V_2 - V_1 = \left(\frac{N_1 - N_2}{N_2} \right) V_1$$

(xi) If Wg of an acid is completely neutralised by V ml of base of normality N

$$\frac{\text{Wt. of acid}}{\text{g eq. wt. of acid}} = \frac{VN}{1000}$$

$$\text{Similarly, } \frac{\text{Wt. of base}}{\text{g eq. wt. of base}} = \frac{\text{Vol. of acid} \times N \text{ of acid}}{1000}$$

(xii) When V_a ml of acid of normality N_a is mixed with V_b ml of base of normality N_b

(a) If $V_a N_a = V_b N_b$ (Solution neutral)

(b) If $V_a N_a > V_b N_b$ (Solution is acidic)

(c) If $V_b N_b > V_a N_a$ (Solution is basic)

$$(xiii) \text{ Normality of the acidic mixture} = \frac{V_a N_a + V_b N_b}{(V_a + V_b)}$$

$$(xiv) \text{ Normality of the basic mixture} = \frac{V_b N_b + V_a N_a}{(V_a + V_b)}$$

$$(xv) N = \frac{\text{No. of meq} \times \text{of solute}}{\text{Vol. of solution in ml}}$$

(* 1 equivalent = 1000 milliequivalent or meq.)

(5) **Molarity (M)** : Molarity of a solution is the *number of moles of the solute per litre of solution (or number of millimoles per ml. of solution)*. Unit of molarity is *mol/litre* or *mol/dm*. For example, a molar (1M) solution of sugar means a solution containing 1 mole of sugar (i.e., 342 g or 6.02×10^{23} molecules of it) per *litre* of the solution. Solutions in term of molarity generally expressed as,

1M = Molar solution, 2M = Molarity is two,

$\frac{M}{2}$ or 0.5 M = Semimolar solution,

$\frac{M}{10}$ or 0.1 M = Decimolar solution,

$\frac{M}{100}$ or 0.01 M = Centimolar solution

$\frac{M}{1000}$ or 0.001 M = Millimolar solution

• Molarity is most common way of representing the concentration of solution.

• Molarity is depend on temperature as, $M \propto \frac{1}{T}$

• When a solution is diluted (x times), its molarity also decreases (by X times)

Mathematically molarity can be calculated by following formulas,

$$(i) M = \frac{\text{No. of moles of solute (n)}}{\text{Vol. of solution in litres}},$$

$$(ii) M = \frac{\text{Wt. of solute (in gm) per litre of solution}}{\text{Mol. wt. of solute}}$$

$$(iii) M = \frac{\text{Wt. of solute (in gm)}}{\text{Mol. wt. of solute}} \times \frac{1000}{\text{Vol. of solution in ml.}}$$

$$(iv) M = \frac{\text{No. of millimoles of solute}}{\text{Vol. of solution in ml}}$$

$$(v) M = \frac{\text{Percent of solute} \times 10}{\text{Mol. wt. of solute}}$$

$$(vi) \quad M = \frac{\text{Strength in } g/l \text{ of solution}}{\text{Mol.wt. of solute}}$$

$$(vii) \quad M = \frac{10 \times \text{Sp. gr. of the solution} \times \text{Wt. \% of the solute}}{\text{Mol.wt. of the solute}}$$

(viii) If molarity and volume of solution are changed from M_1, V_1 to M_2, V_2 . Then,

$$M_1 V_1 = M_2 V_2 \quad (\text{Molarity equation})$$

(ix) In balanced chemical equation, if n_1 moles of reactant one react with n_2 moles of reactant two. Then,

$$\frac{M_1 V_1}{n_1} = \frac{M_2 V_2}{n_2}$$

(x) If two solutions of the same solute are mixed then molarity (M) of resulting solution.

$$M = \frac{M_1 V_1 + M_2 V_2}{(V_1 + V_2)}$$

(xi) Volume of water added to get a solution of molarity M_2 from V_1 ml of molarity M_1 is

$$V_2 - V_1 = \left(\frac{M_1 - M_2}{M_2} \right) V_1$$

Relation between molarity and normality

$$\text{Normality of solution} = \text{molarity} \times \frac{\text{Molecular mass}}{\text{Equivalent mass}}$$

$$\text{Normality} \times \text{equivalent mass} = \text{molarity} \times \text{molecular mass}$$

$$\text{For an acid, } \frac{\text{Molecular mass}}{\text{Equivalent mass}} = \text{Basicity}$$

$$\text{So, Normality of acid} = \text{molarity} \times \text{basicity.}$$

$$\text{For a base, } \frac{\text{Molecular mass}}{\text{Equivalent mass}} = \text{Acidity}$$

$$\text{So, Normality of base} = \text{Molarity} \times \text{Acidity.}$$

(6) **Molality (m)** : It is the number of moles or gram molecules of the solute per 1000 g of the solvent. Unit of molality is mol/kg . For example, a 0.2 molal (0.2m) solution of glucose means a solution obtained by dissolving 0.2 mole of glucose in 1000gm of water. *Molality (m) does not depend on temperature* since it involves measurement of weight of liquids. *Molal solutions are less concentrated than molar solution.*

Mathematically molality can be calculated by following formulas,

$$(i) \quad m = \frac{\text{Number of moles of the solute}}{\text{Weight of the solvent in grams}} \times 1000$$

$$(ii) \quad m = \frac{\text{Strength per 1000 grams of solvent}}{\text{Molecular mass of solute}}$$

$$(iii) \quad m = \frac{\text{No. of gm moles of solute}}{\text{Wt. of solvent in kg}}$$

$$(iv) \quad m = \frac{\text{Wt. of solute}}{\text{Mol.wt. of solute}} \times \frac{1000}{\text{Wt. of solvent in g}}$$

$$(v) \quad m = \frac{\text{No. of millimoles of solute}}{\text{Wt. of solvent in g}}$$

$$(vi) \quad m = \frac{10 \times \text{solubility}}{\text{Mol.wt. of solute}}$$

$$(vii) \quad m = \frac{1000 \times \text{wt. \% of solute}(x)}{(100 - x) \times \text{mol. wt. of solute}}$$

$$(viii) \quad m = \frac{1000 \times \text{Molarity}}{(1000 \times \text{sp. gravity}) - (\text{Molarity} \times \text{Mol.wt. of solute})}$$

Relation between molarity (M) and molality (m)

$$\text{Molality } (m) = \frac{\text{Molarity}}{\text{Density} - \frac{\text{Molarity} \times \text{molecular mass}}{1000}}$$

$$\text{Molarity } (M) = \frac{\text{Molality} \times \text{density}}{1 + \frac{\text{Molality} \times \text{molecular mass}}{1000}}$$

(7) **Formality (F)** : Formality of a solution may be defined as the number of gram formula masses of the ionic solute dissolved per litre of the solution. It is represented by F . Commonly, the term formality is used to express the concentration of the ionic solids which do not exist as molecules but exist as network of ions. A solution containing one gram formula mass of solute per litre of the solution has formality equal to one and is called formal solution. It may be mentioned here that the *formality of a solution changes with change in temperature.*

$$\text{Formality } (F) = \frac{\text{Number of gram formula masses of solute}}{\text{Volume of solution in litres}}$$

$$= \frac{\text{Mass of ionic solute (g)}}{(\text{gm. formula mass of solute}) \times (\text{Volume of solution (l)})}$$

$$\text{Thus, } F = \frac{W_B(g)}{GFM \times V(l)} \quad \text{or} \quad \frac{W_B(g) \times 1000}{GFM \times V(ml)}$$

(8) **Mole fraction (X)** : Mole fraction may be defined as the ratio of number of moles of one component to the total number of moles of all the components (solvent and solute) present in the solution. It is denoted by the letter X . It may be noted that *the mole fraction is independent of the temperature. Mole fraction is dimensionless.* Let us suppose that a solution contains the components A and B and suppose that W_A g of A and W_B g of B are present in it.

$$\text{Number of moles of } A \text{ is given by, } n_A = \frac{W_A}{M_A} \text{ and}$$

$$\text{the number of moles of } B \text{ is given by, } n_B = \frac{W_B}{M_B}$$

where M_A and M_B are molecular masses of A and B respectively.

$$\text{Total number of moles of } A \text{ and } B = n_A + n_B$$

$$\text{Mole fraction of } A, \quad X_A = \frac{n_A}{n_A + n_B}$$

$$\text{Mole fraction of } B, \quad X_B = \frac{n_B}{n_A + n_B}$$

The sum of mole fractions of all the components in the solution is always one.

$$X_A + X_B = \frac{n_A}{n_A + n_B} + \frac{n_B}{n_A + n_B} = 1.$$

Thus, if we know the mole fraction of one component of a binary solution, the mole fraction of the other can be calculated.

Relation between molality of solution (m) and mole fraction of the solute (X).

$$X_A = \frac{m}{55.5 + m}$$

(9) **Mass fraction** : Mass fraction of a component in a solution is the mass of that component divided by the total mass of the solution. For a solution containing $w_A \text{ gm}$ of A and $w_B \text{ gm}$ of B

$$\text{Mass fraction of } A = \frac{w_A}{w_A + w_B}; \text{ Mass fraction of } B = \frac{w_B}{w_A + w_B}$$

It may be noted that molality, mole fraction, mass fraction etc. are preferred to molarity, normality, etc. because the former involve the weights of the solute and solvent where as later involve volumes of solutions. Temperature has no effect on weights but it has significant effect on volumes.

(10) **Demal unit (D)** : The concentrations are also expressed in "Demal unit". One demal unit represents one mole of solute present in one litre of solution at 0°C .

Colligative properties

Certain properties of dilute solutions containing non-volatile solute do not depend upon the nature of the solute dissolved but depend only upon the concentration *i.e.*, the number of particles of the solute present in the solution. Such properties are called colligative properties. The four well known examples of the colligative properties are,

- (1) Lowering of vapour pressure of the solvent.
- (2) Osmotic pressure of the solution.
- (3) Elevation in boiling point of the solvent.
- (4) Depression in freezing point of the solvent.

Since colligative properties depend upon the number of solute particles present in the solution, the simple case will be that when the solute is a *non-electrolyte*. In case the solute is an electrolyte, it may split to a number of ions each of which acts as a particle and thus will affect the value of the colligative property.

Each colligative property is exactly related to other, Relative lowering of vapour pressure, elevation in boiling point and depression in freezing point are directly proportional to osmotic pressure.

Lowering of vapour pressure

The pressure exerted by the vapours above the liquid surface in equilibrium with the liquid at a given temperature is called *vapour pressure of the liquid*. The vapour pressure of a liquid depends on,

(1) **Nature of liquid** : Liquids, which have weak intermolecular forces, are volatile and have greater vapour pressure. For example, dimethyl ether has greater vapour pressure than ethyl alcohol.

(2) **Temperature** : Vapour pressure increases with increase in temperature. This is due to the reason that with increase in temperature more molecules of the liquid can go into vapour phase.

(3) **Purity of liquid** : Pure liquid always has a vapour pressure greater than its solution.

Raoult's law : When a non-volatile substance is dissolved in a liquid, the vapour pressure of the liquid (solvent) is lowered. According to *Raoult's law* (1887), *at any given temperature the partial vapour pressure (p) of any component of a solution is equal to its mole fraction (X) multiplied by the vapour pressure of this component in the pure state (p_A^0)*. That is, $p_A = p_A^0 \times X_A$

The vapour pressure of the solution (P_{total}) is the sum of the partial pressures of the components, *i.e.*, for the solution of two volatile liquids with vapour pressures p_A and p_B .

$$P_{\text{total}} = p_A + p_B = (p_A^0 \times X_A) + (p_B^0 \times X_B)$$

Alternatively, Raoult's law may be stated as "*the relative lowering of vapour pressure of a solution containing a non-volatile solute is equal to the mole fraction of the solute in the solution*".

Relative lowering of vapour pressure is defined as the ratio of lowering of vapour pressure to the vapour pressure of the pure solvent. It is determined by Ostwald-Walker method.

Thus according to Raoult's law,

$$\frac{p^0 - p}{p^0} = \frac{n}{n + N} = \frac{\frac{w}{m}}{\frac{w}{m} + \frac{W}{M}}$$

where, p = Vapour pressure of the solution

p^0 = Vapour pressure of the pure solvent

n = Number of moles of the solute

N = Number of moles of the solvent

w and m = weight and mol. wt. of solute

W and M = weight and mol. wt. of the solvent.

Limitations of Raoult's law

- Raoult's law is applicable only to *very dilute solutions*.
- Raoult's law is applicable to solutions containing non-volatile solute only.
- Raoult's law is not applicable to solutes which dissociate or associate in the particular solution.

Ideal and Non-Ideal solution

Table: 4.1 Ideal and non-ideal solutions

Ideal solutions	Non-ideal solutions	
	Positive deviation from Raoult's law	Negative deviation from Raoult's law
1. Obey Raoult's law at every range of concentration.	1. Do not obey Raoult's law.	1. Do not obey Raoult's law.
2. $\Delta H_{\text{mix}} = 0$; neither heat is evolved nor absorbed during dissolution.	2. $\Delta H_{\text{mix}} > 0$. Endothermic dissolution; heat is absorbed.	2. $\Delta H_{\text{mix}} < 0$. Exothermic dissolution; heat is evolved.
3. $\Delta V_{\text{mix}} = 0$; total volume of solution is equal to sum of volumes of the components.	3. $\Delta V_{\text{mix}} > 0$. Volume is increased after dissolution.	3. $\Delta V_{\text{mix}} < 0$. Volume is decreased during dissolution.

4. $P = p_A + p_B = p_A^0 X_A + p_B^0 X_B$ i.e.,
 $p_A = p_A^0 X_A$; $p_B = p_B^0 X_B$
5. $A-A$, $A-B$, $B-B$ interactions should be same, i.e., 'A' and 'B' are identical in shape, size and character.
6. Escaping tendency of 'A' and 'B' should be same in pure liquids and in the solution.
- Examples:
 Dilute solutions;
 benzene + toluene;
n-hexane + *n*-heptane;
 chlorobenzene + bromobenzene;
 ethyl bromide + ethyl iodide;
n-butyl chloride + *n*-butyl bromide
4. $p_A > p_A^0 X_A$; $p_B > p_B^0 X_B$
 $\therefore p_A + p_B > p_A^0 X_A + p_B^0 X_B$
5. $A-B$ attractive force should be weaker than $A-A$ and $B-B$ attractive forces. 'A' and 'B' have different shape, size and character.
6. 'A' and 'B' escape easily showing higher vapour pressure than the expected value.
- Examples:
 Acetone + ethanol
 acetone + CS_2 ;
 water + methanol;
 water + ethanol;
 CCl_4 + toluene;
 $CCl_4 + CHCl_3$;
 acetone + benzene;
 $CCl_4 + CH_3OH$;
 cyclohexane + ethanol
4. $p_A < p_A^0 X_A$; $p_B < p_B^0 X_B$
 $\therefore p_A + p_B < p_A^0 X_A + p_B^0 X_B$
5. $A-B$ attractive force should be greater than $A-A$ and $B-B$ attractive forces. 'A' and 'B' have different shape, size and character.
6. Escaping tendency of both components 'A' and 'B' is lowered showing lower vapour pressure than expected ideally.
- Examples:
 Acetone + aniline;
 acetone + chloroform;
 $CH_3OH + CH_3COOH$;
 $H_2O + HNO_3$
 chloroform + diethyl ether;
 water + HCl ;
 acetic acid + pyridine;
 chloroform + benzene

Graphical representation of ideal and non-ideal solutions

Azeotropic mixture

Azeotropes are defined as the mixtures of liquids which boil at constant temperature like a pure liquid and possess same composition of components in liquid as well as in vapour phase. Azeotropes are also called constant boiling mixtures because whole of the azeotropes changes into vapour state at constant temperature and their components can not be separated by fractional distillation. Azeotropes are of two types as described below,

(i) **Minimum boiling azeotrope** : For the solutions with positive deviation there is an intermediate composition for which the vapour pressure of the solution is maximum and hence, boiling point is minimum. At this composition the solution distills at constant temperature without change in composition. This type of solutions are called minimum boiling azeotrope. e.g.,

(2) **Maximum boiling azeotrope** : For the solutions with negative deviations there is an intermediate composition for which the vapour pressure of the solution is minimum and hence, boiling point is maximum. At this composition the solution distill's at constant temperature without the change in composition. This type of solutions are called maximum boiling azeotrope. e.g.,

Osmosis and Osmotic pressure of the solution

(i) **Osmosis** : The flow of solvent from pure solvent or from solution of lower concentration into solution of higher concentration through a semi-permeable membrane is called *Osmosis*. Osmosis may be divided in following types,

(i) **Exo-Osmosis** : The outward osmotic flow of water from a cell containing an aqueous solution through a semi-permeable membrane is called as Exo-osmosis. For example, egg (after removing hard shell) placed in conc. $NaCl$ solutions, will shrink due to exo-osmosis.

(ii) **Endo-osmosis** : The inward flow of water into the cell containing an aqueous solution through a semi-permeable membrane is called as endo-osmosis. e.g., an egg placed in water swells up due to endo-osmosis.

(iii) **Reverse osmosis** : If a pressure higher than osmotic pressure is applied on the solution, the solvent will flow from the solution into the pure solvent through the semi-permeable membrane. Since here the flow of solvent is in the reverse direction to that observed in the usual osmosis, the process is called reverse osmosis.

Differences between osmosis and diffusion

Osmosis	Diffusion
In osmosis movement of molecules	In diffusion there is no role of semi-

takes place through a semi-permeable membrane.	permeable membrane.
It involves movement of only solvent molecules from one side to the other.	It involves passage of solvent as well as solute molecules from one region to the other.
Osmosis is limited to solutions only.	Diffusion can take place in liquids, gases and solutions.
Osmosis can be stopped or reversed by applying additional pressure on the solution side.	Diffusion can neither be stopped nor reversed

(2) Osmotic pressure (π)

The osmotic pressure of a solution at a particular temperature may be defined as the excess hydrostatic pressure that builds up when the solution is separated from the solvent by a semi-permeable membrane. It is denoted by π .

or

Osmotic pressure may be defined as the excess pressure which must be applied to a solution in order to prevent flow of solvent into the solution through the semi-permeable membrane.

or

Osmotic pressure is the excess pressure which must be applied to a given solution in order to increase its vapour pressure until it becomes equal to that of the solution.

(i) **Measurements of osmotic pressure** : Following methods are used for the measurement of osmotic pressure,

(a) Pfeffer's method, (b) Morse and Frazer's method, (c) Berkeley and Hartley's method, (d) Townsend's negative pressure method, (e) De Vries plasmolytic method.

(ii) **Determination of molecular mass of non-volatile solute from osmotic pressure (π)** : The osmotic pressure is a colligative property. For a given solvent the osmotic pressure depends only upon the molar concentration of solute but does not depend upon its nature. The following relation relates osmotic pressure to the number of moles of the solute,

According to Boyle Van't Hoff law (at conc. temp.)

$$\pi \propto C \quad \text{.....(i)}$$

According to Gaylussac Van't Hoff law (at conc. temp.)

$$\pi \propto T \quad \text{.....(ii)}$$

From equation (i) and (ii)

$$\pi \propto CT, \pi = CRT \quad (\text{Van't Hoff equation})$$

$$\pi = \frac{n}{V} RT \quad \left(\because C = \frac{n}{V} \right); \pi = \frac{w}{m} \frac{RT}{V} \quad \left(\because n = \frac{w}{m} \right)$$

Here, C = concentration of solution in moles per litre

R = gas constant ; T = temperature

n = number of moles of solute ; V = volume of solution

m = molecular weight of solute ; w = weight of solute

(iii) Conditions for getting accurate value of molecular mass are,

(a) The solute must be non-volatile.

(b) The solution must be dilute.

(c) The solute should not undergo dissociation or association in the solution.

(iv) **Relation of osmotic pressure with different colligative properties** : Osmotic pressure is related to relative lowering of vapour pressure, elevation of boiling point and depression of freezing point according to the following relations,

$$(a) \pi = \left(\frac{P_A^0 - P_A}{P_A^0} \right) \times \frac{dRT}{M} \quad (b) \pi = \Delta T_b \times \frac{dRT}{1000 \times K_b}$$

$$(c) \pi = \Delta T_f \times \frac{dRT}{1000 \times K_f}$$

In the above relations, π = Osmotic pressure; d = Density of solution at temperature T ; R = Universal gas constant; M = Mol. Mass of solute; K_b = Molal elevation constant of solvent; K_f = Molal depression constant of solvent

(v) **Isotonic, Hypertonic and Hypotonic solutions**

(a) **Isotonic or iso-osmotic solutions** : Two solutions of different substances having same osmotic pressure at same temperature are known as isotonic solutions.

For isotonic solutions, $\pi_1 = \pi_2$ Primary Condition(i)

$$\left. \begin{array}{l} \text{Also, } C_1 = C_2 \\ \text{or } \frac{n_1}{V_1} = \frac{n_2}{V_2} \\ \text{or } \frac{w_1}{m_1 V_1} = \frac{w_2}{m_2 V_2} \end{array} \right\} \text{Secondary Conditions} \quad \text{.....(ii)}$$

Eq. (ii) holds good only for those solutes which neither possess the tendency to get associate nor dissociate in solution, e.g.,

Urea and glucose are isotonic then, $\pi_1 = \pi_2$ and $C_1 = C_2$

Urea and NaCl (dissociate) are isotonic then, $\pi_1 = \pi_2$ but $C_1 \neq C_2$

Urea and Benzoic acid (associate) are isotonic then, $\pi_1 = \pi_2$ but $C_1 \neq C_2$

(b) **Hypertonic and hypotonic solution** : The solution which has more osmotic pressure than the other solution is called as hypertonic solution and the solution which has lesser osmotic pressure than the other is called as hypotonic solution.

The flow of solvent is always from lower osmotic pressure to higher osmotic pressure i.e. from hypotonic to hypertonic solution.

Elevation in b.pt. of the solvent (Ebullioscopy)

Boiling point of a liquid may be defined as the temperature at which its vapour pressure becomes equal to atmospheric pressure, i.e., 760 mm. Since the addition of a non-volatile solute lowers the vapour pressure of the solvent, solution always has lower vapour pressure than the solvent and hence it must be heated to a higher temperature to make its vapour pressure equal to atmospheric pressure with the result *the solution boils at a higher temperature than the pure solvent*. Thus sea water boils at a higher temperature than distilled water. If T is the boiling point of the solvent and T is the boiling point of the solution, the difference in the boiling point (ΔT or ΔT) is called the elevation of boiling point.

$$T - T_b = \Delta T_b \text{ or } \Delta T$$

Elevation in boiling point is determined by Landsberger's method and Cottrell's method. Study of elevation in boiling point of a liquid in which a non-volatile solute is dissolved is called as ebullioscopy.

Important relations concerning elevation in boiling point

(1) *The elevation of boiling point is directly proportional to the lowering of vapour pressure, i.e., $\Delta T_b \propto p^0 - p$*

$$(2) \Delta T_b = K_b \times m$$

where K_b = molal elevation constant or ebullioscopic constant of the solvent; m = Molality of the solution, i.e., number of moles of solute per 1000g of the solvent; ΔT_b = Elevation in boiling point

$$(3) \Delta T_b = \frac{1000 \times K_b \times w}{m \times W} \text{ or } m = \frac{1000 \times K_b \times w}{\Delta T_b \times W}$$

where, K_b is *molal elevation constant* and defined as the elevation in b.pt. produced when 1 mole of the solute is dissolved in 1 kg of the solvent.

w and W are the weights of solute and solvent and m is the molecular weight of the solute.

$$(4) K_b = \frac{0.002(T_0)^2}{l_v}$$

where T_0 = Normal boiling point of the pure solvent; l_v = Latent heat of evaporation in cal/g of pure solvent; K_b for water is $0.52 \text{ deg} \cdot \text{kg mol}^{-1}$.

Depression in f.pt. of the solvent (Cryoscopy)

Freezing point is the temperature at which the liquid and the solid states of a substance are in equilibrium with each other or it may be defined as the temperature at which the liquid and the solid states of a substance have the same vapour pressure. It is observed that the freezing point of a solution is always less than the freezing point of the pure solvent. Thus the freezing point of sea water is low than that of pure water. The depression in freezing point (ΔT or ΔT_f) of a solvent is the difference in the freezing point of the pure solvent (T_s) and the solution ($T_{sol.}$).

$$T_s - T_{sol} = \Delta T_f \text{ or } \Delta T$$

NaCl or CaCl_2 (anhydrous) are used to clear snow on roads. They depress the freezing point of water and thus reduce the temperature of the formation of ice.

Depression in freezing point is determined by Beckmann's method and Rast's camphor method. Study of depression in freezing point of a liquid in which a non-volatile solute is dissolved in it is called as cryoscopy.

Important relations concerning depression in freezing point.

(1) Depression in freezing point is directly proportional to the lowering of vapour pressure. $\Delta T_f \propto p^0 - p$

$$(2) \Delta T_f = K_f \times m$$

where K_f = molal depression constant or cryoscopic constant; m = Molality of the solution (i.e., no. of moles of solute per 1000g of the solvent); ΔT_f = Depression in freezing point

$$(3) \Delta T_f = \frac{1000 \times K_f \times w}{m \times W} \text{ or } m = \frac{1000 \times K_f \times w}{\Delta T_f \times W}$$

where K_f is *molal depression constant* and defined as the depression in freezing point produced when 1 mole of the solute is dissolved in 1kg of the solvent. w and W are the weights of solute and solvent and m is the molecular weight of the solute.

$$(4) K_f = \frac{R(T_0)^2}{l_f 1000} = \frac{0.002(T_0)^2}{l_f}$$

where T_0 = Normal freezing point of the solvent; l_f = Latent heat of fusion/g of solvent; K_f for water is $1.86 \text{ deg} \cdot \text{kg mol}^{-1}$

Colligative properties of electrolytes

The colligative properties of solutions, viz. lowering of vapour pressure, osmotic pressure, elevation in b.p. and depression in freezing point, depend on the total number of solute particles present in solution. Since the electrolytes ionise and give more than one particle per formula unit in solution, the colligative effect of an electrolyte solution is always greater than that of a non-electrolyte of the same molar concentration. All colligative properties are used for calculating molecular masses of non-

volatile solutes. However osmotic pressure is the best colligative property for determining molecular mass of a non-volatile substance.

Colligative properties are depending on following factors

- (1) Colligative properties $\propto$ Number of particles
 - $\propto$ Number of molecules
(in case of non-electrolytes)
 - $\propto$ Number of ions
(In case of electrolytes)
 - $\propto$ Number of moles of solute
 - $\propto$ Mole fraction of solute

(2) For different solutes of same molar concentration, the magnitude of the colligative properties is more for that solution which gives more number of particles on ionisation.

(3) For different solutions of same molar concentration of different non-electrolyte solutes, the magnitude of the colligative properties will be same for all.

(4) For different molar concentrations of the same solute, the magnitude of colligative properties is more for the more concentrated solution.

(5) For solutions of different solutes but of same percent strength, the magnitude of colligative property is more for the solute with least molecular weight.

(6) For solutions of different solutes of the same percent strength, the magnitude of colligative property is more for that solute which gives more number of particles, which can be known by the knowledge of molecular weight and its ionisation behaviour.

Abnormal molecular masses

Molecular masses can be calculated by measuring any of the colligative properties. The relation between colligative properties and molecular mass of the solute is based on following assumptions.

- (1) The solution is dilute, so that Raoult's law is obeyed.
- (2) The solute neither undergoes dissociation nor association in solution.

In case of solutions where above assumptions are not valid we find discrepancies between observed and calculated values of colligative properties. These anomalies are primarily due to

- (i) Association of solute molecules.
- (ii) Dissociation of solute molecules.
- (i) **Association of solute molecules** : Certain solutes in solution are found to associate. This eventually leads to a decrease in the number of molecular particles in the solutions. Thus, it results in a decrease in the values of colligative properties.

$$\text{Colligative property} \propto \frac{1}{\text{molecular mass of solute}}$$

therefore, higher values are obtained for molecular masses than normal values for unassociated molecules.

(ii) **Dissociation of solute molecules** : A number of electrolytes dissociate in solution to give two or more particles (ions). Therefore, the number of solute particles, in solutions of such substances, is more than the expected value. Accordingly, such solutions exhibit higher values of colligative properties. Since colligative properties are inversely proportional to molecular masses, therefore, molecular masses of such substances as calculated from colligative properties will be less than their normal values.

Van't Hoff's factor (i) : In 1886, Van't Hoff introduced a factor ' i ' called Van't Hoff's factor, to express the extent of association or dissociation of solutes in solution. It is ratio of the normal and observed molecular masses of the solute, i.e.,

$$i = \frac{\text{Normal molecular mass}}{\text{Observed molecular mass}}$$

In case of association, observed molecular mass being more than the normal, the factor i has a value less than 1. But in case of dissociation, the Van't Hoff's factor is more than 1 because the observed molecular mass has a lesser value than the normal molecular mass. In case there is no dissociation the value of ' i ' becomes equal to one.

Since colligative properties are inversely proportional to molecular masses, the Van't Hoff's factor may also be written as,

$$i = \frac{\text{Observed value of colligative property}}{\text{Calculated value of colligative property assuming no association or dissociation}}$$

$$i = \frac{\text{No. of particles after association or dissociation}}{\text{No. of particles before association or dissociation}}$$

Introduction of the Van't Hoff factor modifies the equations for the colligative properties as follows,

$$\text{Relative lowering of vapour pressure} = \frac{P_A^o - P_A}{P_A^o} = iX_B$$

$$\text{Elevation of boiling point, } \Delta T_b = ik_b m$$

$$\text{Depression in freezing point, } \Delta T_f = ik_f m$$

$$\text{Osmotic pressure, } \pi = \frac{i n R T}{V}; \quad \pi = i C R T$$

From the value of ' i ', it is possible to calculate degree of dissociation or degree of association of substance.

Degree of dissociation (α) : It is defined as the fraction of total molecules which dissociate into simpler molecules or ions.

$$\alpha = \frac{i - 1}{m - 1}; \quad m = \text{number of particles in solution}$$

Degree of association (α) : It is defined as the fraction of the total number of molecules which associate or combine together resulting in the formation of a bigger molecules.

$$\alpha = \frac{i - 1}{1/m - 1}; \quad m = \text{number of particles in solution.}$$

Tips & Tricks

- ✍ A supersaturated solution is metastable.
- ✍ Dissolution of gases in liquid is always exothermic because $\Delta S = -ve$ (non favourable factor) and in order to have $\Delta G = -ve$ (spontaneous process), ΔH has to be $-ve$.
- ✍ 1 M aqueous solution is more concentrated than 1 m aqueous solution.
- ✍ Substances having high V.P. (e.g., petrol) evaporate more quickly than substances having low V.P. (e.g., motor oil).
- ✍ Babo's law : The lowering in vapour pressure of a solution caused by addition of an non-volatile solute is called as Babo's law.
- ✍ Konowaloff's rule : In case of a binary solution, at a fixed temperature, the vapour phase is richer in that component whose addition causes increase in total vapour pressure of the solution i.e., vapour phase is always richer in the more volatile component.
- ✍ When a non-volatile solute is added to the solvent, V.P. decrease, B.P. increase, F.P. decrease.
- ✍ Ethylene glycol is commonly added to car radiators to depress the freezing point of water. It is known as antifreeze.
- ✍ NaCl or $CaCl_2$ (anhydrous) are used to clear snow on roads. It depresses the freezing point of water and reduce the temperature at which ice is expected to be formed.
- ✍ Plasmolysis : When a plant cell is placed in a hypertonic solution, the fluid from the plant cell comes out and the cell shrinks. This phenomenon is called plasmolysis and is due to osmosis.
- ✍ Bursting of red blood cells when placed in water is due to osmosis.
- ✍ Gelatinous $Cu_2[Fe(CN)_6]$ and gelatinous $Ca_3(PO_4)_2$ are artificial semipermeable membranes.
- ✍ Semipermeable membrane of $Cu_2[Fe(CN)_6]$ dose not work in non aqueous solutions because it get dissolved in non aqueous solvents.
- ✍ Osmotic coefficient (g) is the ratio of van't Hoff factor (i) to the no. of ions furnished by one molecule of the electrolyte (N). i.e., $g = i / N$.

Ordinary Thinking

Objective Questions

Solubility

- The solubility of a gas in water depends on [MP PET 2002]
 - Nature of the gas
 - Temperature
 - Pressure of the gas
 - All of the above
- Which of the following is not correct for D_2O [Orissa JEE 2002]
 - Boiling point is higher than H_2O
 - D_2O reacts slowly than H_2O
 - Viscosity is higher than H_2O at 25°
 - Solubility of $NaCl$ in it is more than H_2O
- The statement "The mass of a gas dissolved in a given mass of a solvent at any temperature is proportional to the pressure of the gas above the solvent" is [AMU 2002]
 - Dalton's Law of Partial Pressures
 - Law of Mass Action
 - Henry's Law
 - None of these
- Which is correct about Henry's law [KCET 2002]
 - The gas in contact with the liquid should behave as an ideal gas
 - There should not be any chemical interaction between the gas and liquid
 - The pressure applied should be high
 - All of these
- The statement "If 0.003 moles of a gas are dissolved in 900 g of water under a pressure of 1 atmosphere, 0.006 moles will be dissolved under a pressure of 2 atmospheres", illustrates [JIPMER 1999]
 - Dalton's law of partial pressure
 - Graham's law
 - Raoult's law
 - Henry's law
- The solution of sugar in water contains [BHU 1973]
 - Free atoms
 - Free ions
 - Free molecules
 - Free atom and molecules

Method of expressing concentration of solution

- 25 ml of 3.0 M HNO_3 are mixed with 75 ml of 4.0 M HNO_3 . If the volumes are additive, the molarity of the final mixture would be [DPMT 1986; MH CET 2001]
 - 3.25 M
 - 4.0 M
 - 3.75 M
 - 3.50 M
- The amount of anhydrous Na_2CO_3 present in 250 ml of 0.25 M solution is [DPMT 2001]
 - 6.225 g
 - 66.25 g
 - 6.0 g
 - 6.625 g
- Dilute one litre 1 molar H_2SO_4 solution by 5 litre water, the normality of that solution is [DPMT 1983]
 - 0.2 N
 - 5 N
 - 10 N
 - 0.33 N
- If 5.85 gms of $NaCl$ are dissolved in 90 gms of water, the mole fraction of $NaCl$ is [CMC Vellore 1991; MP PMT 1994; AFMC 1998]
 - 0.1
 - 0.2
 - 0.3
 - 0.01
 - 0.0196
- The molarity of 0.006 mole of $NaCl$ in 100 ml solution is

[Bihar MEE 1996]

- (a) 0.6 (b) 0.06
(c) 0.006 (d) 0.066
(e) None of these
6. 9.8g of H_2SO_4 is present in 2 litres of a solution. The molarity of the solution is [EAMCET 1991; MP PMT 2002]
(a) 0.1M (b) 0.05M
(c) 0.2M (d) 0.01M
7. What will be the molarity of a solution containing 5g of sodium hydroxide in 250ml solution [MP PET 1999; BHU 1999; KCET 1999; AIIMS 2000; Pb. CET 2000]
(a) 0.5 (b) 1.0
(c) 2.0 (d) 0.1
8. The normality of 0.3M phosphorus acid (H_3PO_3) is [IIT 1999; AIIMS 2000]
(a) 0.1 (b) 0.9
(c) 0.3 (d) 0.6
9. Which of the following has maximum number of molecules [CBSE PMT 2002]
(a) 16 gm of O_2 (b) 16 gm of NO_2
(c) 7 gm of N_2 (d) 2 gm of H_2
10. Molarity is expressed as [JIPMER 1991; CBSE PMT 1991]
(a) Gram/litre (b) Moles/litre
(c) Litre/mole (d) Moles/1000 gms
11. 20ml of HCl solution requires 19.85ml of 0.01M $NaOH$ solution for complete neutralization. The molarity of HCl solution is [MP PMT 1999]
(a) 0.0099 (b) 0.099
(c) 0.99 (d) 9.9
12. How much of $NaOH$ is required to neutralise 1500 cm^3 of 0.1 N HCl (At. wt. of $Na=23$) [KCET 2001]
(a) 4 g (b) 6 g
(c) 40 g (d) 60 g
13. If 5.85 g of $NaCl$ (molecular weight 58.5) is dissolved in water and the solution is made up to 0.5 litre, the molarity of the solution will be [AMU 1999; Pb. PMT 2000; AFMC 2001]
(a) 0.2 (b) 0.4
(c) 1.0 (d) 0.1
14. A mixture has 18g water and 414g ethanol. The mole fraction of water in mixture is (assume ideal behaviour of the mixture)
(a) 0.1 (b) 0.4
(c) 0.7 (d) 0.9
15. The number of molecules in 4.25 g of ammonia is approximately
(a) 0.5×10^{23} (b) 1.5×10^{23}
(c) 3.5×10^{23} (d) 2.5×10^{23}
16. The largest number of molecules is in [Kurukshetra CEE 1998]
(a) 25g of CO_2 (b) 46g of C_2H_5OH
(c) 36g of H_2O (d) 54g of N_2O_5
17. If 1 M and 2.5 litre $NaOH$ solution is mixed with another 0.5 M and 3 litre $NaOH$ solution, then molarity of the resultant solution will be [CBSE PMT 2002]
(a) 1.0 M (b) 0.73 M
(c) 0.80 M (d) 0.50 M
18. When a solute is present in trace quantities the following expression is used [Kerala CET (Med.) 2002]
(a) Gram per million (b) Milligram percent
(c) Microgram percent (d) Nano gram percent
(e) Parts per million
19. When the concentration is expressed as the number of moles of a solute per litre of solution it known as [Kerala CET (Med.) 2002]

- (a) Normality (b) Molarity
(c) Mole fraction (d) Mass percentage
(e) Molality

20. The normality of 2.3 M H_2SO_4 solution is [KCET 2000]
(a) 2.3 N (b) 4.6 N
(c) 0.46 N (d) 0.23 N
21. The molarity of a solution made by mixing 50ml of conc. H_2SO_4 (36N) with 50 ml of water is [MP PMT 2001]
(a) 36 M (b) 18 M
(c) 9 M (d) 6 M
22. 171 g of cane sugar ($C_{12}H_{22}O_{11}$) is dissolved in 1 litre of water. The molarity of the solution is [MP PMT 2001]
(a) 2.0 M (b) 1.0 M
(c) 0.5 M (d) 0.25 M
23. The volumes of 4 N HCl and 10 N HCl required to make 1 litre of 6 N HCl are [Kerala PMT 2004]
(a) 0.75 litre of 10 N HCl and 0.25 litre of 4 N HCl
(b) 0.25 litre of 4 N HCl and 0.75 litre of 10 N HCl
(c) 0.67 litre of 4 N HCl and 0.33 litre of 10 N HCl
(d) 0.80 litre of 4 N HCl and 0.20 litre of 10 N HCl
(e) 0.50 litre of 4 N HCl and 0.50 litre of 10 N HCl
24. Which statement is true for solution of 0.020 M H_2SO_4 [DPMT 2001]
(a) 2 litre of the solution contains 0.020 mole of SO_4^{2-}
(b) 2 litre of the solution contains 0.080 mole of H_3O^+
(c) 1 litre of the solution contains 0.020 mole H_3O^+
(d) None of these
25. 10 litre solution of urea contains 240g urea. The active mass of urea will be [KCET 2000]
(a) 0.04 (b) 0.02
(c) 0.4 (d) 0.2
26. 5 ml of N HCl , 20 ml of N/2 H_2SO_4 and 30 ml of N/3 HNO_3 are mixed together and volume made to one litre. The normality of the resulting solution is [Kerala CET (Med.) 2003]
(a) $\frac{N}{5}$ (b) $\frac{N}{10}$
(c) $\frac{N}{20}$ (d) $\frac{N}{40}$
(e) $\frac{N}{25}$
27. The amount of $K_2Cr_2O_7$ (eq. wt. 49.04) required to prepare 100 ml of its 0.05 N solution is [JIPMER 2002]
(a) 2.9424 g (b) 0.4904 g
(c) 1.4712 g (d) 0.2452 g
28. With increase of temperature, which of these changes [AIEEE 2002]
(a) Molality
(b) Weight fraction of solute
(c) Fraction of solute present in water
(d) Mole fraction
29. 25ml of a solution of barium hydroxide on titration with a 0.1molar solution of hydrochloric acid gave a litre value of 35 ml. The molarity of barium hydroxide solution was [AIEEE 2003]
(a) 0.07 (b) 0.14
(c) 0.28 (d) 0.35

30. 2.0 molar solution is obtained, when 0.5 mole solute is dissolved in
(a) 250 ml solvent (b) 250 g solvent
(c) 250 ml solution (d) 1000 ml solvent
31. How many gram of HCl will be present in 150 ml of its 0.52 M solution [RPET 1999]
(a) 2.84 gm (b) 5.70 gm
(c) 8.50 gm (d) 3.65 gm
32. The number of moles present in 2 litre of 0.5 M NaOH is [MH CET 2001]
(a) 0.5 (b) 0.1
(c) 1 (d) 2
33. 36g water and 828g ethyl alcohol form an ideal solution. The mole fraction of water in it, is [MP PMT 2003]
(a) 1.0 (b) 0.7
(c) 0.4 (d) 0.1
34. What will be the normality of a solution containing 4.9 g. H_3PO_4 dissolved in 500 ml water [MP PMT 2003]
(a) 0.3 (b) 1.0
(c) 3.0 (d) 0.1
35. 3.0 molal NaOH solution has a density of 1.110 g/ml. The molarity of the solution is [BVP 2003]
(a) 3.0504 (b) 3.64
(c) 3.05 (d) 2.9732
36. Which of the following modes of expressing concentration is independent of temperature [IIT 1988; CPMT 1999; CBSE PMT 1992, 95; MP PMT 1992; AIIMS 1997, 2001]
(a) Molarity (b) Molality
(c) Formality (d) Normality
37. The molality of a solution is [MP PMT 1996]
(a) Number of moles of solute per 1000 ml of the solvent
(b) Number of moles of solute per 1000 gm of the solvent
(c) Number of moles of solute per 1000 ml of the solution
(d) Number of gram equivalents of solute per 1000 ml of the solution
38. The number of molecules in 16gm of methane is [MP PET/PMT 1998]
(a) 3.0×10^{23} (b) 6.02×10^{23}
(c) $\frac{16}{6.02} \times 10^{23}$ (d) $\frac{16}{3.0} \times 10^{23}$
39. The number of moles of a solute in its solution is 20 and total number of moles are 80. The mole fraction of solute is [MP PMT 1997]
(a) 2.5 (b) 0.25
(c) 1 (d) 0.75
40. The normality of a solution of sodium hydroxide 100 ml of which contains 4 grams of NaOH is [CMC Vellore 1991]
(a) 0.1 (b) 40
(c) 1.0 (d) 0.4
41. Two solutions of a substance (non electrolyte) are mixed in the following manner 480 ml of 1.5M first solution + 520 ml of 1.2M second solution. What is the molarity of the final mixture [AIEEE 2005]
(a) 1.20 M (b) 1.50 M
(c) 1.344 M (d) 2.70 M
42. The normal amount of glucose in 100ml of blood (8–12 hours after a meal) is [BHU 1981]
(a) 8mg (b) 80mg
(c) 200mg (d) 800mg
43. Molar solution is [MP PMT 2003] 1 mole of solute present in [BCECE 2005]
(a) 1000g of solvent (b) 1 litre of solvent
(c) 1 litre of solution (d) 1000g of solution
44. What will be the molality of a solution having 18g of glucose (mol. wt. = 180) dissolved in 500g of water [MP PET/PMT 1998; CBSE PMT 2000; JIPMER 2001]
(a) 1m (b) 0.5m
(c) 0.2m (d) 2m
45. A solution of $Al_2(SO_4)_3$ { $d = 1.253 \text{ gm/ml}$ } contain 22% salt by weight. The molarity, normality and molality of the solution is
(a) 0.805 M, 4.83 N, 0.825 M
(b) 0.825 M, 48.3 N, 0.805 M
(c) 4.83 M, 4.83 N, 4.83 M
(d) None
46. Which of the following should be done in order to prepare 0.40M NaCl starting with 100 ml of 0.30M NaCl (mol.wt. of NaCl = 58.5) [BIT 1992]
(a) Add 0.585 g NaCl (b) Add 20 ml water
(c) Add 0.010ml NaCl (d) Evaporate 10ml water
47. Which of the following solutions has the highest normality [JIPMER 1991]
(a) 8 gm of KOH / litre (b) N phosphoric acid
(c) 6 gm of NaOH / 100 ml (d) 0.5M H_2SO_4
48. What volume of 0.8 M solution contains 0.1 mole of the solute
(a) 100ml (b) 125ml
(c) 500ml (d) 62.5ml
49. Hydrochloric acid solution A and B have concentration of 0.5N and 0.1N respectively. The volumes of solutions A and B required to make 2litres of 0.2N HCl are [KCET 1993]
(a) 0.5l of A + 1.5l of B
(b) 1.5l of A + 0.5l of B
(c) 1.0l of A + 1.0l of B
(d) 0.75l of A + 1.25l of B
50. Conc. H_2SO_4 has a density of 1.98 gm/ml and is 98% H_2SO_4 by weight. Its normality is [MP PET 2002]
(a) 2 N (b) 19.8 N
(c) 39.6 N (d) 98 N
51. The mole fraction of the solute in one molal aqueous solution is [CBSE PMT 2000]
(a) 0.027 (b) 0.036
(c) 0.018 (d) 0.009
52. With 63 gm of oxalic acid how many litres of $\frac{N}{10}$ solution can be prepared [RPET 1999]
(a) 100 litre (b) 10 litre
(c) 1 litre (d) 1000 litre
53. Molarity of 0.2N H_2SO_4 is [KCET 2005]
(a) 0.2 (b) 0.4
(c) 0.6 (d) 0.1
54. 10.6 grams of a substance of molecular weight 106 was dissolved in 100ml. 10ml of this solution was pipetted out into a 1000ml flask and made up to the mark with distilled water. The molarity of the resulting solution is [EAMCET 1998]
(a) 1.0M (b) 10^{-2} M

[EAMCET 1987]

- (c) $10^{-3} M$ (d) $10^{-4} M$
55. The mole fraction of water in 20% aqueous solution of H_2O_2 is
 (a) $\frac{77}{68}$ (b) $\frac{68}{77}$
 (c) $\frac{20}{80}$ (d) $\frac{80}{20}$
56. Mole fraction (X) of any solution is equal to
 (a) $\frac{\text{No. of moles of solute}}{\text{Volume of solution in litre}}$
 (b) $\frac{\text{No. of gram equivalent of solute}}{\text{Volume of solution in litre}}$
 (c) $\frac{\text{No. of moles of solute}}{\text{Mass of solvent in kg}}$
 (d) $\frac{\text{No. of moles of any constituent}}{\text{Total no. of moles of all constituents}}$
57. When $W_B \text{ gm}$ solute (molecular mass M_B) dissolves in $W_A \text{ gm}$ solvent. The molality M of the solution is
 (a) $\frac{W_B}{W_A} \times \frac{M_B}{1000}$ (b) $\frac{W_B}{M_B} \times \frac{1000}{W_A}$
 (c) $\frac{W_A}{W_B} \times \frac{1000}{M_B}$ (d) $\frac{W_A \times M_B}{W_B \times 1000}$
58. Normality (N) of a solution is equal to
 (a) $\frac{\text{No. of moles of solute}}{\text{Volume of solution in litre}}$
 (b) $\frac{\text{No. of gram equivalent of solute}}{\text{Volume of solution in litre}}$
 (c) $\frac{\text{No. of moles of solute}}{\text{Mass of solvent in kg}}$
 (d) None of these
59. The volume strength of $1.5 N H_2O_2$ solution is
 (a) 4.8 (b) 5.2
 (c) 8.8 (d) 8.4 [CBSE PMT 1997; BHU 2002]
60. How many gm of H_2SO_4 is present in 0.25 gm mole of H_2SO_4 [CPMT 1990]
 (a) 24.5 (b) 2.45
 (c) 0.25 (d) 0.245
61. 20 g of hydrogen is present in 5 litre vessel. The molar concentration of hydrogen is [DPMT 2000]
 (a) 4 (b) 1
 (c) 3 (d) 2
62. To prepare a solution of concentration of 0.03 g/ml of $AgNO_3$, what amount of $AgNO_3$ should be added in 60 ml of solution [AFMC 2005]
 (a) 1.8 (b) 0.8
 (c) 0.18 (d) None of these
63. How many grams of dibasic acid (mol. wt. 200) should be present in 100 ml of its aqueous solution to give decinormal strength [AIIMS 1992; CBSE PMT 1999; AFMC 1999; KCET 2000; CPMT 2001]
 (a) 1 g (b) 2 g
 (c) 10 g (d) 20 g
64. The weight of pure $NaOH$ required to prepare 250 cm^3 of $0.1 N$ solution is [KCET 1991; Kerala PMT 2004]
 (a) 4 g (b) 1 g
 (c) 2 g (d) 10 g
65. If 20 ml of $0.4 N NaOH$ solution completely neutralises 40 ml of a dibasic acid. The molarity of the acid solution is
 (a) $0.1 M$ (b) $0.2 M$
 (c) $0.3 M$ (d) $0.4 M$ [EAMCET 1993]
66. Which of the following concentration factor is affected by change in temperature [DCE 2002]
 (a) Molarity (b) Molality
 (c) Mole fraction (d) Weight fraction
67. The distribution law is applied for the distribution of basic acid between [UPSEAT 2001]
 (a) Water and ethyl alcohol
 (b) Water and amyl alcohol
 (c) Water and sulphuric acid
 (d) Water and liquor ammonia
68. Which is heaviest [CBSE PMT 1991]
 (a) 25 gm of mercury
 (b) 2 moles of water
 (c) 2 moles of carbon dioxide
 (d) 4 gm atoms of oxygen
69. The molarity of a solution of Na_2CO_3 having $10.6 \text{ g}/500 \text{ ml}$ of solution is [AFMC 1992; DCE 2000]
 (a) $0.2 M$ (b) $2 M$
 (c) $20 M$ (d) $0.02 M$
70. On passing H_2S gas through a solution of Cu^{+} and Zn^{+2} ions, CuS is precipitated first because [AMU 2001]
 (a) Solubility product of CuS is equal to the ionic product of ZnS
 (b) Solubility product of CuS is equal to the solubility product of ZnS
 (c) Solubility product of CuS is lower than the solubility product of ZnS
 (d) Solubility product of CuS is greater than the solubility product of ZnS
71. The number of moles of solute per kg of a solvent is called its [DPMT 1983; IIT 1983]
 (a) Molarity (b) Normality
 (c) Molar fraction (d) Molality
72. 1.0 gm of pure calcium carbonate was found to require 50 ml of dilute HCl for complete reaction. The strength of the HCl solution is given by [CPMT 1986]
 (a) $4 N$ (b) $2 N$
 (c) $0.4 N$ (d) $0.2 N$
73. Molecular weight of glucose is 180. A solution of glucose which contains 18 gms per litre is [AFMC 1978]
 (a) 2 molal (b) 1 molal
 (c) 0.1 molal (d) 18 molal
74. $0.5 M$ of H_2SO_4 is diluted from 1 litre to 10 litre , normality of resulting solution is [AFMC 2005]
 (a) $1 N$ (b) $0.1 N$
 (c) $10 N$ (d) $11 N$
75. If one mole of a substance is present in 1 kg of solvent, then [CPMT 1996]
 (a) It shows molar concentration
 (b) It shows molal concentration
 (c) It shows normality
 (d) It shows strength gm/gm
76. The molality of 90% H_2SO_4 solution is [density = 1.8 gm/ml] [MP PMT 2004]
 (a) 1.8 (b) 48.4
 (c) 9.18 (d) 94.6
77. The volume of water to be added to 100 cm^3 of $0.5 N H_2SO_4$ to get decinormal concentration is [KCET (Engg.) 2001]
 (a) 400 cm^3 (b) 500 cm^3
 (c) 450 cm^3 (d) 100 cm^3

78. If 25 ml of 0.25 M NaCl solution is diluted with water to a volume of 500 ml the new concentration of the solution is [UPSEAT 2000, 01]
 (a) 0.167 M (b) 0.0125 M
 (c) 0.833 M (d) 0.0167 M
79. 10 grams of a solute is dissolved in 90 grams of a solvent. Its mass percent in solution is
 (a) 0.01 (b) 11.1
 (c) 10 (d) 9
80. What is the molality of a solution which contains 18 g of glucose ($C_6H_{12}O_6$) in 250 g of water [UPSEAT 2001]
 (a) 4.0 m (b) 0.4 m
 (c) 4.2 m (d) 0.8 m
81. Calculate the molality of 1 litre solution of 93% H_2SO_4 (weight/volume). The density of the solution is 1.84 g/ml [UPSEAT 2000]
 (a) 10.43 (b) 20.36
 (c) 12.05 (d) 14.05
82. Volume of water needed to mix with 10 ml 10N HNO_3 to get 0.1 N HNO_3 [UPSEAT 2003]
 (a) 1000 ml (b) 990 ml
 (c) 1010 ml (d) 10 ml
83. The sum of the mole fraction of the components of a solution is
 (a) 0 (b) 1
 (c) 2 (d) 4
84. Increasing the temperature of an aqueous solution will cause [IIT Screening 1993]
 (a) Decrease in molality (b) Decrease in molarity
 (c) Decrease in mole fraction (d) Decrease in % w/w
85. 1000 gms aqueous solution of $CaCO_3$ contains 10 gms of carbonate. Concentration of the solution is [CPMT 1985]
 (a) 10 ppm (b) 100 ppm
 (c) 1000 ppm (d) 10000 ppm
86. 3.65 gms of HCl is dissolved in 16.2 gms of water. The mole fraction of HCl in the resulting solution is [EAMCET 2003]
 (a) 0.4 (b) 0.3
 (c) 0.2 (d) 0.1
87. An aqueous solution of glucose is 10% in strength. The volume in which 1 gm mole of it is dissolved will be [AIIMS 1992; Pb. CET 2004]
 (a) 18 litre (b) 9 litre
 (c) 0.9 litre (d) 1.8 litre
88. The concentration of an aqueous solution of 0.01M CH_3OH solution is very nearly equal to which of the following
 (a) 0.01% CH_3OH (b) 0.01m CH_3OH
 (c) $x_{CH_3OH} = 0.01$ (d) 0.99M H_2O
 (e) 0.01N CH_3OH
89. When 1.80 gm glucose dissolve in 90 gm of H_2O , the mole fraction of glucose is [AFMC 2000]
 (a) 0.00399 (b) 0.00199
 (c) 0.0199 (d) 0.998
90. 6.02×10^{20} molecules of urea are present in 100 ml of its solution. The concentration of urea solution is [AIEEE 2004]
 (a) 0.02 M (b) 0.01 M
 (c) 0.001 M (d) 0.1 M
 (Avogadro constant, $N_A = 6.02 \times 10^{23} \text{ mol}^{-1}$)
91. The number of moles of SO_2Cl_2 in 13.5 gm is [CPMT 1994]
 (a) 0.1 (b) 0.2
 (c) 0.3 (d) 0.4
92. The weight of $H_2C_2O_4 \cdot 2H_2O$ required to prepare 500 ml of 0.2N solution is [EAMCET 1991]
 (a) 126g (b) 12.6g
 (c) 63g (d) 6.3g
93. In a solution of 7.8 gm benzene C_6H_6 and 46.0 gm toluene ($C_6H_5CH_3$), the mole fraction of benzene in this solution is
 (a) 1/6 (b) 1/5
 (c) 1/2 (d) 1/3
94. A solution contains 25% H_2O , 25% C_2H_5OH and 50% CH_3COOH by mass. The mole fraction of H_2O would be
 (a) 0.25 (b) 2.5
 (c) 0.503 (d) 5.03
95. A 5 molar solution of H_2SO_4 is diluted from 1 litre to 10 litres. What is the normality of the solution [AFMC 2005]
 (a) 0.25 N (b) 1 N
 (c) 2 N (d) 7 N
96. Molarity of a solution containing 1g NaOH in 250 ml of solution is [EAMCET 1990]
 (a) 0.1M (b) 1M
 (c) 0.01M (d) 0.001M
97. What is molarity of a solution of HCl which contains 49% by weight of solute and whose specific gravity is 1.41 [CPMT 2001; CBSE PMT 2001]
 (a) 15.25 (b) 16.75
 (c) 18.92 (d) 20.08
98. NaClO solution reacts with H_2SO_3 as, $NaClO + H_2SO_3 \rightarrow NaCl + H_2SO_4$. A solution of NaClO used in the above reaction contained 15g of NaClO per litre. The normality of the solution would be [AMU 1999]
 (a) 0.8 (b) 0.6
 (c) 0.2 (d) 0.33
99. A solution contains 1.2046×10^{24} hydrochloric acid molecules in one dm^3 of the solution. The strength of the solution is [KCET 2004]
 (a) 6 N (b) 2 N
 (c) 4 N (d) 8 N
100. 10N and $\frac{1}{10}$ N solution is called [BITS 1992]
 (a) Decanormal and decanormal solution
 (b) Normal and decinormal solution
 (c) Normal and decanormal solution
 (d) Decanormal and decinormal solution
101. When 7.1 gm Na_2SO_4 (molecular mass 142) dissolves in 100 ml H_2O , the molarity of the solution is [CBSE PMT 1991; MP PET 1993, 95]
 (a) 2.0 M (b) 1.0 M
 (c) 0.5 M (d) 0.05 M
102. Molarity of 4% NaOH solution is [EAMCET 1987]
 (a) 0.1M (b) 0.5M
 (c) 0.01M (d) 1.0M
103. When 6gm urea dissolve in 180 gm H_2O . The mole fraction of urea is [CPMT 1988]
 (a) $\frac{10}{10.1}$ (b) $\frac{10.1}{10}$

- (c) $\frac{10.1}{0.1}$ (d) $\frac{0.1}{10.1}$
104. The normality of 10% (weight/volume) acetic acid is [CPMT 1983]
(a) 1 N (b) 10 N
(c) 1.7 N (d) 0.83 N
105. Unit of mole fraction is [BHU 1998, 2005]
(a) Moles/litre (b) Moles/litre
(c) Moles–litre (d) Dimensionless
106. Normality of 2M sulphuric acid is [AIIMS 1991, 92; Pb. CET 2002]
(a) 2N (b) 4N
(c) N/2 (d) N/4
107. Molar concentration (M) of any solution =
(a) $\frac{\text{No. of moles of solute}}{\text{Volume of solution in litre}}$
(b) $\frac{\text{No. of gram equivalent of solute}}{\text{Volume of solution in litre}}$
(c) $\frac{\text{No. of moles of solute}}{\text{Mass of solvent in kg}}$
(d) $\frac{\text{No. of moles of any constituent}}{\text{Total no. of moles of all constituents}}$
108. If 5.0 gm of $BaCl_2$ is present in 10^6 gm solution, the concentration is
(a) 1 ppm (b) 5 ppm
(c) 50 ppm (d) 1000 ppm
109. 1 Molar solution contains [DPMT 2002]
(a) 1000g of solute (b) 1000g of solvent
(c) 1 litre of solvent (d) 1 litre of solution
110. To neutralise completely 20 mL of 0.1 M aqueous solution of phosphorous acid (H_3PO_3), the volume of 0.1 M aqueous KOH solution required is [AIEEE 2004]
(a) 40 mL (b) 20 mL
(c) 10 mL (d) 60 mL
111. On dissolving 1 mole of each of the following acids in 1 litre water, the acid which does not give a solution of strength 1N is
(a) HCl (b) Perchloric acid
(c) HNO_3 (d) Phosphoric acid
112. How many grams of NaOH will be required to neutralize 12.2 grams of benzoic acid [MP PMT 1999]
(a) 40 gms (b) 4 gms
(c) 16 gms (d) 12.2 gms
113. 10ml of conc. H_2SO_4 (18 molar) is diluted to 1 litre. The approximate strength of dilute acid could be [JIPMER 1991]
(a) 0.18 N (b) 0.09 N
(c) 0.36 N (d) 1800 N
114. The normality of 10 lit. volume hydrogen peroxide is [Kerala CET (Med.) 2003]
(a) 0.176 (b) 3.52
(c) 1.78 (d) 0.88
(e) 17.8
115. Essential quantity of ammonium sulphate taken for preparation of 1 molar solution in 2 litres is
(a) 132 gm (b) 264 gm
(c) 198 gm (d) 212 gm
116. In a mixture of 1 gm H_2 and 8 gm O_2 , the mole fraction of hydrogen is [Orissa JEE 2002]
(a) 0.667 (b) 0.5
- (c) 0.33 (d) None of these
117. A solution of $CaCl_2$ is 0.5 mol/litre, then the moles of chloride ion in 500ml will be [MP PMT 1986]
(a) 0.25 (b) 0.50
(c) 0.75 (d) 1.00
118. What is the molarity of H_2SO_4 solution, that has a density 1.84 gm/cc at $35^\circ C$ and contains solute 98% by weight [AIIMS 2001]
(a) 4.18 M (b) 8.14 M
(c) 18.4 M (d) 18 M
119. A certain aqueous solution of $FeCl_3$ (formula mass =162) has a density of 1.1 g/ml and contains 20.0% $FeCl_3$. Molar concentration of this solution is [Pb. PMT 1998]
(a) 0.028 (b) 0.163
(c) 1.27 (d) 1.47
120. If 0.50 mol of $CaCl_2$ is mixed with 0.20 mol of Na_3PO_4 , the maximum number of moles of $Ca_3(PO_4)_2$ which can be formed, is [Pb. PMT 1998]
(a) 0.70 (b) 0.50
(c) 0.20 (d) 0.10
121. An X molal solution of a compound in benzene has mole fraction of solute equal to 0.2. The value of X is [KCET 1996; DCE 2001]
(a) 14 (b) 3.2
(c) 4 (d) 2
122. Molecular weight of urea is 60. A solution of urea containing 6g urea in one litre is [BHU 1996, 99]
(a) 1 molar (b) 1.5 molar
(c) 0.1 molar (d) 0.01 molar
123. The molar solution of sulphuric acid is equal to [MP PET 1999]
(a) N solution (b) 2N solution
(c) N/2 solution (d) 3N solution
124. The weight of sodium carbonate required to prepare 500 ml of a semi-normal solution is [JIPMER 1999]
(a) 13.25 g (b) 26.5 g
(c) 53 g (d) 6.125 g
125. 200ml of a solution contains 5.85 g dissolved sodium chloride. The concentration of the solution will be ($Na = 23; Cl = 35.5$) [MP PMT 1999]
(a) 1 molar (b) 2 molar
(c) 0.5 molar (d) 0.25 molar
126. Molarity of a solution prepared by dissolving 75.5 g of pure KOH in 540 ml solution is [BHU 1999]
(a) 3.05 M (b) 1.35 M
(c) 2.50 M (d) 4.50 M
127. Which one of the following is an extensive property [KCET 1998]
(a) Molar volume (b) Molarity
(c) Number of moles (d) Mole fraction
128. Addition of conc. HCl to saturated $BaCl_2$ solution precipitates $BaCl_2$; because [AMU 2000]
(a) It follows from Le Chatelier's principle
(b) Of common-ion effect
(c) Ionic product (Ba^{++}), (Cl^-) remains constant in a saturated solution
(d) At constant temperature, the product (Ba^{2+}), (Cl^-)² remains constant in a saturated solution

129. How much water is needed to dilute 10 ml of 10 N hydrochloric acid to make it exactly decinormal (0.1 N) [EAMCET 1982]
(a) 990 ml (b) 1000 ml
(c) 1010 ml (d) 100 ml
130. The formula weight of H_2SO_4 is 98. The weight of the acid in 400 ml of 0.1 M solution is [EAMCET 1987]
(a) 2.45 g (b) 3.92 g
(c) 4.90 g (d) 9.8 g
131. The molarity of pure water is [CPMT 1974, 88, 90; CMC Vellore 1991; RPET 1999; NCERT 1974, 76; MP PMT 1999; AMU 2002]
(a) 55.6 (b) 5.56
(c) 100 (d) 18
132. The molarity of a 0.2 N Na_2CO_3 solution will be [MP PMT 1987; Pb. CET 2004]
(a) 0.05 M (b) 0.2 M
(c) 0.1 M (d) 0.4 M
133. How many moles of water are present in 180 g of water [JIPMER 1991; DPMT 1982; Manipal MEE 1995]
(a) 1 mole (b) 18 mole
(c) 10 mole (d) 100 mole
134. If we take 44 g of CO_2 and 14 g of N_2 what will be mole fraction of CO_2 in the mixture [KCET 1990]
(a) 1/5 (b) 1/3
(c) 2/3 (d) 1/4
135. What is the volume of 0.1 N HCl required to react completely with 1.0 g of pure calcium carbonate ($Ca = 40, C = 12$ and $O = 16$) [KCET 1998]
(a) 150 cm^3 (b) 250 cm^3
(c) 200 cm^3 (d) 100 cm^3
136. The amount of NaOH in gms in 250 cm^3 of a 0.100 M NaOH solution would be
(a) 4 gm (b) 2 gm
(c) 1 gm (d) 2.5 gm
137. 4.0 gm of NaOH are contained in one decilitre of solution. Its molarity would be
(a) 4 M (b) 2 M
(c) 1 M (d) 1.5 M
138. When 90 gm of water is mixed with 300 gm of acetic acid. The total number of moles will be
(a) 5 (b) 10
(c) 15 (d) 20
139. A molal solution is one that contains one mole of a solute in [NCERT 1983; DPMT 1983; CPMT 1985; IIT 1986; MP PMT 1987; EAMCET 1990; MP PET 1994, 99]
(a) 1000 gm of the solvent
(b) One litre of the solvent
(c) One litre of the solution
(d) 22.4 litres of the solution
140. What weight of ferrous ammonium sulphate is needed to prepare 100 ml of 0.1 normal solution (mol. wt. 392) [CPMT 1983]
(a) 39.2 gm (b) 3.92 gm
(c) 1.96 gm (d) 19.6 gm
141. If 18 gm of glucose ($C_6H_{12}O_6$) is present in 1000 gm of an aqueous solution of glucose, it is said to be [CPMT 1986]
(a) 1 molal (b) 1.1 molal
(c) 0.5 molal (d) 0.1 molal
142. The number of moles of KCl in 1000 ml of 3 molar solution is
(a) 1 (b) 2
(c) 3 (d) 1.5
143. The unit of molality is [Pb. CET 2003]
(a) Mole per litre (b) Mole per kilogram
(c) Per mole per litre (d) Mole litre
144. A solution contains 1 mole of water and 4 mole of ethanol. The mole fraction of water and ethanol will be
(a) 0.2 water + 0.8 ethanol
(b) 0.4 water + 0.6 ethanol
(c) 0.6 water + 0.8 ethanol
(d) 0.8 water + 0.2 ethanol

Colligative properties

1. The magnitude of colligative properties in all colloidal dispersions is ...than solution [AMU 1999]
(a) Lower (b) Higher
(c) Both (d) None
2. Equimolar solutions in the same solvent have [AIEEE 2005]
(a) Same boiling point but different freezing point
(b) Same freezing point but different boiling point
(c) Same boiling and same freezing points
(d) Different boiling and different freezing points
3. Which of the following is a colligative property [AFMC 1992; CBSE PMT 1992; MP PMT 1996, 2003]
(a) Osmotic pressure (b) Boiling point
(c) Vapour pressure (d) Freezing point
4. The colligative properties of a solution depend on [CPMT 1984; MP PMT 1993; UPSEAT 2001; Kerala PMT 2002]
(a) Nature of solute particles present in it
(b) Nature of solvent used
(c) Number of solute particles present in it
(d) Number of moles of solvent only
5. Which of the following is not a colligative property [BHU 1982; CPMT 1988; DPMT 1985; MP PET 1999]
(a) Osmotic pressure
(b) Elevation in B.P.
(c) Vapour pressure
(d) Depression in freezing point
6. Which of the following is not a colligative property [MP PET 2001; CPMT 2001; Pb. CET 2001]
(a) Optical activity
(b) Elevation in boiling point
(c) Osmotic pressure
(d) Lowering of vapour pressure
7. Colligative properties of a solution depends upon [MP PMT 1994, 2002]
(a) Nature of both solvent and solute

- (b) The relative number of solute and solvent particles
(c) Nature of solute only
(d) Nature of solvent only
8. Which is not a colligative property
[CPMT 1984; BHU 1982; Manipal MEE 1995]
- (a) Refractive index
(b) Lowering of vapour pressure
(c) Depression of freezing point
(d) Elevation of boiling point
9. Which of the following is a colligative property
[BHU 1990; NCERT 1983; MP PMT 1983; DPMT 1981, 83; MP PET/PMT 1998; AIIMS 1999; Pb. CET 2000]
- (a) Surface tension (b) Viscosity
(c) Osmotic pressure (d) Optical rotation
10. Colligative properties are used for the determination of
[Kerala CET (Engg.) 2002]
- (a) Molar Mass
(b) Equivalent weight
(c) Arrangement of molecules
(d) Melting point and boiling point
(d) Both (a) and (b)
11. What does not change on changing temperature
[DCE 2001]
- (a) Mole fraction (b) Normality
(c) Molality (d) None of these

Lowering of vapour pressure

1. Vapour pressure of CCl_4 at $25^\circ C$ is 143 mm of Hg . 0.5 gm of a non-volatile solute (mol. wt. = 65) is dissolved in $100 \text{ ml } CCl_4$. Find the vapour pressure of the solution (Density of $CCl_4 = 1.58 \text{ g/cm}^3$)
[CBSE PMT 1998]
- (a) 141.43 mm (b) 94.39 mm
(c) 199.34 mm (d) 143.99 mm
2. For a solution of volatile liquids the partial vapour pressure of each component in solution is directly proportional to
(a) Molarity (b) Mole fraction
(c) Molality (d) Normality
3. "The relative lowering of the vapour pressure is equal to the mole fraction of the solute." This law is called
[MP PET 1997, 2001]
- (a) Henry's law (b) Raoult's law
(c) Ostwald's law (d) Arrhenius's law
4. The relative lowering of vapour pressure produced by dissolving 71.5 g of a substance in 1000 g of water is 0.00713 . The molecular weight of the substance will be
[DPMT 2001]
- (a) 18.0 (b) 342
(c) 60 (d) 180
5. When mercuric iodide is added to the aqueous solution of potassium iodide, the
[IIT 1987]
- (a) Freezing point is raised
(b) Freezing point is lowered
(c) Freezing point does not change
(d) Boiling point does not change
6. Vapour pressure of a solution is
[EAMCET 1988; MP PET 1994]
- (a) Directly proportional to the mole fraction of the solvent
(b) Inversely proportional to the mole fraction of the solute
(c) Inversely proportional to the mole fraction of the solvent
(d) Directly proportional to the mole fraction of the solute
7. When a substance is dissolved in a solvent the vapour pressure of the solvent is decreased. This results in
[NCERT 1981]
- (a) An increase in the b.p. of the solution
(b) A decrease in the b.p. of the solvent
(c) The solution having a higher freezing point than the solvent
(d) The solution having a lower osmotic pressure than the solvent
8. If P° and P are the vapour pressure of a solvent and its solution respectively and N_1 and N_2 are the mole fractions of the solvent and solute respectively, then correct relation is
- (a) $P = P^\circ N_1$ (b) $P = P^\circ N_2$
(c) $P^\circ = P N_2$ (d) $P = P^\circ (N_1 / N_2)$
9. An aqueous solution of methanol in water has vapour pressure
- (a) Equal to that of water
(b) Equal to that of methanol
(c) More than that of water
(d) Less than that of water
10. The pressure under which liquid and vapour can coexist at equilibrium is called the
- (a) Limiting vapour pressure
(b) Real vapour pressure
(c) Normal vapour pressure
(d) Saturated vapour pressure
11. Which solution will show the maximum vapour pressure at 300 K
- (a) $1 \text{ M } C_{12}H_{22}O_{11}$ (b) $1 \text{ M } CH_3COOH$
(c) $1 \text{ M } NaCl_2$ (d) $1 \text{ M } NaCl$
12. The relative lowering of the vapour pressure is equal to the ratio between the number of
[EAMCET 1991; CBSE PMT 1991]
- (a) Solute molecules and solvent molecules
(b) Solute molecules and the total molecules in the solution
(c) Solvent molecules and the total molecules in the solution
(d) Solvent molecules and the total number of ions of the solute
13. 5 cm^3 of acetone is added to 100 cm^3 of water, the vapour pressure of water over the solution
- (a) It will be equal to the vapour pressure of pure water
(b) It will be less than the vapour pressure of pure water
(c) It will be greater than the vapour pressure of pure water
(d) It will be very large
14. At 300 K , when a solute is added to a solvent its vapour pressure over the mercury reduces from 50 mm to 45 mm . The value of mole fraction of solute will be
- (a) 0.005 (b) 0.010
(c) 0.100 (d) 0.900
15. A solution has a 1 : 4 mole ratio of pentane to hexane. The vapour pressure of the pure hydrocarbons at $20^\circ C$ are 440 mmHg for pentane and 120 mmHg for hexane. The mole fraction of pentane in the vapour phase would be
[CBSE PMT 2005]
- (a) 0.549 (b) 0.200
(c) 0.786 (d) 0.478
16. Benzene and toluene form nearly ideal solutions. At $20^\circ C$, the vapour pressure of benzene is 75 torr and that of toluene is 22 torr . The partial vapour pressure of benzene at $20^\circ C$ for a solution containing 78 g of benzene and 46 g of toluene in torr is [AIEEE 2005]
- (a) 50 (b) 25

- (c) 37.5 (d) 53.5
17. The vapour pressure lowering caused by the addition of 100 g of sucrose (molecular mass = 342) to 1000 g of water if the vapour pressure of pure water at 25°C is 23.8 mm Hg [RPET 1999]
- (a) 1.25 mm Hg (b) 0.125 mm Hg
(c) 1.15 mm Hg (d) 0.012 mm Hg
18. Which of the following is incorrect [J & K 2005]
- (a) Relative lowering of vapour pressure is independent
(b) The vapour pressure is a colligative property
(c) Vapour pressure of a solution is lower than the vapour pressure of the solvent
(d) The relative lowering of vapour pressure is directly proportional to the original pressure
19. Among the following substances the lowest vapour pressure is exerted by
- (a) Water (b) Mercury
(c) Kerosene (d) Rectified spirit
20. According to Raoult's law the relative lowering of vapour pressure of a solution of volatile substance is equal to [CBSE PMT 1995; BHU 2001]
- (a) Mole fraction of the solvent
(b) Mole fraction of the solute
(c) Weight percentage of a solute
(d) Weight percentage of a solvent
21. When a substance is dissolved in a solvent, the vapour pressure of the solvent is decreased. This results in [MP PMT 1983; NCERT 1981]
- (a) An increase in the boiling point of the solution
(b) A decrease in the boiling point of solvent
(c) The solution having a higher freezing point than the solvent
(d) The solution having a lower osmotic pressure than the solvent
22. The vapour pressure of a liquid depends on
- (a) Temperature but not on volume
(b) Volume but not on temperature
(c) Temperature and volume
(d) Neither on temperature nor on volume
23. Which one of the statements given below concerning properties of solutions, describes a colligative effect [AIIMS 2003]
- (a) Boiling point of pure water decreases by the addition of ethanol
(b) Vapour pressure of pure water decreases by the addition of nitric acid
(c) Vapour pressure of pure benzene decreases by the addition of naphthalene
(d) Boiling point of pure benzene increases by the addition of toluene
24. The atmospheric pressure is sum of the [Kerala CET (Med.) 2002]
- (a) Pressure of the biomolecules
(b) Vapour pressure of atmospheric constituents
(c) Vapour pressure of chemicals and vapour pressure of volatiles
(d) Pressure created on to atmospheric molecules
25. The vapour pressure of pure liquid A is 0.80 atm. On mixing a non-volatile B to A, its vapour pressure becomes 0.6 atm. The mole fraction of B in the solution is [MP PET 2003]
- (a) 0.150 (b) 0.25
(c) 0.50 (d) 0.75
26. Lowering of vapour pressure is highest for [BHU 1997]
- (a) Urea (b) 0.1M glucose
(c) 0.1M MgSO₄ (d) 0.1M BaCl₂
27. An aqueous solution of glucose was prepared by dissolving 18 g of glucose in 90 g of water. The relative lowering in vapour pressure is [KCET 2002]
- (a) 0.02 (b) 1
- (c) 20 (d) 180
28. "Relative lowering in vapour pressure of solution containing non-volatile solute is directly proportional to mole fraction of solute". Above statement is [AFMC 2004]
- (a) Henry law (b) Dulong and Petit law
(c) Raoult's law (d) Le-Chatelier's principle
29. An ideal solution was obtained by mixing methanol and ethanol. If the partial vapour pressure of methanol and ethanol are 2.619 kPa and 4.556 kPa respectively, the composition of the vapour (in terms of mole fraction) will be [Pb. PMT 1998]
- (a) 0.635 methanol, 0.365 ethanol
(b) 0.365 methanol, 0.635 ethanol
(c) 0.574 methanol, 0.326 ethanol
(d) 0.173 methanol, 0.827 ethanol
30. The vapour pressure of two liquids P and Q are 80 and 600 torr, respectively. The total vapour pressure of solution obtained by mixing 3 mole of P and 2 mole of Q would be [CBSE PMT 2005]
- (a) 140 torr (b) 20 torr
(c) 68 torr (d) 72 torr
31. The vapour pressure of benzene at a certain temperature is 640 mm of Hg. A non-volatile and non-electrolyte solid weighing 2.175 g is added to 39.08 g of benzene. The vapour pressure of the solution is 600 mm of Hg. What is the molecular weight of solid substance [CBSE PMT 1999; AFMC 1999]
- (a) 49.50 (b) 59.6
(c) 69.5 (d) 79.8
32. Which one of the following is the expression of Raoult's law
- (a) $\frac{p - p_s}{p} = \frac{n}{n + N}$ (b) $\frac{p_s - p}{p} = \frac{N}{N + n}$
(c) $\frac{p - p_s}{p_s} = \frac{N}{N - n}$ (d) $\frac{p_s - p}{p_s} = \frac{N - n}{N}$
- p = vapour pressure of pure solvent
 p_s = vapour pressure of the solution
 n = number of moles of the solute
 N = number of moles of the solvent
33. Which has maximum vapour pressure [DPMT 2001]
- (a) HI (b) HBr
(c) HCl (d) HF
34. When a non-volatile solute is dissolved in a solvent, the relative lowering of vapour pressure is equal to [BHU 1979; IIT 1983]
- (a) Mole fraction of solute
(b) Mole fraction of solvent
(c) Concentration of the solute in grams per litre
(d) Concentration of the solute in grams 100 ml
35. 60 gm of Urea (Mol. wt 60) was dissolved in 9.9 moles, of water. If the vapour pressure of pure water is P_o , the vapour pressure of solution is [DCE 2000]
- (a) 0.10 P_o (b) 1.10 P_o
(c) 0.90 P_o (d) 0.99 P_o
36. The vapour pressure of water at 20°C is 17.54 mm. When 20 g of a non-ionic, substance is dissolved in 100 g of water, the vapour

- pressure is lowered by 0.30 mm. What is the molecular weight of the substances [UPSEAT 2001]
- (a) 210.2 (b) 206.88
(c) 215.2 (d) 200.8
37. In an experiment, 1 g of a non-volatile solute was dissolved in 100 g of acetone (mol. mass = 58) at 298 K. The vapour pressure of the solution was found to be 192.5 mm Hg. The molecular weight of the solute is (vapour pressure of acetone = 195 mm Hg) [CPMT 2001; CBSE PMT 2001; Pb CET 2002]
- (a) 25.24 (b) 35.24
(c) 45.24 (d) 55.24
38. How many grams of CH_3OH should be added to water to prepare 150 ml solution of 2 M CH_3OH [CBSE PMT 1994]
- (a) 9.6 (b) 2.4
(c) 9.6×10^3 (d) 2.4×10^3
39. The vapour pressure of a solvent decreased by 10 mm of mercury, when a non-volatile solute was added to the solvent. The mole fraction of the solute in the solution is 0.2. What should be the mole fraction of the solvent, if decrease in the vapour pressure is to be 20 mm of mercury [CBSE PMT 1998]
- (a) 0.8 (b) 0.6
(c) 0.4 (d) 0.2
40. For a dilute solution, Raoult's law states that [CPMT 1987; BHU 1979; IIT 1985; MP PMT 2004; MNR 1988; AMU 2002]
- (a) The lowering of vapour pressure is equal to mole fraction of solute
(b) The relative lowering of vapour pressure is equal to mole fraction of solute
(c) The relative lowering of vapour pressure is proportional to the amount of solute in solution
(d) The vapour pressure of the solution is equal to the mole fraction of solvent
41. The vapour pressure of a solvent A is 0.80 atm. When a non-volatile substance B is added to this solvent its vapour pressure drops to 0.6 atm. What is mole fraction of B in solution
- (a) 0.25 (b) 0.50
(c) 0.75 (d) 0.90
42. Determination of correct molecular mass from Raoult's law is applicable to
- (a) An electrolyte in solution
(b) A non-electrolyte in a dilute solution
(c) A non-electrolyte in a concentrated solution
(d) An electrolyte in a liquid solvent
43. If two substances A and B have $P_A^0 : P_B^0 = 1 : 2$ and have mole fraction in solution 1 : 2 then mole fraction of A in vapours
- (a) 0.33 (b) 0.25
(c) 0.52 (d) 0.2
44. A dry air is passed through the solution, containing the 10 gm of solute and 90 gm of water and then it pass through pure water. There is the depression in weight of solution wt by 2.5 gm and in weight of pure solvent by 0.05 gm. Calculate the molecular weight of solute [Kerala CET 2005]
- (a) 50 (b) 180
(c) 100 (d) 25
1. Which of the following liquid pairs shows a positive deviation from Raoult's law [MP PET 1993; UPSEAT 2001; AIEEE 2004]
- (a) Water-nitric acid (b) Benzene-methanol
(c) Water-hydrochloric acid (d) Acetone-chloroform
2. Which one of the following is non-ideal solution
- (a) Benzene + toluene
(b) *n*-hexane + *n*-heptane
(c) Ethyl bromide + ethyl iodide
(d) $CCl_4 + CHCl_3$
3. A non ideal solution was prepared by mixing 30 ml chloroform and 50 ml acetone. The volume of mixture will be [Pb. CET 2003]
- (a) > 80 ml (b) < 80 ml
(c) = 80 ml (d) ≥ 80 ml
4. Which pair from the following will not form an ideal solution
- (a) $CCl_4 + SiCl_4$ (b) $H_2O + C_4H_9OH$
(c) $C_2H_5Br + C_2H_5I$ (d) $C_6H_{14} + C_7H_{16}$
5. An ideal solution is that which [MP PMT 1996]
- (a) Shows positive deviation from Raoult's law
(b) Shows negative deviation from Raoult's law
(c) Has no connection with Raoult's law
(d) Obeys Raoult's law
6. Which one of the following mixtures can be separated into pure components by fractional distillation [CPMT 1987]
- (a) Benzene – toluene (b) Water – ethyl alcohol
(c) Water – nitric acid (d) Water – hydrochloric acid
7. All form ideal solutions except [DPMT 1983; MP PET 1997]
- (a) C_2H_5Br and C_2H_5I (b) C_6H_5Cl and C_6H_5Br
(c) C_6H_6 and $C_6H_5CH_3$ (d) C_2H_5I and C_2H_5OH
8. Which property is shown by an ideal solution [MP PET 2002]
- (a) It obeys Raoult's law (b) $\Delta H_{mix} = 0$
(c) $\Delta V_{mix} = 0$ (d) All of these
9. When two liquid A and B are mixed then their boiling points becomes greater than both of them. What is the nature of this solution
- (a) Ideal solution
(b) Positive deviation with non ideal solution
(c) Negative deviation with non ideal solution
(d) Normal solution
10. In mixture A and B components show –ve deviation as [AIEEE 2002]
- [DPMT 2005]
(a) $\Delta V_{mix} > 0$
(b) $\Delta H_{mix} < 0$
(c) A-B interaction is weaker than A-A and B-B interaction
(d) A-B interaction is strong than A-A and B-B interaction
11. In which case Raoult's law is not applicable
- (a) 1 M NaCl (b) 1 M urea
(c) 1 M glucose (d) 1 M sucrose
12. A solution that obeys Raoult's law is [EAMCET 1993]
- (a) Normal (b) Molar
(c) Ideal (d) Saturated
13. An example of near ideal solution is
- (a) *n*-heptane and *n*-hexane

- (b) $\text{CH}_3\text{COOH} + \text{C}_5\text{H}_5\text{N}$
 (c) $\text{CHCl}_3 + (\text{C}_2\text{H}_5)_2\text{O}$
 (d) $\text{H}_2\text{O} + \text{HNO}_3$
14. A mixture of liquid showing positive deviation in Raoult's law is
 (a) $(\text{CH}_3)_2\text{CO} + \text{C}_2\text{H}_5\text{OH}$ (b) $(\text{CH}_3)_2\text{CO} + \text{CHCl}_3$
 (c) $(\text{C}_2\text{H}_5)_2\text{O} + \text{CHCl}_3$ (d) $(\text{CH}_3)_2\text{CO} + \text{C}_6\text{H}_5\text{NH}_2$
15. All form ideal solution except [UPSEAT 2001]
 (a) $\text{C}_2\text{H}_5\text{Br}$ and $\text{C}_2\text{H}_5\text{I}$ (b) $\text{C}_2\text{H}_5\text{Cl}$ and $\text{C}_6\text{H}_5\text{Br}$
 (c) C_6H_6 and $\text{C}_6\text{H}_5\text{CH}_3$ (d) $\text{C}_2\text{H}_5\text{I}$ and $\text{C}_2\text{H}_5\text{OH}$
16. Formation of a solution from two components can be considered as
 (i) Pure solvent $\rightarrow$ separated solvent molecules ΔH
 (ii) Pure solute $\rightarrow$ separated solute molecules ΔH
 (iii) Separated solvent and solute molecules $\rightarrow$ solution ΔH
 Solution so formed will be ideal if
 (a) $\Delta H_{\text{soln}} = \Delta H_3 - \Delta H_1 - \Delta H_2$
 (b) $\Delta H_{\text{soln}} = \Delta H_1 + \Delta H_2 + \Delta H_3$
 (c) $\Delta H_{\text{soln}} = \Delta H_1 + \Delta H_2 - \Delta H_3$
 (d) $\Delta H_{\text{soln}} = \Delta H_1 - \Delta H_2 - \Delta H_3$
17. Identify the mixture that shows positive deviation from Raoult's law [Kerala CET (Eng.) 2002]
 (a) $\text{CHCl}_3 + (\text{CH}_3)_2\text{CO}$ (b) $(\text{CH}_3)_2\text{CO} + \text{C}_6\text{H}_5\text{NH}_2$
 (c) $\text{CHCl}_3 + \text{C}_6\text{H}_6$ (d) $(\text{CH}_3)_2\text{CO} + \text{CS}_2$
 (e) $\text{C}_6\text{H}_5\text{N} + \text{CH}_3\text{COOH}$
18. When acetone is added to chloroform, then hydrogen bond is formed between them. These liquids show
 (a) Positive deviation from Raoult's law
 (b) Negative deviation from Raoult's law
 (c) No deviation from Raoult's law
 (d) Volume is slightly increased
19. Which of the following is true when components forming an ideal solution are mixed [AMU 2000]
 (a) $\Delta H_m = \Delta V_m = 0$ (b) $\Delta H_m > \Delta V_m$
 (c) $\Delta H_m < \Delta V_m$ (d) $\Delta H_m = \Delta V_m = 1$
20. The liquid pair benzene-toluene shows [MP PET 1995]
 (a) Irregular deviation from Raoult's law
 (b) Negative deviation from Raoult's law
 (c) Positive deviation from Raoult's law
 (d) Practically no deviation from Raoult's law
21. The solution which shows negative or positive deviation by Raoult's law, is called
 (a) Ideal solution (b) Real solution
 (c) Non-ideal solution (d) Colloidal solution
22. Which of the following does not show positive deviation from Raoult's law [MP PMT 2000]
 (a) Benzene-Chloroform
 (b) Benzene-Acetone
 (c) Benzene-Ethanol
 (d) Benzene-Carbon tetrachloride
23. Which of the following mixture shows positive deviation by ideal behaviour
 (a) $\text{CHCl}_3 + (\text{CH}_3)_2\text{CO}$ (b) $\text{C}_6\text{H}_6 + \text{C}_6\text{H}_5\text{CH}_3$
 (c) $\text{H}_2\text{O} + \text{HCl}$ (d) $\text{CCl}_4 + \text{CHCl}_3$
24. Which property is not found in ideal solution
 (a) $P_A \neq P_A^0 \times X_A$ (b) $\Delta H_{\text{mix}} \neq 0$
 (c) $\Delta V_{\text{mix}} \neq 0$ (d) All of these
25. Which of the following is not correct for ideal solution [JIPMER 1997]
 (a) $\Delta S_{\text{mix}} = 0$ (b) $\Delta H_{\text{mix}} = 0$
 (c) It obeys Raoult's law (d) $\Delta V_{\text{mix}} = 0$
26. Which of the following does not show negative deviation from Raoult's law [MP PMT 2001]
 (a) Acetone-Chloroform (b) Acetone-Benzene
 (c) Chloroform-Ether (d) Chloroform-Benzene
27. A mixture of benzene and toluene forms [MP PMT 1993]
 (a) An ideal solution (b) Non-ideal solution
 (c) Suspension (d) Emulsion
28. Which of the following is an ideal solution [CBSE PMT 2003]
 (a) Water + ethanol
 (b) Chloroform + carbon tetrachloride
 (c) Benzene + toluene
 (d) Water + hydrochloric acid
29. When ethanol mixes in cyclohexane; cyclohexane reduces the intermolecular forces between ethanol molecule. In this, liquid pair shows
 (a) Positive deviation by Raoult's law
 (b) Negative deviation by Raoult's law
 (c) No deviation by Raoult's law
 (d) Decrease in volume
30. Liquids A and B form an ideal solution [AIEEE 2003]
 (a) Enthalpy of mixing is zero
 (b) The entropy of mixing is zero
 (c) The free energy of mixing is zero
 (d) The free energy as well as the entropy of mixing are each zero

Azeotropic mixture

1. The azeotropic mixture of water ($b.p. 100^\circ\text{C}$) and HCl ($b.p. 85^\circ\text{C}$) boils at 108.5°C . When this mixture is distilled it is possible to obtain [IIT 1981]
 (a) Pure HCl
 (b) Pure water
 (c) Pure water as well as pure HCl
 (d) Neither HCl nor H_2O in their pure states
2. An azeotropic solution of two liquids has boiling point lower than either when it [NCERT 1978; IIT 1981]
 (a) Shows a negative deviation from Raoult's law
 (b) Shows no deviation from Raoult's law
 (c) Shows positive deviation from Raoult's law
 (d) Is saturated
3. A liquid mixture boils without changing constituent is called [DPMT 1982; CPMT 1987]
 (a) Stable structure complex
 (b) Binary liquid mixture
 (c) Zeotropic liquid mixture
 (d) Azeotropic liquid mixture
4. Azeotropic mixture are [CPMT 1982]
 (a) Constant temperature boiling mixtures
 (b) Those which boils at different temperatures
 (c) Mixture of two solids
 (d) None of the above
5. A mixture of two completely miscible non-ideal liquids which distil as such without change in its composition at a constant temperature as though it were a pure liquid. This mixture is known as
 (a) Binary liquid mixture (b) Azeotropic mixture

- (c) Eutectic mixture (d) Ideal mixture

Osmosis and Osmotic pressure of the solution

- If 3 gm of glucose (mol. wt. 180) is dissolved in 60 gm of water at 15°C . Then the osmotic pressure of this solution will be
(a) 0.34 atm (b) 0.65 atm
(c) 6.57 atm (d) 5.57 atm
- The concentration in gms per litre of a solution of cane sugar ($M = 342$) which is isotonic with a solution containing 6 gms of urea ($M = 60$) per litre is
[Orissa PMT 1989]
(a) 3.42 (b) 34.2
(c) 5.7 (d) 19
- Osmotic pressure is 0.0821 atm at temperature of 300 K. Find concentration in mole/litre
[Roorkee 1990]
(a) 0.033 (b) 0.066
(c) 0.33×10^{-2} (d) 3
- Osmotic pressure of a solution containing 0.1 mole of solute per litre at 273 K is (in atm)
[CPMT 1988]
(a) $\frac{0.1}{1} \times 0.08205 \times 273$ (b) $0.1 \times 1 \times 0.08205 \times 273$
(c) $\frac{1}{0.1} \times 0.08205 \times 273$ (d) $\frac{0.1}{1} \times \frac{273}{0.08205}$
- A solution contains non-volatile solute of molecular mass M_p . Which of the following can be used to calculate molecular mass of the solute in terms of osmotic pressure (m = Mass of solute, V = Volume of solution and π = Osmotic pressure)
(a) $M_p = \left(\frac{m}{\pi}\right)VRT$ (b) $M_p = \left(\frac{m}{V}\right)\frac{RT}{\pi}$
(c) $M_p = \left(\frac{m}{V}\right)\frac{\pi}{RT}$ (d) $M_p = \left(\frac{m}{V}\right)\pi RT$
- The osmotic pressure of a 5% (wt/vol) solution of cane sugar at 150°C is
[AMU 1999]
(a) 2.45 atm (b) 5.078 atm
(c) 3.4 atm (d) 4 atm
- The relationship between osmotic pressure at 273 K when 10g glucose (P_1), 10g urea (P_2) and 10g sucrose (P_3) are dissolved in 250 ml of water is
[CBSE PMT 1996]
(a) $P_1 > P_2 > P_3$ (b) $P_3 > P_1 > P_2$
(c) $P_2 > P_1 > P_3$ (d) $P_2 > P_3 > P_1$
- In osmosis
[DPMT 1985]
(a) Solvent molecules move from higher concentration to lower concentration
(b) Solvent molecules move from lower to higher concentration
(c) Solute molecules move from higher to lower concentration
(d) Solute molecules move from lower to higher concentration
- Semipermeable membrane is that which permits the passage of
[BHU 1979; CPMT 1979; 84, 96; MP PMT 1994]
(a) Solute molecules only
(b) Solvent molecules only
(c) Solute and solvent molecules both
(d) Neither solute nor solvent molecules
- Two solutions A and B are separated by semi-permeable membrane. If liquid flows from A to B then
[MH CET 2000]
(a) A is less concentrated than B
(b) A is more concentrated than B
(c) Both have same concentration
(d) None of these
- A 5% solution of canesugar (mol. wt. = 342) is isotonic with 1% solution of a substance X. The molecular weight of X is
(a) 34.2 (b) 171.2
(c) 68.4 (d) 136.8
- Which of the following colligative properties can provide molar mass of proteins (or polymers or colloids) with greater precision
[Kerala PMT 2004]
(a) Relative lowering of vapour pressure
(b) Elevation of boiling point
(c) Depression in freezing point
(d) Osmotic pressure
(e) Rast's method
- The average osmotic pressure of human blood is 7.8 bar at 37°C . What is the concentration of an aqueous NaCl solution that could be used in the blood stream
[AIIMS 2004]
(a) 0.16 mol/L (b) 0.32 mol/L
(c) 0.60 mol/L (d) 0.45 mol/L
- A solution of sucrose (molar mass = 342 g/mol) is prepared by dissolving 68.4 g of it per litre of the solution, what is its osmotic pressure ($R = 0.082 \text{ lit. atm. K}^{-1} \text{ mol}^{-1}$) at 273 K
[UPSEAT 2001]
(a) 6.02 atm (b) 4.92 atm
(c) 4.04 atm (d) 5.32 atm
- Blood has been found to be isotonic with
[CPMT 1994]
(a) NaCl solution
(b) Saturated NaCl solution
(c) Saturated KCl solution
(d) Saturated solution of a 1 : 1 mixture of NaCl and KCl
- If 20 g of a solute was dissolved in 500 ml of water and osmotic pressure of the solution was found to be 600 mm of Hg at 15°C , then molecular weight of the solute is
[BHU 2004]
(a) 1000 (b) 1200
(c) 1400 (d) 1800
- The osmotic pressure of 0.4% urea solution is 1.66 atm and that of a solution of sugar of 3.42% is 2.46 atm. When both the solution are mixed then the osmotic pressure of the resultant solution will be
[MP PMT 1986]
(a) 1.64 atm (b) 2.46 atm
(c) 2.06 atm (d) 0.82 atm
- Blood is isotonic with
[DCE 2000]
(a) 0.16 M NaCl (b) Conc. NaCl
(c) 50% NaCl (d) 30% NaCl
- Which inorganic precipitate acts as semipermeable membrane or The chemical composition of semipermeable membrane is
[CPMT 1984, 90; MP PMT 1986]
(a) Calcium sulphate (b) Barium oxalate
(c) Nickel phosphate (d) Copper ferrocyanide
- The osmotic pressure of 1 M solution at 27°C is
[CPMT 1999]
(a) 24.6 atm (b) 24.6 atm
(c) 1.21 atm (d) 12.1 atm
- Osmotic pressure of a solution can be measured quickly and accurately by
[JIPMER 1991; CPMT 1983]
(a) Berkeley and Hartley's method

- (b) Morse's method
(c) Pfeffer's method
(d) De Vries method
22. The solution in which the blood cells retain their normal form are with regard to the blood [CBSE PMT 1991]
(a) Isotonic (b) Isomotic
(c) Hypertonic (d) Equinormal
23. The osmotic pressure of a solution is given by the relation [CPMT 1983, 84, 87, 93, 94]
(a) $P = \frac{RT}{C}$ (b) $P = \frac{CT}{R}$
(c) $P = \frac{RC}{T}$ (d) $\frac{P}{C} = RT$
24. The osmotic pressure of a solution is directly proportional to
(a) The molecular concentration of solute
(b) The absolute temperature at a given concentration
(c) The lowering of vapour pressure
(d) All of the above
25. What would happen if a thin slice of sugar beet is placed in a concentrated solution of NaCl [CMC Vellore 1986]
(a) Sugar beet will lose water from its cells
(b) Sugar beet will absorb water from solution
(c) Sugar beet will neither absorb nor lose water
(d) Sugar beet will dissolve in solution
26. The osmotic pressure of a dilute solution is given by [MP PMT 1987]
(a) $P = P_o x$ (b) $\pi V = nRT$
(c) $\Delta P = P_o N_2$ (d) $\frac{\Delta P}{P_o} = \frac{P_o - P}{P_o}$
27. Which statement is wrong regarding osmotic pressure (P), volume (V) and temperature (T) [MP PMT 1985]
(a) $P \propto \frac{1}{V}$ if T is constant
(b) $P \propto T$ if V is constant
(c) $P \propto V$ if T is constant
(d) PV is constant if T is constant
28. Isotonic solutions have [DPMT 1984; MP PMT 1986]
(a) Equal temperature (b) Equal osmotic pressure
(c) Equal volume (d) Equal amount of solute
29. Which of the following associated with isotonic solutions is not correct [AMU 2002]
(a) They will have the same osmotic pressure
(b) They have the same weight concentrations
(c) Osmosis does not take place when the two solutions are separated by a semipermeable membrane
(d) They will have the same vapour pressure
30. Isotonic solution have the same [EAMCET 1979; JIPMER 1991, 2002; AFMC 1995; MP PMT 2002]
(a) Density (b) Molar concentration
(c) Normality (d) None of these
31. A 0.6% solution of urea (molecular weight = 60) would be isotonic with [NCERT 1982; DCE 2002]
(a) 0.1M glucose (b) 0.1M KCl
(c) 0.6% glucose solution (d) 0.6% KCl solution
32. The value of osmotic pressure of a 0.2 M aqueous solution at 293K is
(a) 8.4 atm (b) 0.48 atm
(c) 4.8 atm (d) 4.0 atm
33. Diffusion of solvent through a semi permeable membrane is called
(a) Diffusion (b) Osmosis
(c) Active absorption (d) Plasmolysis
34. Solutions having the same osmotic pressure under a given set of conditions are known as [BHU 1979; EAMCET 1979; CPMT 1990; MP PMT 1999; AFMC 1999, 2001]
(a) Hypertonic (b) Hypotonic
(c) Normal (d) Isotonic
35. At low concentrations, the statement that equimolar solutions under a given set of experimental conditions have equal osmotic pressure is true for [EAMCET 1979; BHU 1979]
(a) All solutions
(b) Solutions of non-electrolytes only
(c) Solutions of electrolytes only
(d) None of these
36. Which one of the following would lose weight on exposure to atmosphere [NCERT 1975]
(a) Concentrated H_2SO_4
(b) Solid NaOH
(c) A saturated solution of CO_2
(d) Anhydrous sodium carbonate
37. The molecular weight of NaCl determined by osmotic pressure method will be
(a) Same as theoretical value
(b) Higher than theoretical value
(c) Lower than theoretical value
(d) None of these
38. The osmotic pressure of solution increases, if [CPMT 1985, 87, 91]
(a) Temperature is decreased
(b) Solution concentration is increased
(c) Number of solute molecules is increased
(d) Volume is increased
39. At the same temperature, following solution will be isotonic [MP PMT 1985]
(a) 3.24 gm of sucrose per litre of water and 0.18 gm glucose per litre of water
(b) 3.42 gm of sucrose per litre and 0.18 gm glucose in 0.1 litre water
(c) 3.24 gm of sucrose per litre of water and 0.585 gm of sodium chloride per litre of water
(d) 3.42 gm of sucrose per litre of water and 1.17 gm of sodium chloride per litre of water
40. The osmotic pressure of a decinormal solution of BaCl_2 in water is
(a) Inversely proportional to its celsius temperature
(b) Inversely proportional to its absolute temperature
(c) Directly proportional to its celsius temperature
(d) Directly proportional to its absolute temperature
41. Blood cells will remain as such in [CPMT 2004]
(a) Hypertonic solution (b) Hypotonic solution
(c) Isotonic solution (d) None of these
42. The osmotic pressure of a dilute solution is directly proportional to the [MP PMT 1987]
(a) Diffusion rate of the solute
(b) Ionic concentration
(c) Elevation of B.P.

- (d) Flow of solvent from a concentrated to a dilute solution
43. The osmotic pressure in atmospheres of 10% solution of canesugar at 69°C is [AFMC 1991]
 (a) 724 (b) 824
 (c) 8.21 (d) 7.21
44. Which of the following molecules would diffuse through a cell membrane [NCERT 1978]
 (a) Fructose (b) Glycogen
 (c) Haemoglobin (d) Catalase
45. Two solutions of KNO_3 and CH_3COOH are prepared separately. Molarity of both is 0.1M and osmotic pressures are P_1 and P_2 respectively. The correct relationship between the osmotic pressures is [CPMT 1983, 84; Pb CET 2004]
 (a) $P_2 > P_1$ (b) $P_1 = P_2$
 (c) $P_1 > P_2$ (d) $\frac{P_1}{P_1 + P_2} = \frac{P_2}{P_1 + P_2}$
46. The osmotic pressure of a dilute solution of a non-volatile solute is
 (a) Directly proportional to its temperature on the centigrade scale
 (b) Inversely proportional to its temperature on the Kelvin scale
 (c) Directly proportional to its temperature on the Kelvin scale
 (d) Inversely proportional to its temperature on the centigrade scale
47. Osmotic pressure of a urea solution at 10°C is 500 mm . Osmotic pressure of the solution become 105.3 mm . When it is diluted and temperature raised to 25°C . The extent of dilution is
 (a) 6 Times (b) 5 Times
 (c) 7 Times (d) 4 Times
48. If a 0.1M solution of glucose (mol. wt. 180) and 0.1M solution of urea (mol. wt. 60) are placed on the two sides of a semipermeable membrane to equal heights, then it will be correct to say [CBSE PMT 1992]
 (a) There will be no net movement across the membrane
 (b) Glucose will flow across the membrane into urea solution
 (c) Urea will flow across the membrane into glucose solution
 (d) Water will flow from urea solution into glucose solution
49. At constant temperature, the osmotic pressure of a solution [CPMT 1986]
 (a) Directly proportional to the concentration
 (b) Inversely proportional to the concentration
 (c) Directly proportional to the square of the concentration
 (d) Directly proportional to the square root of the concentration
50. The solution containing 4.0 gm of a polyvinyl chloride polymer in 1 litre of dioxane was found to have an osmotic pressure 6.0×10^{-4} atmosphere at 300K , the value of R used is 0.082 litre atmosphere $\text{mole}^{-1}\text{K}^{-1}$. The molecular mass of the polymer was found to be [NCERT 1978]
 (a) 3.0×10^2 (b) 1.6×10^5
 (c) 5.6×10^4 (d) 6.4×10^2
51. Solvent molecules pass through the semipermeable membrane is called [CPMT 1983; MP PMT 1987; RPET 2000; DCE 2004]
 (a) Electrolysis (b) Electrophoresis
 (c) Cataphoresis (d) Osmosis
52. If molecular weight of compound is increased then sensitivity is decreased in which of the following methods [DCE 2001]
 (a) Elevation in boiling point (b) Viscosity
 (c) Osmosis (d) Dialysis
53. If solubility of NaCl at 20°C is 35 gm per 100 gm of water. Then on adding 50 gm of NaCl to the same volume at same temperature the salt remains undissolved is
 (a) 15 gm (b) 20 gm
 (c) 50 gm (d) 35 gm
54. Which of the following associated with isotonic solution is not correct
 (a) They will have the same osmotic pressure
 (b) They have the same weight concentration
 (c) Osmosis does not take place when the two solutions are separated by a semipermeable membrane
 (d) They will have the same vapour pressure
55. If osmotic pressure of a solution is 2 atm at 273K , then at 546K [JIPMER 1999]
 (a) 0.5 atm (b) 1 atm
 (c) 2 atm (d) 4 atm
56. In osmosis reaction, the volume of solution
 (a) Decreases slowly (b) Increases slowly
 (c) Suddenly increases (d) No change
57. As a result of osmosis the volume of solution [JIPMER 2000]
 (a) Increases (b) Decreases
 (c) Remains constant (d) Increases or decreases
58. A solution of urea contain 8.6 gm/litre (mol. wt. 60.0). It is isotonic with a 5% solution of a non-volatile solute. The molecular weight of the solute will be [MP PMT 1986]
 (a) 348.9 (b) 34.89
 (c) 3489 (d) 861.2
59. One mole each of urea, glucose and sodium chloride were dissolved in one litre of water. Equal osmotic pressure will be produced by solutions of [MH CET 1999]
 (a) Glucose and sodium chloride
 (b) Urea and glucose
 (c) Sodium chloride and urea
 (d) None of these
60. Which of the following aqueous solutions produce the same osmotic pressure [Roorkee 1999]
 (a) 0.1 M NaCl solution
 (b) 0.1 M glucose solution
 (c) 0.6 g urea in 100 ml solution
 (d) 1.0 g of a non-electrolyte solute (X) in 50 ml solution (Molar mass of $X = 200$)
61. Which of the following aqueous solutions are isotonic ($R = 0.082\text{ atm K}^{-1}\text{mol}^{-1}$) [Roorkee Qualifying 1998]
 (a) 0.01 M glucose
 (b) 0.01 M NaNO_3
 (c) 500 ml solution containing 0.3 g urea
 (d) 0.04 N HCl

Elevation of boiling point of the solvent

1. The latent heat of vapourisation of water is 9700 Cal/mole and if the $b.p.$ is 100°C , ebullioscopic constant of water is

- (a) 0.513°C (b) 1.026°C
(c) 10.26°C (d) 1.832°C
2. The molal elevation constant of water $= 0.52^{\circ}\text{C}$. The boiling point of 1.0 molal aqueous KCl solution (assuming complete dissociation of KCl), therefore, should be [BHU 1987]
(a) 100.52°C (b) 101.04°C
(c) 99.48°C (d) 98.96°C
3. The rise in the boiling point of a solution containing 1.8 gram of glucose in 100g of a solvent in 0.1°C . The molal elevation constant of the liquid is [CPMT 1999]
(a) 0.01 K/m (b) 0.1 K/m
(c) 1 K/m (d) 10 K/m
4. If 0.15g of a solute dissolved in 15g of solvent is boiled at a temperature higher by 0.216°C than that of the pure solvent. The molecular weight of the substance (molal elevation constant for the solvent is 2.16°C) is [CBSE PMT 1999; BHU 1997]
(a) 1.01 (b) 10
(c) 10.1 (d) 100
5. Pressure cooker reduces cooking time for food because [MP PMT 1987; NCERT 1975; CPMT 1991; AIEEE 2003]
(a) Heat is more evenly distributed in the cooking space
(b) Boiling point of water involved in cooking is increased
(c) The higher pressure inside the cooker crushes the food material
(d) Cooking involves chemical changes helped by a rise in temperature
6. Which of the following statements is correct for the boiling point of solvent containing a dissolved solid substance [NCERT 1972, 74]
(a) Boiling point of the liquid is depressed
(b) Boiling point of the liquid is elevated
(c) There is no effect on the boiling point
(d) The change depends upon the polarity of liquid
7. When a substance is dissolved in a solvent, the vapour pressure of solvent decreases. It brings [BHU 2004]
(a) A decrease in boiling point of solution
(b) An increase in boiling point of the solution
(c) A decrease in freezing point of the solution
(d) An increase in freezing point of the solution
8. Elevation in boiling point was 0.52°C when 6gm of a compound X was dissolved in 100gm of water. Molecular weight of X is (K_b for water is 0.52 per 1000 gm of water) [CPMT 1989]
(a) 120 (b) 60
(c) 180 (d) 600
9. If the solution boils at a temperature T_1 and the solvent at a temperature T_2 the elevation of boiling point is given by [MP PET 1996]
(a) $T_1 + T_2$ (b) $T_1 - T_2$
(c) $T_2 - T_1$ (d) $T_1 \div T_2$
10. If for a sucrose solution elevation in boiling point is 0.1°C then what will be the boiling point of NaCl solution for same molal concentration [BHU 1998, 2005]
(a) 0.1°C (b) 0.2°C
(c) 0.08°C (d) 0.01°C
11. The molal elevation constant is the ratio of the elevation in B.P. to
(a) Molarity (b) Molality
(c) Mole fraction of solute (d) Mole fraction of solvent
12. The molal boiling point constant for water is $0.513^{\circ}\text{C kg mol}^{-1}$. When 0.1 mole of sugar is dissolved in 200ml of water, the solution boils under a pressure of one atmosphere at
(a) 100.513°C (b) 100.0513°C
(c) 100.256°C (d) 101.025°C
13. Value of gas constant R is [AIEEE 2002]
(a) 0.082 litre atm (b) $0.987\text{ cal mol}^{-1}\text{K}^{-1}$
(c) $8.3\text{ J mol}^{-1}\text{K}^{-1}$ (d) $83\text{ erg mol}^{-1}\text{K}^{-1}$
14. The temperature, at which the vapour pressure of a liquid becomes equal to the atmospheric pressure is known as [Pb. PMT 2000]
(a) Freezing point (b) Boiling point
(c) Absolute temperature (d) None of these
15. The elevation in boiling point of a solution of 13.44g of CuCl_2 in 1kg of water using the following information will be (Molecular weight of $\text{CuCl}_2 = 134.4$ and $K_b = 0.52\text{ K molal}^{-1}$) [IIT 2005]
(a) 0.16 (b) 0.05
(c) 0.1 (d) 0.2
16. When 10g of a non-volatile solute is dissolved in 100 g of benzene, it raises boiling point by 1°C then molecular mass of the solute is (K_b for benzene $= 2.53\text{ K mol}^{-1}$) [BHU 2002]
(a) 223 g (b) 233 g
(c) 243 g (d) 253 g
17. An aqueous solution containing 1g of urea boils at 100.25°C . The aqueous solution containing 3 g of glucose in the same volume will boil at (Molecular weight of urea and glucose are 60 and 180 respectively) [CBSE PMT 2000]
(a) 100.75°C (b) 100.5°C
(c) 100.25°C (d) 100°C
18. When common salt is dissolved in water [CBSE PMT 1988; MP PET 1995; DCE 2000]
(a) Melting point of the solution increases
(b) Boiling point of the solution increases
(c) Boiling point of the solution decreases
(d) Both melting point and boiling point decreases
19. During the evaporation of liquid [DCE 2003]
(a) The temperature of the liquid will rise
(b) The temperature of the liquid will fall
(c) May rise or fall depending on the nature
(d) The temperature remains unaffected
20. At higher altitudes the boiling point of water lowers because [NCERT 1972; CPMT 1994; J & K 2005]
(a) Atmospheric pressure is low
(b) Temperature is low

- (c) Atmospheric pressure is high
(d) None of these
21. The elevation in boiling point for one molal solution of a solute in a solvent is called [MH CET 2001]
(a) Boiling point constant (b) Molal elevation constant
(c) Cryoscopic constant (d) None of these
22. A solution of 1 molal concentration of a solute will have maximum boiling point elevation when the solvent is [MP PMT 2000]
(a) Ethyl alcohol (b) Acetone
(c) Benzene (d) Chloroform
23. Mark the correct relationship between the boiling points of very dilute solutions of $BaCl_2(t_1)$ and $KCl(t_2)$, having the same molarity [CPMT 1984, 93]
(a) $t_1 = t_2$
(b) $t_1 > t_2$
(c) $t_2 > t_1$
(d) t_2 is approximately equal to t_1
- ### Depression of freezing point of the solvent
1. Molal depression constant for water is $1.86^\circ C$. The freezing point of a 0.05 molal solution of a non-electrolyte in water is [MNR 1990; MP PET 1997]
(a) $-1.86^\circ C$ (b) $-0.93^\circ C$
(c) $-0.093^\circ C$ (d) $0.93^\circ C$
2. The amount of urea to be dissolved in 500 ml of water ($K = 18.6^\circ C \text{ mole}^{-1}$ in 100g solvent) to produce a depression of $0.186^\circ C$ in freezing point is [MH CET 2000]
(a) 9 g (b) 6 g
(c) 3 g (d) 0.3 g
3. The maximum freezing point falls in [MP PMT 1986]
(a) Camphor (b) Naphthalene
(c) Benzene (d) Water
4. Which one of the following statements is FALSE [AIEEE 2004]
(a) The correct order of osmotic pressure for 0.01 M aqueous solution of each compound is $BaCl_2 > KCl > CH_3COOH > \text{sucrose}$.
(b) The osmotic pressure (π) of a solution is given by the equation $\pi = MRT$ where M is the molarity of the solution.
(c) Raoult's law states that the vapour pressure of a component over a solution is proportional to its mole fraction.
(d) Two sucrose solutions of same molality prepared in different solvents will have the same freezing point depression.
5. Solute when dissolved in water [MADT Bihar 1981]
(a) Increases the vapour pressure of water
(b) Decreases the boiling point of water
(c) Decreases the freezing point of water
(d) All of the above
6. The freezing point of a solution prepared from 1.25 gm of a non-electrolyte and 20 gm of water is $271.9 K$. If molar depression constant is $1.86 K \text{ mole}^{-1}$, then molar mass of the solute will be [AFMC 1998; CPMT 1999]
(a) 105.7 (b) 106.7
(c) 115.3 (d) 93.9
7. What is the freezing point of a solution containing 8.1 g HBr in 100g water assuming the acid to be 90% ionised (K_f for water $= 1.86 K \text{ mole}^{-1}$) [BHU 1981; Pb CET 2004]
(a) $0.85^\circ C$ (b) $-3.53^\circ C$
(c) $0^\circ C$ (d) $-0.35^\circ C$
8. If K_f value of H_2O is 1.86. The value of ΔT_f for 0.1m solution of non-volatile solute is
(a) 18.6 (b) 0.186
(c) 1.86 (d) 0.0186
9. 1% solution of $Ca(NO_3)_2$ has freezing point [DPMT 1982, 83; CPMT 1977]
(a) $0^\circ C$ (b) Less than $0^\circ C$
(c) Greater than $0^\circ C$ (d) None of the above
10. A solution of urea (mol. mass 56g mol) boils at $100.18^\circ C$ at the atmospheric pressure. If K_f and K_b for water are 1.86 and $0.512 K \text{ kg mol}^{-1}$ respectively the above solution will freeze at [CBSE PMT 2005]
(a) $-6.54^\circ C$ (b) $6.54^\circ C$
(c) $0.654^\circ C$ (d) $-0.654^\circ C$
11. The molar freezing point constant for water is $1.86^\circ C \text{ mole}^{-1}$. If 342 gm of canesugar ($C_{12}H_{22}O_{11}$) are dissolved in 1000 gm of water, the solution will freeze at [NCERT 1977; CPMT 1989; Roorkee 2000; DCE 2004]
(a) $-1.86^\circ C$ (b) $1.86^\circ C$
(c) $-3.92^\circ C$ (d) $2.42^\circ C$
12. An aqueous solution of a non-electrolyte boils at $100.52^\circ C$. The freezing point of the solution will be
(a) $0^\circ C$ (b) $-1.86^\circ C$
(c) $1.86^\circ C$ (d) None of the above
13. The freezing point of one molal NaCl solution assuming NaCl to be 100% dissociated in water is (molal depression constant = 1.86) [CPMT 1985; BHU 1981; MP PMT 1997; UPSEAT 2001]
(a) $-1.86^\circ C$ (b) $-3.72^\circ C$
(c) $+1.86^\circ C$ (d) $+3.72^\circ C$
14. Heavy water freezes at [CPMT 1993]
(a) $0^\circ C$ (b) $3.8^\circ C$
(c) $38^\circ C$ (d) $-0.38^\circ C$
15. After adding a solute freezing point of solution decreases to -0.186 . Calculate ΔT_b if $K_f = 1.86$ and $K_b = 0.521$. [Orissa JEE 2002, 04; MP PET/PMT 1998; AIEEE 2000]
(a) 0.521 (b) 0.0521
(c) 1.86 (d) 0.0186
16. Given that ΔT_f is the depression in freezing point of the solvent in a solution of a non-volatile solute of molality m , the quantity $\lim_{m \rightarrow 0} \left(\frac{\Delta T_f}{m} \right)$ is equal to [IIT 1994; UPSEAT 2001]
(a) Zero (b) One
(c) Three (d) None of the above
17. The freezing point of 1 percent solution of lead nitrate in water will be [NCERT 1971, 72; CPMT 1972; JIPMER 1991]
(a) Below $0^\circ C$ (b) $0^\circ C$

- (c) 1°C (d) 2°C
18. What is the effect of the addition of sugar on the boiling and freezing points of water [Kerala CET (Med.) 2003]
- (a) Both boiling point and freezing point increases
(b) Both boiling point and freezing point decreases
(c) Boiling point increases and freezing point decreases
(d) Boiling point decreases and freezing point increases
19. During depression of freezing point in a solution the following are in equilibrium [IIT Screening 2003]
- (a) Liquid solvent, solid solvent
(b) Liquid solvent, solid solute
(c) Liquid solute, solid solute
(d) Liquid solute solid solvent
20. 1.00 gm of a non-electrolyte solute dissolved in 50 gm of benzene lowered the freezing point of benzene by 0.40 K . K_f for benzene is 5.12 kg mol^{-1} . Molecular mass of the solute will be [DPMT 2004]
- (a) 256 g mol^{-1} (b) 2.56 g mol^{-1}
(c) $512 \times 10^3\text{ g mol}^{-1}$ (d) $2.56 \times 10^4\text{ g mol}^{-1}$
21. 0.440 g of a substance dissolved in 22.2 g of benzene lowered the freezing point of benzene by 0.567°C . The molecular mass of the substance ($K_f = 5.12^{\circ}\text{C mol}^{-1}$) [BHU 2001; CPMT 2001]
- (a) 178.9 (b) 177.8
(c) 176.7 (d) 175.6
22. Which of the following aqueous molal solution have highest freezing point [UPSEAT 2000, 01, 02; MNR 1988]
- (a) Urea (b) Barium chloride
(c) Potassium bromide (d) Aluminium sulphate
23. Which will show maximum depression in freezing point when concentration is 0.1M [IIT 1989; MNR 1990; UPSEAT 2000; 03; BCECE 2005]
- (a) NaCl (b) Urea
(c) Glucose (d) K_2SO_4
24. The freezing point of a 0.01M aqueous glucose solution at 1 atmosphere is -0.18°C . To it, an addition of equal volume of 0.002 M glucose solution will; produce a solution with freezing point of nearly [AMU 1999]
- (a) -0.036°C (b) -0.108°C
(c) -0.216°C (d) -0.422°C
25. What should be the freezing point of aqueous solution containing 17 gm of $\text{C}_2\text{H}_5\text{OH}$ in 1000 gm of water (water $K_f = 1.86\text{ deg-kg mol}^{-1}$) [MP PMT 1986]
- (a) -0.69°C (b) -0.34°C
(c) 0.0°C (d) 0.34°C
26. In the depression of freezing point experiment, it is found that the [IIT 1999]
- (a) Vapour pressure of the solution is less than that of pure solvent
(b) Vapour pressure of the solution is more than that of pure solvent
(c) Only solute molecules solidify at the freezing point
(d) Only solvent molecules solidify at the freezing point
27. Calculate the molal depression constant of a solvent which has freezing point 16.6°C and latent heat of fusion 180.75 Jg^{-1} . [Orissa JEE 2005]
- (a) 2.68 (b) 3.86
(c) 4.68 (d) 2.86

Colligative properties of electrolyte

1. If O.P. of 1 M of the following in water can be measured, which one will show the maximum O.P. [NCERT 1975; CPMT 1977; JIPMER 2001]
- (a) AgNO_3 (b) MgCl_2
(c) $(\text{NH}_4)_3\text{PO}_4$ (d) Na_2SO_4
2. Which of the following solution in water possesses the lowest vapour pressure [BHU 1996]
- (a) 0.1(M) NaCl (b) 0.1(N) BaCl_2
(c) 0.1(M) KCl (d) None of these
3. Which of the following solutions in water will have the lowest vapour pressure [Roorkee 2000]
- (a) 0.1 M, NaCl (b) 0.1 M, Sucrose
(c) 0.1 M, BaCl_2 (d) 0.1 M Na_3PO_4
4. The vapour pressure will be lowest for [CPMT 2004]
- (a) 0.1 M sugar solution (b) 0.1 M KCl solution
(c) 0.1 M $\text{Cu}(\text{NO}_3)_2$ solution (d) 0.1 M AgNO_3 solution
5. Osmotic pressure of 0.1 M solution of NaCl and Na_2SO_4 will be [AFMC 1978]
- (a) Same
(b) Osmotic pressure of NaCl solution will be more than Na_2SO_4 solution
(c) Osmotic pressure of Na_2SO_4 solution will be more than NaCl
(d) Osmotic pressure of Na_2SO_4 will be less than that of NaCl solution
6. Which of the following solutions has highest osmotic pressure
- (a) 1 M NaCl (b) 1 M urea
(c) 1 M sucrose (d) 1 M glucose
7. Which one has the highest osmotic pressure [CBSE PMT 1991; DPMT 1991; MP PET 1994]
- (a) M/10 HCl (b) M/10 urea
(c) M/10 BaCl_2 (d) M/10 glucose
8. In equimolar solution of glucose, NaCl and BaCl_2 , the order of osmotic pressure is as follow [CPMT 1988, 93; MP PMT/PET 1988; MP PET 1997, 2003]
- (a) Glucose > NaCl > BaCl_2
(b) NaCl > BaCl_2 > Glucose
(c) BaCl_2 > NaCl > Glucose
(d) Glucose > BaCl_2 > NaCl
- The osmotic pressure of which solution is maximum (consider that deci-molar solution of each 90% dissociated) [MP PMT 2003]
- (a) Aluminium sulphate
(b) Barium chloride
(c) Sodium sulphate
(d) A mixture of equal volumes of (b) and (c)
10. At 25°C , the highest osmotic pressure is exhibited by 0.1M solution of [CBSE PMT 1994; AIIMS 2000]
- (a) CaCl_2 (b) KCl
(c) Glucose (d) Urea

11. Which of the following will have the highest boiling point at 1 atm pressure [MP PET/PMT 1998]
 (a) 0.1M NaCl (b) 0.1M sucrose
 (c) 0.1M BaCl₂ (d) 0.1M glucose
12. Which one of the following would produce maximum elevation in boiling point [MP PMT 1985; CPMT 1990; NCERT 1982]
 (a) 0.1 M glucose
 (b) 0.2 M sucrose
 (c) 0.1 M barium chloride
 (d) 0.1 M magnesium sulphate
13. Which of the following solutions will have the highest boiling point [DPMT 1991; CPMT 1991]
 (a) 1% glucose (b) 1% sucrose
 (c) 1% NaCl (d) 1% CaCl₂
14. Which one of the following aqueous solutions will exhibit highest boiling point [AIEEE 2004]
 (a) 0.015 M urea (b) 0.01 M KNO₃
 (c) 0.01 M Na₂SO₄ (d) 0.015 M glucose
15. Which of the following aqueous solutions containing 10 gm of solute in each case has highest B.P.
 (a) NaCl solution (b) KCl solution
 (c) Sugar solution (d) Glucose solution
16. 0.01 molar solutions of glucose, phenol and potassium chloride were prepared in water. The boiling points of
 (a) Glucose solution = Phenol solution = Potassium chloride solution
 (b) Potassium chloride solution > Glucose solution > Phenol solution
 (c) Phenol solution > Potassium chloride solution > Glucose solution
 (d) Potassium chloride solution > Phenol solution > Glucose solution
17. Which one has the highest boiling point [CBSE PMT 1990]
 (a) 0.1N Na₂SO₄ (b) 0.1N MgSO₄
 (c) 0.1M Al₂(SO₄)₃ (d) 0.1M BaSO₄
18. Which of the following solutions boils at the highest temperature
 (a) 0.1 M glucose (b) 0.1 M NaCl
 (c) 0.1 M BaCl₂ (d) 0.1 M Urea
19. 0.01M solution each of urea, common salt and Na₂SO₄ are taken, the ratio of depression of freezing point is [Roorkee 1990]
 (a) 1 : 1 : 1 (b) 1 : 2 : 1
 (c) 1 : 2 : 3 (d) 2 : 2 : 3
20. Which has the minimum freezing point [CPMT 1991]
 (a) One molal NaCl solution
 (b) One molal KCl solution
 (c) One molal CaCl₂ solution
 (d) One molal urea solution
21. Which of the following has lowest freezing point [NCERT 1981]
 (a) 0.1M aqueous solution of glucose
 (b) 0.1M aqueous solution of NaCl
 (c) 0.1M aqueous solution of ZnSO₄
 (d) 0.1M aqueous solution of urea
22. The freezing points of equimolar solutions of glucose, KNO₃ and AlCl₃ are in the order of [AMU 2000]
 (a) AlCl₃ < KNO₃ < Glucose
 (b) Glucose < KNO₃ < AlCl₃
 (c) Glucose < AlCl₃ < KNO₃
 (d) AlCl₃ < Glucose < KNO₃
23. Which of the following will have the highest F.P. at one atmosphere [BHU 1982; MP PMT 1987, MP PET/PMT 1988]
 (a) 0.1M NaCl solution (b) 0.1M sugar solution
 (c) 0.1M BaCl₂ solution (d) 0.1M FeCl₃ solution
24. Which of the following will produce the maximum depression in freezing point of its aqueous solution [MP PMT 1996]
 (a) 0.1M glucose
 (b) 0.1M sodium chloride
 (c) 0.1M barium chloride
 (d) 0.1M magnesium sulphate
25. Which of the following has the lowest freezing point [UPSEAT 2004]
 (a) 0.1 m sucrose (b) 0.1 m urea
 (c) 0.1 m ethanol (d) 0.1 m glucose
26. Which of the following has minimum freezing point [Pb. PMT 1999]
 (a) 0.1M K₂Cr₂O₇ (b) 0.1 M NH₄Cl
 (c) 0.1 M BaSO₄ (d) 0.1 M Al₂(SO₄)₃
27. Which of the following 0.10m aqueous solution will have the lowest freezing point [CBSE PMT 1997]
 (a) Al₂(SO₄)₃ (b) C₅H₁₀O₅
 (c) KI (d) C₁₂H₂₂O₁₁
28. For 0.1 M solution, the colligative property will follow the order [AMU 2001]
 (a) NaCl > Na₂SO₄ > Na₃PO₄
 (b) NaCl < Na₂SO₄ < Na₃PO₄
 (c) NaCl > Na₂SO₄ ≈ Na₃PO₄
 (d) NaCl < Na₂SO₄ = Na₃PO₄
29. Which of the following will have the lowest vapour pressure
 (a) 0.1M KCl solution
 (b) 0.1M urea solution
 (c) 0.1M Na₂SO₄ solution
 (d) 0.1M K₄Fe(CN)₆ solution

Abnormal molecular mass

1. The Van't Hoff factor will be highest for
 (a) Sodium chloride (b) Magnesium chloride
 (c) Sodium phosphate (d) Urea
2. Which of the following salt has the same value of Van't Hoff factor *i* as that of K₃[Fe(CN)₆] [CBSE PMT 1994; AIIMS 1998]
 (a) Al₂(SO₄)₃ (b) NaCl
 (c) Na₂SO₄ (d) Al(NO₃)₃
3. When benzoic acid dissolve in benzene, the observed molecular mass is

- (a) 244 (b) 61
(c) 366 (d) 122
4. The ratio of the value of any colligative property for KCl solution to that for sugar solution is nearly [MP PMT 1985]
(a) 1 (b) 0.5
(c) 2.0 (d) 3
5. Van't Hoff factor of $Ca(NO_3)_2$ is [CPMT 1997]
(a) 1 (b) 2
(c) 3 (d) 4
6. Dry air was passed successively through a solution of 5 gm of a solute in 80 gm of water and then through pure water. The loss in weight of solution was 2.50 gm and that of pure solvent 0.04 gm. What is the molecular weight of the solute [MP PMT 1986]
(a) 70.31 (b) 7.143
(c) 714.3 (d) 80
7. The Van't Hoff factor calculated from association data is always...than calculated from dissociation data [JIPMER 2000]
(a) Less (b) More
(c) Same (d) More or less
8. If α is the degree of dissociation of Na_2SO_4 , the Van't Hoff factor (i) used for calculating the molecular mass is [AIEEE 2005]
(a) $1 + \alpha$ (b) $1 - \alpha$
(c) $1 + 2\alpha$ (d) $1 - 2\alpha$
9. Van't Hoff factor i
(a) $= \frac{\text{Normal molecular mass}}{\text{Observed molecular mass}}$
(b) $= \frac{\text{Observed molecular mass}}{\text{Normal molecular mass}}$
(c) Less than one in case of dissociation
(d) More than one in case of association
10. Which of the following compounds corresponds Van't Hoff factor 'i' to be equal to 2 for dilute solution [NCERT 1978]
(a) K_2SO_4 (b) $NaHSO_4$
(c) Sugar (d) $MgSO_4$
11. The Van't Hoff factor i for a 0.2 molal aqueous solution of urea is
(a) 0.2 (b) 0.1
(c) 1.2 (d) 1.0
12. One mole of a solute A is dissolved in a given volume of a solvent. The association of the solute take place according to $nA \rightleftharpoons (A)_n$. The Van't Hoff factor i is expressed as [MP PMT 1997]
(a) $i = 1 - x$ (b) $i = 1 + \frac{x}{n}$
(c) $i = \frac{1 - x + \frac{x}{n}}{1}$ (d) $i = 1$
13. Acetic acid dissolved in benzene shows a molecular weight of
(a) 60 (b) 120
(c) 180 (d) 240
14. The observed osmotic pressure of a solution of benzoic acid in benzene is less than its expected value because [CET Pune 1998]
(a) Benzene is a non-polar solvent
(b) Benzoic acid molecules are associated in benzene
(c) Benzoic acid molecules are dissociated in benzene
(d) Benzoic acid is an organic compound
15. The experimental molecular weight of an electrolyte will always be less than its calculated value because the value of Van't Hoff factor "i" is [MP PMT 1993]
(a) Less than 1 (b) Greater than 1
(c) Equivalent to one (d) Zero
16. The molecular mass of acetic acid dissolved in water is 60 and when dissolved in benzene it is 120. This difference in behaviour of CH_3COOH is because [AMU 2000]
(a) Water prevents association of acetic acid
(b) Acetic acid does not fully dissolve in water
(c) Acetic acid fully dissolves in benzene
(d) Acetic acid does not ionize in benzene
17. The correct relationship between the boiling points of very dilute solutions of $AlCl_3(t_1)$ and $CaCl_2(t_2)$, having the same molar concentration is [CPMT 1983]
(a) $t_1 = t_2$ (b) $t_1 > t_2$
(c) $t_2 > t_1$ (d) $t_2 \geq t_1$
18. The Van't Hoff factor for sodium phosphate would be
(a) 1 (b) 2
(c) 3 (d) 4
19. The molecular weight of benzoic acid in benzene as determined by depression in freezing point method corresponds to
(a) Ionization of benzoic acid
(b) Dimerization of benzoic acid
(c) Trimerization of benzoic acid
(d) Solvation of benzoic acid

Critical Thinking

Objective Questions

1. On adding solute to a solvent having vapour pressure 0.80 atm, vapour pressure reduces to 0.60 atm. Mole fraction of solute is
(a) 0.25 (b) 0.75
(c) 0.50 (d) 0.33
2. A solution containing 30 gms of non-volatile solute in exactly 90 gm water has a vapour pressure of 21.85 mm Hg at $25^\circ C$. Further 18 gms of water is then added to the solution. The resulting solution has a vapour pressure of 22.15 mm Hg at $25^\circ C$. Calculate the molecular weight of the solute [UPSEAT 2001]
(a) 74.2 (b) 75.6
(c) 67.83 (d) 78.7
3. Vapour pressure of a solution of 5g of non-electrolyte in 100g of water at a particular temperature is $2985 N/m^2$. The vapour pressure of pure water is $3000 N/m^2$. The molecular weight of the solute is [MP PET 1993, 02]
(a) 60 (b) 120
(c) 180 (d) 380

[IIT Screening 1993]

4. Azeotropic mixture of HCl and water has [AFMC 1997; JIPMER 2002]
 (a) 84% HCl (b) 22.2% HCl
 (c) 63% HCl (d) 20.2% HCl
5. The osmotic pressure at $17^\circ C$ of an aqueous solution containing 1.75 g of sucrose per 150 ml solution is [BHU 2001]
 (a) 0.8 atm (b) 0.08 atm
 (c) 8.1 atm (d) 9.1 atm
6. A 1.2 of solution of $NaCl$ is isotonic with 7.2 of solution of glucose. Calculate the van't Hoff's factor of $NaCl$ solution [UPSEAT 2001]
 (a) 2.36 (b) 1.50
 (c) 1.95 (d) 1.00
7. 0.6 g of a solute is dissolved in 0.1 litre of a solvent which develops an osmotic pressure of 1.23 atm at $27^\circ C$. The molecular mass of the substance is [BHU 1990]
 (a) $149.5 \text{ g mole}^{-1}$ (b) 120 g mole^{-1}
 (c) 430 g mole^{-1} (d) None of these
8. The boiling point of a solution of 0.1050 gm of a substance in 15.84 gram of ether was found to be $100^\circ C$ higher than that of pure ether. What is the molecular weight of the substance [Molecular elevation constant of ether per 100 g = 21.6]
 (a) 144.50 (b) 143.18
 (c) 140.28 (d) 146.66
9. Boiling point of chloroform was raised by 0.323 K, when 0.5143 g of anthracene was dissolved in 35 g of chloroform. Molecular mass of anthracene is [Pb PMT 2000]
 (K_b for $CHCl_3 = 3.9 \text{ kg mol}^{-1}$)
 (a) 79.42 g/mol (b) 132.32 g/mol
 (c) 177.42 g/mol (d) 242.32 g/mol
10. The boiling point of water ($100^\circ C$) becomes $100.52^\circ C$, if 3 grams of a nonvolatile solute is dissolved in 200ml of water. The molecular weight of solute is [AIIMS 1998]
 (K_b for water is $0.6 K - m$)
 (a) 12.2 g mol^{-1} (b) 15.4 g/mol
 (c) 17.3 g mol^{-1} (d) 20.4 g/mol
11. Normal boiling point of water is 373 K (at 760 mm). Vapour pressure of water at 298 K is 23 mm. If the enthalpy of evaporation is 40.656 kJ/mole, the boiling point of water at 23 mm pressure will be [CBSE PMT 1995]
 (a) 250 K (b) 294 K
 (c) 51.6 K (d) 12.5 K
12. A 0.2 molal aqueous solution of a weak acid (HX) is 20% ionised. The freezing point of this solution is (Given $K_f = 1.86^\circ C/m$ for water) [IIT 1995]
 (a) $-0.31^\circ C$ (b) $-0.45^\circ C$
 (c) $-0.53^\circ C$ (d) $-0.90^\circ C$
13. A 0.001 molal solution of $[Pt(NH_3)_4Cl_4]$ in water had a freezing point depression of $0.0054^\circ C$. If K_f for water is 1.80, the correct formulation for the above molecule is [Kerala CET (Med.) 2003]
 (a) $[Pt(NH_3)_4Cl_3]Cl$ (b) $[Pt(NH_3)_4Cl]Cl_2$
 (c) $[Pt(NH_3)_4Cl_2]Cl_3$ (d) $[Pt(NH_3)_4Cl_4]$
14. An aqueous solution of a weak monobasic acid containing 0.1 g in 21.7 g of water freezes at 272.813 K. If the value of K_f for water is $1.86 K/m$, what is the molecular mass of the monobasic acid [AMU 2002]
 (a) 50 g/mole (b) 46 g/mole
 (c) 55 g/mole (d) 60 g/mole
15. K_f of 1,4-dioxane is 4.9 mol^{-1} for 1000 g. The depression in freezing point for a 0.001 m solution in dioxane is [DPMT 2001]
 (a) 0.0049 (b) $4.9 + 0.001$
 (c) 4.9 (d) 0.49
16. How many litres of CO_2 at STP will be formed when 100 ml of $0.1 M H_2SO_4$ reacts with excess of Na_2SO_3 [EAMCET 1998]
 (a) 22.4 (b) 2.24
 (c) 0.224 (d) 5.6
17. A solution is obtained by dissolving 12 g of urea (mol.wt.60) in a litre of water. Another solution is obtained by dissolving 68.4 g of cane sugar (mol.wt. 342) in a litre of water at are the same temperature. The lowering of vapour pressure in the first solution is [CPMT 2001]
 (a) Same as that of 2nd solution
 (b) Nearly one-fifth of the 2nd solution
 (c) Double that of 2nd solution
 (d) Nearly five times that of 2nd solution

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

1. Assertion : One molal aqueous solution of urea contains 60g of urea in 1kg (1000g) water.
 Reason : Solution containing one mole of solute in 1000 g solvent is called as one molal solution.
2. Assertion : If 100 cc of 0.1 N HCl is mixed with 100 cc of 0.2 N HCl , the normality of the final solution will be 0.30.
 Reason : Normalities of similar solutions like HCl can be added.
3. Assertion : If a liquid solute more volatile than the solvent is added to the solvent, the vapour pressure of the solution may increase i.e., $p_s > p^0$.
 Reason : In the presence of a more volatile liquid solute, only the solute will form the vapours and solvent will not.
4. Assertion : Azeotropic mixtures are formed only by non-ideal solutions and they may have boiling points either greater than both the components or less than both the components.
 Reason : The composition of the vapour phase is same as that of the liquid phase of an azeotropic mixture.

5. Assertion : Molecular mass of polymers cannot be calculated using boiling point or freezing point method.
Reason : Polymers solutions do not possess a constant boiling point or freezing point.
6. Assertion : The molecular weight of acetic acid determined by depression in freezing point method in benzene and water was found to be different.
Reason : Water is polar and benzene is non-polar.
7. Assertion : Ca^{++} and K^{+} ions are responsible for maintaining proper osmotic pressure balance in the cells of organism.
Reason : Solutions having the same osmotic pressure are called isotonic solutions.
8. Assertion : Reverse osmosis is used in the desalination of sea water.
Reason : When pressure more than osmotic pressure is applied, pure water is squeezed out of the sea water through the membrane.
9. Assertion : Camphor is used as solvent in the determination of molecular masses of naphthalene, anthracene etc.
Reason : Camphor has high molal elevation constant.
10. Assertion : Elevation in boiling point and depression in freezing point are colligative properties.
Reason : All colligative properties are used for the calculation of molecular masses.
11. Assertion : An increase in surface area increases the rate of evaporation.
Reason : Stronger the inter-molecular attractive forces, fast is the rate of evaporation at a given temperature. [AIIMS 2002]
12. Assertion : The boiling and melting points of amides are higher than corresponding acids.
Reason : It is due to strong intermolecular hydrogen bonding in their molecules. [AIIMS 2002]
13. Assertion : The freezing point is the temperature at which solid crystallizes from solution.
Reason : The freezing point depression is the difference between that temperature and freezing point of pure solvent. [AIIMS 2000]
14. Assertion : On adding $NaCl$ to water its vapour pressure increases.
Reason : Addition of non-volatile solute increases the vapour pressure. [AIIMS 1996]
15. Assertion : Molar heat of vaporisation of water is greater than benzene.
Reason : Molar heat of vaporisation is the amount of heat required to vaporise one mole of liquid at constant temperature. [AIIMS 1996]
16. Assertion : Ice melts faster at high altitude.
Reason : At high altitude atmospheric pressure is high. [AIIMS 1996]
17. Assertion : Molecular mass of benzoic acid when determined by colligative properties is found high.
Reason : Dimerisation of benzoic acid. [AIIMS 1998]
18. Assertion : Use of pressure cooker reduces cooking time.
Reason : At higher pressure cooking occurs faster. [AIIMS 2000]
19. Assertion : CCl_4 and H_2O are immiscible.
Reason : CCl_4 is a polar solvent. [AIIMS 2002]
20. Assertion : Isotonic solution do not show the phenomenon of osmosis.
Reason : Isotonic solutions have equal osmotic pressure. [AIIMS 2002]

21. Assertion : Increasing pressure on pure water decreases its freezing point.
Reason : Density of water is maximum at 273 K. [AIIMS 2003]

$$\text{Mole fraction of water} = \frac{n_1}{n_1 + n_2} = \frac{1}{1 + 9} = \frac{1}{10} = 0.1$$

AS Answers and Solutions

Method of expressing concentration of solution

1. (c) $M_1 V_1 + M_2 V_2 = MV$
2. (d) $M = \frac{w}{m \times V(l)}$; $0.25 = \frac{w}{106 \times 0.25}$; $w = 6.625 \text{ gm}$
3. (d) $N_1 V_1 = N_2 V_2$
 $2 \times 1 = N_2 \times 6$
 $N_2 = 0.33$
4. (e) $5.85 \text{ g NaCl} = \frac{5.85}{58.5} \text{ mole} = 0.1 \text{ mol}$
 $90 \text{ g H}_2\text{O} = \frac{90}{18} \text{ moles} = 5 \text{ moles}$
 $\text{mole fraction of NaCl} = \frac{0.1}{5 + 0.1} \approx 0.0196$.
5. (b) $M = \frac{n}{V(l)} = \frac{0.006}{0.1} = 0.06$
6. (b) $M = \frac{W \times 1000}{\text{mol.mass} \times \text{Volume in ml.}} = \frac{9.8 \times 1000}{98 \times 2000} = 0.05 \text{ M}$
7. (a) $M = \frac{W}{m.wt.} \times \frac{1000}{\text{Volume in ml.}} = \frac{5 \times 1000}{40 \times 250} = 0.5 \text{ M}$
8. (d) Basicity of H_3PO_3 is 2.
Hence $0.3 \text{ M H}_3\text{PO}_3 = 0.6 \text{ N}$.
9. (d) 2 gm . Hydrogen has maximum number of molecules than others.
11. (a) $M_1 V_1 = M_2 V_2$
 $0.01 \times 19.85 = M_2 \times 20$
 $M_2 = 0.009925$; $M = 0.0099$.
12. (b) 1500 cm^3 of 0.1 N HCl have number of gm equivalence
 $= \frac{N_1 \times V_1}{1000} = \frac{1500 \times 0.1}{1000} = 0.15$
 $\therefore 0.15 \text{ gm. equivalent of NaOH} = 0.15 \times 40 = 6 \text{ gm.}$
13. (a) $M = \frac{w}{m.wt. \times \text{volume in litre}} = \frac{5.85}{58.5 \times 0.5} = 0.2 \text{ M}$
14. (a) Molecular weight of $\text{C}_2\text{H}_5\text{OH} = 24 + 5 + 16 + 1 = 46$
Molecular mass of $\text{H}_2\text{O} = 18$
 $414 \text{ g of C}_2\text{H}_5\text{OH}$ has $\frac{414}{46} = 9 \text{ mole}$
 $18 \text{ g of H}_2\text{O}$ has $= \frac{18}{18} = 1 \text{ mole}$

15. (b) $17 \text{ gm } \text{NH}_3 = 1 \text{ mole}$.
Molecules of $\text{NH}_3 = \frac{6.02 \times 10^{23} \times 4.25}{17} = 1.5 \times 10^{23}$
17. (b) $(2.5 \times 1 + 3 \times 0.5) = M_3 \times 5.5$
or $2.5 + 1.5 = M_3 \times 5.5$ or $M_3 = \frac{4}{5.5} = 0.73 \text{ M}$
20. (b) Normality of $2.3 \text{ M } \text{H}_2\text{SO}_4 = M \times \text{Valency}$
 $= 2.3 \times 2 = 4.6 \text{ N}$
21. (c) $N_1 V_1 = N_2 V_2$, $36 \times 50 = N_2 \times 100$
 $N_2 = \frac{36 \times 50}{100} = 18$; $18 \text{ N } \text{H}_2\text{SO}_4 = 9 \text{ M } \text{H}_2\text{SO}_4$.
22. (c) Molarity $= \frac{w}{m.wt. \times \text{volume in litre}} = \frac{171}{342 \times 1} = 0.5 \text{ M}$.
23. (c) $N_1 V_1 + N_2 V_2 = NV$
 $4x + 10(1 - x) = 6 \times 1$; $-6x = -4$; $x = 0.66$
24. (b) $[\text{H}_3\text{O}^+] = 2 \times 0.02 = 0.04 \text{ M}$
 $\therefore 2 \text{ litre solution contains } 0.08 \text{ mole of } \text{H}_3\text{O}^+$.
25. (c) $\therefore 10 \text{ litre of urea solution contains } 240 \text{ gm of urea}$
 $\therefore \text{Active mass} = \frac{240}{60 \times 10} = 0.4$.
26. (d) $NV = N_1 V_1 + N_2 V_2 + N_3 V_3$
or, $1000N = 1 \times 5 + \frac{1}{2} \times 20 + \frac{1}{3} \times 30$ or $N = \frac{1}{40}$.
27. (d) $W = \frac{N \times \text{eq.wt.} \times V(\text{ml})}{1000} = \frac{0.05 \times 49.04 \times 100}{1000} = 0.2452$.
29. (a) For HCl $M = N = 0.1$
 $N_1 V_1 = N_2 V_2$; $25 \times N_1 = 0.1 \times 35$
 $N_1 = \frac{0.1 \times 35}{25}$; $\therefore M = \frac{0.1 \times 35}{25 \times 2} = 0.07$.
30. (c) We know that
Molarity $= \frac{\text{Number of moles of solute}}{\text{Volume of solution in litre}}$
 $\therefore 2.0 = \frac{0.5}{\text{Volume of solution in litre}}$
 $\therefore \text{Volume of solution in litre} = \frac{0.5}{2.0} = 0.250 \text{ litre} = 250 \text{ ml}$.
31. (a) $M = \frac{w}{m \times V(l)}$; $0.52 = \frac{w}{36.5 \times 0.15}$; $w = 2.84 \text{ gm}$
32. (c) $M = \frac{n}{V(l)}$; $0.5 = \frac{n}{2}$; $n = 1$
33. (d) $N = \frac{W}{M} = \frac{828}{46} = 18$, $n = \frac{w}{m} = \frac{36}{18} = 2$
 $x_{\text{H}_2\text{O}} = \frac{n}{n + N} = \frac{2}{2 + 18} = \frac{2}{20} = 0.1$
34. (a) $N = \frac{w \times 1000}{E \times \text{volume in ml.}}$, $E = \frac{98}{3} = 32.6$
 $N = \frac{4.9 \times 1000}{32.6 \times 500} = 0.3 \text{ N}$.
39. (b) Mole fraction of solute $= \frac{20}{80} = 0.25$.
40. (c) $N = \frac{w \times 1000}{m.wt. \times \text{Volume in ml}} = \frac{4 \times 1000}{40 \times 100} = 1.0 \text{ N}$.
41. (c) $M_1 V_1 + M_2 V_2 = M_3 V_3$;
 $1.5 \times 480 + 1.2 \times 520 = M \times 1000$
 $M = \frac{720 + 624}{1000} = 1.344 \text{ M}$.
44. (c) $m = \frac{18 \times 1000}{180 \times 500} = 0.2 \text{ m}$
45. (a) Molarity $= \frac{\% \times 10 \times d}{GMM} = \frac{22 \times 10 \times 1.253}{342} = 0.805 \text{ M}$.
Normality $= \frac{\% \times 10 \times d}{GEM} = \frac{22 \times 10 \times 1.253}{342/6} = 4.83 \text{ N}$
Molality $= \frac{22 \times 1000}{342(100 - 22)} = 0.825 \text{ m}$
46. (a) $100 \text{ ml of } 0.30 \text{ M} = \frac{100 \times 0.3}{1000} = 0.03 \text{ mole of NaCl}$
 $100 \text{ ml of } 0.40 \text{ M} = \frac{100 \times 0.4}{1000} = 0.04 \text{ mole of NaCl}$
Moles of NaCl to be added $= 0.04 - 0.03 = 0.01 \text{ mole}$
 $= 0.585 \text{ gm}$
47. (c) $N = \frac{6 \times 1000}{40 \times 100} = 1.5 \text{ N}$
It is show highest normality than others.
48. (b) $M = \frac{n}{V(l)} \Rightarrow 0.8 = \frac{0.1}{V(l)} \Rightarrow V = 125 \text{ ml}$.
50. (c) Strength of $\text{H}_2\text{SO}_4 = 98 \times 19.8 \text{ g/litre}$
 $S = \text{eq.wt.} \times N$; $N = \frac{S}{\text{eq.wt.}} = \frac{98 \times 19.8}{49} = 39.6$
51. (c) $W = 1000 \text{ gm } (\text{H}_2\text{O})$; $n = 1 \text{ mole}$
 $N = \frac{W}{M} = \frac{1000}{18} = 55.55$
 $x_{\text{Solute}} = \frac{n}{n + N} = \frac{1}{1 + 55.55} = 0.018$.
53. (d) Normality of acid = molarity $\times$ basicity
i.e., $0.2 = \text{molarity} \times 2$
 $\therefore \text{Molarity} = 0.2/2 = 0.1$
55. (b) Mole fraction of $\text{H}_2\text{O} = \frac{\frac{80}{18}}{\frac{80}{18} + \frac{20}{34}} = \frac{68}{77}$.
59. (d) Volume strength $= \frac{1.5 \times 100}{17} = 8.82$.
60. (a) $n = \frac{w}{m}$; $w = n \times m = 0.25 \times 98 = 24.5 \text{ gm}$
61. (d) Molar concentration $[\text{H}_2] = \frac{\text{Mole}}{V \text{ in litre}} = \frac{20/2}{5} = 2$.

62. (a) Amount of $AgNO_3$ added in 60 ml of solution
 $= 60 \times 0.03 = 1.8 \text{ g}$
63. (a) $N = \frac{w}{E \times V(l)} \Rightarrow 0.1 = \frac{w}{100 \times 0.1} \Rightarrow w = 1 \text{ gm}$
64. (b) $N = \frac{w}{E \times V(l)} \Rightarrow 0.1 = \frac{w}{40 \times 0.25} \Rightarrow w = 1 \text{ gm}$
65. (a) $20 \times 0.4 = 40 \times N$ or $N = 0.2$ or $M = \frac{0.2}{2} = 0.1 \text{ M}$.
69. (a) $M = \frac{w \times 1000}{m.wt. \times \text{Volume in ml.}} = \frac{10.6 \times 1000}{106 \times 500} = 0.2 \text{ M}$.
72. (c) M.eq. of HCl = M.eq. of $CaCO_3$
 $N \times 50 = \frac{1}{50} \times 1000$; $N = \frac{1 \times 1000}{50 \times 50} = 0.4 \text{ N}$
73. (c) molality = $\frac{18}{180} = 0.1 \text{ molal}$.
74. (b) Molarity of $H_2SO_4 = 0.5$
 Normality of H_2SO_4 (N_1) = $0.5 \times 2 = 1$
 $N_1 V_1 = N_2 V_2$
 $1 \times 1 = N_2 \times 10$ or $N_2 = \frac{1}{10} = 0.1 \text{ N}$.
76. (c) The density of solution = 1.8 gm/ml
 Weight of one litre of solution = 1800 gm
 $\therefore$ Weight of H_2SO_4 in the solution = $\frac{1800 \times 90}{100} = 1620 \text{ gm}$
 $\therefore$ Weight of solvent = $1800 - 1620 = 180 \text{ gm}$
 $\therefore$ Molality = $\frac{1620}{98} \times \frac{100}{180} = 9.18$
77. (a) Suppose the total volume of water = x
 $\therefore 100 \text{ cm}^3 \times 0.5 \text{ N} = x \times 0.1 \text{ N}$
 $\therefore x = \frac{100 \times 0.5}{0.1} = 500 \text{ cm}^3$
 Therefore the volume of water added
 $= \text{Total volume} - 100 \text{ cm}^3 = 500 - 100 = 400 \text{ cm}^3$.
78. (b) $M_1 V_1 = M_2 V_2$, $M_2 = \frac{0.25 \times 25}{500} = 0.0125$.
79. (c) % by wt. = $\frac{\text{wt. of the solute (g)}}{\text{wt. of the solution (g)}} \times 100$
 $= \frac{10}{90 + 10} \times 100 = 10$
80. (b) Molality = $\frac{w}{m \times W} \times 1000 = \frac{18 \times 1000}{180 \times 250} = 0.4 \text{ m}$
81. (d) Molality (m) = $\frac{w \times 1000}{mW} = 14.05$.
82. (b) $N_1 V_1 = N_2 V_2$
 $10 \times 10 = 0.1(10 + V)$
 $V = \frac{10 \times 10}{0.1} - 10 = 1000 - 10 = 990 \text{ ml}$.
83. (b) Sum of mole fraction is always 1.
84. (b) An increase in temperature increases the volume of the solution and thus decreases its molarity.
85. (d) 10^3 parts of $CaCO_3$ has number of parts = 10
 10^6 parts of $CaCO_3$ has number of parts
 $= \frac{10}{10^3} \times 10^6 = 10,000 \text{ ppm}$.
86. (d) $X = \frac{n}{n + N}$
 $n = \frac{w}{m} = \frac{3.65}{36.5} = 0.1$, $N = \frac{W}{M} = \frac{16.2}{18} = 0.9$
 $X = \frac{0.1}{0.1 + 0.9} = 0.1$.
87. (d) 10% glucose solution means $10 \text{ g} = \frac{10}{180} \text{ mole}$ in 100 cc .
i.e., 0.1 litre
 Hence 1 mole will be present in $\frac{0.1 \times 180}{10} = 1.8 \text{ litre}$.
88. (e) For methyl alcohol $N = M$.
89. (b) Mole fraction of glucose = $\frac{n}{n + N}$
 $= \frac{0.01}{0.01 + 5} = 0.00199$
90. (b) Mole of urea = $\frac{6.02 \times 10^{20}}{6.02 \times 10^{23}} = 10^{-3} \text{ moles}$
 Conc. of solution (in molarity) = $\frac{10^{-3}}{100} \times 1000 = 0.01 \text{ M}$.
91. (a) Gram molecule of $SO_2Cl_2 = 135$
 $n = \frac{w}{m} = \frac{13.5}{135} = 0.1$.
92. (d) 1000 ml of 1 N oxalic solution = 63 g
 500 ml of 0.2 N oxalic acid solution
 $= \frac{63}{1000} \times 500 \times 0.2 = 6.3 \text{ g}$.
93. (a) Mole fraction at $C_6H_6 = \frac{\frac{7.8}{78}}{\frac{7.8}{78} + \frac{46}{92}} = \frac{1}{6}$.
94. (c) $X_{H_2O} = \frac{n_{H_2O}}{n_{H_2O} + n_{C_2H_5OH} + n_{CH_3COOH}}$
95. (a) $M_1 V_1 = M_2 V_2$
i.e. $5 \times 1 = M_2 \times 10 \Rightarrow M_2 = 0.5$
 Normality of the solution = $\frac{0.5}{2} = 0.25$.
96. (a) $M = \frac{w \times 1000}{m \times \text{Volume in ml.}} = \frac{1 \times 1000}{40 \times 250} = 0.1 \text{ M}$.
98. (d) $N = \frac{w \times 1000}{eq. wt. \times \text{volume in ml.}} = 0.33 \text{ N}$.
99. (b) Mole of $HCl = \frac{1.2046 \times 10^{24}}{6.023 \times 10^{23}} = 2 \text{ mole}$
 Normality = molarity $\times$ basicity or acidity = $2 \times 1 = 2 \text{ N}$

100. (d) $10 N = \text{Deca-normal}$, $\frac{1}{10} N = \text{Deci-normal}$.
101. (c) $\text{Molarity} = \frac{w \times 1000}{\text{ml wt.} \times \text{Volume ml.}} = \frac{7.1 \times 1000}{142 \times 100} = 0.5 M$.
102. (d) $M = \frac{4 \times 10}{40} = 1 M$.
103. (d) $\text{Mole fraction } X = \frac{n}{n+N} = \frac{\frac{6}{60}}{\frac{6}{60} + \frac{180}{18}} = \frac{0.1}{10.1}$.
104. (c) $N = \frac{w \times 1000}{\text{Eq.wt.} \times \text{Volume}} = \frac{10 \times 1000}{60 \times 100} = 1.66 N$.
106. (b) $N = M \times \text{basicity}$; $N = 2 \times 2 = 4$.
108. (b) $\text{Concentration} = \frac{5 \times 10^6}{10^6} = 5 \text{ ppm}$.
110. (a) H_3PO_3 is a dibasic acid
 $N_1 V_1 (\text{acid}) = N_2 V_2 (\text{base})$
 $0.1 \times 2 \times 20 = 0.1 \times 1 \times V_2$
 $\therefore V_2 = \frac{0.1 \times 2 \times 20}{0.1 \times 1} = 40 \text{ ml}$
111. (d) $H_3PO_4 \rightleftharpoons H^+ + H_2PO_4^-$
 $H_2PO_4^- \rightleftharpoons H^+ + HPO_4^{2-}$
 $HPO_4^{2-} \rightleftharpoons H^+ + PO_4^{3-}$
 Phosphoric acid does not give 1N strength.
112. (b) $C_6H_5COOH + NaOH \rightarrow C_6H_5COONa + H_2O$
 $\frac{w}{40} = \frac{12.2}{122} = 4 \text{ gms.}$
113. (c) $(H_2SO_4) N_1 V_1 = N_2 V_2$ (dilute acid)
 $N_2 = (10 \times 36) / 1000 = 0.36 N$.
114. (c) $H_2O_2 \rightarrow H_2O + \frac{1}{2} O_2$
 $1 M H_2O_2 \text{ solution} = 2N = 34 \text{ gm/litre} = 11.2$
 So Normality = $\frac{2 \times 10}{11.2} = 1.75$
115. (b) $\text{Weight} = \text{molarity} \times \text{m.wt.} \times v = 1 \times 132 \times 2 = 264 \text{ gm.}$
116. (a) $\text{Mole fraction} = \frac{n}{n+N} = \frac{\frac{w}{m}}{\frac{w}{m} + \frac{W}{M}} = \frac{\frac{1}{2}}{\frac{1}{2} + \frac{8}{32}} = 0.667$.
118. (c) 98% H_2SO_4 means 98g H_2SO_4 in 100g solution.
 $\frac{100}{1.84} \text{ cc} = 54.3 \text{ cc}$; 98g $H_2SO_4 = 1 \text{ mol}$
 Hence molarity = $\frac{1}{54.3} \times 1000 = 18.4 M$
120. (d) $3 CaCl_2 + 2 Na_3PO_4 \rightarrow Ca_3(PO_4)_2 + 6 NaCl$
 $\therefore \text{Mole of } Na_3PO_4 = 3 \text{ mole of } CaCl_2 = 1 \text{ mole}$
 $Ca_3(PO_4)_2$
 $\therefore 0.2 \text{ mole of } Na_3PO_4 = 0.3 \text{ mole of } CaCl_2 = 0.1 \text{ mole of}$
 $Ca_3(PO_4)_2$.
121. (b) $\frac{X}{X + \frac{1000}{78}} = 0.2$
122. (c) $C = \frac{6}{60} = 0.1 \text{ molar.}$
123. (b) Molar solution of sulphuric acid is equal to 2N because it is show dibasic nature.
124. (a) $N = \frac{w \times 1000}{\text{eq.wt.} \times \text{volume in ml.}} \text{ eq.wt.} = \frac{106}{2} = 53$
 $w = \frac{0.5 \times 53 \times 500}{1000} = 13.25$.
125. (c) $\text{Molar concentration} = \frac{5.85 \times 1000}{58.5 \times 200} = 0.5 \text{ Molar.}$
126. (c) $M = \frac{w \times 1000}{\text{m.wt.} \times V \text{ in ml}} = \frac{75.5 \times 1000}{56 \times 540} = 2.50 M$
129. (a) $N_1 V_1 = N_2 V_2$
 $10 \times 10 = 0.1 \times \text{Volume of new solution}$
 $\text{Volume of water} = 1000 - 10 = 990 \text{ ml}$
130. (b) $W = \frac{M \times \text{m.wt.} \times V}{1000} = \frac{0.1 \times 98 \times 400}{1000} = 3.92 \text{ g.}$
131. (a) $\text{Molarity of pure water} = \frac{1000}{18} = 55.6 M$.
132. (c) $M = \frac{N}{2} = \frac{0.2}{2} = 0.1 M$
133. (c) $\text{Moles of water} = \frac{180}{18} = 10 \text{ mole.}$
134. (c) $\text{Mole fraction of } CO_2 = \frac{n_{CO_2}}{n_{CO_2} + n_{N_2}} = \frac{\frac{44}{44}}{\frac{44}{44} + \frac{14}{28}} = \frac{2}{3}$.
136. (c) $M = \frac{w}{m \times V(l)} \Rightarrow 0.1 = \frac{w \times 4}{40 \times 1} \Rightarrow w = 1 \text{ gm}$
137. (c) $M = \frac{w \times 1 \text{ litre}}{\text{m.wt.} \times \text{Volume litre}} = \frac{4 \times 1}{40 \times 0.1} = 1 M$.
138. (b) $\text{Number of moles} = \frac{w_1}{m_1} + \frac{w_2}{m_2} = \frac{90}{18} + \frac{300}{60} = 10$
139. (a) The number of moles of solute dissolved in 1000 gm of the solvent is called molal solution.
140. (b) $w = \frac{0.1 \times 100 \times 392}{1000} = 3.92 \text{ g}$
141. (d) $\frac{18}{180 \times 1} = \frac{1}{10} = 0.1 \text{ molal.}$
142. (c) $M = \frac{n}{V(l)} \Rightarrow 3 = \frac{n}{1} \Rightarrow n = 3 \text{ moles.}$
143. (b) The unit of molality is mole per kilogram.
144. (a) 0.2 water + 0.8 ethanol; $X_A = \text{mole fraction of water}$,
 $X_B = \text{mole fraction of ethanol}$
 $X_A = \frac{N_1}{N_1 + N_2}$, $X_B = \frac{N_2}{N_2 + N_1}$
 $\therefore \text{Mole fraction of water} = 0.2 \text{ and ethanol} = 0.8$.

Colligative properties

3. (a) Osmotic pressure is colligative property.
5. (c) Vapour pressure is not colligative property.

Lowering of vapour pressure

1. (a) $\frac{P^0 - P_s}{P^0} = \frac{w \times M}{m \times W} = 143 - \frac{0.5 \times 154}{65 \times 158} \times 143$
 $= 143 - 1.03 = 141.97 \text{ mm}$
4. (d) $\frac{P^0 - P_s}{P^0} = \frac{\frac{w}{m}}{\frac{w}{m} + \frac{W}{M}}$ or $0.00713 = \frac{71.5/m}{\frac{71.5}{m} + \frac{1000}{18}}$
 $m = 180$
5. (b) HgI_2 although insoluble in water but shows complex formation with KI and freezing point is decreases.
6. (a) For solutions containing non-volatile solutes, the Raoult's law may be stated as at a given temperature, the vapour pressure of a solution containing non-volatile solute is directly proportional to the mole fraction of the solvent.
7. (a) Vapour pressure $\propto \frac{1}{\text{Boiling point}}$
 When vapour pressure decreases then *b.pt.* increases.
9. (c) Methanol has low boiling point than H_2O
 Lower is boiling point of solvent more is vapour pressure.
11. (a) Sucrose will give minimum value of ΔP .
 $\Delta P = P^0 - P_s$
 $P_s = P^0 - \Delta P$ is maximum.
12. (b) The relative lowering of the vapour pressure of dilute solution is equal to the mole fraction of the solute molecule present in the solution.
13. (b) Acetone solution has vapour pressure less than pure water.
15. (d) $P_T = P_p^0 x_p + P_h^0 x_h = 440 \times \frac{1}{5} + 120 \times \frac{4}{5}$
 $= 88 + 96 = 184$; $P_p^0 x_p = y_p P_T$; $\frac{88}{184} = y_p$
 $y_p = 0.478$
16. (a) $P_s = P_B^0 X_B$; $\therefore P_B = \frac{\frac{78}{78 + \frac{46}{92}}}{\frac{78}{78 + \frac{46}{92}}} \times 75$; $\therefore P_s = 50 \text{ torr}$
17. (b) Given molecular mass of sucrose = 342
 Moles of sucrose = $\frac{100}{342} = 0.292 \text{ mole}$
 Moles of water $N = \frac{1000}{18} = 55.5 \text{ moles}$ and
 Vapour pressure of pure water $P^0 = 23.8 \text{ mm Hg}$
 According to Raoult's law
 $\frac{\Delta P}{P^0} = \frac{n}{n + N} \Rightarrow \frac{\Delta P}{23.8} = \frac{0.292}{0.292 + 55.5}$
 $\Delta P = \frac{23.8 \times 0.292}{55.792} = 0.125 \text{ mm Hg}$
18. (d) According to Raoult's law, the relative lowering in vapour pressure of a dilute solution is equal to mole fraction of the solute present in the solution.
21. (a) When vapour pressure of solvent decreases, then the boiling point of solvent increases.
25. (b) According to Raoult's Law
 $\frac{P^0 - P_s}{P^0} = x_B$ (Mole fraction of solute)

$$x_B = \frac{0.8 - 0.6}{0.8} = 0.25.$$

26. (d) $\frac{P^0 - P_s}{P^0} = \text{molality} \times (1 - \alpha + x\alpha + y\alpha)$ the value of $P^0 - P_s$ is maximum for BaCl_2 .
27. (a) $\frac{P^0 - P_s}{P^0} = \frac{18 \times 18}{180 \times 90} = 0.02$.
30. (d) $P_T = P_p^0 X_p + P_Q^0 X_Q$; $P_T = 80 \times \frac{3}{5} + 60 \times \frac{2}{5}$
 $P_T = 48 + 24 = 72 \text{ torr}$.
31. (c) $\frac{P^0 - P_s}{P^0} = \frac{\frac{w}{m}}{\frac{w}{m} + \frac{W}{M}}$ $\therefore \frac{W}{M} > \frac{w}{m} \Rightarrow \frac{640 - 600}{640}$
 $= \frac{w}{m} \times \frac{M}{W} \Rightarrow \frac{40}{640} = \frac{2.175 \times 78}{m \times 39.08}$; $m = \frac{2.175 \times 78}{39.08} \times \frac{640}{40}$
 $m = 69.45$.
33. (c) The lower is boiling point more is vapour pressure; boiling point order, $\text{HCl} < \text{HBr} < \text{HI} < \text{HF}$
35. (c) $\frac{P^0 - P_s}{P^0} = \frac{n}{N} \Rightarrow \frac{P^0 - P_s}{P^0} = \frac{1}{9.9} \Rightarrow 9.9P^0 - 9.9P_s = P^0$
 $8.9P^0 = 9.9P_s \Rightarrow P_s = \frac{8.9}{9.9} P^0 \approx 0.90P^0$
38. (a) 1000 ml of CH_3OH requires methanol = 32 g.
 150 ml of 2 M CH_3OH requires methanol
 $= \frac{32}{1000} \times 150 \times 2 = 9.6 \text{ g}$.
39. (b) $\therefore P^0 - P_s = P^0 \times \text{mole fraction solute}$
 $10 = P^0 \times 0.2$; $20 = P^0 \times n \Rightarrow n = 0.4 \therefore N = 0.6$.
40. (b) According to the Raoult's law for the non-volatile solute the relative lowering of vapour pressure of a solution containing a non-volatile is equal to the mole fraction of the solute.
43. (d) Relationship between mole fraction of a component in the vapour phase and total vapour pressure of an ideal solution.
 $y_A = \frac{P_A}{P_{\text{total}}} = \frac{x_A \cdot P_A^0}{x_A \cdot P_A^0 + x_B \cdot P_B^0}$
 $= \frac{1 \times 1}{1 \times 1 + 2 \times 2} = \frac{1}{1 + 4} = \frac{1}{5} = 0.2$
44. (c) Lowering in weight of solution $\propto$ solution pressure
 Lowering in weight of solvent $\propto P^0 - P_s$
 ($\therefore p^0$ = vapour pressure of pure solvent)
 $\frac{p^0 - p_s}{p_s} = \frac{\text{Lowering in weight of solvent}}{\text{Lowering in weight of solution}}$
 $\frac{p^0 - p_s}{p_s} = \frac{w \times M}{m \times W}$
 $\frac{0.05}{2.5} = \frac{10 \times 18}{90 \times m} \Rightarrow m = \frac{2 \times 2.5}{0.05} = \frac{2 \times 250}{5} = 100$

Ideal and Non-ideal solution

1. (b) In solution showing positive type of deviation the partial pressure of each component of solution is greater than the vapour pressure as expected according to Raoult's law.

In solution of methanol & benzene methanol molecules are held together due to hydrogen bonding as shown below.

On adding benzene, the benzene molecules get in between the molecule of methanol thus breaking the hydrogen bonds. As the resulting solution has weak intermolecular attraction, the escaping tendency of alcohol & benzene molecule from the solution increases. Consequently the vapour pressure of the solution is greater than the vapour pressure as expected from Raoult's law.

3. (b) Chloroform & acetone form a non-ideal solution, in which A..... B type interaction are more than A..... A & B..... B type interaction due to H-bonding. Hence, the solution shows, negative deviation from Raoult's Law *i.e.*,

$$\Delta V_{\text{mix}} = -ve ;$$

$$\Delta H_{\text{mix}} = -ve$$

$\therefore$ total volume of solution = less than (30 + 50 ml)

or <80 ml

4. (b) H_2O and $\text{C}_4\text{H}_9\text{OH}$ do not form ideal solution because there is hydrogen bonding between H_2O and $\text{C}_4\text{H}_9\text{OH}$.
6. (a) Aromatic compound generally separated by fractional distillation. *e.g.* Benzene + Toluene.
7. (d) $\text{C}_2\text{H}_5\text{I}$ and $\text{C}_2\text{H}_5\text{OH}$ do not form ideal solution.
19. (a) For the ideal solution ΔH_{mix} and $\Delta V_{\text{mix}} = 0$.
25. (a) For the ideal solution ΔS_{mix} is not equal to zero.

Azeotropic mixture

1. (d) Azeotropic mixture is constant boiling mixture, it is not possible to separate the components of azeotropic mixture by boiling.
3. (d) Azeotropic mixture is a mixture of two liquids which boils at on particular temperature like a pure liquid and distils over in the same composition.

Osmosis and Osmotic pressure of the solution

1. (c) $\pi = CRT = \frac{3 \times 1000}{180 \times 60} \times 0.0821 \times 288 = 6.56 \text{ atm}$.
2. (b) Isotonic solution = $\frac{w_1}{m_1 V_1} = \frac{w_2}{m_2 V_2}$

$$= \frac{w_1}{342 \times 1} = \frac{6}{60 \times 1} = \frac{342 \times 6}{60} = 34.2$$
3. (c) $\pi = CRT$, $C = \frac{\pi}{RT} = \frac{0.0821}{0.0821 \times 300} = 0.33 \times 10^{-2}$.
4. (a) $\pi = \frac{w}{m} \times RT = \frac{0.1}{1} \times 0.0821 \times 273$
5. (b) $\pi = \frac{n}{V} RT \Rightarrow M_p = \left(\frac{m}{V} \right) \frac{RT}{\pi}$
6. (b) $C = \frac{5}{342} \times \frac{1}{100} \times 1000 = \frac{50}{342} \text{ mol/l}$

$$\pi = \frac{50}{342} \times 0.082 \times 423 = 5.07 \text{ atm}$$
7. (c) $P = \frac{w}{mv} RT$ since wvT are constant thus $P \propto \frac{1}{m}$

$$P_2 > P_1 > P_3$$

8. (b) In the osmosis solvent molecule move from lower concentration to higher concentration.
10. (a) Osmosis occur from dilute solution to concentrate solution. Therefore solution A is less concentrated than B.
11. (c) Molar concentration of cane sugar = $\frac{5}{342} \times \frac{1000}{100} = \frac{50}{342}$
Molar concentration of X = $\frac{1}{m} \times \frac{1000}{100} = \frac{10}{m}$

$$\frac{10}{m} = \frac{50}{342} \text{ or } m = 68.4$$
12. (d) Osmotic pressure method is especially suitable for the determination of molecular masses of macromolecules such as protein & polymer because for these substances the value of other colligative properties such as elevation in boiling point or depression in freezing point are too small to be measured on the other hand osmotic pressure of such substances are measurable.
13. (b) $\pi = CRT$; $C = \frac{\pi}{RT} = \frac{7.8}{0.082 \times 310} = 0.31 \text{ mol/litre}$
14. (b) $\pi = CRT$

$$\pi = \frac{w \times R \times T}{mV} = \frac{68.4 \times 0.0821 \times 273}{342} = 4.92 \text{ atm}$$
16. (b) $\pi = \frac{n}{V} RT = \frac{m/MRT}{V}$

$$\frac{600}{760} = \frac{20 \times 0.0821 \times 288 \times 1000}{500 \times M}$$
; $M = 1200$
17. (c) $\pi = \frac{1.66 + 2.46}{2} = 2.06 \text{ atm}$
19. (d) Copper ferrocyanide ppt. acts as a semipermeable membrane.
20. (b) Osmotic pressure = CRT where $C = 1 \text{ M}$

$$\pi = CRT = 1 \times 0.0821 \times 300 = 24.6 \text{ atm}$$
23. (d) $P = CRT$ or $\frac{P}{C} = RT$
24. (d) $\pi = CRT$ or $\pi = \left(\frac{P^0 - P_s}{P^0} \right) \times \frac{dRT}{M}$
31. (a) Isotonic solutions are those which have same concentration.
32. (c) $\pi = CRT = 0.2 \times 0.0821 \times 293 = 4.81 \text{ atm}$.
35. (b) Equal osmotic pressure only applicable of non-electrolytes solution at low concentration.
38. (c) As soon as the solute molecules increases the osmotic pressure of solution increase.
41. (c) Living cells shrinks in hypertonic solution (plasmolysis) while bursts in hypotonic solution (endosmosis). There is no effect when living cells are kept in isotonic solution.
43. (c) $\pi V = nRT$

$$\pi = \frac{w}{m} \frac{RT}{V} = \frac{10}{342} \times \frac{0.0821 \times (273 + 69)}{0.1} = 8.21 \text{ atm}$$
45. (c) KNO_3 dissociates completely while CH_3COOH dissociates to a small extent. Hence, $P_1 > P_2$.
47. (b) $\pi V = nRT$

$$\frac{500V_1}{105.3V_2} = \frac{nR \times 283}{nR \times 298}$$
; $\frac{V_1}{V_2} = \frac{1}{5}$ so $V_2 = 5V_1$

48. (a) There is no net movement of the solvent through the semipermeable membrane between two solution of equal concentration.
50. (b) $\pi V = \frac{w}{m} RT$
 $\therefore 6 \times 10^{-4} \times 1 = \frac{4}{m} \times 0.0821 \times 300$; $m = 1.64 \times 10^5$.
52. (d) According to the dialysis process molecular weight increases but sensitivity decreases.
55. (d) $\pi \propto T$; if T is doubled π is also doubled.
56. (b) Osmosis reaction takes place in increases the volume.
58. (a) For two non-electrolytic solution if isotonic, $C_1 = C_2$
 $\therefore \frac{8.6}{60 \times 1} = \frac{5 \times 1000}{m \cdot \text{wt.} \times 100}$ $\therefore m = 348.9$
59. (b) Both urea and glucose are non-electrolytes but NaCl being electrolyte ionises.

Elevation of boiling point of the solvent

1. (a) $K_b = \frac{M_1 R T_0^2}{1000 \Delta H_v} = \frac{18 \times 1.987 \times (373)^2}{1000 \times 9700} = 0.513^\circ \text{C}$
2. (b) $\Delta T_b = i m K_b = 0.52 \times 1 \times 2 = 1.04$.
 $\therefore T_b = 100 + 1.04 = 101.04^\circ \text{C}$.
3. (c) $K_b = \frac{\Delta T_b}{m} = \frac{0.1 \times 100}{\frac{1.8}{180} \times 1000} = 1 \text{ K/m}$.
4. (d) $m = \frac{K_b \times w \times 1000}{\Delta T_b \times W} = \frac{2.16 \times 0.15 \times 1000}{0.216 \times 15} = 100$.
5. (b) Due to higher pressure inside the boiling point elevated.
6. (b) Dissolution of a non-volatile solute raises the boiling pt. of a liquid.
7. (b) As we know that
 Boiling point $\propto \frac{1}{\text{vapour pressure of liquid}}$
 Hence, on decreasing vapour pressure, boiling point will increase.
8. (b) $\Delta T_b = \frac{100 \times K_b \times w}{m \times W}$ $\therefore 0.52 = \frac{100 \times 5.2 \times 6}{m \times 100}$
 $m = \frac{100 \times 5.2 \times 6}{0.52 \times 100} = 60$.
10. (b) Elevation in a boiling point is a colligative property as it depends upon the number of particles.
 $\Delta T_b \propto n$
 For sucrose, $n = 1$, $\Delta T_b = 0.1^\circ \text{C}$
 For NaCl , $n = 2$, $\Delta T_b = 0.2^\circ \text{C}$
11. (b) $\Delta T_b = K_b \times m$ or $K_b = \Delta T_b / m$
12. (c) $\Delta T_b = K_b \times m = 0.513 \times \left(\frac{0.1}{200} \times 1000 \right)$
 $= 0.2565^\circ \text{C}$, $T_b = 100.256^\circ \text{C}$
15. (a) $\Delta T_b = i K_b m$
 $\text{CuCl}_2 \longrightarrow \text{Cu}^{2+} + 2\text{Cl}^-$
 $\begin{array}{ccc} 1 & 0 & 0 \\ (1-\alpha) & \alpha & 2\alpha \end{array}$
 $i = 1 + 2\alpha$
 Assuming 100% ionization

So, $i = 3$

$$\Delta T_b = 3 \times 0.52 \times 0.1 = 0.156 \approx 0.16$$

16. (d) $\Delta T_b = \frac{K_b \times w \times 1000}{m \times W}$
 $m = \frac{K_b \times w \times 1000}{\Delta T_b \times W} = \frac{2.53 \times 10 \times 1000}{1 \times 100} = 253 \text{g}$.
18. (b) Common salt is non-volatile and rises the b.pt.
19. (b) In the process of evaporation, high energy molecules leave the surface of liquid, hence average kinetic energy and consequently the temperature of liquid falls.
20. (a) The boiling occurs at lowers temperature if atmospheric pressure is lower than 76 cm Hg .
23. (b) BaCl_2 furnishes more ions than KCl and thus shows higher boiling point $T_1 > T_2$.

Depression of freezing point of the solvent

1. (c) $\Delta T_f = K_f \times \text{molality} = 1.86 \times 0.05 = 0.093^\circ \text{C}$
 Thus freezing point = $0 - 0.093 = -0.093^\circ \text{C}$.
2. (c) $\Delta T_f = \frac{100 \times K \times w}{m \times W}$ $\therefore 0.186 = \frac{100 \times 18.6 \times w}{60 \times 500}$
 $w = 3 \text{g}$
3. (a) Camphor has the maximum value of $K_f (= 39.7)$.
4. (d) The extent of depression in freezing point varies with the number of solute particles for a fixed solvent only and it is a characteristics feature of the nature of solvent also. So for two different solvents the extent of depression may vary even if number of solute particles be dissolved.
6. (a) Molar mass = $\frac{K_f \times 1000 \times w}{\Delta T_f \times W} = \frac{1.86 \times 1000 \times 1.25}{20 \times 1.1}$
 $= 105.68 = 105.7$.
7. (b) $\text{HBr} \rightleftharpoons \text{H}^+ + \text{Br}^-$
 $\begin{array}{ccc} (1-\alpha) & \alpha & \alpha \end{array}$
 Total = $1 + \alpha$ $\therefore i = 1 + \alpha = 1 + 0.9 = 1.9$
 $\Delta T_f = i K_f \times m = 1.9 \times 1.86 \times \frac{8.1}{81} \times \frac{1000}{100} = 3.53^\circ \text{C}$
 $T_f = -3.53^\circ \text{C}$.
8. (b) $\Delta T_f = K_f \times m = 1.86 \times 0.1 = 0.186$.
9. (b) Freezing point is lowered on addition of solute in it.
10. (d) $\Delta T_b = 0.18$; $\Delta T_b = m K_b$
 $\frac{0.18}{\Delta T_f} = \frac{m K_b}{m K_f}$; $\frac{0.18 \times 1.86}{0.512} = \Delta T_f$; $\Delta T_f = 0.653$
 $T^0 - T_s = 0.653$; $T^0 - T_s = 0.653$; $T_s = 0 - 0.653^\circ \text{C}$.
11. (a) $\Delta T_f = 1.86 \times \left(\frac{342}{342} \right) = 1.86^\circ$; $\therefore T_f = -1.86^\circ \text{C}$.
12. (b) $\Delta T_b = K_b \times m$ i.e. $0.52 = 0.52 \times m$
 $\Delta T_f = K_f \times m = 1.86 \times 1 = 1.86$; $T_f = -1.86^\circ \text{C}$.
13. (b) For NaCl $i = 2$
 $\Delta T_f = 2 K_f m = 2 \times 1.86 \times 1 = 3.72$

$$T_s = T - \Delta T_f = 0 - 3.72 = -3.72^\circ\text{C}$$

15. (b) $\Delta T_f = K_f \times m \Rightarrow 0.186 = 1.86 \times m$

So $m = 0.1$, Put the value of m in $\Delta T_b = K_b \times m$

$$\Delta T_b = 0.521 \times (0.1) = 0.0521$$

17. (a) Dissolution of a non-volatile solute lowers the freezing pt. of the solution H_2O .

20. (a) By using, $m = \frac{K_f \times 1000 \times w}{\Delta T_f \times W_{\text{Solvent}} (gm)} = \frac{5.12 \times 1000 \times 1}{0.40 \times 50}$
 $= 256 \text{ gm/mol}$

Hence, molecular mass of the solute = 256 gmmol^{-1}

21. (a) $m = \frac{K_f \times w \times 1000}{\Delta T_f \times W} = \frac{5.12 \times 0.440 \times 1000}{0.567 \times 22.2} = 178.9$

22. (a) $KBr = K^+ + Br^- = 2 \text{ ions}$

$\therefore$ urea is not ionise hence it is shows highest freezing point.

23. (d) $NaCl \rightarrow Na^+ + Cl^- = 2 \text{ ions}$

K_2SO_4 give maximum ion in solution so it shows maximum depression in freezing point.

24. (c) $\Delta T_f = \frac{K_f \times 1000 \times w}{m \times W} = -0.216^\circ\text{C}$

25. (a) $\Delta T_f = \frac{1000 \times 1.86 \times 17}{46 \times 1000} = 0.69^\circ\text{C}$

$$T_f = 0 - 0.69 = -0.69^\circ\text{C}$$

26. (ad) The depression of freezing point is less than that of pure solvent and only solvent molecules solidify at the freezing point.

27. (b) $K_f = \frac{RT_f^2}{1000 \times L_f}$, $R = 8.314 \text{ JK}^{-1} \text{ mol}^{-1}$

$$T_f = 273 + 16.6 = 289.6 \text{ K}; L_f = 180.75 \text{ Jg}^{-1}$$

$$K_f = \frac{8.314 \times 289.6 \times 289.6}{1000 \times 180.75}$$

Colligative properties of electrolyte

1. (c) $(NH_4)_3PO_4$ gives maximum ion. Hence, its osmotic pressure is maximum.

2. (b) $BaCl_2$ gives maximum ion hence it is shows lowest vapour pressure.

3. (d) Na_3PO_4 consist of maximum ions hence it show lowest vapour pressure.

4. (c) Vapour pressure of a solvent is lowered by the presence of solute in it. Lowering in vapour pressure is a colligative property *i.e.*, it depends on the no. of particles present in the solution. $Cu(NO_3)_2$ give the maximum no. of ions. (*i.e.*, 3) so it causes the greatest lowering in vapour pressure of water.

5. (c) Na_2SO_4 have more osmotic pressure than $NaCl$ solution because Na_2SO_4 gives 3 ions.

6. (a) $NaCl$ gives maximum ion hence it will show highest osmotic pressure.

8. (c) $BaCl_2 \Rightarrow Ba^{2+} + 2Cl^- = 3 \text{ ion}$

Glucose $\Rightarrow$ No ionisation

$\therefore BaCl_2 > NaCl > \text{Glucose}$

9. (a) $Al_2(SO_4)_3$ gives maximum osmotic pressure because it is gives 5 ion.

10. (a) Highest osmotic pressure is given by solution which produce maximum number of ions *i.e.* $CaCl_2$.

11. (c) $BaCl_2$ gives maximum ion. Hence, its shows highest boiling point.

12. (c) $BaCl_2$ gives maximum ion. Hence, its boiling point is maximum.

13. (d) $CaCl_2$ gives maximum ion hence it shows highest boiling point.

14. (c) Elevation in boiling point is a colligative property which depends upon the number of solute particles. Greater the number of solute particle in a solution higher the extent of elevation in boiling point.

15. (a) $NaCl$ contain highest boiling point than other's compound.

16. (d) $KCl > C_6H_5OH > C_6H_{12}O_6$
 Boiling point decreasing order $\rightarrow$

Potassium chloride is ionic compound and phenol is formed phenoxide ion hence it is shows greater boiling point then glucose.

17. (c) $Al_2(SO_4)_3$ gives maximum ion hence it will show highest boiling point.

18. (b) $NaCl$ is a more ionic compare to $BaCl_2$, glucose and urea solution.

19. (c) Urea = 1; Common salt = 1; $Na_2SO_4 = 3$
 Ratio = 1 : 2 : 3

20. (c) $CaCl_2$ gives maximum ion hence it has minimum freezing point.

21. (b) $NaCl$ gives maximum ion hence it shows lowest freezing point

23. (b) Lesser the number of particles in solution, Lesser the depression in freezing point, *i.e.* higher the freezing point.

24. (c) $BaCl_2$ gives maximum ion hence it shows maximum depression in freezing point.

26. (d) We know that lowering of freezing point is a colligative property which is directly proportional to the number of particles formed by one mole of compound therefore 0.1M $Al_2(SO_4)_3$ solution will have minimum freezing point.

27. (a) $Al_2(SO_4)_3$ gives maximum ion hence its gives lowest freezing point.

28. (b) Colligative property in decreasing order

29. (d) $K_4[Fe(CN)_6]$ gives maximum ion. Hence it have lowest vapour pressure.

Abnormal Molecular Mass

1. (c) Na_3PO_4 gives maximum four ion it is show highest Vant's haff factor.
2. (a) $K_4[Fe(CN)_6]$ dissociates as $4K^+ + [Fe(CN)_6]^{4-}$, thus 1 molecule dissociates into five particles in the similar way $Al_2(SO_4)_3$ also gives five particles per molecule.
3. (a) Benzoic acid in benzene undergoes association through intermolecular hydrogen bonding.
4. (c) vant's Hoff factor (i) = $\frac{\text{experiment al C.P.}}{\text{Calculated C.P.}}$
 $= 1 - \alpha + x\alpha + y\alpha$, for KCl it is = 2 and for sugar it is equal to 1.
5. (c) $Ca(NO_3)_2 \rightarrow Ca^{2+} + 2NO_3^-$ it gives three ions hence the Van't Hoff factor = 3.
6. (a) $m = \frac{5 \times 18 \times 2.5}{0.04 \times 80} = 70.31$
8. (c) $Na_2SO_4 \rightleftharpoons 2Na^+ + SO_4^{2-}$

Mol. before diss.	1	0	0
Mol. after diss	$1 - \alpha$	2α	1α

 $i = \frac{\text{Exp.C.P.}}{\text{Normal C.P.}} = 1 - \alpha + 2\alpha + \alpha = 1 + 2\alpha$
10. (d) $MgSO_4$ dissociates to give 2 ions.
11. (d) Urea does not give ion in the solution.
13. (b) Molecular weight of $CH_3COOH = 60$
 Hence the molecular weight of acetic acid in benzene = $2 \times 60 = 120$.
17. (b) $AlCl_3$ furnishes more ions than $CaCl_2$ and thus shows higher boiling point i.e. $t_1 > t_2$.
18. (d) $Na_3PO_4 = 3Na^+ + PO_4^{3-}$.
19. (b) Benzoic acid dimerises due to strong hydrogen bonding.
4. (d) It is known that azeotropic mixture of HCl and water 20.2% HCl .

$$\pi = CRT = \frac{n}{V} RT = \frac{1.75}{1000} \times \frac{342}{150} \times 0.0821 \times 290$$

$$= 0.8095 \approx 0.81 \text{ atm.}$$
5. (a) $\pi = CRT = \frac{n}{V} RT = \frac{342}{150} \times 0.0821 \times 290$

$$= 0.8095 \approx 0.81 \text{ atm.}$$
6. (c) Vant hoff factor of $NaCl$ about 1.95 because it will be ionise into two ions.
 $NaCl \rightleftharpoons Na^+ + Cl^-$
7. (b) $m = \frac{wRT}{PV} = \frac{0.6 \times 0.082 \times 300}{1.23 \times 0.1} = 120$
8. (b) $m = \frac{K_b \times w \times 1000}{\Delta T_b \times W} = 143.18$
9. (c) Here: $\Delta T_b = 0.323K$
 $w = 0.5143g$ weight of Anthracene.
 $W = 35g$ weight of chloroform
 $K_b = \text{Molal elevation constant (3.9 K-Kg/mol)}$

$$m = \frac{K_b \times w \times 1000}{W \times \Delta T_b} = \frac{3.9 \times 0.5143 \times 1000}{0.323 \times 35}$$

$$= 177.42g/mol$$
10. (c) First boiling point of water = $100^\circ C$
 Final boiling point of water = 100.52°
 $w = 3g$, $W = 200g$, $K_b = 0.6 \text{ kg}^{-1}$
 $\Delta T_b = 100.52 - 100 = 0.52^\circ C$

$$m = \frac{K_b \times w \times 1000}{\Delta T_b \times W}$$

$$= \frac{0.6 \times 3 \times 1000}{0.52 \times 200} = \frac{1800}{104} = 17.3gmol^{-1}.$$

Critical Thinking Questions

1. (a) $\frac{P^o - P_s}{P^o} = \frac{n}{n + N}$; $P^o = 0.80$, $P_s = 0.60$
 $\therefore \frac{n}{n + N} = \frac{0.2}{0.8} = 0.25$.
2. (c) We have,

$$\frac{p^0 - 21.85}{21.85} = \frac{30 \times 18}{90 \times m}$$
(i)
 wt. of solvent = $90 + 18 = 108gm$

$$\frac{p^0 - 22.15}{22.15} = \frac{30 \times 18}{108 \times m}$$
(ii)
 By eq. (i) $p_m^0 - 21.85m = 21.85 \times 6 = 131.1$
 By eq. (2) $p_m^0 - 22.15m = 22.15 \times 5 = 110.75$
 $0.30m = 20.35$
 $m = \frac{20.35}{0.30} = 67.83$
3. (c) $\frac{P^o - P_s}{P^o} = \frac{W_2}{W_1} = \frac{3000 - 2985}{3000} = \frac{M_2}{100}$ or $M_2 = 180$
11. (b) Applying clausius clapeyron equation

$$\log \frac{P_2}{P_1} = \frac{\Delta H_v}{2.303R} \left[\frac{T_2 - T_1}{T_1 \times T_2} \right]$$

$$\log \frac{760}{23} = \frac{40656}{2.303 \times 8.314} \left[\frac{373 - T_1}{373T} \right]$$
 This gives $T_1 = 294.4K$.
12. (b) $\Delta T_f = \text{molality} \times K_f \times (1 + \alpha)$
 $\alpha = 0.2$, Molality = 0.2, $K_f = 1.86$
 $\Delta T_f = 0.2 \times 1.2 \times 1.86 = 0.4464^\circ$
 Freezing point = $-0.45^\circ C$.
13. (b) $\Delta T_f = imK_f$; $0.0054 = i \times 1.8 \times 0.001$
 $i = 3$ so it is $[Pt(NH_3)_4 Cl]Cl_2$.
14. (d) $m = \frac{K_f \times w \times 1000}{\Delta T_f \times W} = 60 g/mole$.
15. (a) $\Delta T = K_f \times \text{Molality} = 4.9 \times 0.001 = 0.0049K$
16. (c) $Na_2CO_3 + H_2SO_4 \rightarrow Na_2SO_4 + CO_2 + H_2O$

$$0.02 = \frac{0.02 \times 22.4}{2} = 0.224$$

17. (a) We know that in the first solution number of the moles of urea
- $$= \frac{\text{Mass of urea}}{\text{m.wt. of urea}} \times \frac{1}{V} = \frac{12}{60} \times \frac{1}{1} = 0.2 \text{ and}$$
- In second solution the number of moles of cane sugar
- $$= \frac{\text{Mass of cane sugar}}{\text{m.wt. of cane sugar}} = \frac{68.4}{342} \times \frac{1}{1} = 0.2.$$

Assertion & Reason

1. (a) Molecular weight of urea (NH_2CONH_2)

$$= 14 + 2 + 12 + 16 + 14 + 2 = 60$$

$$\text{Number of moles} = \frac{\text{Weight}}{\text{molecular weight}} = \frac{60}{60} = 1$$
2. (e) If 100 cc of 0.1 N HCl is mixed with 100 cc of 0.2 N HCl, the normality of the final solution will be 0.15.

$$N_1 V_1 + N_2 V_2 = N_3 V_3 \text{ i.e., } 0.1 \times 100 + 0.2 \times 100$$

$$= N_3 \times 200 \text{ or } N_3 = \frac{0.3 \times 100}{200} = 0.15$$
3. (c) Both the solute and solvent will form the vapour but vapour phase will become richer in the more volatile component.
4. (b) Non-ideal solutions with positive deviation i.e., having more vapour pressure than expected, boil at lower temperature while those with negative deviation boil at higher temperature than those of the components.
5. (c) The polymer solutions possess very little elevation in boiling point or depression in freezing point.
6. (a) Depression in freezing point is a colligative property which depends upon the number of particles. The number of particles are different in case of benzene and water that is why molecular weight of acetic acid determined by depression in freezing point method is also different.
7. (d) Sodium ion, Na^+ and potassium ion, K^+ are responsible for maintaining proper osmotic pressure balance inside and outside of the cells of organisms.
8. (a) If a pressure larger than the osmotic pressure is applied to the solution side, the pure solvent flows out of the solution through semi-permeable membrane and this phenomenon is called as reverse osmosis.
9. (c) Camphor has high molal depression constant.
10. (b) Elevation in boiling point and depression in freezing point are colligative properties because both depend only on the number of particles (ions or molecules) of the solute in a definite amount of the solvent but not on the nature of the solute.
12. (a) The boiling point and melting point are higher due to presence of the intermolecular hydrogen bonding.
14. (d) If a non-volatile solute is added to water its vapour pressure always decreases. Therefore, both assertion and reason are false.
15. (b) We know that heat of vaporisation of water at 100°C is 40.6kJ and that of benzene is 31kJ at 80°C . The amount of heat required to vaporise one mole of liquid at constant temperature is known as heat of vapourisation therefore, both assertion and reason are true but reason is not the correct explanation of assertion.
16. (d) Ice melts slowly at high altitude because melting is favoured at a high pressure at high altitude the atmospheric pressure is low and so ice melts slowly.
17. (a) Colligative properties are the properties of solutions containing non volatile solute. It is correct that molecular mass of benzoic acid when determined by colligative properties is found

abnormally high. This is because dimerisation of benzoic takes place in solution resulting high molecular mass. Therefore, assertion and reason are true and reason is correct explanation.

18. (a) It is fact that use of pressure cooker reduces cooking time because at higher pressure over the liquid due to cooker lid, the liquid boils at higher temperature and cooking occurs faster.
19. (c) The assertion that CCl_4 & H_2O are immiscible is true because CCl_4 is non-polar liquid while water is polar hence assertion is true and reason is false.
20. (b) It is true that isotonic solution doesn't show the phenomenon of osmosis. Isotonic solution are those solution which have same osmotic pressure. Here both assertion and reason are true but reason is not correct explanation.

Solution and Colligative properties

Self Evaluation Test - 4

- The 2N aqueous solution of H_2SO_4 contains
 - 49 gm of H_2SO_4 per litre of solution
 - 4.9 gm of H_2SO_4 per litre of solution
 - 98 gm of H_2SO_4 per litre of solution
 - 9.8 gm of H_2SO_4 per litre of solution
- The amount of $KMnO_4$ required to prepare 100 ml of 0.1N solution in alkaline medium is [CPMT 1986]
 - 1.58 gm
 - 3.16 gm
 - 0.52 gm
 - 0.31 gm
- What weight of hydrated oxalic acid should be added for complete neutralisation of 100ml of 0.2N – NaOH solution ?
 - 0.45 g
 - 0.90 g
 - 1.08 g
 - 1.26 g
- A 500g tooth paste sample has 0.2g fluoride concentration. What is the concentration of F in terms of ppm level
 - 250
 - 200
 - 400
 - 1000
- To 5.85gm of NaCl one kg of water is added to prepare of solution. What is the strength of NaCl in this solution (mol. wt. of NaCl = 58.5) [CPMT 1990; DPMT 1987]
 - 0.1 Normal
 - 0.1 Molal
 - 0.1 Molar
 - 0.1 Formal
- The degree of dissociation of $Ca(NO_3)_2$ in a dilute aqueous solution containing 14g of the salt per 200g of water $100^\circ C$ is 70 percent. If the vapour pressure of water at $100^\circ C$ is 760 cm. Calculate the vapour pressure of the solution [UPSEAT 2000]
 - 746.3 mm of Hg
 - 757.5 mm of Hg
 - 740.9 mm of Hg
 - 750 mm of Hg
- The vapour pressure of pure benzene at a certain temperature is 200 mm Hg. At the same temperature the vapour pressure of a solution containing 2g of non-volatile non-electrolyte solid in 78g of benzene is 195 mm Hg. What is the molecular weight of solid
 - 50
 - 70
 - 85
 - 80
- Which one of the following non-ideal solutions shows the negative deviation
 - $CH_3COCH_3 + CS_2$
 - $C_6H_6 + CH_3COCH_3$
 - $CCl_4 + CHCl_3$
 - $CH_3COCH_3 + CHCl_3$
- The O.P. of equimolar solution of Urea, $BaCl_2$ and $AlCl_3$, will be in the order [DCE 2000]
 - $AlCl_3 > BaCl_2 > \text{Urea}$
 - $BaCl_2 > AlCl_3 > \text{Urea}$
 - $\text{Urea} > BaCl_2 > AlCl_3$
 - $BaCl_2 > \text{Urea} > AlCl_3$
- The osmotic pressure of a 5% solution of cane sugar at $150^\circ C$ is (mol. wt. of cane sugar = 342) [CPMT 1986; Manipal MEE 1995]
 - 4 atm
 - 3.4 atm
 - 5.07 atm
 - 2.45 atm
- Which one of the following pairs of solutions can we expect to be isotonic at the same temperature [NCERT 1982]
 - 0.1M urea and 0.1M NaCl
 - 0.1M urea and 0.2M $MgCl_2$
 - 0.1M NaCl and 0.1M Na_2SO_4
 - 0.1M $Ca(NO_3)_2$ and 0.1M Na_2SO_4
- Which of the following would have the highest osmotic pressure (assume that all salts are 90% dissociated) [NCERT 1982]
 - Decimolar aluminium sulphate
 - Decimolar barium chloride
 - Decimolar sodium sulphate
 - A solution obtained by mixing equal of (b) and (c) and filtering
- Which solution will have the highest boiling point [NCERT 1981]
 - 1% solution of glucose in water
 - 1% solution of sodium chloride in water
 - 1% solution of zinc sulphate in water
 - 1% solution of urea in water
- The boiling point of a solution of 0.11 gm of a substance in 15 gm of ether was found to be $0.1^\circ C$ higher than that of the pure ether. The molecular weight of the substance will be ($K_b = 2.16$) [MP PET 2002]
 - 148
 - 158
 - 168
 - 178
- The boiling point of benzene is 353.23 K. When 1.80 gm of a nonvolatile solute was dissolved in 90 gm of benzene, the boiling point is raised to 354.11 K. the molar mass of the solute is

- [K_b for benzene = 2.53 K mol^{-1}] [DPMT 2004]
- (a) 5.8 g mol^{-1}
 (b) 0.58 g mol^{-1}
 (c) 58 g mol^{-1}
 (d) 0.88 g mol^{-1}
16. The boiling point of 0.1 molal aqueous solution of urea is 100.18°C at 1 atm. The molal elevation constant of water is
 (a) 1.8 (b) 0.18
 (c) 18 (d) 18.6
17. The freezing point of a solution containing 4.8 g of a compound in 60 g of benzene is 4.48°C . What is the molar mass of the compound ($K_f = 5.1 \text{ K mol}^{-1}$), (freezing point of benzene = 5.5°C)
 (a) 100 (b) 200
 (c) 300 (d) 400
18. When 0.01 mole of sugar is dissolved in 100g of a solvent, the depression in freezing point is 0.40° . When 0.03 mole of glucose is dissolved in 50g of the same solvent, the depression in freezing point will be
 (a) 0.60° (b) 0.80°
 (c) 1.60° (d) 2.40°
19. The freezing point of equimolal aqueous solution will be highest for
 (a) $\text{C}_6\text{H}_5\text{NH}_3^+\text{Cl}^-$ (aniline hydrochloride)
 (b) $\text{Ca}(\text{NO}_3)_2$
 (c) $\text{La}(\text{NO}_3)_3$
 (d) $\text{C}_6\text{H}_{12}\text{O}_6$ (glucose)
20. The Van't Hoff factor of the compound $\text{K}_3\text{Fe}(\text{CN})_6$ is
 (a) 1 [AFMC 2000] (b) 2
 (c) 3 (d) 4

AS Answers and Solutions

(SET -4)

1. (c) Wt. of H_2SO_4 per litre = $N \times \text{eq. mass} = 2 \times 49 = 98g$.
2. (a) In alkaline medium $KMnO_4$ act as oxidant as follows.

$$2KMnO_4 + 2KOH \rightarrow 2K_2MnO_4 + H_2O + (O)$$
Hence its eq.wt. = m.wt. = 158
Now, Normality = $\frac{\text{Mass}}{\text{Eq. mass}} \times \frac{1}{V(L)}$

$$\text{mass} = 0.1 \times 158 \times \frac{100}{1000} g = 1.58 g.$$
3. (d) For complete neutralization equivalent of oxalic acid = equivalent of $NaOH$ =

$$\frac{w}{\text{eq. wt}} = \frac{NV}{1000} \therefore \frac{w}{63} = \frac{0.2 \times 100}{1000} \Rightarrow w = 1.26 gm.$$
4. (c) F^- ions in $PPm = \frac{0.2}{500} \times 10^6 = 400$
5. (b) $5.85 g NaCl = 0.1 mol$ as it present in 1 kg of
water ; molality = $\frac{\text{wt.}}{m \text{ wt.} \times l} = \frac{5.85}{58.5 \times 1} = 0.1 molal$
6. (a)
7. (d) $\frac{P^o - P_s}{P^o} = \frac{n}{n + N}; \frac{P^o - P_s}{P^o} = \frac{w \times M}{m \times W} = 80$
8. (d) $CH_3COCH_3 + CHCl_3$ is non ideal solution which shown negative deviation.
9. (a) The particle come of $AlCl_3$ solution will be maximum due to ionisation less in $BaCl_2$ and minimum in urea

$$AlCl_3 \rightarrow Al^{3+} + 3Cl^- = 4$$

$$BaCl_2 \rightarrow Ba^{2+} + 2Cl^- = 3$$
More the number of particles in solution more is the osmotic pressure a colligative properties.
10. (c) $\pi = \frac{5 \times 0.0821 \times 1000 \times 423}{342 \times 100} = 5.07 atm.$
11. (d) Osmotic pressure is a colligative properties equimolar solution of $Ca(NO_3)_2$ and Na_2SO_4 will produce same number of solute particles.

$$Ca(NO_3)_2 \rightleftharpoons Ca^{2+} + 2NO_3^-$$

$$Na_2(SO_4) \rightleftharpoons 2Na^+ + SO_4^{2-}$$
12. (a) $Al_2(SO_4)_3$ Deci-molar gives maximum ion. Hence, its osmotic pressure is maximum.
13. (b) $NaCl$ and $ZnSO_4$ gives 2 ions but $NaCl$ is more ionic than $ZnSO_4$.
14. (b) $m = \frac{K_b \times w \times 1000}{\Delta T_b \times W}$
 $K_b = 2.16, w = 0.11, W = 15g, \Delta T_b = 0.1$

$$m = \frac{2.16 \times 0.11 \times 1000}{0.1 \times 15} = 158.40 \approx 158.$$
15. (c) The elevation (ΔT_b) in the boiling point

$$= 354.11K - 353.23K = 0.88K$$
Substituting these values in expression

$$M_{\text{solute}} = \frac{K_b \times 1000 \times w}{\Delta T_b \times W}$$
Where, w = weight of solute, W = weight of solvent

$$M_{\text{solute}} = \frac{2.53 \times 1.8 \times 1000}{0.88 \times 90} = 58 gmol^{-1}$$
Hence, molar mass of the solute = $58 gmol^{-1}$
16. (a) $K_b = \frac{0.18}{0.1} = 1.8$
17. (d) $m = \frac{K_f \times 1000 \times w}{W \times \Delta T_f} = \frac{5.1 \times 1000 \times 4.8}{60 \times 1.02} = 400.$
18. (d) $\Delta T_f = mk_f$

$$0.40 = \frac{0.01 \times 1000}{100} \times k_f \Rightarrow k_f = 4$$
again $\Delta T_f = mk_f$

$$= \frac{0.03 \times 1000}{50} \times 4$$

$$= 2.4$$
19. (d) $La(NO_3)_3$ will furnish four ions and thus will develop more lowering in freezing point whereas glucose gives only one particle and thus minimum lowering in freezing point.
20. (d) $K_3[Fe(CN)_6] \rightarrow 3K^+ + [Fe(CN)_6]^{3-}.$

Chapter 5 Solid State

The solids are the substances which have definite volume and definite shape. In terms of kinetic molecular model, solids have regular order of their constituent particles (atoms, molecules or ions). These particles are held together by fairly strong forces, therefore, they are present at fixed positions. The properties of the solids not only depend upon the nature of the constituents but also on their arrangements.

Types and Classification of solids

(1) Types of solids

Solids can be broadly classified into following two types,

- Crystalline solids/True solids,
- Amorphous solids/Pseudo solids

Crystalline solids	Amorphous solids
<i>They have long range order.</i>	<i>They have short range order.</i>
They have definite melting point	Not have definite melting point
They have a definite heat of fusion	Not have definite heat of fusion
They are rigid and incompressible	Not be compressed to any appreciable extent
They are given cleavage <i>i.e.</i> they break into two pieces with plane surfaces	They are given irregular cleavage <i>i.e.</i> they break into two pieces with irregular surface
<i>They are anisotropic because of these substances show different property in different direction</i>	<i>They are isotropic because of these substances show same property in all directions</i>
There is a sudden change in volume when it melts.	There is no sudden change in volume on melting.
These possess symmetry	Not possess any symmetry.
These possess interfacial angles.	Not possess interfacial angles.

(2) Crystalline and amorphous silica (SiO_2)

(4) Classification of crystalline solids

Silica occurs in crystalline as well as amorphous states. Quartz is a typical example of crystalline silica. Quartz and the amorphous silica differ considerably in their properties.

Quartz	Amorphous silica
It is crystalline in nature	It is light (fluffy) white powder
All four corners of SiO_4^{4-} tetrahedron are shared by others to give a network solid	The SiO_4^{4-} tetrahedra are randomly joined, giving rise to polymeric chains, sheets or three-dimensional units
It has high and sharp melting point (1710°C)	It does not have sharp melting point

(3) Diamond and graphite

Diamond and graphite are two allotropes of carbon. Diamond and graphite both are covalent crystals. But, they differ considerably in their properties.

Diamond	Graphite
It occurs naturally in free state	It occurs naturally, as well as manufactured artificially
It is the hardest natural substance known.	It is soft and greasy to touch
It has high relative density (about 3.5)	Its relative density is 2.3
It is transparent and has high refractive index (2.45)	It has black in colour and opaque
It is non-conductor of heat and electricity.	Graphite is a good conductor of heat and electricity
It burns in air at 900°C to give CO_2	It burns in air at 700°C to give CO_2
It occurs as octahedral crystals	It occurs as hexagonal crystals

Table : 5.1 Some characteristics of different types of crystalline solids

Types of Solid	Constituents	Bonding	Examples	Physical Nature	M.P.	B.P.	Electrical Conductivity
----------------	--------------	---------	----------	-----------------	------	------	-------------------------

Ionic	Positive and negative ions network systematically arranged	Coulombic	NaCl , KCl , CaO , MgO , LiF , ZnS , BaSO_4 and K_2SO_4 etc.	Hard but brittle	High ($\approx 1000\text{K}$)	High ($\approx 2000\text{K}$)	Conductor (in molten state and in aqueous solution)
Covalent	Atoms connected in covalent bonds	Electron sharing	SiO_2 (Quartz), SiC , C (diamond), C (graphite) etc.	Hard Hard Hard	Very high ($\approx 4000\text{K}$)	Very high ($\approx 5000\text{K}$)	Insulator except graphite
Molecular	Polar or non-polar molecules	(i) Molecular interactions (intermolecular forces)	I_2 , S , P , CO , CH_4 , CCl_4 etc.	Soft	Low ($\approx 300\text{K}$ to 600K)	Low (≈ 450 to 800K)	Insulator
		(ii) Hydrogen bonding	Starch, sucrose, water, dry ice or drycold (solid CO_2) etc.	Soft	Low ($\approx 400\text{K}$)	Low ($\approx 373\text{K}$ to 500K)	Insulator
Metallic	Cations in a sea of electrons	Metallic	Sodium, Au , Cu , magnesium, metals and alloys	Ductile malleable	High ($\approx 800\text{K}$ to 1000K)	High ($\approx 1500\text{K}$ to 2000K)	Conductor
Atomic	Atoms	London dispersion force	Noble gases	Soft	Very low	Very low	Poor thermal and electrical conductors

Crystallography

"The branch of science that deals with the study of structure, geometry and properties of crystals is called crystallography".

(i) **Symmetry in Crystal** : A crystal possess following three types of symmetry,

(i) **Plane of symmetry** : It is an imaginary plane which passes through the centre of a crystal can divides it into two equal portions which are exactly the mirror images of each other.

Plane of symmetry

Rectangular plane of symmetry

Diagonal plane of symmetry

Fig. 5.1

(ii) **Axis of symmetry** : An axis of symmetry or axis of rotation is an imaginary line, passing through the crystal such that when the crystal is rotated about this line, it presents the same appearance more than once in one complete revolution i.e., in a rotation through 360° . Suppose, the same appearance of crystal is repeated, on rotating it through an angle of $360^\circ/n$, around an imaginary axis, is called an **n -fold axis** where, n is known as the order of axis. By order is meant the value of n in $2\pi/n$ so that rotation through $2\pi/n$, gives an equivalent configuration.

Axis of two fold symmetry

Axis of three fold symmetry

Axis of four fold symmetry

Axis of six fold symmetry

Fig. 5.2

(iii) **Centre of symmetry** : It is an imaginary point in the crystal that any line drawn through it intersects the surface of the crystal at equal distance on either side.

Fig. 5.3

Only simple cubic system have one centre of symmetry. Other system do not have centre of symmetry.

The total number of planes, axes and centre of symmetries possessed by a crystal is termed as **elements of symmetry**.

A cubic crystal possesses total 23 elements of symmetry.

Plane of symmetry (3 + 6) = 9

Axes of symmetry (3 + 4 + 6) = 13

Centre of symmetry (1) = 1

Total symmetry = 23

(2) **Laws of crystallography** : Crystallography is based on three fundamental laws.

(i) **Law of constancy of interfacial angles** : This law states that angle between adjacent corresponding faces is inter facial angles of the crystal of a particular substance is always constant inspite of different shapes and sizes and mode of growth of crystal. The size and shape of crystal depend upon the conditions of crystallisation. This law is also known as **Steno's Law**.

Fig. 5.4. Constancy of interfacial angles

(ii) **Law of rational indices** : This law states that the ratio of intercepts of different faces of a crystal with the three axes are constant and can be expressed by rational numbers that the intercepts of any face of a crystal along the crystallographic axes are either equal to unit intercepts (i.e., intercepts made by unit cell) a , b , c or some simple whole number multiples of them e.g., na , $n'b$, $n''c$, where n , n' and n'' are simple whole numbers. The whole numbers n , n' and n'' are called **Weiss indices**. This law was given by **Hauy**.

(iii) **Law of constancy of symmetry** : According to this law, all crystals of a substance have the same elements of symmetry is plane of symmetry, axis of symmetry and centre of symmetry.

Miller indices : Planes in crystals are described by a set of integers (h , k and l) known as Miller indices. Miller indices of a plane are the reciprocals of the fractional intercepts of that plane on the various crystallographic axes. For calculating Miller indices, a reference plane, known as parametral plane, is selected having intercepts a , b and c along x , y and z -axes, respectively. Then, the intercepts of the unknown plane are given with respect to a , b and c of the parametral plane.

Thus, the Miller indices are :

$$h = \frac{a}{\text{intercept of the plane along } x\text{-axis}}$$

$$k = \frac{b}{\text{intercept of the plane along } y\text{-axis}}$$

$$l = \frac{c}{\text{intercept of the plane along } z\text{-axis}}$$

The distance between the parallel planes in crystals are designated as d_{hkl} . For different cubic lattices these interplanar spacing are given by the general formula,

$$d_{(hkl)} = \frac{a}{\sqrt{h^2 + k^2 + l^2}}$$

Where a is the length of cube side while h , k and l are the Miller indices of the plane.

When a plane is parallel to an axis, its intercept with that axis is taken as infinite and the Miller will be zero.

Negative signs in the Miller indices is indicated by placing a bar on the intercept. All parallel planes have same Miller indices.

Space lattice and Unit cell

Crystal is a homogeneous portion of a crystalline substance, composed of a regular pattern of structural units (ions, atoms or molecules) by plane surfaces making definite angles with each other giving a regular geometric form.

A regular array of points (showing atoms/ions) in three dimensions is commonly called as a **space lattice**, or lattice.

Each point in a space lattice represents an atom or a group of atoms.

Each point in a space lattice has identical surroundings throughout.

A three dimensional group of lattice points which when repeated in space generates the crystal called **unit cell**.

The unit cell is described by the lengths of its edges, a , b , c (which are related to the spacing between layers) and the angles between the edges, α , β , γ .

Fig. 5.5

Types of units cells

A units cell is obtained by joining the lattice points. The choice of lattice points to draw a unit cell is made on the basis of the external geometry of the crystal, and symmetry of the lattice. There are four different types of unit cells. These are,

(1) **Primitive or simple cubic (sc)** : Atoms are arranged only at the corners of the unit cell.

(2) **Body centred cubic (bcc)** : Atoms are arranged at the corners and at the centre of the unit cell.

(3) **Face centred cubic (fcc)** : Atoms are arranged at the corners and at the centre of each faces of the unit cell.

(4) **Side centered** : Atoms are arranged at the centre of only one set of faces in addition to the atoms at the corner of the unit cell.

Formation of crystal and Crystal systems

The crystals of the substance are obtained by cooling the liquid (or the melt) of the solution of that substance. The size of the crystal depends upon the rate of cooling. If cooling is carried out slowly, crystals of large size are obtained because the particles (ions, atoms or molecules) get sufficient time to arrange themselves in proper positions.

(If loosing units dissolves as embryo and if gaining unit grow as a crystals).

Bravais (1848) showed from geometrical considerations that there can be only 14 different ways in which similar points can be arranged. Thus, there can be only 14 different space lattices. These 14 types of lattices are known as **Bravais Lattices**. But on the other hand Bravais showed that there are only seven types of crystal systems.

Table : 5.2 Bravais lattices corresponding to different crystal systems

Crystal system	Space lattice			Examples
Cubic $a = b = c$, $\alpha = \beta = \gamma = 90^\circ$	Simple : Lattice points at the eight corners of the unit cells. 	Body centered : Points at the eight corners and at the body centred. 	Face centered : Points at the eight corners and at the six face centres. 	$Pb, Hg, Ag,$ $Au, Cu, ZnS,$ diamond, $KCl, CsCl,$ $NaCl, Cu_2O, CaF_2$ and alums. etc.
	Tetragonal $a = b \neq c$, $\alpha = \beta = \gamma = 90^\circ$	Simple : Points at the eight corners of the unit cell. 	Body centered : Points at the eight corners and at the body centre 	

Orthorhombic (Rhombic) $a \neq b \neq c$, $\alpha = \beta = \gamma = 90^\circ$	Simple: Points at the eight corners of the unit cell. 	End centered : Also called side centered or base centered. Points at the eight corners and at two face centres opposite to each other. 	Body centered : Points at the eight corners and at the body centre 	Face centered: Points at the eight corners and at the six face centres. 	KNO_3, K_2SO_4 , $PbCO_3, BaSO_4$, rhombic sulphur, $MgSO_4 \cdot 7H_2O$ etc.
Rhombohedral or Trigonal $a = b = c$, $\alpha = \beta = \gamma \neq 90^\circ$	Simple : Points at the eight corners of the unit cell 				$NaNO_3, CaSO_4$, calcite, quartz, As, Sb, Bi etc.
Hexagonal $a = b \neq c$, $\alpha = \beta = 90^\circ$ $\gamma = 120^\circ$	Simple : Points at the twelve corners of the unit cell out lined by thick line. 	or Points at the twelve corners of the hexagonal prism and at the centres of the two hexagonal faces. 		ZnO, PbS, CdS , HgS , graphite, ice, Mg, Zn, Cd etc.	
Monoclinic $a \neq b \neq c$, $\alpha = \gamma = 90^\circ, \beta \neq 90^\circ$	Simple : Points at the eight corners of the unit cell 	End centered : Point at the eight corners and at two face centres opposite to the each other. 		$Na_2SO_4 \cdot 10H_2O$, $Na_2B_4O_7 \cdot 10H_2O$, $CaSO_4 \cdot 2H_2O$, monoclinic sulphur etc.	
Triclinic $a \neq b \neq c$, $\alpha \neq \beta \neq \gamma \neq 90^\circ$	Simple : Points at the eight corners of the unit cell. 				$CaSO_4 \cdot 5H_2O$, $K_2Cr_2O_7, H_3BO_3$ etc.

(2) **Co-ordination number (C.N.)** : It is defined as the number of nearest neighbours or touching particles with other particle present in a crystal is called its co-ordination number. It depends upon structure of the crystal.

For simple cubic system C.N. = 6.

For body centred cubic system C.N. = 8

For face centred cubic system C.N. = 12.

(3) **Density of the unit cell (ρ)** : It is defined as the ratio of mass per unit cell to the total volume of unit cell.

$$\rho = \frac{Z \times M}{a^3 \times N_0}$$

Where Z = Number of particles per unit cell

M = Atomic mass or molecular mass

N_0 = Avogadro number ($6.023 \times 10^{23} \text{ mol}^{-1}$)

a = Edge length of the unit cell = $a \text{ pm} = a \times 10^{-10} \text{ cm}$

a^3 = volume of the unit cell

$$\text{i.e. } \rho = \frac{Z \times M}{a^3 \times N_0 \times 10^{-30}} \text{ g/cm}^3$$

Analysis of cubic system

(1) Number of atoms in per unit cell

The total number of atoms contained in the unit cell for a simple cubic called the unit cell content.

The simplest relation can determine for it is, $\frac{n_c}{8} + \frac{n_f}{2} + \frac{n_i}{1}$

Where n_c = Number of atoms at the corners of the cube = 8

n_f = Number of atoms at six faces of the cube = 6

n_i = Number of atoms inside the cube = 1

Cubic unit cell	n_c	n_f	n_i	Total atom in per unit cell
Simple cubic (sc)	8	0	0	1
body centered cubic (bcc)	8	0	1	2
Face centered cubic (fcc)	8	6	0	4

The density of the substance is same as the density of the unit cell.

(4) **Packing fraction (P.F.)** : It is defined as ratio of the volume of the unit cell that is occupied by spheres of the unit cell to the total volume of the unit cell.

Let radius of the atom in the packing = r

Edge length of the cube = a

Volume of the cube $V = a^3$

Volume of the atom (spherical) $v = \frac{4}{3}\pi r^3$

$$\text{Packing density} = \frac{vZ}{V} = \frac{\frac{4}{3}\pi r^3 Z}{a^3}$$

Structure	r related to a	Volume of the atom (v)	Packing density	% of void
Simple cubic	$r = \frac{a}{2}$	$\frac{4}{3}\pi \left(\frac{a}{2}\right)^3$	$\frac{\pi}{6} = 0.52$	$100 - 52 = 48\%$
Face-centred cubic	$r = \frac{a}{2\sqrt{2}}$	$\frac{4}{3}\pi \left(\frac{a}{2\sqrt{2}}\right)^3$	$\frac{\sqrt{2}\pi}{6} = 0.74$	$100 - 74 = 26\%$
Body-centred cubic	$r = \frac{\sqrt{3}a}{4}$	$\frac{4}{3}\pi \left(\frac{\sqrt{3}a}{4}\right)^3$	$\frac{\sqrt{3}\pi}{8} = 0.68$	$100 - 68 = 32\%$

X-ray study of crystal structure

Study of internal structure of crystal can be done with the help of X-rays. The distance of the constituent particles can be determined from diffraction value by **Bragg's equation**.

$$n\lambda = 2d \sin\theta$$

where, λ = Wave length of X-rays, n = order of reflection,

θ = Angle of reflection, d = Distance between two parallel surfaces

The above equation is known as **Bragg's equation** or **Bragg's law**.

The reflection corresponding to $n = 1$ (for a given family of planes) is called first order reflection; the reflection corresponding to $n = 2$ is the second order reflection and so on. Thus by measuring n (the order of reflection of the X-rays) and the incidence angle θ , we can know d/λ .

$$\frac{d}{\lambda} = \frac{n}{2 \sin\theta}$$

From this, d can be calculated if λ is known and vice versa. In X-ray reflections, n is generally set as equal to 1. Thus Bragg's equation may alternatively be written as

$$\lambda = 2d \sin\theta = 2 d_{\sin\theta}$$

Where $d_{\sin}$ denotes the perpendicular distance between adjacent planes with the indices hkl .

Close packing in crystalline solids

In the formation of crystals, the constituent particles (atoms, ions or molecules) get closely packed together. The closely packed arrangement is that in which maximum available space is occupied. This corresponds to a state of maximum density. The closer the packing, the greater is the stability of the packed system.

(i) **Close packing in two dimensions** : The two possible arrangement of close packing in two dimensions.

(i) **Square close packing** : In which the spheres in the adjacent row lie just one over the other and show a horizontal as well as vertical alignment and form square. In this arrangement each sphere is in contact with four spheres.

Fig. 5.6. Square close packing

(ii) **Hexagonal close packing** : In which the spheres in every second row are seated in the depression between the spheres of first row. The spheres in the third row are vertically aligned with spheres in first row. The similar pattern is noticed throughout the crystal structure. In this arrangement each sphere is in contact with six other spheres.

Fig. 5.7. Hexagonal close packing

(2) **Close packing in three dimensions** : In order to develop three dimensional close packing, let us retain the hexagonal close packing in the first layer. For close packing, each spheres in the second layer rests in the hollow at the centre of three touching spheres in the layer as shown in figure. The spheres in the first layer are shown by solid lines while those in second layer are shown by broken lines. It may be noted that only half of the triangular voids in the first layer are occupied by spheres in the second layer (*i.e.*, either b or c). The unoccupied hollows or voids in the first layer are indicated by (c) in figure.

Fig. 5.8. Close packing in three dimensions

There are two alternative ways in which species in third layer can be arranged over the second layer,

(i) **Hexagonal close packing** : The third layer lies vertically above the first and the spheres in third layer rest in one set of hollows on the top of the second layer. This arrangement is called **ABAB** type and 74% of the available space is occupied by spheres. This arrangement is found in *Be, Mg, Zn, Cd, Sc, Y, Ti, Zr, Tc, Ru*.

(ii) **Cubic close packing** : The third layer is different from the first and the spheres in the third layer lie on the other set of hollows marked 'C'

in the first layer. This arrangement is called **ABCABC....** type and in this also 74% of the available space is occupied by spheres. The cubic close packing has face centred cubic (fcc) unit cell. This arrangement is found in *Cu, Ag, Au, Ni, Pt, Pd, Co, Rh, Ca, Sr*.

Fig. 5.10. Cubic close packing (ccp or fcc) in three dimensions

(iii) **Body centred cubic** : This arrangement of spheres (or atoms) is not exactly close packed. This structure can be obtained if spheres in the first layer (A) of close packing are slightly opened up. As a result none of these spheres are in contact with each other. The second layer of spheres (B) can be placed on top of the first layer so that each sphere of the second layer is in contact with four spheres of the layer below it. Successive building of the third will be exactly like the first layer. If this pattern of building layers is repeated infinitely we get an arrangement as shown in figure. This arrangement is found in *Li, Na, K, Rb, Ba, Cs, V, Nb, Cr, Mo, Fe*.

Fig. 5.11. Body centred cubic (bcc) close packing in three dimensions

Table : 5.3 Comparison of hcp, ccp and bcc

Property	hcp	ccp	bcc
Arrangement of packing	Close packed	Close packed	Not close packed
Type of packing	AB AB A...	ABC ABC A...	AB AB A...
Available space occupied	74%	74%	68%
Coordination number	12	12	8
Malleability and ductility	Less malleable, hard, brittle	Malleable and ductile	

Interstitial sites in close packing

Even in the close packing of spheres, there is left some empty space between the spheres. This empty space in the crystal lattice is called site or void or hole. Voids are of following types,

(1) **Trigonal void** : This site is formed when three spheres lie at the vertices of an equilateral triangle. Size of the trigonal site is given by the following relation,

$$r = 0.155R$$

r = Radius of the spherical trigonal void

R = Radius of closely packed spheres

Fig. 5.12

(2) **Tetrahedral void** : A tetrahedral void is developed when triangular voids (made by three spheres in one layer touching each other) have contact with one sphere either in the upper layer or in the lower layer.

The number of tetrahedral voids developed is double the number of spheres in the crystal structure.

$$\frac{r}{R} = 0.225$$

where, r is the radius of the tetrahedral void or atom occupying tetrahedral void.

R is the radius of spheres forming tetrahedral void.

(3) **Octahedral void** : This type of void is surrounded by six closely packed spheres, i.e. it is formed by six spheres.

The number of octahedral voids is equal to the number of spheres.

$$\frac{r}{R} = 0.414$$

(4) **Cubic void** : This type of void is formed between 8 closely packed spheres which occupy all the eight corner of cube.

$$\frac{r}{R} = 0.732$$

Fig. 5.14. Octahedral void

Fig. 5.15. Cubic void

The decreasing order of the size of the various voids is,

Cubic > Octahedral > Tetrahedral > Trigonal

Ionic radii and Radius ratio

(1) **Ionic radii** : X-ray diffraction or electron diffraction techniques provides the necessary information regarding unit cell. From the dimensions of the unit cell, it is possible to calculate ionic radii.

Let, cube of edge length ' a ' having cations and anions say *NaCl* structure.

$$\text{Then, } r_c + r_a = a/2$$

where r_c and r_a are radius of cation and anion.

$$\begin{aligned} \text{Radius of } Cl^- \\ &= \sqrt{\frac{(a/2)^2 + (a/2)^2}{2}} = \frac{a}{4} \end{aligned}$$

For bcc lattice say *CsCl*.

$$r_c + r_a = \frac{\sqrt{3}a}{2}$$

(2) **Radius ratio** : Ionic compounds occur in crystalline forms. Ionic compounds are made of cations and anions. These ions are arranged in three dimensional array to form an aggregate of the type $(AB)_n$. Since, the Coulombic forces are non-directional, hence the structures of such crystals

Fig. 5.16. Radii of chloride ion

are mainly governed by the ratio of the radius of cation (r_+) to that of anion (r_-). The ratio r_+ to r_- (r_+/r_-) is called as radius ratio.

Fig. 5.17. Effect of radius ratio on co-ordination number

Table : 5.4 Limiting Radius ratios and Structure

Limiting radius ratio (r_+/r_-)	C.N.	Shape
< 0.155	2	Linear

Structure of ionic crystals

Table : 5.5 Types of ionic crystal with description

Crystal structure type	Brief description	Examples	Co-ordination number	Number of formula units per unit cell
Type AB Rock salt (NaCl) type	It has <i>fcc</i> arrangement in which Cl^- ions occupy the corners and face centres of a cube while Na^+ ions are present at the body and edge of centres.	Halides of <i>Li, Na, K, Rb, AgF, AgBr, NH₄Cl, NH₄Br, NH₄I</i> etc.	$Na^+ = 6$ $Cl^- = 6$	4
Zinc blende (ZnS) type	It has <i>ccp</i> arrangement in which S^{2-} ions form <i>fcc</i> and each Zn^{2+} ion is surrounded tetrahedrally by four S^{2-} ions and vice versa.	<i>CuCl, CuBr, CuI, AgI, BeS</i>	$Zn^{2+} = 4$ $S^{2-} = 4$	4
Type AB ₂ Fluorite (CaF ₂) type	It has arrangement in which Ca^{2+} ions form <i>fcc</i> with each Ca^{2+} ions surrounded by 8 F^- ions and each F^- ions by 4 Ca^{2+} ions.	<i>BaF₂, BaCl₂, SrF₂, SrCl₂, CdF₂, PbF₂</i>	$Ca^{2+} = 8$ $F^- = 4$	4
Antifluorite type	Here negative ions form the <i>ccp</i> arrangement so that each positive ion is surrounded by 4 negative ions and each negative ion by 8 positive ions	<i>Na₂O</i>	$Na^+ = 4$ $O^{2-} = 8$	4
Caesium chloride (CsCl) type	It has the <i>bcc</i> arrangement with Cs^+ at the body centre and Cl^- ions at the corners of a cube or vice versa.	<i>CsCl, CsBr, CsI, CsCN, TlCl, TlBr, TlI and TlCN</i>	$Cs^+ = 8$ $Cl^- = 8$	1

Defects or Imperfections in solids

Any deviation from the perfectly ordered arrangement constitutes a defect or imperfection. These defects sometimes called thermodynamic defects because the number of these defects depend on the temperature.

(i) **Electronic imperfections** : Generally, electrons are present in fully occupied lowest energy states. But at high temperatures, some of the electrons may occupy higher energy state depending upon the temperature. For example, in the crystals of pure *Si* or *Ge* some electrons are released thermally from the covalent bonds at temperature above 0 K. these electrons are free to move in the crystal and are responsible for electrical conductivity. This type of conduction is known as **intrinsic conduction**. The

0.155 – 0.225	3	Planar triangle
0.225 – 0.414	4	Tetrahedral
0.414 – 0.732	6	Octahedral
0.732 – 0.999 or 1	8	Body-centered cubic

Effect of temperature and Pressure on C.N.

On applying high pressure *NaCl* structure having 6 : 6 co-ordination changes to *CsCl* structure having 8 : 8 co-ordination. Thus, increase in pressure increases the co-ordination number.

Similarly, *CsCl* structure on heating to about 760 K, changes to *NaCl* structure. In other words, increase of temperature decreases the co-ordination number.

electron deficient bond formed by the release of an electron is called a hole. In the presence of electric field the positive holes move in a direction opposite to that of the electrons and conduct electricity. The electrons and holes in solids gives rise to electronic imperfections.

(2) **Atomic imperfections/point defects** : When deviations exist from the regular or periodic arrangement around an atom or a group of atoms in a crystalline substance, the defects are called point defects. Point defect in a crystal may be classified into following three types.

(i) **Stoichiometric defects** : The compounds in which the number of positive and negative ions are exactly in the ratios indicated by their chemical formulae are called stoichiometric compounds. The defects do not

disturb the stoichiometry (the ratio of numbers of positive and negative ions) are called stoichiometric defects. These are of following types,

(a) Interstitial defect : This type of defect is caused due to the presence of ions in the normally vacant interstitial sites in the crystals.

(b) Schottky defect : This type of defect when equal number of cations and anions are missing from their lattice sites so that the electrical neutrality is maintained. This type of defect occurs in highly ionic compounds which have high co-ordination number and cations and anions of similar sizes. *e.g.*, NaCl , KCl , CsCl and KBr etc.

(c) Frenkel defect : This type of defect arises when an ion is missing from its lattice site and occupies an interstitial position. The crystal as a whole remains electrically neutral because the number of anions and cations remain same. Since cations are usually smaller than anions, they occupy interstitial sites. This type of defect occurs in the compounds which have low co-ordination number and cations and anions of different sizes. *e.g.*, ZnS , AgCl and AgI etc. Frenkel defect are not found in pure alkali metal halides because the cations due to larger size cannot get into the interstitial sites. **In AgBr both Schottky and Frenkel defects occur simultaneously.**

Fig. 5.18. Schottky defect

Fig. 5.19. Frenkel defect

Consequences of Schottky and Frenkel defects

Presence of large number of Schottky defect lowers the density of the crystal. When Frenkel defect alone is present, there is no decrease in density. The closeness of the charge brought about by Frenkel defect tends to increase the dielectric constant of the crystal. Compounds having such defect conduct electricity to a small extent. When electric field is applied, an ion moves from its lattice site to occupy a hole, it creates a new hole. In this way, a hole moves from one end to the other. Thus, it conducts electricity across the crystal. Due to the presence of holes, stability (or the lattice energy) of the crystal decreases.

(ii) **Non-stoichiometric defects** : The defects which disturb the stoichiometry of the compounds are called non-stoichiometry defects. These defects are either due to the presence of excess metal ions or deficiency of metal ions.

(a) **Metal excess defects due to anion vacancies** : A compound may have excess metal anion if a negative ion is absent from its lattice site, leaving a 'hole', which is occupied by electron to maintain electrical neutrality. This type of defects are found in crystals which are likely to possess **Schottky defects**. Anion vacancies in alkali metal halides are reduced by heating the alkali metal halides crystals in an atmosphere of alkali metal vapours. The 'holes' occupy by electrons are called **F-centres** (or colour centres).

(b) **Metal excess defects due to interstitial cations** : Another way in which metal excess defects may occur is, if an extra positive ion is present in an interstitial site. Electrical neutrality is maintained by the presence of an electron in the interstitial site. This type of defects are exhibit by the crystals which are likely to exhibit **Frenkel defects** *e.g.*, when ZnO is heated, it loses oxygen reversibly. The excess is accommodated in interstitial sites, with electrons trapped in the neighborhood. **The yellow colour and the electrical conductivity of the non-stoichiometric ZnO is due to these trapped electrons.**

Fig. 5.20. Metal excess defect due to extra cation

Fig. 5.21. Metal excess defect due to anion vacancy

Consequences of Metal excess defects

The crystals with metal excess defects are generally coloured due to the presence of free electrons in them.

The crystals with metal excess defects conduct electricity due to the presence of free electrons and are **semiconductors**. As the electric transport is mainly by "excess" electrons, these are called **n-type** (*n* for negative) semiconductor.

The crystals with metal excess defects are generally paramagnetic due to the presence of unpaired electrons at lattice sites.

When the crystal is irradiated with white light, the trapped electron absorbs some component of white light for excitation from ground state to the excited state. This gives rise to colour. Such points are called **F-centres**. (German word Farbe which means colour) such excess ions are accompanied by positive ion vacancies. These vacancies serve to trap holes in the same way as the anion vacancies trapped electrons. The colour centres thus produced are called **V-centres**.

(c) **Metal deficiency defect by cation vacancy** : In this a cation is missing from its lattice site. To maintain electrical neutrality, one of the nearest metal ion acquires two positive charge. This type of defect occurs in compounds where metal can exhibit variable valency. *e.g.*, Transition metal compounds like NiO , FeO , FeS etc.

(d) **By having extra anion occupying interstitial site** : In this, an extra anion is present in the interstitial position. The extra negative charge is balanced by one extra positive charge on the adjacent metal ion. Since anions are usually larger it could not occupy an interstitial site. Thus, this structure has only a theoretical possibility. No example is known so far.

Fig. 5.22

Consequences of metal deficiency defects

Due to the movement of electron, an ion A^+ changes to A^{2+} ions. Thus, the movement of an electron from A^+ ion is an apparent of positive hole and the substances are called **p-type semiconductor**

(iii) **Impurity defect** : These defects arise when foreign atoms are present at the lattice site (in place of host atoms) or at the vacant interstitial sites. In the former case, we get substitutional solid solutions while in the latter case, we get interstitial solid solution. The formation of the former depends upon the electronic structure of the impurity while that of the later on the size of the impurity.

Properties of solids

Some of the properties of solids which are useful in electronic and magnetic devices such as, transistor, computers, and telephones etc., are summarised below,

(i) **Electrical properties** : Solids are classified into following classes depending on the extent of conducting nature.

(i) **Conductors** : The solids which allow the electric current to pass through them are called conductors. These are further of two types; Metallic conductors and electrolytic conductors. The electrical conductivity of these solids is high in the range $10^4 - 10^6 \text{ ohm}^{-1} \text{ cm}^{-1}$. Their conductance decrease with increase in temperature.

(ii) **Insulators** : The solids which do not allow the current to pass through them are called insulators. *e.g.*, rubber, wood and plastic etc. the electrical conductivity of these solids is very low *i.e.*, $10^{-12} - 10^{-22} \text{ ohm}^{-1} \text{ cm}^{-1}$.

(iii) **Semiconductors** : The solids whose electrical conductivity lies between those of conductors and insulators are called semiconductors. The conductivity of these solid is due to the presence of impurities. *e.g.* Silicon and Germanium. Their conductance increase with increase in temperature. The electrical conductivity of these solids is increased by adding impurity. This is called **Doping**. When silicon is doped with *P* (or *As*, group 5⁺ elements), we get *n*-type semiconductor. This is because *P* has five valence electrons. It forms 4 covalent bonds with silicon and the fifth electron remains free and is loosely bound. This give rise to *n*-type semiconductor because current is carried by electrons when silicon is doped with *Ga* (or in *In/Al*, group 3⁺ elements) we get *p*-type semiconductors.

Superconductivity : When any material loses its resistance for electric current, then it is called superconductor, **Kammerlingh Onnes (1913)** observed this phenomenon at 4K in mercury. The materials offering no resistance to the flow of current at very low temperature (2-5K) are called **superconducting materials** and phenomenon is called **superconductivity**.

Examples, Nb_3Ge alloy (Before 1986)

Following are the important applications of superconductivity,

- (a) Electronics, (b) Building supermagnets,
(c) Aviation transportation, (d) Power transmission

"The temperature at which a material enters the superconducting state is called the superconducting transition temperature, (T_c)". Superconductivity was also observed in lead (*Pb*) at 7.2 K and in tin (*Sn*) at 3.7K. The phenomenon of superconductivity in other materials such as polymers and organic crystals. Examples are

(*SN*), polythiazyl, the subscript *x* indicates a large number of variable size.

(*TMTSF*), *PF*, where *TMTSF* is tetra methyl tetra seleno fulvalene.

(2) **Magnetic properties** : Based on the behavior of substances when placed in the magnetic field, there are classified into five classes.

Table : 5.6 Magnetic properties of solids

Properties	Description	Alignment of Magnetic Dipoles	Examples	Applications
Diamagnetic	Feebly repelled by the magnetic fields. Non-metallic elements (excepts <i>O₂</i> , <i>S</i>) inert gases and species with paired electrons are diamagnetic	All paired electrons 	<i>TiO₂</i> , <i>V₂O₅</i> , <i>NaCl</i> , <i>C₆H₆</i> (benzene)	Insulator
Paramagnetic	Attracted by the magnetic field due to the presence of permanent magnetic dipoles (unpaired electrons). In magnetic field, these tend to orient themselves parallel to the direction of the field and thus, produce magnetism in the substances.	At least one unpaired electron 	<i>O₂</i> , <i>Cu²⁺</i> , <i>Fe³⁺</i> , <i>TiO</i> , <i>Ti₂O₃</i> , <i>VO</i> , <i>VO₂</i> , <i>CuO</i>	Electronic appliances
Ferromagnetic	Permanent magnetism even in the absence of magnetic field, Above a temperature called Curie temperature, there is no ferromagnetism.	Dipoles are aligned in the same direction 	<i>Fe</i> , <i>Ni</i> , <i>Co</i> , <i>CrO₂</i>	<i>CrO₂</i> is used in audio and video tapes
Antiferromagnetic	This arises when the dipole alignment is zero due to equal and opposite alignment.		<i>MnO</i> , <i>MnO₂</i> , <i>Mn₂O</i> , <i>FeO</i> , <i>Fe₂O₃</i> , <i>NiO</i> , <i>Cr₂O₃</i> , <i>CoO</i> , <i>Co₃O₄</i>	—
Ferrimagnetic	This arises when there is net dipole moment		<i>Fe₃O₄</i> , ferrites	—

(3) **Dielectric properties** : A dielectric substance is that which does not allow the electricity to pass through them but on applying the electric field, induced charges are produced on its faces. In an insulator, the electrons are strongly held by the individual atoms. When an electric field is applied polarization takes place because nuclei are attracted to one side and the electron cloud to the other side. As a result, dipoles are created. Such type of crystals shows the following properties,

(i) **Piezoelectricity** : In some of the crystals, the dipoles may align themselves in an ordered way so as to give some net dipole moment. When mechanical stress is applied in such crystals so as to deform them, electricity is produced due to the displacement of ions. The electricity thus produced is called piezoelectricity and the crystals are called piezoelectric

crystals. Examples, Quartz, Rochelle's salt (sod. pot. tartarate). Piezoelectric crystals act as mechanical-electric transducer. These crystals are used as pick-ups in record players where they produce electric signals by application of pressure.

(ii) **Pyroelectricity** : On heating, some polar crystals produce a small electric current. The electricity thus produced is called pyroelectricity.

(iii) **Ferroelectricity** : In some of the piezoelectric crystals, a permanent alignment of the dipoles is always there even in the absence of the electric field, however, on applying field the direction of polarization changes. This phenomenon is called ferroelectricity and the crystals as

ferroelectric crystal. Example, Potassium hydrogen phosphate (KH_2PO_4), Barium titanate ($BaTiO_3$).

(iv) **Antiferroelectricity** : In some crystals, the dipoles in alternate polyhedra point up and down so that the crystals does not possess any net dipole moment. Such crystals are said to be antiferroelectric. Example, Lead zirconate ($PbZrO_3$). Ferroelectrics are used in the preparation of small sized capacitors of high capacitance. Pyroelectric infrared detectors are based on such substances. These can be used in transistors, telephone, computer etc.

Tips & Tricks

- ✍ The reverse of crystallization is the melting of the solid.
- ✍ The slower the rate of formation of crystal, the bigger is the crystal.
- ✍ The hardness of metals increases with the number of electrons available for metallic bonding. Thus Mg is harder than sodium.
- ✍ Isomorphism is applied to those substances which are not only similar in their crystalline form, but also possess an equal number of atoms united in the similar manner. The existence of a substance in more than one crystalline form is known as polymorphism.

Ordinary Thinking

Objective Questions

Properties and Types of solid

- The three states of matter are solid, liquid and gas. Which of the following statement is/are true about them
[AIIMS 1991]
 - Gases and liquids have viscosity as a common property
 - The molecules in all the three states possess random translational motion
 - Gases cannot be converted into solids without passing through the liquid phase
 - Solids and liquids have vapour pressure as a common property
- A pure crystalline substance, on being heated gradually, first forms a turbid looking liquid and then the turbidity completely disappears. This behaviour is the characteristic of substances forming [BHU 2000]
 - Isomeric crystals
 - Liquid crystals
 - Isomorphous crystals
 - Allotropic crystals
- Which of the following is ferroelectric compound
[AFMC 1997]
 - $BaTiO_3$
 - $K_4[Fe(CN)_6]$
 - Pb_2O_3
 - $PbZrO_3$
- Solid CO_2 is an example of
 - Molecular crystal
 - Ionic crystal
 - Covalent crystal
 - Metallic crystal

- Value of heat of fusion of $NaCl$ is
 - Very low
 - Very high
 - Not very low and not very high
 - None of the above
- Piezoelectric crystals are used in
 - TV
 - Radio
 - Record player
 - Freeze
- Which of the following is true for diamond
[AFMC 1997]
 - Diamond is a good conductor of electricity
 - Diamond is soft
 - Diamond is a bad conductor of heat
 - Diamond is made up of C , H and O
- $NaCl$ is an example of
 - Covalent solid
 - Ionic solid
 - Molecular solid
 - Metallic solid

9. Amorphous substances show
(A) Short and long range order
(B) Short range order
(C) Long range order
(D) Have no sharp M.P.
(a) A and C are correct (b) B and C are correct
(c) C and D are correct (d) B and D are correct
10. The characteristic features of solids are [AMU 1994]
(a) Definite shape
(b) Definite size
(c) Definite shape and size
(d) Definite shape, size and rigidity
11. Which one of the following is a good conductor of electricity [MP PMT 1994; AFMC 2002]
(a) Diamond (b) Graphite
(c) Silicon (d) Amorphous carbon
12. A crystalline solid [Kerala CET (Med.) 2003]
(a) Changes abruptly from solid to liquid when heated
(b) Has no definite melting point
(c) Undergoes deformation of its geometry easily
(d) Has an irregular 3-dimensional arrangements
(e) Softens slowly
13. Diamond is an example of [MP PET/PMT 1998; CET Pune 1998]
(a) Solid with hydrogen bonding
(b) Electrovalent solid
(c) Covalent solid
(d) Glass
14. The solid NaCl is a bad conductor of electricity since [AIIMS 1980]
(a) In solid NaCl there are no ions
(b) Solid NaCl is covalent
(c) In solid NaCl there is no velocity of ions
(d) In solid NaCl there are no electrons
15. The existence of a substance in more than one solid modifications is known as **or** Any compound having more than two crystal structures is called [MP PMT 1993; MP PET 1999]
(a) Polymorphism (b) Isomorphism
(c) Allotropy (d) Enantiomorphism
16. Which is not a property of solids [MP PET 1995]
(a) Solids are always crystalline in nature
(b) Solids have high density and low compressibility
(c) The diffusion of solids is very slow
(d) Solids have definite volume
17. Which solid will have the weakest intermolecular forces
(a) Ice (b) Phosphorus
(c) Naphthalene (d) Sodium fluoride
18. Dulong and Petit's law is valid only for [KCET 2004]
(a) Metals (b) Non-metals
(c) Gaseous elements (d) Solid elements
19. Which of the following is an example of metallic crystal solid
(a) C (b) Si
(c) W (d) AgCl
20. Under which category iodine crystals are placed among the following
(a) Ionic crystal (b) Metallic crystal
(c) Molecular crystal (d) Covalent crystal
21. Among solids the highest melting point is established by [Kerala CET (Med.) 2002]
(a) Covalent solids (b) Ionic solids
(c) Pseudo solids (d) Molecular solids
22. To get a n -type semiconductor, the impurity to be added to silicon should have which of the following number of valence electrons [KCET (Engg.)]
(a) 1 (b) 2
(c) 3 (d) 5
23. Which of the following is non-crystalline solid
(a) CsCl (b) NaCl
(c) CaF_2 (d) Glass
24. The lustre of a metal is due to [AFMC 1998]
(a) Its high density (b) Its high polishing
(c) Its chemical inertness (d) Presence of free electrons
25. A crystalline solid have [DCE 2001]
(a) Long range order (b) Short range order
(c) Disordered arrangement (d) None of these
26. Crystalline solids are [Pb. PMT 1999]
(a) Glass (b) Rubber
(c) Plastic (d) Sugar
27. Davy and Faraday proved that [Kerala CET (Med.) 2002]
(a) Diamond is a form of carbon
(b) The bond lengths of carbon containing compounds are always equal
(c) The strength of graphite is minimum compared to platinum
(d) Graphite is very hard
28. Which one of the following metal oxides is antiferromagnetic in nature [MP PET 2002]
(a) MnO_2 (b) TiO_2
(c) VO_2 (d) CrO_2
29. In graphite, carbon atoms are joined together due to [AFMC 2002]
(a) Ionic bonding (b) Vander Waal's forces
(c) Metallic bonding (d) Covalent bonding
30. Which of the following is not correct for ionic crystals [Orissa JEE 2002]
(a) They possess high melting point and boiling point
(b) All are electrolyte
(c) Exhibit the property of isomorphism
(d) Exhibit directional properties of the bond
31. Which of the following is a molecular crystal
(a) SiC (b) NaCl
(c) Graphite (d) Ice
32. Quartz is a crystalline variety of [Pb. PMT 2000]
(a) Silica (b) Sodium silicate
(c) Silicon carbide (d) Silicon
33. Which type of solid crystals will conduct heat and electricity [RPET 2000]
(a) Ionic (b) Covalent
(c) Metallic (d) Molecular
34. Which of the following is an example of covalent crystal solid
(a) Si (b) NaF
(c) Al (d) Ar
35. Which of the following is an example of ionic crystal solid
(a) Diamond (b) LiF
(c) Li (d) Silicon
36. Which one is an example of amorphous solid
(a) Glass (b) Salt
(c) Cesium chloride (d) Calcium fluoride
37. Silicon is [MHCET 2004]

- (a) Semiconductor (b) Insulator
(c) Conductor (d) None of these
38. Which of the following statements about amorphous solids is incorrect [KCET 2004]
(a) They melt over a range of temperature
(b) They are anisotropic
(c) There is no orderly arrangement of particles
(d) They are rigid and incompressible
39. The ability of a given substance to assume two or more crystalline structure is called [DCE 2004]
(a) Amorphism (b) Isomorphism
(c) Polymorphism (d) Isomerism
40. Glass is
(a) Supercooled liquid (b) Crystalline solid
(c) Amorphous solid (d) Liquid crystal

Crystallography and Lattice

1. The correct statement in the following is [MP PET 1997]
(a) The ionic crystal of $AgBr$ has Schottky defect
(b) The unit cell having crystal parameters, $a = b \neq c$, $\alpha = \beta = 90^\circ$, $\gamma = 120^\circ$ is hexagonal
(c) In ionic compounds having Frenkel defect the ratio $\frac{\gamma_+}{\gamma_-}$ is high
(d) The coordination number of Na^+ ion in $NaCl$ is 4
2. Which of the following is correct [DPMT 1997]
- | Crystal system | Axial distance | Axial angles | Examples |
|------------------|----------------|--|--------------------------------|
| (a) Cubic | $a \neq b = c$ | $\alpha = \beta \neq \gamma = 90^\circ$ | Cu, KCl |
| (b) Monoclinic | $a \neq b = c$ | $\alpha = \beta = \gamma = 90^\circ$ | $PbCrO_4, PbCrO_3$ |
| (c) Rhombohedral | $a = b = c$ | $\alpha = \beta = \gamma \neq 90^\circ$ | $CaCO_3, HgS$ |
| (d) Triclinic | $a = b = c$ | $\alpha \neq \beta = \gamma \neq 90^\circ$ | $K_2CrO_4, CuSO_4 \cdot 5H_2O$ |
3. Tetragonal crystal system has the following unit cell dimensions [MP PMT 1993]
(a) $a = b = c$ and $\alpha = \beta = \gamma = 90^\circ$
(b) $a = b \neq c$ and $\alpha = \beta = \gamma = 90^\circ$
(c) $a \neq b \neq c$ and $\alpha = \beta = \gamma = 90^\circ$
(d) $a = b \neq c$ and $\alpha = \beta = 90^\circ$, $\gamma = 120^\circ$
4. Rhombic sulphur has the following structure
(a) Open chain
(b) Tetrahedral
(c) Puckered 6-membered ring
(d) Puckered 8-membered ring
5. Space lattice of CaF_2 is [MP PMT 1993]
(a) Face centred cubic
(b) Body centred cubic
(c) Simple cubic
(d) Hexagonal closed packing
6. For cubic coordination the value of radius ratio is
(a) 0.732 – 1.000 (b) 0.225 – 0.414
(c) 0.000 – 0.225 (d) 0.414 – 0.732
7. How many space lattices are obtainable from the different crystal systems [MP PMT 1996; MP PET/PMT 1998]
(a) 7 (b) 14
(c) 32 (d) 230
8. Example of unit cell with crystallographic dimensions $a \neq b \neq c$, $\alpha = \gamma = 90^\circ$, $\beta \neq 90^\circ$ is [AFMC 1998]
(a) Calcite (b) Graphite
(c) Rhombic sulphur (d) Monoclinic sulphur
9. In a face-centered cubic lattice, a unit cell is shared equally by how many unit cells [CBSE PMT 2005]
(a) 8 (b) 4
(c) 2 (d) 6
10. The maximum radius of sphere that can be fitted in the octahedral hole of cubical closed packing of sphere of radius r is
(a) 0.732 r (b) 0.414 r
(c) 0.225 r (d) 0.155 r
11. The unit cell of a $NaCl$ lattice
(a) Is body centred cube (b) Has $3Na^+$ ions
(c) Has 4 $NaCl$ units (d) Is electrically charged
12. For tetrahedral coordination number, the radius ratio $\frac{r_{c^+}}{r_{a^-}}$ is [KCET 2000]
(a) 0.732 – 1.000 (b) 0.414 – 0.732
(c) 0.225 – 0.414 (d) 0.155 – 0.225
13. What type of lattice is found in potassium chloride crystal [MP PMT 1996]
(a) Face centred cubic (b) Body centred cubic
(c) Simple cubic (d) Simple tetragonal
14. The three dimensional graph of lattice points which sets the pattern for the whole lattice is called
(a) Space lattice (b) Simple lattice
(c) Unit cell (d) Crystal lattice
15. Crystals can be classified into basic crystal habits [MP PMT 1994]
(a) 3 (b) 7
(c) 14 (d) 4
16. How many molecules are there in the unit cell of sodium chloride [MP PMT 1999]
(a) 2 (b) 4
(c) 6 (d) 8
17. In a crystal, the atoms are located at the position of [AMU 1985]
(a) Maximum P.E. (b) Minimum P.E.
(c) Zero P.E. (d) Infinite P.E.
18. The total number of lattice arrangements in different crystal systems is [KCET (Engg.) 2001]
(a) 3 (b) 7
(c) 8 (d) 14
19. Monoclinic crystal has dimension [DCE 2000]
(a) $a \neq b \neq c$, $\alpha = \gamma = 90^\circ$, $\beta \neq 90^\circ$
(b) $a = b = c$, $\alpha = \beta = \gamma = 90^\circ$
(c) $a = b \neq c$, $\alpha = \beta = \gamma = 90^\circ$
(d) $a \neq b \neq c$, $\alpha \neq \beta \neq \gamma \neq 90^\circ$
20. The low solubility of $BaSO_4$ in water can be attributed to [CBSE PMT 1991]
(a) High lattice energy (b) Dissociation energy
(c) Low lattice energy (d) Ionic bond
21. Bravais lattices are of [MP PMT 1997]
(a) 8 types (b) 12 types
(c) 14 types (d) 9 types

22. The structure of $TlCl$ is similar to $CsCl$. What would be the radius ratio in $TlCl$
 (a) $0.155 - 0.225$ (b) $0.225 - 0.414$
 (c) $0.414 - 0.732$ (d) $0.732 - 1.000$
23. Structure similar to zinc blende is found in
 (a) $AgCl$ (b) $NaCl$
 (c) $CuCl$ (d) $TlCl$
24. The structure of Na_2O crystal is
 (a) $CsCl$ type (b) $NaCl$ type
 (c) ZnS type (d) Antifluorite
25. Structure of ZnS is
 (a) Body centred cubic (b) Face centred cubic
 (c) Simple cube (d) Fluorite structure
26. The crystal system of a compound with unit cell dimensions $a = 0.387$, $b = 0.387$ and $c = 0.504 nm$ and $\alpha = \beta = 90^\circ$ and $\gamma = 120^\circ$ is [AIIMS 2004]
 (a) Cubic (b) Hexagonal
 (c) Orthorhombic (d) Rhombohedral
27. The number of tetrahedral voids in the unit cell of a face centered cubic lattice of similar atoms is [Kerala PMT 2004]
 (a) 4 (b) 6
 (c) 8 (d) 10
28. An fcc unit cell of aluminium contains the equivalent of how many atoms [DCE 2003]
 (a) 1 (b) 2
 (c) 3 (d) 4
- (c) 14 and 9 (d) 2 and 4
7. An AB_2 type structure is found in [AIIMS 2002]
 (a) $NaCl$ (b) Al_2O_3
 (c) CaF_2 (d) N_2O
8. Potassium crystallizes with a [MP PET/PMT 1998]
 (a) Face-centred cubic lattice
 (b) Body-centred cubic lattice
 (c) Simple cubic lattice
 (d) Orthorhombic lattice
9. If the number of atoms per unit in a crystal is 2, the structure of crystal is
 (a) Octahedral
 (b) Body centred cubic bcc
 (c) Face centred cubic fcc
 (d) simple cubic
10. The intermetallic compound $LiAg$ crystallizes in cubic lattice in which both lithium and silver have coordination number of eight. The crystal class is [CBSE PMT 1997]
 (a) Simple cube (b) Body-centred cube
 (c) Face-centred cube (d) None of these
11. The number of octahedral sites per sphere in a fcc structure is [MP PMT 2000,
 (a) 8 (b) 4
 (c) 2 (d) 1
12. Hexagonal close packed arrangement of ions is described as [MP PMT 1994]
 (a) ABC ABA (b) ABC ABC
 (c) ABABA (d) ABBAB
13. An example of a body cube is [AIIMS 1996]
 (a) Sodium (b) Magnesium
 (c) Zinc (d) Copper
14. An example of fluorite structure is
 (a) NaF (b) SrF_2
 (c) $AlCl_3$ (d) SiF_4
15. In which of the following crystals alternate tetrahedral voids are occupied? [IIT 2005]
 (a) $NaCl$ (b) ZnS
 (c) CaF_2 (d) Na_2O
16. Which of the following contains rock salt structure
 (a) SrF_2 (b) MgO
 (c) Al_2O_3 (d) All
17. In the fluorite structure, the coordination number of Ca^{2+} ion is
 (a) 4 (b) 6
 (c) 8 (d) 3
18. The ratio of close-packed atoms to tetrahedral holes in cubic close packing is [Pb. PMT 1998]
 (a) 1 : 1 (b) 1 : 2
 (c) 1 : 3 (d) 2 : 1
19. A solid is made of two elements X and Z . The atoms Z are in CCP arrangement while the atom X occupy all the tetrahedral sites. What is the formula of the compound [UPSEAT 2004]
 (a) XZ (b) XZ_2
 (c) X_2Z (d) X_2Z_3

Crystal packing

1. If ' Z ' is the number of atoms in the unit cell that represents the closest packing sequence $---ABCAB C---$, the number of tetrahedral voids in the unit cell is equal to [AIIMS 2005]
 (a) Z (b) $2Z$
 (c) $Z/2$ (d) $Z/4$
2. The close packing represents ABCABC..... order of
 (a) Body centred cubic packing
 (b) Face centred cubic packing
 (c) Simple cubic packing
 (d) Hexagonal cubic closed packing
3. The arrangement $ABCABCABC$ is referred as [MP PET 2001]
 (a) Octahedral close packing (b) Hexagonal close packing
 (c) Tetragonal close packing (d) Cubic close packing
4. The number of close neighbour in a body-centred cubic lattice of identical sphere is [MP PET 2001]
 (a) 8 (b) 6
 (c) 4 (d) 2
5. The number of equidistant oppositely charged ions in a sodium chloride crystal is [MP PET 2001]
 (a) 8 (b) 6
 (c) 4 (d) 2
6. Na and Mg crystallize in BCC and FCC type crystals respectively, then the number of atoms of Na and Mg present in the unit cell of their respective crystal is [AIEEE 2002]
 (a) 4 and 2 (b) 9 and 14

20. An ionic compound has a unit cell consisting of A ions at the corners of a cube and B ions on the centres of the faces of the cube. The empirical formula for this compound would be [CBSE PMT 2004; AIEEE 2005]
- (a) AB (b) A_2B
(c) AB_3 (d) A_3B
21. The vacant space in the bcc unit cell is
- (a) 32% (b) 23%
(c) 26% (d) None of these
22. The number of octahedral voids in a unit cell of a cubical closest packed structure is
- (a) 1 (b) 2
(c) 4 (d) 8
23. In the closest packed structure of a metallic lattice, the number of nearest neighbours of a metallic atom is [JIPMER 2002]
- (a) Twelve (b) Four
(c) Eight (d) Six
24. In the rock salt structure, the number of formula units per unit cell is equal to
- (a) 1 (b) 2
(c) 3 (d) 4
25. Hexagonal close packing is found in crystal lattice of [MH CET 2002]
- (a) Na (b) Mg
(c) Al (d) None of these
26. Which ion has the largest radius from the following ions
- (a) Na^+ (b) Mg^{2+}
(c) Al^{3+} (d) Si^{4+}
- (c) In between 0.41 and 0.22
(d) Less than 0.22
- The number of spheres contained (i) in one body centred cubic unit cell and (ii) in one face centred cubic unit cell, is
- (a) In (i) 2 and in (ii) 4 (b) In (i) 3 and in (ii) 2
(c) In (i) 4 and in (ii) 2 (d) In (i) 2 and in (ii) 3
7. $CsBr$ crystal has bcc structure. It has an edge length of $4.3 \text{ \AA}$. The shortest interionic distance between Cs^+ and Br^- ions is [IIT 1995]
- (a) $1.86 \text{ \AA}$ (b) $3.72 \text{ \AA}$
(c) $4.3 \text{ \AA}$ (d) $7.44 \text{ \AA}$
8. In octahedral holes (voids)
- (a) A simple triangular void surrounded by four spheres
(b) A bi-triangular void surrounded by four spheres
(c) A bi-triangular void surrounded by six spheres
(d) A bi-triangular void surrounded by eight spheres
9. Bragg's law is given by the equation [MP PMT 1995, 2002]
- (a) $n\lambda = 2\theta \sin\theta$ (b) $n\lambda = 2d \sin\theta$
(c) $2n\lambda = d \sin\theta$ (d) $n \frac{\theta}{2} = \frac{d}{2} \sin\theta$
10. The number of atoms in 100 g of an fcc crystal with density $d = 10 \text{ g/cm}^3$ and cell edge equal to 100 pm , is equal to [CBSE PMT 1994; 1995]
- (a) 4×10^{25} (b) 3×10^{25}
(c) 2×10^{25} (d) 1×10^{25}
11. In the crystals of which of the following ionic compounds would you expect maximum distance between centres of cations and anions [CBSE PMT 1995]
- (a) LiF (b) CsF
(c) CsI (d) LiI
12. The number of unit cells in 58.5 g of $NaCl$ is nearly [MP PMT 2000, 01]
- (a) 6×10^{20} (b) 3×10^{22}
(c) 1.5×10^{23} (d) 0.5×10^{24}
13. How many unit cells are present in a cube-shaped ideal crystal of $NaCl$ of mass 1.00 g [Atomic masses: $Na = 23, Cl = 35.5$] [AIEEE 2003]
- (a) 2.57×10^{21} unit cells (b) 5.14×10^{21} unit cells
(c) 1.28×10^{21} unit cells (d) 1.71×10^{21} unit cells
14. In the Bragg's equation for diffraction of X -rays, n represents for [MP PMT 2000]
- (a) Quantum number (b) An integer
(c) Avogadro's numbers (d) Moles
15. In a face centred cubic cell, an atom at the face contributes to the unit cell [Karnataka (Engg./Med.) 2000; AFMC 2001]
- (a) $1/4$ part (b) $1/8$ part
(c) 1 part (d) $1/2$ part
16. The interionic distance for cesium chloride crystal will be [MP PET 2002]
- (a) a (b) $\frac{a}{2}$
(c) $\frac{\sqrt{3}a}{2}$ (d) $\frac{2a}{\sqrt{3}}$

Mathematical analysis of cubic system and Bragg's equation

1. The formula for determination of density of unit cell is
- (a) $\frac{a^3 \times N_o}{N \times M} \text{ g cm}^{-3}$ (b) $\frac{N \times M}{a^3 \times N_o} \text{ g cm}^{-3}$
(c) $\frac{a^3 \times M}{N \times N_o} \text{ g cm}^{-3}$ (d) $\frac{M \times N_o}{a^3 \times N} \text{ g cm}^{-3}$
2. Potassium fluoride has $NaCl$ type structure. What is the distance between K^+ and F^- ions if cell edge is $a \text{ cm}$
- (a) $2a \text{ cm}$ (b) $a/2 \text{ cm}$
(c) $4a \text{ cm}$ (d) $a/4 \text{ cm}$
3. An element occurring in the bcc structure has 12.08×10^{23} unit cells. The total number of atoms of the element in these cells will be [MP PET 1994]
- (a) 24.16×10^{23} (b) 36.18×10^{23}
(c) 6.04×10^{23} (d) 12.08×10^{23}
4. If an atom is present in the centre of the cube, the participation of that atom per unit cell is
- (a) $\frac{1}{4}$ (b) 1
(c) $\frac{1}{2}$ (d) $\frac{1}{8}$
5. For an ionic crystal of the general formula AX and coordination number 6, the value of radius ratio will be [MP PMT 1993]
- (a) Greater than 0.73
(b) In between 0.73 and 0.41

17. Sodium metal crystallizes as a body centred cubic lattice with the cell edge $4.29 \text{ \AA}$. What is the radius of sodium atom

[AIIMS 1999]

- (a) $1.857 \times 10^{-8} \text{ cm}$ (b) $2.371 \times 10^{-7} \text{ cm}$
(c) $3.817 \times 10^{-8} \text{ cm}$ (d) $9.312 \times 10^{-7} \text{ cm}$

18. For an ionic crystal of the type AB , the value of (limiting) radius ratio is 0.40. The value suggests that the crystal structure should be

- (a) Octahedral (b) Tetrahedral
(c) Square planar (d) Plane triangle

19. Potassium has a bcc structure with nearest neighbour distance $4.52 \text{ \AA}$. Its atomic weight is 39. Its density (in kg m^{-3}) will be [AIIMS 1991]

- (a) 454 (b) 804
(c) 852 (d) 908

20. If the value of ionic radius ratio $\left(\frac{r_c}{r_a}\right)$ is 0.52 in an ionic compound, the geometrical arrangement of ions in crystal is

- (a) Tetrahedral (b) Planar
(c) Octahedral (d) Pyramidal

21. The number of atoms/molecules contained in one face centred cubic unit cell of a monoatomic substance is

[CPMT 1989, 94; CBSE PMT 1989, 96; NCERT 1990; MP PET 1993; KCET 1999]

- (a) 1 (b) 2
(c) 4 (d) 6

22. The number of atoms/molecules contained in one body centered cubic unit cell is

- (a) 1 (b) 2
(c) 4 (d) 6

23. If the distance between Na^+ and Cl^- ions in sodium chloride crystal is $X \text{ pm}$, the length of the edge of the unit cell is [KCET 2004]

- (a) $4X \text{ pm}$ (b) $X/4 \text{ pm}$
(c) $X/2 \text{ pm}$ (d) $2X \text{ pm}$

24. The edge of unit cell of FCC Xe crystal is 620 pm . The radius of Xe atom is [MP PET 2004]

- (a) 219.25 pm (b) 235.16 pm
(c) 189.37 pm (d) 209.87 pm

25. In orthorhombic, the value of a, b and c are respectively $4.2 \text{ \AA}, 8.6 \text{ \AA}$ and $8.3 \text{ \AA}$. Given the molecular mass of the solute is 155 gmol^{-1} and that of density is 3.3 gm/cc , the number of formula units per unit cell is

[Orissa JEE 2005]

- (a) 2 (b) 3
(c) 4 (d) 6

26. A metal has bcc structure and the edge length of its unit cell is $3.04 \text{ \AA}$. The volume of the unit cell in cm^3 will be

[Orissa JEE 2005]

- (a) $1.6 \times 10^{21} \text{ cm}^3$ (b) $2.81 \times 10^{-23} \text{ cm}^3$
(c) $6.02 \times 10^{-23} \text{ cm}^3$ (d) $6.6 \times 10^{-24} \text{ cm}^3$

27. In face centred cubic unit cell edge length is [DPMT 2005]

- (a) $\frac{4}{\sqrt{3}} r$ (b) $\frac{4}{\sqrt{2}} r$
(c) $2r$ (d) $\frac{\sqrt{3}}{2} r$

Crystal structure and Coordination number

1. A solid has a structure in which 'W' atoms are located at the corners of a cubic lattice 'O' atoms at the centre of edges and 'Na' atoms at the centre of the cube. The formula for the compound is [KCET 1996]

- (a) NaWO_2 (b) NaWO_3
(c) Na_2WO_3 (d) NaWO_4

2. Potassium crystallizes in a bcc lattice, hence the coordination number of potassium in potassium metal is [KCEE 1993]

- (a) 0 (b) 4
(c) 6 (d) 8

3. Body centered cubic lattice has a coordination number of [AIIMS 1996; MP PMT 2002]

- (a) 4 (b) 8
(c) 12 (d) 6

4. A compound is formed by elements A and B. This crystallizes in the cubic structure when atoms A are the corners of the cube and atoms B are at the centre of the body. The simplest formula of the compounds is

[KCET 1993; CBSE PMT 2000; Kerala PMT 2002]

- (a) AB (b) AB_2
(c) A_2B (d) AB_4

5. Coordination number for Cu is [AMU 1982]

- (a) 1 (b) 6
(c) 8 (d) 12

6. In the crystal of CsCl , the nearest neighbours of each Cs ion are [MP PET 1999]

- (a) Six chloride ions (b) Eight chloride ions
(c) Six Cs ions (d) Eight Cs ions

7. In a cubic structure of compound which is made from X and Y, where X atoms are at the corners of the cube and Y at the face centres of the cube. The molecular formula of the compound is [AIIMS 2000]

- (a) X_2Y (b) X_3Y
(c) XY_2 (d) XY_3

8. Ferrous oxide has a cubic structure and each edge of the unit cell is $5.0 \text{ \AA}$. Assuming density of the oxide as 4.0 g cm^{-3} , then the number of Fe^{2+} and O^{2-} ions present in each unit cell will be [MP PET 2000]

- (a) Four Fe^{2+} and four O^{2-}
(b) Two Fe^{2+} and four O^{2-}
(c) Four Fe^{2+} and two O^{2-}
(d) Three Fe^{2+} and three O^{2-}

9. Which of the following statements is not true about NaCl structure [DCE 2001]

- (a) Cl^- ions are in fcc arrangement
(b) Na^+ ions has coordination number 4
(c) Cl^- ions has coordination number 6
(d) Each unit cell contains 4 NaCl molecules

10. In CsCl structure, the coordination number of Cs^+ is [MP PMT 2001]

- (a) Equal to that of Cl^- , that is 6
(b) Equal to that of Cl^- , that is 8
(c) Not equal to that of Cl^- , that is 6

- (d) Not equal to that of Cl^- , that is 8
11. In a solid ' AB ' having the $NaCl$ structure, ' A ' atoms occupy the corners of the cubic unit cell. If all the face-centered atoms along one of the axes are removed, then the resultant stoichiometry of the solid is [IIT Screening 2001]
- (a) AB_2 (b) A_2B
(c) A_4B_3 (d) A_3B_4
12. In solid $CsCl$ each Cl is closely packed with how many Cs [MP PET 2003]
- (a) 8 (b) 6
(c) 10 (d) 2
13. In A^+B^- ionic compound, radii of A^+ and B^- ions are 180 pm and 187 pm respectively. The crystal structure of this compound will be
- (a) $NaCl$ type (b) $CsCl$ type
(c) ZnS type (d) Similar to diamond
14. In which of the following substances the carbon atom is arranged in a regular tetrahedral structure [NCERT 1978]
- (a) Diamond (b) Benzene
(c) Graphite (d) Carbon black
15. The coordination number of a metal crystallizing in a hexagonal close packed structure is [NCERT 1978; IIT 1999]
- (a) 4 (b) 12
(c) 8 (d) 6
16. The structure of MgO is similar to $NaCl$. What would be the coordination number of magnesium
- (a) 2 (b) 4
(c) 6 (d) 8
17. How many chloride ions are there around sodium ion in sodium chloride crystal [NCERT 1979, 80; CPMT 1988; BHU 1982, 87; MP PET 1995, 99]
- (a) 3 (b) 8
(c) 4 (d) 6
18. Most crystals show good cleavage because their atoms, ions or molecules are [CBSE PMT 1991]
- (a) Weakly bonded together
(b) Strongly bonded together
(c) Spherically symmetrical
(d) Arranged in planes
19. An example of a non-stoichiometric compound is [NCERT 1983]
- (a) Al_2O_3 (b) Fe_3O_4
(c) NiO_2 (d) PbO
20. If the radius ratio is in the range of 0.731–1, then the coordination number will be
- (a) 2 (b) 4
(c) 6 (d) 8
21. If the radius ratio is in the range of 0.414–0.732, then the coordination number will be
- (a) 2 (b) 4
(c) 6 (d) 8
22. What is the coordination number of sodium in Na_2O [AIIMS 2003]
- (a) 6 (b) 4
(c) 8 (d) 2
23. The ratio of cationic radius to anionic radius in an ionic crystal is greater than 0.732. Its coordination number is [KCET 2003]
- (a) 6 (b) 8
(c) 1 (d) 4
24. In $CsCl$ lattice the coordination number of Cs^+ ion is
- (a) 2 (b) 4
(c) 8 (d) 12
25. Crystal structure of $NaCl$ is [NCERT 1982; BHU 1995]
- (a) fcc (b) bcc
(c) Both (a) and (b) (d) None
26. In $NaCl$ lattice the coordination number of Cl^- ion is
- (a) 2 (b) 4
(c) 6 (d) 8
27. In zinc blende structure the coordination number of Zn^{2+} ion is
- (a) 2 (b) 4
(c) 6 (d) 8
28. Coordination number of Na^+ ion in rock salt is [BVP 2004]
- (a) 12 (b) 4
(c) 8 (d) 6
29. The number of Cl^- ions around one Na^+ in $NaCl$ crystal lattice is [MP PET 1996; BVP 2004]
- (a) 12 (b) 4
(c) 8 (d) 6
30. The number of atoms present in unit cell of a monoatomic substance of simple cubic lattice is [Pb. PMT 2004]
- (a) 6 (b) 3
(c) 2 (d) 1
31. The coordination number of a metal crystallizing in a hexagonal close packed chep structure is [MP PMT 2004]
- (a) 12 (b) 8
(c) 4 (d) 6
32. Which of the following statement(s) is(are) correct [IIT 1998]
- (a) The coordination number of each type of ion in $CsCl$ crystal is 8
(b) A metal that crystallizes in bcc structure has a coordination number of 12
(c) A unit cell of an ionic crystal shares some of its ions with other unit cells
(d) The length of the unit cell in $NaCl$ is 552 pm ($r_{Na^+} = 95$ pm; $r_{Cl^-} = 181$ pm)
33. The co-ordination number of Na^+ in $NaCl$ is [Orissa JEE 2005]
- (a) 6 (b) 8
(c) 4 (d) 1
34. In the calcium fluoride structure the co-ordination number of the cation and anions are respectively [J & K 2005]
- (a) 6, 6 (b) 8, 4
(c) 4, 4 (d) 4, 8

Defects in crystal

1. Certain crystals produce electric signals on application of pressure. This phenomenon is called [BHU 2005]
- (a) Pyroelectricity (b) Ferroelectricity
(c) Piezoelectricity (d) Ferrielectricity
2. Which defect causes decrease in the density of crystal [KCET 2000, 05]
- (a) Frenkel (b) Schottky

- (c) Interstitial (d) F – centre
3. The correct statement regarding F – centre is
(a) Electron are held in the voids of crystals
(b) F – centre produces colour to the crystals
(c) Conductivity of the crystal increases due to F – centre
(d) All
4. Doping of silicon (Si) with boron (B) leads to [UPSEAT 2004]
(a) n -type semiconductor (b) p -type semiconductor
(c) Metal (d) Insulator
5. If $NaCl$ is doped with $10^{-3} \text{ mol \% } SrCl_2$, then the concentration of cation vacancies will be
(a) $1 \times 10^{-3} \text{ mol \%}$ (b) $2 \times 10^{-3} \text{ mol \%}$
(c) $3 \times 10^{-3} \text{ mol \%}$ (d) $4 \times 10^{-3} \text{ mol \%}$
6. In the laboratory, sodium chloride is made by burning the sodium in the atmosphere of chlorine which is yellow in colour. The cause of yellow colour is
(a) Presence of Na^+ ions in the crystal lattice
(b) Presence of Cl^- ions in the crystal lattice
(c) Presence of electron in the crystal lattice
(d) Presence of face centered cubic crystal lattice
7. Frenkel defect is caused due to [MP PET 1994]
(a) An ion missing from the normal lattice site creating a vacancy
(b) An extra positive ion occupying an interstitial position in the lattice
(c) An extra negative ion occupying an interstitial position in the lattice
(d) The shift of a positive ion from its normal lattice site to an interstitial site
8. Which one of the following has Frenkel defect [MP PMT 2000]
(a) Sodium chloride (b) Graphite
(c) Silver bromide (d) Diamond
9. Schottky defect generally appears in [DCE 2004]
(a) $NaCl$ (b) KCl
(c) $CsCl$ (d) All of these
10. Schottky defect in crystals is observed when [CBSE PMT 1998; KCET 2002]
(a) Density of crystal is increased
(b) Unequal number of cations and anions are missing from the lattice
(c) An ion leaves its normal site and occupies an interstitial site
(d) Equal number of cations and anions are missing from the lattice
11. Ionic solids, with Schottky defects, contain in their structure [CBSE PMT 1994]
(a) Equal number of cation and anion vacancies
(b) Anion vacancies and interstitial anions
(c) Cation vacancies only
(d) Cation vacancies and interstitial cations
12. The following is not a function of an impurity present in a crystal [MP PET 1995]
(a) Establishing thermal equilibrium
(b) Having tendency to diffuse
(c) Contributing to scattering
(d) Introducing new electronic energy levels
13. Due to Frenkel defect, the density of ionic solids [MP PET 1996; MP PMT 2002]
(a) Increases (b) Decreases
(c) Does not change (d) Changes
14. Point defects are present in [MP PMT 1997]
(a) Ionic solids (b) Molecular solids
(c) Amorphous solids (d) Liquids
15. If a non-metal is added to the interstitial sites of a metal then the metal becomes [DCE 2001]
(a) Softer (b) Less tensile
(c) Less malleable (d) More ductile
16. In $AgBr$ crystal, the ion size lies in the order $Ag^+ \ll Br^-$. The $AgBr$ crystal should have the following characteristics
(a) Defectless (perfect) crystal
(b) Schottky defect only
(c) Frenkel defect only
(d) Both Schottky and Frenkel defects
17. Frenkel and Schottky defects are [BHU 2003]
(a) Nucleus defects (b) Non-crystal defects
(c) Crystal defects (d) None of these
18. Which one of the following is the most correct statement
(a) Brass is an interstitial alloy, while steel is a substitutional alloy
(b) Brass is a substitutional alloy, while steel is an interstitial alloy
(c) Brass and steel are both substitutional alloys
(d) Brass and steel are both interstitial alloys
19. The flame colours of metal ions are due to [KCET 2003]
(a) Frenkel defect (b) Schottky defect
(c) Metal deficiency defect (d) Metal excess defect
20. Which one of the following crystals does not exhibit Frenkel defect [MP PET 2000]
(a) $AgBr$ (b) $AgCl$
(c) KBr (d) ZnS
21. In a solid lattice the cation has left a lattice site and is located at an interstitial position, the lattice defect is [AIIMS 1982, 1991; DCE 2002; J & K 2005]
(a) Interstitial defect (b) Valency defect
(c) Frenkel defect (d) Schottky defect
22. When electrons are trapped into the crystal in anion vacancy, the defect is known as [BHU 2005]
(a) Schottky defect (b) Frenkel defect
(c) Stoichiometric defect (d) F-centres
23. Schottky defect defines imperfection in the lattice structure of a [AIIMS 2002]
(a) Solid (b) Liquid
(c) Gas (d) Plasma

Critical Thinking

Objective Questions

1. Amorphous solids are
(a) Solid substance in real sense
(b) Liquid in real sense
(c) Supercooled liquid
(d) Substance with definite melting point
2. Silicon is found in nature in the form of [MH CET 2002]
(a) Body centered cubic structure
(b) Hexagonal close-packed structure
(c) Network solid
(d) Face centered cubic structure
3. A match box exhibits [MP PET 1993, 95]
(a) Cubic geometry (b) Monoclinic geometry
(c) Orthorhombic geometry (d) Tetragonal geometry
4. Which has no rotation of symmetry [Orissa JEE 2004]
(a) Hexagonal (b) Orthorhombic

- (c) Cubic (d) Triclinic
5. Which of the following molecules has three-fold axis of symmetry [UPSEAT 2004]
 (a) NH_3 (b) C_2H_4
 (c) CO_2 (d) SO_2
6. Which one possess a antifluorite structure
 (a) Na_2O (b) MgO
 (c) Fe_2O_3 (d) Al_2O_3
7. Which one of the following is the biggest ion [MP PET 1993]
 (a) Al^{+3} (b) Ba^{+2}
 (c) Mg^{+2} (d) Na^+
8. The edge length of face centred unit cubic cell is 508 pm. If the radius of the cation is 110 pm, the radius of the anion is [CBSE PMT 1998]
 (a) 285 pm (b) 398 pm
 (c) 144 pm (d) 618 pm
9. An element (atomic mass 100g/mol) having bcc structure has unit cell edge 400 pm. Then density of the element is [CBSE PMT 1996; AIIMS 2002]
 (a) 10.376 g/cm³ (b) 5.188 g/cm³
 (c) 7.289 g/cm³ (d) 2.144 g/cm³
10. If the pressure on a NaCl structure is increased, then its coordination number will [AFMC 2000]
 (a) Increase (b) Decrease
 (c) Remain the same (d) Either (b) or (c)
11. The pycnometric density of sodium chloride crystal is $2.165 \times 10^3 \text{ kg m}^{-3}$ while its X-rays density is $2.178 \times 10^3 \text{ kg m}^{-3}$. The fraction of unoccupied sites in sodium chloride crystal is [CBSE PMT 2003]
 (a) 5.96×10^{-3} (b) 5.96
 (c) 5.96×10^{-2} (d) 5.96×10^{-1}
12. Which of the following statements is correct for $CsBr_3$ [IIT 1996]
 (a) It is a covalent compound
 (b) It contains Cs^{3+} and Br^- ions
 (c) It contains Cs^+ and Br_3^- ions
 (d) It contains Cs^+ , Br^- and lattice Br_2 molecule
13. In which compound 8 : 8 coordination is found [EAMCET 1984]
 (a) $CsCl$ (b) MgO
 (c) Al_2O_3 (d) All of these
14. If the coordination of Ca^{2+} in CaF_2 is 8, then the coordination number of F^- ion would be
 (a) 3 (b) 4
 (c) 6 (d) 8
15. For some crystals, the radius ratio for cation and anion is 0.525, its coordination number will be
 (a) 2 (b) 4
 (c) 6 (d) 8
16. The basic building unit of all silicates is [UPSEAT 2002]
 (a) SiO_4 square planar (b) $[SiO_4]^{4-}$ tetrahedron
 (c) SiO_4 octahedron (d) SiO_4 linear
17. What type of crystal defect is indicated in the diagram below [AIEEE 2004]
- $Na^+ \quad Cl^- \quad Na^+ \quad Cl^- \quad Na^+ \quad Cl^-$
 $Cl^- \quad \square \quad Cl^- \quad Na^+ \quad \square \quad Na^+$
 $Na^+ \quad Cl^- \quad \square \quad Cl^- \quad Na^+ \quad Cl^-$
 $Cl^- \quad Na^+ \quad Cl^- \quad Na^+ \quad \square \quad Na^+$
- (a) Interstitial defect
 (b) Schottky defect
 (c) Frenkel defect
 (d) Frenkel and Schottky defects
18. Which of the following is a three dimensional silicate [MHCET 2003]
 (a) Mica (b) Spodumene
 (c) Zeolite (d) None of these
 (e) 12

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

1. Assertion : Diamond is a precious stone.
 Reason : Carbon atoms are tetrahedrally arranged in diamond. [AIIMS 1994]
2. Assertion : In crystal lattice, the size of the cation is larger in a tetrahedral hole than in an octahedral hole.
 Reason : The cations occupy more space than anions in crystal packing. [AIIMS 1996]
3. Assertion : Crystalline solids have short range order.
 Reason : Amorphous solids have long range order. [AIIMS 1999]
4. Assertion : In any ionic solid (MX) with Schottky defects, the number of positive and negative ions are same.
 Reason : Equal number of cation and anion vacancies are present. [IIT Screening 2001]
5. Assertion : Space or crystal lattice differ in symmetry of the arrangement of points.
 Reason : $n\lambda = 2d \sin\theta$, is known as Bragg's equation.
6. Assertion : In close packing of spheres, a tetrahedral void is surrounded by four spheres whereas an octahedral void is surrounded by six spheres.
 Reason : A tetrahedral void has a tetrahedral shape whereas an octahedral void has an octahedral shape.
7. Assertion : Cyclic silicates and chain silicates have the same general molecular formula.
 Reason : In cyclic silicates, three corners of each SiO_4 tetrahedron are shared while in chain silicates only two are shared with other tetrahedra.
8. Assertion : The presence of a large number of Schottky defects in NaCl lowers its density.

- Reason : In NaCl , there are approximately 10^6 Schottky pairs per cm^3 at room temperature.
9. Assertion : Anion vacancies in alkali halides are produced by heating the alkali halide crystals with alkali metal vapour.
- Reason : Electrons trapped in anion vacancies are referred to as F -centres.
10. Assertion : Electrical conductivity of semiconductors increases with increasing temperature.
- Reason : With increase in temperature, large number of electrons from the valence band can jump to the conduction band.
11. Assertion : On heating ferromagnetic or ferrimagnetic substances, they become paramagnetic.
- Reason : The electrons change their spin on heating.
12. Assertion : Lead zirconate is a piezoelectric crystal.
- Reason : Lead zirconate crystals have no dipole moment.

Answers and Solutions

Properties and Types of solids

1. (a) Both gases and liquids possess fluidity and hence viscosity molecules in the solid state do not have translational motion.
2. (b) It is a characteristic of liquid crystal.
3. (a) $BaTiO_3$ is a ferroelectric compound.
5. (b) The value of heat of fusion of $NaCl$ is very high due to fcc arrangement of its ions.
6. (c) Piezoelectric crystals are used in record player.
8. (b) $NaCl$ is a ionic solid in which constituent particles are positive (Na^+) and negative (Cl^-) ions.
9. (d) Amorphous solids have short range order but no sharp in melting point.
10. (d) Solids have definite shape, size and rigidity.
12. (a) In crystalline solid there is perfect arrangement of the constituent particles only at 0K. As the temperature increases the chance that a lattice site may be unoccupied by an ion increases. As the number of defects increases with temperature solid change in liquid.
13. (c) Diamond is a covalent solid in which constituent particles are atoms.
14. (c) Solid $NaCl$ is a bad conductor of electricity because ions are not free to move.
15. (a) The existence of a substance in more than one crystalline form is known as polymorphism.
16. (a) Solids are also non-crystalline in nature.
17. (a) Ice has the lowest melting point out of the given solids, hence it has the weakest intermolecular forces.
19. (c) All metals and some alloys are metallic crystal.
20. (c) Iodine crystals are molecular crystals, in which constituent particles are molecules having interparticle forces are Vander Waal's forces.
21. (b) Ionic solids have highest melting point due to strong electrostatic forces of attraction.
22. (d) For n -type, impurity added to silicon should have more than 4 valence electrons.
23. (d) Glass is an amorphous solid.
25. (a) Crystalline solids have regular arrangement of constituent particles, sharp melting points and are anisotropic.
26. (d) Sugar is a crystalline solid while glass, rubber and plastic are amorphous solids.
28. (a) MnO_2 is antiferromagnetic.
29. (d) Graphite is sp^2 hybridised and a covalent crystal.
30. (d) Ionic crystals exhibit non-directional properties of the bond.
31. (d) Ice is a molecular crystal in which the constituent units are molecules and the interparticle forces are hydrogen bonds.
32. (a) Quartz is a covalent crystal having a framework of silicates or silica, i.e. a three dimensional network when all the four oxygen atoms of each of SiO_4 tetrahedron are shared.
33. (c) Metallic crystals are good conductor of heat and current due to free electrons in them.
34. (a) Silicon is a covalent crystal in which constituent particles are atoms.

35. (b) LiF is an example of ionic crystal solid, in which constituent particles are positive (Li^+) and negative (F^-) ions.
36. (a) Amorphous solids neither have ordered arrangement (i.e. no definite shape) nor have sharp melting point like crystals, but when heated, they become pliable until they assume the properties usually related to liquids. It is therefore they are regarded as super-cooled liquids.
37. (a) Silicon is a semiconductor because it is a thermal active and its conductivity increased with increasing temperature.
38. (b) Amorphous solids are isotropic, because of these substances show same properties in all directions.
39. (c) Polymorphism is a ability of a substances which show two or more crystalline structure
40. (ac) Amorphous solids neither have ordered arrangement (i.e. no definite shape) nor have sharp melting point like crystals, but when heated, they become pliable until they assume the properties usually related to liquids. It is therefore they are regarded as super-cooled liquids.

Crystallography and Lattice

1. (b) A crystal system is hexagonal if its unit cell having $a = b \neq c$ axial ratio and $\alpha = \beta = 90^\circ$, $\gamma = 120^\circ$ axial angles.
2. (c) Rhombohedral crystal system
 $a = b = c$, $\alpha = \beta = \gamma \neq 90^\circ$
ex - $NaNO_3$, $CaSO_4$, calcite $CaCO_3$, HgS
3. (b) Tetragonal system has the unit cell dimension
 $a = b \neq c$, $\alpha = \beta = \gamma = 90^\circ$.
5. (a) Space lattice of CaF_2 is face centred cubic.
6. (a) For body centred cubic arrangement co-ordination number is 8 and radius ratio (r_+/r_-) is 0.732–1.000.
7. (b) There are 14 Bravais lattices (space lattices).
8. (d) Monoclinic sulphur is an example of Monoclinic crystal system.
10. (b) $r = 0.414r$.
11. (c) Each unit cell of $NaCl$ contains 4 $NaCl$ units.
12. (c) For tetrahedral arrangement co-ordination number is 4 and radius ratio (r_+/r_-) is 0.225–0.414.
13. (a) Face-centred cubic lattice found in KCl and $NaCl$.
14. (c) Definition of unit cell.
16. (b) In $NaCl$ (rock salt) : Number of Na^+ ions = 12 (at edge centers) $\times \frac{1}{4} + 1$ (at body centre) $\times 1 = 4$. Number of Cl^- ions = 8 (at corners) $\times \frac{1}{8} + 6$ (at face centre) $\times \frac{1}{2} = 4$.
Thus 4 formula units per unit cell.
17. (b) Lowest potential energy level provides stable arrangement.
18. (b) The seven basic crystal lattice arrangements are :- Cubic, Tetragonal, Orthorhombic, Monoclinic, Hexagonal, Rhombohedral and Triclinic.
19. (a) The conditions for monoclinic crystal system.
20. (a) High lattice energy of $BaSO_4$ causes low solubility of $BaSO_4$ in water.
21. (c) 14 kinds of Bravais lattices (space lattices) are possible in a crystal.
22. (d) Radius ratio in $TlCl$ is 0.732 – 1.000 and co-ordination number is 8 and arrangement is body centred cubic.
23. (c) Zinc blende (ZnS) has fcc structure and is an ionic crystal having 4 : 4 co-ordination number.

24. (d) Na_2O has anti-fluorite (A_2B) type structure.
25. (b) Zinc blende (ZnS) has *fcc* structure and is an ionic crystal having 4 : 4 co-ordination number.
28. (d) $\frac{1}{8} \times 8$ (at corners) = 1
 $\frac{1}{2} \times 6$ (at face centre) = 3
 $Z = 1 + 3 = 4$ (total no. of atoms)

Crystal packing

1. (b) Number of tetrahedral voids in the unit cell
 $= 2 \times \text{number of atoms} = 2Z$.
2. (b) The system $ABC\ ABC\ \dots$ is also referred to as face-centred cubic or *fcc*.
3. (d) It represents *ccp* arrangement.
4. (a) *BCC* has a coordination number of 8.
5. (b) In rock salt structure the co-ordination number of $\text{Na}^+ : \text{Cl}^-$ is 6 : 6.
6. (d) The *bcc* cell consists of 8 atoms at the corners and one atom at centre.
 $\therefore n = \left(8 \times \frac{1}{8}\right) + 1 = 2$.
 The *fcc* cell consists of 8 atoms at the eight corners and one atom at each of the six faces. This atom at the face is shared by two unit cells.
 $\therefore n = 8 \times \frac{1}{8} + \left(6 \times \frac{1}{2}\right) = 4$.
7. (c) AB_2 type of structure is present in CaF_2
 $\therefore \text{AB}_2 \Rightarrow \text{A}^{2+} + 2\text{B}^-$; $\text{CaF}_2 \Rightarrow \text{Ca}^{2+} + 2\text{F}^-$
8. (b) Potassium (*K*) has *bcc* lattice.
9. (b) Number of atoms per unit cell in *bcc* system = 2.
10. (b) In body centred cubic, each atom/ion has a coordination number of 8.
11. (d) Number of octahedral sites = Number of sphere in the packing.
 $\therefore$ Number of octahedral sites per sphere = 1.
12. (c) $\text{ABAB} \dots$ is hexagonal close packing.
13. (a) Sodium (*Na*) is a body cube.
14. (b) SrF_2 has fluorite (CaF_2) type structure.
15. (b) In ZnS structure, sulphide ions occupy all *FCC* lattice points while *Zn* ions are present in alternate tetrahedral voids.
16. (b) MgO contains rock salt (NaCl) structure.
17. (c) CaF_2 (fluorite) has *fcc* structure with 8 : 4 coordination number.
18. (b) Every constituent has two tetrahedral voids. In *ccp* lattice atoms
 $= 8 \times \frac{1}{8} + 6 \times \frac{1}{2} = 4$
 $\therefore$ Tetrahedral void = $4 \times 2 = 8$,
 Thus ratio = 4 : 8 :: 1 : 2.
19. (c) Tetrahedral sites one double comparable to octahedral sites then ratio of *X* and *Z* respectively 2 : 1 since formula of the compound X_2Z .
20. (c) A atoms are at eight corners of the cube. Therefore, the no. of A atoms in the unit cell = $\frac{8}{8} = 1$. B atoms are at the face centre of six faces. Therefore, its share in the unit cell = $\frac{6}{2} = 3$. The formula is AB_3 .

21. (a) In *bcc* structure 68% of the available volume is occupied by spheres. Thus vacant space is 32%.
22. (c) Number of atoms in the cubic close packed structure = 8.
 Number of octahedral voids = $\frac{1}{2} \times 8 = 4$.
23. (a) Co-ordination number in *HCP* and *CCP* arrangement is 12 while in *bcc* arrangement is 8.
24. (d) In NaCl (rock salt) : Number of Na^+ ions = 12 (at edge centers) $\times \frac{1}{4} + 1$ (at body centre) $\times 1 = 4$. Number of Cl^- ions = 8 (at corners) $\times \frac{1}{8} + 6$ (at face centre) $\times \frac{1}{2} = 4$. Thus 4 formula units per unit cell.
25. (b) Co-ordination number in *HCP* = 12
 Co-ordination number in *Mg* is also = 12
26. (a) All are the iso-electronic species but Na^+ has low positive charge so have largest radius.

Mathematical analysis of cubic system and Bragg's equation

1. (b) Density of unit cell = $\frac{N \times \text{mol. wt.}(M)}{V (= a^3) \times \text{avogadro no.}(N_o)} \text{ g cm}^{-3}$
2. (b) Distance between K^+ and F^- = $\frac{1}{2} \times \text{length of the edge}$
3. (a) There are two atoms in a *bcc* unit cell.
 So, number of atoms in 12.08×10^{23} unit cells
 $= 2 \times 12.08 \times 10^{23} = 24.16 \times 10^{23} \text{ atom}$.
4. (b) *bcc* structure has one atom shared by 1 unit cell.
5. (b) The structural arrangement of co-ordination number '6' is octahedral and its radius ratio is 0.414 – 0.732. The example of octahedral is *KCl* and *NaCl*.
6. (a) The number of spheres in one body centred cubic and in one face centred cubic unit cell is 2 and 4 respectively.
7. (b) Closest approach in *bcc* lattice
 $= \frac{1}{2}$ of body diagonal = $\frac{1}{2} \times \sqrt{3}a = \frac{\sqrt{3}}{2} \times 4.3 = 3.72 \text{ \AA}$.
10. (a) $M = \frac{\rho \times a^3 \times N_o \times 10^{-30}}{Z}$
 $= \frac{10 \times (100)^3 \times (6.02 \times 10^{23}) \times 10^{-30}}{4} = 15.05$
 No. of atoms in 100 g = $\frac{6.02 \times 10^{23}}{15.05} \times 100 = 4 \times 10^{25}$.
11. (c) Cs^+ and I^- have largest sizes.
12. (c) $58.5 \text{ g NaCl} = 1 \text{ mole} = 6.02 \times 10^{23} \text{ Na}^+ \text{Cl}^- \text{ units}$.
 One unit cell contains 4 $\text{Na}^+ \text{Cl}^-$ units. Hence number of unit cell present
 $= \frac{6.02 \times 10^{23}}{4} = 1.5 \times 10^{23}$.
13. (a) $\frac{1}{58.5} \times 6.023 \times 10^{23} = 1.029 \times 10^{22}$
 A unit cell contains 4 Na^+ ion and 4 Cl^- ions
 $\therefore$ Unit cell = $\frac{1.029 \times 10^{22}}{4} = 2.57 \times 10^{21} \text{ unit cell}$.

14. (b) Bragg's equation is $n\lambda = 2d \sin\theta$
where n is an integer i.e. 1, 2, 3, 4 etc.
15. (d) Face centred cubic structure contribute of $1/8$ by each atom present on the corner and $1/2$ by each atom present on the face.
16. (c) As CsCl is body-centred, $d = \sqrt{3}a/2$.
17. (a) Radius of Na (if bcc lattice) $= \frac{\sqrt{3}a}{4} = \frac{\sqrt{3} \times 4.29}{4}$
 $= 1.8574 \text{ \AA} = 1.8574 \times 10^{-8} \text{ cm}$
18. (b) The crystals in which radius ratio value is found between 0.225 – 0.414 shows tetrahedral crystal structure.
19. (d) For bcc ; $d = \frac{\sqrt{3}}{2}a$ or $a = \frac{2d}{\sqrt{3}} = \frac{2 \times 4.52}{1.732} = 5.219 \text{ \AA} = 522 \text{ pm}$
$$\rho = \frac{Z \times M}{a^3 \times N_0 \times 10^{-30}} = \frac{2 \times 39}{(522)^3 \times (6.023 \times 10^{23}) \times 10^{-30}}$$
$$= 0.91 \text{ g/cm}^3 = 910 \text{ kg m}^{-3}$$
20. (c) The value of ionic radius ratio is 0.52 which is between 0.414 – 0.732, then the geometrical arrangement of ions in crystal is octahedral.
21. (c) The number of atoms present in sc , fcc and bcc unit cell are 1, 4, 2 respectively.
22. (b) The number of atoms present in sc , fcc and bcc unit cell are 1, 4, 2 respectively.
23. (d) $\text{Cl}^- \quad \text{Na}^+ \quad \text{Cl}^-$

24. (a) $r = \frac{a}{2\sqrt{2}}$; $r = \frac{620}{2\sqrt{2}} = 219.25 \text{ pm}$
25. (c) $Z = \frac{V \times N_0 \times d}{M}$
$$= \frac{4.2 \times 8.6 \times 8.3 \times 10^{-24} \times 6.023 \times 10^{23} \times 3.3}{155} = 3.84 = 4$$
26. (b) Volume of unit cell $= a^3$
 $= (3.04 \times 10^{-8} \text{ cm})^3 = 2.81 \times 10^{-23} \text{ cm}^3$
27. (b) In FCC
 $4r = \sqrt{2}a$
 $a = \frac{4r}{\sqrt{2}}$
4. (a) A atoms are at eight corners of the cube. Therefore, the number of A atoms in the unit cell $= \frac{8}{8} = 1$, atoms B per unit cell = 1. Hence the formula is AB .
5. (d) Co-ordination number for Cu is 12.
6. (b) Each Cs^+ in CsCl is surrounded by eight Cl^- and each Cl^- in CsCl is surrounded by eight Cs^+ .
7. (d) X atoms are at eight corners of the cube. Therefore, the number of X atoms in the unit cell $= \frac{8}{8} = 1$.
Y atoms are at the face centre of six faces. Therefore, its share in the unit cell $= \frac{6}{2} = 3$. The formula is XY_3 .
8. (a) Let the units of ferrous oxide in a unit cell $= n$, molecular weight of ferrous oxide (FeO) $= 56 + 16 = 72 \text{ g mol}^{-1}$,
weight of n units $= \frac{72 \times n}{6.023 \times 10^{23}}$
Volume of one unit $= (\text{length of corner})^3$
 $= (5 \text{ \AA})^3 = 125 \times 10^{-24} \text{ cm}^3$
Density $= \frac{\text{wt. of cell}}{\text{volume}}$, $4.09 = \frac{72 \times n}{6.023 \times 10^{23} \times 125 \times 10^{-24}}$
 $n = \frac{3079.2 \times 10^{-1}}{72} = 42.7 \times 10^{-1} = 4.27 \approx 4$
9. (b) In NaCl crystal Na^+ ions has coordination number 6.
10. (b) Cl^- ions in CsCl adopt BCC type of packing.
11. (d) There were 6 A atoms on the face-centres removing face-centred atoms along one of the axes means removal of 2 A atoms.
Now, number of A atoms per unit cell
 $= 8 \times \frac{1}{8} + 4 \times \frac{1}{2} = 3$
(corners) (face-centred)
Number of B atoms per unit cell
 $= 12 \times \frac{1}{4} + 1 = 4$
(edge centred) (body centred)
Hence the resultant stoichiometry is A_3B_4
12. (a) In Cs^+Cl^- crystal co-ordination number of each ion is 8.
13. (b) $r_+/r_- = \frac{180}{187} = 0.962$ which lies in the range of 0.732 – 1.000, hence co-ordination number = 8 i.e. the structure is CsCl type.
14. (a) In diamond, C-atoms are arranged in a regular tetrahedral structure.
15. (b) In hcp , co-ordination no. is 12.
16. (c) Mg has 6 co-ordination number (fcc structure).
17. (d) In NaCl crystal every Na^+ ion is surrounded by 6 Cl^- ion and every chloride ion is surrounded by 6 Na^+ ion.
18. (d) Crystals show good cleavage because their constituent particles are arranged in planes.
19. (b) Fe_3O_4 is a non-stoichiometric compound because in it the ratio of the cations to the anions becomes different from that indicated by the chemical formula.
20. (d) The radius ratio for co-ordination number 4, 6 and 8 lies in between the ranges [0.225 – 0.414], [0.414 – 0.732] and [0.732 – 1] respectively.

Crystal structure and Coordination number

1. (b) In a unit cell, W atoms at the corner $= \frac{1}{8} \times 8 = 1$
O atoms at the centre of edges $= \frac{1}{4} \times 12 = 3$
Na atoms at the centre of the cube = 1
W : O : Na = 1 : 3 : 1, hence formula = NaWO_3
2. (d) For bcc lattice, co-ordination number is 8.
3. (b) Body centered cubic lattice has a co-ordination number 8.

21. (c) The radius ratio for co-ordination number 4, 6 and 8 lies in between the ranges $[0.225 - 0.414]$, $[0.414 - 0.732]$ and $[0.732 - 1]$ respectively.
22. (b) In Na_2O , each oxide ions (O^{2-}) is co-ordinated to $8 Na^+$ ions and each Na^+ ion to 4 oxide ions. Hence it has 4 : 8 co-ordination.
23. (b) When radius ratio between $0.732 - 1$, then co-ordination number is 8 and structural arrangement is body-centred cubic.
24. (c) Each Cs^+ is surrounded by eight Cl^- ions in $CsCl$ crystal lattice because its co-ordination number is 8 : 8.
25. (a) $NaCl$ has *fcc* arrangement of ions.
26. (c) Each Na^+ is surrounded by six Cl^- ions in $NaCl$ crystal lattice because its co-ordination number is 6 : 6.
27. (b) Zinc blende (ZnS) has *fcc* structure and is an ionic crystal having 4 : 4 co-ordination number.
30. (d) In a simple cubic structure

$$z = \frac{1}{8} \times 8 \text{ (atoms one at a corners)}$$

$$z = 1$$
31. (a) Co-ordination number in hcp structure is 12.
32. (acd) A metal that crystallizes in *bcc* structure has a co-ordination number of 8.
33. (a) In sodium chloride, each Na^+ ion is surrounded by six Cl^- ions and each Cl^- ion is surrounded by six Na^+ ions. Thus, both the ions have coordination number six.
34. (b) The Ca^{2+} ions are arranged in (ccp) arrangement, i.e. Ca^{2+} ions are present at all corners and at the centre of each face of the cube. the fluoride ions occupy all the tetrahedral sites. This is 8 : 4 arrangement i.e., each Ca^{2+} ion is surrounded by $8 F^-$ ions and each F^- ion by four Ca^{2+} ions.

Defects in crystal

1. (c) When polar crystal is subjected to a mechanical stress, electricity is produced – a case of piezoelectricity. Conversely, if electric field is applied, mechanical stress is developed. Piezoelectric crystal acts as a mechanical electrical transducer.
2. (b) More is the Schottky defect in crystal more is the decrease in density.
3. (d) All the given statements are correct about *F*-centres.
5. (a) As each Sr^{2+} ion introduces one cation vacancy, therefore concentration of cation vacancies = mol % of $SrCl_2$ added.
6. (c) Yellow colour on heating $NaCl$ in presence of Na is due to presence of electrons in anion vacancies (*F*-centres).
7. (d) Frenkel's defect is due to shift of an ion from the normal lattice site (Creating a vacancy) and occupy interstitial spaces.
8. (c) $AgBr$ exhibits Frenkel defect due to large difference in the size of Ag^+ and Br^- ions.
9. (d) Schottky defects occurs in highly ionic compounds which have high co-ordination number ex. $NaCl, KCl, CsCl$.
10. (d) Schottky defect is due to missing of equal number of cations and anions.
11. (a) Schottky defect is due to missing of equal number of cations and anions.
12. (a) Impurity present in a crystal does not establish thermal equilibrium.
13. (c) Since no ions are missing from the crystal as a whole, there is no effect on density.
15. (b) On adding non-metal in metal the metal becomes less tensile.
16. (c) $AgBr$ exhibits Frenkel defect due to large difference in the size of Ag^+ and Br^- ions.
17. (c) Both are stoichiometric crystalline defects.
18. (c) Brass, $Cu = 80\%$, $Zn = 20\%$ substitutional alloy.
 Steel is an interstitial alloy because it is an alloy of Fe with C , C atoms occupy the interstitial voids of Fe crystal.
19. (d) In metal excess defect when holes created by missing of anions are occupied by electrons, there sites are called *F*-centres and are responsible for colour in the crystal.
20. (c) KBr exhibits Schottky defect and not Frenkel defect.
21. (c) When cation shifts from lattice to interstitial site, the defect is called Frenkel defect.
22. (d) *F*-centres are the sites where anions are missing and instead electrons are present. they are responsible for colour.

Critical Thinking Questions

1. (c) Amorphous solids neither have ordered arrangement (i.e. no definite shape) nor have sharp melting point like crystals, but when heated, they become pliable until they assume the properties usually related to liquids. It is therefore they are regarded as super-cooled liquids.
2. (c) Silicon due to its catenation property form network solid.
3. (c) Orthorhombic geometry has $a \neq b \neq c$ and $\alpha = \beta = \gamma = 90^\circ$. The shape of match box obey this geometry.
4. (d) In a triclinic crystal has no notation of symmetry.
5. (a) In NH_3 molecule, the original appearance is repeated as a result of rotation through 120° . Such as axis is said to be an axis of three-fold symmetry or a triad axis.
6. (a) Na_2O has antifluorite (A_2B) type structure.
7. (b) Cationic radius increases down the group and decreases along the period.
8. (c) Distance between centres of cation and anion

$$= \frac{d}{2} = \frac{508}{2} = 254 \text{ pm}$$

$$r_c + r_a = 254 \text{ pm} \text{ or } 110 + r_a = 254 \text{ or } r_a = 144 \text{ pm}$$
9. (b)
$$\rho = \frac{n \times M}{a^3 \times N_0 \times 10^{-30}}$$

$$= \frac{2 \times 100}{(400)^3 \times (6.02 \times 10^{23}) \times 10^{-30}} = 5.188 \text{ g/cm}^3$$
10. (a) $NaCl$ structure $\xrightarrow[760 \text{ K}]{\text{High pressure}}$ $CsCl$ structure
 (6:6 co.-ord.) (8:8 co.-ord.)
11. (a) Difference $= 2.178 \times 10^3 - 2.165 \times 10^3 = 0.013 \times 10^3$
 Fraction unoccupied $= \frac{0.013 \times 10^3}{2.178 \times 10^3} = 5.96 \times 10^{-3}$
12. (c) $CsBr_3$ consist of Cs^+ and Br_3^- ions.
13. (a) Each Cs^+ is surrounded by eight Cl^- ions in $CsCl$ crystal lattice because its co-ordination number is 8 : 8.
14. (b) In each CaF_2 each calcium cation is surrounded by eight fluoride anions in a body centred cubic arrangement. Each fluoride ion is in contact with four calcium ions. Thus CaF_2 has 8 : 4 co-ordination number.
15. (c) The radius ratio for co-ordination number 4, 6 and 8 lies in between the ranges $[0.225 - 0.414]$, $[0.414 - 0.732]$ and $[0.732 - 1]$ respectively.

16. (b)
17. (b) In this diagram, equal number of cations (Na^+) and anions (Cl^-) are missing, so it, shows schottky defect.
18. (c) Zeolite is a three dimensional silicate because of in the silicates all the four oxygen atoms at $(SiO_4)^{-4}$ tetrahedra are shared with other tetrahedra, resulting in a three dimensional network.

Assertion & Reason

1. (b) It is true that in the diamond structure, carbon atoms are arranged in tetrahedrally (sp^3 hybridized) but it is not the correct explanation of assertion.
2. (d) Tetrahedral holes are smaller in size than octahedral holes. Cations usually occupy less space than anions.
3. (d) Crystalline solids have regular arrangement of constituent particles and are anisotropic whereas amorphous solids have no regular arrangement and are isotropic.
4. (a) Schottky defect is due to missing of equal number of cations and anions.
5. (b) Space or crystal lattice is a regular repeating arrangement of points in space and forms the basis of classification of all structures.
6. (c) Tetrahedral void is so called because it is surrounded by four spheres tetrahedrally while octahedral void is so called because it is surrounded by six spheres octahedrally.
7. (c) Two corners per tetrahedron one shared in both the cases.
8. (b) When an atom or an ion is missing from its normal lattice site, a lattice vacancy or defect is created, which is called schottky defect. Due to missing density of crystal will be lowered.
9. (b) On heating, the metal atoms deposit on the surface and finally they diffuse into the crystal and after ionisation the alkali metal ion occupies cationic vacancy where as electron occupies anionic vacancy.
10. (a) In case of semiconductors, the gap between valence band and the conduction band is small and therefore some of the electrons may jump from valence band to conduction band and thus on increasing temperature conductivity is also increased.
11. (a) All magnetically ordered solids (ferromagnetic and antiferromagnetic solids) transform to the paramagnetic state at high temperature due to the randomisation of spins.
12. (c) In piezoelectric crystals, the dipoles may align themselves in an ordered manner such that there is a net dipole moment in the crystal.

Solid State

Self Evaluation Test -5

1. Particles of quartz are packed by
- Electrical attraction forces
 - Vander Waal's forces
 - Covalent bond forces
 - Strong electrostatic attraction forces
2. Crystals of covalent compounds always have [BHU 1984]
- Atoms as their structural units
 - Molecules as structural units
 - Ions held together by electrostatic forces
 - High melting points
3. Wax is an example of
- Ionic crystal
 - Covalent crystal
 - Metallic crystal
 - Molecular crystal
4. Among the following which crystal will be soft and have low melting point
- Covalent
 - Ionic
 - Metallic
 - Molecular
5. In zinc blende structure, zinc atom fill up
- All octahedral holes
 - All tetrahedral holes
 - Half number of octahedral holes
 - Half number of tetrahedral holes
6. Which ion has the lowest radius from the following ions [Kurukshetra CEE 1998]
- Na^+
 - Mg^{2+}
 - Al^{3+}
 - Si^{4+}
7. The second order Bragg's diffraction of X - rays with $\lambda = 1 \text{ \AA}$ from a set of parallel planes in a metal occurs at an angle of 60° . The distance between the scattering planes in the crystal is [CBSE PMT 1998; AFM]
- $0.575 \text{ \AA}$
 - $1.00 \text{ \AA}$
 - $2.00 \text{ \AA}$
 - $1.15 \text{ \AA}$
8. The edge length of the unit cell of $NaCl$ crystal lattice is 552 pm . If ionic radius of sodium ion is 95 pm , what is the ionic radius of chloride ion [KCET 1998]
- 190 pm
 - 368 pm
 - 181 pm
 - 276 pm
9. The ionic radii of Rb^+ and I^- are $1.46 \text{ \AA}$ and $2.16 \text{ \AA}$. the most probable type of structure exhibited by it is [UPSEAT 2004]
- $CsCl$ type
 - ZnS type
 - $NaCl$ type
 - CaF_2 type
10. The coordination number of a cation occupying a tetrahedral hole is
- 6
 - 8
 - 12
 - 4
11. If a electron is present in place of anion in a crystal lattice, then it is called
- Frenkel defect
 - Schottky defect
 - Interstitial defects
 - F - centre

1. (c) Quartz is a covalent solid in which constituent particles are atoms which are held together by covalent bond forces.
2. (a) Constituent particles of covalent compounds are atoms.
3. (d) Iodine crystals are molecular crystals, in which constituent particles are molecules having interparticle forces are Vander Waal's forces.
4. (d) Molecular crystals are soft and have low melting point.
5. (d) In zinc blende (ZnS) half number of tetrahedral holes are filled by zinc atoms.
6. (d) All are the iso-electronic species but Si^{4+} has high positive charge so have lowest radius.
7. (d) $2d\sin\theta = n\lambda$ or $2 \times d \times \sin 60^\circ = 2 \times 1 \text{ \AA}$
 or $2 \times d \times 0.8660 = 2$
 or $d = 1.15 \text{ \AA}$ ($\sin 60^\circ = \sqrt{3} / 2$ or 0.8660).
10. (d) The co-ordination number of a cation occupying a tetrahedral hole is 4.
11. (d) When electrons are trapped in anion vacancies, these are called F -centres.

8. (c) Distance between centres of Na^+ and Cl^-
 $r_{Na^+} + r_{Cl^-} = 276 \text{ pm}$ or $95 + r_{Cl^-} = 276 \text{ pm}$
 or $r_{Cl^-} = 276 - 95 = 181 \text{ pm}$

9. (c) $\frac{r_{c^+}}{r_{a^-}} = \frac{1.46}{2.16} = 0.676$

It permits co-ordination number 6 and octahedral structure of type $NaCl$.

Chapter 6 Gaseous state

The state of matter in which the molecular forces of attraction between the particles of matter are minimum, is known as *gaseous state*. It is the simplest state and shows great uniformity in behaviour.

Characteristics of gases

- (1) Gases or their mixtures are homogeneous in composition.
- (2) Gases have very low density due to negligible intermolecular forces.
- (3) Gases have *infinite expansibility and high compressibility*.
- (4) Gases exert pressure.
- (5) Gases possess high diffusibility.
- (6) Gases do not have definite shape and volume like liquids.
- (7) Gaseous molecules move very rapidly in all directions in a random manner *i.e.*, gases have highest kinetic energy.
- (8) Gaseous molecules collide with one another and also with the walls of container with perfectly *elastic collisions*.
- (9) Gases can be liquified, if subjected to low temperatures (below critical) or high pressures.
- (10) Thermal energy of gases $\gg$ molecular attraction.
- (11) Gases undergo similar change with the change of temperature and pressure. In other words, gases obey certain laws known as **gas laws**.

Measurable properties of gases

- (1) The characteristics of gases are described fully in terms of four parameters or measurable properties :
 - (i) The volume, V , of the gas.
 - (ii) Its pressure, P
 - (iii) Its temperature, T
 - (iv) The amount of the gas (*i.e.*, mass or number of moles).
- (2) **Volume** : (i) Since gases occupy the entire space available to them, the measurement of volume of a gas only requires a measurement of the container confining the gas.
 - (ii) Volume is expressed in litres (L), millilitres (mL) or cubic centimetres (cm^3) or cubic metres (m^3).
 - (iii) $1L = 1000mL$; $1mL = 10^{-3}L$; $1L = 1dm^3 = 10^{-3}m^3$

$$1m^3 = 10^3 dm^3 = 10^6 cm^3 = 10^6 mL = 10^3 L$$

(3) **Mass** : (i) The mass of a gas can be determined by weighing the container in which the gas is enclosed and again weighing the container after removing the gas. The difference between the two weights gives the mass of the gas.

(ii) The mass of the gas is related to the number of moles of the gas *i.e.*

$$\text{moles of gas } (n) = \frac{\text{Mass in grams}}{\text{Molar mass}} = \frac{m}{M}$$

(4) **Temperature** : (i) Gases expand on increasing the temperature. If temperature is increased twice, the square of the velocity (v^2) also increases two times.

(ii) Temperature is measured in centigrade degree ($^{\circ}C$) or celsius degree with the help of thermometers. Temperature is also measured in Fahrenheit (F).

(iii) S.I. unit of temperature is kelvin (K) or absolute degree.

$$K = ^{\circ}C + 273$$

$$(iv) \text{ Relation between } F \text{ and } ^{\circ}C \text{ is } \frac{^{\circ}C}{5} = \frac{F - 32}{9}$$

(5) **Pressure** : (i) Pressure of the gas is the force exerted by the gas per unit area of the walls of the container in all directions. Thus, Pressure

$$(P) = \frac{\text{Force}(F)}{\text{Area}(A)} = \frac{\text{Mass}(m) \times \text{Acceleration}(a)}{\text{Area}(a)}$$

(ii) Pressure exerted by a gas is due to kinetic energy ($KE = \frac{1}{2}mv^2$) of the molecules. Kinetic energy of the gas molecules increases, as the temperature is increased. Thus, **Pressure of a gas $\propto$ Temperature (T)**.

(iii) Pressure of a pure gas is measured by manometer while that of a mixture of gases by barometer.

(iv) Commonly two types of manometers are used,

(a) Open end manometer; (b) Closed end manometer

(v) The S.I. unit of pressure, the pascal (Pa), is defined as 1 newton per *metre square*. It is very small unit.

$$1Pa = 1Nm^{-2} = 1kg\,m^{-1}s^{-2}$$

(vi) C.G.S. unit of pressure is dynes cm^{-2} .

(vii) M.K.S. unit of pressure is kgf/m^2 . The unit kgf/cm^2 sometime called *ata* (atmosphere technical absolute).

(viii) Higher unit of pressure is *bar*, *KPa* or *MPa*.

$$1bar = 10^5 Pa = 10^5 Nm^{-2} = 100KNm^{-2} = 100KPa$$

(ix) Several other units used for pressure are,

Name	Symbol	Value
bar	<i>bar</i>	$1bar = 10^5 Pa$
atmosphere	<i>atm</i>	$1atm = 1.01325 \times 10^5 Pa$
Torr	Torr	$1Torr = \frac{101325}{760} Pa = 133.322 Pa$
millimetre of mercury	mm <i>Hg</i>	$1mm\,Hg = 133.322 Pa$

(x) The pressure relative to the atmosphere is called *gauge pressure*. The pressure relative to the perfect vacuum is called *absolute pressure*.

Absolute pressure = Gauge pressure + Atmosphere pressure.

(xi) When the pressure in a system is less than atmospheric pressure, the gauge pressure becomes negative, but is frequently designated and called vacuum. For example, 16 *cm* vacuum will be

$$\frac{76-16}{76} \times 1.013 = 0.80\,bar.$$

(xii) If ' h ' is the height of the fluid in a column or the difference in the heights of the fluid columns in the two limbs of the manometer, d is the density of the fluid

($Hg = 13.6 \times 10^3 Kg/m^3 = 13.6 g/cm^3$) and g is the gravity, then

pressure is given by, $P_{gas} = P_{atm} + hdg$

(xiii) Two sets of conditions are widely used as 'standard' values for reporting data.

Condition	T	P	V_g (Molar volume)
S.T.P./N.T.P.	273.15 K	1 atm	22.414 L
S.A.T.P.	298.15 K	1 bar	24.800 L

* Standard ambient temperature and pressure.

Boyle's law

(1) In 1662, **Robert Boyle** discovered the first of several relationships among gas variables (P , T , V).

(2) It states that, "For a fixed amount of a gas at constant temperature, the gas volume is inversely proportional to the gas pressure."

Thus, $P \propto 1/V$ at constant temperature and mass

or $P = K/V$ (where K is constant)

or $PV = K$ or $P_1V_1 = P_2V_2 = K$ (For two or more gases)

(3) **Graphical representation of Boyle's law** : Graph between P and V at constant temperature is called *isotherm* and is an equilateral (or rectangular) hyperbola. By plotting P versus $1/V$, this hyperbola can be converted to a straight line. Other types of isotherms are also shown below,

(4) At constant mass and temperature density of a gas is directly proportional to its pressure and inversely proportional to its volume.

$$\text{Thus, } d \propto P \propto \frac{1}{V} \left[\because V = \frac{\text{mass}}{d} \right]$$

$$\text{or } \frac{d_1}{d_2} = \frac{P_1}{P_2} = \frac{V_2}{V_1} = \dots\dots\dots = K$$

(5) At altitudes, as P is low d of air is less. That is why mountaineers carry oxygen cylinders.

Charle's law

(1) French chemist, **Jacques Charles** first studied variation of volume with temperature, in 1787.

(2) It states that, "The volume of a given mass of a gas is directly proportional to the absolute temperature ($= ^\circ C + 273$) at constant pressure".

Thus, $V \propto T$ at constant pressure and mass

or $V = KT = K(t^\circ C + 273.15)$, (where k is constant),

$$K = \frac{V}{T} \text{ or } \frac{V_1}{T_1} = \frac{V_2}{T_2} = K \text{ (For two or more gases)}$$

(3) If $t = 0^\circ C$, then $V = V_0$

hence, $V_0 = K \times 273.15$

$$\therefore K = \frac{V_0}{273.15}$$

$$V = \frac{V_0}{273.15} [t + 273.15] = V_0 \left[1 + \frac{t}{273.15} \right] = V_0 [1 + \alpha_v t]$$

where α_v is the volume coefficient,

$$\alpha_v = \frac{V - V_0}{tV_0} = \frac{1}{273.15} = 3.661 \times 10^{-3} ^\circ C^{-1}$$

Thus, for every 1° change in temperature, the volume of a gas changes by $\frac{1}{273.15} \left(\approx \frac{1}{273} \right)$ of the volume at $0^\circ C$.

(4) **Graphical representation of Charle's law** : Graph between V and T at constant pressure is called *isobar* or *isoplestics* and is always a straight line. A plot of V versus $t(^{\circ}C)$ at constant pressure is a straight line cutting the temperature axis at $-273.15^\circ C$. It is the lowest possible temperature.

(5) At constant mass and pressure density of a gas is inversely proportional to its absolute temperature.

$$\text{Thus, } d \propto \frac{1}{T} \propto \frac{1}{V} \quad \left[\because V = \frac{\text{mass}}{d} \right]$$

$$\text{or } \frac{d_1}{d_2} = \frac{T_2}{T_1} = \frac{V_2}{V_1} = \dots = K$$

(6) Use of hot air balloons in sports and meteorological observations is an application of Charles's law.

Gay-Lussac's law (Amonton's law)

(1) In 1802, French chemist **Joseph Gay-Lussac** studied the variation of pressure with temperature and extended Charles's law so, this law is also called Charles's-Gay Lussac's law.

(2) It states that, "The pressure of a given mass of a gas is directly proportional to the absolute temperature ($= ^\circ\text{C} + 273$) at constant volume."

Thus, $P \propto T$ at constant volume and mass

$$\text{or } P = KT = K(t^\circ\text{C} + 273.15) \quad (\text{where } K \text{ is constant})$$

$$K = \frac{P}{T} \quad \text{or} \quad \frac{P_1}{T_1} = \frac{P_2}{T_2} = K \quad (\text{For two or more gases})$$

(3) If $t = 0^\circ\text{C}$, then $P = P_0$

$$\text{Hence, } P_0 = K \times 273.15$$

$$\therefore K = \frac{P_0}{273.15}$$

$$P = \frac{P_0}{273.15} [t + 273.15] = P_0 \left[1 + \frac{t}{273.15} \right] = P_0 [1 + \alpha t]$$

where α_p is the pressure coefficient,

$$\alpha_p = \frac{P - P_0}{tP_0} = \frac{1}{273.15} = 3.661 \times 10^{-3} \text{ } ^\circ\text{C}^{-1}$$

Thus, for every 1° change in temperature, the pressure of a gas changes by $\frac{1}{273.15} \left(\approx \frac{1}{273} \right)$ of the pressure at 0°C .

(4) This law fails at low temperatures, because the volume of the gas molecules becomes significant.

(5) **Graphical representation of Gay-Lussac's law**: A graph between P and T at constant V is called **isochore**.

Avogadro's law

(1) According to this law, "Equal volumes of any two gases at the same temperature and pressure contain the same number of molecules."

Thus, $V \propto n$ (at constant T and P)

$$\text{or } V = Kn \quad (\text{where } K \text{ is constant})$$

$$\text{or } \frac{V_1}{n_1} = \frac{V_2}{n_2} = \dots = K$$

Example, $2\text{H}_2(\text{g}) + \text{O}_2(\text{g}) \longrightarrow 2\text{H}_2\text{O}(\text{g})$

2 moles	1 mole	2 moles
2 volumes	1 volume	2 volumes
2 litres	1 litre	2 litres
1 litre	1/2 litre	1 litre
1n litre	1/2n litre	1n litre

(2) One mole of any gas contains the same number of molecules (Avogadro's number $= 6.02 \times 10^{23}$) and by this law must occupy the same volume at a given temperature and pressure. The volume of one mole of a gas is called **molar volume**, V_m which is 22.4 L mol^{-1} at S.T.P. or N.T.P.

(3) This law can also express as, "The molar gas volume at a given temperature and pressure is a specific constant independent of the nature of the gas".

$$\text{Thus, } V_m = \text{specific constant} = 22.4 \text{ L mol}^{-1} \text{ at S.T.P. or N.T.P.}$$

Ideal gas equation

(1) The simple gas laws relating gas volume to pressure, temperature and amount of gas, respectively, are stated below:

$$\text{Boyle's law: } P \propto \frac{1}{V} \quad \text{or} \quad V \propto \frac{1}{P} \quad (n \text{ and } T \text{ constant})$$

$$\text{Charles's law: } V \propto T \quad (n \text{ and } P \text{ constant})$$

$$\text{Avogadro's law: } V \propto n \quad (T \text{ and } P \text{ constant})$$

If all the above laws combine, then

$$V \propto \frac{nT}{P}$$

$$\text{or } V = \frac{nRT}{P} \quad (R = \text{Ideal gas constant})$$

$$\text{or } PV = nRT$$

This is called **ideal gas equation**. R is called **ideal gas constant**. This equation is obeyed by isothermal and adiabatic processes.

(2) **Nature and values of R** : From the ideal gas equation,

$$R = \frac{PV}{nT} = \frac{\text{Pressure} \times \text{Volume}}{\text{mole} \times \text{Temperature}}$$

$$\begin{aligned} &= \frac{\frac{\text{Force}}{\text{Area}} \times \text{Volume}}{\text{mole} \times \text{Temperature}} = \frac{\text{Force} \times \text{Length}}{\text{mole} \times \text{Temperature}} \\ &= \frac{\text{Work or energy}}{\text{mole} \times \text{Temperature}} \end{aligned}$$

R is expressed in the unit of work or energy $\text{mol}^{-1} \text{ K}^{-1}$.

Since different values of R are summarised below:

$$R = 0.0821 \text{ L atm mol}^{-1} \text{ K}^{-1}$$

$$= 8.3143 \text{ joulemol}^{-1} \text{ K}^{-1} \quad (\text{S.I. unit})$$

$$= 8.3143 \text{ Nm mol}^{-1} \text{ K}^{-1}$$

$$= 8.3143 \text{ KPadm}^3 \text{ mol}^{-1} \text{ K}^{-1}$$

$$= 8.3143 \text{ MPacm}^3 \text{ mol}^{-1} \text{ K}^{-1}$$

$$= 5.189 \times 10^{19} \text{ eV mol}^{-1} \text{ K}^{-1}$$

$$= 1.99 \text{ cal mol}^{-1} \text{ K}^{-1}$$

(3) Gas constant, R for a single molecule is called *Boltzmann constant* (k)

$$k = \frac{R}{N} = \frac{8.314 \times 10^7}{6.023 \times 10^{23}} \text{ ergsmole}^{-1} \text{ degree}^{-1}$$

$$= 1.38 \times 10^{-16} \text{ ergsmol}^{-1} \text{ degree}^{-1}$$

$$\text{or } 1.38 \times 10^{-23} \text{ joulemol}^{-1} \text{ degree}^{-1}$$

(4) Calculation of mass, molecular weight and density of the gas by gas equation

$$PV = nRT = \frac{m}{M} RT$$

$$\left(\because n = \frac{\text{mass of the gas (m)}}{\text{Molecular weight of the gas (M)}} \right)$$

$$\therefore M = \frac{mRT}{PV}$$

$$d = \frac{PM}{RT} \quad \left(\because d = \frac{m}{V} \right)$$

$$\text{or } \frac{dT}{P} = \frac{M}{R}, \frac{M}{R} = \text{Constant}$$

($\because M$ and R are constant for a particular gas)

$$\text{Thus, } \frac{dT}{P} \text{ or } \frac{d_1 T_1}{P_1} = \frac{d_2 T_2}{P_2} = \text{Constant}$$

(For two or more different temperature and pressure)

(5) Gas densities differ from those of solids and liquids as,

(i) Gas densities are generally stated in g/L instead of g/cm^3 .

(ii) Gas densities are strongly dependent on pressure and temperature as, $d \propto P \propto 1/T$

Densities of liquids and solids, do depend somewhat on temperature, but they are far less dependent on pressure.

(iii) The density of a gas is directly proportional to its molar mass. No simple relationship exists between the density and molar mass for liquid and solids.

$$(iv) \text{ Density of a gas at STP} = \frac{\text{molar mass}}{22.4}$$

$$d(N_2) \text{ at STP} = \frac{28}{22.4} = 1.25 \text{ g L}^{-1},$$

$$d(O_2) \text{ at STP} = \frac{32}{22.4} = 1.43 \text{ g L}^{-1}$$

Dalton's law of partial pressures

(i) According to this law, "When two or more gases, which do not react chemically are kept in a closed vessel, the total pressure exerted by the mixture is equal to the sum of the partial pressures of individual gases."

$$\text{Thus, } P_{\text{total}} = P_1 + P_2 + P_3 + \dots$$

Where $P_1, P_2, P_3, \dots$ are partial pressures of gas number 1, 2, 3

.....

(2) **Partial pressure** is the pressure exerted by a gas when it is present alone in the same container and at the same temperature.

Partial pressure of a gas

$$(P_1) = \frac{\text{Number of moles of the gas (n}_1\text{)} \times P_{\text{Total}}}{\text{Total number of moles (n) in the mixture}} = \text{Mole fraction (X}_1\text{)} \times P_{\text{Total}}$$

(3) If a number of gases having volume $V_1, V_2, V_3, \dots$ at pressure $P_1, P_2, P_3, \dots$ are mixed together in container of volume V , then,

$$P_{\text{Total}} = \frac{P_1 V_1 + P_2 V_2 + P_3 V_3 + \dots}{V}$$

$$\text{or } = (n_1 + n_2 + n_3 + \dots) \frac{RT}{V} \quad (\because PV = nRT)$$

$$\text{or } = n \frac{RT}{V} \quad (\because n = n_1 + n_2 + n_3 + \dots)$$

(4) **Applications** : This law is used in the calculation of following relationships,

$$(i) \text{ Mole fraction of a gas (X}_1\text{) in a mixture of gas} = \frac{\text{Partial pressure of a gas (P}_1\text{)}}{P_{\text{Total}}}$$

$$(ii) \% \text{ of a gas in mixture} = \frac{\text{Partial pressure of a gas (P}_1\text{)}}{P_{\text{Total}}} \times 100$$

(iii) Pressure of dry gas collected over water : When a gas is collected over water, it becomes moist due to water vapour which exerts its own partial pressure at the same temperature of the gas. *This partial pressure of water vapours is called aqueous tension.* Thus,

$$P_{\text{dry gas}} = P_{\text{moist gas}} \text{ or } P_{\text{Total}} - P_{\text{water vapour}}$$

or $P_{\text{dry gas}} = P_{\text{moist gas}} - \text{Aqueous tension}$ (Aqueous tension is directly proportional to absolute temperature)

(iv) Relative humidity (RH) at a given temperature is given by,

$$RH = \frac{\text{Partial pressure of water in air}}{\text{Vapour pressure of water}}$$

(5) **Limitations** : This law is applicable only when the component gases in the mixture do not react with each other. For example, N_2 and O_2 , CO and CO_2 , N_2 and Cl_2 , CO and N_2 etc. But this law is not applicable to gases which combine chemically. For example, H_2 and Cl_2 , CO and Cl_2 , NH_3 , HBr and HCl , NO and O_2 etc.

(6) Another law, which is really equivalent to the law of partial pressures and related to the partial volumes of gases is known as **Law of partial volumes** given by **Amagat**. According to this law, "When two or more gases, which do not react chemically are kept in a closed vessel, the total volume exerted by the mixture is equal to the sum of the partial volumes of individual gases."

$$\text{Thus, } V_{\text{Total}} = V_1 + V_2 + V_3 + \dots$$

Where $V_1, V_2, V_3, \dots$ are partial volumes of gas number 1, 2, 3,

Graham's law of diffusion and Effusion

(i) **Diffusion** is the process of spontaneous spreading and intermixing of gases to form homogenous mixture irrespective of force of gravity. While **Effusion** is the escape of gas molecules through a tiny hole such as pinhole in a balloon.

• All gases spontaneously diffuse into one another when they are brought into contact.

• Diffusion into a vacuum will take place much more rapidly than diffusion into another place.

• Both the rate of diffusion of a gas and its rate of effusion depend on its molar mass. Lighter gases diffuse faster than heavier gases. The gas with highest rate of diffusion is *hydrogen*.

(2) According to this law, "At constant pressure and temperature, the rate of diffusion or effusion of a gas is inversely proportional to the square root of its vapour density."

Thus, rate of diffusion (r) $\propto \frac{1}{\sqrt{d}}$ (T and P constant)

For two or more gases at constant pressure and temperature,

$$\frac{r_1}{r_2} = \sqrt{\frac{d_2}{d_1}}$$

(3) Graham's law can be modified in a number of ways as,

(i) Since, $2 \times \text{vapour density (V.D.)} = \text{Molecular weight}$

$$\text{then, } \frac{r_1}{r_2} = \sqrt{\frac{d_2}{d_1}} = \sqrt{\frac{d_2 \times 2}{d_1 \times 2}} = \sqrt{\frac{M_2}{M_1}}$$

where, M_1 and M_2 are the molecular weights of the two gases.

(ii) Since, rate of diffusion (r) = $\frac{\text{Volume of a gas diffused}}{\text{Time taken for diffusion}}$

$$\text{then, } \frac{r_1}{r_2} = \frac{V_1/t_1}{V_2/t_2} = \frac{w_1/t_1}{w_2/t_2} = \sqrt{\frac{d_2}{d_1}}$$

(a) When equal volume of the two gases diffuse, i.e. $V_1 = V_2$

$$\text{then, } \frac{r_1}{r_2} = \frac{t_2}{t_1} = \sqrt{\frac{d_2}{d_1}}$$

(b) When volumes of the two gases diffuse in the same time, i.e.

$$t_1 = t_2$$

$$\text{then, } \frac{r_1}{r_2} = \frac{V_1}{V_2} = \sqrt{\frac{d_2}{d_1}}$$

(iii) Since, $r \propto p$ (when p is not constant)

$$\text{then, } \frac{r_1}{r_2} = \frac{P_1}{P_2} \sqrt{\frac{M_2}{M_1}} \quad \left(\because r \propto \frac{P}{\sqrt{M}} \right)$$

(4) Rate of diffusion and effusion can be determined as,

(i) Rate of diffusion is equal to distance travelled by gas per unit time through a tube of uniform cross-section.

(ii) Number of moles effusing per unit time is also called rate of diffusion.

(iii) Decrease in pressure of a cylinder per unit time is called rate of effusion of gas.

(iv) The volume of gas effused through a given surface per unit time is also called rate of effusion.

(5) **Applications** : Graham's law has been used as follows,

(i) To determine vapour densities and molecular weights of gases.

(ii) To prepare Ausell's marsh gas indicator, used in mines.

(iii) **Atmolysis** : The process of separation of two gases on the basis of their different rates of diffusion due to difference in their densities is called atmolysis. It has been applied with success for the separation of isotopes and other gaseous mixtures.

Kinetic theory of gases

(1) Kinetic theory was developed by Bernoulli, Joule, Clausius, Maxwell and Boltzmann etc. and represents **dynamic particle or microscopic model** for different gases since it throws light on the behaviour of the particles (atoms and molecules) which constitute the gases and cannot be seen. Properties of gases which we studied earlier are part of macroscopic model.

(2) Postulates

(i) Every gas consists of a large number of small particles called molecules moving with very high velocities in all possible directions.

(ii) The volume of the individual molecule is negligible as compared to the total volume of the gas.

(iii) Gaseous molecules are *perfectly elastic* so that there is no net loss of kinetic energy due to their collisions.

(iv) The effect of gravity on the motion of the molecules is negligible.

(v) Gaseous molecules are considered as *point masses* because they do not possess potential energy. So the attractive and repulsive forces between the gas molecules are negligible.

(vi) The pressure of a gas is due to the continuous bombardment on the walls of the containing vessel.

(vii) At constant temperature the average K.E. of all gases is same.

(viii) The average K.E. of the gas molecules is directly proportional to the absolute temperature.

(3) **Kinetic gas equation** : On the basis of above postulates, the following gas equation was derived,

$$PV = \frac{1}{3} mnu_{rms}^2$$

where, P = pressure exerted by the gas

V = volume of the gas

m = average mass of each molecule

n = number of molecules

u = root mean square (RMS) velocity of the gas.

(4) Calculation of kinetic energy

We know that,

$$\text{K.E. of one molecule} = \frac{1}{2} mu^2$$

$$\text{K.E. of } n \text{ molecules} = \frac{1}{2} mnu^2 = \frac{3}{2} PV \quad (\because PV = \frac{1}{3} mnu^2)$$

$$n = 1, \text{ Then K.E. of 1 mole gas} = \frac{3}{2} RT \quad (\because PV = RT)$$

$$= \frac{3}{2} \times 8.314 \times T = 12.47 T \text{ Joules.}$$

$$= \frac{\text{Average K.E. per mole}}{N(\text{Avogadro number})} = \frac{3}{2} \frac{RT}{N} = \frac{3}{2} KT$$

$$\left(K = \frac{R}{N} = \text{Boltzmann constant} \right)$$

This equation shows that K.E. of translation of a gas depends only on the absolute temperature. This is known as *Maxwell generalisation*. Thus average K.E. $\propto T$.

If $T = 0K$ (i.e., $-273.15^\circ C$) then, average K.E. = 0. Thus, absolute zero (0K) is the temperature at which molecular motion ceases.

Molecular collisions

(1) The closest distance between the centres of two molecules taking part in a collision is called *molecular or collision diameter* (σ). The molecular diameter of all the gases is nearly same lying in the order of 10^{-8} cm.

(2) The number of collisions taking place in unit time per unit volume, called *collision frequency* (Z).

(i) The number of collision made by a single molecule with other molecules per unit time are given by, $Z_A = \sqrt{2}\pi\sigma^2 u_{av} n$

where n is the number of molecules per unit molar volume,

$$n = \frac{\text{Avogadro number}(N_0)}{V_m} = \frac{6.02 \times 10^{23}}{0.0224} \text{ m}^{-3}$$

(ii) The total number of bimolecular collision per unit time are given by, $Z_{AA} = \frac{1}{\sqrt{2}} \pi \sigma^2 u_{av} n^2$

(iii) If the collisions involve two unlike molecules, the number of bimolecular collision are given by,

$$Z_{AB} = \sigma_{AB}^2 \left[8\pi RT \frac{(M_A + M_B)}{M_A M_B} \right]^{1/2}$$

$$\text{where, } \sigma_{AB} = \frac{\sigma_A + \sigma_B}{2}$$

M_A, M_B are molecular weights ($M = mN_0$)

(iv) (a) At particular temperature; $Z \propto p^2$

(b) At particular pressure; $Z \propto T^{-3/2}$

(c) At particular volume; $Z \propto T^{1/2}$

(3) During molecular collisions a molecule covers a small distance before it gets deflected. The average distance travelled by the gas molecules between two successive collision is called *mean free path* (λ).

$$\lambda = \frac{\text{Average distance travelled per unit time}(u_{av})}{\text{No. of collisions made by single molecule per unit time}(Z_A)}$$

$$= \frac{u_{av}}{\sqrt{2}\pi\sigma^2 u_{av} n} = \frac{1}{\sqrt{2}\pi\sigma^2}$$

(4) Based on kinetic theory of gases mean free path, $\lambda \propto \frac{T}{P}$. Thus,

(i) Larger the size of the molecules, smaller the mean free path, i.e.,

$$\lambda \propto \frac{1}{(\text{radius})^2}$$

(ii) Greater the number of molecules per unit volume, smaller the mean free path.

(iii) Larger the temperature, larger the mean free path.

(iv) Larger the pressure, smaller the mean free path.

(5) Relation between collision frequency (Z) and mean free path (λ)

$$\text{is given by, } Z = \frac{u_{rms}}{\lambda}$$

Molecular speeds or velocities

(i) At any particular time, in the given sample of gas all the molecules do not possess same speed, due to the frequent molecular collisions with the walls of the container and also with one another, the molecules move with ever changing speeds and also with ever changing direction of motion.

(2) According to Maxwell, at a particular temperature the distribution of speeds remains constant and this distribution is referred to as the *Maxwell-Boltzmann distribution* and given by the following expression,

$$\frac{dn_0}{n} = 4\pi \left(\frac{M}{2\pi RT} \right)^{3/2} \cdot e^{-Mu^2/2RT} \cdot u^2 dc$$

where, dn_0 = Number of molecules out of total number of molecules n , having velocities between c and $c + dc$, dn_0/n = Fraction of the total number of molecules, M = molecular weight, T = absolute temperature. The exponential factor $e^{-Mu^2/2RT}$ is called *Boltzmann factor*.

(3) Maxwell gave distribution curves of molecular speeds for CO_2 at different temperatures. Special features of the curve are :

(i) Fraction of molecules with two high or two low speeds is very small.

(ii) No molecules has zero velocity.

(iii) Initially the fraction of molecules increases in velocity till the peak of the curve which pertains to most probable velocity and thereafter it falls with increase in velocity.

(4) Types of molecular speeds or Velocities

(i) **Root mean square velocity** (u_{rms}) : It is the square root of the mean of the squares of the velocity of a large number of molecules of the same gas.

$$u_{rms} = \sqrt{\frac{u_1^2 + u_2^2 + u_3^2 + \dots + u_n^2}{n}}$$

$$u_{rms} = \sqrt{\frac{3PV}{(mN_0) = M}} = \sqrt{\frac{3RT}{(mN_0) = M}} = \sqrt{\frac{3RT}{M}} = \sqrt{\frac{3kT}{m}} = \sqrt{\frac{3P}{d}}$$

$$\text{where } k = \text{Boltzmann constant} = \frac{R}{N_0}$$

(a) For the same gas at two different temperatures, the ratio of

$$RMS \text{ velocities will be, } \frac{u_1}{u_2} = \sqrt{\frac{T_1}{T_2}}$$

(b) For two different gases at the same temperature, the ratio of

$$RMS \text{ velocities will be, } \frac{u_1}{u_2} = \sqrt{\frac{M_2}{M_1}}$$

(c) *RMS* velocity at any temperature $t^\circ\text{C}$ may be related to its

$$\text{value at S.T.P. as, } u_t = \sqrt{\frac{3P(273+t)}{273d}}$$

(ii) **Average velocity** (v_{av}) : It is the average of the various velocities possessed by the molecules.

$$v_{av} = \frac{v_1 + v_2 + v_3 + \dots + v_n}{n}; \quad v_{av} = \sqrt{\frac{8RT}{\pi M}} = \sqrt{\frac{8kT}{\pi m}}$$

(iii) **Most probable velocity** (α_{mp}) : It is the velocity possessed by maximum number of molecules of a gas at a given temperature.

$$\alpha_{mp} = \sqrt{\frac{2RT}{M}} = \sqrt{\frac{2PV}{M}} = \sqrt{\frac{2P}{d}}$$

(5) Relation between molecular speeds or velocities,

(i) Relation between u_{rms} and v_{av} : $v_{av} = 0.9213 \times u_{rms}$ or $u_{rms} = 1.085 \times v_{av}$ (ii) Relation between α_{mp} and u_{rms} : $\alpha_{mp} = 0.816 \times u_{rms}$ or $u_{rms} = 1.224 \times \alpha_{mp}$ (iii) Relation between α_{mp} and v_{av} : $v_{av} = 1.128 \times \alpha_{mp}$ (iv) Relation between α_{mp} , v_{av} and u_{rms}

$$\alpha_{mp} : v_{av} : u_{rms}$$

$$\sqrt{\frac{2RT}{M}} : \sqrt{\frac{8RT}{\pi M}} : \sqrt{\frac{3RT}{M}}$$

$$\sqrt{2} : \sqrt{\frac{8}{\pi}} : \sqrt{3}$$

$$1.414 : 1.595 : 1.732$$

$$1 : 1.128 : 1.224 \quad \text{i.e., } \alpha_{mp} < v_{av} < u_{rms}$$

Real and Ideal gases

(1) Gases which obey gas laws or ideal gas equation ($PV = nRT$) at all temperatures and pressures are called *ideal or perfect gases*. Almost all gases deviate from the ideal behaviour i.e., *no gas is perfect* and the concept of perfect gas is only theoretical.

(2) Gases tend to show ideal behaviour more and more as the temperature rises above the boiling point of their liquefied forms and the pressure is lowered. Such gases are known as *real or non ideal gases*. Thus, a "real gas is that which obeys the gas laws under low pressure or high temperature".

(3) The deviations can be displayed, by plotting the P - V isotherms of real gas and ideal gas.

(4) It is difficult to determine quantitatively the deviation of a real gas from ideal gas behaviour from the P - V isotherm curve as shown above. Compressibility factor Z defined by the equation,

$$PV = ZnRT \quad \text{or} \quad Z = PV/nRT = P V_m / RT$$

is more suitable for a quantitative description of the deviation from ideal gas behaviour.

(5) Greater is the departure of Z from unity, more is the deviation from ideal behaviour. Thus, when

(i) $Z = 1$, the gas is ideal at all temperatures and pressures. In case of N_2 , the value of Z is close to 1 at 50°C . This temperature at which a real gas exhibits ideal behaviour, for considerable range of pressure, is known as *Boyle's temperature or Boyle's point* (T_B).

(ii) $Z > 1$, the gas is less compressible than expected from ideal behaviour and shows positive deviation, usual at high P i.e. $PV > RT$.

(iii) $Z < 1$, the gas is more compressible than expected from ideal behaviour and shows negative deviation, usually at low P i.e. $PV < RT$.

(iv) $Z > 1$ for H_2 and He at all pressure i.e., always shows positive deviation.

(v) The most easily liquefiable and highly soluble gases (NH_3, SO_2) show larger deviations from ideal behaviour i.e. $Z \ll 1$.

(vi) Some gases like CO_2 show both negative and positive deviation.

(6) **Causes of deviations of real gases from ideal behaviour** : The ideal gas laws can be derived from the kinetic theory of gases which is based on the following two important assumptions,

(i) The volume occupied by the molecules is negligible in comparison to the total volume of gas.

(ii) The molecules exert no forces of attraction upon one another. It is because neither of these assumptions can be regarded as applicable to real gases that the latter show departure from the ideal behaviour.

Vander Waal's equation

(1) To rectify the errors caused by ignoring the intermolecular forces of attraction and the volume occupied by molecules, Vander Waal (in 1873) modified the ideal gas equation by introducing two corrections,

(i) Volume correction (ii) Pressure correction

(2) Vander Waal's equation is obeyed by the real gases over wide range of temperatures and pressures, hence it is called *equation of state for the real gases*.

(3) The Vander Waal's equation for n moles of the gas is,

$$\left(P + \frac{n^2 a}{V^2} \right) [V - nb] = nRT$$

Pressure correction
for molecular attraction
Volume correction for
finite size of molecules

a and b are Vander Waal's constants whose values depend on the nature of the gas. Normally for a gas $a \gg b$.

(i) **Constant a** : It is a indirect measure of magnitude of attractive forces between the molecules. Greater is the value of a , more easily the gas can be liquefied. Thus the easily liquefiable gases (like $SO_2 > NH_3 > H_2S > CO_2$) have high values than the permanent gases (like $N_2 > O_2 > H_2 > He$).

Units of ' a ' are : $\text{atm} \cdot \text{L}^2 \text{mol}^{-2}$ or $\text{atm} \cdot \text{m}^6 \text{mol}^{-2}$ or $\text{Nm}^4 \text{mol}^{-2}$ (S.I. unit).

(ii) **Constant b** : Also called co-volume or excluded volume,

$$b = 4 N_0 v = 4 N_0 \left(\frac{4}{3} \pi r^3 \right)$$

It's value gives an idea about the effective size of gas molecules. Greater is the value of b , larger is the size and smaller is the compressible volume. As b is the effective volume of the gas molecules, the constant value of b for any gas over a wide range of temperature and pressure indicates that the *gas molecules are incompressible*.

Units of ' b ' are : Lmol^{-1} or $\text{m}^3 \text{mol}^{-1}$ (S.I. unit)

(iii) The two Vander Waal's constants and Boyle's temperature (T_B) are related as,

$$T_B = \frac{a}{bR}$$

(4) **Vander Waal's equation at different temperature and pressures**

(i) **When pressure is extremely low** : For one mole of gas,

$$\left(P + \frac{a}{V^2}\right)(V - b) = RT \quad \text{or} \quad PV = RT - \frac{a}{V} + Pb + \frac{ab}{V^2}$$

(ii) **When pressure is extremely high** : For one mole of gas,

$$PV = RT + Pb; \quad \frac{PV}{RT} = 1 + \frac{Pb}{RT} \quad \text{or} \quad Z = 1 + \frac{Pb}{RT}$$

where Z is compressibility factor.

(iii) **When temperature is extremely high** : For one mole of gas,

$$PV = RT.$$

(iv) **When pressure is low** : For one mole of gas,

$$\left(P + \frac{a}{V^2}\right)(V - b) = RT \quad \text{or} \quad PV = RT + Pb - \frac{a}{V} + \frac{ab}{V^2}$$

$$\text{or} \quad \frac{PV}{RT} = 1 - \frac{a}{VRT} \quad \text{or} \quad Z = 1 - \frac{a}{VRT}$$

(v) **For hydrogen** : Molecular mass of hydrogen is small hence value of ' a ' will be small owing to smaller intermolecular force. Thus the terms $\frac{a}{V}$ and $\frac{ab}{V^2}$ may be ignored. Then Vander Waal's equation becomes,

$$PV = RT + Pb \quad \text{or} \quad \frac{PV}{RT} = 1 + \frac{Pb}{RT}$$

$$\text{or} \quad Z = 1 + \frac{Pb}{RT}$$

In case of hydrogen, compressibility factor is always greater than one.

(5) Merits of Vander Waal's equation

(i) The Vander Waal's equation holds good for real gases upto moderately high pressures.

(ii) The equation represents the trend of the isotherms representing the variation of PV with P for various gases.

(iii) From the Vander Waal's equation it is possible to obtain expressions of Boyle's temperature, critical constants and inversion temperature in terms of the Vander Waal's constants ' a ' and ' b '.

(iv) Vander Waal's equation is useful in obtaining a 'reduced equation of state' which being a general equation of state has the advantage that a single curve can be obtained for all gases when the equation is graphically represented by plotting the variables.

(6) Limitations of Vander Waal's equation

(i) This equation shows appreciable deviations at too low temperatures or too high pressures.

(ii) The values of Vander Waal's constants a and b do not remain constant over the entire ranges of T and P , hence this equation is valid only over specific range of T and P .

(7) **Other equations of state** : In addition to Vander Waal's equation, there are also equations of state which have been used to explain real behaviour of gases are,

(i) **Clausius equation** : $\left[P + \frac{a}{T(V+c)^2}\right](V-b) = RT$. Here ' c ' is

another constant besides a , b and R .

(ii) **Berthelot equation** : $\left(P + \frac{a}{TV^2}\right)(V-b) = RT$.

(iii) **Wohl equation** : $P = \frac{RT}{(V-b)} - \frac{a}{V(V-b)} + \frac{c}{V^2}$

(iv) **Dieterici equation** : $P = \frac{RT}{V-b} \cdot e^{-a/RTV}$.

The expression is derived on the basis of the concept that molecules near the wall will have higher potential energy than those in the bulk.

(v) **Kammerlingh Onnes equation** : It is the most general or satisfactory expression as equation expresses PV as a power series of P at a given temperature.

$$PV = A + BP + CP^2 + DP^3 + \dots$$

Here coefficients A , B , C etc. are known as first, second and third etc. virial coefficients.

(a) Virial coefficients are different for different gases.

(b) At very low pressure, first virial coefficient, $A = RT$.

(c) At high pressure, other virial coefficients also become important and must be considered.

The critical state

(1) A state for every substance at which the vapour and liquid states are indistinguishable is known as *critical state*. It is defined by critical temperature and critical pressure.

(2) **Critical temperature (T_c)** of a gas is that temperature above which the gas cannot be liquified however large pressure is applied. It is given by, $T_c = \frac{8a}{27Rb}$

(3) **Critical pressure (P_c)** is the minimum pressure which must be applied to a gas to liquify it at its critical temperature. It is given by,

$$P_c = \frac{a}{27b^2}$$

(4) **Critical volume (V_c)** is the volume occupied by one mole of the substance at its critical temperature and critical pressure. It is given by, $V_c = 3b$

(5) **Critical compressibility factor (Z_c)** is given by,

$$Z_c = \frac{P_c V_c}{RT_c} = \frac{3}{8} = 0.375$$

A gas behaves as a Vander Waal's gas if its critical compressibility factor (Z_c) is equal to 0.375. A substance is the gaseous state below T_c is called vapour and above T_c is called gas.

Degrees of freedom of a gaseous molecule

(1) The motion of atoms and molecules is generally described in terms of the degree of freedom which they possess.

(2) The *degrees of freedom* of a molecule are defined as the independent number of parameters required to describe the state of the molecule completely.

(3) When a gaseous molecule is heated, the energy supplied to it may bring about three kinds of motion in it, these are,

(i) The translational motion

(ii) The rotational motion

(iii) The vibrational motion.

This is expressed by saying that the molecule possesses translational, rotational and vibrational degrees of freedom.

(4) For a molecule made up of N atoms, total degrees of freedom = $3N$. Further split up of these is as follows,

	Translational	Rotational	Vibrational
For linear molecule :	3	2	$3N - 5$
For non-linear molecule :	3	3	$3N - 6$

Specific and Molar heat capacity of gases

(1) **Specific heat (or specific heat capacity)** of a substance is the quantity of heat (in *calories*, *joules*, *kcal*, or *kilo joules*) required to raise the temperature of 1g of that substance through 1°C . It can be measured at constant pressure (C_p) and at constant volume (C_v).

(2) **Molar heat capacity** of a substance is the quantity of heat required to raise the temperature of 1 *mole* of the substance by 1°C .

$\therefore$ Molar heat capacity = Specific heat capacity $\times$ Molecular weight, i.e.,

$$C_v = c_v \times M \text{ and } C_p = c_p \times M.$$

(3) Since gases upon heating show considerable tendency towards expansion if heated under constant pressure conditions, an additional energy has to be supplied for raising its temperature by 1°C relative to that required under constant volume conditions, i.e.,

$$C_p > C_v \text{ or } C_p = C_v + \text{Work done on expansion, } P\Delta V (= R)$$

where, C_p = molar heat capacity at constant pressure; C_v = molar heat capacity at constant volume.

(4) **Some useful relations of C_p and C_v**

$$(i) C_p - C_v = R = 2 \text{ calories} = 8.314 \text{ J}$$

(ii) $C_v = \frac{3}{2}R$ (for monoatomic gas) and $C_v = \frac{3}{2} + x$ (for di and polyatomic gas), where x varies from gas to gas.

$$(iii) \frac{C_p}{C_v} = \gamma \text{ (Ratio of molar capacities)}$$

(iv) For monoatomic gas $C_v = 3 \text{ calories}$ whereas, $C_p = C_v + R = 5 \text{ calories}$

$$(v) \text{ For monoatomic gas, } (\gamma) = \frac{C_p}{C_v} = \frac{\frac{5}{2}R}{\frac{3}{2}R} = 1.66.$$

$$(vi) \text{ For diatomic gas } (\gamma) = \frac{C_p}{C_v} = \frac{\frac{7}{2}R}{\frac{5}{2}R} = 1.40$$

$$(vii) \text{ For triatomic gas } (\gamma) = \frac{C_p}{C_v} = \frac{8R}{6R} = 1.33$$

Liquefaction of gases

(1) A gas may be liquefied by cooling or by the application of high pressure or by the combined effect of both. The first successful attempt for liquefying gases was made by **Faraday**.

(2) Gases for which the intermolecular forces of attraction are small such as H_2 , N_2 , Ar and O_2 , have low values of T_c and cannot be liquefied by the application of pressure are known as "permanent gases" while the gases for which the intermolecular forces of attraction are large, such as polar molecules NH_3 , SO_2 and H_2O have high values of T_c and can be liquefied easily.

(3) **Methods of liquefaction of gases** : The modern methods of cooling the gas to or below their T_c and hence of liquefaction of gases are done by Linde's method and Claude's method.

(i) **Linde's method** : This process is based upon **Joule-Thomson effect** which states that "When a gas is allowed to expand adiabatically from a region of high pressure to a region of extremely low pressure, it is accompanied by cooling."

(ii) **Claude's method** : This process is based upon the principle that when a gas expands adiabatically against an external pressure (as a piston in an engine), it does some external work. Since work is done by the molecules at the cost of their kinetic energy, the temperature of the gas falls causing cooling.

(iii) By adiabatic demagnetisation.

(4) **Uses of liquefied gases** : Liquefied and gases compressed under a high pressure are of great importance in industries.

(i) Liquid ammonia and liquid sulphur dioxide are used as refrigerants.

(ii) Liquid carbon dioxide finds use in soda fountains.

(iii) Liquid chlorine is used for bleaching and disinfectant purposes.

(iv) Liquid air is an important source of oxygen in rockets and jet-propelled planes and bombs.

(v) Compressed oxygen is used for welding purposes.

(vi) Compressed helium is used in airships.

(5) **Joule-Thomson effect** : When a real gas is allowed to expand adiabatically through a porous plug or a fine hole into a region of low pressure, it is accompanied by cooling (except for hydrogen and helium which get warmed up).

Cooling takes place because some work is done to overcome the intermolecular forces of attraction. As a result, the internal energy decreases and so does the temperature.

Ideal gases do not show any cooling or heating because there are no intermolecular forces of attraction i.e., they do not show Joule-Thomson effect.

During Joule-Thomson effect, enthalpy of the system remains constant.

$$\text{Joule-Thomson coefficient, } \mu = (\partial T / \partial P)_H.$$

For cooling, $\mu = +ve$ (because dT and dP will be $-ve$)

For heating $\mu = -ve$ (because $dT = +ve$, $dP = -ve$).

For no heating or cooling $\mu = 0$ (because $dT = 0$).

(6) **Inversion temperature** : It is the temperature at which gas shows neither cooling effect nor heating effect i.e., Joule-Thomson coefficient $\mu = 0$. Below this temperature, it shows cooling effect and above this temperature, it shows heating effect.

Any gas like H_2 , He etc, whose inversion temperature is low would show heating effect at room temperature. However, if these gases are just cooled below inversion temperature and then subjected to Joule-Thomson effect, they will also undergo cooling.

Tips & Tricks

- ✍ If the number of molecules present in 1 c.c. of the gas or vapour at S.T.P., then that is called Loschmidt number. Its value is 2.687×10^{23} per c.c.
- ✍ $CO_2 > SO_2 > SO > PCl_5$ is order of rate of diffusion.
- ✍ Vapour density is independent of temperature and has no unit while absolute density is dependent of temperature and has unit of gm .
- ✍ The isotherms of CO_2 were first studied by Andrews.
- ✍ $1 \text{ Cal} = 4.2 \text{ Joule}$, $1 \text{ Kcal} = 4200 \text{ Joule}$
- ✍ The gas which has least mean free path has maximum value of a , is easily liquefied and has maximum value of T_c .
- ✍ $T_c < T_b < T_f$
- ✍ For critical constants, compression factor Z is < 1 .
- ✍ Boyle's law and Avogadro's law are applicable under limiting condition. This limiting condition is $P \rightarrow 0$.
- ✍ $T_c = 0.296 T_b$; $T_c = 6.75 T_f$

234 Gaseous State

✍ Mean free path increases if H_2 is replaced by He .

Ordinary Thinking

Objective Questions

Characteristics and Measurable properties of gases

- Which one of the following statements is not correct about the three states of matter *i.e.* solid, liquid and gaseous
 - Molecules of a solid possess least energy whereas those of a gas possess highest energy
 - The density of solid is highest whereas that of gases is lowest
 - Gases like liquids possess definite volumes
 - Molecules of a solid possess vibratory motion
- The temperature and pressure at which ice, liquid water and water vapour can exist together are
 - 0°C , 1 atm
 - 2°C , 4.7 atm
 - 0°C , 4.7 mm
 - -2°C , 4.7 mm
- Which of the following is true about gaseous state
 - Thermal energy = Molecular attraction
 - Thermal energy $\gg$ Molecular attraction
 - Thermal energy $\ll$ Molecular attraction
 - Molecular forces $\gg$ Those in liquids
- Kinetic energy of molecules is highest in
 - Gases
 - Solids
 - Liquids
 - Solutions
- Which of the following statement is correct
 - In all the three states the molecules possess random translational motion
 - Gases cannot be converted into solids without passing through liquid state
 - One of the common property of liquids and gases is viscosity
 - According to Boyle's law V/P is constant at constant T
- A volume of 1 m^3 is equal to
 - 1000 cm^3
 - 100 cm^3
 - 10 dm^3
 - 10^6 cm^3
- Which one of the following is not a unit of pressure
 - Newton
 - Torr
 - Pascal
 - Bar
- 1°C rise in temperature is equal to a rise of
 - 1°F
 - $9/5^{\circ}\text{F}$
 - $5/9^{\circ}\text{F}$
 - 33°F
- Which of the following relations for expressing volume of a sample is not correct
 - $1\text{ L} = 10^3\text{ ml}$
 - $1\text{ dm}^3 = 1\text{ L}$
 - $1\text{ L} = 10^3\text{ m}^3$
 - $1\text{ L} = 10^3\text{ cm}^3$
- One atmosphere is numerically equal to approximately
 - $10^6\text{ dynes cm}^{-2}$
 - $10^2\text{ dynes cm}^{-2}$
 - $10^4\text{ dynes cm}^{-2}$
 - $10^8\text{ dynes cm}^{-2}$
- 2 gm of O_2 at 27°C and 760 mm of Hg pressure has volume [BCECE 2005]
 - 1.5 lit.
 - 2.8 lit.
 - 11.2 lit.
 - 22.4 lit.

- Pressure of a gas in a vessel can be measured by
 - Barometer
 - Manometer
 - Stalgometer
 - All the above
- Volume occupied by a gas at one atmospheric pressure and 0°C is $V\text{ mL}$. Its volume at 273 K will be [Bihar MADT 1982]
 - $V\text{ mL}$
 - $V/2\text{ mL}$
 - $2V$
 - None of these
- Which one of the following statements is wrong for gases [CBSE PMT 1999]
 - Gases do not have a definite shape and volume
 - Volume of the gas is equal to the volume of the container confining the gas
 - Confined gas exerts uniform pressure on the walls of its container in all directions
 - Mass of the gas cannot be determined by weighing a container in which it is enclosed
- Which of the following exhibits the weakest intermolecular forces [AIIMS 2000]
 - NH_3
 - HCl
 - He
 - H_2O
- N_2 is found in a litre flask under 100 kPa pressure and O_2 is found in another 3 litre flask under 320 kPa pressure. If the two flasks are connected, the resultant pressures is [Kerala PMT 2004]
 - 310 kPa
 - 210 kPa
 - 420 kPa
 - 365 kPa
 - 265 kPa

Ideal gas equation and Related gas laws

- If P , V , T represent pressure, volume and temperature of the gas, the correct representation of Boyle's law is [BIT Ranchi 1988]
 - $V \propto \frac{1}{T}$ (at constant P)
 - $PV = RT$
 - $V \propto 1/P$ (at constant T)
 - $PV = nRT$
- At constant temperature, in a given mass of an ideal gas [CBSE PMT 1991]
 - The ratio of pressure and volume always remains constant
 - Volume always remains constant
 - Pressure always remains constant
 - The product of pressure and volume always remains constant
- Air at sea level is dense. This is a practical application of [Kerala CEE 2000]
 - Boyle's law
 - Charles's law
 - Avogadro's law
 - Dalton's law
- If 20 cm^3 gas at 1 atm is expanded to 50 cm^3 at constant T , then what is the final pressure [CPMT 1988]
 - $20 \times \frac{1}{50}$
 - $50 \times \frac{1}{20}$
 - $1 \times \frac{1}{20} \times 50$
 - None of these
- Which of the following statement is false [BHU 1994]
 - The product of pressure and volume of fixed amount of a gas is independent of temperature

- (b) Molecules of different gases have the same K.E. at a given temperature
- (c) The gas equation is not valid at high pressure and low temperature
- (d) The gas constant per molecule is known as Boltzmann constant
6. Which of the following graphs represent Boyle's law
- (a)  (b) 
- (c)  (d) 
7. Densities of two gases are in the ratio 1 : 2 and their temperatures are in the ratio 2 : 1, then the ratio of their respective pressures is [BHU 2000]
- (a) 1 : 1 (b) 1 : 2
(c) 2 : 1 (d) 4 : 1
8. At constant pressure, the volume of fixed mass of an ideal gas is directly proportional to [EAMCET 1985]
- (a) Absolute temperature (b) Degree centigrade
(c) Degree Fahrenheit (d) None
9. Which of the following expression at constant pressure represents Charles's law [AFMC 1990]
- (a) $V \propto \frac{1}{T}$ (b) $V \propto \frac{1}{T^2}$
(c) $V \propto T$ (d) $V \propto d$
10. Use of hot air balloons in sports and meteorological observations is an application of [Kerala MEE 2002]
- (a) Boyle's law (b) Newtonic law
(c) Kelvin's law (d) Charles's law
11. A 10 g of a gas at atmospheric pressure is cooled from 273°C to 0°C keeping the volume constant, its pressure would become
- (a) $1/2 \text{ atm}$ (b) $1/273 \text{ atm}$
(c) 2 atm (d) 273 atm
12. Pressure remaining the same, the volume of a given mass of an ideal gas increases for every degree centigrade rise in temperature by definite fraction of its volume at [CBSE PMT 1989]
- (a) 0°C (b) Its critical temperature
(c) Absolute zero (d) Its Boyle temperature
13. A certain sample of gas has a volume of 0.2 litre measured at 1 atm. pressure and 0°C . At the same pressure but at 273°C , its volume will be [EAMCET 1992, 93; BHU 2005]
- (a) 0.4 litres (b) 0.8 litres
(c) 27.8 litres (d) 55.6 litres
14. 400 cm^3 of oxygen at 27°C were cooled to -3°C without change in pressure. The contraction in volume will be
- (a) 40 cm^3 (b) 30 cm^3
(c) 44.4 cm^3 (d) 360 cm^3
15. The pressure p of a gas is plotted against its absolute temperature T for two different constant volumes, V_1 and V_2 . When $V_1 > V_2$, the
- (a) Curves have the same slope and do not intersect
(b) Curves must intersect at some point other than $T = 0$
(c) Curve for V_2 has a greater slope than that for V_1
(d) Curve for V_1 has a greater slope than that for V_2
16. Two closed vessels of equal volume containing air at pressure P_1 and temperature T_1 are connected to each other through a narrow tube. If the temperature in one of the vessels is now maintained at T_1 and that in the other at T_2 , what will be the pressure in the vessels
- (a) $\frac{2P_1T_1}{T_1 + T_2}$ (b) $\frac{T_1}{2P_1T_2}$
(c) $\frac{2P_1T_2}{T_1 + T_2}$ (d) $\frac{2P_1}{T_1 + T_2}$
17. "One gram molecule of a gas at N.T.P. occupies 22.4 litres." This fact was derived from [CPMT 1981, 1995]
- (a) Dalton's theory
(b) Avogadro's hypothesis
(c) Berzelius hypothesis
(d) Law of gaseous volume
18. In a closed flask of 5 litres, 1.0 g of H_2 is heated from 300 to 600 K. which statement is not correct [CBSE PMT 1991]
- (a) Pressure of the gas increases
(b) The rate of collision increases
(c) The number of moles of gas increases
(d) The energy of gaseous molecules increases
19. Which one of the following statements is false [Manipal PMT 1991]
- (a) Avogadro number = 6.02×10^{21}
(b) The relationship between average velocity ($\bar{v}$) and root mean square velocity (u) is $\bar{v} = 0.9213 u$
(c) The mean kinetic energy of an ideal gas is independent of the pressure of the gas
(d) The root mean square velocity of the gas can be calculated by the formula $(3RT/M)^{1/2}$
20. The compressibility of a gas is less than unity at STP. Therefore [IIT 2000]
- (a) $V_m > 22.4 \text{ litres}$ (b) $V_m < 22.4 \text{ litres}$
(c) $V_m = 22.4 \text{ litres}$ (d) $V_m = 44.8 \text{ litres}$
21. In the equation of state of an ideal gas $PV = nRT$, the value of the universal gas constant would depend only on [KCET 2005]
- (a) The nature of the gas
(b) The pressure of the gas
(c) The units of the measurement
(d) None of these
22. In the ideal gas equation, the gas constant R has the dimensions of [NCERT 1982]
- (a) mole-atm K (b) litre mole
(c) litre-atm K mole (d) erg K
23. In the equation $PV = nRT$, which one cannot be the numerical value of R [BIT 1987]
- (a) $8.31 \times 10^7 \text{ erg K}^{-1} \text{mol}^{-1}$
(b) $8.31 \times 10^7 \text{ dyne cm K}^{-1} \text{mol}^{-1}$
(c) $8.31 \text{ JK}^{-1} \text{mol}^{-1}$
(d) $8.31 \text{ atm K}^{-1} \text{mol}^{-1}$
24. Which one of the following indicates the value of the gas constant R [EAMCET 1991]
- (a) $1.987 \text{ cal K}^{-1} \text{mol}^{-1}$ (b) $8.3 \text{ cal K}^{-1} \text{mol}^{-1}$
(c) $0.0821 \text{ lit K}^{-1} \text{mol}^{-1}$ (d) $1.987 \text{ Joules K}^{-1} \text{mol}^{-1}$
25. The constant R is [Orissa 1990]
- (a) Work done per molecule

- (b) Work done per degree absolute
(c) Work done per degree per mole
(d) Work done per mole
26. Select one correct statement. In the gas equation, $PV = nRT$ [CBSE PMT 1992]
(a) n is the number of molecules of a gas
(b) V denotes volume of one mole of the gas
(c) n moles of the gas have a volume V
(d) P is the pressure of the gas when only one mole of gas is present
27. The correct value of the gas constant R is close to [CBSE PMT 1992]
(a) 0.082 litre-atmosphere K
(b) 0.082 litre-atmosphere $K^{-1} \text{ mol}^{-1}$
(c) 0.082 litre-atmosphere $^{-1} K \text{ mole}^{-1}$
(d) 0.082 litre $^{-1}$ atmosphere $^{-1} K \text{ mol}$
28. S.I. unit of gas constant R is [CPMT 1994]
(a) 0.0821 litre atm $K \text{ mole}$
(b) 2 calories $K \text{ mole}$
(c) 8.31 joule $K \text{ mole}$
(d) None
29. Gas equation $PV = nRT$ is obeyed by [BHU 2000]
(a) Only isothermal process (b) Only adiabatic process
(c) Both (a) and (b) (d) None of these
30. For an ideal gas number of moles per litre in terms of its pressure P , gas constant R and temperature T is [AIEEE 2002]
(a) PT/R (b) P/RT
(c) P/RT (d) RT/P
31. If two moles of an ideal gas at 546 K occupy a volume of 44.8 litres, the pressure must be [NCERT 1981; JIPMER 1991]
(a) 2 atm (b) 3 atm
(c) 4 atm (d) 1 atm
32. How many moles of He gas occupy 22.4 litres at 30 $^{\circ}C$ and one atmospheric pressure [KCET 1992]
(a) 0.90 (b) 1.11
(c) 0.11 (d) 1.0
33. Volume of 0.5 mole of a gas at 1 atm. pressure and 273 K is [EAMCET 1992]
(a) 22.4 litres (b) 11.2 litres
(c) 44.8 litres (d) 5.6 litres
34. At 0 $^{\circ}C$ and one atm pressure, a gas occupies 100 cc. If the pressure is increased to one and a half-time and temperature is increased by one-third of absolute temperature, then final volume of the gas will be [DCE 2000]
(a) 80 cc (b) 88.9 cc
(c) 66.7 cc (d) 100 cc
35. Correct gas equation is [CBSE PMT 1989; CPMT 1991]
(a) $\frac{V_1 T_2}{P_1} = \frac{V_2 T_1}{P_2}$ (b) $\frac{P_1 V_1}{P_2 V_2} = \frac{T_1}{T_2}$
(c) $\frac{P_1 T_2}{V_1} = \frac{P_2 V_2}{T_2}$ (d) $\frac{V_1 V_2}{T_1 T_2} = P_1 P_2$
36. Two separate bulbs contain ideal gases A and B . The density of gas A is twice that of gas B . The molecular mass of A is half that of gas B . The two gases are at the same temperature. The ratio of the pressure of A to that of gas B is [BHU 1994]
(a) 2 (b) 1/2
(c) 4 (d) 1/4
37. 16 g of oxygen and 3 g of hydrogen are mixed and kept at 760 mm pressure and 0 $^{\circ}C$. The total volume occupied by the mixture will be nearly [Vellore CMC 1991]
(a) 22.4 litres (b) 33.6 litres
(c) 448 litres (d) 44800 ml
38. Pure hydrogen sulphide is stored in a tank of 100 litre capacity at 20 $^{\circ}C$ and 2 atm pressure. The mass of the gas will be [CPMT 1989]
(a) 34 g (b) 340 g
(c) 282.4 g (d) 28.24 g
39. At N.T.P. the volume of a gas is found to be 273 ml. What will be the volume of this gas at 600 mm Hg and 273 $^{\circ}C$ [CPMT 1992]
(a) 391.8 mL (b) 380 ml
(c) 691.6 ml (d) 750 ml
40. One litre of a gas weighs 2 g at 300 K and 1 atm pressure. If the pressure is made 0.75 atm, at which of the following temperatures will one litre of the same gas weigh one gram [CBSE PMT 1992]
(a) 450 K (b) 600 K
(c) 800 K (d) 900 K
41. A wheather balloon filled with hydrogen at 1 atm and 27 $^{\circ}C$ has volume equal to 12000 litres. On ascending it reaches a place where the temperature is -23 $^{\circ}C$ and pressure is 0.5 atm. The volume of the balloon is [CBSE PMT 1991]
(a) 24000 litres (b) 20000 litres
(c) 10000 litres (d) 12000 litres
42. The density of a gas at 27 $^{\circ}C$ and 1 atm is d . Pressure remaining constant at which of the following temperatures will its density become 0.75 d [CBSE PMT 1992]
(a) 20 $^{\circ}C$ (b) 30 $^{\circ}C$
(c) 400 K (d) 300 K
43. A sample of gas occupies 100 ml at 27 $^{\circ}C$ and 740 mm pressure. When its volume is changed to 80 ml at 740 mm pressure, the temperature of the gas will be [Vellore CMC 1991]
(a) 21.6 $^{\circ}C$ (b) 240 $^{\circ}C$
(c) -33 $^{\circ}C$ (d) 89.5 $^{\circ}C$
44. The total pressure exerted by a number of non-reacting gases is equal to the sum of the partial pressures of the gases under the same conditions is known as [CPMT 1986]
(a) Boyle's law (b) Charle's law
(c) Avogadro's law (d) Dalton's law
45. "Equal volumes of all gases at the same temperature and pressure contain equal number of particles." This statement is a direct consequence of [Kerala MEE 2002]
(a) Avogadro's law (b) Charle's law
(c) Ideal gas equation (d) Law of partial pressure
46. If three unreactive gases having partial pressures P_A , P_B and P_C and their moles are 1, 2 and 3 respectively then their total pressure will be [CPMT 1994]
(a) $P = P_A + P_B + P_C$ (b) $P = \frac{P_A + P_B + P_C}{6}$
(c) $P = \frac{\sqrt{P_A + P_B + P_C}}{3}$ (d) None
47. Dalton's law of partial pressure will not apply to which of the following mixture of gases [Bihar MADT 1981]
(a) H_2 and SO_2 (b) H_2 and Cl_2
(c) H_2 and CO_2 (d) CO_2 and Cl_2

48. Which of the following mixtures of gases does not obey Dalton's law of partial pressure
[CBSE PMT 1996; Kerala PMT 2000]
(a) O_2 and CO_2 (b) N_2 and O_2
(c) Cl_2 and O_2 (d) NH_3 and HCl
49. To which of the following gaseous mixtures is Dalton's law not applicable
(a) $Ne + He + SO_2$ (b) $NH_3 + HCl + HBr$
(c) $O_2 + N_2 + CO_2$ (d) $N_2 + H_2 + O_2$
50. Equal amounts of two gases of molecular weight 4 and 40 are mixed. The pressure of the mixture is 1.1 atm. The partial pressure of the light gas in this mixture is
[CBSE PMT 1991]
(a) 0.55 atm (b) 0.11 atm
(c) 1 atm (d) 0.12 atm
51. Rate of diffusion of a gas is [IIT 1985; CPMT 1987]
(a) Directly proportional to its density
(b) Directly proportional to its molecular mass
(c) Directly proportional to the square root of its molecular mass
(d) Inversely proportional to the square root of its molecular mass
52. Which of the following gas will have highest rate of diffusion
[Pb. CET Sample paper 1993; CPMT 1990]
(a) NH_3 (b) N_2
(c) CO_2 (d) O_2
53. Which of the following relationship is correct, where r is the rate of diffusion of a gas and d is its density [CPMT 1994]
(a) $r \propto \sqrt{1/d}$ (b) $r \propto \sqrt{d}$
(c) $r = d$ (d) $r \propto d$
54. According to Graham's law at a given temperature, the ratio of the rates of diffusion r_A / r_B of gases A and B is given by [IIT 1998]
(a) $(P_A / P_B)(M_A / M_B)^{1/2}$
(b) $(M_A / M_B)(P_A / P_B)^{1/2}$
(c) $(P_A / P_B)(M_B / M_A)^{1/2}$
(d) $(M_A / M_B)(P_B / P_A)^{1/2}$
(where P and M are the pressures and molecular weights of gases A and B respectively)
55. The ratio of the rate of diffusion of a given element to that of helium is 1.4. The molecular weight of the element is [Kerala PMT 1990]
(a) 2 (b) 4
(c) 8 (d) 16
56. A gas diffuses $1/5$ times as fast as hydrogen. Its molecular weight is [CPMT 1992; Bihar CEE 1982]
(a) 50 (b) 25
(c) $25\sqrt{2}$ (d) $50\sqrt{2}$
57. The molecular weight of a gas which diffuses through a porous plug at $1/6$ th of the speed of hydrogen under identical conditions is [EAMCET 1990]
(a) 27 (b) 72
(c) 36 (d) 48
58. Molecular weight of a gas that diffuses twice as rapidly as the gas with molecular weight 64 is [EAMCET 1994]
(a) 16 (b) 8
(c) 64 (d) 6.4
59. The densities of hydrogen and oxygen are 0.09 and 1.44 g L^{-1} . If the rate of diffusion of hydrogen is 1 then that of oxygen in the same units will be [RPMT 1994]
(a) 4 (b) $1/4$
(c) 16 (d) $1/16$
60. If rate of diffusion of A is 5 times that of B , what will be the density ratio of A and B [AFMC 1994]
(a) $1/25$ (b) $1/5$
(c) 25 (d) 4
61. The densities of two gases are in the ratio of 1 : 16. The ratio of their rates of diffusion is [CPMT 1995]
(a) 16 : 1 (b) 4 : 1
(c) 1 : 4 (d) 1 : 16
62. At constant volume and temperature conditions, the rate of diffusion D_A and D_B of gases A and B having densities ρ_A and ρ_B are related by the expression [IIT 1993]
(a) $D_A = \left[D_B \cdot \frac{\rho_A}{\rho_B} \right]^{1/2}$ (b) $D_A = \left[D_B \cdot \frac{\rho_B}{\rho_A} \right]^{1/2}$
(c) $D_A = D_B \left(\frac{\rho_A}{\rho_B} \right)^{1/2}$ (d) $D_A = D_B \left(\frac{\rho_B}{\rho_A} \right)^{1/2}$
63. Atmolysis is a process of
(a) Atomising gas molecules
(b) The breaking of atoms to sub-atomic particles
(c) Separation of gases from their gaseous mixture
(d) Changing of liquids to their vapour state
64. A bottle of ammonia and a bottle of dry hydrogen chloride connected through a long tube are opened simultaneously at both ends, the white ammonium chloride ring first formed will be [IIT 1988]
(a) At the centre of the tube
(b) Near the hydrogen chloride bottle
(c) Near the ammonia bottle
(d) Throughout the length of the tube
65. Which of the following pairs will diffuse at the same rate through a porous plug [EAMCET 1990]
(a) CO , NO_2 (b) NO_2 , CO_2
(c) NH_3 , PH_3 (d) NO , C_2H_6
66. If 4 g of oxygen diffuse through a very narrow hole, how much hydrogen would have diffused under identical conditions [CPMT 1971]
(a) 16 g (b) 1 g
(c) $1/4$ g (d) 64 g
67. A gas diffuses at a rate which is twice that of another gas B . The ratio of molecular weights of A to B is [EAMCET 1986]
(a) 1.0 (b) 0.75
(c) 0.50 (d) 0.25
68. Two grams of hydrogen diffuse from a container in 10 minutes. How many grams of oxygen would diffuse through the same container in the same time under similar conditions [MNR 1980]
(a) 0.5 g (b) 4 g
(c) 1 g (d) 8 g
69. The rate of diffusion of methane at a given temperature is twice that of X . The molecular weight of X is [MNR 1995; Kerala CEE 2001]
(a) 64.0 (b) 32.0
(c) 40.0 (d) 80.0
70. $X \text{ ml}$ of H_2 gas effuses through a hole in a container in 5 seconds. The time taken for the effusion of the same volume of the gas specified below under identical condition is [IIT 1996]
(a) 10 seconds : He (b) 20 seconds : O_2
(c) 25 seconds : CO (d) 55 seconds : CO_2
71. At what temperature, the rate of effusion of N_2 would be 1.625 times that of SO_2 at $50^\circ C$ [CBSE PMT 1996]

- (a) 110 K (b) 173 K
(c) 373 K (d) 273 K
72. Given the reaction $C(s) + H_2O(l) \rightarrow CO(g) + H_2(g)$ calculate the volume of the gases produced at STP from 48.0 g of carbon
(a) 179.2 L (b) 89.6 L
(c) 44.8 L (d) 22.4 L
73. 4.4 g of a gas at STP occupies a volume of 2.24 L, the gas can be [Haryana CET 2000]
(a) O_2 (b) CO
(c) NO_2 (d) CO_2
74. Under what conditions will a pure sample of an ideal gas not only exhibit a pressure of 1 atm but also a concentration of 1 mole litre⁻¹
($R = 0.082 \text{ litre atm mol}^{-1} \text{ deg}^{-1}$) [CBSE PMT 1993]
(a) At STP
(b) When $V = 22.4 \text{ litres}$
(c) When $T = 12 \text{ K}$
(d) Impossible under any conditions
75. There are 6.02×10^{22} molecules each of N_2 , O_2 and H_2 which are mixed together at 760 mm and 273 K. The mass of the mixture in grams is [Pb. PMT 1997]
(a) 6.2 (b) 4.12
(c) 3.09 (d) 7
76. Volume of 4.4 g of CO_2 at NTP is [Pb. CET 1997]
(a) 22.4 L (b) 44.8 L
(c) 2.24 L (d) 4.48 L
77. The energy of an ideal gas depends only on its
(a) Pressure (b) Volume
(c) Number of moles (d) Temperature
78. A bottle of cold drink contains 200 ml liquid in which CO_2 is 0.1 molar. Suppose CO_2 behaves like an ideal gas, the volume of the dissolved CO_2 at STP is [CBSE PMT 1991]
(a) 0.224 litre (b) 0.448 litre
(c) 22.4 litre (d) 2.24 litre
79. The vapour density of a gas is 11.2. The volume occupied by 11.2 g of this gas at N.T.P. is [MNR 1982; CBSE PMT 1991]
(a) 1 L (b) 11.2 L
(c) 22.4 L (d) 20 L
80. A pre-weighed vessel was filled with oxygen at N.T.P. and weighted. It was then evacuated, filled with SO_2 at the same temperature and pressure, and again weighted. The weight of oxygen will be [NCERT 1989]
(a) The same as that of SO_2
(b) $\frac{1}{2}$ that of SO_2
(c) Twice that of SO_2
(d) One fourth that of SO_2
81. Five grams each of the following gases at $87^\circ C$ and 750 mm pressure are taken. Which of them will have the least volume [MNR 1991]
(a) HF (b) HCl
(c) HBr (d) HI
82. Who among the following scientists has not done any important work on gases [Bihar MADT 1980]
(a) Boyle (b) Charles
(c) Avogadro (d) Faraday
83. A closed vessel contains equal number of nitrogen and oxygen molecules at a pressure of $P \text{ mm}$. If nitrogen is removed from the system then the pressure will be [MP PMT 1985]
(a) P (b) $2P$
(c) $P/2$ (d) P^2
84. The four tubes of a car are filled to the same pressure with N_2 , O_2 , H_2 and Ne separately, then which one will be filled first [Manipal PMT 2000]
(a) N_2 (b) O_2
(c) H_2 (d) Ne
85. Which of the following gas mixture is not applicable for Dalton's law of partial pressure [Pb. CET 2002]
(a) SO_2 and Cl_2 (b) CO_2 and N_2
(c) CO and CO_2 (d) CO and N_2
86. At what pressure a quantity of gas will occupy a volume of 60 ml, if it occupies a volume of 100 ml at a pressure of 720 mm? (while temperature is constant) : [Pb. CET 2000]
(a) 700 mm (b) 800 mm
(c) 100 mm (d) 1200 mm
87. At constant temperature and pressure which gas will diffuse first H_2 or O_2 ? [Pb. CET 2000]
(a) Hydrogen
(b) Oxygen
(c) Both will diffuse in same time
(d) None of the above
88. When a jar containing gaseous mixture of equal volumes of CO_2 and H_2 is placed in a solution of sodium hydroxide, the solution level will [Pb. CET 2001]
(a) Rise (b) Fall
(c) Remain constant (d) Become zero
89. At S.T.P. 1g $CaCO_3$ on decomposition gives CO_2 [Pb. CET 2000]
(a) 22.4 litre (b) 2.24 litre
(c) 0.224 litre (d) 11.2 litre
90. At NTP, the density of a gas, whose molecular weight is 45 is [Pb. CET 2001, 03]
(a) 44.8 gm/litre (b) 11.4 gm/litre
(c) 2 gm/ litre (d) 3 gm/litre
91. What is the ratio of diffusion rate of oxygen and hydrogen [Pb. CET 2003]
(a) 1 : 4 (b) 4 : 1
(c) 1 : 8 (d) 8 : 1
92. The maximum number of molecules is present in [CBSE PMT 2004]
(a) 0.5 g of H_2 gas (b) 10 g of O_2 gas
(c) 15 L of H_2 gas at STP (d) 5 L of N_2 gas at STP
93. One litre oxygen gas at STP will weigh [Pb. CET 2004]
(a) 1.43 g (b) 2.24 g
(c) 11.2 g (d) 22.4 g
94. How will you separate mixture of two gases [AFMC 2004]
(a) Fractional distillation technique
(b) Graham's law of diffusion technique
(c) Osmosis
(d) Chromatography
95. The rate of diffusion of hydrogen gas is [MH CET 2003; Pb. CET 2000]
(a) 1.4 times to He gas (b) Same as He gas

- (c) 5 times to *He* gas (d) 2 times to *He* gas
96. Hydrogen diffuses six times faster than gas *A*. The molar mass of gas *A* is [KCET 2004]
(a) 72 (b) 6
(c) 24 (d) 36
97. At what pressure will a quantity of gas, which occupies 100 ml at a pressure of 720 mm, occupy a volume of 84 ml [DPMT 2004]
(a) 736.18 mm (b) 820.20 mm
(c) 784.15 mm (d) 857.14 mm
98. Containers *A* and *B* have same gases. Pressure, volume and temperature of *A* are all twice that of *B*, then the ratio of number of molecules of *A* and *B* are [AFMC 2004]
(a) 1 : 2 (b) 2
(c) 1 : 4 (d) 4
99. A mixture of NO_2 and N_2O_4 has a vapour density of 38.3 at 300K. What is the number of moles of NO_2 in 100g of the mixture [Kerala PMT 2004]
(a) 0.043 (b) 4.4
(c) 3.4 (d) 3.86
(e) 0.437
100. A cylinder of 5 litres capacity, filled with air at NTP is connected with another evacuated cylinder of 30 litres of capacity. The resultant air pressure in both the cylinders will be [BHU 2004]
(a) 10.8 cm of Hg (b) 14.9 cm of Hg
(c) 21.8 cm of Hg (d) 38.8 cm of Hg
101. A certain mass of gas occupies a volume of 300 c.c. at 27°C and 620 mm pressure. The volume of this gas at 47°C and 640 mm pressure will be [MH CET 2003]
(a) 400 c.c. (b) 510 c.c.
(c) 310 c.c. (d) 350 c.c.
102. What will be the volume of the mixture after the reaction?
$$\underset{4 \text{ litre}}{\text{NH}_3} + \underset{1.5 \text{ litre}}{\text{HCl}} \rightarrow \underset{(solid)}{\text{NH}_4\text{Cl}}$$
 [BVP 2004]
(a) 0.5 litre (b) 1 litre
(c) 2.5 litre (d) 0.1 litre
103. The pressure and temperature of 4 dm³ of carbon dioxide gas are doubled. Then the volume of carbon dioxide gas would be [KCET 2004]
(a) 2 dm³ (b) 3 dm³
(c) 4 dm³ (d) 8 dm³
104. If the absolute temperature of an ideal gas become double and pressure become half, the volume of gas would be [Kerala CET 2005]
(a) Remain unchange (b) Will be double
(c) Will be four time (d) will be half
(e) Will be one fourth
105. At what temperature, the sample of neon gas would be heated to double of its pressure, if the initial volume of gas is/are reduced to 15% at 75°C [Kerala CET 2005]
(a) 319°C (b) 592°C
(c) 128°C (d) 60°C
(e) 90°C
106. Equation of Boyle's law is [DPMT 2005]
(a) $\frac{dP}{P} = -\frac{dV}{V}$ (b) $\frac{dP}{P} = +\frac{dV}{V}$
(c) $\frac{d^2P}{P} = -\frac{dV}{dT}$ (d) $\frac{d^2P}{P} = +\frac{d^2V}{dT}$
1. Postulate of kinetic theory is [EAMCET 1980]
(a) Atom is indivisible
(b) Gases combine in a simple ratio
(c) There is no influence of gravity on the molecules of a gas
(d) None of the above
2. According to kinetic theory of gases, [EAMCET 1980]
(a) There are intermolecular attractions
(b) Molecules have considerable volume
(c) No intermolecular attractions
(d) The velocity of molecules decreases after each collision
3. In deriving the kinetic gas equation, use is made of the root mean square velocity of the molecules because it is [Bihar MADT 1980]
(a) The average velocity of the molecules
(b) The most probable velocity of the molecules
(c) The square root of the average square velocity of the molecules
(d) The most accurate form in which velocity can be used in these calculations
4. Kinetic energy of a gas depends upon its [Bihar MADT 1982]
(a) Molecular mass (b) Atomic mass
(c) Equivalent mass (d) None of these
5. The kinetic theory of gases predicts that total kinetic energy of a gaseous assembly depends on [NCERT 1984]
(a) Pressure of the gas
(b) Temperature of the gas
(c) Volume of the gas
(d) Pressure, volume and temperature of the gas
6. According to kinetic theory of gases, the energy per mole of a gas is equal to [EAMCET 1985]
(a) 1.5 RT (b) RT
(c) 0.5 RT (d) 2.5 RT
7. Internal energy and pressure of a gas per unit volume are related as [CBSE PMT]
(a) $P = \frac{2}{3} E$ (b) $P = \frac{3}{2} E$
(c) $P = \frac{1}{2} E$ (d) $P = 2E$
8. The translational kinetic energy of an ideal gas depends only on its
(a) Pressure (b) Force
(c) Temperature (d) Molar mass
9. Helium atom is two times heavier than a hydrogen molecule at 298 K, the average kinetic energy of helium is [IIT 1982]
(a) Two times that of a hydrogen molecule
(b) Same as that of a hydrogen molecule
(c) Four times that of a hydrogen molecule
(d) Half that of a hydrogen molecule
10. Which of the following is valid at absolute zero [Pb. CET 1985]
(a) Kinetic energy of the gas becomes zero but the molecular motion does not become zero
(b) Kinetic energy of the gas becomes zero and molecular motion also becomes zero
(c) Kinetic energy of the gas decreases but does not become zero
(d) None of the above
11. The average K.E. of an ideal gas in calories per mole is approximately equal to [EAMCET 1989]
(a) Three times the absolute temperature
(b) Absolute temperature
(c) Two times the absolute temperature
(d) 1.5 times the absolute temperature
12. According to kinetic theory of gases, for a diatomic molecule [MNR 1991]

- (a) The pressure exerted by the gas is proportional to the mean velocity of the molecules
 (b) The pressure exerted by the gas is proportional to the root mean square velocity of the molecules
 (c) The root mean square velocity is inversely proportional to the temperature
 (d) The mean translational kinetic energy of the molecules is proportional to the absolute temperature
13. At STP, 0.50 mol H_2 gas and 1.0 mol He gas [CBSE PMT 1993, 2000]
 (a) Have equal average kinetic energies
 (b) Have equal molecular speeds
 (c) Occupy equal volumes
 (d) Have equal effusion rates
14. Which of the following expressions correctly represents the relationship between the average molar kinetic energy, $\overline{K.E.}$, of CO and N_2 molecules at the same temperature [CBSE PMT 2000]
 (a) $\overline{KE}_{CO} = \overline{KE}_{N_2}$
 (b) $\overline{KE}_{CO} > \overline{KE}_{N_2}$
 (c) $\overline{KE}_{CO} < \overline{KE}_{N_2}$
 (d) Cannot be predicted unless the volumes of the gases are given
15. Indicate the correct statement for a 1-L sample of $N_2(g)$ and $CO_2(g)$ at 298 K and 1 atm pressure
 (a) The average translational KE per molecule is the same in N_2 and CO_2
 (b) The rms speed remains constant for both N_2 and CO_2
 (c) The density of N_2 is less than that of CO_2
 (d) The total translational KE of both N_2 and CO_2 is the same
16. With increase of pressure, the mean free path [Pb. CET 1985]
 (a) Decreases (b) Increases
 (c) Does not change (d) Becomes zero
17. Which one of the following statements is NOT true about the effect of an increase in temperature on the distribution of molecular speeds in a gas [AIEEE 2005]
 (a) The most probable speed increases
 (b) The fraction of the molecules with the most probable speed increases
 (c) The distribution becomes broader
 (d) The area under the distribution curve remains the same as under the lower temperature
18. If P , V , M , T and R are pressure, volume, molar mass, temperature and gas constant respectively, then for an ideal gas, the density is given by [CBSE PMT 1989, 91]
 (a) $\frac{RT}{PM}$ (b) $\frac{P}{RT}$
 (c) $\frac{M}{V}$ (d) $\frac{PM}{RT}$
19. An ideal gas will have maximum density when [CPMT 2000]
 (a) $P = 0.5 \text{ atm}$, $T = 600 \text{ K}$
 (b) $P = 2 \text{ atm}$, $T = 150 \text{ K}$
 (c) $P = 1 \text{ atm}$, $T = 300 \text{ K}$
 (d) $P = 1.0 \text{ atm}$, $T = 500 \text{ K}$
20. If the inversion temperature of a gas is $-80^\circ C$, then it will produce cooling under Joule-Thomson effect at
 (a) 298 K (b) 273 K
 (c) 193 K (d) 173 K
21. Ratio of C_p and C_v of a gas 'X' is 1.4. The number of atoms of the gas 'X' present in 11.2 litres of it at N.T.P. is [CBSE PMT 1989]
 (a) 6.02×10^{23} (b) 1.2×10^{24}
 (c) 3.01×10^{23} (d) 2.01×10^{23}
22. The density of air is 0.00130 g/ml. The vapour density of air will be [DCE 2000]
 (a) 0.00065 (b) 0.65
 (c) 14.4816 (d) 14.56
23. At $100^\circ C$ and 1 atm, if the density of liquid water is 1.0 g cm^{-3} and that of water vapour is 0.0006 g m^{-3} , then the volume occupied by water molecules in 1 litre of steam at that temperature is [IIT 2000]
 (a) 6 cm^3 (b) 60 cm^3
 (c) 0.6 cm^3 (d) 0.06 cm^3
24. The ratio γ for inert gases is [AFMC 1990]
 (a) 1.33 (b) 1.66
 (c) 2.13 (d) 1.99
25. The density of neon will be highest at [CBSE PMT 1990]
 (a) S.T.P. (b) $0^\circ C$, 2 atm
 (c) $273^\circ C$, 1 atm (d) $273^\circ C$, 2 atm
26. Absolute zero is defined as the temperature [CBSE PMT 1990]
 (a) At which all molecular motion ceases
 (b) At which liquid helium boils
 (c) At which ether boils
 (d) All of the above
27. Consider the following statements :
 (1) Joule-Thomson experiment is isenthalpic as well as adiabatic.
 (2) A negative value of μ_{JT} (Joule Thomson coefficient) corresponds to warming of a gas on expansion.
 (3) The temperature at which neither cooling nor heating effect is observed is known as inversion temperature.
 Which of the above statements are correct
 (a) 1 and 2 (b) 1 and 3
 (c) 2 and 3 (d) 1, 2 and 3
28. Vibrational energy is [Pb. CET 1985]
 (a) Partially potential and partially kinetic
 (b) Only potential
 (c) Only kinetic
 (d) None of the above
29. At the same temperature and pressure, which of the following gases will have the highest kinetic energy per mole [MNR 1991]
 (a) Hydrogen (b) Oxygen
 (c) Methane (d) All the same
30. Dimensions of pressure are the same as that of [CBSE PMT 1995]
 (a) Energy (b) Force
 (c) Energy per unit volume (d) Force per unit volume
31. The density of a gas A is three times that of a gas B. If the molecular mass of A is M , the molecular mass of B is [CPMT 1987]
 (a) $3M$ (b) $\sqrt{3}M$
 (c) $M/3$ (d) $M/\sqrt{3}$

1. The ratio of root mean square velocity to average velocity of gas molecules at a particular temperature is [IIT 1981]
 - (a) 1.086 : 1
 - (b) 1 : 1.086
 - (c) 2 : 1.086
 - (d) 1.086 : 2
2. Which is not true in case of an ideal gas [CBSE PMT 1991]
 - (a) It cannot be converted into a liquid
 - (b) There is no interaction between the molecules
 - (c) All molecules of the gas move with same speed
 - (d) At a given temperature, PV is proportional to the amount of the gas
3. The ratio among most probable velocity, mean velocity and root mean square velocity is given by [CBSE PMT 1993]
 - (a) 1 : 2 : 3
 - (b) 1 : $\sqrt{2}$: $\sqrt{3}$
 - (c) $\sqrt{2}$: $\sqrt{3}$: $\sqrt{8/\pi}$
 - (d) $\sqrt{2}$: $\sqrt{8/\pi}$: $\sqrt{3}$
4. Which of the following has maximum root mean square velocity at the same temperature [Manipal PMT 2002]
 - (a) SO_2
 - (b) CO_2
 - (c) O_2
 - (d) H_2
5. The temperature at which RMS velocity of SO_2 molecules is half that of He molecules at 300 K is [NTSE 1991]
 - (a) 150 K
 - (b) 600 K
 - (c) 900 K
 - (d) 1200 K
6. At 27°C, the ratio of rms velocities of ozone to oxygen is [EAMCET 1992]
 - (a) $\sqrt{3/5}$
 - (b) $\sqrt{4/3}$
 - (c) $\sqrt{2/3}$
 - (d) 0.25
7. The average kinetic energy of an ideal gas per molecule in SI units at 25°C will be [CBSE PMT 1996]
 - (a) $6.17 \times 10^{-21} \text{ kJ}$
 - (b) $6.17 \times 10^{-21} \text{ J}$
 - (c) $6.17 \times 10^{-20} \text{ J}$
 - (d) $7.16 \times 10^{-20} \text{ J}$
8. At what temperature the RMS velocity of SO_2 be same as that of O_2 at 303 K [KCET 2001]
 - (a) 273 K
 - (b) 606 K
 - (c) 303 K
 - (d) 403 K
9. Among the following gases which one has the lowest root mean square velocity at 25°C [EAMCET 1983]
 - (a) SO_2
 - (b) N_2
 - (c) O_2
 - (d) Cl_2
10. The root mean square velocity of an ideal gas in a closed container of fixed volume is increased from $5 \times 10^4 \text{ cm s}^{-1}$ to $10 \times 10^4 \text{ cm s}^{-1}$. Which of the following statement correctly explains how the change is accomplished [Pb. CET 1986]
 - (a) By heating the gas, the temperature is doubled
 - (b) By heating the gas, the pressure is quadrupled (i.e. made four times)
 - (c) By heating the gas, the temperature is quadrupled
 - (d) By heating the gas, the pressure is doubled
11. The rms velocity at NTP of the species can be calculated from the expression [EAMCET 1990]
 - (a) $\sqrt{\frac{3P}{d}}$
 - (b) $\sqrt{\frac{3PV}{M}}$
 - (c) $\sqrt{\frac{3RT}{M}}$
 - (d) All the above
12. Root mean square velocity of a gas molecule is proportional to [CBSE PMT 1990]
 - (a) $m^{1/2}$
 - (b) m^0
 - (c) $m^{-1/2}$
 - (d) m
13. At constant volume, for a fixed number of moles of a gas, the pressure of the gas increases with increase in temperature due to [IIT 1992]
 - (a) Increase in the average molecular speed
 - (b) Increased rate of collision amongst molecules
 - (c) Increase in molecular attraction
 - (d) Decrease in mean free path
14. Molecular velocities of the two gases at the same temperature are u_1 and u_2 . Their masses are m_1 and m_2 respectively. Which of the following expressions is correct [BHU 1994]
 - (a) $\frac{m_1}{u_1^2} = \frac{m_2}{u_2^2}$
 - (b) $m_1 u_1 = m_2 u_2$
 - (c) $\frac{m_1}{u_1} = \frac{m_2}{u_2}$
 - (d) $m_1 u_1^2 = m_2 u_2^2$
15. The temperature of the gas is raised from 27°C to 927°C, the root mean square velocity is [CBSE PMT 1994]
 - (a) $\sqrt{927/27}$ times the earlier value
 - (b) Same as before
 - (c) Halved
 - (d) Doubled
16. The ratio between the root mean square velocity of H_2 at 50 K and that of O_2 at 800 K is [IIT 1996]
 - (a) 4
 - (b) 2
 - (c) 1
 - (d) 1/4
17. The root mean square velocity of an ideal gas at constant pressure varies density (d) as [IIT 2000]
 - (a) d^2
 - (b) d
 - (c) $\sqrt{d}$
 - (d) $1/\sqrt{d}$
18. Consider a mixture of SO_2 and O_2 kept at room temperature. Compared to the oxygen molecule, the SO_2 molecule will hit the wall with
 - (a) Smaller average speed
 - (b) Greater average speed
 - (c) Greater kinetic energy
 - (d) Greater mass
19. The rms speed of N_2 molecules in a gas is u . If the temperature is doubled and the nitrogen molecules dissociate into nitrogen atoms, the rms speed becomes
 - (a) $u/2$
 - (b) $2u$
 - (c) $4u$
 - (d) $14u$
20. Choose the correct arrangement, where the symbols have their usual meanings
 - (a) $\bar{u} > u_p > u_{rms}$
 - (b) $u_{rms} > \bar{u} > u_p$
 - (c) $u_p > \bar{u} > u_{rms}$
 - (d) $u_p > u_{rms} > \bar{u}$
21. The ratio of most probable velocity to that of average velocity is [JEE Orissa 2000]
 - (a) $\pi/2$
 - (b) $2/\pi$
 - (c) $\sqrt{\pi}/2$
 - (d) $2/\sqrt{\pi}$
22. The r.m.s. velocity of a certain gas is v at 300K. The temperature, at which the r.m.s. velocity becomes double [Pb. CET 2002]
 - (a) 1200K
 - (b) 900K
 - (c) 600K
 - (d) 150K
23. The r.m.s. velocity of a gas depends upon [DCE 2002]
 - (a) Temperature only

- (b) Molecular mass only
(c) Temperature and molecular mass of gas
(d) None of these
24. What is the pressure of 2 mole of NH_3 at $27^\circ C$ when its volume is 5 litre in vander Waal's equation ($a = 4.17$, $b = 0.0371$) [JEE Orissa-2004]
(a) 10.33 atm (b) 9.33 atm
(c) 9.74 atm (d) 9.2 atm
25. The root mean square velocity of one mole of a monoatomic having molar mass M is U_{rms} . The relation between the average kinetic energy (E) of the U_{rms} is [IIT-JEE Screening 2004]
(a) $U_{rms} = \sqrt{\frac{3E}{2M}}$ (b) $U_{rms} = \sqrt{\frac{2E}{3M}}$
(c) $U_{rms} = \sqrt{\frac{2E}{M}}$ (d) $U_{rms} = \sqrt{\frac{E}{3M}}$
26. Ratio of average to most probable velocity is [Orissa JEE 2005]
(a) 1.128 (b) 1.224
(c) 1.0 (d) 1.112
27. If the v_{rms} is $30R^{1/2}$ at $27^\circ C$ then calculate the molar mass of gas in kilogram. [DPMT 2005]
(a) 1 (b) 2
(c) 4 (d) 0.001
- (b) $100^\circ C$ and 2 atmospheric pressure
(c) $-100^\circ C$ and 5 atmospheric pressure
(d) $500^\circ C$ and 1 atmospheric pressure
- The temperature at which the second virial coefficient of real gas is zero is called [AFMC 1993]
(a) Critical temperature
(b) Eutetic point
(c) Boiling point
(d) Boyle's temperature
8. When is deviation more in the behaviour of a gas from the ideal gas equation $PV = nRT$ [DPMT 1981; NCERT 1982; CBSE PMT 1993]
(a) At high temperature and low pressure
(b) At low temperature and high pressure
(c) At high temperature and high pressure
(d) At low temperature and low high pressure
9. Vander Waal's constants ' a ' and ' b ' are related with..... respectively [RPMT 1994]
(a) Attractive force and bond energy of molecules
(b) Volume and repulsive force of molecules
(c) Shape and repulsive forces of molecules
(d) Attractive force and volume of the molecules
10. Gas deviates from ideal gas nature because molecules [CPMT 1996]
(a) Are colourless
(b) Attract each other
(c) Contain covalent bond
(d) Show Brownian movement
11. The Vander Waal's equation reduces itself to the ideal gas equation at [Kerala MEE 2001; CBSE PMT 2002]
(a) High pressure and low temperature
(b) Low pressure and low temperature
(c) Low pressure and high temperature
(d) High pressure and high temperature
12. The compressibility factor for an ideal gas is [IIT 1997]
(a) 1.5 (b) 1.0
(c) 2.0 (d) ∞
13. When an ideal gas undergoes unrestrained expansion, no cooling occurs because the molecules [IIT 1984, 89]
(a) Are above the inversion temperature
(b) Exert no attractive force on each other
(c) Do work equal to loss in kinetic energy
(d) Collide without loss of energy
14. A gas is said to behave like an ideal gas when the relation $PV/T = \text{constant}$. When do you expect a real gas to behave like an ideal gas [IIT 1999; CBSE PMT 1990; CPMT 1991]
(a) When the temperature is low
(b) When both the temperature and pressure are low
(c) When both the temperature and pressure are high
(d) When the temperature is high and pressure is low
15. A real gas most closely approaches the behaviour of an ideal gas at [KCET 1992]
(a) 15 atm and 200 K (b) 1 atm and 273 K
(c) 0.5 atm and 500 K (d) 15 atm and 500 K
16. The temperature at which real gases obey the ideal gas laws over a wide range of pressure is called [AFMC 1993; IIT 1981, 94]
(a) Critical temperature
(b) Boyle temperature
(c) Inversion temperature

Real gases and Vander waal's equation

1. The Vander Waal's equation explains the behaviour of [DPMT 1981]
(a) Ideal gases (b) Real gases
(c) Vapour (d) Non-real gases
2. Gases deviate from the ideal gas behaviour because their molecules [NCERT 1981]
(a) Possess negligible volume
(b) Have forces of attraction between them
(c) Are polyatomic
(d) Are not attracted to one another
3. The compressibility factor of a gas is defined as $Z = PV/RT$. The compressibility factor of ideal gas is [Pb. CET 1986]
(a) 0 (b) Infinity
(c) 1 (d) -1
4. In Vander Waal's equation of state for a non-ideal gas, the term that accounts for intermolecular forces is [CBSE PMT 1990; IIT 1988]
(a) $(V-b)$ (b) $(RT)^{-1}$
(c) $\left(P + \frac{a}{V^2}\right)$ (d) RT
5. Vander Waal's equation of state is obeyed by real gases. For n moles of a real gas, the expression will be [IIT 1992; Pb. CET 1986; DPMT 1986]
(a) $\left(\frac{P}{n} + \frac{na}{V^2}\right)\left(\frac{V}{n-b}\right) = RT$
(b) $\left(P + \frac{a}{V^2}\right)(V-b) = nRT$
(c) $\left(P + \frac{na}{V^2}\right)(nV-b) = nRT$
(d) $\left(P + \frac{n^2a}{V^2}\right)(V-nb) = nRT$
6. Any gas shows maximum deviation from ideal gas at [CPMT 1991]
(a) $0^\circ C$ and 1 atmospheric pressure

- (d) Reduced temperature
17. At low pressure, the Vander Waal's equation is reduced to
- (a) $Z = \frac{pV_m}{RT} = 1 - \frac{ap}{RT}$ (b) $Z = \frac{pV_m}{RT} = 1 + \frac{b}{RT} p$
- (c) $pV_m = RT$ (d) $Z = \frac{pV_m}{RT} = 1 - \frac{a}{RT}$
18. At high temperature and low pressure, the Vander Waal's equation is reduced to
- (a) $\left(p + \frac{a}{V_m^2}\right)(V_m) = RT$
- (b) $pV_m = RT$
- (c) $p(V_m - b) = RT$
- (d) $\left(p + \frac{a}{V_m^2}\right)(V_m - b) = RT$
19. When helium is allowed to expand into vacuum, heating effect is observed. Its reason is that [CPMT 1987]
- (a) Helium is an ideal gas
- (b) Helium is an inert gas
- (c) The inversion temperature of helium is very low
- (d) The boiling point of helium is the lowest among the elements
20. In van der Waal's equation of state of the gas law, the constant 'b' is a measure of [AIEEE 2004]
- (a) Volume occupied by the molecules
- (b) Intermolecular attraction
- (c) Intermolecular repulsions
- (d) Intermolecular collisions per unit volume
21. In which molecule the vander Waal's force is likely to be the most important in determining the *m.pt.* and *b.pt.* [DPMT 2000]
- (a) H_2S (b) Br_2
- (c) HCl (d) CO
22. Pressure exerted by 1 mole of methane in a 0.25 litre container at 300K using vander Waal's equation (given $1 = 2.253 \text{ atm l}^2 \text{ mol}^{-2}$, $b = 0.0428 \text{ l mol}^{-1}$) is [Orissa JEE 2005]
- (a) 82.82 atm (b) 152.51 atm
- (c) 190.52 atm (d) 70.52 atm

Critical state and Liquefaction of gases

1. Which set of conditions represents easiest way to liquefy a gas [NCERT 1983]
- (a) Low temperature and high pressure
- (b) High temperature and low pressure
- (c) Low temperature and low pressure
- (d) High temperature and high pressure
2. Adiabatic demagnetisation is a technique used for [BHU 1984]
- (a) Adiabatic expansion of a gas
- (b) Production of low temperature
- (c) Production of high temperature
- (d) None
3. An ideal gas can't be liquefied because [CBSE PMT 1992]
- (a) Its critical temperature is always above $0^\circ C$

- (b) Its molecules are relatively smaller in size
- (c) It solidifies before becoming a liquid
- (d) Forces operative between its molecules are negligible
4. However great the pressure, a gas cannot be liquefied above its
- (a) Boyle temperature
- (b) Inversion temperature
- (c) Critical temperature
- (d) Room temperature
5. An ideal gas obeying kinetic theory of gases can be liquefied if [CBSE PMT 1995]
- (a) Its temperature is more than critical temperature T_c
- (b) Its pressure is more than critical pressure P_c
- (c) Its pressure is more than P_c at a temperature less than T_c
- (d) It cannot be liquefied at any value of P and T
6. The Vander Waal's parameters for gases W, X, Y and Z are
- | Gas | a (atm L ² mol ⁻²) | b (L mol ⁻¹) |
|-----|---|--------------------------|
| W | 4.0 | 0.027 |
| X | 8.0 | 0.030 |
| Y | 6.0 | 0.032 |
| Z | 12.0 | 0.027 |
- Which one of these gases has the highest critical temperature
- (a) W (b) X
- (c) Y (d) Z
7. The Vander Waal's constant 'a' for the gases O_2 , N_2 , NH_3 and CH_4 are 1.3, 1.390, 4.170 and $2.253 \text{ L}^2 \text{ atm mol}^{-2}$ respectively. The gas which can be most easily liquefied is [IIT 1989]
- (a) O_2 (b) N_2
- (c) NH_3 (d) CH_4

8. A gas can be liquefied [AFMC 2005]
- (a) Above its critical temperature
- (b) At its critical temperature
- (c) Below its critical temperature
- (d) At any temperature
9. Which of the following is correct for critical temperature
- (a) It is the highest temperature at which liquid and vapour can coexist
- (b) Beyond the critical temperature, there is no distinction between the two phases and a gas cannot be liquefied by compression
- (c) At critical temperature (T_c) the surface tension of the system is zero
- (d) At critical temperature the gas and the liquid phases have different critical densities
10. A gas has a density of 2.68 g/L at stp. Identify the gas
- (a) NO_2 (b) Kr
- (c) CO_2 (d) SO_2
11. Weight of 112 ml of oxygen at NTP on liquefaction would be [DPMT 1984]
- (a) 0.32 g (b) 0.64 g
- (c) 0.16 g (d) 0.96 g

Critical Thinking

Objective Questions

1. As the temperature is raised from $20^\circ C$ to $40^\circ C$ the average kinetic energy of neon atoms changes by a factor of which of the following [AIEEE 2004]
- (a) $313/293$ (b) $\sqrt{313/293}$

- (c) $1/2$ (d) 2
2. A gas is found to have a formula $[CO]_x$. If its vapour density is 70, the value of x is [DCE 2004]
(a) 2.5 (b) 3.0
(c) 5.0 (d) 6.0
3. Which of the given sets of temperature and pressure will cause a gas to exhibit the greatest deviation from ideal gas behavior [DCE 2003]
(a) $100^\circ C$ and 4 atm (b) $100^\circ C$ and 2 atm
(c) $-100^\circ C$ and 4 atm (d) $0^\circ C$ and 2 atm
4. The molecular weight of O_2 and SO_2 are 32 and 64 respectively. If one litre of O_2 at $15^\circ C$ and 750 mm pressure contains N molecules, the number of molecules in two litres of SO_2 under the same conditions of temperature and pressure will be [CBSE 1990; MNR 1991]
(a) $N/2$ (b) N
(c) $2N$ (d) $4N$
5. What is the relationship between the average velocity (v), root mean square velocity (u) and most probable velocity (α) [AFMC 1994]
(a) $\alpha : v : u :: 1 : 1.128 : 1.224$
(b) $\alpha : v : u :: 1.128 : 1 : 1.224$
(c) $\alpha : v : u :: 1.128 : 1.224 : 1$
(d) $\alpha : v : u :: 1.124 : 1.228 : 1$
6. Consider the following statements : For diatomic gases, the ratio C_p / C_v is equal to
(1) 1.40 (lower temperature)
(2) 1.66 (moderate temperature)
(3) 1.29 (higher temperature)
which of the above statements are correct
(a) 1, 2 and 3 (b) 1 and 2
(c) 2 and 3 (d) 1 and 3
7. The compressibility factor for an ideal gas is [MP PET 2004]
(a) 1.5 (b) 1.0
(c) 2.0 (d) ∞
8. The compressibility factor of a gas is less than 1 at STP. Its molar volume V_m will be [MP PET 2004]
(a) $V_m > 22.42$ (b) $V_m < 22.42$
(c) $V_m = 22.42$ (d) None
9. If some moles of O_2 diffuse in 18 sec and same moles of other gas diffuse in 45 sec then what is the molecular weight of the unknown gas [CPMT 1988]
(a) $\frac{45^2}{18^2} \times 32$ (b) $\frac{18^2}{45^2} \times 32$
(c) $\frac{18^2}{45^2 \times 32}$ (d) $\frac{45^2}{18^2 \times 32}$
10. The ratio of rates of diffusion of SO_2 , O_2 and CH_4 is [BHU 1992]
(a) $1 : \sqrt{2} : 2$ (b) $1 : 2 : 4$
(c) $2 : \sqrt{2} : 1$ (d) $1 : 2 : \sqrt{2}$
11. If $C_1, C_2, C_3, \dots$ represent the speeds of $n_1, n_2, n_3, \dots$ molecules, then the root mean square speed is [IIT 1993]
(a) $\left(\frac{n_1 C_1^2 + n_2 C_2^2 + n_3 C_3^2 + \dots}{n_1 + n_2 + n_3 + \dots} \right)^{1/2}$
(b) $\frac{(n_1 C_1^2 + n_2 C_2^2 + n_3 C_3^2 + \dots)^{1/2}}{n_1 + n_2 + n_3 + \dots}$
(c) $\frac{(n_1 C_1^2)^{1/2}}{n_1} + \frac{(n_2 C_2^2)^{1/2}}{n_2} + \frac{(n_3 C_3^2)^{1/2}}{n_3} + \dots$
(d) $\left[\frac{(n_1 C_1 + n_2 C_2 + n_3 C_3 + \dots)^2}{(n_1 + n_2 + n_3 + \dots)} \right]^{1/2}$
12. 50 ml of hydrogen diffuses out through a small hole from a vessel in 20 minutes. The time needed for 40 ml of oxygen to diffuse out is [CBSE PMT 1993]
(a) 12 min (b) 64 min
(c) 8 min (d) 32 min
13. At what temperature will the average speed of CH_4 molecules have the same value as O_2 has at 300 K [CBSE PMT 1989]
(a) 1200 K (b) 150 K
(c) 600 K (d) 300 K
14. A sample of O_2 gas is collected over water at $23^\circ C$ at a barometric pressure of 751 mm Hg (vapour pressure of water at $23^\circ C$ is 21 mm Hg). The partial pressure of O_2 gas in the sample collected is [CBSE PMT 1993]
(a) 21 mm Hg (b) 751 mm Hg
(c) 0.96 atm (d) 1.02 atm
15. In an experiment during the analysis of a carbon compound, 145 l of H_2 was collected at 760 mm Hg pressure and $27^\circ C$ temperature. The mass of H_2 is nearly [MNR 1987]
(a) 10 g (b) 12 g
(c) 24 g (d) 6 g
16. The volume of 1 g each of methane (CH_4), ethane (C_2H_6), propane (C_3H_8) and butane (C_4H_{10}) was measured at 350 K and 1 atm. What is the volume of butane [NCERT 1981]
(a) 495 cm^3 (b) 600 cm^3
(c) 900 cm^3 (d) 1700 cm^3
17. The ratio of the rate of diffusion of helium and methane under identical condition of pressure and temperature will be [IIT 2005]
(a) 4 (b) 2
(c) 1 (d) 0.5
18. At what temperature in the celsius scale, V (volume) of a certain mass of gas at $27^\circ C$ will be doubled keeping the pressure constant [Orissa 1993]
(a) $54^\circ C$ (b) $327^\circ C$
(c) $427^\circ C$ (d) $527^\circ C$
19. Pressure of a mixture of 4 g of O_2 and 2 g of H_2 confined in a bulb of 1 litre at $0^\circ C$ is [AIIMS 2000]
(a) 25.215 atm (b) 31.205 atm

- (c) 45.215 atm (d) 15.210 atm
20. If pressure becomes double at the same absolute temperature on 2 L CO_2 , then the volume of CO_2 becomes [AIIMS 1992]
- (a) 2 L (b) 4 L
(c) 25 L (d) 1 L
21. Volume of the air that will be expelled from a vessel of 300 cm^3 when it is heated from 27°C to 37°C at the same pressure will be
- (a) 310 cm^3 (b) 290 cm^3
(c) 10 cm^3 (d) 37 cm^3
22. 300 ml of a gas at 27°C is cooled to -3°C at constant pressure, the final volume is [NCERT 1981, MP PMT 1992]
- (a) 540 ml (b) 135 ml
(c) 270 ml (d) 350 ml

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Plot of P Vs. $1/V$ (volume) is a straight line.
Reason : Pressure is directly proportional to volume.
2. Assertion : Jet aeroplane flying at high altitude need pressurization of the cabin.
Reason : Oxygen is not present at higher altitude.
3. Assertion : 1 mol of H_2 and O_2 each occupy 22.4 L of volume at 0°C and 1 bar pressure.
Reason : Molar volume for all gases at the same temperature and pressure has the same volume.
4. Assertion : Pressure exerted by a mixture of reacting gases is equal to the sum of their partial pressures.
Reason : Reacting gases react to form a new gas having pressure equal to the sum of both.
5. Assertion : Greater the value of Vander Waal's constant ' a ' greater is the liquefaction of gas.
Reason : ' a ' indirectly measures the magnitude of attractive forces between the molecules.
6. Assertion : Carbon dioxide has greater value of root mean square velocity μ_{rms} than carbon monoxide.
Reason : μ_{rms} is directly proportional to molar mass.
7. Assertion : 4.58 mm and 0.0098°C is known to be triple point of water.
Reason : At this pressure and temperature all the three states i.e., water, ice and vapour exist simultaneously.

8. Assertion : $1/4^{\text{th}}$ of the gas is expelled if air present in an open vessel is heated from 27°C to 127°C .
Reason : Rate of diffusion of a gas is inversely proportional to the square root of its molecular mass.
9. Assertion : Compressibility factor for hydrogen varies with pressure with positive slope at all pressures.
Reason : Even at low pressures, repulsive forces dominate hydrogen gas. [AIIMS 2005]
10. Assertion : vander Waal's equation is applicable only to non-ideal gases.
Reason : Ideal gases obey the equation $PV = nRT$.
11. Assertion : Pressure exerted by gas in a container with increasing temperature of the gas.
Reason : With the rise in temperature, the average speed of gas molecules increases. [AIIMS 1995]
12. Assertion : Gases do not settle to the bottom of container.
Reason : Gases have high kinetic energy. [AIIMS 1997]
13. Assertion : A mixture of He and O_2 is used for respiration for deep sea divers.
Reason : He is soluble in blood. [AIIMS 1998]
14. Assertion : Wet air is heavier than dry air.
Reason : The density of dry air is more than density of water. [AIIMS 1999]
15. Assertion : All molecules in a gas have some speed.
Reason : Gas contains molecules of different size and shape. [AIIMS 2001]
16. Assertion : Effusion rate of oxygen is smaller than nitrogen.
Reason : Molecular size of nitrogen is smaller than oxygen. [AIIMS 2000]

AS Answers and Solutions

Characteristics and Measurable properties of gases

- (c) Gases do not have definite shape and volume. Their volume is equal to the volume of the container.
- (c) All the three phases of water can coexist at 0°C & 4.7 mm pressure.
- (b) It is characteristic of gases *i.e.* Thermal energy $\gg$ molecular attraction
- (a) In gases, molecular attraction is very less and intermolecular spaces are large hence kinetic energy of gases is highest.
- (c) Gases and liquids, both can flow and possess viscosity.
- (a) Newton is unit of force.
- (b) $\frac{C^\circ}{5} = \frac{F^\circ - 32}{9}$
- (c) $1\text{ L} = 10^{-3}\text{ m}^3 = 10^3\text{ cm}^3 = 1\text{ dm}^3 = 10^3\text{ ml}$.
- (a) $1\text{ atm} = 10^6\text{ dynes cm}^{-2}$
- (b) Barometer is used to measure atmospheric pressure of mixture of gases. Stagnometer is used to measure surface tension. Only manometer is used to measure pressure of pure gas in a vessel.
- (a) 0°C is equivalent to 273°K *i.e.* conditions are same so volume will be $V\text{ ml}$.
- (d) The mass of gas can be determined by weighing the container, filled with gas and again weighing this container after removing the gas. The difference between the two weights gives the mass of the gas.
- (c) Noble gases have no intermolecular forces due to inertness.
- (e) Total volume of two flasks = $1 + 3 = 4$
If P_1 the pressure of gas N_2 in the mixture of N_2 and O_2 then

$$P = 100\text{ kPa}, P_1 = ?, V = 1\text{ litre}, V_1 = 4\text{ litre}$$

applying Boyle's law $PV = P_1V_1$

$$100 \times 1 = P_1 \times 4; P_1 = 25$$

If P_2 is the pressure of O_2 gas in the mixture of O_2 and N_2 then, $320 \times 3 = P_2 \times 4; P_2 = 240$

$$\text{Hence, Total pressure } P = P_1 + P_2 = 25 + 240 = 265\text{ kPa}$$

Ideal gas equation and Related gas laws

- (c) Boyle's law is $V \propto \frac{1}{P}$ at constant T
- (d) According to Boyle's law $V \propto \frac{1}{P}$
 $V = \frac{\text{Constant}}{P}; VP = \text{Constant}$.
- (a) At sea level, because of compression by air above the proximal layer of air, pressure increases hence volume decreases *i.e.* density increases. It is Boyle's law.
- (a) At constant T , $P_1V_1 = P_2V_2$
 $1 \times 20 = P_2 \times 50; P_2 = \frac{20}{50} \times 1$
- (a) $PV = \text{constant}$ at constant temperature. As temperature changes, the value of constant also changes.
- (b,c) According to Boyle's Law $PV = \text{constant}$, at constant temperature either P increases or V increases both (b) & (c) may be correct.
- (a) $\frac{d_1}{d_2} = \frac{1}{2}, \frac{T_1}{T_2} = \frac{2}{1} \therefore \frac{P_1}{P_2} = \frac{V_2}{V_1} \times \frac{T_1}{T_2} = \frac{T_1 \cdot d_1}{T_2 \cdot d_2}$
 $\frac{P_1}{P_2} = \frac{2}{1} \cdot \frac{1}{2} = \frac{1}{1}$
- (a) Absolute temperature is temperature measured in $^\circ\text{Kelvin}$, expressed by T
- (a) $T_1 = 273^\circ\text{C} = 273 + 273^\circ\text{K} = 546^\circ\text{K}$
 $T_2 = 0^\circ\text{C} = 273 + 0^\circ\text{C} = 273^\circ\text{K}$
 $P_1 = 1; P_2 = ?$
According to Gay-Lussac's law
 $\frac{P_1}{T_1} = \frac{P_2}{T_2} \therefore P_2 = \frac{P_1 T_2}{T_1} = \frac{1 \times 273^\circ\text{K}}{546^\circ\text{K}} \text{ atm}; \frac{1}{2} \text{ atm}$.
- (a) $V_t = V_o(1 + \alpha_v t)$
 $\therefore (V_2 - V_1) = \Delta V = V_o \alpha(t_2 - t_1)$
if $t_2 - t_1 = 1^\circ$ then $\Delta V = \alpha V_o$
For every 1°C increase in temperature, the volume of a given mass of an ideal gas increases by a definite fraction $\frac{1}{273.15}$ of V_o . Here V_o is volume at 0°C temperature.
- (a) $\frac{V_1}{V_2} = \frac{T_1}{T_2} \therefore V_2 = \frac{T_2}{T_1} V_1 = \frac{546^\circ\text{K}}{273^\circ\text{K}} \times 0.2\text{ L} = 0.4\text{ L}$.
- (a) $V_2 = \frac{T_2}{T_1} \cdot V_1 = \frac{270^\circ\text{K}}{300^\circ\text{K}} \cdot 400\text{ cm}^3 = 360\text{ cm}^3$
contraction = $V_1 - V_2 = 400 - 360 = 40\text{ cm}^3$
- (c) At constant volumes $P \propto T$
 $P = \text{constant } T; PV = nRT \therefore P = \frac{nR}{V} T$

$$\text{slope} = m = \frac{nR}{V} \therefore V_2 < V_1$$

$$\frac{m_1}{m_2} = \frac{V_2}{V_1} \therefore m_1 < m_2 \text{ is curve for } V_1 \text{ has a greater slope than for } V_2$$

$$16. \quad (c) \quad \frac{P_1}{T_1} + \frac{P_1}{T_1} = \frac{P}{T_1} + \frac{P}{T_2}$$

$$\frac{2P_1}{T_1} = P \left(\frac{T_1 + T_2}{T_1 T_2} \right); \therefore P = \frac{2P_1(T_1 T_2)}{T_1(T_1 + T_2)} = \frac{2P_1 T_2}{T_1 + T_2}$$

$$18. \quad (c) \text{ At constant } V \text{ of a definite mass}$$

$$\frac{P_1}{T_1} = \frac{P_2}{T_2} \therefore \frac{P_1}{P_2} = \frac{300}{600} = \frac{1}{2} \text{ i.e. pressure increases}$$

and on increasing temperature energy of molecules increases so the rate of collisions also increases and number of moles remains constant because there is neither addition nor removal of gas in the occurring.

$$19. \quad (a) \text{ Avogadro number} = 6.0224 \times 10^{23}$$

$$20. \quad (b) \text{ Compressibility} = \frac{PV}{nRT} < 1 \text{ at STP (as given)}$$

$$\left. \begin{aligned} nRT &> PV \\ N \times 0.0821 \times 273 &> 1V_m \\ 22.41 \text{ litres} &> V_m \end{aligned} \right\} \begin{aligned} R &= 0.821 \\ T &= 273 \text{ K} \\ P &= 1 \\ n &= 1 \end{aligned}$$

$$21. \quad (c) \text{ The value of universal gas constant can be expressed in different units and its value would depend only on the units of the measurement.}$$

$$22. \quad (c) \quad PV = nRT$$

$$R = \frac{PV}{nT} = \text{litre} \cdot \text{atm} \cdot \text{K}^{-1} \cdot \text{mole}^{-1}$$

$$23. \quad (d) \text{ (atm} \cdot \text{K} \cdot \text{mol)} \text{ is not a unit of } R$$

$$24. \quad (a) \quad 8.31 \text{ J} \cdot \text{K}^{-1} \cdot \text{mol}^{-1}$$

$$1 \text{ cal} = 4.2 \text{ J}$$

$$\therefore \frac{8.31}{4.2} \text{ cal} \cdot \text{K}^{-1} \cdot \text{mol}^{-1} = 1.987 \text{ cal} \cdot \text{K}^{-1} \cdot \text{mol}^{-1}$$

$$30. \quad (c) \quad PV = nRT \therefore \frac{n}{V} = \frac{P}{RT}$$

$$31. \quad (a) \quad P = \frac{nRT}{V} = \frac{2 \times 0.0821 \times 546}{44.8 \text{ l}} = 2 \text{ atm}$$

$$32. \quad (a) \quad \frac{P_1 V_1}{n_1 T_1} = \frac{P_2 V_2}{n_2 T_2} \therefore n_2 = \frac{P_2 V_2 T_1}{P_1 V_1 T_2} n_1$$

$$\text{at STP } n_1 = \text{one mole.}$$

$$P_1 = 1 \text{ atm}$$

$$V_1 = 22.4 \text{ l}$$

$$T_1 = 273 \text{ K}$$

$$n_2 = \frac{1}{1} \times \frac{22.4}{22.4} \times \frac{273}{303} \times 1 = 0.9 \text{ moles}$$

$$33. \quad (b) \quad V = \frac{nRT}{P} = \frac{0.5 \times 0.082 \times 273^\circ \text{K}}{1} = 11.2 \text{ lit}$$

$$34. \quad (b) \quad V_2 = \frac{P_1 V_1 T_2}{P_2 T_1} \Rightarrow P_1 = P; T_1 = 273^\circ \text{K}$$

$$P_2 = \frac{3}{2} P; T_2 = T_1 + \frac{T_1}{3} = \frac{4}{3} \times 273^\circ \text{K}$$

$$V_2 = \frac{2P}{3P} \times \frac{4}{3} \times \frac{273}{273} \times 100 \text{ cc} = \frac{800}{9} \text{ cc} = 88.888 \text{ cc}$$

$$= 88.9 \text{ cc}$$

$$35. \quad (b) \quad \frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2} \therefore \frac{P_1 V_1}{P_2 V_2} = \frac{T_1}{T_2}$$

$$36. \quad (c) \quad d_a = 2d_b; 2M_a = M_b$$

$$PV = nRT = \frac{m}{M} RT; P = \frac{m}{V} \cdot \frac{RT}{M} = \frac{dRT}{M}$$

$$\frac{P_a}{P_b} = \frac{d_a}{d_b} \cdot \frac{M_b}{M_a} = \frac{2d_b}{d_b} \times \frac{2M_a}{M_a} = 4$$

$$37. \quad (d) \quad n \text{ of } O_2 = \frac{16}{32} = \frac{1}{2}$$

$$n \text{ of } H_2 = \frac{3}{2}$$

$$\text{Total no. of moles} = \frac{3}{2} + \frac{1}{2} = 2$$

$$V = \frac{nRT}{P} = \frac{2 \times 0.082 \times 273}{1} = 44.8 \text{ lit} = 44800 \text{ ml}$$

$$38. \quad (c) \quad n = \frac{PV}{RT} = \frac{m}{M}$$

$$m = \frac{MPV}{RT} = \frac{34 \times 2 \times 100}{0.082 \times 293} = 282.4 \text{ gm}$$

$$39. \quad (c) \quad V_2 = \frac{P_1 V_1}{T_1} \cdot \frac{T_1}{P_2} = \frac{760}{600} \times \frac{546}{273} \times 273 = 691.6 \text{ ml}$$

$$40. \quad (a) \quad \frac{P_1 V_1}{n_1 T_1} = \frac{P_2 V_2}{n_2 T_2} \therefore T_2 = \frac{P_2}{P_1} \cdot \frac{V_2}{V_1} \cdot \frac{n_1}{n_2} \cdot T_1$$

$$= \frac{0.75}{1} \times \frac{1}{1} \times \frac{2}{1} \times 300^\circ \text{K} = 450^\circ \text{K}$$

$$41. \quad (b) \quad V_2 = \frac{P_1}{P_2} \cdot \frac{T_2}{T_1} \cdot V_1 = \frac{1}{0.5} \times \frac{250}{300} \times 12000 \text{ lit} = 20000 \text{ lit}$$

$$42. \quad (c) \text{ At constant pressure}$$

$$V \propto nT \propto \frac{m}{M} T$$

$$\frac{V_1}{V_2} = \frac{m_1 T_1}{m_2 T_2} \therefore \frac{T_1}{T_2} = \frac{V_1}{m_1} \times \frac{m_2}{V_2} = \frac{d_2}{d_1} \Rightarrow \frac{300^\circ \text{K}}{T_2} = \frac{0.75d}{d}$$

$$T_2 = \frac{300}{0.75} = 400^\circ \text{K}$$

$$43. \quad (c) \quad \frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2} \therefore T_2 = \frac{P_2 V_2}{P_1 V_1} \times T_1 = \frac{740}{740} \times \frac{80}{100} \times 300$$

$$= 240^\circ \text{K} = -33^\circ \text{C}$$

$$47. \quad (b) \text{ Because } H_2 \text{ \& } Cl_2 \text{ gases may react with each other to produce } HCl \text{ gas hence Dalton's law is not applicable.}$$

$$48. \quad (d) \text{ Because } HCl \text{ \& } NH_3 \text{ gases may react to produce } NH_4Cl \text{ gas. Dalton's Law is applicable for non reacting gas mixtures.}$$

$$49. \quad (b) \quad NH_3 \text{ \& } HCl \text{ \& } HBr \text{ is a reacting gas mixture to produce } NH_4Cl \text{ \& } NH_4Br \text{ so Dalton's law is not applicable.}$$

$$50. \quad (c) \quad \text{No. of moles of lighter gas} = \frac{m}{4}$$

$$\text{No. of moles of heavier gas} = \frac{m}{40}$$

$$\text{Total no. of moles} = \frac{m}{4} + \frac{m}{40} = \frac{11m}{40}$$

$$\text{Mole fraction of lighter gas} = \frac{\frac{m}{4}}{\frac{11m}{40}} = \frac{10}{11}$$

$$\text{Partial pressure due to lighter gas} = P_o \times \frac{10}{11}$$

$$= 1.1 \times \frac{10}{11} = 1 \text{ atm.}$$

52. (a) $m. wt. \text{ of } NH_3 = 17$; $m. wt. \text{ of } N_2 = 28$

$m. wt. \text{ of } CO_2 = 44$; $m. wt. \text{ of } O_2 = 32$

because NH_3 is lightest gas out of these gases

$$\left[r \propto \frac{1}{\sqrt{\text{Molecular Weight}}} \right]$$

55. (a) $\frac{r_g}{r_{He}} = \sqrt{\frac{M_{He}}{M_g}} \therefore M_g = M_{He} \cdot \frac{r_{He}^2}{r_g^2} = \frac{4}{(1.4)^2} = \frac{4}{1.96} = 2$

[Note : $1.4 = \sqrt{2}$]

56. (a) $r_g = \frac{1}{5} r_{H_2}$

$$\frac{M_g}{M_{H_2}} = \left[\frac{r_{H_2}}{r_g} \right]^2 = (5)^2 = 25 ; M_g = 2 \times 25 = 50$$

57. (b) $r_g = \frac{1}{6} r_{H_2}$; $M_g = M_{H_2} \cdot \left[\frac{r_{H_2}}{r_g} \right]^2 = 2 \times 6^2 = 2 \times 36 = 72$

58. (a) $M_1 = 64$; $r_2 = 2r_1$

$$M_2 = M_1 \left[\frac{r_1}{r_2} \right]^2 = 64 \times \frac{1}{4} = 16$$

59. (b) $r_o = r_H \sqrt{\frac{d_H}{d_o}} = 1 \sqrt{\frac{0.09}{1.44}} = \sqrt{\frac{1}{16}} = \frac{1}{4}$

60. (a) $r_a = 5r_b$; $\frac{d_a}{d_b} = \left[\frac{r_b}{r_a} \right]^2 = \left(\frac{1}{5} \right)^2 = \frac{1}{25}$

61. (b) $\frac{d_1}{d_2} = \frac{1}{16}$; $\frac{r_1}{r_2} = \sqrt{\frac{d_2}{d_1}} = \sqrt{16} = \frac{4}{1}$

62. (d) $\frac{D_A}{D_B} = \sqrt{\frac{\rho_B}{\rho_A}} = \left[\frac{\rho_B}{\rho_A} \right]^{\frac{1}{2}}$; $\therefore D_A = D_B \left(\frac{\rho_B}{\rho_A} \right)^{\frac{1}{2}}$

63. (c) Gases may be separated by this process because of different rates of diffusion due to difference in their densities.

64. (b) NH_4Cl ring will first formed near the HCl bottle because rate of diffusion of NH_3 is more than that of HCl because $M_{NH_3} : M_{HCl} = 17 : 36.5$. SO NH_3 will reach first to the HCl bottle & will react there with HCl to form NH_4Cl ring

65. (d) Because both NO and C_2H_6 have same molecular weights [$M_{NO} = M_{C_2H_6} = 30$] and rate of diffusion $\propto$ molecular weight.

67. (d) $\frac{M_A}{M_B} = \left(\frac{r_B}{r_A} \right)^2 \therefore r_A = 2r_B \therefore \frac{r_B}{r_A} = \frac{1}{2} = \frac{1}{(2)^2} = \frac{1}{4} = .25$

68. (a) $r_H = \frac{2gm}{10 \text{ min}}$ if $r_O = \frac{xgm}{10 \text{ min}}$

$$r_O = r_H \sqrt{\frac{M_{H_2}}{M_{O_2}}} = \frac{2}{10} \sqrt{\frac{2}{32}}$$

$$\frac{x}{10} = \frac{2}{10 \times 4} = \frac{1}{2} gm. = .5gm$$

69. (a) $r_{CH_4} = 2r_g$

$$M_g = M_{CH_4} \left(\frac{r_{CH_4}}{r_g} \right)^2 = 16 \times 2^2 = 64$$

70. (b) $r \propto \frac{1}{\sqrt{M}} \therefore r = \frac{\text{Volume effused}}{\text{time taken}} = \frac{V}{t}$

$$\frac{V}{t} \propto \frac{1}{\sqrt{M}} \therefore \text{for same volumes (V constant)}$$

$$t \propto \sqrt{M} \therefore \frac{t_1}{t_2} = \sqrt{\frac{M_1}{M_2}}$$

$$t_{He} = t_{H_2} \sqrt{\frac{M_{He}}{M_{H_2}}} = 5 \sqrt{\frac{4}{2}} = 5\sqrt{2} s.$$

$$t_{O_2} = t = 5 \sqrt{\frac{32}{2}} = 20 s$$

$$t_{CO} = 5 \sqrt{\frac{28}{2}} = 5\sqrt{14} s ; t_{CO_2} = 5 \sqrt{\frac{44}{2}} = 5\sqrt{22} s$$

71. (c) $\frac{r_{N_2}}{r_{SO_2}} = \frac{V_{rms} N_2}{V_{rms} SO_2} = \sqrt{\frac{T_{N_2}}{T_{SO_2}} \cdot \frac{M_{SO_2}}{M_{N_2}}} = \sqrt{\frac{T_{N_2}}{323} \times \frac{64}{28}}$

$$1.625 = \sqrt{\frac{T_{N_2}}{323} \cdot \frac{16}{7}}$$

$$T_{N_2} = \frac{(1.625)^2 \times 323 \times 7}{16} = 373^\circ K$$

72. (a) $C + H_2O \rightarrow CO_{(g)} + H_{2(g)}$

12 gm C produces 2mole of gases (1mole CO & 1 mole of H)

$$\therefore 48 gm C \text{ may produce } \frac{48}{12} \times 2 = 4 \times 2 = 8 \text{ mole}$$

$$= 22.4 \times 8 \text{ L gases} = 179.2 \text{ L gas.}$$

73. (d) Molecular weight = $\frac{mRT}{PV} = \frac{4.4 \times .082 \times 273}{1 \times 2.24} = 44$

So the gas should be CO_2

74. (c) $PV = nRT$

$$P = \frac{n}{V} RT \therefore \frac{n}{V} = C \Rightarrow P = CRT$$

$$T = \frac{P}{CR} = \frac{1}{1 \times .821} = 12^\circ K$$

75. (a) 6.02×10^{22} molecules of each N_2, O_2 and H_2

$$= \frac{6.02 \times 10^{22}}{6.02 \times 10^{23}} \text{ moles of each}$$

$$\text{Weight of mixture} = \text{weight of } 0.1 \text{ mole } N_2 + \text{weight of } 0.1 \text{ mole } H_2 + \text{weight of } 0.1 \text{ mole of } O_2$$

$$= (28 \times 0.1) + (2 \times 0.1) + (32 \times 0.1) = 6.2gm$$

76. (c) $M. wt \text{ of } CO_2 = 12 + 16 + 16 = 44$

Volume of 44 gm of CO_2 at NTP = 22.4 litre

$$1 gm \text{ of } CO_2 \text{ at NTP} = \frac{22.4}{44}$$

4.4 gm of CO_2 at N.T.P

$$\Rightarrow \frac{22.4}{44} \times 4.4 \text{ litre} = 2.24 \text{ litre}$$

78. (b) No. of moles of CO_2 present in 200 ml solution
 $= \text{molarity} \times \text{Volume (in lt)} = 0.1 \times \frac{200}{1000} = .02$
 Volume of 0.02 mole of $CO_2 = 22.4 \times .02 \text{ lt} = 0.448 \text{ lit}$
79. (b) Molecular weight = $V.d. \times 2 = 11.2 \times 2 = 22.4$
 Volume of 22.4 gm Substance of NTP = 22.4 litre
 1 gm substance at NTP = $\frac{22.4}{22.4} \text{ litre}$
 11.2 gm substance of NTP = 11.2 litre
80. (b) $\frac{M.wt. of O_2}{M.wt. of SO_2} \Rightarrow \frac{M_1}{M_2} \Rightarrow \frac{32}{64} = \frac{1}{2}$
 The weight of oxygen will be $\frac{1}{2}$ that of SO_2
81. (b) For HI has the least volume because of greater molecular weight $V \propto \frac{1}{M}$
83. (c) Since no. of molecules is halved so pressure should also be halved.
84. (c) H_2 will be filled first because of lower molecular weight
85. (a) Mixture of SO_2 and Cl_2 are reacted chemically and forms SO_2Cl_2 . That is why mixture of these gases is not applicable for Dalton's law.
86. (d) According to Boyle's law
 $P_1V_1 = P_2V_2 \Rightarrow P_1 \times 60 = 720 \times 100$
 $P_1 = \frac{720 \times 100}{60} = 1200 \text{ mm}$
87. (a) Rate of diffusion $\propto \frac{1}{\sqrt{\text{Molecular Mass}}}$
 that is why H_2 gas diffuse first
88. (a) Solution level will rise, due to absorption of CO_2 by sodium hydroxide.
 $2NaOH + CO_2 \rightarrow Na_2CO_3 + H_2O$
89. (c) $CaCO_3 \xrightarrow{(40+12+16 \times 3)=100 \text{ gm}} CaO + CO_2 \uparrow$
 $\xrightarrow{22.4 \text{ litre}}$
 $\therefore$ At S.T.P. 100g $CaCO_3$ produce = 22.4 litre of CO_2
 $\therefore$ At S.T.P. 1g $CaCO_3$ produce = $\frac{22.4}{100} = .224 \text{ litre}$ of CO_2
90. (c) The density of gas = $\frac{\text{Molecular wt. Of Metal}}{\text{Volume}} = \frac{45}{22.4}$
 $= 2 \text{ gmlitre}^{-1}$
91. (a) $M_1 = 32 \text{ g}$ for O_2 , $M_2 = 2 \text{ g}$ for H_2
 $\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}}$; $\frac{r_1}{r_2} = \sqrt{\frac{2}{32}} = \sqrt{\frac{1}{16}} = \frac{1}{4}$
92. (c) In 22.4l of H_2 maximum number of molecules = 6.023×10^{23}

In 1l of H_2 maximum number of molecules
 $= \frac{6.023 \times 10^{23}}{22.4}$

In 15l of H_2 maximum number of molecules
 $= \frac{6.023 \times 10^{23}}{22.4} \times 15 = 4.03 \times 10^{23}$ molecules.

93. (a) 22.4l O_2 at S.T.P. = 32gm of O_2
 1l O_2 at S.T.P. = $\frac{32}{22.4} = 1.43 \text{ gm}$ of O_2
95. (a) We know that molecular mass of hydrogen $M_1 = 2$ and that of helium $M_2 = 4$, we also know that Graham's law of diffusion
 $\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}} = \sqrt{\frac{4}{2}} = \sqrt{2} = 1.4$; $r_1 = 1.4m$
96. (a) $\frac{r_A}{r_H} = \sqrt{\frac{M_H}{M_A}} = \frac{r}{6r} = \sqrt{\frac{2}{M_A}}$
 $M_A = 6 \times 6 \times 2 = 72 \text{ g}$
97. (d) Given that:
 $V_1 = 100 \text{ ml}$, $P_1 = 720 \text{ mm}$, $V_2 = 84 \text{ ml}$, $P_2 = ?$
 By using $P_1V_1 = P_2V_2$ [According to the Boyle's law]
 $P_2 = \frac{P_1V_1}{V_2} = \frac{720 \times 100}{84} = 857.142$
 Hence, $P_2 = 857.14 \text{ mm}$
98. (b) According to gas law
 $PV = nRT$, $n = \frac{PV}{RT}$
 $\frac{n_A}{n_B} = \frac{\frac{P_1V_1}{RT_1}}{\frac{P_2V_2}{RT_2}}$; $\frac{n_A}{n_B} = \frac{P_1V_1}{T_1} \times \frac{T_2}{P_2V_2}$
 $\frac{n_A}{n_B} = \frac{2P \times 2V}{2T} \times \frac{T}{PV}$; $\frac{n_A}{n_B} = \frac{2}{1}$
99. (e) No. of molecules = $2 \times V.d$
 $2 \times 38.3 = 76.3$
 $wt. of NO_2 = x$
 So that $wt. of N_2O_4 = 100 - x$
 Hence, $\frac{x}{46} + \frac{100-x}{92} = \frac{100}{76.6} = \frac{2x+100-x}{92} = \frac{100}{76.6}$
 $x = 20.10$, no. of mole. of $NO_2 = \frac{20.10}{46} = 0.437$
100. (a) Given that
 $P_1 = 76 \text{ cm}$ of Hg (Initial pressure at N.T.P.)
 $P_2 = ?$, $V_1 = 5 \text{ litre}$, $V_2 = 30 + 5 = 35 \text{ litres}$
 According to Boyle's law
 $P_1V_1 = P_2V_2$; $76 \times 5 = P_2 \times 35$
 $P_2 = \frac{76 \times 5}{35} \Rightarrow P_2 = 10.8 \text{ cm}$ of Hg
101. (c) Given initial volume (V_1) = 300cc, initial temperature (T_1) = $27^\circ C = 300K$, initial pressure (P_1) = 620mm, final

temperature $T_2 = 47^\circ\text{C} = 320\text{K}$ and final pressure $(P_2) = 640\text{mm}$. We know from the general gas equation

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2} = \frac{620 \times 300}{300} = \frac{640 \times V_2}{320} \Rightarrow V_2 = 310\text{cc}$$

102. (c) $\text{NH}_3 + \text{HCl} \rightarrow \text{NH}_4\text{Cl}$

4litre 1.5litre

HCl is a limiting compound. That's why 1.5litre of HCl reacts with 1.5litre of NH_3 and forms NH_4Cl . Thus (4 - 1.5) 2.5litre NH_3 remains after the reaction.

103. (c) $\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$; $\frac{P_1 \times 4}{T_1} = \frac{2P_1 \times V_2}{2T_1}$

$$8 = 2 \times V_2 \text{ so } V_2 = 4\text{dm}^3$$

104. (c) $P_1 = P, V_1 = V, T_1 = T$

$$P_2 \frac{P}{2}, V_2 = ?, T_2 = T$$

According to gas equation

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2} \text{ or } \frac{PV}{T} = \frac{PV_2}{2T}$$

$$\therefore V_2 = 4V$$

105. (a) $P_1 = P, V_1 = V, T_1 = 273 + 75 = 348\text{K}$

$$P_2 = 2P, V_2 = \frac{85}{100}, T_2 = ?$$

$$\frac{P \times V}{398} = \frac{2P \times 85V}{T_2 \times 100} \Rightarrow T_2 = \frac{348 \times 2 \times 85}{100}$$

$$\therefore T_2 = 591.6\text{K} = 318.6^\circ\text{C}$$

106. (a) Boyle's law $-PV = \text{constant}$
On differentiating the equation,
 $d(PV) = d(C) \Rightarrow PdV + VdP = 0$
 $\Rightarrow VdP = -PdV \Rightarrow \frac{dP}{P} = -\frac{dV}{V}$

Kinetic molecular theory of gases and Molecular collisions

4. (d) Kinetic energy $= \frac{3}{2} RT$

5. (b) $KE = \frac{3}{2} RT$ it means that KE depends upon T (absolute temperature) only.

7. (a) $KE = \frac{3}{2} RT = \frac{3}{2} PV$

$$\therefore P = \frac{2}{3} \frac{E}{V} \text{ for unit volume } (V=1) \Rightarrow P = \frac{2}{3} E$$

8. (c) Tr. $KE = \frac{3RT}{2}$ it means that the Translational Kinetic energy of Ideal gas depends upon temperature only.

9. (b) $\frac{E_{\text{He}}}{E_{\text{H}_2}} = \sqrt{\frac{T_{\text{He}}}{T_{\text{H}_2}}}$ so energies will be same for

He & H_2 at same temperature.

11. (a) $KE = \frac{3}{2} RT = \frac{3}{2} \cdot 2T \quad \therefore R \approx 2\text{calK}^{-1}\text{mol}^{-1}$
 $KE = 3T$

12. (d) All molecules of an ideal gas show random motion. They collide with each other and walls of container during which they lose or gain energy so they may not have same kinetic energy always.

13. (a) For same temperature kinetic energies of H_2 & He molecules will be same because kinetic energy depends only on temperature.

14. (a) For same temp. kinetic energies would be equal for all molecules, what ever their molecular weights will be, it doesn't matter.

15. (a,c,d) Kinetic energies per molecule will be same because it is proportional to absolute temperature only.

$$\frac{d_{\text{N}_2}}{d_{\text{CO}_2}} = \frac{M_{\text{N}_2}}{M_{\text{CO}_2}} = \frac{28}{44} \text{ i.e. } d_{\text{N}_2} < d_{\text{CO}_2}$$

Total translational kinetic energy will also be same because at same temperature & pressure number of molecules present in same volume would be same (according to Avogadro's Law)

16. (a) On increasing pressure, the volume decreases and density increases. So molecules get closer to each other hence mean free path also decreases.

17. (b) Most probable velocity increase and fraction of molecule possessing most probable velocity decrease.

18. (d) $PV = nRT = \frac{m}{M} RT$

$$\therefore \frac{m}{V} = \frac{PM}{RT} = \text{density}$$

19. (b) $d \propto \frac{P}{T}$ the value of $\frac{P}{T}$ is maximum for (b)

20. (d) If inversion temperature is $80^\circ\text{C} = 193^\circ\text{K}$ then the temperature, at which it will produce cooling under Joule Thomson's effect, would be below inversion temperature except 173°K all other values given as

21. (a) Since $\frac{C_p}{C_v} = 1.4$, the gas should be diatomic.

If volume is 11.2 lt then, no. of moles = $\frac{1}{2}$

$$\therefore \text{no. of molecules} = \frac{1}{2} \times \text{Avagadro's No.}$$

no. of atoms = $2 \times \text{no. of molecules}$

$$2 \times \frac{1}{2} \times \text{Avagadro's No.}$$

$$= 6.0223 \times 10^{23}$$

22. (d) Density $= \frac{M}{V}$

$$d = \frac{v \cdot d \times 2}{V} \quad (M = V \cdot d \times 2)$$

$$V \cdot d = \frac{d \times V}{2}$$

$$V \cdot d = \frac{0.00130 \times 22400}{2} = 14.56\text{gm}^{-1}$$

23. (c) Volume of steam = 1lt = 10^3cm^3

$$\therefore m = d \cdot V$$

$$\therefore \text{mass of } 10^3\text{cm}^3 \text{ steam} = \text{density} \times \text{Volume}$$

$$= \frac{0.0006\text{gm}}{\text{cm}^3} \times 10^3\text{cm}^3 = 0.6\text{gm}$$

Actual volume occupied by H_2O molecules is equal to volume of water of same mass

$\therefore$ Actual volume of H_2O molecules in 6gm steam

= mass of steam/density of water

$$= 0.6 \text{ gm} / 1 \text{ gm/cm}^3 \Rightarrow 0.6 \text{ cm}^3$$

24. (b) $r = \frac{C_p}{C_v} = \frac{5}{3} = 1.66$ (For Monoatomic as He, Ne, Ar)

25. (b) The density of neon will be highest at 0°C 2 atm according to $d \propto \frac{P}{T}$

29. (d) $K.E. \text{ per mole} = \frac{3}{2} RT$

so all will have same K.E. at same temperature.

30. (c) $\therefore W = P.dV = E$

$\therefore$ Energy per unit volume = P

31. (c) $d \propto M \Rightarrow \frac{d_1}{d_2} = \frac{M_1}{M_2}; \frac{3d}{d} = \frac{M}{M_2}; M_2 = \frac{M}{3}$

Molecular speeds

1. (a) $V_{rms} = \sqrt{\frac{3RT}{M}}, V_{av} = \sqrt{\frac{8RT}{\pi M}}; \frac{V_{rms}}{V_{av}} = \sqrt{\frac{3\pi}{8}}$

$$= \sqrt{\frac{66}{56}} \Rightarrow \frac{1.086}{1}$$

3. (d) most probable velocity : mean velocity : V_{rms}
 $= \sqrt{\frac{2RT}{M}} : \sqrt{\frac{8RT}{\pi M}} : \sqrt{\frac{3RT}{M}} = \sqrt{2} : \sqrt{\frac{8}{\pi}} : \sqrt{3}$

4. (d) $V_{rms} = \sqrt{\frac{3RT}{M}} \therefore V_{rms} \propto \frac{1}{\sqrt{M}}$ at same T

because H_2 has least molecular weight so its r.m.s. velocity should be maximum.

5. (d) $\frac{U_{SO_2}}{U_{He}} = \frac{1}{2} = \sqrt{\frac{M_{He}}{M_{SO_2}} \cdot \frac{T_{SO_2}}{T_{He}}} = \sqrt{\frac{4}{64} \cdot \frac{T_{SO_2}}{300}}$
 $= \frac{4}{64} \cdot \frac{T_{SO_2}}{300} = \frac{1}{4}; T_{SO_2} = 1200^\circ\text{K}$

6. (c) $\frac{U_{O_3}}{U_{O_2}} = \sqrt{\frac{M_{O_2}}{M_{O_3}}} = \sqrt{\frac{32}{48}} = \sqrt{\frac{2}{3}}$

7. (b) Average kinetic energy per molecule
 $= \frac{3}{2} KT = \frac{3}{2} \times 1.38 \times 10^{-23} \times 300 \text{ J} = 6.17 \times 10^{-21} \text{ J}$

8. (b) $\frac{U_{SO_2}}{U_{O_2}} = \sqrt{\frac{M_{O_2} T_{SO_2}}{M_{SO_2} T_{O_2}}} = \sqrt{\frac{32 \times T_{SO_2}}{64 \times 303}} = 1$
 $1 = \frac{32 \times T_{SO_2}}{64 \times 303} \Rightarrow T_{SO_2} = 606$

9. (d) Among these Cl_2 has the highest molecular weight so it will possess lowest root mean square velocity.

10. (b) $\frac{U_1}{U_2} = \sqrt{\frac{T_1}{T_2}} \therefore \frac{T_1}{T_2} = \left(\frac{5 \times 10^4}{10 \times 10^4} \right)^2 = \frac{1}{4}$

12. (c) $V_{rms} = \sqrt{\frac{3KT}{\text{Molecular weight}}} \text{ i.e. } V_{rms} \propto \frac{1}{\sqrt{m}} \propto (m)^{-\frac{1}{2}}$

13. (a) When average speed of molecule is increased due to increase in temperature then the change in momentum during collision between wall of container and molecules of gas also increases.

14. (d) $\frac{U_1}{U_2} = \sqrt{\frac{m_2}{m_1} \cdot \frac{T_1}{T_2}} \therefore T_1 = T_2$

$$\frac{U_1^2}{U_2^2} = \frac{m_2}{m_1} \therefore m_1 U_1^2 = m_2 U_2^2$$

15. (d) $U_2 = U_1 \sqrt{\frac{T_2}{T_1}} = U_1 \sqrt{\frac{1200}{300}} = U_1 \times 2$

r.m.s. velocity will be doubled.

16. (c) $\frac{U_{H_2}}{U_{O_2}} = \sqrt{\frac{T_{H_2}}{M_{H_2}} \cdot \frac{M_{O_2}}{T_{O_2}}} = \sqrt{\frac{50}{2} \cdot \frac{32}{800}} = 1$

17. (d) $U = \sqrt{\frac{3RT}{M}} = \sqrt{\frac{3PV}{M}} = \sqrt{\frac{3P}{d}} \therefore U \propto \frac{1}{\sqrt{d}}$

19. (b) $\frac{U_1}{U_2} = \sqrt{\frac{n_1 T_1}{n_2 T_2}} = \sqrt{\frac{n \times T}{2n \times 2T}} = \sqrt{\frac{1}{4}} = \frac{1}{2}$
 $U_2 = 2U_1 = 2U$

21. (c) $\frac{V_{mp}}{V_{av}} = \frac{\sqrt{\frac{2RT}{M}}}{\sqrt{\frac{8RT}{\pi M}}} = \frac{\sqrt{\pi}}{2}$

22. (a) $V_{rms} = \sqrt{\frac{3RT}{M}} \Rightarrow V_{rms} = \sqrt{T}$

Given $V_1 = V, T_1 = 300\text{K}, V_2 = 2V, T_2 = ?$

$$\frac{V_1}{V_2} = \sqrt{\frac{T_1}{T_2}}; \left(\frac{V}{2V} \right)^2 = \frac{300}{T_2} \Rightarrow T_2 = 300 \times 4 = 1200\text{K}$$

24. (b) $\left(P - \frac{n^2 a}{V^2} \right) (V - nb) = nRT$
 $\left(P - \frac{(2)^2 \times 4.17}{(5)^2} \right) (5 - 2 \times 0.03711) = 2 \times 0.0821 \times 300$

$$P = \frac{2 \times 0.0821 \times 300}{5 - 2 \times 0.03711} - \frac{4.17 \times 2^2}{5^2} \Rightarrow 10 - 0.66 = 9.33\text{atm}$$

26. (a) Average speed : most probable speed
 $\sqrt{\frac{8RT}{\pi M}} : \sqrt{\frac{2RT}{M}} \Rightarrow \sqrt{\frac{8}{\pi}} : \sqrt{2} \Rightarrow 1.128 : 1$

27. (d) $v_{rms} = \sqrt{\frac{3RT}{M}}$
 $\sqrt{30^2 R} = \sqrt{\frac{3RT}{M}} \Rightarrow 30 \times 30R = \frac{3R \times 300}{M}$
 $\Rightarrow M = \frac{3 \times 300}{30 \times 30} \text{ gm} = 0.001\text{kg}$

Real gases and Vander waal's equation

2. (b) Because molecules of real gases have intermolecular forces of attraction so the effective impact on the wall of container is

diminished. Pressure of real gas is reduced by $\frac{a}{V^2}$ factor hence

behaviour of real gas deviate from ideal behaviour.

3. (c) $Z = \frac{PV}{RT}$ $\therefore$ for ideal gas $PV = RT$ so $Z = 1$
12. (b) $Z = \frac{PV}{RT}$; for ideal gas $PV = RT$; so $Z = 1$
13. (b) Ideal gas has no attractive force between the particles
14. (d) $PV = nRT$ is a ideal gas equation it is allowed when the temperature is high and pressure is low.
16. (b) At Boyle temperature real gas is changed into ideal gas
17. (a) When pressure is low
- $$\left[P + \frac{a}{V^2}\right](V - b) = RT$$
- or $PV = RT + Pb - \frac{a}{V} + \frac{ab}{V^2}$ or $\frac{PV}{RT} = 1 - \frac{a}{VRT}$
- $$Z = -\frac{a}{VRT} \left(\because \frac{PV}{RT} = Z\right)$$
18. (b) At high temperature and low pressure, Vander Waal's equation is reduced to ideal gas equation.
- $$PV = nRT$$
- $$PV = RT \text{ (For 1 mole of gas)}$$
20. (a) Vander waal's constant for volume correction b is the measure of the effective volume occupied by the gas molecule.
22. (a) $\left(P + \frac{n^2 a}{V^2}\right)(V - nb) = nRT$
- $$\left(P + \frac{2.253}{0.25 \times 0.25}\right)(0.25 - 0.0428) = 0.0821 \times 300$$
- or $(P + 36.048)(0.2072) = 24.63$
- $$\Rightarrow P + 36.048 = 118.87 \Rightarrow P = 82.82 \text{ atm.}$$

Critical state and Liquefaction of gases

2. (b) A diabatic demagnetisation is a technique of liquefaction of gases in which temperature is reduced.
3. (d) An ideal gas can't be liquefied because molecules of ideal gas have not force of attraction between them.
4. (c) At above critical temperature, substances are existing in gaseous state, since gas cannot be liquefied above it.
5. (d) Absence of inter molecular attraction ideal gas cannot be liquefied at any volume of P and T .
6. (d) For Z gas of given gases, critical temperature is highest
- $$T_c = \frac{8a}{27Rb} \Rightarrow T_c = \frac{8 \times 12}{27 \times 0.0821 \times 0.027} = 1603.98K$$
7. (c) Value of constant a is greater than other for NH_3 that's why NH_3 can be most easily liquefied.
8. (c) The temperature below which the gas can be liquefied by the application of pressure alone is called critical temperature.
10. (c) $d = \frac{M}{V} \Rightarrow M = d \times V$
- $$M = 2.68 \times 22.4 \text{ at N.T.P. } (\because V = 22.41)$$
- $$M = 60.03 \text{ gm}$$
- $$m. \text{ wt of } COS = 12 + 16 + 32 = 60$$
11. (c) 22400 ml is the volume of O_2 at N.T.P. = 32 gm of O_2
- $$1 \text{ ml is the volume of } O_2 \text{ at NTP} = \frac{32}{22400}$$
- $$112 \text{ ml is the volume of } O_2 \text{ at NTP} = \frac{32}{22400} \times 112$$

$$= 0.16 \text{ gm of } O_2$$

Critical Thinking Questions

1. (a) Average kinetic energy $\propto (T \text{ Kelvin})$
- $$(\text{Factor}) \frac{K.E_2}{K.E_1} = \frac{T_2}{T_1} = \frac{40 + 273}{20 + 273} = \frac{313}{293}$$
2. (c) $M. \text{ wt} = V.d \times 2$
- $$= 70 \times 2 = 140 \Rightarrow x = \frac{m. \text{ wt.}}{\text{wt. of } [CO]} = \frac{140}{[12 + 16]} = 5$$
3. (c) Gas deviate from ideal gas behaviour to real gas (according to Vander Waal's at low temperature and high pressure)
4. (c) At same temperature and pressure, equal volumes have equal number of molecules. If 1 lit. of oxygen consists N molecules then at same temperature and pressure 1 lit of SO_2 will consists N molecules. So 2 lit. of SO_2 will contain $2N$ molecules.
5. (a) $V_{av} : V_{rms} : V_{\text{most probable}} = V : U : \alpha$
- $$\sqrt{\frac{8RT}{\pi M}} : \sqrt{\frac{3RT}{M}} : \sqrt{\frac{2RT}{M}}$$
- $$\alpha : V : U = \sqrt{2} : \sqrt{\frac{8}{\pi}} : \sqrt{3} = 1 : 1.128 : 1.224$$
6. (d) $\frac{C_p}{C_v}$ ratio for diatomic gases is 1.40 at lower temperature & 1.29 at higher temperature so the answer is 'd'.
7. (b) $PV = nRT$ (For ideal gas)
- $$Z = \frac{PV}{nRT} = 1 \text{ (For ideal gas)}$$
8. (b) If $Z < 1$ then molar volume is less than 22.4 L
9. (a) $r_{O_2} = \frac{x}{18} \text{ mole / sec} \Rightarrow r_g = \frac{x}{45} \text{ mol / sec}$
- $$M_g = M_{O_2} \left(\frac{r_{O_2}}{r_g}\right)^2 = 32 \left(\frac{x}{18} \times \frac{45}{x}\right)^2 = 32 \times \frac{45^2}{18^2}$$
10. (a) $r_{SO_2} : r_{O_2} : r_{CH_4} = \frac{1}{\sqrt{M_{SO_2}}} : \frac{1}{\sqrt{M_{O_2}}} : \frac{1}{\sqrt{M_{CH_4}}}$
- $$= \frac{1}{\sqrt{64 : 32 : 16}} = \frac{1}{\sqrt{4 : 2 : 1}}$$
- $$\frac{1}{2} : \frac{1}{\sqrt{2}} : \frac{1}{1} ; \frac{2}{2} : \frac{2}{\sqrt{2}} : \frac{2}{1} ; 1 : \sqrt{2} : 2$$
11. (a) Root mean square speed = $\left[\frac{n_1 c_1^2 + n_2 c_2^2 + n_3 c_3^2 + \dots}{n_1 + n_2 + n_3 + \dots}\right]^{1/2}$
12. (b) If 40 ml O_2 will diffuse in t min. then. $r_{O_2} = \frac{40}{t}$
- $$r_H = \frac{50}{20} \Rightarrow r_O = r_H \sqrt{\frac{M_{H_2}}{M_{O_2}}} = \frac{50}{20} \sqrt{\frac{2}{32}} = \frac{50}{20} \cdot \frac{1}{4}$$
- $$\frac{40}{t} = \frac{50}{80} \therefore t = \frac{40 \times 80}{50} = 60 \text{ min.}$$
13. (b) $\frac{V_{av} CH_4}{V_{ab} O_2} = \sqrt{\frac{T_{CH_4}}{T_{O_2}}} \cdot \frac{M_{O_2}}{M_{CH_4}} = 1$
- $$\frac{T_{CH_4}}{300} \cdot \frac{32}{16} = 1 ; T_{CH_4} = 150^\circ K$$
14. (c) Pressure of O_2 (dry) = 751 - 21 = 730 mm Hg

$$= \frac{730}{760} = 0.96 \text{ atm}$$

15. (b) $PV = nRT$, $n = \frac{PV}{RT} = \frac{1 \times 145}{0.082 \times 3} = 5.8 \approx 6 \text{ mole}$.

16. (a) $V = \frac{nRT}{P} = \frac{m}{M} \cdot \frac{RT}{P} = \frac{1}{58} \times \frac{0.82 \times 350}{1} = 0.495 \text{ lit}$
 $= 495 \text{ cm}^3$

17. (b) $\frac{r_{\text{He}}}{r_{\text{CH}_4}} = \sqrt{\frac{M_{\text{CH}_4}}{M_{\text{He}}}} = \sqrt{\frac{16}{4}} = 2$

18. (b) $\frac{V_1}{V_2} = \frac{T_1}{T_2} \therefore T_2 = \frac{T_1 V_2}{V_1} = 300^\circ \text{K}$, $\frac{2V}{V} = 600^\circ \text{K}$
 $T_2 = 600^\circ \text{K} = (600 - 273)^\circ \text{C} = 327^\circ \text{C}$

19. (a) no. of moles of $\text{O}_2 = \frac{4}{32} = 0.125$

no. of moles of $\text{H}_2 = \frac{2}{2} = 1$

total no. of moles = $1 + 0.125 = 1.125$

$P = \frac{nRT}{V} = \frac{1.125 \times 0.082 \times 273}{1} = 25.184 \text{ atm}$.

20. (d) $\frac{P_1}{P_2} = \frac{1}{2}$, $\therefore \frac{V_1}{V_2} = \frac{P_2}{P_1} = 2$

$\frac{2L}{V_2} = \frac{2}{1}$; $V_2 = 1L$

21. (c) $\frac{V_2}{V_1} = \frac{T_2}{T_1}$

$\therefore V_2 = \frac{T_2}{T_1} V_1 = \frac{310^\circ \text{K}}{300^\circ \text{K}} \times 300 \text{ cm}^3 = 310 \text{ cm}^3$

22. (c) $V_2 = \frac{T_2}{T_1} V_1 = \frac{270^\circ \text{K}}{300^\circ \text{K}} \times 300 \text{ ml} = 270 \text{ ml}$

8. (b) $\frac{V_1}{T_1} = \frac{V_2}{T_2}$ (Initial fraction $\frac{V_1}{V_2} = 1$ when temperature is

27°C . At 127°C the new fraction is $\frac{V_1}{V_2} = \frac{300}{400} = \frac{3}{4} \therefore$

air expelled $\Rightarrow 1 - \frac{3}{4} = \frac{1}{4}$

9. (a) In case of H_2 , compressibility factor increases with the pressure. At 273 K , $Z > 1$ which shows that it is difficult to compress the gas as compared to ideal gas. In this case repulsive forces dominate.

10. (b) In real gases, the intermolecular forces of attraction and the volume occupied by the gas molecules cannot be neglected.

11. (a) When the temperature increase, the average speed of gas molecules increases and by this increase the pressure of gas is also increases.

12. (a) It is correct that gases do not settle to the bottom of container and the reason for this is that due to higher kinetic energy of gaseous molecules they diffuse.

13. (c) The assertion, that a mixture of helium and oxygen is used for deep sea divers, is correct. The He is not soluble in blood. Therefore, this mixture is used.

14. (e) Dry air is heavier than wet air because the density of dry air is more than water.

15. (d) All molecule of a gas have different speed. Therefore, they move by its own speed.

16. (c) Assertion is true but reason is false because of effusion rate $\propto \frac{1}{\sqrt{M}}$ (Molecular weight) but it does not depend on molecular size.

Assertion & Reason

1. (c) Pressure is inversely proportional to volume (Boyle's law).
 $p \propto \frac{1}{V}$ (n, T constant).

2. (c) The air pressure decreases with increase in altitude. So the partial pressure of Oxygen is not sufficient for breathing at higher altitude and thus pressurization is needed.

3. (a) At a given temperature and pressure the volume of a gas is directly proportional to the amount of gas $V \propto n$ (P and T constant).

4. (d) According to Dalton's law of partial pressure, the pressure exerted by a mixture of non-interacting gases is equal to the sum of their partial pressures (pressure exerted by individual gases in mixture) $P_{\text{Total}} = P_1 + P_2 + P_3 \dots$ (T and V constant). Both the gases if non-interacting would spread uniformly to occupy the whole volume of the vessel.

5. (a) Considering the attractive force pressure in ideal gas equation ($PV = nRT$) is correct by introducing a factor of $\frac{an^2}{V^2}$ where a is a vander waal's constant.

6. (d) $\mu_{\text{rms}} = \sqrt{\frac{3RT}{M}}$ is inversely related to molecular mass.

Therefore, $\mu_{\text{rms}}(\text{CO}) > \mu_{\text{rms}}(\text{CO}_2)$.

Gaseous State

Self Evaluation Test - 6

1. Same mass of CH_4 and H_2 is taken in container. The partial pressure caused by H_2 is [IIT 1989; CPMT 1996]
- (a) 8 / 9 (b) 1 / 9
(c) 1 / 2 (d) 1
2. The following graph illustrates [JIPMER 2000]
- 
- (a) Dalton's law (b) Charles's law
(c) Boyle's law (d) Gay-Lussac's law
3. If the pressure and absolute temperature of 2 litres of CO_2 are doubled, the volume of CO_2 would become [CBSE PMT 1991]
- (a) 2 litres (b) 4 litres
(c) 5 litres (d) 7 litres
4. What is kinetic energy of 1g of O_2 at $47^\circ C$ [Orissa JEE 2004]
- (a) $1.24 \times 10^2 J$ (b) $2.24 \times 10^2 J$
(c) $1.24 \times 10^3 J$ (d) $3.24 \times 10^2 J$
5. The root mean square speeds at STP for the gases H_2, N_2, O_2 and HBr are in the order [Pb. CET 1994; CBSE PMT 1991]
- (a) $H_2 < N_2 < O_2 < HBr$
(b) $HBr < O_2 < N_2 < H_2$
(c) $H_2 < N_2 = O_2 < HBr$
(d) $HBr < O_2 < H_2 < N_2$
6. By what ratio the average velocity of the molecule in gas change when the temperature is raised from 50 to $200^\circ C$ [DCE 2003]
- (a) 1.21 / 1 (b) 1.46 / 1
(c) 1.14 / 1 (d) 4 / 1
7. Which of the following volume (V) – temperature (T) plots represents the behaviour of one mole of an ideal gas at one atmospheric pressure [IIT Screening 2002]
- 
- (a) (b) (c) (d)
8. If the average velocity of N_2 molecule is $0.3 m/s$ at $27^\circ C$, then the velocity will be $0.6 m/s$ at [Pb. CET 2001]
- (a) 1200K (b) 600K
(c) 400K (d) 1800K
9. Equal volumes of two gases which do not react together are enclosed in separate vessels. Their pressures at 100 mm and 400 mm respectively. If the two vessels are joined together, then what will be the pressure of the resulting mixture (temperature remaining constant) [CBSE PMT 1981]
- (a) 125 mm (b) 500 mm
(c) 1000 mm (d) 250 mm
10. A gas of volume 100 cc is kept in a vessel at pressure $10^4 Pa$ maintained at temperature $24^\circ C$. If now the pressure is increased to $10^5 Pa$, keeping the temperature constant, then the volume of the gas becomes [AFMC 1992]
- (a) 10 cc (b) 100 cc
(c) 1 cc (d) 1000 cc
11. If a gas is expanded at constant temperature [IIT 1986]
- (a) The pressure increases
(b) The kinetic energy of the molecules remains the same
(c) The kinetic energy of the molecules decreases
(d) The number of molecules of the gas increases
12. The rate of diffusion of SO_2 and O_2 are in the ratio [Assam JET 1991; EAMCET 1980]
- (a) $1 : \sqrt{2}$ (b) $1 : 32$
(c) $1 : 2$ (d) $1 : 4$

1. (a) N_{CH_4} = number of moles of $CH_4 = \frac{m}{16}$
 N_{H_2} = number of moles of $H_2 = \frac{m}{2}$
fraction partial pressure of H_2 is

$$H_2 = \frac{n_{H_2}}{n_{H_2} + n_{CH_4}} = \frac{\frac{m}{2}}{\frac{m}{2} + \frac{m}{16}} = \frac{\frac{m}{2}}{\frac{9m}{16}} = \frac{8}{9}$$
2. (b) According to Charles's Law $V \propto T$
 $V_t = V_o + V_o \alpha t$
compare it with $V = C + mx$
3. (a) $V_2 = \frac{P_1 V_1}{P_2} \cdot \frac{T_2}{T_1} = \frac{P}{2P} \times 2lt \times \frac{2T}{T} = 2lt$
4. (a) K.E. $= \frac{3}{2} nRT = \frac{3}{2} \times \frac{1}{32} \times 8.314 \times 320 J$
 $= 1.24 \times 10^2 J$
5. (b) $V_{rms} \propto \frac{1}{\sqrt{m}}$

$$U_{H_2} : U_{N_2} : U_{O_2} : U_{HBr} = \frac{1}{\sqrt{2}} : \frac{1}{\sqrt{20}} : \frac{1}{\sqrt{32}} : \frac{1}{\sqrt{81}}$$
 is
 $U_{HBr} < U_{O_2} < U_{N_2} < U_{H_2}$
6. (c) $T_1 = 150 + 273 = 423K$; $T_2 = 50 + 273 = 323K$
Hence, $\frac{(V_{av})_1}{(V_{av})_2} = \sqrt{\frac{T_1}{T_2}} = \sqrt{\frac{423}{323}} = \frac{1.14}{1}$
7. (c) $\frac{V_1}{V_2} = \frac{T_1}{T_2} \therefore V_2 = V_1 \cdot \frac{T_2}{T_1} = \frac{22.4 \times 373}{273} = 30.6L$
8. (a) $V_{rms} = \sqrt{\frac{3RT}{M}}$; $V_{rms} = \sqrt{T}$
Given, $V_1 = V$, $T_1 = 300K$
 $V_2 = 2V$, $T_2 = ?$

$$= \frac{V_1}{V_2} = \sqrt{\frac{T_1}{T_2}} = \left(\frac{V}{2V} \right)^2 = \frac{300}{T_2}$$

 $T_2 = 300 \times 4 = 1200K$
9. (d) When two vessels are joined together, the volume will be doubled hence effective pressure will be halved

$$P = \frac{P_1 + P_2}{2} = \frac{100 + 400}{2} = 250mm$$
10. (a) $P_1 V_1 = P_2 V_2$ at constant T
 $10^4 \cdot 100 = 10^5 \times V_2$
 $V_2 = 10cc$
11. (b) Kinetic energy will also remain constant if Temperature is constant.
12. (a) $\frac{r_{SO_2}}{r_{O_2}} = \sqrt{\frac{M_{O_2}}{M_{SO_2}}} = \sqrt{\frac{32}{64}} = \frac{1}{\sqrt{2}}$

Chapter 7 Nuclear Chemistry

"The branch of chemistry which deals with the study of composition of atomic nucleus and the nuclear transformations is known as nuclear chemistry".

The common examples of nuclear processes are radioactivity, artificial transmutations, nuclear fission and nuclear fusion. The nuclear is also an important aspect of chemistry because the energies involved in some of these are million times greater than those in ordinary chemical reactions.

Radioactivity

"Radioactivity is a process in which nuclei of certain elements undergo spontaneous disintegration without excitation by any external means." and the elements whose atoms disintegrate and emit radiations are called radioactive elements.

Henry Becquerel (1891) observed the spontaneous emission of invisible, penetrating rays from potassium uranyl sulphate $K_2UO_2(SO_4)_2$, which influenced photographic plate in dark and were able to produce luminosity in substances like ZnS.

Later on, M.M. Curie and her husband P. Curie named this phenomenon of spontaneous emission of penetrating rays as, **Radioactivity**.

Curies also discovered a new radioactive element Radium from pitchblende (an ore of U i.e. U_3O_8) which is about 3 million times more radioactive than uranium. Now a days about 42 radioactive elements are known.

The radioactivity may be broadly classified into two types,

- (1) If a substance emits radiations by itself, it is said to possess **natural radioactivity**.
- (2) If a substance starts emitting radiations on exposure to rays from some natural radioactive substance, the phenomenon is called **induced** or **artificial radioactivity**.

Radioactivity can be detected and measured by a number of devices like ionisation chamber, Geiger Muller counter, proportional counter, flow counter, end window counter, scintillation counter, Wilson cloud chamber, electroscope, etc.

Nature and characteristics of radioactive emissions

The phenomenon of radioactivity arises because of the decay of unstable nuclei or certain element. The nature of the radiations emitted from a radioactive substance was investigated by Rutherford (1904) by

Fig. 7.1

applying electric and magnetic fields. When these radiation were subjected to electric or magnetic field, these were split into three types α , β and γ – rays.

Characteristics of radioactive rays

α -Ray	β -Ray	γ -Ray
Charge and mass : It carries +2 charge and 4 unit mass.	It carries -1 charge and no mass.	It has no charge and negligible mass.
Identity : Helium nuclei or helium ion ${}_2\text{He}^4$ or He^2+ .	Electron $-1e^0$	High energy raditions.
Action of magnetic field : Deflected towards the cathode.	Deflected to anode.	Not deflected.
Velocity : $1/10^{\text{th}}$ to that of light.	Same as that of light.	Same as that of light.
Ionizing power : Very high nearly 100 times to that of β -rays.	Low nearly 100 times to that of γ -rays.	Very low.
Effect on ZnS plate : They cause luminescence.	Very little effect.	Very little effect.
Penetrating power : Low	100 times that of α -particles.	10 times that of β -particles.
Range : Very small.	More than α -particles.	More
Nature of product : Product obtained by the loss of 1 α -particle has atomic number less by 2 units and mass number less by 4 units.	Product obtained by the loss of 1 β -particle has atomic number more by 1 unit, without any change in mass number.	There is no change in the atomic number as well as in mass number.

Theory of radioactivity disintegration

Rutherford and Soddy, in 1903, postulated that radioactivity is a nuclear phenomenon and all the radioactive changes are taking place in the nucleus of the atom. They presented an interpretation of the radioactive processes and the origin of radiations in the form of a theory known as **theory of radioactive disintegration**. The main points of this theory are,

- (1) The atomic nuclei of the radioactive elements are unstable and liable to disintegrate any moment.
- (2) The disintegration is spontaneous, i.e., constantly breaking. The rate of breaking is not affected by external factors like temperature, pressure, chemical combination etc.

(3) During disintegration, atoms of new elements called daughter elements having different physical and chemical properties than the parent elements come into existence.

(4) During disintegration, either alpha or beta particles are emitted from the nucleus.

The disintegration process may proceed in one of the following two ways,

(i) **α -particle emission** : When an α -particle (${}_2\text{He}^4$) is emitted from the nucleus of an atom of the parent element, the nucleus of the new element, called daughter element possesses atomic mass or atomic mass number less by four units and nuclear charge or atomic number less by 2 units because α -particle has mass of 4 units and nuclear charge of two units.

(ii) **β -particle emission** : β -particle is merely an electron which has negligible mass. Whenever a beta particle is emitted from the nucleus of a radioactive atom, the nucleus of the new element formed possesses the same atomic mass but nuclear charge or atomic number is increased by 1 unit than the parent element. Beta particle emission is due to the result of decay of neutron into proton and electron. ${}_0n^1 \rightarrow {}_1p^1 + {}_{-1}e^0$

The electron produced escapes as a beta-particle-leaving proton in the nucleus.

(iii) **γ -ray emission** : γ -rays are emitted due to secondary effects. The excess of energy is released in the form of γ -rays. Thus γ -rays arise from energy re-arrangements in the nucleus. As γ -rays are short wavelength electromagnetic radiations with no charge and no mass, their emission from a radioactive element does not produce new element.

Special case : If in a radioactive transformation 1 alpha and 2 beta-particles are emitted, the resulting nucleus possesses the same atomic number but atomic mass is less by 4 units. A radioactive transformation of this type always produces an isotope of the parent element.

A and D are isotopes.

Group displacement law

Soddy, Fajans and Russell (1911-1913) observed that when an α -particle is lost, a new element with atomic number less by 2 and mass number less by 4 is formed. Similarly, when β -particle is lost, new element with atomic number greater by 1 is obtained. The element emitting then α or β -particle is called *parent element* and the new element formed is called *daughter element*. The above results have been summarized as,

(1) When an α -particle is emitted, the new element formed is displaced two positions to the **left** in the periodic table than that of the parent element (*because the atomic number decreases by 2*).

(2) When a β -particle is emitted, the new element formed is displaced one position to the **right** in the periodic table than that of the parent element (*because atomic number increased by 1*).

(3) When a positron is emitted, the daughter element occupies its position one group to the left of the parent element in periodic table.

Group displacement law should be applied with great care especially in the case of elements of lanthanide series (57 to 71), actinide series (89 to 103), VIII group (26 to 28; 44 to 46; 76 to 78), IA and IIA groups.

To determine the number of α - and β - particles emitted during the nuclear transformation. It can be done in following manner,

$${}_c^a X \rightarrow {}_d^b Y + x {}_2^4 \text{He} + y {}_{-1}^0 e$$

$$a = b + 4x \quad \text{or} \quad x = \frac{a-b}{4} \quad \dots(i)$$

$$c = d + 2x - y \quad \dots(ii)$$

where x = no. of α -emitted, y = no. of β -emitted

substituting the value of x from eq. (i) in eq. (ii) we get

$$c = d + \left(\frac{a-b}{4}\right)2 - y ; y = d + \left[\frac{a-b}{2}\right] - c$$

Radioactive disintegration series

The phenomenon of natural radioactivity continues till stable nuclei are formed. All the nuclei from the initial element to the final stable element constitute a series known as disintegration series. Further we know that mass numbers change only when α -particles are emitted (and not when β -particles are emitted) causing the change in mass of 4 units at each step. Hence the mass numbers of all elements in a series will fit into one of the formulae. $4n$, $4n+1$, $4n+2$ and $4n+3$, hence there can be only four disintegration series.

	$4n$	$4n+1$	$4n+2$	$4n+3$
n	58	59	59	58
Parent element	${}_{90}\text{Th}^{232}$	${}_{94}\text{Pu}^{241}$	${}_{92}\text{U}^{238}$	${}_{92}\text{U}^{235}$
Half life (yrs)	1.39×10^{10}	10	4.5×10^9	7.07×10^8
Half life (yrs)	1.39×10^{10}	2.2×10^6	4.5×10^9	13.5
Name of series	Thorium (Natural)	Neptunium (Artificial)	Uranium (Natural)	Actinium (Natural)
End product	${}_{82}\text{Pb}^{208}$	${}_{83}\text{Bi}^{209}$	${}_{82}\text{Pb}^{206}$	${}_{82}\text{Pb}^{207}$
n	52	52	51	51
Number of lost particles	$\alpha = 6$ $\beta = 4$	$\alpha = 8$ $\beta = 5$	$\alpha = 8$ $\beta = 6$	$\alpha = 7$ $\beta = 4$

Nuclear structure and Nuclear forces

According to an earlier hypothesis, the nucleus is considered as being composed of two building blocks, proton's and neutron's, which are collectively called **nucleons**. The forces, which hold the nucleons together means stronger proton – proton, neutron – neutron and even proton – neutron attractive forces, exist in the nucleus. These attractive forces are called **nuclear forces**. Nuclear forces operate only within small distance of about $1 \times 10^{-15} \text{ m}$ or 1 fermi (1 fermi = 10^{-13} cm) and drops rapidly to zero at a distance of $1 \times 10^{-13} \text{ cm}$. These are referred to as short range forces. Nuclear forces are nearly 10^{21} times stronger than electrostatic forces.

Yukawa in 1935, put forward a postulate that neutrons and protons are held together by very rapid exchange of nuclear particles called *Pi-mesons* (π -mesons have mass equal to 275 times of the mass of an electron and a charge equal to +1, 0 or -1. These are designated as π^+ , π^0 and π^- respectively). The nuclear force which is used in rapid exchange of *Pi*-mesons between nucleons are also called *exchange forces*.

The binding forces between unlike nucleons (p and n) are explained by the oscillation of a charged π -meson (π or π^-)

Binding forces between like nucleons (p - p or n - n) result from the exchange of neutral mesons (π) as represented below.

Nuclear stability

Nuclides can be grouped on the basis of nuclear stability, i.e. stable and unstable nucleus. The most acceptable theory about the atomic nuclear stability is based upon the fact that the observed atomic mass of all known isotopes (except hydrogen) is always less from the sum of the weights of protons and neutrons present in it. Electron (β^- particle) from a radioactive nucleus may be regarded as derived from a neutron in the following way,

Similarly, photons are produced from internal stresses within the nucleus.

The stability of nucleus may be discussed in terms of any one of the following,

(1) **Nuclear Binding Energy and Mass defect** : It is observed that atomic mass of all nuclei (except hydrogen) is different from the sum of masses of protons and neutrons. The difference is termed *mass defect*.

$$\text{Mass defect} = \text{Total mass of nucleons} - \text{obs. atomic mass}$$

The mass defect is converted into energy. This energy is called the *binding energy*. This is the energy required to break the nucleus into its constituents (p and n).

$$\text{Binding energy} = \text{Mass defect} \times 931 \text{ MeV}$$

The stability of the nucleus is explained on the value of binding energy per nucleon and not on the basis of total binding energy. Binding energy per nucleon is maximum (8.7 MeV) in the case of iron (56). The value of binding energy per nucleon can be increased either by fusion of lighter nuclei or fission of heavier nuclei.

Value of binding energy predicts the relative stability of the different isotopes of an element. If the value of binding energy is negative, the product nucleus or nuclei will be less stable than the reactant nucleus. Thus the relative stability of the different isotopes of an element can be predicted by the values of binding energy for each successive addition of one neutron to the nucleus.

Therefore, ${}_2\text{He}^4$ is more stable than ${}_2\text{He}^3$ and ${}_2\text{He}^5$.

(2) **Packing fraction** : The difference of actual isotopic mass and the mass number in terms of packing fraction is defined as,

$$\text{Packing fraction} = \frac{\text{Actual isotopic mass} - \text{Mass number}}{\text{Mass number}} \times 10^4$$

The value of packing fraction depends upon the manner of packing of the nucleons within the nucleus. Its value can be negative, positive or even zero. A negative packing fraction generally indicates stability of the nucleus.

In general, lower the packing fraction, greater is the binding energy per nucleon and hence greater is the stability. The relatively low packing fraction of He, C and O implies their exceptional stability, packing fraction is least for Fe (negative) and highest for H (+78).

(3) **Magic number** : Nucleus of atom, like extra-nuclear electrons, also has definite energy levels (shells).

Nuclei with 2, 8, 20, 28, 50, 82 or 126 protons or neutrons have been found to be particularly stable with a large number of isotopes. These numbers, commonly known as *Magic numbers* are defined as the number of

nucleons required for completion of the energy levels of the nucleus. Nucleons are arranged in shells as two protons or two neutrons (with paired spins) just like electrons arranged in the extra-nuclear part. Thus the following nuclei ${}_2\text{He}^4$, ${}_8\text{O}^{16}$, ${}_{20}\text{Ca}^{40}$ and ${}_{82}\text{Pb}^{208}$ containing protons 2, 8, 20 and 82 respectively (all magic numbers) and neutrons 2, 8, 20 and 126 respectively (all magic numbers) are the most stable.

Magic numbers for protons : 2, 8, 20, 28, 50, 82, 114

Magic numbers for neutrons : 2, 8, 20, 28, 50, 126, 184, 196

When both the number of protons and number of neutrons are magic numbers, the nucleus is very stable. That is why most of the radioactive disintegration series terminate into stable isotope of lead (magic number for proton = 82, magic number for neutron = 126). Nuclei with nucleons just above the magic numbers are less stable and hence these may emit some particles to attain magic numbers.

(4) **Neutron-proton ratio or causes of radioactivity** It has been found that the stability of nucleus depends upon the neutron to proton ratio (n/p). If we plot the number of neutrons against number of protons for nuclei of various elements, it has been observed that most of the stable (non-radioactive) nuclei lie in a belt shown by shaded region in figure this is called *stability belt* or *stability zone*. The nuclei whose n/p ratio does not lie in the belt are unstable and undergo spontaneous radioactive disintegration.

It has been observed that,

(i) n/p ratio for stable nuclei lies quite close to unity for elements with low atomic numbers (20 or less) but it is more than one for nuclei having higher atomic numbers. Nuclei having n/p ratio either very high or low undergo nuclear transformation.

(ii) When n/p ratio is higher than required for stability, the nuclei have the tendency to emit β^- rays i.e., a neutron is converted into a proton.

(iii) When n/p ratio is lower than required for stability, the nuclei increase the ratio, either by emitting α - particle or by emitting a positron or by K -electron capture.

Rate of radioactive decay

"According to the law of radioactive decay, the quantity of a radioactive element which disappears in unit time (rate of disintegration) is directly proportional to the amount present."

The law of radioactive decay may also be expressed mathematically.

Suppose N_0 be the number of atoms of the radioactive element present at the commencement of observation, $t = 0$ and after time t , the number of atoms remaining unchanged is N_t . The rate of disintegration

$$\left(-\frac{dN_t}{dt} \right) \text{ at any time } t \text{ is directly proportional to } N. \text{ Then, } -\frac{dN_t}{dt} = \lambda N$$

where λ is a radioactive constant or decay constant.

Various forms of equation for radioactive decay are,

$$N_t = N_0 e^{-\lambda t}; \log N_0 - \log N_t = 0.4343 \lambda t$$

$$\log \frac{N_0}{N_t} = \frac{\lambda t}{2.303}; \lambda = \frac{2.303}{t} \log \frac{N_0}{N_t}$$

This equation is similar to that of first order reaction, hence we can say that radioactive disintegration are examples of first order reactions. However, unlike first order rate constant (K), the decay constant (λ) is independent of temperature.

Rate of decay of nuclide is **independent** of temperature, so its energy of activation is zero.

(1) **Half-life period ($T_{1/2}$ or $t_{1/2}$)** : The half-life period of a radioelement is defined, as the time required by a given amount of the element to decay to one-half of its initial value.

$$t_{1/2} = \frac{0.693}{\lambda}$$

Now since λ is a constant, we can conclude that half-life period of a particular radioelement is independent of the amount of the radioelement. In other words, whatever might be the amount of the radioactive element present at a time, it will always decompose to its half at the end of one half-life period.

Let the initial amount of a radioactive substance be N_0

Amount of radioactive substance left after n half-life periods

$$N = \left(\frac{1}{2}\right)^n N_0$$

Total time $T = n \times t_{1/2}$ where n is a whole number.

(2) **Average-life period (T)** : Since total decay period of any element is infinity, it is meaningless to use the term total decay period (total life period) for radioelements. Thus the term **average life** is used.

$$\text{Average life } (T) = \frac{\text{Sum of lives of the nuclei}}{\text{Total number of nuclei}}$$

Average life (T) of an element is the inverse of its decay constant,

i.e., $T = \frac{1}{\lambda}$, Substituting the value of λ in the above equation,

$$T = \frac{t_{1/2}}{0.693} = 1.44 t_{1/2}$$

Thus, **Average life (T)** = $1.44 \times \text{Half life } (T_{1/2}) = \sqrt{2} \times t_{1/2}$

Thus, the average life period of a radioisotope is approximately under-root two times of its half life period.

(3) **Activity of population or specific activity** : It is the measure of radioactivity of a radioactive substance. It is defined as 'the number of radioactive nuclei, which decay per second per gram of radioactive isotope.' Mathematically, if ' m ' is the mass of radioactive isotope, then

$$\text{Specific activity} = \frac{\text{Rate of decay}}{m} = \frac{\lambda N}{m} = \lambda \times \frac{\text{Avogadro number}}{\text{Atomic mass in g}}$$

where N is the number of radioactive nuclei which undergoes disintegration.

(4) **Radioactive equilibrium** : Suppose a radioactive element A disintegrates to form another radioactive element B which in turn disintegrates to still another element C .

B is said to be in radioactive equilibrium with A if its rate of formation from A is equal to its rate of decay into C .

It is important to note that the term equilibrium is used for reversible reactions but the radioactive reactions are irreversible, hence it is preferred to say that B is in a steady state rather than in equilibrium state.

$$\text{At a steady state, } \frac{N_A}{N_B} = \frac{\lambda_B}{\lambda_A} = \frac{T_A}{T_B} = \frac{(t_{1/2})_A}{(t_{1/2})_B}$$

Thus at a steady state (at radioactive equilibrium), the amounts (number of atoms) of the different radioelements present in the reaction series are inversely proportional to their radioactive constants or directly proportional to their half-life and also average life periods.

(5) **Units of radioactivity** : The standard unit in radioactivity is curie (c) which is defined as that amount of any radioactive material which gives 3.7×10^{10} disintegration's per second (dps), i.e., $1c = \text{Activity of } 1g \text{ of } Ra^{226} = 3.7 \times 10^{10} \text{ dps}$

The millicurie (mc) and microcurie (μc) are equal to 10^{-3} and 10^{-6} curies i.e. 3.7×10^7 and 3.7×10^4 dps respectively.

$$1c = 10^3 mc = 10^6 \mu c ; 1c = 3.7 \times 10^{10} \text{ dps}$$

$$1mc = 3.7 \times 10^7 \text{ dps} ; 1\mu c = 3.7 \times 10^4 \text{ dps}$$

But now a day, the unit curie is replaced by rutherford (rd) which is defined as the amount of a radioactive substance which undergoes 10^6 dps. i.e., $1rd = 10^6 \text{ dps}$. The **millicurie** and **microcurie** correspondingly rutherford units are **millirutherford** (mrd) and **microrutherford** (μrd) respectively.

$$1c = 3.7 \times 10^{10} \text{ dps} = 37 \times 10^3 rd$$

$$1mc = 3.7 \times 10^7 \text{ dps} = 37 rd$$

$$1\mu c = 3.7 \times 10^4 \text{ dps} = 37 mrd$$

However, in SI system the unit of radioactivity is **Becquerel** (Bq)

$$1 Bq = 1 \text{ disintegration per second} = 1 \text{ dps} = 1\mu rd, \\ 10^6 Bq = 1rd, 3.7 \times 10^{10} Bq = 1c$$

(6) **The Geiger-Nuttall relationship** : It gives the relationship between decay constant of an α -radioactive substance and the range of the α -particle emitted.

$$\log \lambda = A + B \log R$$

Where R is the range or the distance which an α -particle travels from source before it ceases to have ionizing power. A is a constant which varies from one series to another and B is a constant for all series. It is obvious that the greater the value of λ the greater the range of the α -particle.

Artificial transmutation of elements

The conversion of one element into another by artificial means, i.e., by means of bombarding with some fundamental particles, is known as artificial transmutation. The phenomenon was first applied on nitrogen whose nucleus was bombarded with α -particles to produce oxygen.

The element, which is produced, shows radioactivity, the phenomenon is known as **Induced radioactivity**. The fundamental particles which have been used in the bombardment of different elements are,

$$\alpha\text{-particle} : {}_2He^4 ; \text{Proton} : {}_1H^1$$

$$\text{Deuteron} : {}_1H^2 \text{ or } {}_1D^2 ; \text{Neutron} : {}_0n^1$$

Since α -particles, protons and neutrons carry positive charge, they are repelled by the positively charged nucleus and hence these are not good projectiles. On the other hand, neutrons, which carry no charge at all, are the **best projectiles**. **Cyclotron** is the most commonly used instrument for accelerating these particles. The particles leave the instrument with a velocity of about 25,000 miles per second. A more recent accelerating instrument is called the **synchrotron** or **bevatron**. It is important to note that this instrument cannot accelerate the neutrons, being neutral.

When a target element is bombarded with neutrons, product depends upon the speed of neutrons. **Slow neutrons** penetrate the nucleus while a **high-speed neutron passes through the nucleus**.

Thus slow neutrons, also called **thermal neutrons** are more effective in producing nuclear reactions than high-speed neutrons.

Alchemy : The process of transforming one element into other is known as alchemy and the person involved in such experiments is called alchemist. Although, gold can be prepared from lead by alchemy, the gold obtained is radioactive and costs very high than natural gold.

(i) **Transmutation by α -particles**

(a) **α , n type**

(b) **α , p type**

(c) **α , β type**

(ii) **Transmutation by protons**

(a) **p, n type**

(b) **p, γ type**

(c) **p, d type**

(d) **p, α type**

(iii) **Transmutation by neutrons**

(a) **n, p type**

(b) **n, α type**

(c) **n, γ type**

(d) **n, β type**

(iv) **Transmutation by deuterons**

(a) **d, p type**

(v) **Transmutation by γ -radiations**

(a) **γ , n type**

Synthetic elements : Elements with atomic number greater than 92 i.e. the elements beyond uranium in the periodic table are not found in nature like other elements. All these elements are prepared by artificial transmutation technique and are therefore known as **transuranic elements** or **synthetic elements**.

Nuclear fission and Nuclear fusion

(i) **Nuclear fission** : The splitting of a heavier atom like that of uranium – 235 into a number of fragments of much smaller mass, by suitable bombardment with sub-atomic particles with liberation of huge amount of energy is called **Nuclear fission**. Hahn and Strassman discovered that when uranium-235 is bombarded with neutrons, it splits up into two relatively lighter elements.

Spallation reactions are similar to nuclear fission. However, they differ by the fact that they are brought by high energy bombarding particles or photons.

Elements capable of undergoing nuclear fission and their fission products. Among elements capable of undergoing nuclear fission, uranium is the most common. The natural uranium consists of three isotopes, namely U^{234} (0.006%), U^{235} (0.7%) and U^{238} (99.3%). Of the three isomers of uranium, nuclear fission of U^{235} and U^{238} are more important. Uranium-238 undergoes fission by fast moving neutrons while U^{235} undergoes fission by slow moving neutrons; of these two, U^{235} fission is of much significance. Other examples are Pu^{239} and U^{233} .

Uranium-238, the most abundant (99.3%) isotope of uranium, although itself does not undergo nuclear fission, is converted into plutonium-239.

Which when bombarded with neutrons, undergo fission to emit three neutrons per plutonium nucleus. Such material like U^{238} which themselves are non-fissile but can be converted into fissile material (Pu^{239}) are known as **fertile materials**.

Nuclear chain reaction : With a small lump of U^{235} , most of the neutrons emitted during fission escape but if the amount of U^{235} exceeds a few kilograms (**critical mass**), neutrons emitted during fission are absorbed by adjacent nuclei causing further fission and so producing more neutrons. Now since each fission releases a considerable amount of energy, vast quantities of energy will be released during the chain reaction caused by U^{235} fission.

Fig. 7.3

Atomic bomb : An atomic bomb is based upon the process of that nuclear fission in which no secondary neutron escapes the lump of a fissile material for which the size of the fissile material should not be less than a minimum size called the critical size. There is accordingly a sudden release

of a tremendous amount of energy, which represents an explosive force much greater than that of the most powerful TNT bomb. In the world war II in 1945 two atom bombs were used against the Japanese cities of Hiroshima and Nagasaki, the former contained $U-235$ and the latter contained $Pu-239$.

Atomic pile or Nuclear reactor : It is a device to obtain the nuclear energy in a controlled way to be used for peaceful purposes. The most common reactor consists of a large assembly of graphite (an allotropic form of carbon) blocks having rods of uranium metal (fuel). Many of the neutrons formed by the fission of nuclei of ${}_{92}U^{235}$ escape into the graphite, where they are very much slow down (from a speed of about 6000 or more miles/sec to a mile/sec) and now when these low speed neutrons come back into the uranium metal they are more likely to cause additional fissions. Such a substance like graphite, which slow down the neutrons without absorbing them is known as a **moderator**. Heavy water, D_2O is another important moderator where the nuclear reactor consists of rods of uranium metal suspended in a big tank of heavy water (swimming pool type reactor). Cadmium or boron are used as control rods for absorbing excess neutrons.

Plutonium from a nuclear reactor : For such purposes the fissile material used in nuclear reactors is the natural uranium which consists mainly (99.3%) of $U-238$. In a nuclear reactor some of the neutrons produced in $U-235$ (present in natural uranium) fission converts $U-238$ to a long-lived plutonium isotope, $Pu-239$ (another fissionable material). Plutonium is an important nuclear fuel. Such reactors in which neutrons produced from fission are partly used to carry out further fission and partly used to produce some other fissionable material are called **Breeder reactors**.

Nuclear reactors in India : India is equipped with the five nuclear reactors, namely

- (i) Apsara (1952) (ii) Cirus (1960)
(iii) Zerlina (1961) (iv) Purnima (1972) and R-5

Purnima uses plutonium fuel while the others utilize uranium as fuel.

(2) **Nuclear fusion :** "Oposite to nuclear fission, nuclear fusion is defined as a process in which lighter nuclei fuse together to form a heavier nuclei. However, such processes can take place at reasonable rates only at very high temperatures of the order of several million degrees, which exist only in the interior of stars. Such processes are, therefore, called **Thermonuclear reactions** (temperature dependent reactions). Once a fusion reaction initiates, the energy released in the process is sufficient to maintain the temperature and to keep the process going on.

This is not a simple reaction but involves a set of the thermonuclear reactions, which take place in stars including sun. In other words, *energy of sun is derived due to nuclear fission*.

Controlled nuclear fusion : Unlike the fission process, the fusion process could not be controlled. Since there are estimated to be some 10^{17} pounds of deuterium (${}_1H^2$) in the water of the earth, and since each pound is equivalent in energy to 2500 tonnes of coal, a controlled fusion reactor would provide a virtually inexhaustible supply of energy.

Hydrogen bomb : Hydrogen bomb is based on the *fusion of hydrogen nuclei into heavier ones by the thermonuclear reactions with release of enormous energy*.

As mentioned earlier the above nuclear reactions can take place only at very high temperatures. Therefore, it is necessary to have an external source of energy to provide the required high temperature. For this purpose, the atom bomb, (i.e., *fission bomb*) is used as a *primer*, which by exploding provides the high temperature necessary for successful working of hydrogen bomb (i.e., *fusion bomb*). In the preparation of a hydrogen bomb, a suitable quantity of deuterium or tritium or a mixture of both is enclosed in a space surrounding an ordinary atomic bomb. The first hydrogen bomb was exploded in November 1952 in Marshall Islands; in 1953 Russia exploded a powerful hydrogen bomb having power of 1 million tonnes of TNT

A hydrogen bomb is far more powerful than an atom bomb. Thus if it is possible to have sufficiently high temperatures required for nuclear fusion, the deuterium present in sea (as D_2O) is sufficient to provide all energy requirements of the world for millions of years. The first nuclear reactor was assembled by Fermi in 1942.

Difference between Nuclear fission and fusion

Nuclear fission	Nuclear fusion
The process occurs only in the nuclei of heavy elements.	The process occurs only in the nuclei of light elements.
The process involves the fission of the heavy nucleus to the lighter nuclei.	The process involves the fusion of the lighter nuclei to heavy nucleus.
The process can take place at ordinary temperature.	The process takes place at higher temperature (10^8 °C).
The energy liberated during this process is high (200 MeV per fission)	The energy liberated during the process is comparatively low (3 to 24 MeV per fusion)
Percentage efficiency of the energy conversion is comparatively less.	Percentage efficiency of the energy conversion is high (four times to that of the fission process).
The process can be controlled for useful purposes.	The process cannot be controlled.

Application of radioactivity

Radioisotopes find numerous applications in a variety of areas such as medicine, agriculture, biology, chemistry, archeology, engineering and industry.

(i) **Age determination :** The age of earth has been determined by uranium dating technique as follows. Samples of uranium ores are found to contain Pb^{206} as a result of long series of α - and β -decays. Now if it is assumed that the ore sample contained no lead at the moment of its formation, and if none of the lead formed from U^{238} decay has been lost then the measurement of the Pb^{206} / U^{238} ratio will give the value of time t of the mineral.

$$\frac{\text{No. of atoms of } Pb^{206}}{\text{No. of atoms of } U^{238} \text{ left}} = e^{-\lambda t - 1}$$

where λ is the decay constant of uranium-238

Alternatively,

$$t = \frac{2.303}{\lambda} \log \frac{\text{Initial amount of } U^{238}}{\text{Amount of } U^{238} \text{ in the mineral present till date}}$$

Similarly, the less abundant isotope of uranium, U^{235} eventually decays to Pb^{207} ; Th^{232} decays to Pb^{208} and thus the ratios of Pb^{207} / U^{235} and Pb^{208} / Th^{232} can be used to determine the age of rocks and minerals.

${}_6C^{14}$ (half-life 5760 years) was used by **Willard Libby** (Nobel lauret) in determining the age of carbon-bearing materials (e.g. wood, animal fossils, etc.) Carbon-14 is produced by the bombardment of nitrogen atoms present in the upper atmosphere with neutrons (from cosmic rays).

Thus carbon-14 is oxidised to CO_2 and eventually ingested by plants and animals. The death of plants or animals puts an end to the intake of C^{14} from the atmosphere. After this the amount of C^{14} in the dead tissues starts decreasing due to its disintegration.

It has been observed that on an average, one gram of radioactive carbon emits about 12 β -particles per minute. Thus by knowing either the amount of C^{14} or the number of β -particles emitted per minute per gram of carbon at the initial and final (present) stages, the age of carbon material can be determined by using the following formulae.

$$\lambda = \frac{2.303}{t} \log \frac{N_0}{N_t} \text{ or } t = \frac{2.303}{\lambda} \log \frac{N_0}{N_t}$$

where t = Age of the fossil, λ = Decay constant, N_0 = Initial radioactivity (in the fresh wood), N_t = Radioactivity in the fossil

The above formula can be modified as,

$$t = \frac{2.303}{\lambda} \log \frac{\text{Initial ratio of } C^{14} / C^{12} \text{ (in fresh wood)}}{C^{14} / C^{12} \text{ ratio in the old wood}}$$

Similarly, tritium ${}^3_1\text{H}$ has been used for dating purposes.

(2) **Radioactive tracers** (use of radio-isotopes) : A radioactive isotope can be easily identified by its radioactivity. The radioactivity can, therefore act as a tag or label that allows studying the behaviour of the element or compounding which contains this isotope. An isotope added for this purpose is known as isotopic tracer. The radioactive tracer is also known as an isotopic tracer. The radioactive tracer is also known as an indicator because it indicates the reaction. Radioisotopes of moderate half-life periods are used for tracer work. The activity of radioisotopes can be detected by means of electroscope, the electrometer or the Geiger-Muller counter. Tracers have been used in the following fields,

(i) **To diagnose many diseases** : For example, Arsenic – 74 tracer is used to detect the presence of tumours, Sodium – 24 tracer is used to detect the presence of blood clots and Iodine – 131 tracer is used to study the activity of the thyroid gland. It should be noted that the radioactive isotopes used in medicine have very short half-life periods.

(ii) **In agriculture** : The use of radioactive phosphorus ${}^{32}_{15}\text{P}$ in fertilizers has revealed how phosphorus is absorbed by plants. This study has led to an improvement in the preparation of fertilizers. ${}^{14}_6\text{C}$ is used to study the kinetics of photo synthesis.

(iii) **In industry** : Radioisotopes are used in industry to detect the leakage in underground oil pipelines, gas pipelines and water pipes. Radioactive carbon has been used as a tracer in studying mechanisms involved in many reactions of industrial importance such as alkylation, polymerization, catalytic synthesis etc.

(iv) **In analysis** : Several analytical procedures can be used employing radioisotopes as tracers.

(a) A small amount of radioactive isotope is mixed with the inactive substance and the activity is studied before and after adsorption. Fall in activity gives the amount of substance adsorbed.

(b) The solubility of lead sulphate in water may be estimated by mixing a known amount of radioactive lead with ordinary lead.

(c) Ion exchange process of separation is readily followed by measuring activity of successive fractions eluted from the column.

(d) By labelling oxygen of the water, mechanism of ester hydrolysis has been studied.

(e) The efficiency of analytical procedures may be measured by adding a known amount of radio-isotopes to the sample before analysis begins. After the completion, the activity is again determined. The comparison of activity tells about the efficiency of separation.

(3) **Use of γ rays** : γ rays are used for disinfecting food grains and for preserving food stuffs. Onions, potatoes, fruits and fish etc., when irradiated with γ rays, can be preserved for long periods. High yielding disease resistant varieties of wheat, rice, groundnut, jute etc., can be developed by the application of nuclear radiations. The γ rays radiations are used in the treatment of cancer. The γ radiations emitted by cobalt – 60 can burn cancerous cells. The γ radiations are used to sterilize medical instruments like syringes, blood transfusion sets. etc. These radiations make the rubber and plastics objects heat resistant.

The increased pace of synthesis and use of radio isotopes has led to increased concern about the effect of radiations on matter, particularly in biological systems. The accident of Chernobyl occurred in 1986 in USSR is no older when radioisotopes caused a hazard there. The nuclear radiations (alpha, beta, gamma as well as X-rays) possess energies far in excess of ordinary bond energies and ionisation energies. Consequently, these radiations are able to break up and ionise the molecules present in living organisms if they are exposed to such radiations. This disrupts the normal functions of living organisms. The damage caused by the radiations, however, depends upon the radiations received. The resultant radiation damage to living system can be classified as,

(1) **Somatic or pathological damage** : This affects the organism during its own life time. It is a permanent damage to living civilization produced in body. Larger dose of radiations cause immediate death whereas smaller doses can cause the development of many diseases such as paralysis, cancer, leukaemia, burns, fatigue, nausea, diarrhoea, gastrointestinal problems etc. some of these diseases are fatal. Many scientists presently believe that the effect of radiations is proportional to exposure, even down to low exposures. This means that any amount of radiation causes some finite risk to living civilization.

(2) **Genetic damage** : As the term implies, radiations may develop genetic effect. This type of damage is developed when radiations affect genes and chromosomes, the body's reproductive material. Genetic effects are more difficult to study than somatic ones because they may not become apparent for several generations.

Tips & Tricks

- ✍ The particle like mesons, positron, neutrino, etc, about 20 in number are created by stresses in nucleus but do not exist as component of nucleus.
- ✍ Highest degree of radioactivity is shown by radium.
- ✍ The nuclear forces are not governed by inverse square law.
- ✍ About 42 radioactive nuclides ($Z > 82$) occur in nature. Each of these gives stable end product of an isotope of lead.
- ✍ The half life is independent of physical or chemical state of a radioactive element.
- ✍ The average life of the natural radioactive element vary from 10^5 to 10^{10} years or more.
- ✍ It has been observed that fusion of 45 mg of hydrogen produce as much energy as obtained from one ton of coal.
- ✍ Beryllium has been found to be the best moderator as it occupies small space and have low absorption cross-section.
- ✍ The total life span of a radioactive element is infinite.
- ✍ The γ - radiation of total energy 1.02 MeV, emitted when a positron and an electron interact are known as annihilation radiation.

Hazards of radiations

Ordinary Thinking

Objective Questions

Nucleus (Stability and Reaction)

- Nucleons are [CPMT 1982]
 - Protons and electrons
 - Protons and neutrons
 - Electrons and neutrons
 - Electrons, protons and neutrons
- A deuteron contains [NCERT 1982; CPMT 1994]
 - A neutron and a positron
 - A neutron and a proton
 - A neutron and two protons
 - A proton and two neutrons
- The nucleus of radioactive element possesses
 - Low binding energy
 - High binding energy
 - Zero binding energy
 - High potential energy
- On bombarding ${}^7_3\text{N}^{14}$ with α -particles, the nuclei of the product formed after the release of a proton will be or In nuclear reaction ${}^7_3\text{N}^{14} + {}^4_2\text{He}^4 \rightarrow {}^A_Z\text{X} + {}^1_1\text{H}^1$, the term ${}_Z\text{X}^A$ represents [NCERT 1979; CPMT 1989; MPMT 1989; MP PET 1996; BHU 1996]
 - ${}_8\text{O}^{17}$
 - ${}_9\text{F}^{18}$
 - ${}_9\text{F}^{17}$
 - ${}_8\text{O}^{18}$
- Nuclear energy is based on the conversion of
 - Protons into neutrons
 - Mass into energy
 - Neutrons into protons
 - Uranium into radium
- Positron has nearly the same weight as that of [NCERT 1975; JIPMER 1991; BHU 1995]
 - α -particle
 - Proton
 - Neutron
 - Electron
- In the reaction ${}_3\text{Li}^6 + (?) \rightarrow {}_2\text{He}^4 + {}_1\text{H}^3$. The missing particle is [CPMT 1983, 84]
 - Electron
 - Neutron
 - Proton
 - Deuteron
- The ${}_6\text{C}^{14}$ in upper atmosphere is generated by the nuclear reaction [MP PET 1993]
 - ${}_7\text{N}^{14} + {}_1\text{H}^1 \longrightarrow {}_6\text{C}^{14} + {}_{+1}\text{e}^0 + {}_1\text{H}^1$
 - ${}_7\text{N}^{14} \longrightarrow {}_6\text{C}^{14} + {}_{+1}\text{e}^0$
 - ${}_7\text{N}^{14} + {}_0\text{n}^1 \longrightarrow {}_6\text{C}^{14} + {}_1\text{H}^1$
 - ${}_7\text{N}^{14} + {}_1\text{H}^3 + {}_0\text{n}^1 \longrightarrow {}_6\text{C}^{14} + {}_2\text{He}^4$
- Deuterons when bombarded on a nuclide produce ${}_{18}\text{Ar}^{38}$ and neutrons. The target is [CPMT 1982, 87]
 - ${}_{17}\text{Cl}^{35}$
 - ${}_{19}\text{K}^{27}$
 - ${}_{17}\text{Cl}^{37}$
 - ${}_{19}\text{K}^{39}$
- Which can be used for carrying out nuclear reaction [AFMC 2003]
 - Uranium – 238
 - Neptunium – 239
 - Thorium – 232
 - Plutonium – 239
- On comparing chemical reactivity of C^{12} and C^{14} , it is revealed that
 - C^{12} is more reactive
 - C^{14} is more reactive
 - Both are inactive
 - Both are equally active
- The radionuclide ${}^{234}_{90}\text{Th}$ undergoes two successive β -decays followed by one α -decay. The atomic number and the mass number respectively of the resulting radionuclide are
 - 92 and 234
 - 94 and 230
 - 90 and 230
 - 92 and 230
- Hydrogen and deuterium differ in [CPMT 1980]
 - Reactivity with oxygen
 - Reactivity with chlorine
 - Melting point
 - Reducing action
- A nuclear reaction must be balanced in terms of
 - Only energy
 - Only mass
 - Mass and energy
 - None of these
- In the following nuclear reaction, the other product is ${}_{52}\text{Te}^{130} + {}_1\text{H}^2 \longrightarrow {}_{53}\text{I}^{131} + ?$ [MP PET 1991]
 - Positron
 - Alpha particle
 - One neutron
 - Proton
- ${}_{96}\text{Pu}^{248} \longrightarrow {}_{94}\text{Be}^8 + {}_1\text{e}^0$ is due to [MP PMT 1991]
 - Loss of α -particles
 - Loss of β -particles
 - Loss of positron
 - Electron loss
- Positronium is the name given to an atom-like combination formed between [NCERT 1980; JIPMER 1991]
 - A positron and a proton
 - A positron and a neutron
 - A positron and α -particle
 - A positron and an electron
- An electrically charged atom or a group of atoms is known as
 - A meson
 - A proton
 - An ion
 - A cyclotron
- The charge on positron is equal to the charge on which one of the following [NCERT 1977]
 - Proton
 - Electron
 - α -particle
 - Neutron
- In the nuclear reaction ${}_{12}\text{Mg}^{24} + {}_2\text{He}^4 \longrightarrow {}_0\text{n}^1 + ?$ The product nucleus is [BHU 1987]
 - ${}_{13}\text{Al}^{27}$
 - ${}_{14}\text{Si}^{27}$
 - ${}_{13}\text{Al}^{28}$
 - ${}_{12}\text{Mg}^{25}$
- ${}_6\text{C}^{14}$ is formed from ${}_7\text{N}^{14}$ in the upper atmosphere by the action of the fundamental particle [Orissa JEE 2002]
 - Positron
 - Neutron
 - Electron
 - Proton
- In the nuclear reaction ${}_{92}\text{U}^{238} \longrightarrow {}_{82}\text{Pb}^{206} + x {}_2\text{He}^4 + y {}_{-1}\beta^0$ the value of x and y are respectively [Orissa JEE 2002]
 - 8, 6
 - 6, 4
 - 6, 8
 - 8, 10
- If an isotope of hydrogen has two neutrons in its atom, its atomic number and atomic mass number will respectively be

[CBSE 1992]

- (a) 2 and 1 (b) 3 and 1
(c) 1 and 1 (d) 1 and 3

24. Which one of the following nuclear transformation is (n, p) type [AIIMS 1980, 83]

- (a) ${}_3\text{Li}^7 + {}_1\text{H}^1 \longrightarrow {}_4\text{Be}^7 + {}_0\text{n}^1$
(b) ${}_{33}\text{As}^{75} + {}_2\text{He}^4 \longrightarrow {}_{35}\text{Br}^{78} + {}_0\text{n}^1$
(c) ${}_{83}\text{Bi}^{209} + {}_1\text{H}^2 \longrightarrow {}_{84}\text{Po}^{210} + {}_0\text{n}^1$
(d) ${}_{21}\text{Sc}^{45} + {}_0\text{n}^1 \longrightarrow {}_{20}\text{Ca}^{45} + {}_1\text{H}^1$

25. What is X in the following nuclear reaction

- (a) ${}_{+1}\text{e}^0$ (b) ${}_0\text{n}^1$
(c) γ (d) ${}_{-1}\text{e}^0$

26. In the reaction ${}_{93}\text{Np}^{239} \longrightarrow {}_{94}\text{Pu}^{239} + (?)$, the missing particle is [MNR 1987]

- (a) Proton (b) Positron
(c) Electron (d) Neutron

27. According to the nuclear reaction ${}_4\text{Be} + {}_2\text{He}^4 \rightarrow {}_6\text{C}^{12} + {}_0\text{n}^1$, mass number of (Be) atom is

[AFMC 2002]

- (a) 4 (b) 9
(c) 7 (d) 6

28. Which of the following nuclides has the magic number of both protons and neutrons [EAMCET 1989]

- (a) ${}_{50}\text{Sn}^{115}$ (b) ${}_{82}\text{Pb}^{206}$
(c) ${}_{82}\text{Pb}^{208}$ (d) ${}_{50}\text{Sn}^{118}$

29. In the carbon cycle, from which hot stars obtain their energy, the ${}_6\text{C}^{14}$ nucleus is

- (a) Completely converted into energy
(b) Regenerated at the end of the cycle
(c) Combined with oxygen to form carbon monoxide
(d) Broken up into its constituents protons and neutrons

30. The atomic mass of lead is 208 and atomic number is 82. The atomic mass of bismuth is 209 and atomic number is 83. The ratio of n/p in the atom is [EAMCET 1982]

- (a) Higher of lead (b) Higher of bismuth
(c) Same (d) None of these

31. Which of the following is an n, p reaction [BHU 1995]

- (a) ${}_5\text{C}^{13} + {}_1\text{H}^1 \longrightarrow {}_6\text{C}^{14}$
(b) ${}_7\text{N}^{14} + {}_1\text{H}^1 \longrightarrow {}_8\text{O}^{15}$
(c) ${}_{13}\text{Al}^{27} + {}_0\text{n}^1 \longrightarrow {}_{12}\text{Mg}^{27} + {}_1\text{H}^1$
(d) ${}_{92}\text{U}^{235} + {}_0\text{n}^1 \longrightarrow {}_{54}\text{Xe}^{140} + {}_{38}\text{Sr}^{93} + 3{}_0\text{n}^1$

32. Which one of the following statements is incorrect

[MP PET 1997]

- (a) Mass defect is related with binding energy
(b) 'Meson' was discovered by Yukawa
(c) The size of the nucleus is of the order of $10^{-12} - 10^{-13} \text{ cm}$
(d) Magnetic quantum number is a measure of 'orbital angular momentum' of the electron

33. In the sequence of following nuclear reactions

The value of n will be

[MP PMT 1999]

- (a) 3 (b) 4
(c) 5 (d) 6

34. The introduction of a neutron into the nuclear composition of an atom would lead to a change in [MNR 1995]

- (a) The number of the electrons also
(b) The chemical nature of the atom
(c) Its atomic number
(d) Its atomic weight

35. The composition of tritium (${}_1\text{H}^3$) is

[Manipal MEE 1995; DPMT 1982, 96]

- (a) 1 electron, 1 proton, 1 neutron
(b) 1 electron, 2 protons, 1 neutron
(c) 1 electron, 1 proton, 2 neutrons
(d) 1 electron, 1 proton, 3 neutrons

36. Identify 'X' in ${}_{16}\text{S}^{32} + \text{X} \rightarrow {}_{15}\text{P}^{30} + {}_2\text{He}^4$

- (a) ${}_1\text{H}^1$ (b) ${}_1\text{D}^2$
(c) ${}_0\text{n}^1$ (d) e^-

37. In terms of energy 1 a. m.u. is equal to

[MP PET/PMT 1998]

- (a) 100 J (b) 931.1 MeV
(c) 931.1 kcal (d) 10^7 erg

38. Positron is [AIIMS 1997]

- (a) Electron with +ve charge
(b) A helium nucleus
(c) A nucleus with two protons
(d) A nucleus with one neutron and one proton

In the above sequence of reaction, the elements which are isotopes of each other are [JIPMER 1997]

- (a) X and W (b) Y and Z
(c) X and Z (d) None of these

40. Stable nuclides are those whose n/p ratio is [MP PMT 1993]

- (a) $n/p = 1$ (b) $n/p = 2$
(c) $n/p > 1$ (d) $n/p < 1$

41. Neutrino has [NCERT 1981]

- (a) Charge +1, mass 1 (b) Charge 0, mass 0
(c) Charge -1, mass 1 (d) Charge 0, mass 1

42. Which one of the following nuclear reaction is correct

[CPMT 1997]

- (a) ${}_6\text{C}^{13} + {}_1\text{H}^1 \rightarrow {}_7\text{N}^{13} + \beta^- + \nu^-$
(b) ${}_{11}\text{Na}^{23} + {}_1\text{H}^1 \rightarrow {}_{10}\text{Ne}^{20} + {}_2\text{He}^4$
(c) ${}_{13}\text{Al}^{23} + {}_0\text{n}^1 \rightarrow {}_{11}\text{Na}^{23} + \text{e}^0$
(d) None of these

43. Formation of nucleus from its nucleons is accompanied by

[NCERT 1975; RPET 2000]

- (a) Decrease in mass (b) Increase in mass
(c) No change of mass (d) None of them

44. A particle having the same charge and 200 times greater mass than that of electron is

- (a) Positron (b) Proton
(c) Neutrino (d) Meson

45. The positron is [AFMC 1997]
 (a) ${}_{-1}e^0$ (b) ${}_{+1}e^0$
 (c) ${}_1H^1$ (d) ${}_0n^1$
46. Which of the following is the most stable atom [AFMC 1997]
 (a) Bi (b) Al
 (c) U (d) Pb
47. The positron is discovered by [RPMT 1997]
 (a) Pauling (b) Anderson
 (c) Yukawa (d) Segar
48. The nucleus of an atom is made up of X protons and Y neutrons. For the most stable and abundant nuclei [NCERT 1980]
 (a) X and Y are both even (b) X and Y are both odd
 (c) X is even and Y is odd (d) X is odd and Y is even
49. Atom A possesses higher values of packing fraction than atom B. The relative stabilities of A and B are
 (a) A is more stable than B
 (b) B is more stable than A
 (c) A and B both are equally stable
 (d) Stability does not depend on packing fraction
50. How many neutrons are present in the nucleus of Ra [CPMT 1980]
 (a) 88 (b) 226
 (c) 140 (d) 138
51. In a nuclear explosion, the energy is released in the form of [CPMT 1994]
 (a) Kinetic energy (b) Electrical energy
 (c) Potential energy (d) None of these
52. In equation ${}_{11}Na^{23} + {}_1H^1 \rightarrow {}_{12}Mg^{23} + x$, x represents [MP PMT 1990; MP PET 1999]
 (a) Neutron (b) Deuteron
 (c) α -particle (d) Positron
53. Which of the following atomic mass of uranium is the most radioactive [AFMC 1997]
 (a) 238 (b) 235
 (c) 226 (d) 248
54. Which of the following particle is emitted in the reaction ${}_{13}Al^{27} + {}_2He^4 \rightarrow {}_{14}P^{30} + \dots$ [DCE 1999]
 (a) ${}_0n^1$ (b) ${}_{-1}e^0$
 (c) ${}_1H^1$ (d) ${}_1H^2$
55. Which of the following sub-atomic particles is not present in an atom [JIPMER 1999]
 (a) Neutron (b) Proton
 (c) Electron (d) Positron
56. Electromagnetic radiation with maximum wave length is [DCE 2000; UPSEAT 2000]
 (a) Ultraviolet ray (b) Radiowave
 (c) X-ray (d) Infrared
57. Neutrons are obtained by [JIPMER 1999]
 (a) Bombardment of Ra with β -particles
 (b) Bombardment of Be with α -particles
 (c) Radioactive disintegration of uranium
 (d) None of these
58. In the reaction, $Po \xrightarrow{-\alpha} Pb \xrightarrow{-\beta} Bi$, if Bi belongs to group 15, to which Po belongs [DCE 2000]
 (a) 14 (b) 15
 (c) 13 (d) 16
59. In the nuclear reaction ${}_4Be(p, \alpha)X$, the X is [MP PMT 2000]
 (a) ${}_2He^4$ (b) ${}_3Li^6$
 (c) ${}_3Li^7$ (d) ${}_4Be^8$
60. Which of the following does not contain number of neutrons equal to that of ${}_{18}^{40}Ar$ [MP PMT 2000]
 (a) ${}_{19}^{41}K$ (b) ${}_{21}^{43}Sc$
 (c) ${}_{21}^{40}Sc$ (d) ${}_{20}^{42}Ca$
61. Nuclear reactivity of Na and Na^+ is same because both have
 (a) Same electron and proton
 (b) Same proton and same neutron
 (c) Different electron and proton
 (d) Different proton and neutron
62. Which of the following is the heaviest metal [MH CET 2001]
 (a) Hg (b) Pb
 (c) Ra (d) U
63. In the following reaction, x will be ${}_{29}Cu^{64} \rightarrow {}_{28}Ni^{64} + x$
 (a) A proton (b) An electron
 (c) A neutron (d) A positron
64. Which one out of the following statements is not correct for ortho and para hydrogen [Orissa JEE 2002]
 (a) They have different boiling point
 (b) Ortho form is more stable than para form
 (c) They differ in the spin of their protons
 (d) The ratio of ortho to para hydrogen increases with increase in temperature and finally pure ortho form is obtained
65. For the nuclear reaction, ${}_{12}^{24}Mg + {}_1D^2 \rightarrow \alpha + ?$, the missing nuclide is [Kurukshestra CEE 2002]
 (a) ${}_{11}^{22}Na$ (b) ${}_{11}^{23}Na$
 (c) ${}_{12}^{23}Mg$ (d) ${}_{12}^{26}Mg$
66. ${}_ZX^M + {}_2He^4 \rightarrow {}_{15}P^{30} + {}_0n^1$. Then [KCET 2002]
 (a) $Z = 12, M = 27$ (b) $Z = 13, M = 27$
 (c) $Z = 12, M = 17$ (d) $Z = 13, M = 28$
67. An element ${}_{96}X^{227}$ emits 4α and 5β particles to form new element Y. Then atomic number and mass number of Y are
 (a) 93; 211 (b) 211; 93
 (c) 212; 88 (d) 88; 211
68. Meson was discovered [MH CET 2004]
 (a) Yukawa (b) Austin
 (c) Moseley (d) Einstein

Radioactivity and α , β and γ rays

1. Which of the following does not contain material particles [BHU 2002]
 (a) Alpha rays (b) Beta rays
 (c) Gamma rays (d) Canal rays
2. Radioactive substances emit γ -rays, which are

- (a) +ve charged particle (b) -ve charged particle
(c) Massive particle (d) Packet of energy
[Orissa JEE 2002]
3. Which statement is incorrect [CPMT 1982]
(a) α -rays have more penetrating power than β -rays
(b) α -rays have less penetrating power than γ -rays
(c) β -rays have less penetrating power than γ -rays
(d) β -rays have more penetrating power than α -rays
4. The velocity of α -rays is approximately [CPMT 1982]
(a) Equal to that of the velocity of light
(b) 1/10 of the velocity of light
(c) 10 times more than the velocity of light
(d) Uncomparable to the velocity of light
5. The radiations having high penetrating power and not affected by electrical and magnetic field are [Kerala CET 1992]
(a) Alpha rays (b) Beta rays
(c) Gamma rays (d) Neutrons
6. Alpha particles are times heavier (approximately) than neutrons [CPMT 1971]
(a) 2 (b) 4
(c) 3 (d) $2\frac{1}{2}$
7. Uranium ${}_{92}\text{U}^{235}$ on bombardment with slow neutrons produces [CPMT 1982]
(a) Deutrons (b) Fusion reaction
(c) Fission reaction (d) Endothermic reaction
8. α -particles can be detected using [AIIMS 2005]
(a) Thin aluminum sheet (b) Barium sulphate
(c) Zinc sulphide screen (d) Gold foil
9. Alpha rays consist of a stream of [BHU 1979]
(a) H^+ (b) He^{+2}
(c) Only electrons (d) Only neutrons
10. Which is the correct statement [CPMT 1971]
(a) Isotopes are always radioactive
(b) β -rays are always negatively charged particles
(c) α -rays are always negatively charged particles
(d) γ -rays can be deflected in magnetic field
11. The α -particle is identical with [CPMT 1972, 82, 86; BHU 1984; MP PMT 1990, 91, 93; MP PET 1999]
(a) Helium nucleus
(b) Hydrogen nucleus
(c) Electron
(d) Proton
12. If by mistake some radioactive substance gets inside the human body, then from the point of view of radiation damage, the most harmful will be the one which emits [DPMT 1986]
(a) γ -rays (b) Neutrons
(c) β -particles (d) α -particles
13. Radioactivity was discovered by [CPMT 1983, 88; DPMT 1982; AMU 1983; MADT Bihar 1982]
(a) Henry Becquerel (b) Rutherford
(c) J. J. Thomson (d) Madam Curie
14. Which of the following is radioactive element [CPMT 1988]
(a) Sulphur (b) Polonium
(c) Tellurium (d) Selenium
15. Penetrating power of α -particle is [MP PMT 2002]
(a) More than γ -rays (b) More than β -rays
(c) Less than β -rays (d) None of these
16. β -particle is emitted in radioactivity by [AIEEE 2002; MP PMT 2004]
(a) Conversion of proton to neutron
(b) Form outermost orbit
(c) Conversion of neutron to proton
(d) β -particle is not emitted
17. α -rays have [CPMT 1973, 78; NCERT 1977]
(a) Positive charge
(b) Negative charge
(c) No charge
(d) Sometimes positive charge and sometimes negative charge
18. X-rays are produced due to [JIPMER 2002]
(a) Bombarding of electrons on solids
(b) Bombarding of α -particle on solids
(c) Bombarding of γ -rays on solids
(d) Bombarding of neutron on solids
19. Choose the element which is not radioactive [CPMT 1988]
(a) Cm (b) No
(c) Mo (d) Md
20. A magnet will cause the greatest deflection of [MP PMT 1991]
(a) γ -rays (b) β -rays
(c) α -rays (d) Neutrons
21. Of the following radiations, the one most easily stopped by air is [MP PMT 1990]
(a) α -rays (b) β -rays
(c) γ -rays (d) X-rays
22. Uranium ultimately decays into a stable isotope of [MP PET 1995]
(a) Radium (b) Carbon
(c) Lead (d) Neptunium
23. Which leaves no track on Wilson cloud chamber [AFMC 1988]
(a) Electrons (b) Protons
(c) α -particles (d) Neutrons
24. Which has the least penetrating power [CPMT 1994]
(a) β -rays (b) α -rays
(c) γ -rays (d) X-rays
25. There exists on γ -rays [MP PMT 1996; Pb. PMT 2004; EAMCET 2004]
(a) Positive charge
(b) Negative charge
(c) No charge
(d) Sometimes positive charge, sometimes negative charge
26. Which is not emitted by radioactive substance [AIIMS 1997]
(a) α -rays (b) β -rays
(c) Positron (d) Proton
27. The radiations from a naturally occurring radio element, as seen after deflection in a magnetic field in one direction, are [IIT 1984; MP PMT 1986; MP PET/PMT 1988 JIPMER 1999]
(a) Definitely α -rays (b) Definitely β -rays
(c) Both α and β -rays (d) Either α or β -rays
28. The ${}_{88}\text{Ra}^{226}$ is [AIIMS 2001]

- (a) n -mesons (b) u -mesons (c) 0.0018 amu (d) 1.8 amu
(c) Radioactive (d) Non-radioactive (e) 18 amu
29. During β -decay [UPSEAT 2001]
(a) An atomic electron is ejected
(b) An electron which is already present within the nucleus is ejected
(c) A neutron in the nucleus decays emitting an electron
(d) A part of binding of the nucleus is converted into an electron
30. The element californium belongs to the family of [UPSEAT 2002]
(a) Actinide series (b) Alkali metal family
(c) Alkaline earth family (d) Lanthanide series
31. Which of the following is not deflected by magnetic field [MP PMT 2001]
(a) Deuteron (b) Positron
(c) Proton (d) Photon
32. Which of the following can be used to convert ${}^{14}_7\text{N}$ into ${}^{17}_8\text{O}$ [MP PMT 2001]
(a) Deuteron (b) Proton
(c) α -particle (d) Neutron
33. The amount of energy, which is required to separate the nucleons from a nucleus. The energy is called [UPSEAT 2001]
(a) Binding energy (b) Lattice energy
(c) Kinetic energy (d) None of these
34. What happens when α -particle is emitted [CBSE PMT 1989; JIPMER 2002]
(a) Mass number decreases by 12 unit, atomic number decreases by 4 unit
(b) Mass number decreases by 4 unit, atomic number decreases by 2 unit
(c) Only mass number decreases
(d) Only atomic number decreases
35. The charge on gamma rays is [Pb. PMT 2004; EAMCET 2004]
(a) Zero (b) +1
(c) -1 (d) +2
36. A nuclear reaction is accompanied by loss of mass equivalent to 0.01864 amu. Energy liberated is [DCE 2002]
(a) 931 MeV (b) 186.6 MeV
(c) 17.36 MeV (d) 460 MeV
37. Nuclear theory of the atom was put forward by [KCET 2004]
(a) Rutherford (b) Aston
(c) Neils Bohr (d) J.J. Thomson
38. Decrease in atomic number is observed during [IIT 1998]
(a) Alpha emission (b) Beta emission
(c) Positron emission (d) Electron capture
39. Calculate mass defect in the following reaction
 ${}_1\text{H}^2 + {}_1\text{H}^3 \rightarrow {}_1\text{He}^4 + {}_0\text{n}^1$
(Given : mass $\text{H}^2 = 2.014$, $\text{H}^3 = 3.016$, $\text{He} = 4.004$, $n = 1.008 \text{ amu}$) [Kerala CET 2005]
(a) 0.018 amu (b) 0.18 amu

Causes of radioactivity and Group displacement law

1. ${}_{95}\text{Am}^{241}$ and ${}_{90}\text{Th}^{234}$ belong respectively to [MP PMT 1999]
(a) $4n$ and $4n+1$ radioactive disintegration series
(b) $4n+1$ and $4n+2$ radioactive disintegration series
(c) $4n+1$ and $4n+3$ radioactive disintegration series
(d) $4n+1$ and $4n$ radioactive disintegration series
2. Group displacement law states that the emission of α or β particles results in the daughter element occupying a position, in the periodic table, either to the left or right of that of the parent element. Which one of the following alternatives gives the correct position of the daughter element
- | On emission of α particles | On emission of β particles |
|-----------------------------------|----------------------------------|
| (a) 2 groups to the right | 1 group to the right |
| (b) 2 groups to the right | 1 group to the left |
| (c) 2 groups to the left | 1 group to the left |
| (d) 2 groups to the left | 1 group to the right |
3. The nuclides (A nuclide is the general name for any nuclear species) ${}^{12}_{26}\text{Fe}^{56}$ and ${}^{238}_{92}\text{U}$ have 12, 56 and 238 nucleons respectively in the nuclei. The total number of nucleons in a nucleus is equal to [NCERT 1975]
(a) The total number of neutrons in the nucleus
(b) The total number of neutrons in the atom
(c) The total number of protons in the nucleus
(d) The total number of protons and neutrons in the nucleus
4. Radioactivity is due to [DPMT 1983, 89; AIIMS 1988]
(a) Stable electronic configuration
(b) Unstable electronic configuration
(c) Stable nucleus
(d) Unstable nucleus
5. Radioactive disintegration differs from a chemical change in being [MNR 1991]
(a) An exothermic change
(b) A spontaneous process
(c) A nuclear process
(d) A unimolecular first order reaction
6. ${}^{238}_{92}\text{U}$ emits 8 α -particles and 6 β -particles. The neutron/proton ratio in the product nucleus is [AIIMS 2005]
(a) 60/41 (b) 61/40
(c) 62/41 (d) 61/42
7. The element with atomic number 84 and mass number 218 change to other element with atomic number 84 and mass number 214. The number of α and β -particles emitted are respectively [CPMT 1989]
(a) 1, 3 (b) 1, 4
(c) 1, 2 (d) 1, 5
8. A radium ${}_{88}\text{Ra}^{224}$ isotope, on emission of an α -particle gives rise to a new element whose mass number and atomic number will be [CPMT 1980; EAMCET 1985; MP PMT 1993]
(a) 220 and 86 (b) 225 and 87
(c) 228 and 88 (d) 224 and 86

9. ${}_{89}\text{Ac}^{231}$ gives ${}_{82}\text{Pb}^{207}$ after emission of some α and β -particles. The number of such α and β -particles are respectively [MP PMT 1993; UPSEAT 2001]
- (a) 5, 6 (b) 6, 5
(c) 7, 5 (d) 5, 7
10. The number of α and β -particles emitted in the nuclear reaction ${}_{90}\text{Th}^{228} \rightarrow {}_{83}\text{Bi}^{212}$ are respectively [MNR 1992; MP PMT 1993; AFMC 1998, 2001; MH CET 1999; UPSEAT 2000, 01; AMU 2001; CPMT 2002]
- (a) 4, 1 (b) 3, 7
(c) 8, 1 (d) 4, 7
11. The number of neutrons in the parent nucleus which gives N^{14} on β -emission and the parent nucleus is [EAMCET 1985; MNR 1992; Kurukshetra CEE 1998; UPSEAT 2000, 01]
- (a) $8, \text{C}^{14}$ (b) $6, \text{C}^{12}$
(c) $4, \text{C}^{13}$ (d) None of these
12. After the emission of α -particle from the atom ${}_{92}\text{X}^{238}$, the number of neutrons in the atom will be [MNR 1993; UPSEAT 1999, 2001, 02]
- (a) 138 (b) 140
(c) 144 (d) 150
13. When a radioactive element emits an electron the daughter element formed will have [EAMCET 1988; MP PET 1994]
- (a) Mass number one unit less
(b) Atomic number one unit less
(c) Mass number one unit more
(d) Atomic number one unit more
14. If the amount of radioactive substance is increased three times, the number of atoms disintegrated per unit time would [MP PMT 1994]
- (a) Be double (b) Be triple
(c) Remain one third (d) Not change
15. β -particles are emitted from the atom
- (a) Due to disintegration of neutron
(b) Due to disintegration of proton
(c) Due to removal of electron from K shell
(d) Due to removal of electron from outermost orbit
16. Nd ($Z = 60$) is a member of group -3 in periodic table. An isotope of it is β -active. The daughter nuclei will be a member of
- (a) Group -3 (b) Group -4
(c) Group -1 (d) Group -2
17. Number of neutrons in a parent nucleus X , which gives ${}_{7}\text{N}^{14}$ nucleus after two successive β emissions would be [CBSE PMT 1998; MP PMT 2003]
- (a) 9 (b) 8
(c) 7 (d) 6
18. The disintegration of an isotope of sodium, ${}_{11}\text{Na}^{24} \rightarrow {}_{12}\text{Mg}^{24} + {}_{-1}\text{e}^0$ shown is due to [AMU (Engg.) 2000]
- (a) The emission of β -radiation
(b) The formation of a stable nuclide
(c) The fall in the neutron : proton ratio
(d) None of these
19. After losing a number of α and β -particles, ${}_{92}\text{U}^{238}$ is changed to ${}_{82}\text{Pb}^{206}$. The total number of α -particles lost in this process is [UPSEAT 1999, 2000]
- (a) 10 (b) 5
(c) 8 (d) 32
20. Which element is the end product of each natural radioactive series [MP PMT 1993; UPSEAT 2001]
- (a) Sn (b) Bi
(c) Pb (d) C
21. ${}_{13}^{27}\text{Al}$ is a stable isotope. ${}_{13}^{29}\text{Al}$ is expected to disintegrate by [IIT 1996; UPSEAT 2001]
- (a) α -emission (b) β -emission
(c) Positron emission (d) Proton emission
22. An isotope ${}_Y\text{A}^X$ undergoes a series of m alpha and n beta disintegration to form a stable isotope ${}_{Y-10}\text{B}^{X-32}$. The values of m and n are respectively [MP PET 1995]
- (a) 6 and 8 (b) 8 and 10
(c) 5 and 8 (d) 8 and 6
23. During a β -decay the mass of the atomic nucleus [MP PET 1996]
- (a) Decreases by one unit (b) Increases by one unit
(c) Decreases by two units (d) Remains unaffected
24. Which one of the following notations shows the product incorrectly [MP PET/PM 1999]
- (a) ${}_{96}^{242}\text{Cm}(\alpha, 2n){}_{97}^{243}\text{Bk}$ (b) ${}_{10}^{10}\text{B}(\alpha, n){}_{7}^{13}\text{N}$
(c) ${}_{7}^{14}\text{N}(n, p){}_{6}^{14}\text{C}$ (d) ${}_{14}^{28}\text{Si}(d, n){}_{15}^{29}\text{P}$
25. An atom has mass number 232 and atomic number 90. How many α -particles should it emit after emission of two β -particles, so that the new element's atom has mass number 212 and atomic number 82
- (a) 4 (b) 5
(c) 6 (d) 3
26. After the emission of one α -particle followed by one β -particle from the atom of ${}_{92}\text{X}^{238}$, the number of neutrons in the atom will be [CBSE PMT 1995]
- (a) 142 (b) 146
(c) 144 (d) 143
27. A nuclide of an alkaline earth metal undergoes radioactive decay by emission of the α -particles in succession. The group of the periodic table to which the resulting daughter element would belong is [CBSE PMT 2005]
- (a) Gr.14 (b) Gr.16
(c) Gr.4 (d) Gr.6
28. Which one of the following is not correct [MP PMT 1997]
- (a) ${}_3\text{Li}^7 + {}_1\text{H}^1 \rightarrow {}_4\text{Be}^7 + {}_0\text{n}^1$
(b) ${}_{21}\text{Sc}^{45} + {}_0\text{n}^1 \rightarrow {}_{20}\text{Ca}^{45} + {}_0\text{n}^1$
(c) ${}_{33}\text{As}^{75} + {}_2\text{He}^4 \rightarrow {}_{35}\text{Br}^{78} + {}_0\text{n}^1$
(d) ${}_{83}\text{Bi}^{209} + {}_1\text{H}^2 \rightarrow {}_{84}\text{Po}^{210} + {}_0\text{n}^1$
29. The end product of $(4n+2)$ radioactive disintegration series is [MP PET 1997; Pb. PMT 1998; BHU 2000]
- (a) ${}_{82}\text{Pb}^{208}$ (b) ${}_{82}\text{Pb}^{206}$
(c) ${}_{82}\text{Pb}^{207}$ (d) ${}_{83}\text{Bi}^{210}$

30. The element ${}_{90}\text{Th}$ belongs to thorium series. Which of the following will act as the end product of the series [BHU 2005]
- (a) ${}_{82}\text{Pb}^{206}$ (b) ${}_{82}\text{Pb}^{208}$
(c) ${}_{82}\text{Pb}^{210}$ (d) ${}_{82}\text{Pb}^{214}$
31. On bombarding ${}_{8}\text{O}^{16}$ with deuterons, the nuclei of the product formed will be [NCERT 1978]
- (a) ${}_{9}\text{F}^{18}$ (b) ${}_{9}\text{F}^{17}$
(c) ${}_{8}\text{O}^{17}$ (d) ${}_{7}\text{N}^{14}$
32. An element with atomic number 84 and mass number 218 loses one α -particle and two β -particles in three successive stages, the resulting element will have [NCERT 1979; CPMT 1990]
- (a) At. no. 84 and mass number 214
(b) At. no. 82 and mass number 214
(c) At. no. 84 and mass number 218
(d) At. no. 82 and mass number 218
33. Group displacement law was given by [DPMT 1984]
- (a) Becquerel (b) Rutherford
(c) Soddy and Fajan (d) Madam Curie
34. How many alpha particles are emitted in the nuclear transformation ${}_{84}\text{Po}^{215} \longrightarrow {}_{82}\text{Pb}^{211}$ [CPMT 1993]
- (a) 0 (b) 1
(c) 2 (d) 3
35. If uranium (mass no. 238 and atomic no. 92) emits α -particle, the product has mass number and atomic number [CPMT 1984, 90, 93, 94; MNR 1991; IIT 1981]
- (a) 234, 90 (b) 236, 92
(c) 238, 90 (d) 236, 90
36. Initial mass of a radioactive element is 40 g. How many grams of it would be left after 24 years, if its half-life period is 8 years [MP PMT 1985]
- (a) 2 (b) 5
(c) 10 (d) 20
37. What is the symbol for the nucleus remaining after ${}_{20}\text{Ca}^{42}$ undergoes β -emission [MNR 1987; UPSEAT 2000, 02]
- (a) ${}_{21}\text{Ca}^{42}$ (b) ${}_{20}\text{Sc}^{42}$
(c) ${}_{21}\text{Sc}^{42}$ (d) ${}_{21}\text{Sc}^{41}$
38. When a radioactive nucleus emits an α -particle, the mass of the atom [NCERT 1973, 82]
- (a) Increases and its at. number decreases
(b) Decreases and its at. number decreases
(c) Decreases and its at. number increases
(d) Remains same and its at. number decreases
39. A photon of hard gamma radiation knocks a proton out of ${}_{12}^{24}\text{Mg}$ nucleus to form [AIEEE 2005]
- (a) The isotope of parent nucleus
(b) The isobar of parent nucleus
(c) The nuclide ${}_{11}^{23}\text{Na}$
(d) The isobar of ${}_{11}^{23}\text{Na}$
40. ${}_{84}\text{Pb}^{210} \longrightarrow {}_{82}\text{Pb}^{206} + {}_2\text{He}^4$. From the above equation, deduce the position of polonium in the periodic table (lead belongs to group IV A) [AIIMS 1980]
- (a) II A (b) IV B
(c) VI B (d) VI A
41. Whenever the parent nucleus emits a β -particle, the daughter element is shifted in the periodic table [NCERT 1984]
- (a) One place to the right
(b) One place to the left
(c) Two places to the right
(d) Two places to the left
42. In the nuclear reaction ${}_{92}\text{U}^{238} \longrightarrow {}_{82}\text{Pb}^{206}$, the number of alpha and beta particles decayed are [DPMT 1983; MNR 1985; Roorkee Qualifying 1998]
- (a) $4\alpha, 3\beta$ (b) $8\alpha, 6\beta$
(c) $6\alpha, 4\beta$ (d) $7\alpha, 5\beta$
43. Atomic number after a β -emission from a nucleus having atomic number 40, will be [BHU 1981]
- (a) 36 (b) 39
(c) 41 (d) 44
44. A certain nuclide has a half-life period of 30 minutes. If a sample containing 600 atoms is allowed to decay for 90 minutes, how many atoms will remain [NCERT 1978]
- (a) 200 atoms (b) 450 atoms
(c) 75 atoms (d) 500 atoms
45. The reaction which disintegrates neutron is or neutron is emitted (which completes first) [IIT 1988; MP PMT 1991; KCET 2005]
- (a) ${}_{96}\text{Am}^{240} + {}_2\text{He}^4 \longrightarrow {}_{97}\text{Bk}^{244} + {}_{+1}\text{e}^0$
(b) ${}_{15}\text{P}^{30} \longrightarrow {}_{14}\text{Si}^{30} + {}_1\text{e}^0$
(c) ${}_6\text{C}^{12} + {}_1\text{H}^1 \longrightarrow {}_7\text{N}^{13}$
(d) ${}_{13}\text{Al}^{27} + {}_2\text{He}^4 \longrightarrow {}_{15}\text{P}^{30}$
- If ${}_{92}\text{U}^{236}$ nucleus emits one α -particle, the remaining nucleus will have [MP PMT 1976, 80; BHU 1985; CPMT 1980]
- (a) 119 neutrons and 119 protons
(b) 142 neutrons and 90 protons
(c) 144 neutrons and 92 protons
(d) 146 neutrons and 90 protons
47. α -rays have high ionization power because they possess [CPMT 1982]
- (a) Lesser kinetic energy
(b) Higher kinetic energy
(c) Lesser penetrating power
(d) Higher penetrating power
48. When radium atom which is placed in II group, loses an α -particle, a new element is formed which should be placed in group [CPMT 1979]
- (a) Second (b) First
(c) Fourth (d) Zero
49. Starting from radium, the radioactive disintegration process terminates when the following is obtained [CPMT 1979]
- (a) Lead (b) Radon
(c) Radium A (d) Radium B
50. The appreciable radioactivity of uranium minerals is mainly due to [NCERT 1980]
- (a) An uranium isotope of mass number 235
(b) A thorium isotope of mass number 232
(c) Actinium
(d) Radium
51. After losing a number of α and β -particles, ${}_{92}\text{U}^{238}$ changed to ${}_{82}\text{Pb}^{206}$. The total number of particles lost in this process is [MNR 1985]

- (a) 14 (b) 5
(c) 8 (d) 32
52. When an radioactive element emits an alpha particle, the daughter element is placed in the periodic table [MP PET 1991; MADT Bihar 1981]
(a) Two positions to the left of the parent element
(b) Two positions to the right of the parent element
(c) One position to the right of the parent element
(d) In the same position as the parent element
53. If the quantity of a radioactive element is doubled, then its rate of disintegration per unit time will be [NCERT 1972, 92; MP PET 1989]
(a) Unchanged
(b) Reduced to half
(c) Increased by $\sqrt{2}$ times
(d) Doubled
54. The number of α and β -particles emitted during the transformation of ${}_{90}\text{Th}^{232}$ to ${}_{82}\text{Pb}^{208}$ are respectively [MNR 1978; NCERT 1984; CPMT 1989; RPET 1999; MP PMT 2001; KCET 2003]
(a) 4, 2 (b) 2, 2
(c) 8, 6 (d) 6, 4
55. The atomic number of a radioactive element increases by one unit in
(a) Alpha emission (b) Beta emission
(c) Gamma emission (d) Electron capture
56. The end product of $(4n+1)$ radioactive disintegration series is [MP PMT 1999]
(a) ${}_{83}\text{Bi}^{209}$ (b) ${}_{84}\text{Po}^{210}$
(c) ${}_{82}\text{Pb}^{208}$ (d) ${}_{82}\text{Pb}^{207}$
57. When a β -particle emits from the atom of an element, then [MP PET 1990]
(a) Atomic number increases by two units
(b) Atomic number increases by three units
(c) Atomic number decreases by one unit
(d) Atomic number increases by one unit
58. The number of β -particles emitted in radioactive change ${}_{92}\text{U}^{238} \rightarrow {}_{82}\text{Pb}^{206} + {}_2\text{He}^4$ is [KCET 2000]
(a) 2 (b) 4
(c) 6 (d) 10
59. If half-life of a certain radioactive nucleus is 1000 s, the disintegration constant is [MP PET 2001]
(a) $6.93 \times 10^{-2} \text{ s}^{-1}$ (b) $6.93 \times 10^{-4} \text{ s}^{-1}$
(c) $6.93 \times 10^{-4} \text{ s}^{-1}$ (d) $6.93 \times 10^{-3} \text{ s}^{-1}$
60. Radioactivity of naptunium stops when it is converted to [JIPMER 2001]
(a) Bi (b) Rn
(c) Th (d) Pb
61. The highest binding energy per nucleon will be for [AIIMS 2001]
(a) Fe (b) H_2
(c) O_2 (d) U
62. In the Thorium series, ${}_{90}\text{Th}^{232}$ loses total of 6 α -particles and 4 β -particles in ten stages. The final isotope produced in the series is [MP PET 2001]
(a) ${}_{82}\text{Pb}^{209}$ (b) ${}_{83}\text{Bi}^{209}$
(c) ${}_{82}\text{Pb}^{208}$ (d) ${}_{82}\text{Pb}^{206}$
63. All the nuclei from the initial element to the final element constitute a series which is called [Kerala (Med.) 2002]
(a) g-series (b) b-series
(c) b-g series (d) Disintegration series
64. The number of neutrons in the parent nucleus which gives N^{14} on β - emission is [Pb.CET 2004]
(a) 7 (b) 14
(c) 6 (d) 8
65. The nuclear binding energy for Ar (39.962384 amu) is: (given mass of proton and neutron are 1.007825 amu and 1.008665 amu respectively) [Pb.CET 2002]
(a) 343.81 MeV (b) 0.369096 MeV
(c) 931 MeV (d) None of these
66. The number α - and β - particles emitted respectively during the transformation of ${}_{90}^{232}\text{Th}$ to ${}_{82}^{208}\text{Pb}$ is [Kerala PMT 2004]
(a) 3, 6 (b) 6, 3
(c) 4, 6 [AMCET 1997] (d) 6, 4
(e) 6, 8
67. Consider the following nuclear reactions, ${}_{92}^{238}\text{M} \rightarrow {}_x^y\text{N} + 2 {}_2^4\text{He}$
 ${}_x^y\text{N} \rightarrow {}_B^A\text{L} + 2\beta^+$
The number of neutrons in the element L is [AIEEE 2004]
(a) 140 (b) 144
(c) 142 (d) 146
68. The number of α - and β - particles emitted when a radioactive element ${}_{90}\text{E}^{232}$ changes into ${}_{86}\text{G}^{220}$ will be [MP PET 2004]
(a) 5 and 4 (b) 2 and 3
(c) 3 and 2 (d) 4 and 1
69. The disintegration constant of radium with half-life 1600 years is [MHCET 2004]
(a) $2.12 \times 10^{-4} \text{ year}^{-1}$ (b) $4.33 \times 10^{-4} \text{ year}^{-1}$
(c) $3.26 \times 10^{-3} \text{ year}^{-1}$ (d) $4.33 \times 10^{-12} \text{ year}^{-1}$
70. The number of α and β - particles emitted in the nuclear reaction ${}_{92}\text{U}^{238} \rightarrow {}_{90}\text{Th}^{234} \rightarrow {}_{91}\text{Pa}^{234}$ are respectively [Pb.CET 2001]
(a) 1 and 1 (b) 1 and 2
(c) 2 and 1 (d) 2 and 2
71. In which radiation mass number and atomic number will not change [JEE Orissa]
(a) α (b) β
(c) γ (d) α and 2β
72. Disintegration constant for a radioactive substance is 0.58 hr^{-1} . Its half-life period [BHU 2004]
(a) 8.2 hr (b) 5.2 hr
(c) 1.2 hr (d) 2.4 hr
73. A radioactive nucleus will not emit [DPMT 2005]
(a) Alpha and beta rays simultaneously
(b) Beta and gamma rays simultaneously
(c) Gamma and alpha rays

- (d) Gamma rays only
74. ${}_{72}^{180}\text{X} \xrightarrow{2\alpha} \xrightarrow{\beta} \xrightarrow{\gamma} {}_Z^AX'$. Z and A are [DPMPT 2005]
 (a) 69, 172 (b) 172, 69
 (c) 180, 70 (d) 182, 68
75. Loss of a beta particle is equivalent to [J & K 2005]
 (a) Increase of one neutron only
 (b) Decrease of one neutron only
 (c) Both (a) and (b)
 (d) None of these

Rate of decay and Half-life

1. The half-life period of a radioactive substance is 8 years. After 16 years, the mass of the substance will reduce from starting 16.0 g to [MP PMT 1999]
 (a) 8.0 g (b) 6.0 g
 (c) 4.0 g (d) 2.0 g
2. The atomic mass of an element is 12.00710 amu. If there are 6 neutrons in the nucleus of the atom of the element, the binding energy per nucleon of the nucleus will be [MP PMT 1999]
 (a) 7.64 MeV (b) 76.4 MeV
 (c) 764 MeV (d) 0.764 MeV
 ($e^- = 0.00055$ amu, $p = 1.00814$ amu, $n = 1.00893$ amu)
3. Half-life period of a metal is 20 days. What fraction of metal does remain after 80 days [BHU 1996]
 (a) 1 (b) 1/16
 (c) 1/4 (d) 1/8
4. In the radioactive decay ${}_{92}\text{X}^{232} \rightarrow {}_{89}\text{Y}^{220}$, how many α and β - particles are ejected from X to form Y [CBSE 1999]
 (a) 3α and 3β (b) 5α and 3β
 (c) 3α and 5β (d) 5α and 5β
5. Which of the following does not take place by α - decay [MP PMT 1996]
 (a) ${}_{92}\text{U}^{238} \longrightarrow {}_{90}\text{Th}^{234}$ (b) ${}_{90}\text{Th}^{232} \longrightarrow {}_{88}\text{Ra}^{228}$
 (c) ${}_{88}\text{Ra}^{226} \longrightarrow {}_{86}\text{Rn}^{222}$ (d) ${}_{83}\text{Bi}^{213} \longrightarrow {}_{84}\text{Po}^{213}$
6. 1.0 g of a radioactive isotope was found to reduce to 125 mg after 24 hours. The half-life of the isotope is [MP PET 1996]
 (a) 8 hours (b) 24 hours
 (c) 6 hours (d) 4 hours
7. A radioactive element decays at such a rate that after 15 minutes only 1/10 of the original amount is left. How many more minutes will be needed when only 1/100 of the original amount will be left
 (a) 1.5 minutes (b) 15.0 minutes
 (c) 16.5 minutes (d) 30 minutes
8. The radioactive decay of ${}_{35}\text{X}^{88}$ by a beta emission produces an unstable nucleus which spontaneously emits a neutron. The final product is [MNR 1995; CBSE 2001]
 (a) ${}_{37}\text{X}^{88}$ (b) ${}_{35}\text{Y}^{89}$
 (c) ${}_{34}\text{Z}^{88}$ (d) ${}_{36}\text{W}^{87}$
9. What is the half-life of a radioactive substance if 75% of a given amount of the substance disintegrates in 30 minutes
 (a) 7.5 minutes (b) 25 minutes
- (c) 20 minutes (d) 15 minutes
10. In radioactive decay which one of the following moves the fastest [MP PET/PMT 1999]
 (a) α -particle (b) β -particle
 (c) γ -rays (d) Positron
11. The half-life of a radionuclide is 69.3 minutes. What is its average life (in minutes)
 (a) 100 (b) 10^{-2}
 (c) $(69.3)^{-1}$ (d) 0.693×69.3
12. 10 gm of a radioactive substance is reduced to 1.25 gm after 15 days. Its 1 kg mass will reduce (in how many days) to 500 gm in
 (a) 500 days (b) 125 days
 (c) 25 days (d) 5 days
13. A radioactive isotope having a half-life of 3 days was received after 12 days. It was found that there were 3 gm of the isotope in the container. The initial weight of the isotope when packed was [NCERT 1980; CPMT 1999; KCET 2000; Pb.CET 2001]
 (a) 12 gm (b) 24 gm
 (c) 36 gm (d) 48 gm
14. C^{14} is radioactive. The activity and the disintegration product are
 (a) β -active, ${}_{7}\text{N}^{14}$ (b) α - active, ${}_{7}\text{Be}^{10}$
 (c) Positron active, ${}_{5}\text{B}^{14}$ (d) γ - active, C^{14}
15. Radioactivity of a radioactive element remains $\frac{1}{10}$ of the original radioactivity after 2.303 seconds. The half-life period is
 (a) 2.303 (b) 0.2303
 (c) 0.693 (d) 0.0693
16. A radioactive substance has $t_{1/2}$ 60 minutes. After 3 hrs, what percentage of radioactive substance will remain [BHU 1995]
 (a) 50% (b) 75%
 (c) 25% (d) 12.5%
17. A freshly prepared radioactive source of half-life 2 hours emits radiations of intensity which is 64 times the permissible safe level. The minimum time after which it would be possible to work safely with this source is [IIT 1988]
 (a) 6 hours (b) 12 hours
 (c) 24 hours (d) 128 hours
18. During a negative β -decay [MNR 1990; IIT 1985]
 (a) An atomic electron is ejected
 (b) An electron which is already present within the nucleus is ejected
 (c) A neutron in the nucleus decays emitting an electron
 (d) A part of the binding energy of the nucleus is converted into an electron
19. The decay constant of a radioactive sample is ' λ '. The half-life and mean life of the sample are respectively [MNR 1990; IIT 1989]
 (a) $\frac{1}{\lambda}, \frac{\ln 2}{\lambda}$ (b) $\frac{\ln 2}{\lambda}, \frac{1}{\lambda}$
 (c) $\lambda \ln 2, \frac{1}{\lambda}$ (d) $\frac{\lambda}{\ln 2}, \frac{1}{\lambda}$
20. The half-life of a radio isotope is 20 hours. After 60 hours, how much amount will be left behind [MP PMT 1991]

- (a) $1/8$ (b) $1/4$
(c) $1/3$ (d) $1/2$
21. Half-life period of a zero order reaction is [AMU (Engg.) 1999]
(a) Inversely proportional to the concentration
(b) Independent of the concentration
(c) Directly proportional to the initial concentration
(d) Directly proportional to the final concentration
22. If 12 g of sample is taken, and 6 g of a sample decays in 1 hr. The amount of sample showing decay in next hour is [AMU (Engg.) 1999]
(a) 3 g (b) 1 g
(c) 2 g (d) 6 g
23. What will be half-life period of a nucleus if at the end of 4.2 days, $N = 0.798 N_0$ [MP PET 2000]
(a) 15 days (b) 10 days
(c) 12.83 days (d) 20 days
24. If 2.0 g of a radioactive substance has half-life of 7 days. The half-life of 1 g sample is [MP PET 2000]
(a) 7 days (b) 14 days
(c) 28 days (d) 35 days
25. The half-life of $^{90}_{38}\text{Sr}$ is 20 years. If its sample having initial activity of 8000 dis/min is taken, what would be its activity after 80 years
(a) 500 dis/min (b) 800 dis/min
(c) 1000 dis/min (d) 1600 dis/min
26. $^{24}_{11}\text{Na}$ half-life is 15 hours. On heating it will
(a) Reduce (b) Remain unchanged
(c) Depend on temperature (d) Become double
27. In a radioactive decay, an emitted electron comes from [CBSE 1994; Pb. PET 1999]
(a) Nucleus of the atom
(b) Inner orbital of the atom
(c) Outermost orbit of the atom
(d) Orbit having principal quantum number one
28. What is the value of decay constant of a compound having half-life time $T_{1/2} = 2.95$ days [AFMC 1997]
(a) $2.7 \times 10^{-5} \text{ s}^{-1}$ (b) $2.7 \times 10^6 \text{ s}^{-1}$
(c) $2.7 \times 10^{-6} \text{ s}^{-1}$ (d) $3 \times 10^5 \text{ s}^{-1}$
29. What kind of radioactive decay does not lead to the formation of a daughter nucleus that is an isobar of the parent nucleus
(a) α -rays (b) β -rays
(c) Positron (d) Electron capture
30. The half-life of $^{14}_6\text{C}$ if its K or λ is 2.31×10^{-4} is [BHU 1999]
(a) $2 \times 10^2 \text{ yrs}$ (b) $3 \times 10^3 \text{ yrs}$
(c) $3.5 \times 10^4 \text{ yrs}$ (d) $4 \times 10^3 \text{ yrs}$
31. A radioactive isotope has a half-life of 10 days. If today 125 mg is left over, what was its original weight 40 days earlier [KCET 2005]
(a) 2g (b) 600 mg
(c) 1 g (d) 1.5 g
32. The binding energy of $^{16}_8\text{O}$ is 127 MeV. Its binding energy per neutron is [MH CET 1999]
(a) 0.794 MeV (b) 1.5875 MeV
(c) 7.94 MeV (d) 15.875 MeV
33. If the half-life period of a first order reaction is 138.6 minutes, then the value of decay constant for the reaction will be [MH CET 1999]
(a) 5 minute (b) 0.5 minute
(c) 0.05 minute (d) 0.005 minute
34. Half-life of 10 gm of radioactive substance is 10 days. The half-life of 20 gm is [CPMT 1996]
(a) 10 days (b) 20 days
(c) 25 days (d) Infinite
35. 8 gm of the radioactive isotope, cesium-137 were collected on February 1 and kept in a sealed tube. On July 1, it was found that only 0.25 gm of it remained. So the half-life period of the isotope is [KCET 1989]
(a) 37.5 days (b) 30 days
(c) 25 days (d) 50 days
36. The half-life of radium (226) is 1620 years. The time taken to convert 10 grams of radium to 1.25 grams is [MP PET 1994; UPSEAT 2001]
(a) 810 years (b) 1620 years
(c) 3240 years (d) 4860 years
37. Half-life of a radioactive substance is 120 days. After 480 days, 4 gm will be reduced to [EAMCET 1993]
(a) 2 (b) 1
(c) 0.5 (d) 0.25
38. The half-life of $^{60}_{27}\text{Co}$ is 7 years. If one gm of it decays, the amount of the substance remaining after 28 years is [EAMCET 1992]
(a) 0.25 gm (b) 0.125 gm
(c) 0.0625 gm (d) 0.50 gm
39. A radioactive isotope decays at such a rate that after 96 minutes only $\frac{1}{8}$ th of the original amount remains. The half-life of this nuclide in minutes is [KCET 1992]
(a) 12 (b) 24
(c) 32 (d) 48
40. $\text{C}-14$ has a half-life of 5760 years. 100 mg of a sample containing $\text{C}-14$ is reduced to 25 mg in [Bihar CEE 1992; AMU 2002; MHCET 1999]
(a) 11520 years (b) 2880 years
(c) 1440 years (d) 17280 years
41. Half-life of a radioactive element is 100 yrs. The time in which it disintegrates to 50% of its mass, will be [MP PET 1999]
(a) 50 yrs (b) 200 yrs
(c) 100 yrs (d) 25 yrs
42. The average life period of a radioactive element is the reciprocal of its [MP PET 1995]
(a) Half-life period
(b) Disintegration constant
(c) Number of atoms present at any time
(d) Number of neutrons
43. The half-life period of a radioactive element is 30 minutes. One sixteenth of the original quantity of the element will remain unchanged after [CPMT 1983; MP PMT 1994]
(a) 60 minutes (b) 120 minutes
(c) 70 minutes (d) 75 minutes
44. For a radioactive substance with half-life period 50 years, the time for complete decay of 100 milligram of it would be [MADT Bihar 1984]
(a) 1000 years (b) 100×500 years

- (c) 500 years (d) Infinite time
45. A substance of which one gram is taken, after half-life time what fraction of it is left ? [MADT Bihar 1983]
- (a) $\frac{1}{4}$ (b) $\frac{1}{8}$
- (c) $\frac{1}{2}$ (d) $\frac{1}{32}$
46. The half-life of the radio element $_{83}\text{Bi}^{210}$ is 5 days. Starting with 20 g of this isotope, the amount remaining after 15 days is
- (a) 10 g (b) 5 g
- (c) 2.5 g (d) 6.66 g
47. In radioactive decay of X into Y below, ${}_Z Y^m$ is
- $${}_6 X^{14} \xrightarrow{-3\beta} {}_Z Y^m$$
- (a) ${}_6 Y^{15}$ (b) ${}_7 Y^{17}$
- (c) ${}_9 Y^{14}$ (d) ${}_8 Y^{14}$
48. 75% of the first order reaction was completed in 32 minutes. When was 50% of the reaction completed [MNR 1983; MP PET 1997; EAMCET 1998]
- (a) 24 minutes (b) 16 minutes
- (c) 8 minutes (d) 4 minutes
49. If 2.0 g of a radioactive isotope has a half-life of 20 hr, the half-life of 0.5 g of the same substance is [MP PMT 1990; MNR 1992]
- (a) 20 hr (b) 80 hr
- (c) 5 hr (d) 10 hr
50. Radioactive lead $_{82}\text{Pb}^{201}$ has a half-life of 8 hours. Starting from one milligram of this isotope, how much will remain after 24 hours [MP PMT 1990]
- (a) $1/2 \text{ mg}$ (b) $1/3 \text{ mg}$
- (c) $1/8 \text{ mg}$ (d) $1/4 \text{ mg}$
51. The half-life of $_{92}\text{U}^{238}$ is 4.5×10^9 years. After how many years, the amount of $_{92}\text{U}^{238}$ will be reduced to half of its present amount [CPMT 1990; MP PET 1999]
- (a) 9.0×10^9 years (b) 13.5×10^9 years
- (c) 4.5×10^9 years (d) $4.5 \times 10^{4.5}$ years
52. Radium has atomic weight 226 and a half-life of 1600 years. The number of disintegrations produced per second from 1 gm are [BHU 1990]
- (a) 4.8×10^{10} (b) 9.2×10^6
- (c) 3.7×10^{10} (d) Zero
53. The half-life of a radioactive element is 6 months. The time taken to reduce its original concentration to its 1/16 value is [MP PET 1991]
- (a) 1 year (b) 16 years
- (c) 2 years (d) 8 years
54. In the case of a radio isotope the value of $T_{1/2}$ and λ are identical in magnitude. The value is [KCET 2002]
- (a) 0.693 (b) $(0.693)^{1/2}$
- (c) $1/0.693$ (d) $(0.693)^2$
55. A radioactive element has half-life of one day. After three days, the amount of the element left will be [MNR 1985; UPSEAT 2000, 01; MH CET 2002]
- (a) 1/2 of the original amount
- (b) 1/4 of the original amount
- (c) 1/8 of the original amount
- (d) 1/16 of the original amount
56. The radioactivity due to C^{14} isotope (half-life 6000 years) of a sample of wood from an ancient tomb was found to be nearly half that of fresh wood, the tomb is therefore about [NCERT 1980, 81; MP PET 1989]
- (a) 3000 years old (b) 6000 years old
- (c) 9000 years old (d) 1200 years old
57. The decay of a radioactive element follows first order kinetics, as a result [NCERT 1982]
- (a) Half-life period = constant / k , where k is the decay constant [BHU 1987]
- (b) Rate of decay is independent of temperature
- (c) Rate can be changed by changing chemical conditions
- (d) The element will be completely transformed into a new element after expiry of two half-life period
58. Half-life of a radioactive substance which disintegrates by 75 % in 60 minutes, will be [MP PMT 2002]
- (a) 120 min (b) 30 min
- (c) 45 min (d) 20 min
59. 87.5% decomposition of a radioactive substance complete in 3 hours. What is the half-life of that substance [MP PMT 2003]
- (a) 2 hours (b) 3 hours
- (c) 90 minutes (d) 1 hours
60. Tritium undergoes radioactive decay giving [CPMT 1976; NCERT 1978]
- (a) α -particles (b) β -particles
- (c) Neutrons (d) None of these
61. Given that a radioactive species decays according to exponential law $N = N_0 e^{-\lambda t}$. The half-life of the species is [Kerala (Med.) 2003]
- (a) λ (b) No
- (c) $\lambda/\ln 2$ (d) $\ln 2/\lambda$
62. Half-life of a radioactive disintegration ($A \rightarrow B$) having rate constant 231 sec^{-1} is [CPMT 1988]
- (a) $3.0 \times 10^{-2} \text{ sec}$ (b) $3.0 \times 10^{-3} \text{ sec}$
- (c) $3.3 \times 10^{-2} \text{ sec}$ (d) $3.3 \times 10^{-3} \text{ sec}$
63. The amount of $_{53}\text{I}^{128}$ ($t_{1/2} = 25$ minutes) left after 50 minutes will be [AIIMS 1982; DPMT 1982, 83]
- (a) One – half (b) One – third
- (c) One – fourth (d) Nothing
64. If 3/4 quantity of a radioactive element disintegrates in two hours, its half-life would be [MP PMT 1989; CPMT 1984]
- (a) 1 hour (b) 45 minutes
- (c) 30 minutes (d) 15 minutes
65. Radioactive decay is a [MP PMT 1989, 97]
- (a) Second order reaction (b) First order reaction
- (c) Zero order reaction (d) Third order reaction
66. The half-life of a radioactive element depends upon [EAMCET 1980]
- (a) The amount of the element
- (b) The temperature
- (c) The pressure
- (d) None of these
67. The activity of radio isotope changes with [MNR 1986]
- (a) Temperature (b) Pressure
- (c) Chemical environment (d) None of these
68. A certain nuclide has a half-life of 25 minutes. If one starts with 100 g of it, how much of it will remain at the end of 100 minutes

- (a) 1.0 g (b) 4.0 g
(c) 6.25 g (d) 12.50 g
69. If U^{235} is bombarded with neutrons, atom will split into [CPMT 1981]
(a) $Sr + Pb$ (b) $Cs + Rb$
(c) $Kr + Cd$ (d) $Ba + Kr$
70. If 8.0 g of a radioactive isotope has a half-life of 10 hrs. The half-life of 2.0 g of the same substance is [UPSEAT 2001]
(a) 2.5 hrs. (b) 5 hrs.
(c) 10 hrs. (d) 40 hrs.
71. If the disintegration constant is 6.93×10^{-6} , then half-life of ${}_6C^{14}$ will be [KCET 2001]
(a) 10^2 yrs (b) 10^3 yrs
(c) 10^4 yrs (d) 10^5 yrs
72. The decay constant of Ra^{226} is $1.37 \times 10^{-11} \text{ sec}^{-1}$. A sample of Ra^{226} having an activity of 1.5 millicurie will contain atoms
(a) 4.1×10^{18} (b) 3.7×10^{17}
(c) 2.05×10^{15} (d) 4.7×10^{10}
73. Amount of ${}_{53}I^{128}$ ($t_{1/2} = 25 \text{ min}$) left after 75 minutes is [DCE 2002]
(a) 1/6 (b) 1/4
(c) 1/8 (d) 1/9
74. The half-life of a radioisotope is four hours. If the initial mass of the isotope was 200 g, the mass remaining after 24 hours undecayed is
(a) 3.125 g (b) 2.084 g
(c) 1.042 g (d) 4.167 g
75. An artificial radioactive isotope gave ${}^{14}_7N$ after two successive β -particle emissions. The number of neutrons in the parent nucleus must be [KCET 2004]
(a) 9 (b) 14
(c) 5 (d) 7
76. If the half-life of an isotope X is 10 years, its decay constant is [DCE 2004]
(a) 6.932 yr^{-1} (b) 0.6932 yr^{-1}
(c) 0.06932 yr^{-1} (d) 0.006932 yr^{-1}
77. A radioactive isotope decays at such a rate that after 192 minutes only 1/16 of the original amount remains. The half-life of the radioactive isotope is [Kerala CET 2004]
(a) 32 min (b) 48 min
(c) 12 min (d) 24 min
78. In the given reaction, ${}_{92}U^{235} \xrightarrow{-\alpha} (A) \xrightarrow{-\beta} (B) \xrightarrow{-\beta} (C)$ isotope are [Pb. CET 2000]
(a) A and C (b) ${}_{92}U^{235}$ and C
(c) A and B (d) A , B and C
79. Rate constant for a reaction is λ . Average life is representative by
(a) $1/\lambda$ (b) $\ln 2/\lambda$
(c) $\frac{\lambda}{\sqrt{2}}$ (d) $\frac{0.693}{\lambda}$
80. For a reaction, the rate constant is 2.34 sec^{-1} . The half-life period for the reaction is
(a) 0.30 sec (b) 0.60 sec
(c) 3.3 sec (d) Data is insufficient
81. $T_{1/2}$ of C^{14} isotope is 5770 years. time after which 72% of isotope left is [Orissa JEE 2005]
(a) 2740 years (b) 274 years
(c) 2780 years (d) 278 years
82. A radioactive substance takes 20 min to decay 25%. How much time will be taken to decay 75% [Orissa JEE 2005]
(a) 96.4 min (b) 68 min
(c) 964 min (d) 680 min
83. A radioactive sample is emitting 64 times radiations than non hazardous limit. if its half life is 2 hours, after what time it becomes non-hazardous [DPMT 2005]
(a) 16 hr (b) 12 hr
(c) 8 hr (d) 4 hr
84. If 8.0 g of a radioactive substance has a half-life of 10 hrs., the half life of 2.0 g of the same substance is [J & K 2005]
(a) 2.6 hr (b) 5 hr
(c) 10 hr (d) 40 hr

Artificial transmutation

1. The age of most ancient geological formation is estimated by [NCERT 1981; MP PET/PMT 1988; CBSE 1989; MP PET 1997; MP PMT 2002]
(a) Potassium – Argon method
(b) Carbon – 14 dating method
(c) Radioactive carbon method
(d) Uranium – Lead method
2. The equation ${}_3Li^6 + {}_1H^2 \longrightarrow {}_2He^4 + \text{energy}$ represents
(a) Synthesis of helium (b) Transmutation of element
(c) Fusion reaction (d) Nuclear fission
3. The phenomenon of radioactivity arises from the [Kerala (Med.) 2002]
(a) Binary fission
(b) Nuclear fusion
(c) Stable nuclei
(d) Decay of unstable nuclei
4. The first artificial disintegration of an atomic nucleus was achieved by [Kerala (Engg.) 2002]
(a) Geiger (b) Wilson
(c) Madame curie (d) Rutherford
(e) Soddy
5. Artificial elements have been prepared by bombardment reactions in high energy accelerators. What is the mass number of the element X produced in the following nuclear reaction
 ${}_{95}^{249}Cf + {}_7^{15}N \rightarrow {}_{105}X + {}_0^1n$ [AMU (Engg.) 2002]
(a) 261 (b) 264
(c) 260 (d) 257
6. Radioactive carbon dating was discovered by [MP PET 2001]
(a) W.F. Libby (b) G.N. Lewis
(c) J. Willard Gibbs (d) W. Nernst
7. The nuclear reaction
 ${}_{29}^{63}Cu + {}_2^4He \rightarrow {}_{17}^{37}Cl + {}_{14}^1H + {}_{16}^0n$ is referred to as [MP PET 2002]
(a) Spallation reaction (b) Fusion reaction
(c) Fission reaction (d) Chain reaction

8. The carbon dating is based on [MP PMT 2001]
 (a) $^{15}_6\text{C}$ (b) $^{14}_6\text{C}$
 (c) $^{13}_6\text{C}$ (d) $^{11}_6\text{C}$
9. A possible material for use in the nuclear reactors as a fuel is [DPMT 1986]
 (a) Thorium (b) Zirconium
 (c) Beryllium (d) Plutonium
10. Heavy water freezes at [UPSEAT 2001]
 (a) 0°C (b) 3.8°C
 (c) 38°C (d) -0.38°C
11. To determine the masses of the isotopes of an element which of the following techniques is useful [NCERT 1978; MNR 1979]
 (a) The acceleration of charged atoms by an electric field and their subsequent deflection by a variable magnetic field
 (b) The spectroscopic examination of the light emitted by vaporised elements subjected to electric discharge
 (c) The photographing of the diffraction patterns which arise when X-rays are passed through crystals
 (d) The bombardment of metal foil with alpha particles
12. The radioisotope, tritium (^3_1H) has a half-life of 12.3 years. If the initial amount of tritium is 32 mg. How many milligrams of it would remain after 49.2 years [CBSE 2003]
 (a) 8 mg (b) 1 mg
 (c) 2 mg (d) 4 mg
13. Neutron is used as a [CPMT 1988]
 (a) Reducing agent (b) Moderator
 (c) Tracer (d) In biological programme
14. Hydrogen bomb is based on the phenomenon of [EAMCET 1980; CPMT 1984, 96; MP PMT 1993, 95, 2002; RPET 1999]
 (a) Nuclear fission (b) Nuclear fusion
 (c) Nuclear explosion (d) Disintegration
15. In the nuclear reactors the speed of the neutrons is slowed down by
 (a) Heavy water (b) Ordinary water
 (c) Zinc rods (d) Molten caustic soda
16. By which law, energy produced in nuclear reaction is given [MP PET 2000]
 (a) Graham's law (b) Charle's law
 (c) Gas Lussac's Law (d) Einstein's law
17. If two light nuclei are fused together in nuclear reaction the average energy per nucleon [Pb. PMT 2001]
 (a) Increases (b) Cannot be determined
 (c) Remains same (d) Decreases
18. A wood piece is 11460 years old. What is the fraction of ^{14}C activity left in the piece? (Half-life period of ^{14}C is 5730 years) [MP PMT 2000]
 (a) 0.12 (b) 0.25
 (c) 0.50 (d) 0.75
19. When nuclear energy is intended to be harnessed for generation of electricity, potentially destructive neutron released in a nuclear reactor are absorbed by [MH CET 2001]
 (a) Long rods of Cd (b) Heavy water
 (c) Cubical blocks of steel (d) Both (a) and (c)
20. The proper rays for radiocarbon dating are [MP PET 2002]
 (a) UV-rays (b) IR-rays
 (c) Cosmic rays (d) X-rays
21. $^1_1\text{H}^2 + ^1_1\text{H}^2 \rightarrow ^4_2\text{He}^3 + ^1_0\text{n}^1$. Above nuclear reaction is called [UPSEAT 2001]
 (a) Nuclear fission
 (b) Nuclear fusion
 (c) Artificial transmutation
 (d) Spontaneous disintegration
22. Which of the following is used as a moderator in a nuclear reactor
 (a) D_2O (b) N_2O
 (c) H_2O (d) NaOH
23. The fuel of atomic pile is [NCERT 1973; AFMC 1989]
 (a) Thorium (b) Sodium
 (c) Uranium (d) Petroleum
24. Atom bomb is based on the principle of [CPMT 1982; BHU 1985]
 (a) Nuclear fusion
 (b) Nuclear fission
 (c) Radioactivity
 (d) Fusion and fission both
25. Who observed that when the nucleus of uranium atom was bombarded with fast moving neutrons, it becomes so very unstable that it is immediately broken into two nuclei of nearly equal mass besides other fragments
 (a) J.J. Thomson (b) Chadwick
 (c) Einstein (d) Hahn and Strassmann
26. When a radioactive substance is subjected to vacuum, the rate of disintegration per second [DPMT 1985; NCERT 1972]
 (a) Increases considerably
 (b) Increases only if the products are gaseous
 (c) Is not affected
 (d) Suffers a slight decrease
27. A radio isotope will not emit [KCET 2002]
 (a) Gamma and alpha rays simultaneously
 (b) Gamma rays only
 (c) Alpha and beta rays simultaneously
 (d) Beta and gamma rays simultaneously
28. What is the packing fraction of $^{56}_{26}\text{Fe}$ [JIPMER 2002]
 (Isotopic mass = 55.92066)
 (a) -14.167 (b) 173.90
 (c) -14.187 (d) -73.90
29. The energy released in an atom bomb explosion is mainly due to
 (a) Release of neutrons
 (b) Release of electrons
 (c) Greater mass of products than initial material
 (d) Lesser mass of products than initial material
30. C^{14} is [KCET 2002]
 (a) A natural radioactive isotope
 (b) A natural non-radioactive isotope
 (c) An artificial radioactive isotope
 (d) An artificial non-radioactive isotope
31. A radioactive isotope has a half-life of 10 years. What percentage of the original amount of it remain after 20 years [KCET 2001]
 (a) 0 (b) 12.5
 (c) 8 (d) 25
32. In a chain reaction, uranium atom gets fissioned forming two different materials. The total weight of these put together is
 (a) More than the weight of parent uranium atom

- (b) Less than the weight of parent uranium atom
(c) More or less depends upon experimental conditions
(d) Neither more nor less
33. A substance used as a moderator in nuclear reactors is [MP PET 1995]
(a) Cadmium (b) Uranium-235
(c) Lead (d) Heavy water
34. Equation ${}_{17}\text{Cl}^{37} + {}_1\text{H}^2 \rightarrow {}_{18}\text{Ar}^{38} + {}_0\text{n}^1$ is [MP PMT 1989]
(a) Nuclear fission
(b) Nuclear fusion
(c) Transformation of chlorine
(d) Synthesis of argon
35. 1.0 gm radioactive sodium on decay becomes 0.25 gm in 16 hours. How much time 48 gm of same radioactive sodium will need to become 3.0 gm
(a) 48 hours (b) 32 hours
(c) 20 hours (d) 16 hours
36. Large energy released in an atomic bomb explosion is mainly due to
(a) Products having a lesser mass than initial substance
(b) Conversion of heavier to lighter atoms
(c) Release of neutrons
(d) Release of electrons
37. The reaction ${}_1\text{H}^2 + {}_1\text{H}^3 \rightarrow {}_2\text{He}^4 + {}_0\text{n}^1 + \text{energy}$ represents [MP PMT 1990; CPMT 1990; KCET 1992]
(a) Nuclear fission
(b) Nuclear fusion
(c) Artificial disintegration
(d) Transmutation of element
38. Carbon-14 dating method is based on the fact that [CBSE 1997]
(a) Carbon-14 fraction is the same in all objects
(b) Carbon-14 is highly insoluble
(c) Ratio of carbon-14 and carbon-12 is constant
(d) All of these
39. Half-life period of a radioactive element is 10.6 yrs. How much time will it take in its 99% decomposition [RPET 1999]
(a) 7046 yrs (b) 7.046 yrs
(c) 704.6 yrs (d) 70.4 yrs
40. Deuterium resembles hydrogen in chemical properties but reacts
(a) More vigorously than hydrogen
(b) Faster than hydrogen
(c) Slower than hydrogen
(d) Just as hydrogen
41. Which of the following is heavy water [AFMC 1997]
(a) H_2O_{18} (b) H_2O_{16}
(c) H_2O_3 (d) D_2O
42. D_2O is used in [CPMT 1997]
(a) Industry (b) Nuclear reactor
(c) Medicine (d) Insecticide
43. India conducted an underground nuclear test at [KCET 1998]
(a) Tarapur (b) Narora
(c) Pokhran (d) Pushkar
44. Energy required to separate neutron and proton from the nucleus is called [RPMT 1999]
(a) Bond energy (b) Nuclear energy
(c) Chemical energy (d) Radiation energy
45. Liquid sodium finds use in nuclear reactors. Its function is
(a) To collect the reaction products
(b) To act as a heat exchanger or coolant
(c) To absorb the neutrons in order to control the chain reaction
(d) To act as a moderator which slows down the neutrons
46. Which is least effective for artificial transmutation [DPMT 2000]
(a) Deuterons (b) Neutrons
(c) α -particles (d) Protons
47. A piece of wood was found to have $\text{C}^{14}/\text{C}^{12}$ ratio 0.7 times that in a living plant. The time period when the plant died is (Half-life of $\text{C}^{14} = 5760 \text{ yrs}$) [Pb. PMT 1999]
(a) 2770 yrs (b) 2966 yrs
(c) 2980 yrs (d) 3070 yrs
48. When a slow neutron goes sufficiently close to a U^{235} nucleus, then the process which takes place is [AFMC 2000]
(a) Fusion of U^{235} (b) Fission of U^{235}
(c) First (a) then (b) (d) First (b) then (a)
49. ${}_{13}\text{Al}^{28}$ when radiated by suitable projectile gives ${}_{15}\text{P}^{31}$ and neutron. The projectile used is [MP PMT/PET 1988; CPMT 1985, 82]
(a) Proton (b) Neutron
(c) Alpha particle (d) Deuteron
50. Which of the following statements about radioactivity of an element is incorrect
(a) It is a nuclear property
(b) It does not involve any rearrangement of electrons
(c) Its rate is affected by change in temperature and/or pressure
(d) It remains unaffected by the presence of other element or elements chemically combined with it
51. Radioactive iodine is being used to diagnose the disease of [MP PET 1996]
(a) Bones (b) Kidneys
(c) Blood cancer (d) Thyroid
52. C-14 is used in carbon dating of dead objects because [DPMT 1996]
(a) Its half-life is 10^3 years
(b) Its half-life is 10^4 years
(c) It is found in nature abundantly and in definite ratio
(d) It is found in dead animals abundantly
53. A radioactive element resembling iodine in properties is [Kurukshetra CEE 1998]
(a) Astatine (b) Lead
(c) Radium (d) Thorium
54. For artificial transmutation of nuclei, the most effective one is [MP PMT 1996]
(a) Proton (b) Deuteron
(c) Helium nuclei (d) Neutron
55. Which of the following cannot be accelerated [KCET 2005]
(a) α -particle (b) β -particle
(c) Protons (d) Neutrons
56. For the fission reaction
 ${}_{92}\text{U}^{235} + {}_0\text{n}^1 \rightarrow {}_{56}\text{Ba}^{140} + {}_y\text{E}^x + 2{}_0\text{n}^1$
The value of x and y will be
(a) $x = 93$ and $y = 34$ (b) $x = 92$ and $y = 35$
(c) $x = 89$ and $y = 44$ (d) $x = 94$ and $y = 36$
57. Heavy water is used as

- [Bihar MEE 1996; UPSEAT 1999, 2000, 02]
- (a) Control rods (b) Moderator
(c) Fuel (d) Coolant
(e) None of these
58. Unit for radioactive constant is [MP PET 1990]
(a) Time^{-1} (b) Time
(c) $\text{Mole} - \text{time}^{-1}$ (d) $\text{Time} - \text{mole}^{-1}$
59. Which of the following is used in dating archeological findings or in a method of absolute dating of fossils a radioactive element is used. It is [CPMT 1983, 85; NCERT 1978; BHU 1981; MP PMT 1993; AFMC 1997]
(a) ${}_{92}\text{U}^{235}$ (b) ${}_6\text{C}^{14}$
(c) ${}_6\text{C}^{12}$ (d) ${}_{20}\text{Ca}^{40}$
60. A radioactive isotope has a half-life of 20 days. If 100 gm of the substance is taken, the weight of the isotope remaining after 40 days is [NCERT 1979]
(a) 25 gm (b) 2.5 gm
(c) 60 gm (d) 40 gm
61. In a fission reaction the nucleus of an element [NCERT 1977]
(a) Loses only some elementary nuclear particles from another nucleus
(b) Captures some elementary nuclear particles from another nucleus
(c) Breaks up into several smaller nuclei
(d) Breaks up into two smaller nuclei with the loss of some elementary nuclear particles
62. The huge amount of energy which is released during atomic fission is due to [CPMT 1990]
(a) Loss of mass (b) Loss of electrons
(c) Loss of protons (d) Loss of α -particles
63. The measure of binding energy of a nucleus is the [CPMT 1982; Kurukshetra CEE 1998]
(a) Mass defect (b) Energy of protons
(c) Energy of neutrons (d) Total energy of nucleons
64. The first controlled artificial disintegration of an atomic nucleus was achieved by [BHU 1987]
(a) Geiger (b) Wilson
(c) Cockcroft (d) Rutherford
65. Artificial radioactivity was first discovered by [CPMT 1972; BHU 1984; KCET 1999]
(a) Seaberg (b) Rutherford
(c) Einstein (d) Irene Curie & Juliot
66. The half-life period of a radioactive element is 140 days. After 560 days, one gram of the element will reduce to [CPMT 1989; IIT 1986; EAMCET 1992; MP PET 1997; UPSEAT 1999]
(a) $1/2$ g (b) $1/4$ g
(c) $1/8$ g (d) $1/16$ g
67. A device used for the measurement of radioactivity is [BHU 1979]
(a) Mass spectrometer (b) Cyclotron
(c) Nuclear reactor (d) G.M. counter
68. In a nuclear reactor, chain reaction is controlled by introducing
(a) Iron rod (b) Cadmium rod
(c) Graphite rod (d) Platinum rod
69. In atomic reactors, graphite is used as a [NCERT 1980; MP PET 1989]
(a) Lubricant
(b) Moderator to slow down neutrons
(c) Fuel
(d) Liner of the reactor
70. The modern basis of atomic weight is [MP PET 1989; CPMT 1993]
(a) Isotope $H^1 = 1.000$ (b) Oxygen = 16.000
(c) Isotope $O^{16} = 16.000$ (d) Isotope $C^{12} = 12.000$
71. Which radioactive carbon has been helpful in understanding the mechanism of photosynthesis in plants
(a) ${}_6\text{C}^{14}$ (b) ${}_6\text{C}^{13}$
(c) ${}_6\text{C}^{12}$ (d) ${}_6\text{C}^{15}$
72. Artificial transmutation was discovered by [Pb.CET 2003]
(a) Pauli (b) Rutherford
(c) Soddy (d) Curie
73. Which of the following is an example of nuclear fusion [MP PMT 1989; DCE 2004]
(a) ${}_1\text{H}^2 + {}_1\text{H}^2 \rightarrow {}_2\text{He}^4 + \text{energy}$
(b) ${}_{92}\text{U}^{235} + {}_0\text{n}^1 \rightarrow {}_{56}\text{Ba}^{141} + {}_{36}\text{Kr}^{92} + {}_{30}\text{n}^1 + \text{energy}$
(c) ${}_{13}\text{Al}^{27} + {}_1\text{H}^1 \rightarrow {}_{12}\text{Mg}^{24} + {}_2\text{He}^4$
(d) None of these
74. The radioactivity isotope ${}_{27}^{60}\text{Co}$ which is used in the treatment of cancer can be made by (n, p) reaction. For this reaction the target nucleus is [CBSE PMT 2004]
(a) ${}_{28}^{60}\text{Ni}$ (b) ${}_{27}^{60}\text{Co}$
(c) ${}_{28}^{59}\text{Ni}$ (d) ${}_{27}^{59}\text{Co}$
75. Fusion bomb involves [AFMC 2004]
(a) Combination of lighter nuclei into bigger nucleus
(b) Destruction of heavy nucleus into smaller nuclei
(c) Combustion of oxygen
(d) Explosion of TNT
76. The element used for dating the ancient remains is [AFMC 2004]
(a) Ni (b) C-14
(c) C-12 (d) Rd
77. If radium and chlorine combine to form radium chloride the compound is [Kerala PMT 2004]
(a) No longer radioactive
(b) Twice as radioactive as radium
(c) Half as radioactive as radium
(d) As radioactive as radium
(e) Thrice as radioactive as radium
78. Which of the following is an example of nuclear fission [Pb. CET 2002]
(a) ${}_1\text{H}^2 + {}_1\text{H}^2 \rightarrow {}_2\text{He}^4 + \gamma$
(b) $A + B \rightarrow C + \text{energy}$ [EAMCET 1984]
(c) ${}_{92}\text{U}^{235} + {}_0\text{n}^1 \rightarrow {}_{56}\text{Ba}^{141} + {}_{36}\text{Kr}^{92} + 3 {}_0\text{n}^1 + \text{energy}$
(d) ${}_{13}\text{Al}^{27} + {}_2\text{He}^4 \rightarrow {}_{15}\text{P}^{30} + {}_0\text{n}^1$

79. The C^{14} to C^{12} ratio in a wooden article is 13% that of the fresh wood. Calculate the age of the wooden article. Given that the half-life of C^{14} is 5770 years [Pb.CET 2004]

(a) 16989 years (b) 16858 years
(c) 15675 years (d) 17700 years

80. Hydrogen bomb is based on the principle of [AIEEE 2005]

(a) Nuclear fission (b) Natural radioactivity
(c) Nuclear fusion (d) Artificial radioactivity

81. Match List –I and List-II and choose right one by using code given in list [Kerala CET 2005]

List – I	List –II
Nuclear reactor	Used substance
Component	
1. Moderator	(A) Uranium
2. Control rods	(B) Graphite
3. Fuel rods	(C) Boron
4. Coolent	(D) Lead
	(E) Sodium

Code :

1	2	3	4
(a) B	A	C	E
(b) B	C	A	E
(c) C	B	A	E
(d) C	D	A	B
(e) D	C	B	A

Isotopes-Isotones and Nuclear isomers

1. Substances which have identical chemical properties but differ in atomic weights are called

[EAMCET 1980, 83; DPMT 1985; MNR 1982]

(a) Isothermals (b) Isotopes
(c) Isentropus (d) Elementary particles

2. Tritium is an isotope of [DPMT 1985]

(a) Hydrogen (b) Titanium
(c) Tantalum (d) Tellurium

3. O – 18 isotope of oxygen will have [CPMT 1972, 79]

(a) 18 protons
(b) 9 protons and 9 neutrons
(c) 8 neutrons and 10 protons
(d) 10 neutrons and 8 protons

4. Which of the following is an isobaric pair [CPMT 1987, 93]

(a) ${}_6C^{13}, {}_7N^{13}$ (b) ${}_6C^{13}, {}_7N^{14}$
(c) ${}_7N^{14}, {}_8O^{15}$ (d) ${}_7N^{13}, {}_8O^{15}$

5. Isotopes are atoms having the same

[EAMCET 1978, 79; MP PMT 1980; CPMT 1973; BHU 2001; AFMC 2003]

(a) Atomic mass (b) Mass number
(c) Atomic number (d) Number of neutrons

6. Successive emission of an α -particle and two β -particles by an atom of an element results in the formation of its

[MP PMT/PET 1988; BHU 1979]

(a) Isobar (b) Isomorph
(c) Isotope (d) Isomer

7. In treatment of cancer, which of the following isotope is used [DPMT 1985; BHU 1995; KCET 1999; AMU 1999; Pb.CET 2001; MP PET 2002; Kurukshetra CET 2002]

(a) ${}_{53}I^{131}$ (b) ${}_{15}P^{32}$
(c) ${}_{27}Co^{60}$ (d) ${}_1H^2$

8. Elements having different nuclear charge but the same mass number are called [NCERT 1974; MP PMT 1991; CBSE PMT 1991; CPMT 1989; EAMCET 1992]

(a) Isotopes (b) Isobars
(c) Isomers (d) Isotones

9. Which isotope on bombardment with α -particles will give ${}_8O^{17}$ and ${}_1H^1$ [NCERT 1983]

(a) ${}_8O^{16}$ (b) ${}_7N^{14}$
(c) ${}_7N^{15}$ (d) ${}_6C^{14}$

10. Emission of β -particle by an atom of an element results in the formation of its [BHU 1979; DPMT 1985; KCET 1999]

(a) Isotope (b) Isomer
(c) Isomorph (d) Isobar

11. Radioactive isotopes that have an excessive neutron/proton ratio generally exhibit

(a) e^- emission (b) ${}_2He^4$ emission
(c) e^+ emission (d) K -electron capture

12. Atomic weights of carbon, nitrogen and oxygen are 12, 14 and 16 respectively. An atom of atomic weight 14 and nuclear charge + 6 is an isotope of

(a) Oxygen (b) Carbon
(c) Nitrogen (d) None of these

13. Isotopes of an element have [MNR 1985]

(a) Similar chemical properties but different physical properties
(b) Similar chemical and physical properties
(c) Similar physical properties but different chemical properties
(d) Different chemical and physical properties

14. Whose number is common in isotopes [AIIMS 1988]

(a) Proton (b) Neutron
(c) Proton and neutron (d) Nucleon

15. In the following radioactive transformation $R \xrightarrow{\alpha} X \xrightarrow{\beta} Y \xrightarrow{\beta} Z$; the nuclei R and Z are [BHU 1987]

(a) Isotopes (b) Isobars
(c) Isomers (d) Isotones

16. Which one of the following pairs represents isobars [CPMT 1988]

(a) ${}_3He$ and ${}_2He$
(b) ${}_{12}Mg^{24}$ and ${}_{12}Mg^{25}$
(c) ${}_{19}K^{40}$ and ${}_{20}Ca^{40}$
(d) ${}_{19}K^{39}$ and ${}_{19}K^{40}$

17. Nuclei of isotopes differ in [CPMT 1986, 90; MP PMT 1987]

(a) The number of protons
(b) The number of neutrons
(c) The number of protons and neutrons both
(d) None of these

18. An isotope of 'parent' is produced, when its nucleus loses [CPMT 1987; MP PET 1991]

(a) One α -particle
(b) One β -particle

- (c) One α and two β -particles
(d) One β and two α -particles
19. Which of the following isotopes is likely to be most stable [EAMCET 1982]
(a) ${}_{30}\text{Zn}^{71}$ (b) ${}_{30}\text{Zn}^{66}$
(c) ${}_{30}\text{Zn}^{64}$ (d) None of these
20. Which of the following statement is false [Manipal MEE 1995]
(a) In chlorine gas, the ratio of Cl^{35} and Cl^{37} is 1 : 3
(b) The hydrogen bomb is based on the principle of nuclear fusion
(c) The atom bomb is based on the principle of nuclear fission
(d) The penetrating power of a proton is less than that of an electron
21. Isotones are elements having [Bihar MEE 1996; Bihar CEE 1995]
(a) Same mass number but different neutrons
(b) Same atomic number but different neutrons
(c) Same atomic number, mass number and neutrons
(d) Different atomic and mass number but same neutrons
22. Isobaric atoms may contain
(a) Same number of p^+ and different number of n^0
(b) Same number of n^0 and different number of p^+
(c) Same number of both p^+ and n^0
(d) Different numbers of both p^+ and n^0
23. ${}_{20}\text{X}^{40}$ and ${}_{21}\text{X}^{40}$ are [CPMT 1996]
(a) Isobars (b) Isotopes
(c) Isotones (d) Isostereomers
24. Which property is different for neutral atoms of the two isotopes of the same element [JIPMER 2001]
(a) Number of protons (b) Atomic number
(c) Number of neutrons (d) None of these
25. Which of the following species is isotonic with ${}_{37}\text{Rb}^{86}$ [BHU 2001]
(a) ${}_{36}\text{Kr}^{84}$ (b) ${}_{37}\text{Rb}^{85}$
(c) ${}_{38}\text{Sr}^{87}$ (d) ${}_{39}\text{Y}^{89}$
26. The maximum sum of the number of neutrons and protons in an isotope of hydrogen is [Pb. PMT 2001]
(a) 4 (b) 5
(c) 6 (d) 3
27. Difference in ${}_{17}\text{Cl}^{35}$ and ${}_{17}\text{Cl}^{37}$ is of [AFMC 2000]
(a) Atomic number (b) Number of protons
(c) Number of neutrons (d) Number of electrons
28. Which of the following is an isotonic pair [AMU (Engg.) 2000]
(a) ${}_{19}^{40}\text{K}$, ${}_{20}^{40}\text{Ca}$ (b) ${}_{19}^{39}\text{K}$, ${}_{20}^{40}\text{Ca}$
(c) ${}_{18}^{33}\text{Ar}$, ${}_{18}^{40}\text{Ar}$ (d) ${}_{18}^{40}\text{Ar}$, ${}_{20}^{40}\text{Ca}$
29. ${}_{6}\text{C}^{11}$ and ${}_{5}\text{B}^{11}$ are referred as [NCERT 1978]
(a) Nuclear isomers (b) Isobars
(c) Isotopes (d) Fission products
30. The atomic number of bromine is 35 and its atomic weight is 79. Two isotopes of bromine are present in equal amounts. Which of the following statements represents the correct number of neutrons [NCERT 1983]
(a) 44 (b) 43
(c) 45 (d) 46
31. Isotopes are those which contain [RPMT 1997]
(a) Same number of neutrons
(b) Same physical properties
(c) Same chemical properties
(d) Different atomic mass
32. An element 'A' emits an α -particle and forms 'B'. 'A' and 'B' are [DPMT 1990]
(a) Isotopes (b) Isobars
(c) Isotones (d) Isodiasphere
33. Which of the following properties are different for neutral atoms of isotopes of the same element [EAMCET 1987; NCERT 1971; CPMT 1976; MP PET 1994]
(a) Mass
(b) Atomic number
(c) General chemical reactions
(d) Number of electrons
34. The isotope ${}_{92}\text{U}^{235}$ decays in a number of steps to an isotope of lead ${}_{82}\text{Pb}^{207}$. The groups of particles emitted in this process will be [MP PMT 1987]
(a) $4\alpha, 7\beta$ (b) $6\alpha, 4\beta$
(c) $7\alpha, 4\beta$ (d) $10\alpha, 8\beta$
35. Addition of two neutrons in an atom A would [AMU 1984]
(a) Change the chemical nature of A
(b) Produce an isobar of A
(c) Produce an isotope of A
(d) Produce another element
36. Atomic weight of the isotope of hydrogen which contains 2 neutrons in the nucleus would be [CPMT 1980]
(a) 2 (b) 3
(c) 1 (d) 4
37. If a radioactive isotope with atomic number A and mass number M emits an α -particle, the atomic number and mass number of that new isotope will become [NCERT 1980]
(a) $A - 2$, $M - 4$ (b) $A - 2$, M
(c) A, $M - 2$ (d) $A - 4$, $M - 2$
38. Which character is different of the two isotopes of an element [NCERT 1971; EAMCET 1987]
(a) Atomic mass (b) Atomic number
(c) Number of electrons (d) Number of protons
39. The symbol of an isotope is ${}_{32}\text{X}^{65}$, this reveals that [MP PET 1991]
(a) Its atomic number is 32 and atomic weight is 65
(b) Its atomic number is 65
(c) It has 65 electrons
(d) It has 32 neutrons
40. Two atoms have the same atomic mass but different atomic numbers. Such atoms are called as [NCERT 1971, 76; IIT 1983]
(a) Isotopes (b) Isobars
(c) Isomer (d) Isoelectronic
- 18 Ar^{40} , 20 Ca^{40} and 19 K^{40} are

[MNR 1983; DPMT 1991; EAMCET 1992;
RPMT 1997; Pb.CET 2000]

- (a) Isomers (b) Isotopes
(c) Isobars (d) Isotones
42. Atoms in hydrogen gas have preponderance of [CPMT 1972]
(a) ${}_1H^1$ atoms
(b) Deuteron atoms
(c) Tritium atoms
(d) All the three (a), (b) and (c) are in equal proportion
43. Positron emission results from the transformation of one nuclear proton into neutron. The isotope thus produced possesses
(a) Same mass number (b) Higher nuclear charge
(c) Intense radioactivity (d) No radioactivity
44. An isotope of oxygen has mass number 18. Other isotopes of oxygen will have the same [MP PMT 1985; MADT Bihar 1981]
(a) Mass number (b) Atomic weight
(c) Number of neutrons (d) Number of protons
45. Two nuclei which are not identical but have the same number of nucleons represent
(a) Isotopes (b) Isobars
(c) Isotones (d) None of the three
46. The β -decay of ${}_{11}Na^{24}$ produces an isotope of [NCERT 1978]
(a) Mg (b) Na
(c) Al (d) Ne
47. Isotopes differ in [NCERT 1973]
(a) Number of protons (b) Valency
(c) Chemical reactivity (d) Number of neutrons
48. The isobars are atoms with the same number of [DPMT 1982; CPMT 1994]
(a) Protons (b) Neutrons
(c) Protons and neutrons (d) Nucleons
49. Radioactive isotope of hydrogen is [MP PMT 2001; MPPET 2003]
(a) Tritium (b) Deuterium
(c) Para hydrogen (d) Ortho hydrogen
50. Isotopes of same elements have the same number of [BHU 1984; DPMT 1983; CPMT 1972, 78; AFMC 2000, 01]
(a) Protons (b) Neutrons
(c) Deutrons (d) None
51. In chlorine gas, ratio of Cl^{35} and Cl^{37} is [BHU 1984; CPMT 1977, 80]
(a) 1 : 3 (b) 3 : 1
(c) 1 : 1 (d) 1 : 4
52. An ordinary oxygen contains [NCERT 1977]
(a) Only O-16 isotopes
(b) Only O-17 isotopes
(c) A mixture of O-16 and O-18 isotopes
(d) A mixture of O-16, O-17 and O-18 isotopes
53. Isotopes were discovered by [AMU 1983; AFMC 1995]
(a) Aston (b) Soddy
(c) Thomson (d) Millikan
54. Which of the following are iso-electronic [CBSE 2002]
(a) CO_2 and NO (b) SO_2 and CO_2

(c) CN and CO (d) NO_2 and CO_2

55. Which of the following are pairs of isotopes [Bihar CEE 1982]
(a) ${}_1^2H^+$ and ${}_1^3H$ (b) ${}_1^3H$ and ${}_2^4H^-$
(c) ${}_2^3He$ and ${}_2^4He$ (d) ${}_6^{12}C$ and ${}_7^{14}N^+$
56. Which among the following isotope is not found in natural uranium
(a) ${}_{92}U^{234}$ (b) ${}_{92}U^{235}$
(c) ${}_{92}U^{238}$ (d) ${}_{92}U^{239}$
57. An isotone of ${}_{32}^{76}Ge$ is (one or more are correct) [MP PMT 1990] [IIT 1984; MADT Bihar 1995; MP PMT 1995]
(a) ${}_{32}^{77}Ge$ (b) ${}_{33}^{77}As$
(c) ${}_{34}^{77}Se$ (d) ${}_{34}^{78}Se$

Critical Thinking

Objective Questions

1. ${}_{11}^{23}Na$ is the more stable isotope of Na . Find out the process by which ${}_{11}^{24}Na$ can undergo radioactive decay [IIT Screening 2003]
(a) β^- emission (b) α emission
(c) β^+ emission (d) K electron capture
2. Oxygen contains 90% of O^{16} and 10% of O^{18} . Its atomic mass is
(a) 17.4 (b) 16.2
(c) 16.5 (d) 17
3. The missing particle in the reaction, ${}_{92}^{235}U + {}_0^1n \rightarrow {}_{56}^{146}Ba + \dots + 3{}_0^1n$ is [DPMT 2001]
(a) ${}_{32}^{87}Ge$ (b) ${}_{35}^{89}Br$
(c) ${}_{36}^{87}Kr$ (d) ${}_{35}^{86}Br$
4. Sulphur-35 (34.96903 amu) emits a β -particle but no γ -rays, the product is chlorine-35 (34.96885 amu). The maximum energy emitted by the β -particle is [DPMT 2004]
(a) 0.016767 MeV (b) 1.6758 MeV
(c) 0.16758 MeV (d) 16.758 MeV
5. A radioactive substance has a constant activity of 2000 disintegration/minute. The material is separated into two fractions, one of which has an initial activity of 1000 disintegrations per second while the other fraction decays with $t_{1/2} = 24$ hours. The total activity in both samples after 48 hours of separation is
(a) 2000 (b) 1250
(c) 1000 (d) 1500
6. How many alpha particles are emitted per second by 1 microgram of radium
(a) 3.62×10^4 / sec (b) 0.362×10^4 / sec
(c) 362×10^4 / sec (d) 36.2×10^4 / sec
7. If 1 microgram of radium has disintegrated for 500 years, how many alpha particles will be emitted per second
(a) 2.92×10^4 / sec (b) 292×10^4 / sec

[EAMCET 1991]

- (c) $0.292 \times 10^4 / \text{sec}$ (d) $29.2 \times 10^4 / \text{sec}$
8. A radioactive nuclide X decays at the rate of 1.00×10^5 disintegration $\text{s}^{-1} \text{g}^{-1}$. Radium decays at the rate of 3.70×10^{10} disintegration $\text{s}^{-1} \text{g}^{-1}$. The activity of X in millicuries g^{-1} (mci g^{-1}) is [MP PET 2001]
- (a) 0.027 (b) 0.270×10^{-5}
(c) 0.00270 (d) 0.000270
9. If ${}_{92}\text{U}^{235}$ nucleus absorbs a neutron and disintegrates in ${}_{54}\text{Xe}^{139}$, ${}_{38}\text{Sr}^{94}$ and X , then what will be the product X [CBSE 2002]
- (a) α -particle (b) β -particle
(c) 2-neutrons (d) 3-neutrons
10. The half-life of a radioactive isotope is 3 hours. Value of its disintegration constant is [BHU 2002]
- (a) 0.231 per hr (b) 2.31 per hr
(c) 0.2079 per hr (d) 2.079 per hr
11. The activity of carbon-14 in a piece of an ancient wood is only 12.5%. If the half-life period of carbon-14 is 5760 years, the age of the piece of wood will be ($\log 2 = 0.3010$) [MP PMT 1999]
- (a) 17.281×10^2 years (b) 172.81×10^2 years
(c) 1.7281×10^2 years (d) 1728.1×10^2 years
12. The radium and uranium atoms in a sample of uranium mineral are in the ratio of $1 : 2.8 \times 10^6$. If half-life period of radium is 1620 years, the half-life period of uranium will be [MP PMT 1999]
- (a) 45.3×10^9 years (b) 45.3×10^{10} years
(c) 4.53×10^9 years (d) 4.53×10^{10} years
13. Half-life of radium is 1580 yrs. Its average life will be [AIIMS 1999; AFMC 1999; CPMT 1999]
- (a) 2.5×10^3 yrs (b) 1.832×10^3 yrs
(c) 2.275×10^3 yrs (d) 8.825×10^2 yrs
14. 8 gms of a radioactive substance is reduced to 0.5 g after 1 hour. The $t_{1/2}$ of the radioactive substance is [DCE 2000]
- (a) 15 min (b) 30 min
(c) 45 min (d) 10 min
15. A first order nuclear reaction is half completed in 45 minutes. How long does it need 99.9% of the reaction to be completed [KCET 2001]
- (a) 5 hours (b) 7.5 hours
(c) 10 hours (d) 20 hours
16. Number of α -particles emitted per second by a radioactive element falls to $1/32$ of its original value in 50 days. The half-life-period of this elements is [AMU 2001]
- (a) 5 days (b) 15 days
(c) 10 days (d) 20 days
17. What is the half-life of a radioactive substance if 87.5% of any given amount of the substance disintegrates in 40 minutes [Kerala CET 1996]
- (a) 160 min (b) 10 min
(c) 20 min (d) 13 min 20 sec
18. A radioactive isotope has a $t_{1/2}$ of 10 days. If today 125 gm of it is left, what was its weight 40 days earlier
- (a) 600gm (b) 1000gm
(c) 1250gm (d) 2000gm
19. The half-life of ${}_{6}\text{C}^{14}$, if its decay constant is 6.31×10^{-4} is [CBSE PMT 2001]
- (a) 1098 yrs (b) 109.8 yrs
(c) 10.98 yrs (d) 1.098 yrs
20. A radioactive sample has a half-life of 1500 years. A sealed tube containing 1gm of the sample will contain after 3000 years [MNR 1994; UPSEAT 1994]
- (a) 1gm of the sample
(b) 0.5gm of the sample
(c) 0.25gm of the sample
(d) 0.00gm of the sample
21. The half-life of a radioactive isotope is three hours. If the initial mass of the isotope were 256 g, the mass of it remaining undecayed after 18 hours would be [AIEEE 2003]
- (a) 4.0 g (b) 8.0 g
(c) 12.0 g (d) 16.0 g
22. $\frac{15}{16}$ th of a radioactive sample decays in 40 days half-life of the sample is [DCE 2001]
- (a) 100 days (b) 10 days
(c) 1 day (d) $\log_e 2$ days
23. A radioactive element with half-life 6.5 hrs has 48×10^{19} atoms. Number of atoms left after 26 hrs [BHU 2003]
- (a) 24×10^{19} (b) 12×10^{19}
(c) 3×10^{19} (d) 6×10^{19}
24. The half-life of 1 gm of radioactive sample is 9 hours. The radioactive decay obeys first order kinetics. The time required for the original sample to reduce to 0.2 gm is [AMU (Engg.) 2002]
- (a) 15.6 hours (b) 156 hours
(c) 20.9 hours (d) 2.09 hours
25. The half-life period of a radioactive substance is 140 days. After how much time 15 g will decay from 16 g sample of it [AFMC 2002]
- (a) 140 days (b) 560 days
(c) 280 days (d) 420 days
26. Percentage of a radioactive element decayed after 20 sec when half-life is 4 sec [BHU 2003]
- (a) 92.25 (b) 96.87
(c) 50 (d) 75
27. Consider an α -particle just in contact with a ${}_{92}\text{U}^{238}$ nucleus. Calculate the coulombic repulsion energy (i.e. the height of the coulombic barrier between U_{238} and alpha particle) assuming that the distance between them is equal to the sum of their radii [UPSEAT 2001]
- (a) $23.8517 \times 10^4 \text{ eV}$
(b) $26.147738 \times 10^4 \text{ eV}$

- (c) $25.3522 \times 10^4 \text{ eV}$
(d) $20.2254 \times 10^4 \text{ eV}$
28. The half-life period of Pb^{210} is 22 years. If 2 gm of Pb^{210} is taken, then after 11 years how much of Pb^{210} will be left
[KCET 2001]
- (a) 1.414 gm (b) 2.428 gm
(c) 3.442 gm (d) 4.456 gm
29. A wood specimen from an archeological centre shows a $^{14}_6C$ activity of 5.0 counts/min/gm of carbon. What is the age of the specimen ($t_{1/2}$ for $^{14}_6C$ is 5000 years) and a freshly cut wood gives 15 counts/min/gm of carbon
[AMU (Engg.) 2002]
- (a) $5.78 \times 10^4 \text{ years}$ (b) $9.85 \times 10^4 \text{ years}$
(c) $7.85 \times 10^3 \text{ years}$ (d) $0.85 \times 10^4 \text{ years}$
30. $^{92}_{235}U + n \rightarrow \text{fission product} + \text{neutron} + 3.20 \times 10^{-11} \text{ J}$. The energy released when 1g of $^{92}_{235}U$ undergoes fission is
[CBSE PMT 1997]
- (a) $12.75 \times 10^8 \text{ kJ}$ (b) $18.60 \times 10^9 \text{ kJ}$
(c) $8.21 \times 10^7 \text{ kJ}$ (d) $6.55 \times 10^6 \text{ kJ}$
31. The triad of nuclei that is isotonic is
[IIT 1988; DCE 2000; MP PMT 2004]
- (a) $^{14}_6C, ^{15}_7N, ^{17}_9F$
(b) $^{12}_6C, ^{14}_7N, ^{19}_9F$
(c) $^{14}_6C, ^{14}_7N, ^{17}_9F$
(d) $^{14}_6C, ^{14}_7N, ^{19}_9F$
32. The relative abundance of two isotopes of atomic weight 85 and 87 is 75% and 25% respectively. The average atomic weight of element is
[DCE 2003]
- (a) 75.5 (b) 85.5
(c) 40.0 (d) 86.0

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Mass number of an atom is equal to total number of nucleons present in the nucleus.
Reason : Mass number defines the identity of an atom.
2. Assertion : $^1_1H, ^2_1H$ and 3_1H are isotopes of hydrogen.

- Reason : Nuclides of the same element of different mass numbers are called isotopes of that element.
3. Assertion : The activity of 1 g pure uranium-235 will be greater than the same amount present as U_3O_8 .
Reason : In the combined state, the activity of the radioactive element decreases.
4. Assertion : Nuclear forces are called short range forces.
Reason : Nuclear forces operate over very small distance i.e., 10^{-15} m or 1 fermi.
5. Assertion : An example of K -capture is $^{133}_{56}Ba + e^- \rightarrow ^{133}_{55}Cs + X - \text{ray}$.
Reason : The atomic number decreases by one unit as result of K -capture.
6. Assertion : Radioactive heavy nuclei decay by a series of α - and / or β -emission, to form a stable isotope of lead.
Reason : Radioactivity is a physical phenomenon.
7. Assertion : Actinium series is so called because it starts with an isotope of actinium.
Reason : Actinium is formed in the nature as such and is not formed from the disintegration of any other radioisotope.
8. Assertion : For maximum stability N/P ratio must be equal to 1.
Reason : Loss of α - and β -particles has no role in N/P ratio.
9. Assertion : The neutrons are better initiators of nuclear reactions, than the protons, deuterons or α -particles of the same energy.
Reason : Neutrons are uncharged particles and hence, they are not repelled by positively charged nucleus.
10. Assertion : Breeder reactor produces fissile $^{239}_{94}Pu$ from non-fissile uranium.
Reason : A breeder reactor is one that produces more fissionable nuclei than it consumes.
11. Assertion : The activation energies for fusion reactions are very low.
Reason : They require very low temperature to overcome electrostatic repulsion between the nuclei.
12. Assertion : The archeological studies are based on the radioactive decay of carbon-14 isotope.
Reason : The ratio of $C-14$ to $C-12$ in the animals and plants is same as that in the atmosphere.
13. Assertion : Photochemical smog is produced by nitrogen oxides.
Reason : Vehicular pollution is a major source of nitrogen oxides.
14. Assertion : A nuclear binding energy per nucleon is in the order $^9_4Be > ^7_3Li > ^4_2He$.

- Reason : Binding energy per nuclear increases linearly with difference in number of neutrons and protons.
15. Assertion : Nuclear fission is always accompanied by release of energy.
- Reason : Nuclear fission is a chain process.
- [AIIMS 1994]
16. Assertion : Protons are more effective than neutrons of equal energy in causing artificial disintegration of atoms.
- Reason : Neutrons are neutral they penetrate the nucleus. [AIIMS]
17. Assertion : A beam of electrons deflects more than a beam of α -particles in an electric field.
- Reason : Electrons possess negative charge while α -particles possess positive charge.
- [AIIMS 2002]
18. Assertion : ${}^{22}_{11}\text{Na}$ emits a positron giving ${}^{22}_{12}\text{Mg}$.
- Reason : In β^+ emission neutron is transformed into proton.
- [AIIMS 1994]

AS Answers and Solutions

Nucleus (Stability and Reaction)

- (b) Protons + Neutrons = Nucleons
- (b) A deuteron (${}_1H^2$) contains a neutron and a proton
- (a) Low binding energy causes radioactivity.
- (a) ${}_7N^{14} + {}_2He^4 \rightarrow {}_8O^{17} + {}_1H^1$
- (b) Follow Einstein mass-energy relation.
- (d) Mass (weight) of positron and electron is $9.11 \times 10^{-31} \text{ kg}$.

7. (b) ${}_3\text{Li}^6 + {}_0n^1 \rightarrow {}_2\text{He}^4 + {}_1\text{H}^3$
8. (c) ${}_7\text{N}^{14} + {}_0n^1 \rightarrow {}_6\text{C}^{14} + {}_1\text{H}^1$
9. (c) ${}_{17}\text{Cl}^{37} + {}_1\text{H}^2 \rightarrow {}_{18}\text{Ar}^{38} + {}_0n^1$
10. (d) Because of its high instability.
12. (c) ${}_{90}\text{Th}^{234} \xrightarrow{-\beta} {}_{91}\text{X}^{234} \xrightarrow{-\beta} {}_{92}\text{Y}^{234} \xrightarrow{-\alpha} {}_{90}\text{Z}^{230}$
13. (c) Isotopes of an element have similar chemical properties but different physical properties.
14. (c) A nuclear reaction must be balanced in terms of mass and energy.
15. (c) ${}_{52}\text{Te}^{130} + {}_1\text{H}^2 \rightarrow {}_{53}\text{I}^{131} + {}_0n^1$
16. (c) The emission of positron takes place.
18. (c) An ion is electrically charged atom or a group of atoms.
19. (a) Charge on positron and proton is about $+1.602 \times 10^{-19} \text{ C}$.
20. (b) ${}_{12}\text{Mg}^{24} + {}_2\text{He}^4 \rightarrow {}_{14}\text{Si}^{27} + {}_0n^1$
21. (b) The radioactive isotope ${}_6\text{C}^{14}$ is produced in the atmosphere by the action of cosmic ray neutrons on ${}_7\text{N}^{14}$
- $${}_7\text{N}^{14} + {}_0n^1 \rightarrow {}_6\text{C}^{14} + {}_1\text{H}^1$$
23. (b) Tritium is the isotope.
24. (d) ${}_{21}\text{Sc}^{45}(n, p){}_{20}\text{Ca}^{45}$ according to Beath's notation
25. (c) ${}_7\text{N}^{14} + {}_1\text{H}^1 \rightarrow {}_8\text{O}^{15} + \gamma$
26. (c) ${}_{93}\text{Np}^{239} \rightarrow {}_{94}\text{Pu}^{239} + {}_{-1}e^0$
27. (b) Equate atomic no. and mass no.
28. (c) Magic no. are 2, 8, 20, 28, 50 and 82 protons in nucleus or 2, 8, 20, 28, 50, 82, 126 neutrons in nucleus. These numbers imparts stability to nucleus.
30. (a) $\frac{n}{p}$ of ${}_{82}\text{Pb}^{208} = \frac{126}{82} = 1.53$
 $\frac{n}{p}$ of ${}_{83}\text{Bi}^{209} = \frac{126}{83} = 1.51$
31. (c) According to Beath's notation ${}_{13}\text{Al}^{27}(n, p){}_{12}\text{Mg}^{27}$
32. (d) Azimuthal quantum no. is related to angular momentum.
33. (b) The value of $n = \frac{238 - 218}{4} = \frac{20}{4} = 5 - 1 = 4$
34. (d) Mass number increases by one unit.
36. (b) Equal atomic number and mass number.
37. (b) $1 \text{ amu} = 931.478 \text{ MeV}$
38. (a) Positron is anti-particle of electron.
39. (a) Isotopes are formed by the emission of one α - and two β - particles respectively.
40. (a) The $\frac{n}{p}$ ratio of stable nucleoids is $\frac{n}{p} = 1$.
41. (b) Neutrino have no mass and no charge and thus known as ghost particles.
42. (b) Equate mass number and atomic number on both sides.
43. (a) Due to mass decay.
44. (d) Mesons (μ) have 200-300 times mass of electron and $+ve$, 0 or $-ve$ charges.
45. (b) ${}_{+1}e^0$ is positron.
46. (d) Pb is the most stable atom.
47. (b) Anderson discovered positron in 1932.
48. (a) Even-Even are most stable
Odd-Odd are most unstable
49. (b) The atom which have lower value of packing fraction is stable.
50. (d) Number of neutrons in ${}_{88}\text{Ra}^{226} = 226 - 88 = 138$.
51. (d) Nuclear reactions involves exchange of nuclear energy.
52. (a) ${}_{11}\text{Na}^{23} + {}_1\text{H}^1 \rightarrow {}_{12}\text{Mg}^{23} + {}_0n^1$
53. (b) ${}_{92}\text{U}^{235}$ is radioactive because it is most unstable.
54. (c) Equate atomic no. and mass no.
57. (b) ${}_4\text{Be}^9 + {}_2\text{He}^4 \rightarrow {}_6\text{C}^{12} + {}_0n^1$
58. (d) According to group displacement law.
59. (b) ${}_4\text{Be}^9 + {}_1\text{H}^1 \rightarrow {}_3\text{Li}^6 + {}_2\text{He}^4$
 $(p) \quad (\alpha - \text{particle})$
60. (c) ${}_{18}\text{Ar}$ having $40 - 18 = 22$ neutrons
While ${}_{21}\text{Sc}$ having $40 - 21 = 19$ neutrons.
61. (b) Nuclear reactivity depends upon the number of protons and neutrons.
63. (d) ${}_{29}\text{Cu}^{64} \rightarrow {}_{28}\text{Ni}^{64} + {}_{+1}e^0$
65. (a) ${}_{12}\text{Mg} + {}_1\text{D}^2 \rightarrow {}_2\text{He}^4 + {}_{11}\text{Na}^{22}$
66. (b) Equate atomic no. and mass no.
67. (a) ${}_{96}\text{X}^{227} \rightarrow \text{Y} + 4\alpha + 5\beta$
On equating mass number
 $227 = y + 4 \times 4 + 0, \quad y = 211$
On equating atomic number
 $96 = y + 2 \times 4 - 5, \quad y = 93$.
68. (a) Meson was discovered by Yukawa

Radioactivity and α , β and γ rays

1. (c) γ - rays does not contain material particles.
2. (d) γ - rays are neutral energy packet.
3. (a) The order of penetrating power is : $\alpha < \beta < \gamma$ -rays. It is due to lower mass and high speed.
4. (b) α -rays travel with a velocity which is $\frac{1}{10}$ th to $\frac{1}{20}$ th of that of light.
5. (c) γ -rays have maximum penetrating power.
6. (b) α -particles are 4 time heavier than neutrons.
7. (c) ${}_{92}\text{U}^{235} + {}_0n^1 \rightarrow {}_{56}\text{Ba}^{145} + {}_{36}\text{Kr}^{88} + 3{}_0n^1$
8. (c) Rutherford first of all used zinc sulphide (ZnS) as phosphor in the detection of α -particles.
9. (b) α -rays consist of a stream of He^{2+} .
10. (b) α -rays are positively charged, β -rays are negatively charged, γ -rays carry no charge and thus not deflected in field.
11. (a) α -particle is identical with ${}_2\text{He}^4$ helium nucleus.
12. (a) γ -rays have maximum penetrating power.
13. (a) Henry Becquerel noticed the emission of penetrating rays from potassium uranyl sulphate and Madam Curie named it as radioactivity.
15. (c) Penetrating powers α - rays $< \beta$ - rays $< \gamma$ - rays
17. (a) α -rays are positively charged, β -rays are negatively charged, γ -rays carry no charge.
20. (b) Deflection in β - rays is large.
21. (a) Penetrating power of α - rays are less than β, γ and X -rays.
22. (c) Lead is a stable isotope.
23. (d) Neutrons carry no charge.

24. (b) α -rays has least penetrating power.
 25. (c) γ -rays carry no charge.
 26. (d) Proton is not emitted by radioactive substances.
 27. (d) Due to it's nature.
 28. (c) ${}_{88}\text{Ra}^{226}$ is radioactive because $\frac{n}{p}$ ratio for it is 1.56 which is greater than 1.5.
 30. (a) Cf-98 belongs to actinid series.
 31. (d) Photons are not carry any charge.
 32. (c) ${}_7\text{N}^{14} + {}_2\text{He}^4 (\alpha\text{-particle}) \rightarrow {}_8\text{O}^{17} + {}_1\text{H}^1$
 33. (a) Definition of binding energy.
 34. (b) α - particle is ${}_2\text{He}^4$.
 35. (a) Gamma ray doesn't deviate from electromagnetic field, the main reason of it is that there is no charge on gamma rays.
 36. (c) Energy liberated = loss of mass $\times$ 931
 $= 0.01864 \times 931 = 17.36 \text{ MeV}$
 38. (acd) Beta emission causes increase in atomic number by one unit.
 39. (a) Mass loss = mass of reactant - mass of product.
 $= (2.014 + 3.016) - (4.004 + 1.008)$
 $= 5.030 - 5.012 = 0.018 \text{ amu}$

Causes of Radioactivity and Group Displacement Law

1. (b) In ${}_{95}\text{Am}^{241}$ the mass no. division by four gives a residue of 1.
 In ${}_{90}\text{Th}^{234}$ the mass no. division by four gives a residue of 2.
 2. (d) On emission of α -particles daughter element shift 2 group to the left. On emission of β -particles daughter element shift 1 group to the right.
 3. (d) Protons + Neutrons = Nucleons
 4. (d) Radioactivity is characteristic property of unstable nucleus.
 5. (c) Chemical change is extra nuclear phenomenon.
 6. (c) ${}_Z\text{X}^A \xrightarrow[-6\beta]{-8\alpha} {}_Z\text{X}^A$
 Number of protons = 82; Number of neutrons = 124
 Neutron/proton ratio in the product nucleus = $\frac{124}{82} = \frac{62}{41}$
 7. (c) ${}_{84}\text{X}^{218} \rightarrow {}_{84}\text{Y}^{214} + x {}_2\alpha^4 + y {}_{-1}\beta^0$
 no. of α -particle = $\frac{218 - 214}{4} = \frac{4}{4} = 1$
 no. of β -particle = $84 - 84 + 2 \times 1 = 2$.
 8. (a) When an α -particle is emitted by any nucleus than atomic weight decreases by four units and atomic number decreases by two units
 ${}_{88}\text{Ra}^{224} \xrightarrow{-\alpha} {}_{86}\text{X}^{220}$
 9. (b) Number of α -particles = $\frac{231 - 207}{4} = 6$
 Number of β -particles = $89 - 82 - 2 \times 6 = 5$.
 10. (a) ${}_{90}\text{Th}^{228} \rightarrow {}_{83}\text{Bi}^{212}$
 No. of α -particles = $\frac{228 - 212}{4} = \frac{16}{4} = 4$
 No. of β -particles = $90 - 83 - 2 \times 4 = 1$.
 11. (a) ${}_6\text{C}^{14} \rightarrow {}_7\text{N}^{14} + {}_{+1}e^0$
 No. of neutrons in $\text{C}^{14} = 14 - 6 = 8$.
 12. (c) ${}_{92}\text{X}^{238} \xrightarrow{-\alpha} {}_{90}\text{Y}^{234}$
 Number of neutrons = $234 - 90 = 144$.
 13. (d) ${}_Z\text{A}^m \rightarrow {}_{Z+1}\text{B}^m + {}_{-1}e^0$
 14. (b) $r = \lambda \cdot N$
 15. (a) ${}_o\text{n}^1 \rightarrow {}_{+1}\text{P}^1 + {}_{-1}e^0$ (β -particle comes out)
 16. (a) Element 57 to 71 are placed in III group.
 17. (a) ${}_5\text{X}^{14} \xrightarrow{-2\beta} {}_7\text{N}^{14}$ than no. of neutrons in
 ${}_5\text{X}^{14} = 14 - 5 = 9$.
 18. (a,b,c) An emission of β -particle means that atomic number increases by 1 but mass number remains unaffected and neutron- proton ratio decreases.
 19. (c) Suppose the no. of α -particles emitted = x and the no. of β -particles emitted = y , then
 ${}_{92}\text{U}^{238} \rightarrow {}_{82}\text{Pb}^{206} + x {}_2\alpha^4 + y {}_{-1}\beta^0$
 Equating the mass number on both sides, we get
 $238 = 206 + 4x + 0y$ or $4x = 32$ or $x = \frac{32}{4} = 8$
 Hence 8 α -particles will be emitted.
 20. (c) Pb is the end product of each natural radioactive series.
 21. (b) The $\frac{n}{p}$ ratio of ${}_{13}\text{Al}^{29}$ places it above the belt of stability and thus it emits β -particles.
 22. (d) ${}_Y\text{A}^X \rightarrow {}_{Y-10}\text{B}^{X-32} + m {}_2\text{He}^4 + n {}_{+1}e^0$
 Value of $m = \frac{X - (X) - 32}{4} = 8$
 Value of $n = Y - Y - 10 - 2 \times 8 = 6$.
 23. (d) During β -decay atomic mass is unaffected while atomic no. increases by one unit.
 24. (a) Equate atomic number and mass no.
 25. (b) ${}_{90}\text{X}^{232} \xrightarrow{-2\beta} {}_{92}\text{Y}^{232} \rightarrow {}_{82}\text{Z}^{212} + x {}_2\text{He}^4$
 No. of α -particles = $\frac{232 - 212}{4} = \frac{20}{4} = 5$.
 26. (d) ${}_{92}\text{X}^{238} \xrightarrow{-\alpha} {}_{90}\text{Y}^{234} \xrightarrow{-\beta} {}_{91}\text{Z}^{234}$
 no. of neutrons = $234 - 91 = 143$.
 27. (b) ${}_Z\text{A}^M \xrightarrow[\text{Gr. 2}]{-\alpha} {}_{Z-2}\text{B}^{M-4} \xrightarrow[\text{Gr. 18}]{-\alpha} {}_{Z-4}\text{C}^{M-8}$.
 28. (b) Equate atomic no. and mass no.
 29. (b) The mass no. on division by four gives a residue of 2.
 30. (a)

Series	Name of the series	Parent element	End stable element
$4n$	Thorium series	Th-232	Pb-208
$4n + 1$	Neptunium series	Pu-241	Bi-209
$4n + 2$	Uranium series	U-238	Pb-206
$4n + 3$	Actinium series	U-235	Pb-207

31. (a) ${}_8\text{O}^{16} + {}_1\text{H}^2 \rightarrow {}_9\text{F}^{18}$
 32. (a) ${}_{84}\text{A}^{218} \rightarrow {}_{84}\text{B}^{214} + {}_2\text{He}^4 + 2 {}_{-1}e^0$.
 33. (c) It is also called Soddy and Fajan rule.
 34. (b) ${}_{84}\text{Po}^{215} \rightarrow {}_{82}\text{Pb}^{211} + {}_2\text{He}^4$
 35. (a) ${}_{92}\text{U}^{238} \rightarrow {}_{90}\text{Th}^{234} + {}_2\text{He}^4$

36. (b) $N = \frac{N_o}{2^n}$ and $n = \frac{24}{8} = 3$
 $N = \frac{40}{2^3} = \frac{40}{8} = 5$
37. (c) ${}_{20}\text{Ca}^{42} \rightarrow {}_{21}\text{Sc}^{42} + {}_{-1}e^0$
38. (b) ${}_A X^M \xrightarrow{-\alpha} {}_{A-2} Y^{M-4}$
39. (c) ${}_{12}^{24}\text{Mg} + \gamma \longrightarrow {}_{11}^{23}\text{Na} + {}_1^1\text{H}$
40. (d) An element formed by losing one α -particle occupies two position left to parent element, Pb in IVA, thus Po should be in VIA.
41. (a) According to group displacement law.
42. (b) Number of α -particles = $\frac{238 - 206}{4} = 8$
 Number of β -particles = $92 - 82 - 2 \times 8 = 6$
43. (c) ${}_{40}\text{X} \rightarrow {}_{41}\text{Y} + {}_{-1}e^0$ (β -emission)
44. (c) $n = \frac{90}{30} = 3 \Rightarrow N = \frac{600}{2^3} = 75$ atoms.
45. (d) Equate mass no. and atomic no.
46. (b) ${}_{92}\text{U}^{236} \rightarrow {}_{90}\text{X}^{232} + {}_2\text{He}^4$
 ${}_{90}\text{X}^{232}$ have 90 protons and 142 neutrons.
47. (b) α -rays have high I.P. due to high kinetic energy.
48. (d) Going two positions back from 2^- group gives zero group.
49. (a) Ra belongs to $(4n + 2)$ series. End product will also belong to the same series.
50. (d) Ra contaminated with uranium mineral shows appreciable radioactivity.
51. (a) ${}_{92}\text{U}^{238} \rightarrow {}_{82}\text{Pb}^{206} + x {}_{+2}\alpha^4 + y {}_{-1}\beta^0$
 no. of α -particles = $\frac{238 - 206}{4} = 8$
 no. of β -particles = $92 - 82 - 2 \times 8 = 6$
 Total no. of particles = $8 + 6 = 14$
52. (a) According to Group displacement law.
53. (d) Rate = $\lambda \times$ number of atoms.
54. (d) ${}_{90}\text{Th}^{232} \rightarrow {}_{82}\text{Pb}^{208} + x {}_2\text{He}^4 + y {}_{-1}\beta^0$
 Equating mass no.
 $232 = 208 + 4x + 0y$ or $4x = 24$ or $x = 6$
 Equating atomic no.
 $90 = 82 + 2x - y$ or $90 = 82 + 2 \times 6 - y$ or $y = 4$
 Hence 6α and 4β particles will be emitted.
55. (b) ${}_Z A^m \rightarrow {}_{Z+1} B^m + {}_{-1}e^0$
56. (a) The mass no. division by four gives a residue of 1
57. (d) ${}_A X^m \xrightarrow{-\beta} {}_{A+1} Y^m$
58. (c) Suppose the no. of α -particles emitted = x and the no. of β -particles emitted = y . Then
 ${}_{92}\text{U}^{238} \rightarrow {}_{82}\text{Pb}^{206} + x {}_{+2}\alpha^4 + y {}_{-1}\beta^0$
 equating the mass number on both sides, we get
 $238 = 206 + 4x + 0y$ or $4x = 32$, $x = 8$
 equating the atomic number on both sides, we get
 $92 = 82 + 2x - y$
 $92 = 82 + 2 \times 8 - y$
 $y = 6$
- Hence 8α and 6β are emitted.
59. (c) $k = \frac{0.693}{t_{1/2}} = \frac{0.693}{1000\text{s}} = 0.000693 = 6.93 \times 10^{-4} \text{ s}^{-1}$
60. (a) Bi is a stable end product of Neptunium series.
62. (c) $Pb - 208$ is the stable end product of thorium series.
63. (d) Definition of disintegration series.
64. (d) ${}_6\text{X}^{14} \xrightarrow{\beta} {}_{6+1}\text{N}^{14}$
 in ${}_6\text{X}^{14}$ no. of neutrons $14 - 6 = 8$.
65. (a) ${}_{18}\text{Ar}^{40}$
 Total no of protons = 18
 Total no of neutrons = 22
 Mass defect = $[m \times p + m \times n] - 39.962384$
 $= [1.007825 \times 18 + 1.008665 \times 22] - 39.962384$
 $= [18.14085 + 22.19063] - 39.962384 = 0.369$
 Binding energy = mass defect $\times 931$
 $= 0.369 \times 931 = 343.62 \text{ MeV}$
66. (d) ${}_{90}\text{Th}^{232} \longrightarrow {}_{82}\text{Pb}^{208}$
 No. of α - particle $\Rightarrow \frac{232 - 208}{4} = 6$
 No. of β - particle $\Rightarrow 82 - [90 - 6 \times 2] = 4$
67. (b) ${}_{92}\text{M}^{238} \longrightarrow {}_y\text{N}^x + 2 {}_2\text{He}^4$
 ${}_y\text{N}^x \longrightarrow {}_B\text{L}^A + 2\beta^+$
 ${}_y\text{N}^x = ({}_{92-2 \times 2})\text{N}^{(238-4 \times 2)} = {}_{88}\text{N}^{230}$
 ${}_{88}\text{N}^{230} \xrightarrow{2\beta^+} ({}_{88-2})\text{L}^{(230)} = {}_{86}\text{L}^{230}$
 Total no of neutrons in ${}_{90}\text{L}^{330}$
 $230 - 86 = 144$
68. (c) ${}_{90}\text{E}^{232} \longrightarrow {}_{86}\text{G}^{220}$
 No. of α particle = $\frac{232 - 220}{4} = 3$
 No. of β particle = $86 - [90 - 2 \times 3] = 2$
69. (b) $K = \frac{0.693}{t_{1/2}} = \frac{0.693}{1600}$
 $= 4.33 \times 10^{-4} \text{ year}^{-1}$
70. (a) ${}_{92}\text{U}^{238} \longrightarrow {}_{90}\text{Th}^{234} \longrightarrow {}_{91}\text{Pa}^{234}$
 No. of α particle = $\frac{238 - 234}{4} = \frac{4}{4} = 1$
 No. of β particle = $91 - 90 = 1$
72. (c) $K = \frac{0.693}{t_{1/2}}$
 $t_{1/2} = \frac{0.693}{K} = \frac{0.693}{0.58} \Rightarrow 1.2 \text{ hrs}$
73. (d) A radioisotope first emits α or β particles, then it becomes unstable and emits γ -rays.
74. (a) ${}_{72}^{180}\text{X} \xrightarrow{2\alpha} {}_{68}^{172}\text{P} \xrightarrow{\beta} {}_{69}^{172}\text{Q} \xrightarrow{\gamma} {}_{69}^{172}\text{X}$
75. (b) Loss of beta particle is equivalent to decrease of one neutron only.

Rate of decay and Half-life

1. (c) $n = \frac{16}{8} = 2$, $N = \frac{N_o}{2^n} = \frac{16.0}{2^2} = \frac{16.0}{4} = 4.0 \text{ gm}$.
2. (a) Mass of 6 neutrons = 6.05358 amu, Mass of 6 protons = 6.04884 amu, Mass of $n + \text{Mass of } p = 12.10242 \text{ amu}$
Mass defect = 12.10242 - 12.00710 = 0.09532
Binding energy = 0.09532 $\times$ 931 = 88.74292 MeV.
Binding energy per nucleon = 88.74292/12 = 7.39 MeV
3. (b) $T = t_{1/2} \times n$, $\therefore n = \frac{80}{20} = 4$
Amount left = $\frac{1}{2^n} = \frac{1}{2^4} = \frac{1}{16}$.
4. (a) ${}_{92}\text{X}^{232} \rightarrow {}_{89}\text{Y}^{220} + {}_2\text{He}^4 + {}_{-1}\text{e}^0$
no. of α -particles = $\frac{232 - 220}{4} = 3$
no. of β -particles = $89 - [92 - 2 \times 3] = 3$.
5. (d) It occurs by β -decay.
6. (a) $N = \left[\frac{1}{2}\right]^n \times N_o = 125 \text{ mg} = \left(\frac{1}{2}\right)^n \times 1000 \text{ mg}$
 $\left(\frac{1}{2}\right)^n = \frac{125}{1000} = \frac{1}{8}$
 $\left(\frac{1}{2}\right)^n = \left(\frac{1}{2}\right)^3$, $n = 3$, so number, of $t_{1/2} = 3$
Total time = 24 hours, Half-life time = $\frac{24}{3} = 8 \text{ hours}$.
8. (d) ${}_{35}\text{X}^{88} \xrightarrow{-\beta} {}_{36}\text{W}^{88} \rightarrow {}_{36}\text{W}^{87} + {}_0\text{n}^1$
9. (d) 75% of the substance disintegrates in two half lives.
2 half lives = 30 min $\therefore t_{1/2} = 15 \text{ min}$.
10. (c) γ -rays are electromagnetic waves.
11. (a) Average life
(τ) = 1.44 $t_{1/2} = 1.44 \times 69.3 = 99.7 \approx 100 \text{ minutes}$.
12. (d) $N = \left[\frac{1}{2}\right]^n \times N_o$
 $1.25 = \left[\frac{1}{2}\right]^n \times 10$
 $\left[\frac{1}{2}\right]^n = \frac{1.25}{10} = \frac{1}{8} = \left[\frac{1}{2}\right]^3$, $n = 3$
Half-life time = $\frac{15}{3} = 5 \text{ days}$.
13. (d) $n = \frac{12}{3} = 4$
 $\therefore N_o = N \times 2^n = 3 \times 2^4 = 48 \text{ g}$.
14. (a) ${}_6\text{C}^{14} \rightarrow {}_7\text{N}^{14} + {}_{-1}\text{e}^0$, β -active.
15. (c) $2.303 = \frac{2.303}{0.693} \times t_{1/2} \log 10$

$$\therefore N = \frac{N_o}{10} \therefore \frac{N_o}{N} = 10.$$

16. (d) Amount left = $\frac{N_o}{2^3} = \frac{100}{8} = 12.5\%$
17. (b) $N = \frac{N_o}{64} = \frac{N_o}{2^6}$ $\therefore n = 6$
Thus total time = $2 \times 6 = 12 \text{ hr}$.
18. (c) β -decay occurs by the nuclear change $n \rightarrow p + {}_{-1}\text{e}^0$.
19. (b) $t_{1/2} = \frac{\log_e 2}{\lambda}$, Average life = $\frac{1}{\lambda}$
20. (a) $N = \frac{N_o}{2^n}$, $n = \frac{60}{20} = 3$; $N_o = 1 \text{ g}$, then $N = \frac{1}{2^3} = \frac{1}{8}$.
21. (b) $t_{1/2}$ of zero order reaction is independent of the concentration.
22. (a) Half-life is 1 hr and thus in each half-life, half of the sample decays.
23. (c) $t = \frac{2.303 \times t_{1/2}}{0.693} \log \frac{N_o}{N}$, $N = 0.798 N_o$
24. (a) Half-life is independent of initial amount.
25. (a) 80 years = 4 half lives
Activity after n half lives = $\frac{1}{2^n} \times a$.
26. (b) $t_{1/2}$ is independent of all external factors and is constant for a given species.
27. (a) In nucleus electrons formed by the following decay.
 ${}_0\text{n}^1 \rightarrow {}_{+1}\text{P}^1 + {}_{-1}\text{e}^0$
28. (c) $t_{1/2} = 2.95 \text{ days}$
 $= 2.95 \times 24 \times 60 \times 60 \text{ s} = 254880$
 $\lambda = \frac{0.693}{t_{1/2}} = \frac{0.693}{254880} = 2.7 \times 10^{-6} \text{ s}^{-1}$
29. (a) When a radioactive element emits an α -particle, the atomic no. of the resulting nuclide decreases by two units and atomic mass decreases by 4 units.
30. (b) $t_{1/2} = \frac{0.693}{k} = \frac{0.693}{2.31 \times 10^{-4}} = 0.3 \times 10^4 \text{ yrs}$
 $= 3.0 \times 10^3 \text{ yrs}$.
31. (a) $N = N_o \left(\frac{1}{2}\right)^n$, $n = \frac{40}{10} = 4$
 $\frac{125}{1000} = N_o \left(\frac{1}{2}\right)^4$, $N_o = \frac{125}{1000} \times 2 \times 2 \times 2 \times 2 = 2 \text{ g}$
32. (c) Binding energy per nucleon = $\frac{127}{16} = 7.94 \text{ MeV}$.
33. (d) $k = \frac{0.693}{t_{1/2}} = \frac{0.693}{138.6 \text{ min}} = 0.005 \text{ min}^{-1}$
34. (a) Half-life period is independent of initial amount.
35. (b) $t = \text{Feb 1 to July 1} = 28 + 31 + 30 + 31 + 30 = 150 \text{ days}$
 $\lambda = \frac{2.303}{150} \log \frac{8}{0.25} = \frac{2.303}{150} \log 2^5 = \frac{0.693}{30} \text{ day}^{-1}$
 $t_{1/2} = \frac{0.693}{0.693/30} = 30 \text{ days}$.

36. (d) $t = \frac{2.303 \times t_{1/2}}{0.693} \log \frac{N_o}{N}$
37. (d) $n = \frac{480}{120} = 4, N = \frac{N_o}{2^n}, N = \frac{4}{2^4} = \frac{4}{16} = 0.25 \text{ gm.}$
38. (c) $n = \frac{28}{7} = 4, N = \frac{N_o}{2^n}, N = \frac{1}{2^4} = \frac{1}{16} = 0.0625 \text{ gm.}$
39. (c) $\lambda = \frac{2.303}{t} \log \frac{[N_o]}{[N]} = \frac{2.303}{96} \log \frac{1}{1/8}$
 $= \frac{2.303}{96} \times 0.9 = 0.0216$
 $\therefore t_{1/2} = \frac{0.693}{\lambda} = \frac{0.693}{0.0216} = 32.0 \text{ min.}$
40. (a) $25 = \left[\frac{1}{2}\right]^n \times 100, \left[\frac{1}{2}\right]^n = \frac{25}{100} = \frac{1}{4} = \left[\frac{1}{2}\right]^2$
 $n = 2, \text{ No. of half lives} = 2$
 $\text{so time required} = 2 \times 5760 = 11520 \text{ yr.}$
41. (c) $t_{1/2} = 100 \text{ years.}$
42. (b) Average life $(\tau) = \frac{1}{\lambda}$.
43. (b) $\frac{1}{16} = \frac{1}{2^n}$ or $\frac{1}{2^4} = \frac{1}{2^n}$ or $n = 4$
 $\therefore \text{Required time} = 4 \times t_{1/2} = 120 \text{ min.}$
44. (d) The time required for complete decay (1 order) is always infinite.
45. (c) After half-life time the half of the substance will be decayed.
46. (c) $n = \frac{15}{5} = 3, N = \frac{N_o}{2^n} = \frac{20}{2^3} = \frac{20}{8} = 2.5 \text{ gm.}$
47. (c) ${}_6X^{14} \xrightarrow{-3\beta} {}_9Y^{14}$
48. (b) $N = \frac{25}{100} N_o \text{ (at } t = 32 \text{ minutes)}$
 $\text{Thus } t = \frac{2.303}{0.693} \times t_{1/2} \log \frac{N_o}{N}$
49. (a) Half-life period is a characteristic of radioactive isotope which is independent of initial concentration.
50. (c) $n = \frac{24}{8} = 3, N = \frac{N_o}{2^n} = \frac{1}{2^3} = \frac{1}{8} \text{ mg.}$
51. (c) Because $t_{1/2} = 4.5 \times 10^9$ years, so after 4.5×10^9 years the amount of ${}_{92}U^{238}$ will be half decayed.
52. (c) $r = \frac{0.693}{t_{1/2}} \times N_o$
 $= \frac{0.693}{1600 \times 365 \times 24 \times 60 \times 60} \times \frac{6.023 \times 10^{23}}{226}$
 $= 3.7 \times 10^{10} \text{ dps.}$
53. (c) $t = \frac{2.303 \times t_{1/2}}{0.693} \log \frac{N_o}{N}; N = \frac{1}{16}$
54. (b) $t_{1/2} = \frac{0.693}{k \text{ or } \lambda}$
55. (c) $n = \frac{3}{1} = 3; N = \frac{N_o}{2^3} = \frac{1}{8}$
56. (b) $N = N_o \times \left(\frac{1}{2}\right)^n$
 $\frac{1}{2} = 1 \times \left(\frac{1}{2}\right)^n; n = 1$
 $t = n \times t_{1/2} = 1 \times 6000 = 6000 \text{ yrs.}$
57. (a) For 1st order $t_{1/2} = 0.693 K^{-1}$.
58. (b) 75% of the substance disintegrates in two half lives 2 half lives = 60 min. $\therefore t_{1/2} = 30 \text{ min.}$
59. (d) $\frac{0.693}{t_{1/2}} = \frac{2.303}{180} \times \log \frac{100}{12.5}$
 $t_{1/2} = \frac{0.693 \times 180}{2.303 \times 3 \times 0.3010} = 60 \text{ min} = 1 \text{ hr.}$
60. (b) Tritium (${}_1H^3 \rightarrow {}_2He^3 + {}_{-1}e^0$) is a β -emitter.
61. (d) $t_{1/2} = \ln 2 / \lambda$
62. (b) $t_{1/2} = \frac{0.693}{\lambda} = \frac{0.693}{231 \text{ sec}^{-1}} = 3.0 \times 10^{-3} \text{ sec.}$
63. (c) The amount of ${}_{53}I^{128}$ left after 50 minutes will be
 $= 25 \text{ minutes} = \frac{100}{25} = \frac{1}{4}$.
64. (a) $N = \frac{25}{100} N_o \text{ (at } t = 2 \text{ hr)}$
 $\text{Thus } t = \frac{2.303}{0.693} \times t_{1/2} \log \frac{N_o}{N}$
65. (b) Radioactive decay is a first order reaction.
66. (d) $t_{1/2}$ is independent of all external factors.
67. (d) Rate of decay of radioactive species is independent of all external factors.
68. (c) $n = \frac{100}{25} = 4, N = \frac{N_o}{2^n} = \frac{100}{2^4} = \frac{100}{16} = 6.25 \text{ gm.}$
69. (d) ${}_{92}U^{235} + {}_0n^1 \rightarrow {}_{56}Ba^{145} + {}_{36}Kr^{88} + 3{}_0n^1$
70. (c) Half-life is independent of initial amount.
71. (d) $t_{1/2} = \frac{0.693}{k} = \frac{0.693}{6.93 \times 10^{-6}} = 0.1 \times 10^6 = 10^5 \text{ yrs.}$
72. (a) 1 milli curie = $3.7 \times 10^7 \text{ dps}$
 $1.5 \text{ milli curie} = 5.55 \times 10^7 \text{ dps}$
 $\frac{5.55 \times 10^7}{N_o} = \lambda = 1.37 \times 10^{-11}$
73. (c) $\frac{N}{N_o} = \left(\frac{1}{2}\right)^{\frac{T}{t_{1/2}}}; \frac{N}{N_o} = \left(\frac{1}{2}\right)^{\frac{75}{25}}; \frac{N}{N_o} = \left(\frac{1}{2}\right)^3 = \frac{1}{8}$
74. (a) $\frac{N}{N_o} = \left(\frac{1}{2}\right)^{\frac{T}{t_{1/2}}}; \frac{N}{200} = \left(\frac{1}{2}\right)^{\frac{24}{4}}; \frac{N}{200} = \left(\frac{1}{2}\right)^6$
 $N = \frac{200}{64} = 3.125 \text{ g}$
75. (a) ${}_xX^y \xrightarrow{2\beta} {}_7N^{14}$
 ${}_{x=7-2}X^{y=14} = {}_5X^{14}$
 $\text{Total no. of neutrons} = 14 - 5 = 9$

76. (c) $K = \frac{0.693}{t_{1/2}}$; $K = \frac{0.693}{10} = 0.0693 \text{ yr}^{-1}$

77. (b) $\frac{N}{N_0} = \left(\frac{1}{2}\right)^{\frac{T}{t_{1/2}}}$; $\left(\frac{1}{16}\right) = \left(\frac{1}{2}\right)^{\frac{192}{t_{1/2}}}$; $\left(\frac{1}{2}\right)^4 = \left(\frac{1}{2}\right)^{\frac{192}{t_{1/2}}}$
 $t_{1/2} = 48 \text{ min}$

Isotopes are ${}_{92}\text{U}^{235}$ and C

80. (a) $t_{1/2} = \frac{0.693}{K} = \frac{0.693}{2.34} = 0.296 \text{ sec}$

81. (a) $K = \frac{0.693}{T_{1/2}} = \frac{0.693}{5770}$
 $\therefore t = \frac{2.303}{K} \log \frac{100}{72} = \frac{2.303 \times 5770}{0.693} \log \frac{100}{72}$
 $= 19175.05 \times (\log 100 - \log 72)$
 $19175.05 \times 0.143 = 2742.03 \text{ years.}$

82. (a) For 25% decay
 $K = \frac{2.303}{20} \log \frac{100}{75} = \frac{2.303}{20} \times 0.1249 = 0.1438$

For 75% decay,

$t = \frac{2.303}{0.01438} \log \frac{100}{25} = 96.4 \text{ minute.}$

83. (b) $N = N_0 \left(\frac{1}{2}\right)^n \Rightarrow \frac{N}{N_0} = \left(\frac{1}{2}\right)^n$
 or $\frac{1}{64} = \left(\frac{1}{2}\right)^n \Rightarrow \left(\frac{1}{2}\right)^6 = \left(\frac{1}{2}\right)^n \Rightarrow n = 6$
 $T = t_{1/2} \times n = 2 \times 6 = 12 \text{ hours.}$

After 12 hours, sample became non-hazardous.

84. (c) Half-life of same substance remains same.

Artificial transmutation

- (b) C-14 dating method is used in estimate the age of most ancient geological formation.
- (c) Joining up of two lighter nuclei is fusion.
- (c) Equate atomic no. and mass no.
- (a) For studies on carbon dating, W. F. Libby was awarded a Nobel prize.
- (a) Spallation reactions are similar to fission reactions. They brought about by high energy bombarding particles or photons.
- (d) Uranium or Plutonium are atomic fuel.
- (a) It is the required technique.
- (c) $N_t = N_0 \left(\frac{1}{2}\right)^n = 32 \times \left(\frac{1}{2}\right)^{49.2/12.3} = 32 \times \left(\frac{1}{2}\right)^4 = 2$.
- (b) In hydrogen bomb, the following reaction is occur,
 ${}_1\text{H}^2 + {}_1\text{H}^3 \rightarrow {}_2\text{He}^4 + {}_0^1\text{n} + \text{energy}$.
- (a) Heavy water is D_2O .

16. (d) Einstein's law is $E = mc^2$.

17. (d)

18. (b) 11460 years = 2 half lives

Activity left = 25% = 0.25.

19. (a) The control rods used in nuclear reactor are made up of Cd-113 or B-10. They can absorb neutrons.

20. (c) The radioactive isotope ${}_6\text{C}^{14}$ is produced in the atmosphere by the action of cosmic ray neutrons on ${}_7\text{N}^{14}$

22. (a) Heavy water (D_2O) is used as a moderator in a nuclear reactor. It slows down the speed of neutrons. It also acts as a coolant.

23. (c) Uranium or Plutonium are atomic fuel.

24. (b) atom bomb is based on the principal of nuclear fission.

25. (d) Hahn and Strassmann discovered the phenomenon of nuclear fission in 1939.

26. (c) Rate of disintegration is not affected by environmental conditions.

27. (b) It is believed that when an α or β -particle is emitted, the nucleus becomes excited i.e. has higher energy and emits the excess energy in the form of radiation which form γ -rays.

28. (a) Packing fraction = $\frac{\text{Isotopic mass} - \text{Mass number}}{\text{Mass number}} \times 10^{-4}$

30. (a) C^{14} is a natural radioactive isotope of C¹².

31. (d) $t_{1/2} = 10 \text{ yrs}, t = 20 \text{ yrs.}$

$\therefore n = \frac{t}{t_{1/2}} = \frac{20}{10} = 2$

$N = \frac{N_0}{2^n} = \frac{1}{4} N_0 = \frac{1}{4} \times 100\% \text{ of } N_0 = 25$.

32. (b) Due to evolution of nuclear energy as a result of mass decay.

33. (d) Heavy water (D_2O) is used as a moderator in nuclear reactor.

34. (c) It is a transformation of chlorine.

35. (b) 48 gm of radioactive sodium will need 32 hours to become 3.0 gm.

36. (a) Mass decay occurs.

37. (b) In hydrogen bomb, the following reaction is occur,

38. (c) A reason for the C-14 dating technique.

39. (d) $t = \frac{2.303}{k} \log \frac{a}{0.99a}, (a-x) = \frac{99}{100} = 0.99a$

But $k = \frac{0.693}{t_{1/2}} = \frac{0.693}{10.6} = 0.0653 \text{ year}$

$t = \frac{2.303}{0.0653} \log \frac{1}{0.99} = 70.4 \text{ yrs.}$

41. (d) D_2O is heavy water.

42. (b) D_2O is used as moderator in nuclear reactor.

45. (b) Liquid sodium use in nuclear reactors as heat exchanger or coolant.

46. (c) Due to heavy mass α -particles can not easily pass through solid matter so they are less effective for artificial transmutation.

47. (b) Given $N_0 = 1, N_t = 0.70$ and $t_{1/2} = 5760 \text{ yrs.}$

$k = \frac{0.693}{t_{1/2}} = \frac{0.693}{5760}$.

We also know, $k = \frac{2.303}{t} \log \frac{N_0}{N_t} = \frac{0.693}{5760}$

or $t = \frac{2.303 \times 5760 \times 0.155}{0.693} = 2966 \text{ yrs.}$

48. (b) The splitting of a heavier atom like that of $U-235$ into a number of fragments of much smaller mass by suitable bombardment with sub-atomic particles with liberation of huge amount of energy is called nuclear fission.
49. (c) ${}_{13}\text{Al}^{28} + {}_2\text{He}^4 \rightarrow {}_{15}\text{P}^{31} + {}_0n^1$
50. (c) Rate of radioactivity is independent of all external factors.
51. (d) I^{131} is used for goitre therapy, i.e. iodine deficiency.
52. (c) $C-14$ is found in nature abundantly and in definite ratio.
53. (a) Astatine (At) is resembles in properties with iodine.
56. (d) Equate mass number and atomic number.
57. (b,d) D_2O is used as moderator in nuclear reactor.
58. (a) The rate of disintegration is expressed in terms of the number of disintegrations per second.
59. (b) ${}_6C^{14}$ is used in dating archeological findings.
60. (a) $n = \frac{40}{20} = 2$
 $\therefore \text{Amount left } \frac{N_0}{2^n} = \frac{100}{2^2} = 25 \text{ gm}$
61. (d) The definition of nuclear fission.
62. (a) The huge amount of energy released during atomic fission is due to loss of mass.
63. (a) Mass defect is the measure of binding energy of a nucleus.
65. (d) Irene curie and Juliot studied the artificial radioactivity.
66. (d) $N = \frac{N_0}{2^n}$ and $n = \frac{560}{140} = 4$; $N = \frac{1}{2^4} = \frac{1}{16} \text{ gm.}$
67. (d) G.M counter is used to determine rate of decay.
68. (b) Cd and boron rods are control rods used in reactors.
69. (b) Graphite is used as moderator to slow down the speed of neutrons in atomic reactors.
70. (d) Isotope C^{12} is the modern basis of atomic weight.
71. (a) ${}_6C^{14}$ is used to determine the mechanism of photosynthesis.
74. (a) ${}_{28}\text{Ni}^{60} + {}_0n^1 \longrightarrow {}_{28}\text{Ni}^{61} \longrightarrow {}_{27}\text{Co}^{60} + {}_1p^1$
76. (b) ${}_6C^{14}$ used for dating process.
79. (a) $\frac{N}{N_0} = \left(\frac{1}{2}\right)^{\frac{T}{t_{1/2}}} \Rightarrow \frac{13}{100} = \left(\frac{1}{2}\right)^{\frac{T}{5770}}$
 Taking $\log \Rightarrow \log \frac{13}{100} = \frac{T}{5770} \log 1/2 \Rightarrow 16989 \text{ yrs}$

Isotopes-Isotones and Nuclear isomers

1. (b) The definition of Isotopes.
2. (a) Isotopes of hydrogen is ${}_1H^1, {}_1H^2, {}_1H^3$ known as protium, deuterium and tritium respectively.
3. (d) ${}_8O^{18}$ isotope of oxygen have 10 neutrons and 8 protons.
4. (a) Atoms of different elements having different atomic no. but same mass no. are called isobars.
5. (c) Isotopes have same atomic number but different mass number.
6. (c) ${}_Z A^m \rightarrow {}_Z B^{m-4} + {}_2He^4 + 2{}_{-1}e^0$
7. (c) Co^{60} is used in radiotherapy of cancer.
8. (b) Atoms of different elements having different atomic no. but same mass no. are called isobars.
9. (b) ${}_7N^{14} + {}_2He^4 \rightarrow {}_8O^{17} + {}_1H^1$
10. (d) ${}_1H^3 \rightarrow {}_2He^3 + {}_{-1}e^0$
 ${}_1H^3$ and ${}_2He^3$ are isobars (same mass no.)
11. (a) The isotopes having an excessive n/p ratio exhibit e^- -emission.
12. (b) ${}_6C^{14}$ is an isotope of carbon (${}_6C^{12}$).
14. (a) Isotopes differ in number of neutrons but have same number of protons.
15. (a) ${}_Z A^m \rightarrow {}_Z B^{m-4} + {}_2He^4 + 2{}_{-1}e^0$
16. (c) Atoms of different elements having different atomic no. but same mass no. are called isobars.
17. (b) Isotopes differ in number of neutrons but have same number of protons.
18. (c) ${}_Z A^m \rightarrow {}_Z B^{m-4} + {}_2He^4 + 2{}_{-1}e^0$
19. (c) $\frac{n}{p}$ is minimum for this isotope.
20. (a) In chlorine gas ratio of Cl^{35} and Cl^{37} is 3 : 1.
21. (d) Isotones have the same number of neutrons but different number of nucleons ($n + p$). e.g., ${}_{18}Ar, {}_{19}K$.
22. (d) Isobars have different no. of protons and neutrons.
23. (a) Atoms of different elements having different atomic no. but same mass no. are called isobars.
24. (c) Isotopes differ in mass no. and hence in the number of neutrons.
25. (c) Isotones are the species which have same number of neutrons and different number of nucleons ($p + n$).
26. (d) In ${}_1^3H$ their are 1 proton and 2 neutrons.
27. (c) Isotopes differ in mass number, and hence in the number of neutrons.
28. (b) In isotones have same number of neutrons.
29. (b) Atoms of different elements having different atomic no. but same mass no. are called isobars.
30. (b) Two isotopes of bromine are ${}_{35}Br^{79}, {}_{35}Br^{81}$
 No. of neutrons in ${}_{35}Br^{79} = 79 - 35 = 44$
 No. of neutrons in ${}_{35}Br^{81} = 81 - 35 = 46$.
31. (c,d) Isotopes have same atomic number but different mass number and same chemical properties.
33. (a) Isotopes have same atomic number but different mass number.
34. (c) ${}_{92}U^{235} \rightarrow {}_{82}Pb^{207} + {}_2He^4 + {}_{-1}\beta^0$
 no. of α -particles = $\frac{235 - 207}{4} = \frac{28}{4} = 7\alpha$
 no. of β -particles = $92 - 82 - 2 \times 7 = 4\beta$.
35. (c) ${}_Z A^m + 2{}_0n^1 \rightarrow {}_Z A^{m+2}$, an isotope of A.
36. (b) Atoms of different elements having different atomic no. but same mass no. are called isobars.
37. (a) ${}_A X^M \xrightarrow{-\alpha} {}_{A-2} Y^{M-4}$
38. (a) Isotopes have same atomic number but different mass number.
39. (a) In isotope ${}_{32}X^{65}$, 32 is atomic number and 65 is atomic weight.

40. (b) Atoms of different elements having different atomic no. but same mass no. are called isobars.
41. (c) Atoms of different elements having different atomic no. but same mass no. are called isobars.
43. (a) Mass no. will remain same as proton is replaced by neutron.
44. (d) Isotopes differ in number of neutrons but have same number of protons.
45. (b) Atoms of different elements having different atomic no. but same mass no. are called isobars.
46. (a) ${}_{11}\text{Na}^{24} \rightarrow {}_{12}\text{Mg}^{24} + {}_{-1}e^0$ (β -particle comes out).
47. (d) Isotopes differ in number of neutrons but have same number of protons.
48. (d) Atoms of different elements having different atomic no. but same mass no. are called isobars.
49. (a) ${}_1\text{H}^3 \rightarrow {}_2\text{He}^3 + {}_{-1}e^0$
50. (a) Isotopes of same elements have the same number of protons but different number of neutrons.
51. (b) $35.5 = \frac{x \times 37 + (100 - x)35}{100} \Rightarrow 35.5 = \frac{3500 - 2x}{100}$
 $2x = 50 \Rightarrow x = 25 \Rightarrow \text{Ratio } 75 : 25 = 3 : 1$
52. (d) An ordinary oxygen contains a mixture of $O-16$ (99.8%), $O-17$ (0.037%), $O-18$ (0.204%) isotopes.
54. (c) They are isomers i.e. Number of atoms = same
 Number of e^- = same ; Physical properties = same
55. (ac) Isotopes have same atomic number but different mass number.
57. (bd) Both have 34 neutrons; Isotones have same number of neutrons.

Critical Thinking Questions

1. (a) ${}_{11}^{23}\text{Na} \rightarrow \frac{n}{p}$ ratio = 12 / 11
 ${}_{11}^{24}\text{Na} \rightarrow \frac{n}{p}$ ratio = 23 / 11
 so decrease in $\frac{n}{p}$ ratio gives out β^- -particle
 $n \rightarrow p + e(\beta^-)$.
2. (b) Oxygen have 90% O^{16} and 10% O^{18}
 Atomic mass = $\left[\frac{90}{100} \times 16 + \frac{10}{100} \times 18 \right]$
 $= \frac{1440 + 180}{100} = \frac{1620}{100} = 16.2$.
3. (c) It is a neutron induced fission reaction.
4. (a) Mass defect = mass of sulphur – mass of chlorine
 $= 34.96903 - 34.96885 = 0.00018 \text{ g}$
 Binding energy = mass defect $\times 931$
 $= 0.00018 \times 931$
 $= 0.1675 \text{ MeV}$
5. (a) The problem refers that rate is constant.
6. (a) $1\text{C} = \text{Activity of } 1\text{g of } \text{Ra}^{226} = 3.7 \times 10^{10} \text{ dps}$
 Activity of $1\mu\text{g}$ of $\text{Ra}^{226} = 3.7 \times 10^4 \text{ dps}$
 So, the no. of α -particles are emitted per second by $1\mu\text{g}$ of Ra is $3.7 \times 10^4 \text{ dps} \approx 3.62 \times 10^4 / \text{sec}$
7. (a) $2.92 \times 10^4 \alpha$ -particles will be emitted per second.

8. (b) $\frac{dx_1}{dt} = \lambda N_1, 1 \times 10^5 = \lambda N_1$
 $\frac{dx_2}{dt} = \lambda N_2, 3.7 \times 10^{10} = \lambda N_2$
 $\frac{N_1}{N_2} = \frac{1 \times 10^5}{3.7 \times 10^{10}} = \frac{1 \times 10^{-5}}{3.7} = 0.27 \times 10^{-5}$.
9. (d) ${}_{92}\text{U}^{235} + {}_0n^1 \rightarrow {}_{54}\text{Xe}^{139} + {}_{38}\text{Sr}^{94} + 3{}_0n^1$
10. (a) $k = \frac{0.693}{t_{1/2}} = \frac{0.693}{3\text{hr.}} = 0.231 \text{ per hrs.}$
11. (b) $t_{1/2}$ of $\text{C-14} = 5760 \text{ year}, \lambda = \frac{0.693}{5760}$,
 Now $t = \frac{2.303}{\lambda} \log \frac{{}^{14}\text{C original}}{{}^{14}\text{C after time } t}$
 $= \frac{2.303 \times 5760}{0.693} \log \frac{100}{12.5} = \frac{2.303 \times 5760 \times 0.9030}{0.693}$
 $= 17281 = 172.81 \times 10^2 \text{ years.}$
12. (c) According to radioactive equilibrium $\lambda_A N_A = \lambda_B N_B$
 or $\frac{0.693 \times N_A}{t_{1/2}(A)} = \frac{0.693 \times N_B}{t_{1/2}(B)} \left[\lambda = \frac{0.693}{t_{1/2}} \right]$
 Where $t_{1/2}(A)$ and $t_{1/2}(B)$ are half periods of A and B respectively
 $\therefore \frac{N_A}{t_{1/2}(A)} = \frac{N_B}{t_{1/2}(B)}$ or $\frac{N_A}{N_B} = \frac{t_{1/2}(A)}{t_{1/2}(B)}$
 $\therefore$ At equilibrium A and B are present in the ratio of their half
 lives $\frac{1}{2.8 \times 10^6} = \frac{1620}{\text{Half life of uranium}}$
 $\therefore$ Half-life of uranium
 $= 2.8 \times 10^6 \times 1620 = 4.53 \times 10^9 \text{ years.}$
13. (c) Average life period = $1.44 \times t_{1/2}$
 $1.44 \times 1580 = 2275.2 = 2.275 \times 10^3 \text{ yrs.}$
14. (a) $N_o = 8 \text{ gms}, N = 0.5 \text{ g}$ and $t = 1 \text{ hr.} = 60 \text{ min.}$ find $t_{1/2}$ by
 $t = \frac{2.303 \times t_{1/2}}{0.693} \log \frac{N_o}{N}$.
15. (b) $k = \frac{0.693}{0.75 \text{ hr}} = \frac{2.303}{t} \log \frac{a}{a - 0.999a}$
 $= \frac{2.303}{t} \log 10^3 = 7.5 \text{ hrs.}$
16. (c) $T = 50 \text{ days}, t_{1/2} = ?, N_o = 1, N = \frac{1}{32}$,
 $N = N_o \times \left(\frac{1}{2} \right)^n$ or $\frac{1}{32} = 1 \times \left(\frac{1}{2} \right)^n$,
 or $\left(\frac{1}{2} \right)^5 = \left(\frac{1}{2} \right)^n$ or $n = 5$
 $T = t_{1/2} \times 2, \text{ or } t_{1/2} = \frac{50}{5} = 10 \text{ days.}$

17. (d) $K = \frac{2.303}{40} \log \frac{a}{a-0.875a} = \frac{2.303}{40} \log 8$
 $= 0.05199 \text{ min}^{-1}$ $t_{1/2} = 0.693/0.05199$
 $= 13.33 \text{ min.} = 13 \text{ min } 20 \text{ sec.}$
18. (d) $t_{1/2} = 10 \text{ days}, N = 125$
 Calculate as, $t = \frac{2.303 \times t_{1/2}}{0.693} \log \frac{N_o}{125}$.
19. (a) $t_{1/2} = \frac{0.693}{k} = \frac{0.693}{6.31 \times 10^{-4}} = 0.1098 \times 10^4 = 1098 \text{ yrs.}$
20. (c) $T = t_{1/2} \times n, \therefore 3000 = 1500 \times n \therefore n = 2$
 $\therefore \text{Amount left} = \frac{1}{2^2} = \frac{1}{4} = 0.25g$.
21. (a) $N_t = N_o \left(\frac{1}{2}\right)^n, N_t = 256 \left(\frac{1}{2}\right)^{18/3} = 256 \left(\frac{1}{2}\right)^6 = 4$.
22. (b) Quantity of radioactive element decayed = $\frac{15}{16}$
 Quantity left = $1 - \frac{15}{16} = \frac{1}{16}$
 $\frac{1}{16} = 1 \times \left(\frac{1}{2}\right)^n \text{ or } \left(\frac{1}{2}\right)^4 = \left(\frac{1}{2}\right)^n$
 one half-life = $\frac{40}{4} = 10 \text{ days}$.
23. (c) $N_t = N_o \left(\frac{1}{2}\right)^n = 48 \times 10^{19} \left(\frac{1}{2}\right)^{26/6.5}$
 $= 48 \times 10^{19} \left(\frac{1}{2}\right)^4 = 3 \times 10^{19}$.
24. (c) $\frac{0.693}{9} = \frac{2.303}{t} \log \frac{1}{1-0.2}$
25. (b) $\frac{0.693}{140} = \frac{2.303}{t} \log \frac{16}{16-15} = 560 \text{ days}$
26. (b) $n = \frac{20}{4} = 5, \frac{N_t}{N_o} = \left(\frac{1}{2}\right)^5 = \frac{1}{32}, \therefore \text{decayed}$
 $= \left(1 - \frac{1}{32}\right) \times 100 = \frac{31}{32} \times 100 = 96.87$.
27. (b) $r_{\text{nucleus}} = 1.3 \times 10^{-13} \times (A)^{1/3}$, where A is mass number
 $r_{U^{238}} = 1.3 \times 10^{-13} \times (238)^{1/3} = 8.06 \times 10^{-13} \text{ cm.}$
 $r_{He^4} = 1.3 \times 10^{-13} \times (4)^{1/3} = 2.06 \times 10^{-13} \text{ cm.}$
 $\therefore \text{Total distance in between uranium and } \alpha \text{ nuclei}$
 $= 8.06 \times 10^{-13} + 2.06 \times 10^{-13} = 10.12 \times 10^{-13} \text{ cm}$
 Now repulsion energy =
 $\frac{Q_1 Q_2}{r} = \frac{92 \times 4.8 \times 10^{-10} \times 2 \times 4.8 \times 10^{-10}}{10.12 \times 10^{-13}} \text{ erg}$
 $= 418.9 \times 10^{-7} \text{ erg} = 418.9 \times 10^{-7} \times 6.242 \times 10^{11} \text{ eV}$
 $= 26.147738 \times 10^4 \text{ eV.}$
28. (a) $N_t = N_o \left(\frac{1}{2}\right)^2$ [$\therefore t_{1/2} = 22 \text{ years}, T = 11 \text{ years}, N_o = 2, N_t = ?$]
 $T = t_{1/2} \times n, 11 = 2 \times n \text{ or } n = \frac{11}{2} = \frac{1}{2}$
 $\therefore N_t = 2gm \times \left(\frac{1}{2}\right)^{1/2} = 1.414gm$.
29. (c) $t = \frac{2.303}{0.693} \times 5000 \times \log \frac{15}{5}$
 $= \frac{2.303}{0.693} \times 5000 \times \log 3 = 7927 = 7.92 \times 10^3 \text{ yrs.}$
30. (c) ${}_{92}\text{U}^{235} = \frac{6.023 \times 10^{23}}{235} \text{ atoms}$
 $\therefore \text{energy released} = 3.2 \times 10^{-11} \times \frac{6.023 \times 10^{23}}{235} \text{ J} = 8.21 \times 10^{10} \text{ J}$
 $= 8.2 \times 10^7 \text{ kJ}.$
31. (a) Isotones have same number of neutrons.
32. (b) Average atomic weight of element = $\frac{85 \times 3 + 87 \times 1}{3 + 1} = 85.5$

Assertion & Reason

1. (c) Atomic number defines identity of an atom because each atom has a definite number of protons in its nucleus.
3. (d) The activity of 1g of pure $U-235$ and that in U_3O_8 is same. Activity does not depend upon the state of combination.
5. (b) In some nuclides, the nucleus may capture an electron from the K-shell and the vacancy created is filled by electrons from higher levels giving rise to characteristic X-rays. This process is known as K-electron capture or simply K-capture.
6. (c) Radioactivity of an element is independent of its physical state its chemical environment or temperature, suggesting that it is a property of nucleus i.e., nuclear phenomenon.
7. (d) At onetime, it was believed that actinium series starts with $Ac-227$ but now it is well known that it starts with $U-235$ and $Ac-227$ is one of the main products.
9. (a) ${}_{92}\text{U}^{238} + {}_0n^1 \longrightarrow {}_{92}\text{U}^{239} \xrightarrow{-\beta} {}_{93}\text{Np}^{239} \xrightarrow{-\beta} {}_{94}\text{Pu}^{239}$
 In breeder reactors, the neutrons produced from fission of $U-235$ are partly used to carry on the fission of $U-235$ and partly used to produce some other fissionable material.
10. (a) The activation energies for fusion reactions are very high. They require very high temperature ($>10^6$) to overcome electrostatic repulsion between the nuclei.
12. (c) Loss of α or β -particle is to change N/P ratio so that it lies within the stability belt. Loss of α -particle increases N/P ratio while loss of β -particle decreases N/P ratio.
13. (b) It is correct that photochemical smog is produced by nitrogen oxide and it is also fact that vehicular pollution is a major source of nitrogen oxide but it is not correct explanation.
14. (d) Binding energy per nucleon of ${}_3\text{Li}^7$ (5.38 MeV) is lesser than ${}_2\text{He}^4$ (7.08 MeV) as helium is found to be more stable than Li . As the atomic mass number increases, the binding energy

per nucleon decreases. As the atomic number and the atomic mass number increase, the repulsive electrostatic forces within the nucleus increase due to the greater number of protons in the heavy elements. To overcome this increased repulsion, the proportion of neutrons in the nucleus must increase to maintain stability. This increase in the neutron to proton ratio only partially compensates for the growing proton – proton repulsive force in the heavier, naturally occurring elements.

Because the repulsive forces are increasing less energy must be supplied, on the average, to remove a nucleon from the nucleus. The BE/A has decreased. The BE/A of a nucleus is an indication of its degree of stability. Generally, the more stable nuclides have higher BE/A than the less stable ones. The increase in BE/A as the atomic mass number decreases from 260 to 60 is the primary reason for the energy liberation in the fission process. The increase in the BE/A as the atomic mass number increases from 1 to 60 is the reason for the energy liberation in the fusion process, which is the opposite reaction of fission.

15. (b) It is correct that during nuclear fission energy is always released and it is also true that nuclear fission is a chain process.
16. (e) Neutrons are more effective than protons of equal energy in causing artificial disintegration of atoms. Neutrons are neutral they penetrate the nucleus and do not exert any repulsive force like positive charged protons.
17. (b) It is true that a beam of electrons deflects more than a beam of α -particles in an electric field. It is also true that electrons have $-ve$ while α -particles have $+ve$ charge. Here both are true but reason is not a correct explanation.
18. (d) ${}_{11}\text{Na}^{22} \longrightarrow {}_{12}\text{Mg}^{22} + {}_{-1}\beta^0$.

Thus this change involves a β -particle emission and not a positron. Also, proton emission converts proton into neutron as

Nuclear Chemistry

Self Evaluation Test - 7

- When ${}_3\text{Li}^7$ are bombarded with protons, γ -rays are produced. The nuclide formed is [CPMT 1987]
 - ${}_3\text{Li}^8$
 - ${}_4\text{Be}^8$
 - ${}_3\text{B}^9$
 - ${}_4\text{Be}^9$
- Nuclides [BVP 2003]
 - Have specific atomic numbers
 - Have same number of protons
 - Have specific atomic number and mass numbers
 - Are isotopes
- In the following nuclear reactions
 ${}_7\text{N}^{14} + {}_2\text{He}^4 \rightarrow {}_8\text{O}^{17} + X_1$ and ${}_{13}\text{Al}^{27} + {}_1\text{D}^2 \rightarrow {}_{14}\text{Si}^{28} + X_2$
 X_1 and X_2 are respectively [MP PMT 1999]
 - ${}_1\text{H}^1$ and ${}_0\text{n}^1$
 - ${}_0\text{n}^1$ and ${}_1\text{H}^1$
 - ${}_2\text{He}^4$ and ${}_0\text{n}^1$
 - ${}_0\text{n}^1$ and ${}_2\text{He}^4$
- Gamma rays are [NCERT 1978; MNR 1990; UPSEAT 1999, 2000]
 - High energy electromagnetic waves
 - High energy electrons
 - High energy protons
 - Low energy electrons
- Which particle can be used to change ${}_{13}\text{Al}^{27}$ into ${}_{15}\text{P}^{30}$ [MP PMT 2003]
 - Neutron
 - α -particle
 - Proton
 - Deuteron
- Which of the following does not characterise γ -rays [UPSEAT 2001]
 - The radiation can ionise gases
 - It causes ZnS to fluorescence
 - Deflected by electric and magnetic field
 - Have wavelengths shorter than ultraviolet rays
- During emission of β -particle [Bihar MEE 1996]
 - One electron increases
 - One electron decreases
 - One proton increases
 - No change
 - None of these
- Emission is caused by the transformation of one neutron into a proton. This results in the formation of a new element having
 - Same nuclear charge
 - Very lower nuclear charge
 - Nuclear charge higher by one unit
 - Nuclear charge lower by one unit
- The end product of $4n$ series is [MNR 1983]
 - ${}_{82}\text{Pb}^{208}$
 - ${}_{82}\text{Pb}^{207}$
 - ${}_{82}\text{Pb}^{209}$
 - ${}_{83}\text{Bi}^{204}$
- ${}_{92}\text{U}^{235}$ belongs to group III B of periodic table. If it loses one α -particle, the new element will belong to group [MNR 1984; CPMT 2001]
 - I B
 - I A
 - III B
 - V B
- Radioactive disintegration differs from a chemical change in being
 - An exothermic change
 - A spontaneous process
 - A nuclear process
 - A unimolecular first order reaction
- Half-life is the time in which 50% of radioactive element disintegrates. Carbon-14 disintegrates 50% in 5770 years. Find the half-life of carbon-14 [DPMT 1996]
 - 5770 years
 - 11540 years
 - $\sqrt{5770}$ years
 - None of the above
- The half-life of ${}^{14}\text{C}$ is about [MP PET 1996]
 - 12.3 years
 - 5730 years
 - 4.5×10^9 years
 - 2.52×10^5 years
- Half-life for radioactive C^{14} is 5760 years. In how many years 200 mg of C^{14} sample will be reduced to 25 mg [CBSE PMT 1995]
 - 11520 years
 - 23040 years
 - 5760 years
 - 17280 years
- The decay constant of a radioactive element is $3 \times 10^{-6} \text{ min}^{-1}$. Its half-life is [MP PET 1993; Pb. CET 2002]
 - $2.31 \times 10^5 \text{ min}$
 - $2.31 \times 10^6 \text{ min}$
 - $2.31 \times 10^{-6} \text{ min}$
 - $2.31 \times 10^{-7} \text{ min}$

16. A radioactive sample decays to half of its initial concentration in 6.93 minutes. It further decays half in next 6.93 minutes. The rate constant for the reaction is [RPET 2000]
- (a) 0.10 min (b) 0.01 min
(c) 1.0 min (d) 0.001 min
17. The half-life of an isotope is 10 hrs. How much will be left behind after 4 hrs in 1 gm sample [BHU 1997]
- (a) 45.6×10^{23} atoms
(b) 4.56×10^{23} atoms
(c) 4.56×10^{21} atoms
(d) 45.6×10^{21} atoms
18. The half-life period $t_{1/2}$ of a radioactive element is N years. The period of its complete decay is [KCET 1998]
- (a) N^2 years (b) $2N$ years
(c) $\frac{1}{2}N^2$ years (d) Infinity
19. A radioactive element has a half-life of 20 minutes. How much time should elapse before the element is reduced to $\frac{1}{8}$ th of the original mass [EAMCET 1990]
- (a) 40 minutes
(b) 60 minutes
(c) 80 minutes
(d) 160 minutes
20. The half-life period of a radioactive material is 15 minutes. What % of radioactivity of that material will remain after 45 minutes
- (a) 10 % (b) 12.5%
(c) 15% (d) 17.5%
21. ^{226}Ra disintegrates at such a rate that after 3160 years only one-fourth of its original amount remains. The half-life of ^{226}Ra will be
- (a) 790 years (b) 3160 years
(c) 1580 years (d) 6230 years
22. The ratio of the amount of two elements X and Y at radioactive equilibrium is $1:2 \times 10^{-6}$. If the half-life period of element Y is 4.9×10^{-4} days, then the half-life period of element X will be
- (a) 4.8×10^{-3} days (b) 245 days
(c) 122.5 days (d) None of these
23. If half-life of a substance is 5 yrs, then the total amount of substance left after 15 years, when initial amount is 64 grams is [AIEEE 2002]
- (a) 16 grams (b) 2 grams
(c) 32 grams (d) 8 grams
24. An element has half-life 1600 years. The mass left after 6400 years will be [AFMC 2003]
- (a) $1/16$ (b) $1/12$
(c) $1/4$ (d) $1/32$
25. Wooden artifact and freshly cut tree are 7.6 and $15.2 \text{ min}^{-1} \text{ g}^{-1}$ of carbon ($t_{1/2} = 5760$ years) respectively. The age of the artifact is [AIIMS 1980]
- (a) 5760 years
(b) $5760 \times \frac{15.2}{7.6}$ years
(c) $5760 \times \frac{7.6}{15.2}$ years
(d) $5760 \times (15.2 - 7.6)$ years
26. An element has two main isotopes of mass numbers 85 and 87. In nature they occur in the ratio of 75% and 25% respectively. The atomic weight of the element will be approximately
- (a) 86.0 (b) 86.5
(c) 85.5 (d) 85.75
27. A sample of rock from moon contains equal number of atoms of uranium and lead ($t_{1/2}$ for $U = 4.5 \times 10^9$ years). The age of the rock would be [MNR 1988; UPSEAT 2000]
- (a) 9.0×10^9 years [MP PMT 1991]
(b) 4.5×10^9 years
(c) 13.5×10^9 years
(d) 2.25×10^9 years
28. The value of one microcurie = disintegrations / second [MP PET 2002] [EAMCET 1982]
- (a) 3.7×10^5 (b) 3.7×10^7
(c) 3.7×10^4 (d) 3.7×10^{10}
29. The sum of the number of neutrons and proton in the radio isotope of hydrogen is [IIT 1986]
- (a) 6 (b) 5
(c) 4 (d) 3

AS Answers and Solutions

(SET -7)

1. (b) ${}_3\text{Li}^7 + {}_1\text{H}^1 \rightarrow {}_4\text{Be}^8 + \gamma$
2. (d) The isotopes of an element is represented by writing the symbol of the element and representing the atomic number and mass number as subscript and superscript respectively are called nuclides.
3. (a) Equate atomic no. and mass no.
4. (a) γ -rays are designated by $h\nu$.
5. (b) ${}_{13}\text{Al}^{27} + {}_2\text{He}^4 \rightarrow {}_{15}\text{P}^{30} + {}_0\text{n}^1$

6. (c) x -rays do not carry any charge and hence are not deflected by electric and magnetic fields.

7. (c) During β -particle emission one proton increases.

8. (c) ${}_o n^1 \rightarrow {}_{+1} p^1 + {}_{-1} e^0$ (β -particle comes out).

9. (a) The end product of 4n series is ${}_{82} Pb^{208}$.

10. (c) Elements 89 to 103 are placed in III group.

11. (c) Chemical reaction is not nuclear reaction, but radioactivity is nuclear distingration.

12. (a) $t_{1/2} = 5770$ years.

13. (b) $t_{1/2}$ of $C^{14} = 5730$ years.

14. (d) $25 = \left[\frac{1}{2}\right]^n \times 200, \left[\frac{1}{2}\right]^n = \frac{25}{200} = \frac{1}{8} = \left[\frac{1}{2}\right]^3$

$n = 3$, Number of half lives = 3

so time required = $3 \times 5760 = 17280$ yrs.

15. (a) $t_{1/2} = \frac{0.693}{\lambda} = \frac{0.693}{3 \times 10^{-6} \text{ min}^{-1}} = 2.31 \times 10^5 \text{ min.}$

16. (a) $k = \frac{0.693}{t_{1/2}} = \frac{0.693}{6.93} = 0.10 \text{ min}^{-1}$

17. (b) 4.56×10^{23} atoms will be left behind after 4 hrs in 1 gm. sample.

18. (d) The $t_{1/2}$ of a radioactive element = N years

$\therefore$ The period of its complete decay is infinity.

19. (b) $t_{1/2} = 20$ minute, $N = \frac{1}{9} N_o$

Use, $t = \frac{2.303}{0.693} \times t_{1/2} \log \frac{N_o}{N}$.

20. (b) $N = \frac{N_o}{2^n}$ and $n = \frac{45}{15} = 3$

Also use $N_o = 100$ than $N = \frac{100}{2^3} = 12.5\%$.

$$\therefore n = \frac{t}{t_{1/2}} = \frac{15}{5} = 3$$

$$\text{Now } N = \frac{N_o}{2^n} = \frac{N_o}{2^3} = \frac{1}{8} N_o = \frac{1}{8} \times 64 = 8 \text{ grams.}$$

24. (a) $T_{1/2} = 1600 \text{ yrs.}, N_o = 1, N = ?, T = 6400 \text{ yrs.}$

$$T = t_{1/2} \times n, \text{ or } n = \frac{6400}{1600} = 4$$

$$N = N_o \times \left(\frac{1}{2}\right)^n, N = 1 \times \left(\frac{1}{2}\right)^4, N = \frac{1}{16}.$$

25. (a) $r_o = 15.2$ and $r = 7.6, \therefore t = \frac{2.303}{\lambda} \log \frac{r_o}{r}$.

26. (c) Isotopes have 75% and 25% respectively.

$$\therefore \text{Atomic mass} = \left[\frac{75}{100} \times 85 + \frac{25}{100} \times 87 \right]$$

$$= \frac{6375 + 2175}{100} = 85.5.$$

27. (b) $N = \frac{N_o}{2^n}$, use $t = \frac{2.303 \times t_{1/2}}{0.693} \log \frac{N_o}{N}$

28. (c) $1 \text{ Ci} = 3.7 \times 10^{10} \text{ dps}$ or $3.7 \times 10^{10} \text{ Bq.}$

$$1 \text{ mCi} = 3.7 \times 10^4 \text{ dps}.$$

29. (d) Tritium (${}_1 H^3$) consist of 1 proton and 2 neutrons.

21. (c) For an element to disintegrate

$$N = N_o \left(\frac{1}{2}\right)^n \quad \dots(i), \quad t = n \times t_{1/2} \quad \dots(ii)$$

For $Ra^{226} \frac{N}{N_o} = \frac{1}{4}$, from eq. (i)

$$\frac{1}{4} = \left(\frac{1}{2}\right)^n \text{ or } \left(\frac{1}{2}\right)^n = \left(\frac{1}{2}\right)^2, n = 2; \text{ from eq. (ii)}$$

$$T_{1/2} = \frac{t}{n} = \frac{3160}{2} = 1580 \text{ yrs.}$$

22. (b) $\frac{N_x}{N_y} = \frac{t_{1/2}(X)}{t_{1/2}(Y)}, t_{1/2}(X) = \frac{4.9 \times 10^{-4}}{2 \times 10^{-6}} = 245 \text{ days.}$

23. (d) $t_{1/2} = 5 \text{ yrs.}, t = 15 \text{ yrs}$

Chapter 8 Chemical Equilibrium

Whenever we hear the word Equilibrium immediately a picture arises in our mind an object under the influence of two opposing forces. For chemical reactions also this is true. A reaction also can exist in a state of equilibrium balancing forward and backward reactions.

Reversible and Irreversible reactions

A *chemical reaction* is said to have taken place when the concentration of reactants decreases, and the concentration of the products increases with time. The chemical reactions are classified on the basis of the extent to which they proceed, into the following two classes;

(1) **Reversible reactions** : Reaction in which entire amount of the reactants is not converted into products is termed as *reversible reaction*.

(i) **Characteristics of reversible reactions**

- (a) These reactions can be started from either side,
- (b) These reactions are never complete,
- (c) These reactions have a tendency to attain a state of equilibrium, in which Free energy change is zero ($\Delta G = 0$),

(d) This sign ($\rightleftharpoons$) represents the reversibility of the reaction,

(ii) **Examples of reversible reactions**

(a) *Neutralisation between an acid and a base either of which or both are weak e.g.,*

(b) *Salt hydrolysis, e.g.,*

(c) *Thermal decomposition, e.g.,*

(d) *Esterification, e.g.,*

(e) *Evaporation of water in a closed vessel, e.g.,*

(2) **Irreversible reactions** : Reaction in which entire amount of the reactants is converted into products is termed as *irreversible reaction*.

(i) **Characteristics of irreversible reactions**

(a) These reactions proceed only in one direction (forward direction),

(b) These reactions can proceed to completion,

(c) In an irreversible reaction, $\Delta G < 0$,

(d) The arrow ($\rightarrow$) is placed between reactants and products,

(ii) **Examples of irreversible reactions**

(a) *Neutralisation between strong acid and strong base e.g.,*

(b) *Double decomposition reactions or precipitation reactions e.g.,*

(c) *Thermal decomposition, e.g.,*

(d) *Redox reactions, e.g.,*

Equilibrium and Its dynamic nature

"Equilibrium is the state at which the concentration of reactants and products do not change with time. i.e. concentrations of reactants and products become constant."

The important characteristics of equilibrium state are,

(1) Equilibrium state can be recognised by the constancy of certain measurable properties such as *pressure, density, colour, concentration* etc. by changing these conditions of the system, we can control the extent to which a reaction proceeds.

(2) Equilibrium state can only be achieved in *close vessel*.

(3) Equilibrium state is *reversible* in nature.

(4) Equilibrium state is also *dynamic* in nature.

(5) At equilibrium state,

Rate of forward reaction = Rate of backward reaction

(6) At equilibrium state, $\Delta G = 0$, so that $\Delta H = T\Delta S$.

Law of mass action and Equilibrium constant

On the basis of observations of many equilibrium reactions, two Norwegian chemists **Goldberg** and **Waage** suggested (1864) a quantitative relationship between the rates of reactions and the concentration of the reacting substances. This relationship is known as *law of mass action*. It states that

"The rate of a chemical reaction is directly proportional to the product of the molar concentrations of the reactants at a constant temperature at any given time."

The molar concentration *i.e. number of moles per litre* is also called *active mass*. It is expressed by enclosing the symbols of formulae of the substance in square brackets. For example, molar concentration of *A* is expressed as $[A]$.

Consider a simple reversible reaction

According to law of mass action

$$\text{Rate of forward reaction} \propto [A]^a[B]^b = k_f[A]^a[B]^b$$

$$\text{Rate of backward reaction} \propto [C]^c[D]^d = k_b[C]^c[D]^d$$

At equilibrium,

Rate of forward reaction = Rate of backward reaction

$$k_f[A]^a[B]^b = k_b[C]^c[D]^d$$

$$\frac{k_f}{k_b} = K_c = \frac{[C]^c[D]^d}{[A]^a[B]^b}$$

Where, K_c is called equilibrium constant.

In terms of partial pressures, equilibrium constant is denoted by K_p and

$$K_p = \frac{P_C^c P_D^d}{P_A^a P_B^b}$$

In terms of mole fraction, equilibrium constant is denoted by K_x and

$$K_x = \frac{(X_C)^c (X_D)^d}{(X_A)^a (X_B)^b}$$

Relation between K_p , K_c and K_x

$$K_p = K_c(RT)^{\Delta n}$$

$$K_p = K_x(P)^{\Delta n}$$

Δn = number of moles of gaseous products – number of moles of gaseous reactants in chemical equation.

As a general rule, the concentration of pure solids and pure liquids are not included when writing an equilibrium equation.

Value of Δn	Relation between K_p and K_c	Units of K_p	Units of K_c
0	$K_p = K_c$	No unit	No unit
>0	$K_p > K_c$	$(\text{atm})^{\Delta n}$	$(\text{mole l}^{-1})^{\Delta n}$
<0	$K_p < K_c$	$(\text{atm})^{\Delta n}$	$(\text{mole l}^{-1})^{\Delta n}$

Characteristics of equilibrium constant

(1) The value of equilibrium constant is independent of the original concentration of reactants.

(2) The equilibrium constant has a definite value for every reaction at a particular temperature. However, it varies with change in temperature.

(3) For a reversible reaction, the equilibrium constant for the forward reaction is inverse of the equilibrium constant for the backward reaction.

$$\text{In general, } K_{\text{forward reaction}} = \frac{1}{K'_{\text{backward reaction}}}$$

(4) The value of an equilibrium constant tells the extent to which a reaction proceeds in the forward or reverse direction.

(5) The equilibrium constant is independent of the presence of catalyst.

(6) The value of equilibrium constant changes with the change of temperature. Thermodynamically, it can be shown that if K_1 and K_2 be the equilibrium constants of a reaction at absolute temperatures T_1 and T_2 . If ΔH is the heat of reaction at constant volume, then

$$\log K_2 - \log K_1 = \frac{-\Delta H}{2.303 R} \left[\frac{1}{T_2} - \frac{1}{T_1} \right] \quad (\text{Van't Hoff equation})$$

The effect of temperature can be studied in the following three cases

(i) When $\Delta H = 0$ *i.e., neither heat is evolved nor absorbed*

$$\log K_2 - \log K_1 = 0 \quad \text{or} \quad \log K_2 = \log K_1 \quad \text{or} \quad K_2 = K_1$$

Thus, equilibrium constant remains the same at all temperatures.

(ii) When $\Delta H = +ve$ *i.e., heat is absorbed*, the reaction is *endothermic*. The temperature T_2 is higher than T_1 .

$$\log K_2 - \log K_1 = +ve \quad \text{or} \quad \log K_2 > \log K_1 \quad \text{or} \quad K_2 > K_1$$

The value of equilibrium constant is higher at higher temperature in case of endothermic reactions.

(iii) When $\Delta H = -ve$ *i.e., heat is evolved*, the reaction is *exothermic*. The temperature T_2 is higher than T_1 .

$$\log K_2 - \log K_1 = -ve \quad \text{or} \quad \log K_1 > \log K_2 \quad \text{or} \quad K_1 > K_2$$

The value of equilibrium constant is lower at higher temperature in the case of exothermic reactions.

(7) The value of the equilibrium constant depends upon the stoichiometry of the chemical equation.

For the reaction

$$K = \frac{[SO_2]^2 [O_2]}{[SO_3]^2} \text{ and } K' = \frac{[SO_2][O_2]^{1/2}}{[SO_3]}$$

$$K' = \sqrt{K} \text{ or } (K)^{1/2}$$

(i) Similarly, if a particular equation is multiplied by 2, the equilibrium constant for the new reaction (K') will be the square of the equilibrium constant (K) for the original reaction i.e., $K' = K^2$

(ii) If the chemical equation for a particular reaction is written in two steps having equilibrium constants K_1 and K_2 , then the equilibrium constants are related as $K = K_1 \times K_2$

Applications of equilibrium constant

(1) Judging the extent of reaction

(i) If $K_c > 10^3$, products predominate over reactants. If K_c is very large, the reaction proceeds almost all the way to completion.

(ii) If $K_c < 10^{-3}$, reactants predominate over products. If K_c is very small, the reaction proceeds hardly at all.

(iii) If K_c is in the range 10^{-3} to 10^3 , appreciable concentration of both reactants and products are present.

(2) Predicting the direction of reaction : The concentration ratio, i.e., ratio of the product of concentrations of products to that of reactants is also known as *concentration quotient* and is denoted by Q .

$$\text{Concentration quotient, } Q = \frac{[X][Y]}{[A][B]}$$

It may be noted that Q becomes equal to equilibrium constant (K) when the reaction is at the equilibrium state. At equilibrium, $Q = K = K_c = K_p$. Thus,

(i) If $Q > K$, the reaction will proceed in the direction of reactants (*reverse reaction*).

(ii) If $Q < K$, the reaction will proceed in the direction of the products (*forward reaction*).

(iii) If $Q = K$, the reaction mixture is already *at equilibrium*.

Thus, a reaction has a tendency to form products if $Q < K$ and to form reactants if $Q > K$.

Fig. 8.1

Types of equilibria

The equilibrium between different chemical species present in the same or different phases is called chemical equilibrium. There are two types of chemical equilibrium.

(1) **Homogeneous equilibrium** : The equilibrium reactions in which all the reactants and the products are in the same phase are called *homogeneous equilibrium reactions*.

(2) **Heterogeneous equilibrium** : The equilibrium reactions in which the reactants and the products are present in different phases are called *heterogeneous equilibrium reactions*.

Table : 8.1 Homogeneous equilibria and equations for equilibrium constant (Equilibrium pressure is P atm in a V L flask)

	$\Delta n = 0; K_p = K_c$	$\Delta n < 0; K_p < K_c$			$\Delta n > 0; K_p > K_c$
	$H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$	$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$	$2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$	$PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$	
Initial mole	1 1 0	1 3 0	2 1 0	1 0 0	
Mole at Equilibrium	(1-x) (1-x) 2x	(1-x) (3-3x) 2x	(2-2x) (1-x) 2x	(1-x) x x	
Total mole at equilibrium	2	(4-2x)	(3-x)	(1+x)	
Active masses	$\left(\frac{1-x}{V}\right) \left(\frac{1-x}{V}\right) \frac{2x}{V}$	$\left(\frac{1-x}{V}\right) 3\left(\frac{1-x}{V}\right) \left(\frac{2x}{V}\right)$	$\left(\frac{2-2x}{V}\right) \left(\frac{1-x}{V}\right) \left(\frac{2x}{V}\right)$	$\left(\frac{1-x}{V}\right) \left(\frac{x}{V}\right) \left(\frac{x}{V}\right)$	
Mole fraction	$\left(\frac{1-x}{2}\right) \left(\frac{1-x}{2}\right) \frac{2x}{2}$	$\frac{1-x}{2(2-x)} \frac{3(1-x)}{2(2-x)} \frac{x}{(2-x)}$	$\left(\frac{2-2x}{3-x}\right) \left(\frac{1-x}{3-x}\right) \left(\frac{2x}{3-x}\right)$	$\left(\frac{1-x}{1+x}\right) \left(\frac{x}{1+x}\right) \left(\frac{x}{1+x}\right)$	

Partial pressure	$p\left(\frac{1-x}{2}\right) p\left(\frac{1-x}{2}\right) p\left(\frac{2x}{2}\right)$	$P\left(\frac{1-x}{2(2-x)}\right) P\left(\frac{3(1-x)}{2(2-x)}\right) \frac{Px}{(2-x)}$	$P\left(\frac{2-2x}{3-x}\right) p\left(\frac{1-x}{3-x}\right) P\left(\frac{2x}{3-x}\right)$	$p\left(\frac{1-x}{1+x}\right) p\left(\frac{x}{1+x}\right) p\left(\frac{x}{1+x}\right)$
K_c	$\frac{4x^2}{(1-x)^2}$	$\frac{4x^2V^2}{27(1-x)^4}$	$\frac{x^2V}{(1-x)^3}$	$\frac{x^2}{(1-x)V}$
K_p	$\frac{4x^2}{(1-x)^2}$	$\frac{16x^2(2-x)^2}{27(1-x)^4P^2}$	$\frac{x^2(3-x)}{P(1-x)^3}$	$\frac{Px^2}{(1-x^2)}$

Table : 8.2 Heterogeneous equilibria and equation for equilibrium constant (Equilibrium pressure is P atm)

	$NH_4HS(s) \rightleftharpoons NH_3(g) + H_2S(g)$			$C(s) + CO_2(g) \rightleftharpoons 2CO(g)$			$NH_2CO_2NH_4(s) \rightleftharpoons 2NH_3(g) + CO_2(g)$		
Initial mole	1	0	0	1	1	0	1	0	0
Mole at equilibrium	(1-x)	x	x	(1-x)	(1-x)	2x	(1-x)	2x	x

				$\left(\frac{2x}{1+x}\right)$			$\frac{1}{3}$		
Partial pressure	$\frac{P}{2}$			$P\left(\frac{1-x}{1+x}\right)$			$\frac{2P}{3}$		
	$\frac{P}{2}$			$P\left(\frac{2x}{1+x}\right)$			$\frac{P}{3}$		
K_p	$\frac{P^2}{4}$			$\frac{4P x^2}{(1-x^2)}$			$\frac{4P^3}{27}$		

Relationship between equilibrium constant and ΔG°

ΔG for a reaction under any condition is related with ΔG° by the relation, $\Delta G = \Delta G^\circ + 2.303 RT \log Q$

Standard free energy change of a reaction and its equilibrium constant are related to each other at temperature T by the relation, $\Delta G^\circ = -2.303 RT \log K$

For a general reaction $aA + bB \rightleftharpoons cC + dD$

$$K = \frac{(a_C)^c (a_D)^d}{(a_A)^a (a_B)^b}$$

Where a represent the activity of the reactants and products. It is unit less.

For pure solids and liquids: $a = 1$.

For gases: $a =$ pressure of gas in atm.

For components in solution: $a =$ molar concentration.

Le-Chatelier's principle

Le-Chatelier and Braun (1884), French chemists, made certain generalizations to explain the effect of changes in concentration, temperature or pressure on the state of system in equilibrium. When a system is subjected to a change in one of these factors, the equilibrium gets disturbed and the system readjusts itself until it returns to equilibrium. The generalization is known as **Le-Chatelier's principle**. It may be stated as :

"Change in any of the factors that determine the equilibrium conditions of a system will shift the equilibrium in such a manner to reduce or to counteract the effect of the change."

The principle is very helpful in predicting **qualitatively** the effect of change in concentration, pressure or temperature on a system in equilibrium.

Table : 8.3 The effect of varying conditions on the equilibrium $aA + bB \rightleftharpoons cC + dD$, $\Delta n = (c + d) - (a + b)$

Change imposed on the system in equilibrium	Equilibrium position moves	Equilibrium constant	Any other points
Conc. of A and/or B increased	To right	No change	No change
Conc. of C and /or D increased	To left	No change	No change
Pressure increased	To right if $(c + d) < (a + b)$, i.e. $\Delta n = -ve$ To left if $(c + d) > (a + b)$, i.e. $\Delta n = +ve$ No change if $(c + d) = (a + b)$, i.e. $\Delta n = 0$	No change No change No change	Very little effect, if any, on reactions in liquid solution.
Temperature increased	To left if $\Delta H = -ve$ (exothermic) To right if $\Delta H = +ve$ (endothermic)	Value decreased Value increased	Equilibrium achieved faster
Addition of catalyst	No change	No change	Equilibrium achieved faster

Application of Le-Chatelier's principle

The Le-Chatelier's principle has a great significance for the chemical, physical systems and in every day life in a state of equilibrium.

(1) Applications to the chemical equilibrium

(i) *Synthesis of ammonia (Haber's process)*

- (a) High pressure ($\Delta n < 0$)
 (b) Low temperature
 (c) Excess of N_2 and H_2
 (d) Removal of NH_3 favours forward reaction.

(ii) *Formation of sulphur trioxide*

- (a) High pressure ($\Delta n < 0$)
 (b) Low temperature
 (c) Excess of SO_2 and O_2 , favours the reaction in forward direction.

(iii) *Synthesis of nitric oxide*

- (a) High temperature
 (b) Excess of N_2 and O_2
 (c) Since reaction takes place without change in volume *i.e.*, $\Delta n = 0$, pressure has no effect on equilibrium.

(iv) *Formation of nitrogen dioxide*

- (a) High pressure
 (b) Low temperature
 (c) Excess of NO and O_2 favours the reaction in forward direction.

(v) *Dissociation of phosphorus pentachloride*

- (a) Low pressure or high volume of the container, $\Delta n > 0$ (b) High temperature (c) Excess of PCl_5 .

(2) Applications to the physical equilibrium

(i) *Melting of ice (Ice – water system)*

(In this reaction volume is decreased from 1.09 c.c. to 1.01 c.c. per gm.)

- (a) At high temperature more water is formed as it absorbs heat.
 (b) At high pressure more water is formed as it is accompanied by decrease in volume.
 (c) At higher pressure, melting point of ice is lowered, while boiling point of water is increased.

(ii) *Melting of sulphur*: $S_{(s)} \rightleftharpoons S_{(l)} - x \text{ kcal}$

(This reaction accompanies increase in volume.)

- (a) At high temperature, more liquid sulphur is formed.

(b) At higher pressure, less sulphur will melt as melting increases volume.

(c) At higher pressure, melting point of sulphur is increased.

(iii) *Boiling of water (water- water vapour system)* $\underset{\text{(Low volume)}}{\text{Water}} \rightleftharpoons$

(It is accompanied by absorption of heat and increase in volume.)

- (a) At high temperature more vapours are formed.
 (b) At higher pressure, vapours will be converted to liquid as it decreases volume.

(c) At higher pressure, boiling point of water is increased (principle of pressure cooker).

(iv) *Solubility of salts*: If solubility of a salt is accompanied by absorption of heat, its solubility increases with rise in temperature; e.g., NH_4Cl , K_2SO_4 , KNO_3 etc.

On the other hand if it is accompanied by evolution of heat, solubility decreases with increase in temperature; e.g., $CaCl_2$, $Ca(OH)_2$, $NaOH$, KOH etc.

Relation between vapour density and Degree of dissociation

In the following reversible chemical equation.

Initial mol 1 0
 At equilibrium $(1-x)$ yx $x = \text{degree of dissociation}$
 Number of moles of A and B at equilibrium
 $= 1 - x + yx = 1 + x(y-1)$

If initial volume of 1 mole of A is V , then volume of equilibrium mixture of A and B is, $= [1 + x(y-1)]V$

Molar density before dissociation,

$$D = \frac{\text{molecular weight}}{\text{volume}} = \frac{m}{V}$$

Molar density after dissociation,

$$d = \frac{m}{[1 + x(y-1)]V} ; \frac{D}{d} = [1 + x(y-1)] ; x = \frac{D-d}{d(y-1)}$$

y is the number of moles of products from one mole of reactant.

$\frac{D}{d}$ is also called **Van't Hoff factor**.

In terms of molecular mass, $x = \frac{M-m}{(y-1)m}$

Where M = Initial molecular mass,

m = molecular mass at equilibrium

Thus for the equilibria

$$\therefore x = \frac{D-d}{d} \quad (\text{for I and II}) \quad \text{and} \quad x = \frac{2(d-D)}{d} \quad (\text{for III})$$

Also $D \times 2 = \text{Molecular weight (theoretical value)}$

$d \times 2 = \text{Molecular weight (abnormal value) of the mixture.}$

[MP PMT 1990]

Tips & Tricks

- ✍ Pure ice can be made to melt at a temperature slightly below 0°C by increasing the pressure. As the water so obtained on melting is below 0°C , it refreezes when pressure is reduced. It is called regelation of ice.
- ✍ Increase in external pressure always increases the boiling point and vice-versa.
- ✍ If the reaction is multiplied by 2, the equilibrium constant is squared.
- ✍ When a bottle of coca or beer is opened, the pressure is decreased and dissolved CO gas escapes out with a fizzle.
- ✍ Increase in pressure favours melting of ice into water
- ✍ Flash evaporation is a technique generally used for concentrating certain aqueous solutions which cannot be concentrated by normal boiling.
- ✍ Freeze drying is a technique where water is made to sublime off at a temperature below 0°C .

Ordinary Thinking

Objective Questions

Reversible and Irreversible reaction

- A reversible reaction is one which [MP PET 1986]
 - Proceeds in one direction
 - Proceeds in both directions
 - Proceeds spontaneously
 - All the statements are wrong
 - Which of the following is a characteristic of a reversible reaction [AFMC 1993]
 - Number of moles of reactants and products are equal
 - It can be influenced by a catalyst
 - It can never proceed to completion
 - None of the above
 - The reaction $\text{CaCO}_3 \rightleftharpoons \text{CaO} + \text{CO}_2(\text{g})$ goes to completion in lime kiln because [MP PMT/PET 1988; CPMT 1990]
 - Of the high temperature
 - CaO is more stable than CaCO_3
 - CaO is not dissociated
 - CO_2 escapes continuously
 - In the given reaction $\text{N}_2 + \text{O}_2 \rightleftharpoons 2\text{NO}$, equilibrium means that [MADT Bihar 1984]
 - Concentration of reactants is changing where as concentration of products is constant
 - Concentration of all substances is constant
 - Concentration of reactants is constant where as concentration of products is changing
 - Concentration of all substances is changing
 - Which of the following reactions is reversible [MADT Bihar 1980]
 - $\text{H}_2 + \text{I}_2 \longrightarrow 2\text{HI}$
 - $\text{H}_2\text{SO}_4 + \text{Ba}(\text{OH})_2 \longrightarrow \text{BaSO}_4 + 2\text{H}_2\text{O}$
 - $\text{NaCl} + \text{AgNO}_3 \longrightarrow \text{NaNO}_3 + \text{AgCl}$
 - $\text{Fe} + \text{S} \longrightarrow \text{FeS}$
 - All reactions which have chemical disintegration
 - Is reversible
 - Is reversible and endothermic
 - Is exothermic
 - Is reversible or irreversible and endothermic or exothermic
7. Amongst the following chemical reactions the irreversible reaction is
- $\text{H}_2 + \text{I}_2 \rightleftharpoons \text{HI}$
 - $\text{AgNO}_3 + \text{NaCl} \rightleftharpoons \text{AgCl} + \text{NaNO}_3$
 - $\text{CaCO}_3 \rightleftharpoons \text{CaO} + \text{CO}_2$
 - $\text{O}_2 + 2\text{SO}_2 \rightleftharpoons 2\text{SO}_3$

Equilibrium state

- In any chemical reaction, equilibrium is supposed to be establish when
[CPMT 1974, 80, 89; EAMCET 1975, 77, 79; MP PMT 1990; NCERT 1980; MP PET 1995]
 - Mutual opposite reactions undergo
 - Concentration of reactants and resulting products are equal
 - Velocity of mutual reactions become equal
 - The temperature of mutual opposite reactions become equal
- Which of the following conditions represents an equilibrium
 - Freezing of ice in a open vessel, temperature of ice is constant
 - Few drops of water is present along with air in a balloon, temperature of balloon is constant
 - Water is boiling in an open vessel over stove, temperature of water is constant
 - All the statements (a), (b) and (c) are correct for the equilibrium
- When rate of forward reaction becomes equal to backward reaction, this state is termed as
[NCERT 1975, 80; CPMT 1973, 74, 77]
 - Chemical equilibrium
 - Reversible state
 - Equilibrium
 - All of these
- In chemical reaction $A \rightleftharpoons B$, the system will be known in equilibrium when
[MP PMT 1990; NCERT 1977]
 - A completely changes to B
 - 50% of A changes to B
 - The rate of change of A to B and B to A on both the sides are same
 - Only 10% of A changes to B
- A chemical reaction is at equilibrium when
[NCERT 1975; CPMT 1974; MP PMT 1996; KCET 1993; IIT 1978; Manipal MEE 1995; Pb. PMT 2002]
 - Reactants are completely transformed into products
 - The rates of forward and backward reactions are equal
 - Formation of products is minimised
 - Equal amounts of reactants and products are present
- In the chemical reaction $N_2 + 3H_2 \rightleftharpoons 2NH_3$ at equilibrium point, state whether
[NCERT 1977]
 - Equal volumes of N_2 and H_2 are reacting
 - Equal masses of N_2 and H_2 are reacting
 - The reaction has stopped
 - The same amount of ammonia is formed as is decomposed into N_2 and H_2
- For the reaction $PCl_3(g) + Cl_2(g) \rightleftharpoons PCl_5(g)$ the position of equilibrium can be shifted to the right by
[MP PMT 2004]
 - Increasing the temperature
 - Doubling the volume
 - Addition of Cl_2 at constant volume
 - Addition of equimolar quantities of PCl_3 and PCl_5
- If a system is at equilibrium the rate of forward to the reverse reaction is
[UPSEAT 2004]
 - Less
 - Equal
 - High
 - At equilibrium
- Chemical equilibrium is dynamic in nature because
[IIT 1977]
 - Equilibrium is maintained rapidly
 - The concentration of reactants and products become same at equilibrium

- The concentration of reactants and products are constant but different
 - Both forward and backward reactions occur at all times with same speed
- The number of gram molecules of a substance present in unit volume is termed as
[MP PMT 1993]
 - Activity
 - Normal solution
 - Molar concentration
 - Active mass

Law of mass action

- According to law of mass action rate of a chemical reaction is proportional to
[AFMC 2005]
 - Concentration of reactants
 - Molar concentration of reactants
 - Concentration of products
 - Molar concentration of products
- In a reaction the rate of reaction is proportional to its active mass, this statement is known as
[IIT 1979]
 - Law of mass action
 - Le-chatelier principle
 - Faraday law of electrolysis
 - Law of constant proportion
- The active mass of 64 gm of HI in a two litre flask would be
[CPMT 1979]
 - 2
 - 1
 - 5
 - 0.25
- Under a given set of experimental conditions, with increase in the concentration of the reactants, the rate of a chemical reaction
 - Decreases
 - Increases
 - Remains unaltered
 - First decreases and then increases
- The law of mass action was enunciated by
[MP PMT 1995]
 - Guldberg and Waage
 - Bodenstein
 - Birthelet
 - Graham
- Theory of 'active mass' indicates that the rate of chemical reaction is directly proportional to the
[MP PET 1990]
 - Equilibrium constant
 - Properties of reactants
 - Volume of apparatus
 - Concentration of reactants
- The rate at which substances react depends on their
[MP PMT 1997]
 - Atomic weight
 - Molecular weight
 - Equivalent weight
 - Active mass
- Which is false
[AMU 1999]
 - The greater the concentration of the substances involved in a reaction, the lower the speed of the reaction
 - The point of dynamic equilibrium is reached when the reaction rate in one direction just balances the reaction rate in the opposite direction
 - The dissociation of weak electrolyte is a reversible reaction
 - The presence of free ions facilitates chemical changes
- Chemical equations convey quantitative information on the
[Orissa JEE 2002]
 - Type of atoms/molecules taking part in the reaction
 - Number of atoms/molecules of the reactants and products involved in the reaction
 - Relative number of moles of reactants and products involved in the reaction
 - Quantity of reactant consumed and quantity of product formed

10. In the thermal decomposition of potassium chlorate given as $2KClO_3 \longrightarrow 2KCl + 3O_2$, law of mass action

[MADT Bihar 1983]

- (a) Cannot be applied
(b) Can be applied
(c) Can be applied at low temperature
(d) Can be applied at high temp. and pressure

Law of equilibrium and Equilibrium constant

1. For the system $3A + 2B \rightleftharpoons C$, the expression for equilibrium constant is

[NCERT 1981; CPMT 1989; MP PMT 1990; RPMT 1999; Pb. PMT 2002; Pb. CET 2002]

- (a) $\frac{[3A][2B]}{C}$ (b) $\frac{[C]}{[3A][2B]}$
(c) $\frac{[A]^3[B]^2}{[C]}$ (d) $\frac{[C]}{[A]^3[B]^2}$

2. In the reversible reaction $A + B \rightleftharpoons C + D$, the concentration of each C and D at equilibrium was 0.8 mole/litre, then the equilibrium constant K_c will be

[MP PET 1986]

- (a) 6.4 (b) 0.64
(c) 1.6 (d) 16.0

3. 4 moles of A are mixed with 4 moles of B . At equilibrium for the reaction $A + B \rightleftharpoons C + D$, 2 moles of C and D are formed. The equilibrium constant for the reaction will be

[CPMT 1992]

- (a) $\frac{1}{4}$ (b) $\frac{1}{2}$
(c) 1 (d) 4

4. On a given condition, the equilibrium concentration of HI , H_2 and I_2 are 0.80, 0.10 and 0.10 mole/litre. The equilibrium constant for the reaction $H_2 + I_2 \rightleftharpoons 2HI$ will be

[MP PET 1986]

- (a) 64 (b) 12
(c) 8 (d) 0.8

5. In which of the following, the reaction proceeds towards completion

- (a) $K = 10^3$ (b) $K = 10^{-2}$
(c) $K = 10$ (d) $K = 1$

6. A reversible chemical reaction having two reactants in equilibrium. If the concentrations of the reactants are doubled, then the equilibrium constant will

[CPMT 1982, 90; MP PMT 1990, 2004; MNR 1992; UPSEAT 2002; KCET 1999; Pb. CET 2004]

- (a) Also be doubled (b) Be halved
(c) Become one-fourth (d) Remain the same

7. The equilibrium constant in a reversible reaction at a given temperature

[AIIMS 1982]

- (a) Depends on the initial concentration of the reactants
(b) Depends on the concentration of the products at equilibrium
(c) Does not depend on the initial concentrations
(d) It is not characteristic of the reaction

8. Pure ammonia is placed in a vessel at temperature where its dissociation constant (α) is appreciable. At equilibrium

[IIT 1984; Kurukshetra CEE 1998]

- (a) K_p does not change significantly with pressure
(b) α does not change with pressure
(c) Concentration of NH_3 does not change with pressure

- (d) Concentration of H_2 is less than that of N_2

9. For the system $A(g) + 2B(g) \rightleftharpoons C(g)$, the equilibrium concentrations are (A) 0.06 mole/litre (B) 0.12 mole/litre (C) 0.216 mole/litre. The K_{eq} for the reaction is

[CPMT 1983]

- (a) 250 (b) 416
(c) 4×10^{-3} (d) 125

10. The equilibrium constant for the given reaction $H_2 + I_2 \rightleftharpoons 2HI$ is correctly given by expression

[CPMT 1984]

- (a) $K_c = \frac{[H_2][I_2]}{[HI]}$ (b) $K_c = \frac{[H_2][I_2]}{[2HI]}$
(c) $K_c = \frac{[H_2][I_2]}{[HI]^2}$ (d) $K_c = \frac{[HI]^2}{[H_2][I_2]}$

11. Partial pressures of A , B , C and D on the basis of gaseous system $A + 2B \rightleftharpoons C + 3D$ are $A = 0.20$; $B = 0.10$; $C = 0.30$ and $D = 0.50$ atm. The numerical value of equilibrium constant is

- (a) 11.25 (b) 18.75
(c) 5 (d) 3.75

12. For the reaction $A + 2B \rightleftharpoons C$, the expression for equilibrium constant is

[MNR 1987; MP PMT 1999; UPSEAT 2002]

- (a) $\frac{[A][B]^2}{[C]}$ (b) $\frac{[A][B]}{[C]}$
(c) $\frac{[C]}{[A][B]^2}$ (d) $\frac{[C]}{2[B][A]}$

13. 2 moles of PCl_5 were heated in a closed vessel of 2 litre capacity. At equilibrium, 40% of PCl_5 is dissociated into PCl_3 and Cl_2 . The value of equilibrium constant is

[MP PMT 1989; RPMT 2000; UPSEAT 2004; Kerala CET 2005]

- (a) 0.266 (b) 0.53
(c) 2.66 (d) 5.3

14. For which of the following reactions does the equilibrium constant depend on the units of concentration

[AIIMS 1983]

- (a) $NO_{(g)} \rightleftharpoons \frac{1}{2}N_{2(g)} + \frac{1}{2}O_{2(g)}$
(b) $Zn_{(s)} + Cu_{(aq)}^{2+} \rightleftharpoons Cu_{(s)} + Zn_{(aq)}^{2+}$
(c) $C_2H_5OH_{(l)} + CH_3COOH_{(l)} \rightleftharpoons CH_3COOC_2H_5_{(l)} + H_2O_{(l)}$
(Reaction carried in an inert solvent)
(d) $COCl_{2(g)} \rightleftharpoons CO_{(g)} + Cl_{2(g)}$

15. Unit of equilibrium constant for the reversible reaction $H_2 + I_2 \rightleftharpoons 2HI$ is

[DPMT 1984]

- (a) $\text{mol}^{-1} \text{ litre}$ (b) $\text{mol}^{-2} \text{ litre}$
(c) mol litre^{-1} (d) None of these

16. The decomposition of N_2O_4 to NO_2 is carried out at 280K in chloroform. When equilibrium has been established, 0.2 mol of

- N_2O_4 and 2×10^{-3} mol of NO_2 are present in 2 litre solution. The equilibrium constant for reaction $N_2O_4 \rightleftharpoons 2NO_2$ is
- (a) 1×10^{-2} (b) 2×10^{-3}
(c) 1×10^{-5} (d) 2×10^{-5}
17. Concentration of a gas is expressed in the following terms in the calculation of equilibrium constant [EAMCET 1982]
(a) No. of molecules per litre
(b) No. of grams per litre
(c) No. of gram equivalent per litre
(d) No. of molecules equivalent per litre
18. The unit of equilibrium constant K for the reaction $A + B \rightleftharpoons C$ would be [CPMT 1987]
(a) $mol\ litre^{-1}$ (b) $litremol^{-1}$
(c) $mol\ litre$ (d) Dimensionless
19. In a reaction $A + B \rightleftharpoons C + D$, the concentrations of A , B , C and D (in moles/litre) are 0.5, 0.8, 0.4 and 1.0 respectively. The equilibrium constant is [BHU 1981]
(a) 0.1 (b) 1.0
(c) 10 (d) ∞
20. In a chemical equilibrium $A + B \rightleftharpoons C + D$, when one mole each of the two reactants are mixed, 0.6 mole each of the products are formed. The equilibrium constant calculated is [CBSE PMT 1989]
(a) 1 (b) 0.36
(c) 2.25 (d) 4/9
21. For the reaction $N_{2(g)} + 3H_{2(g)} \rightleftharpoons 2NH_{3(g)}$, the correct expression of equilibrium constant K is [CPMT 1984, 2000]
(a) $K = \frac{[NH_3]^2}{[N_2][H_2]^3}$ (b) $K = \frac{[N_2][H_2]^3}{[NH_3]^2}$
(c) $K = \frac{2[NH_3]}{[N_2] \times 3[H_2]}$ (d) $K = \frac{[N_2] \times 3[H_2]}{2[NH_3]}$
22. The suitable expression for the equilibrium constant of the reaction $2NO_{(g)} + Cl_{2(g)} \rightleftharpoons 2NOCl_{(g)}$ is [CPMT 1983, 87]
(a) $K_c = \frac{[2NOCl]}{[2NO][Cl_2]}$ (b) $K_c = \frac{[NOCl]^2}{[NO]^2[Cl_2]}$
(c) $K_c = \frac{[NOCl]^2}{[NO][Cl_2]^2}$ (d) $K_c = \frac{[NOCl]^2}{[NO]^2[Cl_2]^2}$
23. $A + B \rightleftharpoons C + D$. If finally the concentration of A and B are both equal but at equilibrium concentration of D will be twice of that of A then what will be the equilibrium constant of reaction. [BHU 2005]
(a) 4/9 (b) 9/4
(c) 1/9 (d) 4
24. If in the reaction $N_2O_4 = 2NO_2$, α is that part of N_2O_4 which dissociates, then the number of moles at equilibrium will be [MP PET 1990; MH CET 2001; KCET 2005]
(a) 3 (b) 1
(c) $(1 - \alpha)^2$ (d) $(1 + \alpha)$
25. In the gas phase reaction, $C_2H_4 + H_2 \rightleftharpoons C_2H_6$, the equilibrium constant can be expressed in units of [CBSE PMT 1992; Pb. PMT 1999]
(a) $litre^{-1} mole^{-1}$ (b) $litremole^{-1}$
(c) $mole\ litre$ (d) $mole\ litre^{-1}$
26. For the reaction $2SO_2 + O_2 \rightleftharpoons 2SO_3$, the units of K_c are [CPMT 1990]
(a) $litremole^{-1}$ (b) $mol\ litre^{-1}$
(c) $(mol\ litre^{-1})^2$ (d) $(litremole^{-1})^2$
27. A quantity of PCl_5 was heated in a 10 litre vessel at $250^\circ C$; $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$. At equilibrium the vessel contains 0.1 mole of PCl_5 , 0.20 mole of PCl_3 and 0.2 mole of Cl_2 . The equilibrium constant of the reaction is [KCET 1993, 2001; MP PMT 2003]
(a) 0.02 (b) 0.05
(c) 0.04 (d) 0.025
28. A mixture of 0.3 mole of H_2 and 0.3 mole of I_2 is allowed to react in a 10 litre evacuated flask at $500^\circ C$. The reaction is $H_2 + I_2 \rightleftharpoons 2HI$, the K is found to be 64. The amount of unreacted I_2 at equilibrium is [KCET 1990]
(a) 0.15 mole (b) 0.06 mole
(c) 0.03 mole (d) 0.2 mole
29. In a chemical equilibrium, the rate constant of the backward reaction is 7.5×10^{-4} and the equilibrium constant is 1.5. So the rate constant of the forward reaction is [KCET 1989]
(a) 5×10^{-4} (b) 2×10^{-3}
(c) 1.125×10^{-3} (d) 9.0×10^{-4}
30. 28 g of N_2 and 6 g of H_2 were kept at $400^\circ C$ in 1 litre vessel, the equilibrium mixture contained 27.54g of NH_3 . The approximate value of K_c for the above reaction can be (in $mole^{-2} litre^2$) [CBSE PMT 1990]
(a) 75 (b) 50
(c) 25 (d) 100
31. The equilibrium concentration of X , Y and YX_2 are 4, 2 and 2 moles respectively for the equilibrium $2X + Y \rightleftharpoons YX_2$. The value of K_c is [EAMCET 1990]
(a) 0.625 (b) 0.0625
(c) 6.25 (d) 0.00625
32. An amount of solid NH_4HS is placed in a flask already containing ammonia gas at a certain temperature and 0.50 atm. pressure. Ammonium hydrogen sulphide decomposes to yield NH_3 and H_2S gases in the flask. When the decomposition reaction reaches equilibrium, the total pressure in the flask rises to 0.84 atm. The equilibrium constant for NH_4HS decomposition at this temperature is [AIEEE 2005]
(a) 0.30 (b) 0.18
(c) 0.09 (d) 0.11
33. In the reaction $A + 2B \rightleftharpoons 2C$, if 2 moles of A , 3.0 moles of B and 2.0 moles of C are placed in a 2.0 l flask and the equilibrium concentration of C is 0.5 mole/l. The equilibrium constant (K_c) for the reaction is [KCET 1996]
(a) 0.073 (b) 0.147

- (c) 0.05 (d) 0.026
34. In a 500 ml capacity vessel CO and Cl_2 are mixed to form $COCl_2$. At equilibrium, it contains 0.2 moles of $COCl_2$ and 0.1 mole of each of CO and CO_2 . The equilibrium constant K_c for the reaction $CO + Cl_2 \rightleftharpoons COCl_2$ is [CBSE PMT 1998]
- (a) 5 (b) 10
(c) 15 (d) 20
35. A reaction is $A + B \rightarrow C + D$. Initially we start with equal concentration of A and B . At equilibrium we find the moles of C is two times of A . What is the equilibrium constant of the reaction [BHU 1998; KCET 2000]
- (a) 4 (b) 2
(c) $1/4$ (d) $1/2$
36. 4.5 moles each of hydrogen and iodine heated in a sealed ten litre vessel. At equilibrium, 3 moles of HI were found. The equilibrium constant for $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$ is [EAMCET 1998]
- (a) 1 (b) 10
(c) 5 (d) 0.33
37. An equilibrium mixture of the reaction $2H_2S(g) \rightleftharpoons 2H_2(g) + S_2(g)$ had 0.5 mole H_2S , 0.10 mole H_2 and 0.4 mole S_2 in one litre vessel. The value of equilibrium constant (K) in mole litre is [AIIMS 1998; IIT 1992; AFMC 1999; UPSEAT 2001]
- (a) 0.004 (b) 0.008
(c) 0.016 (d) 0.160
38. At 3000 K the equilibrium pressures of CO , CO and O_2 are 0.6, 0.4 and 0.2 atmospheres respectively. K_p for the reaction, $2CO_2 \rightleftharpoons 2CO + O_2$ is [JIPMER 1999]
- (a) 0.089 (b) 0.0533
(c) 0.133 (d) 0.177
39. The rate constant for forward and backward reactions of hydrolysis of ester are 1.1×10^{-2} and 1.5×10^{-3} per minute respectively. Equilibrium constant for the reaction is $CH_3COOC_2H_5 + H_2O \rightleftharpoons CH_3COOH + C_2H_5OH$ [AIIMS 1999]
- (a) 4.33 (b) 5.33
(c) 6.33 (d) 7.33
40. At a certain temp. $2HI \rightleftharpoons H_2 + I_2$. Only 50% HI is dissociated at equilibrium. The equilibrium constant is [DCE 1999]
- (a) 0.25 (b) 1.0
(c) 3.0 (d) 0.50
41. When 3 mole of A and 1 mole of B are mixed in 1 litre vessel the following reaction takes place $A_{(g)} + B_{(g)} \rightleftharpoons 2C_{(g)}$. 1.5 moles of C are formed. The equilibrium constant for the reaction is [MP PMT 2000]
- (a) 0.12 (b) 0.25
(c) 0.50 (d) 4.0
42. A 1 M solution of glucose reaches dissociation equilibrium according to equation given below $6HCHO \rightleftharpoons C_6H_{12}O_6$. What is the concentration of $HCHO$ at equilibrium if equilibrium constant is 6×10^{22} [MP PMT 2000]
- (a) $1.6 \times 10^{-8} M$ (b) $3.2 \times 10^{-6} M$
(c) $3.2 \times 10^{-4} M$ (d) $1.6 \times 10^{-4} M$
43. Equilibrium concentration of HI , I_2 and H_2 is 0.7, 0.1 and 0.1 M respectively. The equilibrium constant for the reaction $I_2 + H_2 \rightleftharpoons 2HI$ is [JIPMER 2000]
- (a) 36 (b) 49
(c) 0.49 (d) 0.36
44. For the equilibrium $N_2 + 3H_2 \rightleftharpoons 2NH_3$, K_c at 1000 K is 2.37×10^{-3} . If at equilibrium $[N_2] = 2M$, $[H_2] = 3M$, the concentration of NH_3 is [JIPMER 2000]
- (a) 0.00358 M (b) 0.0358 M
(c) 0.358 M (d) 3.58 M
45. In the reaction, $A + B \rightleftharpoons 2C$, at equilibrium, the concentration of A and B is 0.20 mol l^{-1} each and that of C was found to be 0.60 mol l^{-1} . The equilibrium constant of the reaction is
- (a) 2.4 (b) 18
(c) 4.8 (d) 9
46. 15 moles of H_2 and 5.2 moles of I_2 are mixed and allowed to attain equilibrium at $500^\circ C$. At equilibrium, the concentration of HI is found to be 10 moles. The equilibrium constant for the formation of HI is [KCET 2005]
- (a) 50 (b) 15
(c) 100 (d) 25
47. In a chemical reaction equilibrium is established when [MP PET 2001]
- (a) Opposing reaction ceases
(b) Concentration of reactants and products are equal
(c) Velocity of opposing reaction is the same as that of forward reaction
(d) Reaction ceases to generate heat
48. For the reaction $H_2 + I_2 \rightleftharpoons 2HI$, the equilibrium concentration of H_2 , I_2 and HI are 8.0, 3.0 and 28.0 mol per litre respectively, the equilibrium constant of the reaction is [BHU 2000; CBSE PMT 2001]
- (a) 30.66 (b) 32.66
(c) 34.66 (d) 36.66
49. Change in volume of the system does not alter the number of moles in which of the following equilibrium [AIEEE 2002]
- (a) $N_{2(g)} + O_{2(g)} \rightleftharpoons 2NO_{(g)}$
(b) $PCl_{5(g)} \rightleftharpoons PCl_{3(g)} + Cl_{2(g)}$
(c) $N_{2(g)} + 3H_{2(g)} \rightleftharpoons 2NH_{3(g)}$
(d) $SO_2Cl_{2(g)} \rightleftharpoons SO_{2(g)} + Cl_{2(g)}$
50. The rate of forward reaction is two times that of reverse reaction at a given temperature and identical concentration. K_{eq} is [KCET 2002]
- (a) 2.5 (b) 2.0
(c) 0.5 (d) 1.5
51. Write the equilibrium constant K for $CH_3COOH + H_2O \rightleftharpoons H_3O^+ + CH_3COO^-$ [Kerala (Med.) 2002]
- (a) $K = \frac{[H_3O^+][H_2O]}{[CH_3COO^-][CH_3COOH]}$

$$(b) K = \frac{[H_3O^+][CH_3COO^-]}{[H_2O][CH_3COOH]}$$

$$(c) K = \frac{[H_3O^+][H_2O]}{[CH_3COOH][CH_3COO^-]}$$

$$(d) K = \frac{[H_2O][CH_3COO^-]}{[H_2O][CH_3COOH]}$$

52. The equilibrium constant (K) for the reaction

$HA + B \rightleftharpoons BH^+ + A^-$ is 100. If the rate constant for the forward reaction is 10 then rate constant for the backward reaction is [CBSE PMT 2002]

- (a) 10^7 (b) 10^3
(c) 10^{-3} (d) 10^{-5}

53. 9.2 grams of $N_2O_{4(g)}$ is taken in a closed one litre vessel and heated till the following equilibrium is reached $N_2O_{4(g)} \rightleftharpoons 2NO_{2(g)}$.

At equilibrium, 50% $N_2O_{4(g)}$ is dissociated. What is the equilibrium constant (in mol litre^{-1}) (Molecular weight of $N_2O_4 = 92$) [MP PET 2003]

- (a) 0.1 (b) 0.4
(c) 0.2 (d) 2

54. Two moles of NH_3 when put into a previously evacuated vessel (one litre), partially dissociate into N_2 and H_2 . If at equilibrium one mole of NH_3 is present, the equilibrium constant is

- (a) $3/4 \text{ mol}^2 \text{ litre}^{-2}$ (b) $27/64 \text{ mol}^2 \text{ litre}^{-2}$
(c) $27/32 \text{ mol}^2 \text{ litre}^{-2}$ (d) $27/1 \text{ mol}^2 \text{ litre}^{-2}$

55. In a reaction, reactant 'A' decomposes 10% in 1 hour, 20% on 2 hour and 30% in 3 hour. The unit of rate constant of this reaction is

- (a) sec^{-1} (b) $\text{mol litre}^{-1} \text{ sec}^{-1}$
(c) $\text{litre mol}^{-1} \text{ sec}^{-1}$ (d) $\text{litre}^2 \text{ mol}^{-2} \text{ sec}^{-1}$

56. In the reaction $PCl_{5(g)} \rightleftharpoons PCl_{3(g)} + Cl_{2(g)}$.

The equilibrium concentrations of PCl_5 and PCl_3 are 0.4 and 0.2 mole/litre respectively. If the value of K_c is 0.5 what is the concentration of Cl_2 in moles/litre [EAMCET 2003]

- (a) 2.0 (b) 1.5
(c) 1.0 (d) 0.5

57. In Haber process 30 litres of dihydrogen and 30 litres of dinitrogen were taken for reaction which yielded only 50% of the expected product. What will be the composition of gaseous mixture under the aforesaid condition in the end [CBSE PMT 2003]

- (a) 20 litres ammonia, 25 litres nitrogen, 15 litres hydrogen
(b) 20 litres ammonia, 20 litres nitrogen, 20 litres hydrogen
(c) 10 litres ammonia, 25 litres nitrogen, 15 litres hydrogen
(d) 20 litres ammonia, 10 litres nitrogen, 30 litres hydrogen

58. For the reaction equilibrium $N_2O_4 \rightleftharpoons 2NO_{2(g)}$, the concentrations of N_2O_4 and NO_2 at equilibrium are 4.8×10^{-2} and $1.2 \times 10^{-2} \text{ mol litre}^{-1}$ respectively. The value of K_c for the reaction is [AIEEE 2003]

- (a) $3.3 \times 10^2 \text{ mol litre}^{-1}$ (b) $3 \times 10^{-1} \text{ mol litre}^{-1}$
(c) $3 \times 10^{-3} \text{ mol litre}^{-1}$ (d) $3 \times 10^3 \text{ mol litre}^{-1}$

59. 3.2 moles of hydrogen iodide were heated in a sealed bulb at 444°C till the equilibrium state was reached. Its degree of

dissociation at this temperature was found to be 22%. The number of moles of hydrogen iodide present at equilibrium are [BHU 1982]

- (a) 2.496 (b) 1.87
(c) 2 (d) 4

60. 56 g of nitrogen and 8 g hydrogen gas are heated in a closed vessel. At equilibrium 34 g of ammonia are present. The equilibrium number of moles of nitrogen, hydrogen and ammonia are respectively [KCET 2004]

- (a) 1,2,2 (b) 2,2,1
(c) 1,1,2 (d) 2,1,2

61. The reaction, $2SO_{2(g)} + O_{2(g)} \rightleftharpoons 2SO_{3(g)}$ is carried out in a 1 dm^3 vessel and 2 dm^3 vessel separately. The ratio of the reaction velocities will be [KCET 2004]

- (a) 1 : 8 (b) 1 : 4
(c) 4 : 1 (d) 8 : 1

62. The compound A and B are mixed in equimolar proportion to form the products, $A + B \rightleftharpoons C + D$. At equilibrium, one third of A and B are consumed. The equilibrium constant for the reaction is [KCET 2004]

- (a) 0.5 (b) 4.0
(c) 2.5 (d) 0.25

63. Calculate the partial pressure of carbon monoxide from the following

- (a) 0.4 [MP PET 2003] (b) 0.4
(c) 1.6 (d) 4

64. The equilibrium constant for the reaction $N_{2(g)} + O_{2(g)} \rightleftharpoons 2NO_{(g)}$ at temperature T is 4×10^{-4} . The value of K_c for the reaction $NO_{(g)} \rightleftharpoons \frac{1}{2} N_{2(g)} + \frac{1}{2} O_{2(g)}$ at the same temperature is [MP PET 2003]

- (a) 4×10^{-4} (b) 50
(c) 2.5×10^2 (d) 0.02

65. What is the equilibrium expression for the reaction $P_{4(s)} + 5O_{2(g)} \rightleftharpoons P_4O_{10(s)}$ [AIEEE 2004]

- (a) $K_c = [O_2]^5$ (b) $K_c = [P_4O_{10}]/5[P_4][O_2]$
(c) $K_c = [P_4O_{10}]/[P_4][O_2]^5$ (d) $K_c = 1/[O_2]^5$

66. In the reaction, $H_2 + I_2 \rightleftharpoons 2HI$. In a 2 litre flask 0.4 moles of each H_2 and I_2 are taken. At equilibrium 0.5 moles of HI are formed. What will be the value of equilibrium constant, K_c

- (a) 20.2 (b) 25.4
(c) 0.284 (d) 11.1

67. Ammonia carbonate when heated to 200°C gives a mixture of NH_3 and CO_2 vapour with a density of 13.0. What is the degree of dissociation of ammonium carbonate [Kerala PMT 2004]

- (a) $3/2$ (b) $1/2$
(c) 2 (d) 1
(e) $5/2$

68. 2 mol of N_2 is mixed with 6 mol of H_2 in a closed vessel of one litre capacity. If 50% of N_2 is converted into NH_3 at equilibrium, the value of K_c for the reaction $N_{2(g)} + 3H_{2(g)} \rightleftharpoons 2NH_{3(g)}$ is

- (a) 4/27 (b) 27/4
(c) 1/27 (d) 24
(e) 9
69. For a reaction $H_2 + I_2 \rightleftharpoons 2HI$ at 721K, the value of equilibrium constant is 50. If 0.5 mols each of H_2 and I_2 is added to the system the value of equilibrium constant will be [DCE 2004]
(a) 40 (b) 60
(c) 50 (d) 30
70. What is the effect of halving the pressure by doubling the volume on the following system at 500°C
 $H_{2(g)} + I_{2(g)} \rightleftharpoons 2HI_{(g)}$ [UPSEAT 2004]
(a) Shift to product side
(b) Shift to product formation
(c) Liquefaction of HI
(d) No effect
71. When $NaNO_3$ is heated in a closed vessel, O_2 is liberated and $NaNO_2$ is left behind. At equilibrium [IIT 1986; Roorkee 1995]
(a) Addition of $NaNO_3$ favours forward reaction
(b) Addition of $NaNO_2$ favours reverse reaction
(c) Increasing pressure favours reverse reaction
(d) Increasing temperature favours forward reaction
72. For the reaction : $H_{2(g)} + CO_{2(g)} \rightleftharpoons CO_{(g)} + H_2O_{(g)}$, if the initial concentration of $[H_2] = [CO_2]$ and x moles/litre of hydrogen is consumed at equilibrium, the correct expression of K_p is [Orissa JEE 2005]
(a) $\frac{x^2}{(1-x)^2}$ (b) $\frac{(1+x)^2}{(1-x)^2}$
(c) $\frac{x^2}{(2+x)^2}$ (d) $\frac{x^2}{1-x^2}$
73. 0.6 mole of NH_3 in a reaction vessel of 2 dm capacity was brought to equilibrium. The vessel was then found to contain 0.15 mole of H_2 formed by the reaction
 $2NH_{3(g)} \rightleftharpoons N_{2(g)} + 3H_{2(g)}$
Which of the following statements is true [KCET 1999]
(a) 0.15 mole of the original NH_3 had dissociated at equilibrium
(b) 0.55 mole of ammonia is left in the vessel
(c) At equilibrium the vessel contained 0.45 mole of N_2
(d) The concentration of NH_3 at equilibrium is 0.25 mole per dm
74. 5 moles of SO_2 and 5 moles of O_2 are allowed to react to form SO_3 in a closed vessel. At the equilibrium stage 60% of SO_2 is used up. The total number of moles of SO_2 , O_2 and SO_3 in the vessel now is [KCET 2001]
(a) 10.0 (b) 8.5
(c) 10.5 (d) 3.9
1. In which of the following reaction, the value of K_p will be equal to K_c [MP PMT 1995]
(a) $H_2 + I_2 \rightleftharpoons 2HI$ (b) $PCl_5 \rightleftharpoons PCl_3 + Cl_2$
(c) $2NH_3 \rightleftharpoons N_2 + 3H_2$ (d) $2SO_2 + O_2 \rightleftharpoons 2SO_3$
2. Equilibrium constants K_1 and K_2 for the following equilibria
 $NO(g) + \frac{1}{2}O_2 \rightleftharpoons NO_2(g)$
and $2NO_2(g) \rightleftharpoons 2NO(g) + O_2(g)$ are related as [CBSE PMT 2005]
(a) $K_2 = \frac{1}{K_1}$ (b) $K_2 = K_1^2$
(c) $K_2 = \frac{K_1}{2}$ (d) $K_2 = \frac{1}{K_1^2}$
3. For the reaction $PCl_3(g) + Cl_2(g) \rightleftharpoons PCl_5(g)$ at 250°C, the value of K_c is 26, then the value of K_p on the same temperature will be [MNR 1990; MP PET 2001]
(a) 0.61 (b) 0.57
(c) 0.83 (d) 0.46
4. The relation between equilibrium constant K_p and K_c is [IIT 1994; MP PMT 1994; CPMT 1997; AMU 2000; RPMT 2000, 02; MP PET 2002; Kerala PMT 2002]
(a) $K_c = K_p (RT)^{\Delta n}$ (b) $K_p = K_c (RT)^{\Delta n}$
(c) $K_p = \left(\frac{K_c}{RT}\right)^{\Delta n}$ (d) $K_p - K_c = (RT)^{\Delta n}$
5. $CH_3COOH_{(l)} + C_2H_5OH_{(l)} \rightleftharpoons CH_3COOC_2H_5_{(l)} + H_2O_{(l)}$
In the above reaction, one mole of each of acetic acid and alcohol are heated in the presence of little conc. H_2SO_4 . On equilibrium being attained [CPMT 1985; MP PET 1992]
(a) 1 mole of ethyl acetate is formed
(b) 2 mole of ethyl acetate are formed
(c) 1/2 moles of ethyl acetate is formed
(d) 2/3 moles of ethyl acetate is formed
6. If the equilibrium constant of the reaction $2HI \rightleftharpoons H_2 + I_2$ is 0.25, then the equilibrium constant of the reaction $H_2 + I_2 \rightleftharpoons 2HI$ would be [MP PMT 1989, 95]
(a) 1.0 (b) 2.0
(c) 3.0 (d) 4.0
7. For $N_2 + 3H_2 \rightleftharpoons 2NH_3 + \text{heat}$ [CPMT 1990; MP PMT 1997; RPMT 1999; MP PET 2000; KCET 2001]
(a) $K_p = K_c(RT)$ (b) $K_p = K_c(RT)$
(c) $K_p = K_c(RT)^{-2}$ (d) $K_p = K_c(RT)^{-1}$
8. In the reaction $N_2(g) + 3H_2 \rightleftharpoons 2NH_3(g)$, the value of the equilibrium constant depends on [CPMT 1990; AIIMS 1991; MP PET 1996]
(a) Volume of the reaction vessel

 K_p & K_c Relationship and Characteristics of K

- (b) Total pressure of the system
(c) The initial concentration of nitrogen and hydrogen
(d) The temperature
9. For the chemical equilibrium, $\text{CaCO}_3(\text{s}) \rightleftharpoons \text{CaO}(\text{s}) + \text{CO}_2(\text{g})$, ΔH_r° can be determined from which one of the following plots [AIIMS 2005]
- (a)  (b) 
(c)  (d) 
10. In which of the following equilibria, the value of K_p is less than K_c [MP PMT 1993]
- (a) $\text{H}_2 + \text{I}_2 \rightleftharpoons 2\text{HI}$
(b) $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$
(c) $\text{N}_2 + \text{O}_2 \rightleftharpoons 2\text{NO}$
(d) $\text{CO} + \text{H}_2\text{O} \rightleftharpoons \text{CO}_2 + \text{H}_2$
11. Two gaseous equilibria $\text{SO}_{2(\text{g})} + \frac{1}{2}\text{O}_{2(\text{g})} \rightleftharpoons \text{SO}_{3(\text{g})}$ and $2\text{SO}_{3(\text{g})} \rightleftharpoons 2\text{SO}_{2(\text{g})} + \text{O}_{2(\text{g})}$ have equilibrium constants K_1 and K_2 respectively at 298 K. Which of the following relationships between K_1 and K_2 is correct [CPMT 1988; CBSE PMT 1989; MP PET 1993, 95; RPMT 1999; MP PMT 2001]
- (a) $K_1 = K_2$ (b) $K_2 = K_1^2$
(c) $K_2 = \frac{1}{K_1^2}$ (d) $K_2 = \frac{1}{K_1}$
12. $\text{H}_2 + \text{I}_2 \rightleftharpoons 2\text{HI}$
In the above equilibrium system if the concentration of the reactants at 25°C is increased, the value of K_c will [BHU 1979; CPMT 1990; CBSE PMT 1990]
- (a) Increase
(b) Decrease
(c) Remains the same
(d) Depends on the nature of the reactants
13. At a given temperature, the equilibrium constant for reaction $\text{PCl}_5(\text{g}) \rightleftharpoons \text{PCl}_3(\text{g}) + \text{Cl}_2(\text{g})$ is 2.4×10^{-3} . At the same temperature, the equilibrium constant for reaction $\text{PCl}_3(\text{g}) + \text{Cl}_2(\text{g}) \rightleftharpoons \text{PCl}_5(\text{g})$ is [KCET 1992]
- (a) 2.4×10^{-3} (b) -2.4×10^{-3}
(c) 4.2×10^2 (d) 4.8×10^{-2}
14. For the reaction $\text{C}(\text{s}) + \text{CO}_2(\text{g}) \rightleftharpoons 2\text{CO}(\text{g})$, the partial pressure of CO_2 and CO are 2.0 and 4.0 atm respectively at equilibrium. The K_p for the reaction is [Roorkee 1990]
- (a) 0.5 (b) 4.0
(c) 8.0 (d) 32.0
15. K for the synthesis of HI is 50. K for dissociation of HI is [Roorkee 1990]
- (a) 50 (b) 5
(c) 0.2 (d) 0.02
16. In which one of the following gaseous equilibria K_p is less than K_c [EAMCET 1989; MP PET 1994; Pb. PMT 2000; KCET 2001; CBSE PMT 2002]
- (a) $\text{N}_2\text{O}_4 \rightleftharpoons 2\text{NO}_2$ (b) $2\text{HI} \rightleftharpoons \text{H}_2 + \text{I}_2$
(c) $2\text{SO}_2 + \text{O}_2 \rightleftharpoons 2\text{SO}_3$ (d) $\text{N}_2 + \text{O}_2 \rightleftharpoons 2\text{NO}$
17. For which of the following reactions $K_p = K_c$ [KCET 1991; IIT 1991; EAMCET 1992; AIIMS 1996; KCET 2000; AMU 2000]
- (a) $2\text{NOCl}(\text{g}) \rightleftharpoons 2\text{NO}(\text{g}) + \text{Cl}_2(\text{g})$
(b) $\text{N}_2(\text{g}) + 3\text{H}_2(\text{g}) \rightleftharpoons 2\text{NH}_3(\text{g})$
(c) $\text{H}_2(\text{g}) + \text{Cl}_2(\text{g}) \rightleftharpoons 2\text{HCl}(\text{g})$
(d) $\text{N}_2\text{O}_4(\text{g}) \rightleftharpoons 2\text{NO}_2(\text{g})$
18. For the reaction $\text{H}_2(\text{g}) + \text{I}_2(\text{g}) \rightleftharpoons 2\text{HI}(\text{g})$ at 721 K the value of equilibrium constant (K_c) is 50. When the equilibrium concentration of both is 0.5 M, the value of K_p under the same conditions will be [CBSE PMT 1990]
- (a) 0.002 (b) 0.2
(c) 50.0 (d) 50/RT
19. In which of the following reaction $K_p > K_c$ [AFMC 1995]
- (a) $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$ (b) $\text{H}_2 + \text{I}_2 \rightleftharpoons 2\text{HI}$
(c) $\text{PCl}_3 + \text{Cl}_2 \rightleftharpoons \text{PCl}_5$ (d) $2\text{SO}_3 \rightleftharpoons \text{O}_2 + 2\text{SO}_2$
20. For the reaction $\text{PCl}_5(\text{g}) \rightleftharpoons \text{PCl}_3(\text{g}) + \text{Cl}_2(\text{g})$ [MP PET 1996]
- (a) $K_p = K_c$ (b) $K_p = K_c(\text{RT})^{-1}$
(c) $K_p = K_c(\text{RT})$ (d) $K_p = K_c(\text{RT})^2$
21. The equilibrium constant of the reaction $\text{H}_2(\text{g}) + \text{I}_2(\text{g}) \rightleftharpoons 2\text{HI}(\text{g})$ is 64. If the volume of the container is reduced to one fourth of its original volume, the value of the equilibrium constant will be [MP PET 1996]
- (a) 16 (b) 32
(c) 64 (d) 128
22. For the following gaseous reaction $\text{H}_2 + \text{I}_2 \rightleftharpoons 2\text{HI}$, the equilibrium constant [MP PMT 1996; MP PET/PMT 1998]
- (a) $K_p > K_c$ (b) $K_p < K_c$
(c) $K_p = K_c$ (d) $K_p = 1/K_c$
23. For the reaction $2\text{NO}_{2(\text{g})} \rightleftharpoons 2\text{NO}_{(\text{g})} + \text{O}_{2(\text{g})}$
($K_c = 1.8 \times 10^{-6}$ at 184°C)
($R = 0.0831 \text{ kJ}/(\text{mol} \cdot \text{K})$)

When K_p and K_c are compared at 184°C it is found that

[AIEEE 2005]

- (a) K_p is greater than K_c
 (b) K_p is less than K_c
 (c) $K_p = K_c$
 (d) Whether K_p is greater than, less than or equal to K_c depends upon the total gas pressure

24. In equilibrium $\text{CH}_3\text{COOH} + \text{H}_2\text{O} \rightleftharpoons \text{CH}_3\text{COO}^- + \text{H}_3\text{O}^+$

The equilibrium constant may change when

- (a) CH_3COO^- are added (b) CH_3COOH is added
 (c) Catalyst is added (d) Mixture is heated

25. For reaction $2\text{NOCl}(g) \rightleftharpoons 2\text{NO}(g) + \text{Cl}_2(g)$, K_c at 427°C is

$3 \times 10^{-6} \text{ L mol}^{-1}$. The value of K_p is nearly [AIIMS 2005]

- (a) 7.50×10^{-5} (b) 2.50×10^{-5}
 (c) 2.50×10^{-4} (d) 1.75×10^{-4}

26. For which one of the following reactions $K_p = K_c$

[MP PET 1997]

- (a) $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$ (b) $\text{N}_2 + \text{O}_2 \rightleftharpoons 2\text{NO}$
 (c) $\text{PCl}_5 \rightleftharpoons \text{PCl}_3 + \text{Cl}_2$ (d) $2\text{SO}_3 \rightleftharpoons 2\text{SO}_2 + \text{O}_2$

27. The equilibrium constant for the reversible reaction, $\text{N}_2 + 3\text{H}_2 \rightleftharpoons$

2NH_3 is K and for the reaction $\frac{1}{2}\text{N}_2 + \frac{3}{2}\text{H}_2 \rightleftharpoons \text{NH}_3$ the

equilibrium constant is K' . K and K' will be related as

- (a) $K = K'$ (b) $K' = \sqrt{K}$
 (c) $K = \sqrt{K'}$ (d) $K \times K' = 1$

28. The equilibrium constant (K_p) for the reaction $\text{PCl}_5(g) \rightarrow \text{PCl}_3(g) + \text{Cl}_2(g)$ is 16. If the volume of the container is reduced to one half its original volume, the value of K_p for the reaction at the same temperature will be

[KCET 1996]

- (a) 32 (b) 64
 (c) 16 (d) 4

29. $2\text{NO}_2 \rightleftharpoons 2\text{NO} + \text{O}_2$; $K = 1.6 \times 10^{-12}$

$\text{NO} + \frac{1}{2}\text{O}_2 \rightleftharpoons \text{NO}_2$ $K' = ?$

[CPMT 1996]

- (a) $K' = \frac{1}{K^2}$ (b) $K' = \frac{1}{K}$
 (c) $K' = \frac{1}{\sqrt{K}}$ (d) None of these

30. The value of K_p for the following reaction $2\text{H}_2\text{S}(g) \rightleftharpoons 2\text{H}_2(g) + \text{S}_2(g)$ is 1.2×10^{-2} at 106.5°C . The value of K_c for this reaction is

[EAMCET 1997; AIIMS 1999; AFMC 2000; KCET 2001]

- (a) 1.2×10^{-2} (b) $< 1.2 \times 10^{-2}$
 (c) 83 (d) $> 1.2 \times 10^{-2}$

31. Which statement for equilibrium constant is true for the reaction $\text{A} + \text{B} \rightleftharpoons \text{C}$

[CPMT 1997]

- (a) Not changes with temperature
 (b) Changes when catalyst is added
 (c) Increases with temperature

(d) Changes with temperature

32. The equilibrium constant for the reaction $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$ is K , then the equilibrium constant for the equilibrium $\text{NH}_3 \rightleftharpoons \frac{1}{2}\text{N}_2 + \frac{3}{2}\text{H}_2$ is

[CBSE PMT 1996; UPSEAT 2001]

- (a) $1/K$ (b) $1/K^2$
 (c) $\sqrt{K}$ (d) $\frac{1}{\sqrt{K}}$

33. Which of the following statements regarding a chemical equilibrium is wrong [JIPMER 1999]

- (a) An equilibrium can be shifted by altering the temperature or pressure
 (b) An equilibrium is dynamic
 (c) The same state of equilibrium is reached whether one starts with the reactants or the products
 (d) The forward reaction is favoured by the addition of a catalyst

34. The reaction between N_2 and H_2 to form ammonia has

$K_c = 6 \times 10^{-2}$ at the temperature 500°C . The numerical value of K_p for this reaction is [UPSEAT 1999]

- (a) 1.5×10^{-5} (b) 1.5×10^5
 (c) 1.5×10^{-6} (d) 1.5×10^6

35. For the gaseous phase reaction

$2\text{NO} \rightleftharpoons \text{N}_2 + \text{O}_2$ $\Delta H^\circ = +43.5 \text{ kcal mol}^{-1}$

Which statement is correct

[MP PET 1997]

[MH CET 1999]

- (a) K varies with addition of NO
 (b) K decrease as temperature decreases
 (c) K increases as temperature decreases
 (d) K is independent of temperature

36. For the reversible reaction,

$\text{N}_{2(g)} + 3\text{H}_{2(g)} \rightleftharpoons 2\text{NH}_{3(g)}$

at 500°C , the value of K_p is 1.44×10^{-5} when partial pressure is measured in atmospheres. The corresponding value of K_c with concentration in mole litre, is

[IIT Screening 2000; Pb. CET 2004]

- (a) $1.44 \times 10^{-5} / (0.082 \times 500)^{-2}$
 (b) $1.44 \times 10^{-5} / (8.314 \times 773)^{-2}$
 (c) $1.44 \times 10^{-5} / (0.082 \times 773)^{-2}$
 (d) $1.44 \times 10^{-5} / (0.082 \times 773)^{-2}$

37. A chemical reaction is catalyzed by a catalyst X . Hence X

[AIIMS 2000]

- (a) Reduces enthalpy of the reaction
 (b) Decreases rate constant of the reaction
 (c) Increases activation energy of the reaction
 (d) Does not affect equilibrium constant of reaction

38. At 490°C , the equilibrium constant for the synthesis of HI is 50, the value of K for the dissociation of HI will be

[KCET 2000]

- (a) 20.0 (b) 2.0
 (c) 0.2 (d) 0.02

39. In which of the following case K is less than K'

[AFMC 1997; Pb. PMT 2000]

- (a) $\text{H}_2 + \text{Cl}_2 \rightleftharpoons 2\text{HCl}$ (b) $2\text{SO}_2 + \text{O}_2 \rightleftharpoons 2\text{SO}_3$
 (c) $\text{N}_2 + \text{O}_2 \rightleftharpoons 2\text{NO}$ (d) $\text{PCl}_5 \rightleftharpoons \text{PCl}_3 + \text{Cl}_2$

40. $\text{CaCO}_{3(s)} \rightleftharpoons \text{CaO}_{(s)} + \text{CO}_{2(g)}$ which of the following expression is correct [MH CET 2000]
- $K_p = (P_{\text{CaO}} + P_{\text{CO}_2} / P_{\text{CaCO}_3})$
 - $K_p = P_{\text{CO}_2}$
 - $K_p \times (P_{\text{CaO}} \times P_{\text{CO}_2}) \cdot P_{\text{CaCO}_3}$
 - $\frac{K_p [\text{CaO}][\text{CO}_2]}{[\text{CaCO}_3]}$
41. If K_c is the equilibrium constant for the formation of NH_3 , the dissociation constant of ammonia under the same temperature will be [DPMT 2001]
- K_c
 - $\sqrt{K_c}$
 - K_c^2
 - $1/K_c$
42. 3.2 moles of hydrogen iodide were heated in a sealed bulb at 444°C till the equilibrium was reached. The degree of dissociation of HI at this temperature was found to be 22%. The number of moles of hydrogen iodide present at equilibrium are [MH CET 2001]
- 1.87
 - 2.496
 - 4.00
 - 2.00
43. The K_c for $\text{H}_{2(g)} + \text{I}_{2(g)} \rightleftharpoons 2\text{HI}_{(g)}$ is 64. If the volume of the container is reduced to one-half of its original volume, the value of the equilibrium constant will be [JIPMER 2001]
- + 28
 - 64
 - 32
 - 16
44. A reversible reaction $\text{H}_2 + \text{Cl}_2 \rightleftharpoons 2\text{HCl}$ is carried out in one litre flask. If the same reaction is carried out in two litre flask, the equilibrium constant will be [JIPMER 2001]
- Decreased
 - Doubled
 - Halved
 - Same
45. For the reaction $2\text{NO}_{2(g)} \rightleftharpoons 2\text{NO}_{(g)} + \text{O}_{2(g)}$ $K_c = 1.8 \times 10^{-6}$ at 185°C . At 185°C the K for $\text{NO}_{(g)} + \frac{1}{2}\text{O}_{2(g)} \rightleftharpoons \text{NO}_{2(g)}$ is [JIPMER 2001]
- 1.95×10^{-3}
 - 1.95×10^3
 - 7.5×10^2
 - 0.9×10^6
46. If for $\text{H}_{2(g)} + \frac{1}{2}\text{S}_{2(g)} \rightleftharpoons \text{H}_2\text{S}_{(g)}$ and $\text{H}_{2(g)} + \text{Br}_{2(g)} \rightleftharpoons 2\text{HBr}_{(g)}$ The equilibrium constants are K_1 and K_2 respectively, the reaction $\text{Br}_{2(g)} + \text{H}_2\text{S}_{(g)} \rightleftharpoons 2\text{HBr}_{(g)} + \frac{1}{2}\text{S}_{2(g)}$ would have equilibrium constant [MP PMT 2001]
- $K_1 \times K_2$
 - K_1 / K_2
 - K_2 / K_1
 - K_2^2 / K_1
47. Some solid NH_4HS is placed in a flask containing 0.5 atm of NH_3 , what would be pressures of NH_3 and H_2S when equilibrium is reached $\text{NH}_4\text{HS}_{(g)} \rightleftharpoons \text{NH}_{3(g)} + \text{H}_2\text{S}_{(g)}$, $K_p = 0.11$ [UPSEAT 2001]
- 6.65 atm
 - 0.665 atm
 - 0.0665 atm
 - 66.5 atm
48. In which of the following reactions, increase in the volume at constant temperature don't affect the number of moles at equilibrium. [AIEEE 2002]
- $2\text{NH}_3 \rightleftharpoons \text{N}_2 + 3\text{H}_2$
 - $\text{C}_{(g)} + \frac{1}{2}\text{O}_{2(g)} \rightarrow \text{CO}_{(g)}$
 - $\text{H}_{2(g)} + \text{O}_{2(g)} \rightarrow \text{H}_2\text{O}_{2(g)}$
 - None of these
49. A chemical reaction was carried out at 300 K and 280 K. The rate constants were found to be K and K' respectively. The energy of activation is $1.157 \times 10^4 \text{ cal mole}^{-1}$ and $R = 1.987 \text{ cal}$. Then
- $K_2 \approx 0.25K_1$
 - $K_2 \approx 0.5K_1$
 - $K_2 \approx 4K_1$
 - $K_2 \approx 2K_1$
50. Δn , the change in the number of moles for the reaction, $\text{C}_{12}\text{H}_{22}\text{O}_{11(s)} + 12\text{O}_{2(g)} \rightleftharpoons 12\text{CO}_{2(g)} + 11\text{H}_2\text{O}_{(l)}$ at 25°C is [Pb. PMT 2002]
- 0
 - 2
 - 4
 - 1
51. Value of K_p in the reaction $\text{MgCO}_{3(s)} \rightleftharpoons \text{MgO}_{(s)} + \text{CO}_{2(g)}$ is [CBSE PMT 2000; RPMT 2002]
- $K_p = P_{\text{CO}_2}$
 - $K_p = P_{\text{CO}_2} \times \frac{P_{\text{CO}_2} \times P_{\text{MgO}}}{P_{\text{MgCO}_3}}$
 - $K_p = \frac{P_{\text{CO}_2} \times P_{\text{MgO}}}{P_{\text{MgCO}_3}}$
 - $K_p = \frac{P_{\text{MgCO}_3}}{P_{\text{CO}_2} \times P_{\text{MgO}}}$
52. For $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$ equilibrium constant is k then equilibrium constant for $2\text{N}_2 + 6\text{H}_2 \rightleftharpoons 4\text{NH}_3$ is [RPMT 2002]
- $\sqrt{k}$
 - k^2
 - $k/2$
 - $\sqrt{k+1}$
53. For the reaction, $\text{PCl}_{3(g)} + \text{Cl}_{2(g)} \rightleftharpoons \text{PCl}_{5(g)}$, the value of K_c at 250°C is 26. The value of K_p at this temperature will be [UPSEAT 1999, 2000, 02]
- 0.61
 - 0.57
 - 0.83
 - 0.46
54. A tenfold increase in pressure on the reaction $\text{N}_{2(g)} + 3\text{H}_{2(g)} \rightleftharpoons 2\text{NH}_{3(g)}$ at equilibrium, makes K_p [MP PET 2003]
- Unchanged
 - Two times
 - Four times
 - Ten times
55. If equilibrium constant for reaction $2\text{AB} \rightleftharpoons \text{A}_2 + \text{B}_2$ is 49, then the equilibrium constant for reaction $\text{AB} \rightleftharpoons \frac{1}{2}\text{A}_2 + \frac{1}{2}\text{B}_2$ will be [EAMCET 1998; MP PMT 2003]
- 7
 - 20
 - 49
 - 21
56. In the manufacture of ammonia by Haber's process, $\text{N}_{2(g)} + 3\text{H}_2 \rightleftharpoons 2\text{NH}_{3(g)} + 92.3\text{kJ}$, which of the following conditions is unfavourable [KCET 2004]
- Increasing the temperature

- (b) Increasing the pressure
(c) Reducing the temperature
(d) Removing ammonia as it is formed
57. The chemical equilibrium of a reversible reaction is not influenced by [KCET 2004]
(a) Pressure
(b) Catalyst
(c) Concentration of the reactants
(d) Temperature
58. Of the following which change will shift the reaction towards the product
 $I_2(g) \rightleftharpoons 2I(g)$, $\Delta H_r^\circ(298K) = +150 \text{ kJ}$ [AIIMS 2004]
(a) Increase in concentration of I
(b) Decrease in concentration of I_2
(c) Increase in temperature
(d) Increase in total pressure
59. For the reaction, $CO(g) + Cl_{2(g)} \rightleftharpoons COCl_{2(g)}$ the K_p / K_c is equal to [AIEEE 2004]
(a) $\sqrt{RT}$ (b) RT
(c) $1/RT$ (d) 1.0
60. Consider the following reversible reaction at equilibrium, $2H_2O(g) \rightleftharpoons 2H_{2(g)} + O_{2(g)}$; $\Delta H = 241.7 \text{ kJ}$
Which one of the following changes in conditions will lead to maximum decomposition of $H_2O(g)$ [Kerala PMT 2004]
(a) Increasing both temperature and pressure
(b) Decreasing temperature and increasing pressure
(c) Increasing temperature and decreasing pressure
(d) Increasing temperature at constant pressure
61. For reaction, $2A(g) \rightleftharpoons 3C(g) + D(s)$, the value of K_c will be equal to [Pb. CET 2003]
(a) $K_p(RT)$ (b) K_p / RT
(c) $= K_p$ (d) None of these
62. In the reaction, $A_2(g) + 4B_2(g) \rightleftharpoons 2AB_4(g)$
 $\Delta H < 0$ the formation of AB_4 is will be favoured at [IIT Screening 1990; MP PET 2004]
(a) Low temperature, high pressure
(b) High temperature, low pressure
(c) Low temperature, low pressure
(d) High temperature, high pressure
63. The formation of SO_3 takes place according to the following reaction, $2SO_2 + O_2 \rightleftharpoons 2SO_3$; $\Delta H = -45.2 \text{ kcal}$
The formation of SO_3 is favoured by [UPSEAT 2004]
(a) Increasing in temperature
(b) Removal of oxygen
(c) Increase of volume
(d) Increasing of pressure
64. What is the effect of increasing pressure on the dissociation of PCl_5 according to the equation
 $PCl_{5(g)} \rightleftharpoons PCl_{3(g)} + Cl_{2(g)} - x \text{ cal}$ [UPSEAT 2004]
(a) Dissociation decreases
(b) Dissociation increases
(c) Dissociation does not change
(d) None of these
65. If equilibrium constants of reaction, $N_2 + O_2 \rightleftharpoons 2NO$ is K_1 and $\frac{1}{2}N_2 + \frac{1}{2}O_2 \rightleftharpoons NO$ is K_2 , then [BHU 2004]
(a) $K_1 = K_2$ (b) $K_2 = \sqrt{K_1}$
(c) $K_1 = 2K_2$ (d) $K_1 = \frac{1}{2}K_2$
66. For the following reaction in gaseous phase $CO + \frac{1}{2}O_2 \rightarrow CO_2$; K_p / K_c is [DCE 2002]
(a) $(RT)^{1/2}$ (b) $(RT)^{-1/2}$
(c) (RT) (d) $(RT)^{-1}$
67. For the reaction $N_{2(g)} + O_{2(g)} \rightleftharpoons 2NO_{(g)}$, the value of K_c at $800^\circ C$ is 0.1. When the equilibrium concentrations of both the reactants is 0.5 mol, what is the value of K_p at the same temperature [KCET 2005]
(a) 0.5 (b) 0.1
(c) 0.01 (d) 0.025
68. $A_{(g)} + 3B_{(g)} \rightleftharpoons 4C_{(g)}$. Starting concentration of A is equal to B, equilibrium concentration of A and C are same. $K_c =$ [Kerala CET 2005]
(a) 0.08 (b) 0.8
(c) 8 (d) 80
(e) 1/8
69. $NH_4COONH_{2(s)} \rightleftharpoons 2NH_{3(g)} + CO_{2(g)}$ if equilibrium pressure is 3 atm for the above reaction K_p for the reaction is
(a) 4 (b) 27
(c) 4/27 (d) 1/27

Activation energy, Standard free energy and Degree of dissociation and Vapour density

1. The vapour density of completely dissociated NH_4Cl would be
(a) Slight less than half that of NH_4Cl
(b) Half that of NH_4Cl
(c) Double that of NH_4Cl
(d) Determined by the amount of solid NH_4Cl in the experiment
2. In an equilibrium reaction for which $\Delta G^\circ = 0$, the equilibrium constant $K =$ [BHU 1987]
(a) 0 (b) 1
(c) 2 (d) 10
3. For a system in equilibrium $\Delta G = 0$ under conditions of constant
(a) Temperature and pressure
(b) Temperature and volume
(c) Energy and volume
(d) Pressure and volume
4. A reaction attains equilibrium when the free energy change accompanying it is [KCET 1989]
(a) Positive and large (b) Zero

- (c) Negative and large (d) Negative and small
5. $\Delta G^0(HI, g) \cong +1.7 \text{ kJ}$. What is the equilibrium constant at 25°C for $2HI(g) \rightleftharpoons H_2(g) + I_2(g)$ [KCET 1992]
- (a) 24.0 (b) 3.9
(c) 2.0 (d) 0.5
6. The standard state gibbs free energy change for the given isomerization reaction *cis*-2-pentene $\rightleftharpoons$ *trans*-2-pentene is -3.67 kJ/mol at 400 K . If more *trans*-2-pentene is added to the reaction vessel, then [CBSE PMT 1995; BHU 1999; AFMC 2000]
- (a) More *cis*-2-pentene is formed
(b) Equilibrium is shifted in the forward direction
(c) Equilibrium remains unaffected
(d) Additional *trans*-2-pentene is formed
7. In a reversible reaction, the catalyst [KCET 2003]
- (a) Increases the activation energy of the backward reaction
(b) Increases the activation energy of the forward reaction
(c) Decreases the activation energy of both, forward and backward reaction
(d) Decreases the activation energy of forward reaction
8. For the reaction $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$, the equilibrium constant changes with [IIT 1981; MNR 1983, 85; NCERT 1984; MP PMT 1987, 97; MP PET/PMT 1988; CPMT 1976, 90; UPSEAT 2000]
- (a) Total pressure
(b) Catalyst
(c) The amounts of H_2 and I_2 taken
(d) Temperature
9. Calculate ΔG° for conversion of oxygen to ozone $3/2 O_2(g) \rightarrow O_3(g)$ at 298 K , if K_p for this conversion is 2.47×10^{-29} [DPMT 2004]
- (a) 163 kJ mol^{-1} (b) $2.4 \times 10^2 \text{ kJ mol}^{-1}$
(c) 1.63 kJ mol^{-1} (d) $2.38 \times 10^6 \text{ kJ mol}^{-1}$
- (a) The speed of forward and backward reaction increases
(b) The speed of forward and backward reaction decreases
(c) Only the speed of that reaction increases which nullifies the factor causing increase of speed
(d) No difference
4. Which of the following reactions proceed at low pressure [MP PET 1985; CPMT 1984; MP PMT 1995; RPMT 1997]
- (a) $N_2 + 3H_2 \rightleftharpoons 2NH_3$ (b) $H_2 + I_2 \rightleftharpoons 2HI$
(c) $PCl_5 \rightleftharpoons PCl_3 + Cl_2$ (d) $N_2 + O_2 \rightleftharpoons 2NO$
5. Le-chatelier principle is applicable
- (a) Both for physical and chemical equilibrium
(b) Only for chemical equilibrium
(c) Only for physical equilibrium
(d) Neither for (b) nor for (c)
6. In the following reversible reaction $2SO_2 + O_2 \rightleftharpoons 2SO_3 + Q \text{ Cal}$
- Most suitable condition for the higher production of SO_3 is [NCERT 1974; DPMT 1983, 89; IIT 1981; MP PET 1992; MP PMT 1990, 91, 94, 99; CPMT 1973, 77, 84, 89, 94, 99]
- (a) High temperature and high pressure
(b) High temperature and low pressure
(c) Low temperature and high pressure
(d) Low temperature and low pressure
7. When the pressure is applied over system $ice \rightleftharpoons water$ what will happen? [MP PMT 1990; CPMT 1983; NCERT 1978; DPMT 2002]
- (a) More water will form
(b) More ice will form
(c) There will be no effect over equilibrium
(d) Water will decompose in H_2 and O_2
8. The reaction $A + B \rightleftharpoons C + D + \text{heat}$ has reached equilibrium. The reaction may be made to proceed forward by [IIT 1978]
- (a) Adding more C
(b) Adding more D
(c) Decreasing the temperature
(d) Increasing the temperature
9. On the velocity in a reversible reaction, the correct explanation of the effect of catalyst is [MP PMT 1987]
- (a) It provides a new reaction path of low activation energy
(b) It increases the kinetic energy of reacting molecules
(c) It displaces the equilibrium state on right side
(d) It decreases the velocity of backward reaction
10. Select the correct statement from the following [MP PMT 1985]
- (a) Equilibrium constant changes with addition of catalyst
(b) Catalyst increases the rate of forward reaction
(c) The ratio of mixture at equilibrium is not changed by catalyst
(d) Catalyst are active only in solution
11. According to Le-chatelier principle, if heat is given to solid-liquid system, then [MNR 1990]
- (a) Quantity of solid will reduce

Le-Chatelier principle and It's application

1. When in any system at equilibrium state pressure, temperature and concentration is changed then the equilibria shifted to such a direction which neutralize the effect of change. This is known as [MP PMT/PET 1988; DPMT 1985]
- (a) First law of thermodynamics
(b) Le-chatelier's principle
(c) Ostwald's rule
(d) Hess's law of constant heat summation
2. $N_2 + O_2 \rightleftharpoons 2NO - Q \text{ cal}$
- In the above reaction which is the essential condition for the higher production of NO [CPMT 1971, 89; MP PMT 1985]
- (a) High temperature (b) High pressure
(c) Low temperature (d) Low pressure
3. A reversible reaction is in equilibrium. If a factor is changed which affect it, then

- (b) Quantity of liquid will reduce
(c) Increase in temperature
(d) Decrease in temperature
12. In the reaction $A(g) + 2B(g) \rightleftharpoons C(g) + Q$, greater product will be obtained **or** the forward reaction is favoured by
[MNR 1988; MP PMT 1989, 97]
(a) At high temperature and high pressure
(b) At high temperature and low pressure
(c) At low temperature and high pressure
(d) At low temperature and low pressure
13. Following gaseous reaction is undergoing in a vessel
 $C_2H_4 + H_2 \rightleftharpoons C_2H_6$; $\Delta H = -32.7 \text{ Kcal}$
Which will increase the equilibrium concentration of C_2H_6
[IIT 1984; MP PET/PMT 1988; MADT Bihar 1995]
(a) Increase of temperature
(b) By reducing temperature
(c) By removing some hydrogen
(d) By adding some C_2H_6
14. The effect of increasing the pressure on the equilibrium
 $2A + 3B \rightleftharpoons 3A + 2B$ is
[EAMCET 1980; MP PMT 1991]
(a) Forward reaction is favoured
(b) Backward reaction is favoured
(c) No effect
(d) None of the above
15. For the equilibrium $2NO_2(g) \rightleftharpoons N_2O_4(g) + 14.6 \text{ kcal}$ the increase in temperature would
[CPMT 1974, 78]
(a) Favour the formation of N_2O_4
(b) Favour the decomposition of N_2O_4
(c) Not alter the equilibrium
(d) Stop the reaction
16. Which of the following factors will favour the reverse reaction in a chemical equilibrium
[AIIMS 1982]
(a) Increase in the concentration of one of the reactants
(b) Removal of at least one of the product at regular time intervals
(c) Increase in the concentration of one or more products
(d) None of these
17. In the formation of SO_3 by contact process, the conditions used are
[CPMT 1984]
(a) Catalyst, optimum temperature and higher concentration of reactants
(b) Catalyst, optimum temperature and lower concentration of reactants
(c) Catalyst, high temperature and higher concentration of reactants
(d) Catalyst, low temperature and lower concentration of reactants
18. Given reaction is $2X_{(gas)} + Y_{(gas)} \rightleftharpoons 2Z_{(gas)} + 80 \text{ kcal}$
Which combination of pressure and temperature gives the highest yield of Z at equilibrium
[NCERT 1979]
(a) 1000 atm and $500^\circ C$
(b) 500 atm and $500^\circ C$
(c) 1000 atm and $100^\circ C$
(d) 500 atm and $100^\circ C$
19. Consider the reaction $HCN_{(aq)} \rightleftharpoons H^+_{(aq)} + CN^-_{(aq)}$. At equilibrium, the addition of $CN^-_{(aq)}$ would
[NCERT 1979]
(a) Reduce $HCN_{(aq)}$ concentration
(b) Decrease the $H^+_{(aq)}$ ion concentration
(c) Increase the equilibrium constant
(d) Decrease the equilibrium constant
20. In the gaseous equilibrium $H_2X_2 + \text{heat} \rightleftharpoons 2HX$, the formation of HX will be favoured by [CPMT 1977]
(a) High pressure and low temperature
(b) High temperature and low pressure
(c) Low temperature and low pressure
(d) High temperature and high pressure
21. Raising the temperature of an equilibrium system
[MP PMT 1987]
(a) Favours the exothermic reaction only
(b) Favours the endothermic reaction only
(c) Favours both the exothermic and endothermic reactions
(d) Favours neither the exothermic nor endothermic reactions
22. Reaction in which yield of product will increase with increase in pressure is
[NCERT 1984]
(a) $H_{2(g)} + I_{2(g)} \rightleftharpoons 2HI_{(g)}$
(b) $H_2O_{(g)} + CO_{(g)} \rightleftharpoons CO_{2(g)} + H_{2(g)}$
(c) $H_2O_{(g)} + C_{(s)} \rightleftharpoons CO_{(g)} + H_{2(g)}$
(d) $CO_{(g)} + 3H_{2(g)} \rightleftharpoons CH_{4(g)} + H_2O_{(g)}$
23. In reaction $N_{2(g)} + 3H_{2(g)} \rightleftharpoons 2NH_{3(g)}$; $\Delta H = -93.6 \text{ kJ}$, the yield of ammonia does not increase when
[CPMT 1988]
(a) Pressure is increased
(b) Temperature is lowered
(c) Pressure is lowered
(d) Volume of the reaction vessel is decreased
24. The equilibrium which remains unaffected by change in pressure of the reactants is
[CPMT 1987; KCET 1991; EAMCET 1992; MP PET 1992, 95; MP PMT 1999]
(a) $N_{2(g)} + O_{2(g)} \rightleftharpoons 2NO_{(g)}$
(b) $2SO_{2(g)} + O_{2(g)} \rightleftharpoons 2SO_{3(g)}$
(c) $2O_{3(g)} \rightleftharpoons 3O_{2(g)}$
(d) $2NO_{2(g)} \rightleftharpoons N_2O_{4(g)}$
25. The endothermic reaction ($M + N \rightleftharpoons P$) is allowed to attain an equilibrium at 25° . Formation of P can be increased by [BHU 1981]
(a) Raising temperature
(b) Lowering temperature
(c) Keeping temperature constant
(d) Decreasing the concentration of M and N
26. According to Le-chatelier's principle, an increase in the temperature of the following reaction will
 $N_2 + O_2 \rightleftharpoons 2NO - 43,200 \text{ kcal}$
[MP PMT 1985, 93]
(a) Increase the yield of NO
(b) Decrease the yield of NO

- (c) Not effect the yield of NO
(d) Not help the reaction to proceed in forward direction
27. In the manufacture of NH_3 by Haber's process, the condition which would give maximum yield is

$$N_2 + 3H_2 \rightleftharpoons 2NH_3 + Q_{kcal}$$
 [NCERT 1978; EAMCET 1980; MNR 1987; AFMC 1999; CPMT 1983, 84, 86, 94; MP PMT 1999]
 (a) High temperature, high pressure and high concentrations of the reactants
 (b) High temperature, low pressure and low concentrations of the reactants
 (c) Low temperature and high pressure
 (d) Low temperature, low pressure and low concentration of H_2
28. Suppose the reaction $PCl_{5(s)} \rightleftharpoons PCl_{3(s)} + Cl_{2(g)}$ is in a closed vessel at equilibrium stage. What is the effect on equilibrium concentration of $Cl_{2(g)}$ by adding PCl_5 at constant temperature [MP PMT 1992]
 (a) Decreases
 (b) Increases
 (c) Unaffected
 (d) Cannot be described without the value of K_p
29. In which of the following equilibrium reactions, the equilibrium would shift to the right, if total pressure is increased [KCET 1993]
 (a) $N_2 + 3H_2 \rightleftharpoons 2NH_3$ (b) $H_2 + I_2 \rightleftharpoons 2HI$
 (c) $H_2 + Cl_2 \rightleftharpoons 2HCl$ (d) $N_2O_4 \rightleftharpoons 2NO$
30. In which of the following gaseous equilibrium an increase in pressure will increase the yield of the products [EAMCET 1988]
 (a) $2HI \rightleftharpoons H_2 + I_2$ (b) $2SO_2 + O_2 \rightleftharpoons 2SO_3$
 (c) $H_2 + Br_2 \rightleftharpoons 2HBr$ (d) $H_2O + CO \rightleftharpoons H_2 + CO_2$
31. In the reaction $A(g) + B(g) \rightleftharpoons C(g)$, the backward reaction is favoured by [EAMCET 1986]
 (a) Decrease of pressure (b) Increase of pressure
 (c) Either of the two (d) None of the two
32. The formation of NO_2 in the reaction $2NO + O_2 \rightleftharpoons 2NO_2 + \text{heat}$ is favoured by [Rooke Qualifying 1998]
 (a) Low pressure (b) High pressure
 (c) Low temperature (d) Reduction in the mass of
33. For the reaction $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$, the forward reaction at constant temperature is favoured by [IIT 1991; AMU 2001]
 (a) Introducing an inert gas at constant volume
 (b) Introducing chlorine gas at constant volume
 (c) Introducing an inert gas at constant pressure
 (d) Decreasing the volume of the container
34. Which of the following conditions is favourable for the production of ammonia by Haber's process [MP PET 1994]
 (a) High concentration of reactants
 (b) Low temperature and high pressure
 (c) Continuous removal of ammonia
 (d) All of these
35. According to Le-chatelier's principle, which of the following factors influence a chemical system [MP PMT 1996]
 (a) Concentration only
 (b) Pressure only
 (c) Temperature only
 (d) Concentration, pressure and temperature
36. If pressure increases then its effect on given equilibrium $C(s) + H_2O(g) \rightleftharpoons CO(g) + H_2(g)$ it is satisfied in [BCECE 2005]
 (a) Forward direction (b) Backward direction
 (c) No effect (d) None of these
37. The exothermic formation of ClF_3 is represented by the equation

$$Cl_{2(g)} + 3F_{2(g)} \rightleftharpoons 2ClF_{3(g)}; \Delta H = -329 kJ$$
 Which of the following will increase the quantity of ClF_3 in an equilibrium mixture of Cl_2 , F_2 and ClF_3 [AIEEE 2005]
 (a) Increasing the temperature
 (b) Removing Cl_2
 (c) Increasing the volume of the container
 (d) Adding F_2
38. What would happen to a reversible reaction at equilibrium when an inert gas is added while the pressure remains unchanged
 (a) More of the product will be formed
 (b) Less of the product will be formed
 (c) More of the reactants will be formed
 (d) It remains unaffected
39. Formation of SO_3 takes place according to the reaction $2SO_2 + O_2 \rightleftharpoons 2SO_3; \Delta H = -45.2 kcal$
 Which of the following factors favours the formation of SO_3 [MP PET/PMT 1998]
 (a) Increase in temperature
 (b) Increase in pressure
 (c) Removal of oxygen
 (d) Increase in volume
40. For the chemical reaction $3X(g) + Y(g) \rightleftharpoons X_3Y(g)$, the amount of X_3Y at equilibrium is affected by [IIT 1999]
 (a) Temperature and pressure
 (b) Temperature only
 (c) Pressure only
 (d) Temperature, pressure and catalyst
41. In $N_2 + 3H_2 \rightleftharpoons 2NH_3$ reversible reaction, increase in pressure will favour [DPMT 1996]
 (a) Reaction in forward direction
 (b) Reaction in reverse direction
 (c) Will not exert any effect
 (d) In backward and forward direction equally
42. In the reaction $N_2 + 3H_2 \rightarrow 2NH_3$, the product increases on
 (a) Increasing temperature
 (b) Increasing pressure
 (c) Increasing temperature and pressure both
 (d) Decreasing temperature and pressure both
 (e) None of these
43. In which of the following system, doubling the volume of the container cause a shift to the right [AIIMS 1996]
 (a) $H_2(g) + Cl_2(g) \rightleftharpoons 2HCl(g)$
 (b) $2CO(g) + O_2(g) \rightleftharpoons 2CO_2(g)$

- (c) $N_2(g) + 3H_2(g) = 2NH_3(g)$
 (d) $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$
44. Which of the following information can be obtained on the basis of Le-Chatelier's principle
 [AIIMS 1998; Pb. PMT 1999; BHU 2000; DPMT 2004]
 (a) Entropy change in a reaction
 (b) Dissociation constant of a weak acid
 (c) Equilibrium constant of a chemical reaction
 (d) Shift in equilibrium position on changing value of a constant
45. The equilibrium $2SO_{2(g)} + O_{2(g)} \rightleftharpoons 2SO_{3(g)}$ shifts forward, if
 [CPMT 1988]
 (a) A catalyst is used
 (b) An adsorbent is used to remove SO_3 as soon as it is formed
 (c) Low pressure
 (d) Small amounts of reactants are used
46. The equilibrium $SO_2Cl_{2(g)} \rightleftharpoons SO_{2(g)} + Cl_{2(g)}$ is attained at $25^\circ C$ in a closed container and an inert gas helium is introduced which of the following statement is correct
 [MP PMT 2000]
 (a) More chlorine is formed
 (b) Concentration of SO_2 is reduced
 (c) More SO_2Cl_2 is formed
 (d) Concentration of SO_2Cl_2 , SO_2 and Cl_2 does not change
47. Which of the following equilibria will shift to right side on increasing the temperature
 [MP PMT 2000]
 (a) $CO_{(g)} + H_2O_{(g)} \rightleftharpoons CO_{2(g)} + H_{2(g)}$
 (b) $2SO_{2(g)} + O_{2(g)} \rightleftharpoons 2SO_{3(g)}$
 (c) $H_2O_{(g)} \rightleftharpoons H_{2(g)} + \frac{1}{2}(O_{2(g)})$
 (d) $4HCl_{(g)} + O_{2(g)} \rightleftharpoons 2H_2O_{(g)} + 2Cl_{2(g)}$
48. Sodium sulphate dissolves in water with evolution of heat. Consider a saturated solution of sodium sulphate. If the temperature is raised, then according to Le-Chatelier principle
 (a) More solid will dissolve
 (b) Some solid will precipitate out from the solution
 (c) The solution will become supersaturated
 (d) Solution concentration will remain unchanged
49. Consider the equilibrium
 $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$; $\Delta H = -93.6 \text{ kJ}$. The maximum yield of ammonia is obtained by
 [UPSEAT 1999; AMU 2000]
 (a) Decrease of temp. and increase of pressure
 (b) Increase of temp. and decrease of pressure
 (c) Decrease of both the temp. and pressure
 (d) Increase of both the temp. and pressure
50. In the equilibrium $AB \rightleftharpoons A + B$; if the equilibrium concentration of A is doubled, the equilibrium concentration of B would become: [AMU 2000]
 (a) Twice (b) Half
 (c) $1/4$ (d) $1/8$
51. Le-Chatelier's principle is applicable only to a
 [MP PET/PMT 1988; KCET 1999; AFMC 2000; Pb. CET 2002]
 (a) System in equilibrium (b) Irreversible reaction
 (c) Homogeneous reaction (d) Heterogeneous reaction
52. In a vessel containing SO_3 , SO_2 and O_2 at equilibrium, some helium gas is introduced so that the total pressure increases while temperature and volume remain constant. According to Le-Chatelier principle the dissociation of SO_3
 [UPSEAT 2000]
 (a) Increases (b) Decreases
 (c) Remains unaltered (d) Changes unpredictably
53. $H_{2(g)} + I_{2(g)} \rightleftharpoons 2HI_{(g)}$ $\Delta H = +q \text{ cal}$, then formation of HI
 [AMU 2000]
 (a) Is favoured by lowering the temperature
 (b) Is favoured by increasing the pressure
 (c) Is unaffected by change in pressure
 (d) Is unaffected by change in temperature
54. In which of the following equilibrium systems is the rate of the backward reaction favoured by increase of pressure
 [KCET 2001]
 (a) $PCl_5 \rightleftharpoons PCl_3 + Cl_2$ (b) $2SO_2 + O_2 \rightleftharpoons 2SO_3$
 (c) $N_2 + 3H_2 \rightleftharpoons 2NH_3$ (d) $N_2 + O_2 \rightleftharpoons 2NO$
55. Which of the following equilibrium is not shifted by increase in the pressure
 [MP PMT 2001]
 (a) $H_{2(g)} + I_{2(g)} \rightleftharpoons 2HI_{(g)}$
 (b) $N_{2(g)} + 3H_{2(g)} \rightleftharpoons 2NH_{3(g)}$
 (c) $2CO_{(g)} + O_{2(g)} \rightleftharpoons 2CO_{2(g)}$
 (d) $2C_{(s)} + O_{2(g)} \rightleftharpoons 2CO_{(g)}$
56. According to Le-Chatelier's principal adding heat to a solid and liquid in equilibrium with endothermic nature will cause the [JIPMER 2000; MP PMT 2001]
 (a) Temperature to rise
 (b) Temperature to fall
 (c) Amount of solid to decrease
 (d) Amount of liquid to decrease
57. On addition of an inert gas at constant volume to the reaction
 $N_2 + 3H_2 \rightleftharpoons 2NH_3$ at equilibrium
 [Pb. PMT 2001]
 (a) The reaction remains unaffected
 (b) Forward reaction is favoured
 (c) The reaction halts
 (d) Backward reaction is favoured
58. Le-Chatelier principle is not applicable to
 [MH CET 2001]
 (a) $H_{2(g)} + I_{2(g)} \rightleftharpoons 2HI_{(g)}$
 (b) $Fe_{(s)} + S_{(s)} \rightleftharpoons FeS_{(s)}$
 (c) $N_{2(g)} + 3H_{2(g)} \rightleftharpoons 2NH_{3(g)}$
 (d) $N_{2(g)} + O_{2(g)} \rightleftharpoons 2NO_{(g)}$
59. For the reaction: $A + B + Q \rightleftharpoons C + D$, if the temperature is increased, then concentration of the products will
 [AFMC 2001]
 (a) Increase (b) Decrease
 (c) Remain same (d) Become Zero
60. $H_{2(g)} + I_{2(g)} \rightleftharpoons 2HI_{(g)}$
 In this reaction when pressure increases, the reaction direction [RPMT 2002]

- (a) Does not change (b) Forward
(c) Backward (d) Decrease
61. The rate of reaction of which of the following is not affected by pressure [MP PMT 2002]
(a) $PCl_3 + Cl_2 \rightleftharpoons PCl_5$ (b) $N_2 + 3H_2 \rightleftharpoons 2NH_3$
(c) $N_2 + O_2 \rightleftharpoons 2NO$ (d) $2SO_2 + O_2 \rightleftharpoons 2SO_3$
62. In the equilibrium $N_2 + 3H_2 \rightleftharpoons 2NH_3$, $\Delta H = -92 \text{ kJ}$, the formation of ammonia is favoured by [MP PET 2000, 02]
(a) Increasing the pressure
(b) Increasing the temperature
(c) Decreasing the pressure
(d) Adding ammonia
63. The reaction $2SO_2 + O_2 \rightleftharpoons 2SO_3$; $\Delta H = -ve$ is favoured by [CPMT 2002; Pb. PMT 2001]
(a) Low temperature, low pressure
(b) Low temperature, high pressure
(c) High temperature, high pressure
(d) High temperature, low pressure
64. Which of the following will favour the reverse reaction in a chemical equilibrium [Kerala (Med.) 2002]
(a) Increasing the concentration of the reactants
(b) Removal of at least one of the products at regular intervals
(c) Increasing the concentration of one or more of the products
(d) Increasing the pressure
(e) None of these
65. Under what conditions of temperature and pressure the formation of atomic hydrogen from molecular hydrogen will be favoured most [UPSEAT 2000, 01, 02]
(a) High temperature and high pressure
(b) Low temperature and low pressure
(c) High temperature and low pressure
(d) Low temperature and high pressure
66. The formation of nitric oxide by contact process $N_2 + O_2 \rightleftharpoons 2NO$. $\Delta H = 43.200 \text{ kcal}$ is favoured by [AMU 2002]
(a) Low temperature and low pressure
(b) Low temperature and high pressure
(c) High temperature and high pressure
(d) High temperature and excess reactants concentration
67. The chemical reaction: $BaO_{2(s)} \rightleftharpoons BaO_{(s)} + O_{2(g)}$. $\Delta H = +ve$. In equilibrium condition, pressure of O_2 depends upon [CBSE PMT 2002]
(a) Increase mass of BaO
(b) Increase mass of BaO_2
(c) Increase in temperature
(d) Increase mass of BaO_2 and BaO both
68. The yield of product in the reaction $A_{2(g)} + 2B_{(g)} \rightleftharpoons C_{(g)} + Q_{(g)}$ would be high at [UPSEAT 2002]
(a) High temperature and high pressure
(b) High temperature and low pressure
(c) Low temperature and high pressure
(d) Low temperature and low pressure
69. Which reaction is not effected by change in pressure [UPSEAT 2003]
(a) $H_2 + I_2 \rightleftharpoons 2HI$ (b) $2C + O_2 \rightleftharpoons 2CO$
(c) $N_2 + 3H_2 \rightleftharpoons 2NH_3$ (d) $PCl_5 \rightleftharpoons PCl_3 + Cl_2$
70. The gaseous reaction $A + B \rightleftharpoons 2C + D + Q$ is most favoured at [Karnataka CET 2003]
(a) Low temperature and high pressure
(b) High temperature and high pressure
(c) High temperature and low pressure
(d) Low temperature and low pressure
71. For a reaction if $K_p > K_c$, the forward reaction is favoured by [RPET 2003]
(a) Low pressure (b) High pressure
(c) High temperature (d) Low temperature
72. $A_{2(g)} + B_{2(g)} \rightleftharpoons 2AB_{(g)}$; $\Delta H = +ve$ [BHU 2003]
(a) Unaffected by pressure
(b) It occurs at 1000 pressure
(c) It occurs at high temperature
(d) It occurs at high pressure and high temperature
73. Consider the reaction equilibrium, $2SO_{2(g)} + O_{2(g)} \rightleftharpoons 2SO_{3(g)}$; $\Delta H^\circ = -198 \text{ kJ}$. On the basis of Le-Chatelier's principle, the condition favourable for the forward reaction is
(a) Lowering of temperature as well as pressure
(b) Increasing temperature as well as pressure
(c) Lowering the temperature and increasing the pressure
(d) Any value of temperature and pressure

Critical Thinking

Objective Questions

1. If dissociation for reaction, $PCl_5 \rightleftharpoons PCl_3 + Cl_2$ is 20% at 1 atm. pressure. Calculate K_c [Kerala (Med.) 2003]
(a) 0.04 (b) 0.05
(c) 0.07 (d) 0.06
2. Ammonia under a pressure of 15 atm at $27^\circ C$ is heated to $347^\circ C$ in a closed vessel in the presence of a catalyst. Under the conditions, NH_3 is partially decomposed according to the equation,
 $2NH_3 \rightleftharpoons N_2 + 3H_2$. The vessel is such that the volume remains effectively constant where as pressure increases to 50 atm. Calculate the percentage of NH_3 actually decomposed. [IIT 1981; MNR 1991; UPSEAT 2001]
(a) 65% (b) 61.3%
(c) 62.5% (d) 64%
3. K_c for the following reaction at 700 K is 1.3×10^{-3} atm. The K_c at same temperature for the reaction $2SO_2 + O_2 \rightleftharpoons 2SO_3$ will be [AIIMS 2001]
(a) 1.1×10^{-2} (b) 3.1×10^{-2}
(c) 5.2×10^{-2} (d) 7.4×10^{-2}
4. For the reaction $2NO_{2(g)} \rightleftharpoons 2NO_{(g)} + O_{2(g)}$
 $K_c = 1.8 \times 10^{-6}$ at $185^\circ C$. At $185^\circ C$, the value of K_c for the reaction $NO_{(g)} + \frac{1}{2}O_{2(g)} \rightleftharpoons NO_{2(g)}$ is [UPSEAT 2000]
(a) 0.9×10^6 (b) 7.5×10^2
(c) 1.95×10^{-3} (d) 1.95×10^3

5. $2SO_3 \rightleftharpoons 2SO_2 + O_2$. If $K_c = 100$, $\alpha = 1$, half of the reaction is completed, the concentration of SO_3 and SO_2 are equal, the concentration of O_2 is [CPMT 1996]

- (a) $0.001M$ (b) $\frac{1}{2}SO_2$
(c) 2 times of SO_2 (d) Data incomplete

6. At 700 K, the equilibrium constant K_p for the reaction $2SO_{3(g)} \rightleftharpoons 2SO_{2(g)} + O_{2(g)}$ is 1.80×10^{-3} and K_p is 14, ($R = 8.314 \text{ J/K mol}$). The numerical value in moles per litre of K_c for this reaction at the same temperature will be [AFMC 2001]

- (a) $3.09 \times 10^{-7} \text{ mol-litre}$ (b) $5.07 \times 10^{-8} \text{ mol-litre}$
(c) $8.18 \times 10^{-9} \text{ mol-litre}$ (d) $9.24 \times 10^{-10} \text{ mol-litre}$

7. 0.1 mole of $N_2O_{4(g)}$ was sealed in a tube under one atmospheric conditions at $25^\circ C$. Calculate the number of moles of $NO_{2(g)}$ present, if the equilibrium $N_2O_{4(g)} \rightleftharpoons 2NO_{2(g)}$ ($K_p = 0.14$) is reached after some time [UPSEAT 2001]

- (a) 1.8×10^2 (b) 2.8×10^2
(c) 0.034 (d) 2.8×10^{-2}

8. The partial pressures of CH_3OH , CO and H_2 in the equilibrium mixture for the reaction

at $427^\circ C$ are 2.0, 1.0 and 0.1 atm respectively. The value of K_p for the decomposition of CH_3OH to CO and H_2 is [Roorkee 1999]

- (a) $1 \times 10^2 \text{ atm}$ (b) $2 \times 10^2 \text{ atm}^{-1}$
(c) 50 atm^2 (d) $5 \times 10^{-3} \text{ atm}^2$

9. One mole of a compound AB reacts with one mole of a compound CD according to the equation

When equilibrium had been established it was found that $\frac{3}{4}$ mole each of reactant AB and CD had been converted to AD and CB . There is no change in volume. The equilibrium constant for the reaction is [Kerala (Med.) 2003]

- (a) $\frac{9}{16}$ (b) $\frac{1}{9}$
(c) $\frac{16}{9}$ (d) 9

10. For the reaction $CO(g) + H_2O(g) \rightleftharpoons CO_2(g) + H_2(g)$ at a given temperature, the equilibrium amount of $CO_2(g)$ can be increased by [IIT 1998]

- (a) Adding a suitable catalyst
(b) Adding an inert gas
(c) Decreasing the volume of the container

- (d) Increasing the amount $CO(g)$

11. At constant temperature, the equilibrium constant (K) for the decomposition reaction $N_2O_4 \rightleftharpoons 2NO_2$ is expressed by

$$K_p = \frac{(4x^2P)}{(1-x^2)},$$

where P = pressure, x = extent of decomposition. Which one of the following statements is true [IIT Screening 2001]

- (a) K increases with increase of P
(b) K increases with increase of x
(c) K increases with decrease of x
(d) K remains constant with change in P and x

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : The equilibrium constant is fixed and is the characteristic of any given chemical reaction at a specified temperature.

Reason : The composition of the final equilibrium mixture at a particular temperature depends upon the starting amount of reactants. [AIIMS 2000]

2. Assertion : $K_p = K_c$ for all reaction.

Reason : At constant temperature, the pressure of the gas is proportional to its concentration.

3. Assertion : The equilibrium constant for the reaction $CaSO_4 \cdot 5H_2O(s) \rightleftharpoons CaSO_4 \cdot 3H_2O(s) + 2H_2O(g)$

$$\text{is } K_c = \frac{[CaSO_4 \cdot 3H_2O][H_2O]^2}{[CaSO_4 \cdot 5H_2O]}$$

Reason : Equilibrium constant is the ratio of the product of molar concentration of the substances produced to the product of the molar concentrations of reactants with each concentrations term raised to the power equal to the respective stoichiometric constant.

4. Assertion : On cooling a freezing mixture, colour of the mixture turns to pink from deep blue for a reaction. $Co(H_2O)_6^{2+}_{(aq)} + 4Cl^{-}_{(aq)} \rightleftharpoons$

Reason : Reaction is endothermic so on cooling, the reaction moves to backward direction.

5. Assertion : If Q_c (reaction quotient) $< K_c$ (equilibrium constant) reaction moves in direction of reactants.

Reason : Reaction quotient is defined in the same way as equilibrium constant at any stage of the reaction.

6. Assertion : $NaCl$ solution can be purified by passage of hydrogen chloride through brine.

- Reason : This type of purification is based on Le-Chatelier's principle.
7. Assertion : According to Le-Chatelier's principle addition of heat to an equilibrium solid $\rightleftharpoons$ liquid results in decrease in the amount of solid.
- Reason : Reaction is endothermic, so on heating forward reaction is favoured.
8. Assertion : Equilibrium constant has meaning only when the corresponding balanced chemical equation is given.
- Reason : Its value changes for the new equation obtained by multiplying or dividing the original equation by a number.
9. Assertion : Equilibrium constant for the reverse reaction is the inverse of the equilibrium constant for the reaction in the forward direction.
- Reason : Equilibrium constant depends upon the way in which the reaction is written.
10. Assertion : The value of K gives us a relative idea about the extent to which a reaction proceeds.
- Reason : The value of K is independent of the stoichiometry of reactants and products at the point of equilibrium.
11. Assertion : Catalyst affects the final state of the equilibrium.
- Reason : It enables the system to attain a new equilibrium state by complexing with the reagents.
12. Assertion : For the reaction,

$$2NH_3(g) \rightleftharpoons N_2(g) + 3H_2(g),$$
the unit of K_p will be atm.
- Reason : Unit of K_p is $(atm)^{\Delta n}$.
13. Assertion : Effect of temperature of K_c or K_p depends on enthalpy change.
- Reason : Increase in temperature shifts the equilibrium in exothermic direction and decrease in temperature shifts the equilibrium position in endothermic direction.
14. Assertion : For a gaseous reaction,

$$xA + yB \rightleftharpoons lC + mD, K_p = K_c.$$
- Reason : Concentration of gaseous reactant is taken to be unity.
15. Assertion : Ice $\rightleftharpoons$ water, if pressure is applied water will evaporate.
- Reason : Increase of pressure pushes the equilibrium towards the side in which number of gaseous mole decreases.
16. Assertion : $SO_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons SO_3(g) + \text{heat}.$
- Reason : Forward reaction is favoured at high temperature and low pressure.
- Reason : Reaction is exothermic.
17. Assertion : For a reaction $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$ if the volume of vessel is reduced to half of its original volume, equilibrium constant will be doubled.
- Reason : According to Le-Chatelier principle, reaction shifts in a direction that tends to undo the effect of the stress.

AS Answers and Solutions

Reversible and Irreversible reaction

- (b) Reversible reaction always attains equilibrium which proceeds both sides and never go for completion.
- (c) In a reversible reaction some amount of the reactants remains unconverted into products.
- (d) In lime kiln CO_2 escaping regularly so reaction proceeds in forward direction.
- (b) The reaction is not reversible.

Equilibrium state

- (c) When rate of forward reaction is equal to the rate of backward reaction then equilibrium is supposed to be established.
- (b) Equilibrium can be achieved only in closed vessel.
- (c) When rate of forward reaction is equal to rate of backward reaction the reaction is said to be in equilibrium.
- (d) At equilibrium rate of forward reaction is equal to the rate of backward reaction.
- (c) According to Le-chatelier principle when concentration of reactant increases, the equilibrium shift in favour of forward reaction.
- (b) At equilibrium, the rate of forward & backward reaction become equal.

Law of mass action

- (b) According to law of mass-action, "at a given temperature, the rate of a reaction at a particular instant is proportional to the product of the active masses of the reactants at that instant raised to powers which are numerically equal to the numbers of their respective molecules in the stoichiometric equation describing the reaction".
- (d) $[HI] = \frac{64 \text{ gm}}{128 \times 2 \text{ litre}} = 0.25$
Active mass is the concentration in *moles/litre*.
- (a) As we increase the concentration of substance, then speed of the reaction increases.
- (c) Chemical reaction quantitatively depend on the reactant and product molecule.

Law of equilibrium and Equilibrium constant

- (d) Equilibrium constant for the reaction, $3A + 2B \rightleftharpoons C$ is
 $K = \frac{[C]}{[A]^3[B]^2}$.
 - (d) Suppose 1 mole of A and B each taken then 0.8 mole/litre of C and D each formed remaining concentration of A and B will be $(1 - 0.8) = 0.2$ mole/litre each.
 $K_c = \frac{[C][D]}{[A][B]} = \frac{0.8 \times 0.8}{0.2 \times 0.2} = 16.0$
 - (c)
- | | | | | |
|--------------------|----------------------------------|-------|---|---|
| | $A + B \rightleftharpoons C + D$ | | | |
| Initial conc. | 4 | 4 | 0 | 0 |
| After T time conc. | (4-2) | (4-2) | 2 | 2 |

$$\text{Equilibrium constant} = \frac{[C][D]}{[A][B]} = \frac{2 \times 2}{2 \times 2} = 1$$

- (a) $H_2 + I_2 \rightleftharpoons 2HI$; $[HI] = 0.80$, $[H_2] = 0.10$, $[I_2] = 0.10$
 $K_c = \frac{[HI]^2}{[H_2][I_2]} = \frac{0.80 \times 0.80}{0.10 \times 0.10} = 64$
 - (a) Those reaction which have more value of K proceeds towards completion.
 - (d) K_c is a characteristic constant for the given reaction.
 - (c) Equilibrium constant is independent of original concentration of reactant.
 - (a) K_p is constant and does not change with pressure.
 - (a) For reaction $A + 2B \rightleftharpoons C$
 $K = \frac{[C]}{[A][B]^2} = \frac{0.216}{0.06 \times 0.12 \times 0.12} = 250$.
 - (b) $A + 2B \rightleftharpoons C + 3D$
 $K = \frac{[pC][pD]^3}{[pA][pB]^2} = \frac{0.30 \times 0.50 \times 0.50 \times 0.50}{0.20 \times 0.10 \times 0.10} = 18.75$
 - (a) $PCl_5 \rightleftharpoons PCl_3 + Cl_2$
 $\frac{2 \times 60}{100} \quad \frac{2 \times 40}{100} \quad \frac{2 \times 40}{100}$
Volume of container = 2 litre.
 $K_c = \frac{\frac{2 \times 40}{100 \times 2} \times \frac{2 \times 40}{100 \times 2}}{\frac{2 \times 60}{100 \times 2}} = 0.266$.
 - (d) $\Delta n = 1$ for this change
So the equilibrium constant depends on the unit of concentration.
 - (d) Unit of $K_p = (\text{atm})^{\Delta n}$
Unit of $K_c = (\text{mole/litre})^{\Delta n}$
 $= [\text{mole/litre}]^0 = 0$
 - (c) $K = \frac{[NO_2]^2}{[N_2O_4]} = \frac{\left[2 \times \frac{10^{-3}}{2}\right]^2}{\left[\frac{.2}{2}\right]} = \frac{10^{-6}}{10^{-1}} = 10^{-5}$.
 - (b) For $A + B \rightleftharpoons C + D$
 $K = \frac{[C][D]}{[A][B]} = \frac{0.4 \times 1}{0.5 \times 0.8} = 1$.
 - (c)
- | | | | | |
|--------------------------|--|-----|-----|-----|
| | $A + B \rightleftharpoons C + D$ | | | |
| Initial | 1 | 1 | 0 | 0 |
| remaining at equilibrium | 0.4 | 0.4 | 0.6 | 0.6 |
| | $K = \frac{[C][D]}{[A][B]} = \frac{0.6 \times 0.6}{0.4 \times 0.4} = \frac{36}{16} = 2.25$ | | | |
- (a) $K = \frac{[NH_3]^2}{[N_2][H_2]^3}$
 - (d) $A + B \rightleftharpoons C + D$

$$K_c = \frac{[C][D]}{[A][B]} = \frac{2x \cdot 2x}{x \cdot x} = 4$$

$$\text{total mole at equilibrium} = (1-\alpha) + 2\alpha = 1 + \alpha$$

25. (b) $K = \frac{[C_2H_6]}{[C_2H_4][H_2]} = \frac{[\text{mole/litre}]}{[\text{mole/litre}][\text{mole/litre}]}$
 $= \text{litre/mole, or litre mole}^{-1}$

27. (c) $K_c = \frac{[PCl_3][Cl_2]}{[PCl_5]} = \frac{\frac{0.2}{10} \times \frac{0.2}{10}}{[0.1/10]} = 0.04$

28. (b) $K_c = \frac{[HI]^2}{[H_2][I_2]}$; $64 = \frac{x^2}{0.03 \times 0.03}$

$$x^2 = 64 \times 9 \times 10^{-4}$$

$$x = 8 \times 3 \times 10^{-2} = 0.24$$

x is the amount of HI at equilibrium amount of I_2 at equilibrium will be

$$0.30 - 0.24 = 0.06$$

29. (c) $K_c = \frac{K_f}{K_b}$

$$K_f = K_c \times K_b = 1.5 \times 7.5 \times 10^{-4} = 1.125 \times 10^{-3}$$

$$\text{Initial conc.} \quad 1 \quad 3 \quad 0$$

$$\text{at equilibrium } 1-0.81 \quad 3-2.43 \quad 1.62$$

$$0.19 \quad 0.57$$

$$\text{No. of moles of } N_2 = \frac{28}{28} = 1 \text{ mole}$$

$$\text{No. of moles of } H_2 = \frac{6}{2} = 3 \text{ mole}$$

$$\text{No. of moles of } NH_3 = \frac{27.54}{17} = 1.62 \text{ mole}$$

$$K_c = \frac{[NH_3]^2}{[N_2][H_2]^3} = \frac{[1.62]^2}{[0.19][0.57]^3} = 75$$

31. (b) $K_c = \frac{[YX_2]}{[X]^2[Y]} = \frac{2}{4 \times 4 \times 2} = \frac{1}{16} = 0.0625$

$$\text{Total pressure} = 0.5 + 2x = 0.84$$

$$\text{i.e., } x = 0.17$$

$$K_p = P_{NH_3} \cdot P_{H_2S} = (0.67)(0.17) = 0.1139$$

$$\text{Initial conc.} \quad 2 \quad 3 \quad 2$$

$$\text{at eqm.} \quad 2.5 \quad 4 \quad 1$$

$$\text{Molar} \quad \frac{2.5}{2} = 1.25 \quad \frac{4}{2} = 2 \quad \frac{1}{2} = 0.5$$

$$K = \frac{[0.5]^2}{[1.25][2]^2} = 0.05$$

$$[CO] = \frac{0.1}{0.5}, [Cl_2] = \frac{0.1}{0.5}, [COCl_2] = \frac{0.2}{0.5}$$

$$= \frac{[COCl_2]}{[CO][Cl_2]} = 0 \cdot \frac{0.2}{\frac{0.1}{0.5} \times \frac{0.1}{0.5}} = \frac{2}{5} \times 25 = 10$$

$$\text{at equilibrium} \quad a \quad a \quad 2a \quad 2a$$

$$K = \frac{2a \times 2a}{a \times a} = 4$$

$$\text{Initial conc.} \quad 4.5 \quad 4.5 \quad 0$$

$$x \quad x \quad 2x$$

$$\text{from question } 2x = 3$$

$$x = \frac{3}{2} = 1.5$$

$$\text{So conc. at eqm. } 4.5 - 1.5 \text{ of } H_2$$

$$= 4.5 - 1.5 \text{ of } I_2 \text{ and } 3 \text{ of } HI$$

$$K = \frac{[HI]^2}{[I_2][H_2]} = \frac{3 \times 3}{3 \times 3} = 1$$

37. (c) $K = \frac{[H_2]^2[S_2]}{[H_2S]^2} = \frac{[0.10]^2[0.4]}{[0.5]^2} = 0.016$

38. (a) $K_p = \frac{[P_{CO}]^2[P_{O_2}]}{[P_{CO_2}]^2} = \frac{[0.4]^2 \times [0.2]}{[0.6]^2} = 0.0888$

39. (d) $K_f = 1.1 \times 10^{-2}$; $K_b = 1.5 \times 10^{-3}$

$$K_c = \frac{K_f}{K_b} = \frac{1.1 \times 10^{-2}}{1.5 \times 10^{-3}} = 7.33$$

40. (a) $2HI \rightleftharpoons H_2 + I_2$

$$\begin{array}{ccc}
 100 & 0 & 0 \\
 50 & 25 & 25
 \end{array}$$

$$\frac{[H_2][I_2]}{[HI]^2} = \frac{25 \times 25}{50 \times 50} = 0.25$$

$$(3-0.75) \quad (1-0.75) \quad 1.5$$

$$K = \frac{[C]^2}{[A][B]} = \frac{(1.5)^2}{2.25 \times 0.25} = \frac{2.25}{2.25 \times 0.25} = 4.0$$

$$K_2 = \left[\frac{1}{K_1} \right]^{1/6}; K_2 = \left[\frac{1}{6 \times 10^{22}} \right]^{1/6}$$

$$K_2 = 1.6 \times 10^{-4} M$$

43. (b) $K_c = \frac{[HI]^2}{[H_2][I_2]} = \frac{[0.7]^2}{[0.1][0.1]} = 49$

44. (c) $K_c = \frac{[NH_3]^2}{[N_2][H_2]^3}$

$$2.37 \times 10^{-3} = \frac{x^2}{[2][3]^3} = x^2 = 0.12798$$

$$x = 0.358 \text{ M}$$

$$K_c = \frac{[C]^2}{[A][B]} = \frac{[0.6]^2}{[0.2][0.2]} = 9$$

$$K_c = \frac{[HI]^2}{[H_2][I_2]} = \frac{10 \times 10}{10 \times 0.2} = 50$$

$$K = \frac{K_1}{K_2} = \frac{2}{1} = 2.$$

$$N_2 = 30 - 5 = 25 \text{ litre}$$

$$H_2 = 30 - 3 \times 5 = 15 \text{ litre}$$

$$NH_3 = 2 \times 5 = 10 \text{ litre}$$

$$\therefore \text{at equil. moles of HI} = 3.2 - 0.704 = 2.496$$

According to eq. (i) 2 mole of ammonia are present & to produce 2 mole of NH_3 , we need 1 mole of N_2 and 3 mole of H_2 hence $2-1=1$ mole of N_2 and $4-3=1$ mole of H_2 are present at equilibrium in vessel.

$$\text{For } 1dm^3 \quad R = k[SO_2]^2[O_2]$$

$$R = K \left[\frac{1}{T} \right]^2 \left[\frac{1}{1} \right] = 1$$

$$\text{For } 2dm^3 \quad R = K \left[\frac{1}{2} \right]^2 \left[\frac{1}{2} \right] = \frac{1}{8}$$

So, the ratio is 8 : 1

So, $K = 0.25$

$$Kp_2 = \frac{[pCO]^2}{[pCO_2]}; pCO = \sqrt{[Kp_1 \times Kp_2]}$$

$$pCO = \sqrt{[8 \times 10^{-2} \times 2]} = \sqrt{16 \times 10^{-2}} = 4 \times 10^{-1} = 0.4$$

$$K_c = \frac{[NO]^2}{[N_2][O_2]} = 4 \times 10^{-4}$$

$$K'_c = \frac{[N_2]^{1/2}[O_2]^{1/2}}{[NO]} = \frac{1}{\sqrt{K_c}} = \frac{1}{\sqrt{4 \times 10^{-4}}}$$

$$= \frac{1}{2 \times 10^{-2}} = \frac{100}{2} = 50$$

$$K_c = \frac{[P_4O_{10}(s)]}{[P_4(s)][O_2(g)]^5}$$

We know that concentration of a solid component is always

$$\text{taken as unity } K_c = \frac{1}{[O_2]^5}$$

$$K_c = \frac{[HI]^2}{[H_2][I_2]} = \frac{\left[\frac{0.5}{2} \right]^2}{\left[\frac{0.15}{2} \right] \left[\frac{0.15}{2} \right]} = \frac{0.5 \times 0.5}{0.15 \times 0.15} = 11.11$$

$$\alpha = \frac{D-d}{(n-1)d} \text{ where } D \text{ is the density (initial)}$$

$$D = \frac{\text{mol. wt}}{2} = \frac{78}{2} = 39$$

n = no. of product = 3 d = final density

$$\alpha = \frac{39-13}{(3-1)13} = 1, \text{ so } \alpha = 1$$

50% Dissociation of N_2 take place so,

$$\text{At equilibrium } \frac{2 \times 50}{100} = 1; \text{ value of } x = 1$$

$$K_c = \frac{[2]^2}{[1][3]^3} = \frac{4}{27} \text{ so, } K_c = \frac{4}{27}$$

69. (c) The equilibrium constant does not change when concentration of reactant is changed as the concentration of product also get changed accordingly.

70. (d) We know that $PV = nRT$

P become $\frac{1}{2}P$ & V become $2V$ so,

$$\frac{1}{2}P \times 2V = PV = nRT$$

So there is no effect in equation.

71. (abcd) All options are true for that equilibrium.

Initial conc.	1	1	0	0
At equili	(1-x)	(1-x)	x	x

$$K_p = \frac{P_{CO} \cdot P_{H_2O}}{P_{H_2} \cdot P_{CO_2}} = \frac{x \cdot x}{(1-x)(1-x)} = \frac{x^2}{(1-x)^2}$$

K_p & K_c Relationship and Characteristics of K

1. (a) $n_p = n_r$ then $K_p = K_c$

where n_p = no. of moles of product

n_r = no. of moles of reactant.

2. (d) $K_1 = \frac{[NO_2]}{[NO][O_2]^{1/2}}; K_2 = \frac{[NO]^2[O_2]}{[NO_2]^2}$
 $\Rightarrow \frac{[NO_2]^2}{[NO]^2[O_2]} = \frac{1}{K_2} \Rightarrow \frac{[NO_2]}{[NO][O_2]^{1/2}} = \frac{1}{\sqrt{K_2}}$
 $\Rightarrow K_1 = \frac{1}{\sqrt{K_2}}; K_2 = \frac{1}{K_1^2}$

3. (a) $K_p = K_c(RT)^{\Delta n} = 26(0.0821 \times 523)^{-1} = 0.61$.
 $\Delta n_g = 1 - 2 = -1$

5. (d) In presence of little H_2SO_4 (as catalyst) about 2/3 mole of each of CH_3COOH and C_2H_5OH react to form 2/3 mole of the product at equilibrium.

6. (d) K_1 for reaction $2HI \rightleftharpoons H_2 + I_2$ is 0.25 K_2 for reaction $H_2 + I_2 \rightleftharpoons 2HI$ will be $K_2 = \frac{1}{K_1} = \frac{1}{0.25} = 4$

Because IInd reaction is reverse of Ist.

9. (a) For the reaction,

$$K_c = P_{CO_2} \text{ and } K_p = [CO_2]$$

($\because [CaCO_3] = 1$ and $[CaO] = 1$ for solids)

According to Arrhenius equation we have

$$K = Ae^{-\Delta H^\circ_r / RT}$$

Taking logarithm, we have

$$\log K_p = \log A - \frac{\Delta H^\circ_r}{RT(2.303)}$$

This is an equation of straight line. When $\log K_c$ is plotted against $1/T$, we get a straight line.

The intercept of the line on the $1/T$ axis is $\log A$, slope = $-\Delta H^\circ_r / 2.303 R$

Knowing the value of slope from the plot and universal gas constant R , ΔH°_r can be calculated.

(Equation of straight line : $Y = mx + C$. Here,

$$\log K_p = -\frac{\Delta H^\circ_r}{2.303R} \left(\frac{1}{T} \right) + \log A$$

Y m x C

10. (b) $K_p = K_c(RT)^{\Delta n}$; When $\Delta n = 2 - (2 + 1) = -1$, i.e. negative, $K_p < K_c$.

11. (c) $K_1 = \frac{[SO_3]}{[SO_2][O_2]^{1/2}}$ and $K_2 = \frac{[SO_2]^2[O_2]}{[SO_3]^2}$; $K_2 = \frac{1}{K_1^2}$.

13. (c) Reaction is reversed. Hence

$$K = \frac{1}{(2.4 \times 10^{-3})} = 4.2 \times 10^2$$

14. (c) $K_p = \frac{[P_{CO}]^2}{[P_{CO_2}]} = \frac{4 \times 4}{2} = 8$.

15. (d) K_{c1} for $H_2 + I_2 \rightleftharpoons 2HI$ is 50

K_{c2} for $2HI \rightleftharpoons H_2 + I_2$

$$K_{c2} = \frac{1}{K_{c1}} = \frac{1}{50} = 0.02$$

16. (c) $K_p = K_c(RT)^{\Delta n}$

So for this reaction K_p is less than K_c .

17. (c) $K_p = K_c(RT)^{\Delta n}$; $\Delta n = 2 - 2 = 0$

18. (c) For the reaction $H_2 + I_2 \rightleftharpoons 2HI$

$$\Delta n = 0$$

So $K_p = K_c \therefore 50.0$

19. (d) For reaction $2SO_3 \rightleftharpoons O_2 + 2SO_2$

Δn is +ve so K_p is more than K_c .

$$\text{By } K_p = K_c(RT)^{\Delta n}$$

20. (c) $\Delta n = 2 - 1 = 1$

$$K_p = K_c(RT)$$

21. (c) For this reaction there is no change in equilibrium constant by change of volume.

22. (c) If $\Delta n = 0$ then $K_p = K_c$

23. (a) $k_p = k_c(RT)^{\Delta n}$

$$\Delta n = 3 - 2 = 1; \quad k_p > k_c.$$

24. (d) Equilibrium constant depends upon temperature.

$$K_c = K_c(RT)^{-\Delta n}$$

$$K_c = 3 \times 10^{-4} (0.0821 \times 700) = 172.41 \times 10^{-4}$$

$$= 1.72 \times 10^{-2}$$

27. (b) $K' = K^n$; Hence $n = \frac{1}{2}$

$$\therefore K' = K^{1/2} = \sqrt{K}$$

$$K = 1.6 \times 10^{-12}$$

Reaction (ii) is half of reaction (i)

$$K = \frac{[NO]^2[O_2]}{[NO_2]^2}$$
(i)

$$K' = \frac{[NO_2]}{[NO][O_2]^{1/2}}$$
(ii)

On multiplying (i) and (ii)

$$K \times K' = \frac{[NO]^2[O_2]}{[NO_2]^2} \times \frac{[NO_2]}{[NO][O_2]^{1/2}} = \frac{[NO][O_2]^{1/2}}{[NO_2]} = \frac{1}{K'}$$

$$K \times K' = \frac{1}{K'}; \quad K = \frac{1}{K'^2}; \quad K' = \frac{1}{\sqrt{K}}.$$

30. (b) $K_p = K_c(RT)^{\Delta n}$; $\Delta n = 1$

So K_c will be less than K_p .

$$K_1 \times K_2 = \frac{[NH_3]^2}{[N_2][H_2]^3} \times \frac{[N_2]^{1/2}[H_2]^{3/2}}{[NH_3]}$$

$$K_1 \times K_2 = \frac{1}{K_2}; \quad K_2 = \frac{1}{\sqrt{K_1}}$$

34. (a) $K_p = K_c(RT)^{\Delta n}$; $\Delta n = 2 - 4 = -2$

$$K_p = 6 \times 10^{-2} \times (0.0812 \times 773)^{-2}$$

$$K_p = \frac{6 \times 10^{-2}}{(0.0812 \times 773)^2} = 1.5 \times 10^{-5}.$$

35. (b) $2.303 \log \frac{K_2}{K_1} = \frac{\Delta H}{R} \left[\frac{1}{T_1} - \frac{1}{T_2} \right]$

$$\Delta H = +ve \text{ for the reaction}$$

$$\Delta n = 2 - 4 = -2$$

$$K_p = K_c[RT]^{\Delta n}; \quad K_p = K_c[RT]^{-2}$$

$$K_c = \frac{K_p}{[RT]^{-2}} = \frac{1.44 \times 10^{-5}}{[0.082 \times 773]^{-2}}$$

37. (d) Catalyst does not affect equilibrium constant.

38. (d) K for dissociation of HI ?

$$K_a = 50, \quad K_b = \frac{1}{50} = 0.02$$

$$\Delta n = -1; \quad \therefore K_c > K_p$$

$$K_p = P_{CO_2}$$

Solid molecule does not have partial pressure so in calculation of K_p only P_{CO_2} is applicable.

$$K_c = \frac{[N_2]^{1/2}[H_2]^{3/2}}{[NH_3]} \text{ and } \frac{1}{2}N_2 + \frac{3}{2}H_2 \rightleftharpoons NH_3$$

$$K_c = \frac{[NH_3]}{[N_2]^{1/2}[H_2]^{3/2}}$$

$$\text{So for dissociation} = \frac{1}{K_c}$$

42. (b) Given $x = \frac{22}{100}$ and $a = 3.2$

$$\therefore [HI] \text{ at equilibrium} = 3.2 \left[1 - \frac{22}{100} \right] = 2.496$$

43. (b) K_c does not depend upon initial concentration of reactants or product.

44. (d) K_p and K_c are characteristic for a given reaction if $\Delta n = 0$ then there is no change.

45. (c) $K_{c1} = \frac{[NO]^2[O_2]}{[NO_2]^2} = 1.8 \times 10^{-6} \Rightarrow K_{c2} = \frac{[NO_2]}{[NO][O_2]^{1/2}}$

$$K_{c1} = \frac{1}{K_{c2}^2}; \quad 1.8 \times 10^{-6} = \frac{1}{K_{c2}^2} \Rightarrow K_{c2} = 7.5 \times 10^2$$

$$K_3 = \frac{[HBr]^2 \times [S_2]^{1/2}}{[Br_2] \times [H_2S]}; \quad \frac{K_2}{K_1} = K_3$$

47. (b) $K_p = \frac{p^2}{4}$; $0.11 = \frac{p^2}{4} \Rightarrow p^2 = 0.44$

or $p = \sqrt{0.44} = 0.66444 \approx 0.665 \text{ atm}$

$\Delta n = 12 - 12 = 0$

51. (a) In this reaction gaseous molecule count

$K_p = P_{CO_2}$

53. (a) $K_p = K_c[RT]^{\Delta n}$; $\Delta n = -1$, $K_c = 26$

$R = 0.0812$, $T = 250 + 273 = 523K$

$K_p = 26[0.0812 \times 523]^{-1} = 0.605 \approx 0.61$

$K_c = \frac{[A_2][B_2]}{[AB]^2}$

For reaction $AB \rightleftharpoons \frac{1}{2}A_2 + \frac{1}{2}B_2$

$K_c' = \frac{[A_2]^{1/2}[B_2]^{1/2}}{[AB]}$; $K_c' = \sqrt{K_c} = \sqrt{49} = 7$.

56. (a) For this reaction Δn is negative & ΔH is positive so it take forward by decrease in temperature.

57. (b) Chemical equilibrium of reversible reaction is not influenced by catalyst. It is affected by pressure, temperature & concentration of reactant.

58. (c) ΔH is positive so it will shift toward the product by increase in temperature.

$\Delta n = 1 - 2 = -1$

$K_p = K_c[RT]^{\Delta n}$; $\therefore \frac{K_p}{K_c} = [RT]^{-1} = \frac{1}{RT}$

60. (c) ΔH is positive so reaction move forward by increase in temperature & value of $\Delta n = 3 - 2 = +1$ is positive so it forward with decrease in pressure.

For this reaction, $\Delta n_g = 3 - 2 = 1$

$\therefore K_p = K_c[RT]^1$ or $\frac{K_p}{K_c} = RT$ or $K_c = \frac{K_p}{RT}$

62. (a) According to Le-Chatelier principle exothermic reaction is forwarded by low temperature, in forward direction number of moles is less, hence pressure is high.

63. (d) In this reaction ΔH is negative so reaction move forward by decrease in temperature while value of $\Delta n = 2 - 3 = -1$ i.e., negative so the reaction move forward by increase in pressure.

For this reaction $\Delta n = 2 - 1 = 1$

Value of Δn is positive so the dissociation of PCl_5 take forward by decrease in pressure & by increase in pressure the dissociation of PCl_5 decrease.

For equation number (i)

$K_1 = \frac{[NO]^2}{[N_2][O_2]}$ (iii)

For equation number (ii)

$K_2 = \frac{[NO]}{[N_2]^{1/2}[O_2]^{1/2}}$ (iv)

From equation (iii) & (iv) it is clear that

$K_2 = (K_1)^{1/2} = \sqrt{K_1}$; Hence, $K_2 = \sqrt{K_1}$

$\Delta n_g = 1 - 1.5 = -0.5$

$K_p = K_c[RT]^{-1/2}$ $\therefore \frac{K_p}{K_c} = [RT]^{-1/2}$

$K_c = 0.1$, $K_p = K_c(RT)^{\Delta n}$

$\Delta n = 0$, $K_p = K_c = 0.1$

68. (c)

$K_c = \frac{[C]^4}{[A][B]^3} = \frac{4x \cdot 4x \cdot 4x \cdot 4x}{(a - x)(b - 3x)}$

Given $a = b$, $a - x = 4x \Rightarrow a = 5x = b$

$K_c = \frac{4x \cdot 4x \cdot 4x \cdot 4x}{(5x - x)(5x - 3x)} = \frac{4x \cdot 4x \cdot 4x \cdot 4x}{4x \cdot 2x \cdot 2x} = 8$.

69. (b) Equilibrium pressure = 3atm

$K_p = p_{NH_3}^2 \cdot p_{CO_2} = 3^2 \cdot 3 = 27$

Activation energy, Standard free energy and Degree of dissociation and Vapour density

1. (b) $\frac{\text{Normal molecular weight}}{\text{experimental molecular wt.}} = 1 + \alpha$

$\therefore \alpha = 1$ $\therefore$ Experimental Molecular wt = $\frac{\text{nor.mol.wt.}}{2}$

2. (b) If $\Delta G^\circ = 0$

$\Delta G^\circ = -2.303 RT \log K_p$

$\log K_p = 0$ ($\therefore \log 1 = 0$)

$K_p = 1$.

5. (d) $\Delta G^\circ = -2.303 \times 8.314 \times 10^{-3} \times 298 \log K_p$

$$1.7 = -2.303 \times 8.314 \times 10^{-3} \times 298 \times \log K_p$$

$$K_p = 0.5$$

6. (a) Equilibrium shifts backward by Le-chatelier's principle.
 7. (c) Decreases the activation energy of both forward and backward reaction.
 8. (d) Equilibrium constant changes with temperature, pressure and the concentration of either reactant or product.
 9. (a) As we know that, $\Delta G^\circ = -2.303RT \log K_p$

$$\text{Therefore, } \Delta G^\circ = -2.303 \times (8.314) \times (298)$$

$$(\log 2.47 \times 10^{-29})$$

$$\Delta G^\circ = 16,3000 \text{ J mol}^{-1} = 163 \text{ KJ mol}^{-1}$$

Le-Chatelier principle and It's application

2. (a) $N_2 + O_2 \rightleftharpoons 2NO$; Q cal
 The above reaction is endothermic so for higher production of NO , and the temperature should be high.
4. (c) At low pressure, reaction proceeds where volume is increasing. This is the favourable condition for the reaction.
 $PCl_5 \rightleftharpoons PCl_3 + Cl_2$.
6. (c) Reaction is exothermic and volume is decreasing from left to right so for higher production of SO_3 there should be low temperature and high pressure.
7. (a) $\text{Ice} \rightleftharpoons \text{Water}$
 more volume less volume
 On increasing pressure, equilibrium shifts forward.
8. (c) Exothermic reaction is favoured by low temperature to proceed in forward direction.
9. (a) Effect of catalyst is that it attains equilibrium quickly by providing a new reaction path of low activation energy. It does not alter the state of equilibrium.
11. (a) On increasing temperature equilibrium will shift in forward direction due to decrease in intermolecular forces of solid.
12. (c) Both Δn and ΔH are negative. Hence, high pressure and low temperature will forward reaction.
13. (b) Exothermic reaction, favoured by low temperature.
14. (c) $\Delta n = 0$, No effect of pressure.
15. (b) The reaction is endothermic in reverse direction and hence increase in temperature will favour reverse reaction.
16. (c) A reaction is in equilibrium it will shift in reverse or backward direction when we increase the concentration of one or more product (from Le chatelier's principle).
17. (a) According to Le chatelier's principle.
18. (c) The reaction takes place with a reduction in number of moles (volume) and is exothermic. So high pressure and low temperature with favour the reaction in forward direction
19. (b) At equilibrium, the addition of $(CN)^-$ would decrease the (H^+) ion concentration to produce more and more H^+CN^- nullified the increase of CN^-_{aq} .
20. (b) $H_2X_2 + \text{heat} \rightleftharpoons 2HX$
 Reaction is endothermic and volume increasing in forward direction so according to Le chatelier's principle for formation of HX , Temperature of the reaction should be high and pressure should be low.
21. (b) According to Le chatelier's principle.
22. (d) In reaction $CO + 3H_2 \rightleftharpoons CH_4 + H_2O$
 Volume is decreasing in forward direction so on increasing pressure the yield of product will increase.
25. (a) In endothermic reaction rate of forward reaction can be increased by raising temperature.
26. (a) Being endothermic, the forward reaction is favoured by high temperature.
27. (c) According to Le chatelier's principle.
28. (b) On adding more PCl_5 , equilibrium shifts forward.
29. (a) According to Le chatelier's principle.
30. (b) Increase in pressure causes the equilibrium to shift in that direction in which no. of moles (volume) is less.
32. (b,c) According to Le-chatelier's principle.
37. (d) By increasing the amount of F_2 in the reaction the amount of ClF_3 increases.
39. (b) According to Le chatelier's principle when we increase pressure reaction proceeds in that direction where volume is decreasing.
40. (a) Factors affecting equilibrium are pressure, temperature and concentration of product or reactant.
42. (b) According to Le chatelier's principle.
43. (d) Increase in volume, i.e., decrease in pressure shifts the equilibrium in the direction in which number of moles increases (Δn positive)
46. (d) At constant volume. There is no change in concentration (closed container).
47. (c) $H_2O(g) \rightleftharpoons H_{2(g)} + \frac{1}{2} O_{2(g)}$
 In this reaction volume is increasing in the forward reaction. So on increasing temperature reaction will proceed in forward direction.
48. (b) When temperature increases precipitation of sodium sulphate takes place. Because reaction is exothermic so reverse reaction will take place.
49. (a) For high yield of ammonia low temperature, high pressure and high concentration of the reactant molecule.
53. (c) Since $\Delta n = 0$.
54. (a) The rate of backward reaction favoured by increase of pressure in the reaction as Δn is positive
 $PCl_5 \rightleftharpoons PCl_3 + Cl_2$
55. (a) $H_{2(g)} + I_{2(g)} \rightleftharpoons 2HI$
 $\Delta n = 0$; $\therefore K_c = K_p$
56. (c) Solid + liquid $\rightleftharpoons$ Solution $\Delta H = +ve$
 Increase in temperature favours forward reaction.
57. (a) Addition of an inert gas of constant volume condition to an equilibrium has no effect.
58. (b) Le chatelier principle is not applicable to solid-solid equilibrium.

The reaction is endothermic so on increase temperature concentration of product will increase.

Critical Thinking Questions

1. (b) $K_c = \frac{[PCl_3][Cl_2]}{[PCl_5]} = \frac{\left[\frac{20}{100}\right] \times \left[\frac{20}{100}\right]}{\left[\frac{80}{100}\right]}$

$$= \frac{0.2 \times 0.2}{0.8} = \frac{0.04}{0.8} = 0.05$$

Initial mole a 0 0
Mole at equilibrium (a - 2x) x 3x

Initial pressure of NH_3 of a mole = 15 atm at $27^\circ C$

The pressure of 'a' mole of NH_3 = p atm at $347^\circ C$

$$\therefore \frac{15}{300} = \frac{p}{620}$$

$$\therefore p = 31 \text{ atm}$$

At constant volume and at $347^\circ C$, mole $\propto$ pressure

$a \propto 31$ (before equilibrium)

$\therefore a + 2x \propto 50$ (after equilibrium)

$$\therefore \frac{a + 2x}{a} = \frac{50}{31}$$

$$\therefore x = \frac{19}{62}a$$

$$\therefore \% \text{ of } NH_3 \text{ decomposed} = \frac{2x}{a} \times 100$$

$$= \frac{2 \times 19a}{62 \times a} \times 100 = 61.33\%$$

$$K_c = \frac{K_p}{(RT)^{\Delta n}} = \frac{1.3 \times 10^{-3}}{(0.0821 \times 700)^{-1}} = 7.4 \times 10^{-2}$$

$$K = \sqrt{1/1.8 \times 10^{-6}} = 7.5 \times 10^2$$

$$\Delta n = 3 - 2 = +1; K_p = 1.80 \times 10^{-3}$$

$$[RT]^{\Delta n} = (8.314 \times 700)^1$$

$$K_c = \frac{K_p}{(RT)^{\Delta n}} = \frac{1.8 \times 10^{-3}}{(8.314 \times 700)^1}$$

$$= 3.09 \times 10^{-7} \text{ mole-litre.}$$

$$(1-\alpha) \quad 2\alpha$$

$$\therefore P \propto 0.1$$

If V and T are constant ($P \propto 0.1 + \alpha$)

$$P = (0.1 + \alpha)/0.1$$

$$K_p = \frac{[2\alpha]^2}{[0.1 - \alpha]} \times \left[\frac{P}{0.1 + \alpha} \right] \text{ or } K_p = \frac{40\alpha^2}{[0.1 - \alpha]} = 0.14$$

$$\alpha = 0.017$$

$$NO_2 = 0.017 \times 2 = 0.034 \text{ mole}$$

$$\frac{[H_2]^2[CO]}{[CH_3OH]} = \frac{0.1 \times 0.1 \times 1}{2} = \frac{0.01}{2} = \frac{10 \times 10^{-3}}{2}$$

$$= 5 \times 10^{-3}.$$

mole at $t = 0$ 1 1 0 0

$$\text{Mole at equilibrium} \left(1 - \frac{3}{4}\right) \left(1 - \frac{3}{4}\right) \rightleftharpoons \left(\frac{3}{4}\right) \left(\frac{3}{4}\right)$$

$$0.25 \quad 0.25 \rightleftharpoons 0.75 \quad 0.75$$

$$K_c = \frac{0.75 \times 0.75}{0.25 \times 0.25} = \frac{0.5625}{0.0625} = 9$$

Assertion & Reason

$$K_p \neq K_c \text{ for all reaction.}$$

$$K_p = K_c(RT)^{\Delta n}$$

Δn = number of moles of products – number of moles of reactants in the balanced chemical equation.

So, if for a reaction $\Delta n = 0$. Then $K_p = K_c$

$K_c = [H_2O]^2$, because concentration of solids is taken to be unity.

4. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

$CO(H_2O)_6^{2+}$ (Pink) while $CoCl_4^{2-}$ (blue). So, on

Cooling because of Le-chatelier's principle the reaction tries to overcome the effect of temperature.

5. (e) Assertion is false but reason is true.

If $Q_c > K_c$, reaction will proceed in the direction of reactants.

If $Q_c < K_c$, reaction will move in direction of products.

If $Q_c = K_c$, the reaction mixture is already at equilibrium.

6. (c) Assertion is true but reason is false. This is based on common ion effect.

Concentration of Cl^- ions increases due to ionisation of HCl which increases the ionic product $[Na^+][Cl^-]$. This result in the precipitation of pure $NaCl$.

7. (b) Both assertion and reason are true and reason is not the correct explanation of assertion, solid+heat $\rightleftharpoons$ liquid, so on heating forward reactions is favoured and amount of solid will decrease.

8. (a) $aA + bB \rightleftharpoons cC + dD$

$$K_c = \frac{[C]^c [D]^d}{[A]^a [B]^b}$$

For $2aA + 2bB \rightleftharpoons 2cC + 2dD$

$$K_c = \frac{[C]^{2c} [D]^{2d}}{[A]^{2a} [B]^{2b}}$$

9. (a) $H_{2(g)} + I_{2(g)} \rightleftharpoons 2HI_{(g)}$

$$K_c = \frac{[HI]^2}{[H_2][I_2]}$$

For reverse reaction $2HI_{(g)} \rightleftharpoons H_{2(g)} + I_{2(g)}$

$$K_c = \frac{[H_2][I_2]}{[HI]^2} = \frac{1}{K_c}$$

10. (c) The value of K depends on the stoichiometry of reactants and products at the point of equilibrium. For *e.g.*, if the reaction is multiplied by 2, the equilibrium constant is squared.

11. (d) Catalyst does not affect the final state of the equilibrium. It enables the system to attain equilibrium state earlier by providing an alternative path which involve lower energy of activation.

12. (e) $K_p = \frac{P_{H_2}^3 \times P_{N_2}}{P_{NH_3}^2} = \frac{(atm)^3 (atm)}{(atm)^2} = (atm)^2$

or $\Delta n = 4 - 2 = 2$.

Unit of K_p for given reaction $= (atm)^2$.

13. (c) According to Le-Chatelier's principle endothermic reaction favours increase in temperature. However exothermic reaction favours decrease in temperature.

14. (d) $K_p = K_c (RT)^{\Delta n}$; where $\Delta n = (l + m) - (x + y)$

Concentration of solids and liquids is taken to be unity.

15. (e) Increase in pressure favours melting of ice into water because at higher pressure melting point of ice is lowered.

16. (e) As assertion is exothermic, low temperature favours forward reaction. High pressure favours forward reaction as it is accompanied by decrease in the number of moles.

17. (e) There is no change in number of gas molecules. Therefore the expression for K is independent of volume. Hence K will remain same.

Chemical Equilibrium

SET Self Evaluation Test -8

1. One mole of SO_3 was placed in a litre reaction vessel at a certain temperature. The following equilibrium was established $2SO_3 \rightleftharpoons 2SO_2 + O_2$
- At equilibrium 0.6 moles of SO_2 were formed. The equilibrium constant of the reaction will be [MP PMT 1991]
- (a) 0.36 (b) 0.45
(c) 0.54 (d) 0.675
2. For the following homogeneous gas reaction $4NH_3 + 5O_2 \rightleftharpoons 4NO + 6H_2O$, the equilibrium constant K_c has the dimension of [CPMT 1990; MP PET/PMT 1998]
- (a) Conc^{+10} (b) Conc^{+1}
(c) Conc^{-1} (d) It is dimensionless
3. Consider the imaginary equilibrium
- $$4A + 5B \rightleftharpoons 4X + 6Y$$
- The equilibrium constant K_c has the unit [RPMT 2000]
- (a) Mole litre (b) Litre mole
(c) Mole litre (d) Litre mole
4. For the reaction $CO(g) + 2H_2(g) \rightleftharpoons CH_3OH(g)$, true condition is
- (a) $K_p = K_c$ (b) $K_p > K_c$
(c) $K_p < K_c$ (d) $K_c = 0$ but $K_p \neq 0$
5. For the reaction $CO(g) + \frac{1}{2}O_2(g) \rightleftharpoons CO_2(g)$; $\frac{K_p}{K_c}$ is equivalent to [MP PET/PMT 1998; AIEEE 2002]
- (a) 1 (b) RT
(c) $\frac{1}{\sqrt{RT}}$ (d) $(RT)^{1/2}$
6. $2N_2O_5 \xrightarrow{(g)} 4NO_2 + O_2$ what is the ratio of the rate of decomposition of N_2O_5 to rate of formation of NO_2 [DCE 2003]
- (a) 1 : 2 (b) 2 : 1
(c) 1 : 4 (d) 4 : 1
7. The reaction quotient (Q) for the reaction
- $$N_{2(g)} + 3H_{2(g)} \rightleftharpoons 2NH_{3(g)}$$
- is given by $Q = \frac{[NH_3]^2}{[N_2][H_2]^3}$. The reaction will proceed from right to left is [CBSE PMT 2003]
- (a) $Q = 0$ (b) $Q = K_c$
(c) $Q < K_c$ (d) $Q > K_c$
8. In the thermal dissociation of PCl_5 , the partial pressure in the gaseous equilibrium mixture is 1.0 atmosphere when half of PCl_5 is found to dissociate. The equilibrium constant of the reaction (K_p) in atmosphere is [JIPMER 2002]
- (a) 0.25 (b) 0.50
(c) 1.00 (d) 0.3
9. HI was heated in a closed tube at $440^\circ C$ till equilibrium is obtained. At this temperature 22% of HI was dissociated. The equilibrium constant for this dissociation will be [MP PET 1988, 92; MNR 1987; UPSEAT 2000]
- (a) 0.282 (b) 0.0796
(c) 0.0199 (d) 1.99
10. The following equilibrium exists in aqueous solution $CH_3COOH \rightleftharpoons CH_3COO^- + H^+$. If dilute HCl is added without a change in temperature, then the [MNR 1987]
- (a) Concentration of CH_3COO^- will increase
(b) Concentration of CH_3COO^- will decrease
(c) Equilibrium constant will increase
(d) Equilibrium constant will decrease
11. Which of the following is not favourable for SO_3 formation
- $$2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g); \Delta H = -45.0 \text{ kcal}$$
- [IIT 1984; MP PET 1997]
- (a) High pressure
(b) High temperature
(c) Decreasing SO_3 concentration
(d) Increasing reactant concentration
12. 120 gm of urea are present in 5 litre solution, the active mass of urea is [MP PMT 1994]
- (a) 0.2 (b) 0.06
(c) 0.4 (d) 0.08
13. For the system $2A(g) + B(g) \rightleftharpoons 3C(g)$, the expression for equilibrium constant K is [NCERT 1973; DCE 1999]
- (a) $\frac{[2A] \times [B]}{[3C]}$ (b) $\frac{[A]^2 \times [B]}{[C]^3}$
(c) $\frac{[3C]}{[2A] \times [B]}$ (d) $\frac{[C]^3}{[A]^2 \times [B]}$
14. If concentration of reactants is increased by 'x', then K becomes [AFMC 1997]
- (a) $\ln(K/x)$ (b) K/x
(c) $K+x$ (d) K

$$K_c = \frac{[SO_2]^2 [O_2]}{[SO_3]^2} = \frac{0.6 \times 0.6 \times 0.3}{0.4 \times 0.4} = 0.675.$$

$$= (\text{mole litre}^{-1})^{\Delta}$$

$$\Delta n = 10 - 9 = 1$$

$$\therefore K_c = \text{mol Litre}.$$

where n_r = no. of moles of reactant

n_p = no. of moles of product.

$$K_p = K_c(RT)^{1-\frac{1}{2}} = K_c(RT)^{-\frac{1}{2}}; \quad \frac{K_p}{K_c} = \sqrt{\frac{1}{RT}}$$

Rate of decomposition of N_2O_5

$$= -\frac{1}{2} \cdot \frac{K[N_2O_5]}{dt}$$

$$\text{Rate of formation of } NO_2 = \frac{1}{4} \cdot \frac{d[NO_2]}{dt}$$

$$\therefore \text{Ratio} = 2 : 1$$

Initial conc. 2 moles 0 0

at equilibrium $\frac{22}{100} \times 2$ 0.22 0.22

$$= 2 - 0.44 = 1.56$$

$$K = \frac{[H_2][I_2]}{[HI]^2} = \frac{0.22 \times 0.22}{[1.56]^2} = 0.0199.$$

$$= \frac{\text{wt. in gm/molecular wt.}}{V \text{ in litre}} = \frac{120/60}{5} = \frac{2}{5} = .4$$

Initial conc. 1 0 0

At equilibrium 0.5 0.5 0.5

$$K_p = \frac{Px^2}{(1-x^2)} = \frac{1 \times 0.5 \times 0.5}{[1-(0.5)^2]} = \frac{0.5 \times 0.5}{0.75} = \frac{1}{3} = 0.3$$

Chapter 9 Ionic Equilibrium

In chemical equilibrium we studied reaction involving molecules only but in ionic equilibrium we will study reversible reactions involving formation of ions in water. When solute is polar covalent compound then it reacts with water to form ions.

Electrical conductors

Substances, which allow electric current to pass through them, are known as conductors or electrical conductors. Conductors can be divided into two types,

(1) Conductors which conduct electricity without undergoing any chemical change are known as metallic or electronic conductors.

(2) Conductors which undergo decomposition (a chemical change) when an electric current is passed through them are known as electrolytic conductors or electrolytes.

Electrolytes are further divided into two types on the basis of their strengths,

(i) Substances which almost completely ionize into ions in their aqueous solution are called strong electrolytes. Degree of ionization for this type of electrolyte is one i.e., $\alpha \approx 1$.

For example : HCl , H_2SO_4 , NaCl , HNO_3 , KOH , NaOH , HNO_3 , AgNO_3 , CuSO_4 etc. means all strong acids, bases and all types of salts.

(ii) Substances which ionize to a small extent in their aqueous solution are known as weak electrolytes. Degree of ionization for this types of electrolytes is $\alpha \ll 1$.

For example : H_2O , CH_3COOH , NH_4OH , HCN , Li_2SO_3 , HCOOH etc. means all weak acids and bases.

Arrhenius theory of electrolytic dissociation

(1) Postulates of Arrhenius theory

(i) In aqueous solution, the molecules of an electrolyte undergo spontaneous dissociation to form positive and negative ions.

(ii) Degree of ionization(α)

$$= \frac{\text{Number of dissociated molecules}}{\text{Total number of molecules of electrolyte before dissociation}}$$

(iii) At moderate concentrations, there exists an equilibrium

between the ions and undissociated molecules, such as, $\text{NaOH} \rightleftharpoons \text{Na}^+ + \text{OH}^-$; $\text{KCl} \rightleftharpoons \text{K}^+ + \text{Cl}^-$

This equilibrium state is called *ionic equilibrium*.

(iv) Each ion behaves osmotically as a molecule.

(2) Factors affecting degree of ionisation

(i) At normal dilution, value of α is nearly 1 for strong electrolytes, while it is very less than 1 for weak electrolytes.

(ii) Higher the dielectric constant of a solvent more is its ionising power. Water is the most powerful ionising solvent as its dielectric constant is highest.

$$(iii) \alpha \propto \frac{1}{\text{Con. of solution}} \propto \frac{1}{\text{wt. of solution}}$$

$\propto$ Dilution of solution $\propto$ Amount of solvent

(iv) Degree of ionisation of an electrolyte in solution increases with rise in temperature.

(v) **Presence of common ion** : The degree of ionisation of an electrolyte decreases in the presence of a strong electrolyte having a common ion.

Ostwald's dilution law

The strength of an acid or a base is experimentally measured by determining its dissociation or ionisation constant.

When acetic acid (a weak electrolyte) is dissolved in water, it dissociates partially into H^+ or H_3O^+ and CH_3COO^- ions and the following equilibrium is obtained,

Applying law of chemical equilibrium,

$$K = \frac{[CH_3COO^-] \times [H_3O^+]}{[CH_3COOH] \times [H_2O]}$$

In dilute solution, $[H_2O]$ is constant. The product of K and constant $[H_2O]$ is denoted as K_a , the ionization constant or dissociation constant of the acid is,

$$K_a = \frac{[CH_3COO^-] \times [H_3O^+]}{[CH_3COOH]} \quad \dots(i)$$

The fraction of total number of molecules of an electrolyte which ionise into ions is known as degree of dissociation/ionisation α .

If ' C ' represents the initial concentration of the acid in moles L^{-1} and α the degree of dissociation, then equilibrium concentration of the ions (CH_3COO^- and H_3O^+) is equal to $C\alpha$ and that of the undissociated acetic acid $= C(1 - \alpha)$ i.e., we have

Initial conc	C	0	0
Conc. at eqb.	$C(1 - \alpha)$	$C\alpha$	$C\alpha$

Substituting the values of the equilibrium concentrations in equation (i), we get

$$K_a = \frac{C\alpha \cdot C\alpha}{C(1 - \alpha)} = \frac{C^2\alpha^2}{C(1 - \alpha)} = \frac{C\alpha^2}{1 - \alpha} \quad \dots(ii)$$

In case of weak electrolytes, the value of α is very small and can be neglected in comparison to 1 i.e., $1 - \alpha = 1$.

Hence, we get

$$K_a = C\alpha^2 \text{ or } \alpha = \sqrt{\frac{K_a}{C}} \quad \dots(iii)$$

The degree of dissociation, α can therefore be calculated at a given concentration, C if K_a is known. Further, if V is the volume of the solution in litres containing 1 mole of the electrolyte, $C = 1/V$. Hence we have

$$\alpha = \sqrt{K_a V} \quad \dots(iv)$$

Similarly, for a weak base like NH_4OH , we have

$$\alpha = \sqrt{K_b / C} = \sqrt{K_b V} \quad \dots(v)$$

The above equations lead to the following result

"For a weak electrolyte, the degree of ionisation is inversely proportional to the square root of molar concentration or directly proportional to the square root of volume containing one mole of the solute."

This is called **Ostwald's dilution law**.

Dissociation constants of acids and Bases

(i) **Dissociation constant for weak acid** : Consider an acid HA which, when dissolved in water ionizes as,

Applying the law of mass action, $K_a = \frac{[H^+][A^-]}{[HA]}$

Where, K_a is the dissociation constant of the acid, HA . It has constant value at definite temperature and does not change with the change of concentration.

Dissociation Constant for polybasic acid : Polybasic acids ionise stepwise as, for example, orthophosphoric acid ionises in three steps and each step has its own ionisation constant.

Let K_1 , K_2 and K_3 be the ionization constants of first, second and third steps respectively. Thus,

$$K_1 = \frac{[H^+][H_2PO_4^-]}{[H_3PO_4]}; K_2 = \frac{[H^+][HPO_4^{2-}]}{[H_2PO_4^-]}; K_3 = \frac{[H^+][PO_4^{3-}]}{[HPO_4^{2-}]}$$

In general, $K_1 > K_2 > K_3$

The overall dissociation constant (K) is given by the relation,

$$K = K_1 \times K_2 \times K_3$$

(2) **Dissociation constant for weak base** : The equilibrium of NH_4OH (a weak base) can be represented as,

Applying the law of mass action, $K_b = \frac{[NH_4^+][OH^-]}{[NH_4OH]}$

K_b is constant at a definite temperature and does not change with the change of concentration.

Common ion effect

The degree of dissociation of an electrolyte (weak) is suppressed by the addition of another electrolyte (strong) containing a common ion, this is termed as **common ion effect**. Acetic acid is a weak electrolyte and its ionisation is suppressed in presence of a strong acid (H^+ ion as common ion) or a strong salt like sodium acetate (acetate ion is a common ion). Similarly, the addition of NH_4Cl or $NaOH$ to NH_4OH solution will suppress the dissociation of NH_4OH due to common ion either NH_4^+ or OH^- .

As a result of common ion effect, the concentration of the ion of weak electrolyte which is not common in two electrolytes, is decreased. The use of this phenomenon is made in qualitative analysis to adjust concentration of S^{2-} ions in second group and OH^- ion concentration in third group.

Isohydric solution

If the concentration of the common ions in the solution of two electrolytes, for example H^+ ion concentration in HCl and HNO_3 or OH^- ion concentration in $Ca(OH)_2$ and $Ba(OH)_2$ is same, then on mixing them there is no change in the degree of dissociation of either of the electrolytes. Such solutions are called **isohydric solutions**.

Consider two isohydric solutions of acids HA_1 and HA_2 . Let V_1 and V_2 be their dilutions and α_1 and α_2 be their degree of dissociation at the respective dilution. Then,

$$\frac{\alpha_1}{V_1} = \frac{\alpha_2}{V_2}$$

Above equation is useful for calculating the relative dilution of two acids at which they would be isohydric.

Solubility product

In a saturated solution of sparingly soluble electrolyte two equilibria exist and can be represented as, $\underset{\text{Solid}}{AB} \rightleftharpoons \underset{\substack{\text{Unionised} \\ \text{(Dissolved)}}}{AB} \rightleftharpoons \underbrace{A^+ + B^-}_{\text{ions}}$

Applying the law of mass action, $\frac{[A^+][B^-]}{[AB]} = K$

Since the solution is saturated, the concentration of unionised molecules of the electrolyte is constant at a particular temperature, i.e., $[AB] = K' = \text{constant}$.

Hence, $[A^+][B^-] = K[AB] = KK' = K_{sp}$ (constant)

K_{sp} is termed as the solubility product. It is defined as the product of the concentration of ions in a saturated solution of an electrolyte at a given temperature.

Consider, in general, the electrolyte of the type A_xB_y which dissociates as, $A_xB_y \rightleftharpoons xA^{y+} + yB^{x-}$

Applying law of mass action, $\frac{[A^{y+}]^x[B^{x-}]^y}{[A_xB_y]} = K$

When the solution is saturated, $[A_xB_y] = K'$ (constant) or

$$[A^{y+}]^x[B^{x-}]^y = K[A_xB_y] = KK' = K_{sp} \text{ (constant)}$$

Thus, solubility product is defined as the product of concentrations of the ions raised to a power equal to the number of times the ions occur in the equation representing the dissociation of the electrolyte at a given temperature when the solution is saturated.

(1) **Difference between solubility product and ionic product** : Both ionic product and solubility product represent the product of the concentrations of the ions in the solution. The term ionic product has a broad meaning since, it is applicable to all types of solutions, either unsaturated or saturated and varies accordingly.

On the other hand, the term solubility product is applied only to a saturated solution in which there exists a dynamic equilibrium between the undissolved salt and the ions present in solution. Thus the solubility product is in fact the ionic product for a saturated solution at a constant temperature.

(2) Different expression for solubility products

(i) Electrolyte of type AB (1 : 1 type salt) e.g., $AgCl$, $BaSO_4$

$$K_{sp} = [Ag^+][Cl^-] ; K_{sp} = x^2 ; x = \sqrt{K_{sp}}$$

(ii) Electrolytes of type AB_2 (1:2 type salt) e.g., $PbCl_2$, CaF_2

$$K_{sp} = [Pb^{2+}][Cl^-]^2 ; K_{sp} = [x][2x]^2 ; K_{sp} = 4x^3$$

$$x = 3\sqrt{K_{sp}/4}$$

(iii) Electrolyte of type AB (2 : 1 type salt) e.g., Ag_2CrO_4 , H_2S

$$K_{sp} = [Ag^+]^2 [CrO_4^{2-}] ; K_{sp} = [2x]^2 [x] ; K_{sp} = 4x^3$$

$$x = \sqrt[3]{\frac{K_{sp}}{4}}$$

(iv) Electrolyte of type A_2B_3 (2 : 3 type salt)

$$K_{sp} = [As^{3+}]^2 [S^{2-}]^3 ; K_{sp} = [2x]^2 [3x]^3 ; K_{sp} = 4x^2 \times 27x^3$$

$$K_{sp} = 108x^5 ; x = \sqrt[5]{\frac{K_{sp}}{108}}$$

(v) Electrolyte of type AB_3 (1 : 3 type salt)

$$K_{sp} = [Al^{3+}][3Cl^-] ; K_{sp} = [x][3x]^3$$

$$K_{sp} = 27x^4 ; x = \sqrt[4]{\frac{K_{sp}}{27}}$$

(3) **Criteria of precipitation of an electrolyte** : When ionic product of an electrolyte is greater than its solubility product, precipitation occurs.

(4) Applications of solubility product

(i) In predicting the formation of a precipitate

Case I : When $K_{ip} < K_{sp}$, then solution is unsaturated in which more solute can be dissolved. i.e., no precipitation.

Case II : When $K_{ip} = K_{sp}$, then solution is saturated in which no more solute can be dissolved but no ppt. is formed.

Case III : When $K_{ip} > K_{sp}$, then solution is supersaturated and precipitation takes place.

When the ionic product exceeds the solubility product, the equilibrium shifts towards left-hand side, i.e., increasing the concentration of undissociated molecules of the electrolyte. As the solvent can hold a fixed amount of electrolyte at a definite temperature, the excess of the electrolyte is thrown out from the solutions as precipitate.

(ii) **In predicting the solubility of sparingly soluble salts** Knowing the solubility product of a sparingly soluble salt at any given temperature, we can predict its solubility.

(iii) **Purification of common salt** : HCl gas is circulated through the saturated solution of common salt. HCl and $NaCl$ dissociate into their respective ions as,

The concentration of Cl^- ions increases considerably in solution due to ionisation of HCl and due to common ion effect, dissociation of $NaCl$ is decreased. Hence, the ionic product $[Na^+][Cl^-]$ exceeds the solubility product of $NaCl$ and therefore pure $NaCl$ precipitates out from the solution.

(iv) **Salting out of soap** : From the solution, soap is precipitated by the addition of concentrated solution of $NaCl$.

Hence, the ionic product $[RCOO^-][Na^+]$ exceeds the solubility product of soap and therefore, soap precipitates out from the solution.

(v) **In qualitative analysis** : The separation and identification of various basic radicals into different groups is based upon solubility product principle and common ion effect.

(a) **Precipitation of group first radicals (Pb, Ag, Hg)** The group reagent is dilute HCl . $[Ag^+][Cl^-] > K_{sp}$ for $AgCl$.

(b) **Precipitation of group second radicals (Hg, Pb, Bi, Cu, Cd, As, Sb and Sn)** : The group reagent is H_2S in presence of dilute HCl . $[Pb^{+2}][S^{-2}] > K_{sp}$ for PbS .

(c) **Precipitation of group third radicals (Fe, Al and Cr)** The group reagent is NH_4OH in presence of NH_4Cl .

$$[Fe^{+3}][OH^-]^3 > K_{sp}$$

(d) **Precipitation of group fourth radicals (Co, Ni, Mn and Zn)** : The group reagent is H_2S in presence of NH_4OH .

$$[Co^{+2}][S^{-2}] > K_{sp}$$

(e) **Precipitation of group fifth radicals (Ba, Sr, Ca)** The group reagent is ammonium carbonate in presence of NH_4Cl and NH_4OH . $[Ba^{+2}][CO_3^{2-}] > K_{sp}$

(vi) **Calculation of remaining concentration after precipitation** : Sometimes an ion remains after precipitation if it is in excess. Remaining concentration can be determined,

$$\text{Example : } [A^+]_{left} = \frac{K_{sp}[AB]}{[B^-]} ; [Ca^{2+}]_{left} = \frac{K_{sp}[Ca(OH)_2]}{[OH^-]^2}$$

$$\text{In general } [A^{n+}]_{left}^m = \frac{K_{sp}[A_m B_n]}{[B^{m-}]^n}$$

$$\% \text{ precipitation of ion} = \left[\frac{\text{Initial conc.} - \text{Remaining conc.}}{\text{Initial conc.}} \right] \times 100$$

(vii) **Calculation of simultaneous solubility** : Solubility of two electrolytes having common ion; when they are dissolved in the same solution, is called *simultaneous solubility*.

Calculation of simultaneous solubility is divided into two cases.

Case I : When the two electrolytes are almost equally strong (having close solubility product).

$$\text{e.g., } AgBr (K_{sp} = 5 \times 10^{-13}); AgSCN (K_{sp} = 10^{-12})$$

Here, charge balancing concept is applied.

$$\text{Charge of } Ag^+ = \text{Charge of } Br^- + \text{Charge of } SCN^-$$

$$[Ag^+] = [Br^-] + [SCN^-]$$

$$(a+b) = a + b$$

Case II : When solubility products of two electrolytes are not close, i.e., they are not equally strong.

$$\text{e.g., } CaF_2 (K_{sp} = 3.4 \times 10^{-11}); SrF_2 (K_{sp} = 2.9 \times 10^{-9})$$

Most of fluoride ions come of stronger electrolyte.

Acid and Bases

(i) **Arrhenius concept** : According to Arrhenius concept *all substances which give H^+ ions when dissolved in water are called acids while those which ionise in water to furnish OH^- ions are called bases.*

Some acids and bases ionise almost completely in solutions and are called *strong acids and bases*. Others are dissociated to a limited extent in solutions and are termed *weak acids and bases*. $HCl, HNO_3, H_2SO_4, HClO_4$, etc., are examples of strong acids and $NaOH, KOH, (CH_3)_4NOH$ are strong bases. Every hydrogen compound cannot be regarded as an acid, e.g., CH_4 is not an acid. Similarly, CH_3OH, C_2H_5OH , etc., have OH groups but they are not bases.

(i) **Utility of Arrhenius concept** : The Arrhenius concept of acids and bases was able to explain a number of phenomenon like neutralization, salt hydrolysis, strength of acids and bases etc.

(ii) **Limitations of Arrhenius concept**

(a) For the acidic or basic properties, the presence of water is absolutely necessary. Dry HCl shall not act as an acid. HCl is regarded as an acid only when dissolved in water and not in any other solvent.

(b) The concept does not explain acidic and basic character of substances in non-aqueous solvents.

(c) The neutralisation process is limited to those reactions which can occur in aqueous solutions only, although reactions involving salt formation do occur in absence of solvent.

(d) It cannot explain the acidic character of certain salts such as $AlCl_3$ in aqueous solution.

(2) **Bronsted-Lowry concept** : According to this concept,

"An acid is defined as a substance which has the tendency to give a proton (H^+) and a base is defined as a substance which has a tendency to accept a proton. In other words, an acid is a proton donor whereas a base is a proton acceptor."

(i) HCl and CH_3COOH are acids because they donate a proton to H_2O . (ii) NH_3 and CO_3^{2-} are bases because they accept a proton from water.

In reaction (i), in the reverse process, H_3O^+ can give a proton and hence is an acid while Cl^- can accept the proton and hence is a base. Thus there are two acid-base pairs in reaction (i). These are $HCl - Cl^-$ and $H_3O^+ - H_2O$. These acid-base pairs are called *conjugate acid-base pairs*.

Conjugate base of a strong acid is a weak base and vice a versa. Weak acid has a strong conjugate base and vice a versa.

Levelling effect and classification of solvents : In acid-base strength series, all acids above H_2O in aqueous solution fall to the strength of H_3O^+ . Similarly the basic strength of bases above OH^- fall to the strength of OH^- in aqueous solution. This is known as *levelling effect*. Levelling effect of water is due to its high dielectric constant and strong proton accepting tendency.

On the basis of proton interaction, solvents are of four types,

(i) **Protophilic solvents** : Solvents which have greater tendency to accept protons, i.e., water, alcohol, liquid ammonia, etc.

(ii) **Protogenic solvents** : Solvents which have the tendency to produce protons, i.e., water, liquid hydrogen chloride, glacial acetic acid, etc.

(iii) **Amphiprotic solvents** : Solvents which act both as protophilic or protogenic, e.g., water, ammonia, ethyl alcohol, etc.

(iv) **Aprotic solvents** : Solvents which neither donate nor accept protons, e.g., benzene, carbon tetrachloride, carbon disulphide, etc.

HCl acts as acid in H_2O , stronger acid in NH_3 , weak acid in CH_3COOH , neutral in CH_4 and a weak base in HF .

Utility of Bronsted – Lowry concept

(i) Bronsted – Lowry concept is not limited to molecules but includes even the ionic species to act as acids or bases.

(ii) It can explain the basic character of the substances like Na_2CO_3 , NH_3 etc.

(iii) It can explain the acid-base reactions in the non-aqueous medium or even in the absence of a solvent (e.g., between HCl and NH_3).

Limitations of Bronsted lowry concept

(i) The protonic definition cannot be used to explain the reactions occurring in non-protonic solvents such as $COCl_2$, SO_2 , NO_2 , etc.

(ii) It cannot explain the reactions between acidic oxides like CO_2 , SO_2 , SO_3 etc and the basic oxides like CaO , BaO , MgO etc which take place even in the absence of the solvent e.g.,

There is no proton transfer in the above example.

(iii) Substances like BF_3 , $AlCl_3$ etc, do not have any hydrogen and hence cannot give a proton but are known to behave as acids.

Table: 9.1 Conjugate acid-base pairs

Acid		Conjugate base	
$HClO_4$	(Perchloric acid)	ClO_4^-	(Perchlorate ion)
H_2SO_4	(Sulphuric acid)	HSO_4^-	(Hydrogen sulphate ion)
HCl	(Hydrogen chloride)	Cl^-	(Chloride ion)
HNO_3	(Nitric acid)	NO_3^-	(Nitrate ion)
H_3O^+	(Hydronium ion)	H_2O	(Water)
HSO_4^-	(Hydrogen sulphate ion)	SO_4^{2-}	(Sulphate ion)
H_3PO_4	(Ortho phosphoric acid)	$H_2PO_4^-$	(Dihydrogen phosphate ion)
CH_3COOH	(Acetic acid)	CH_3COO^-	(Acetate ion)
H_2CO_3	(Carbonic acid)	HCO_3^-	(Hydrogen carbonate ion)
H_2S	(Hydrogen sulphide)	HS^-	(Hydrogen sulphide ion)
NH_4^+	(Ammonium ion)	NH_3	(Ammonia)
HCN	(Hydrogen cyanide)	CN^-	(Cyanide ion)
C_6H_5OH	(Phenol)	$C_6H_5O^-$	(Phenoxide ion)
H_2O	(Water)	OH^-	(Hydroxide ion)
C_2H_5OH	(Ethyl alcohol)	$C_2H_5O^-$	(Ethoxide ion)
NH_3	(Ammonia)	NH_2^-	(Amide ion)
CH_4	(Methane)	CH_3^-	(Methyl carbanion)

Increasing order of acidic strength

Increasing order of basic strength

(3) **Lewis concept** : This concept was proposed by G.N. Lewis, in 1939. According to this concept, "a base is defined as a substance which can furnish a pair of electrons to form a coordinate bond whereas an acid is a substance which can accept a pair of electrons." The acid is also known as electron pair acceptor or *electrophile* while the base is electron pair donor or *nucleophile*.

A simple example of an acid-base is the reaction of a proton with hydroxyl ion,

$$\underset{\text{Acid}}{H^+} + \underset{\text{Base}}{OH^-} \rightarrow HOH$$

Lewis concept is more general than the Bronsted Lowry concept. All Bronsted bases are also Lewis bases but all Bronsted acids are not Lewis acids. [e.g., HCl , H_2SO_4 as they are not capable of accepting a pair of electrons]

(i) **Types of Lewis acids** : According to Lewis concept, the following species can act as Lewis acids.

(a) Molecules in which the central atom has incomplete octet BF_3 , BCl_3 , $AlCl_3$, $BeCl_2$, etc.

(b) All cations are expected to act as Lewis acids since they are deficient in electrons.

(c) Molecules in which the central atom has empty *d*-orbitals. e.g., SiF_4 , $SnCl_4$, PF_5 etc.

(d) Molecules having a multiple bond between atoms of dissimilar electronegativity e.g., CO_2 , SO_2 .

(ii) **Types of Lewis bases** : The following species can act as Lewis bases.

(a) Neutral species having at least one lone pair of electrons

(b) Negatively charged species or anions

(iii) **Hard and Soft principle of acids and bases** : Lewis acids and bases are classified as hard and soft acids and bases. Hardness is defined as the property of retaining valence electrons very strongly. Thus a hard acid is that in which electron-accepting atom is small, has a high positive charge and has no electron which can be easily polarised or removed e.g., Li^+ , Na^+ , Be^{2+} , Mg^{+2} , Al^{+3} , BF_3 , SO_3 etc.. On the contrary, a soft acid is that in which the acceptor atom is large, carries a low positive charge or it has electrons in orbitals which are easily polarised or distorted e.g., Pb^{+2} , Cd^{+2} , Pt^{+2} , Hg^{+2} , Ro^+ , Rs^+ , I_2 etc..

A Lewis base which holds its electrons strongly is called hard base, e.g., OH^- , F^- , H_2O , NH_3 , CH_3OCH_3 , etc. on the other hand, a Lewis

base in which the position of electrons is easily polarised or removed is called a soft base e.g., I^- , CO , CH_3S^- , $(CH_3)_3P$, etc.

In general, hard acids prefer to bind to hard bases and soft acids prefer to bind to soft bases. The bonding between hard acids and hard bases is chiefly ionic and that between soft bases and soft acids is mainly covalent.

(iv) **Utility of Lewis concept** : Lewis concept is the most general of all the concepts and can explain the acidic and basic nature of all those substances which could not be explained by the earlier concepts. Similarly, it can explain even those acid-base reactions which could not be explained by the other concepts.

(v) **Limitations of Lewis concept** : It does not explain behaviour of well known protonic acids, as HCl , H_2SO_4 etc, as which do not form coordinate bonds with bases.

It does not explain relative strengths of acids and bases. Many Lewis acids do not possess catalytic property.

Relative strength of acids and Bases

In practice K_a is used to define the strength only of those acids that are weaker than H_3O^+ and K_b is used to define the strength of only those bases that are weaker than OH^- . For two weak acids HA_1 and HA_2 of ionisation constant K_{a1} and K_{a2} respectively at the same concentration C , we have,

$$\frac{\text{Acid strength of } HA_1}{\text{Acid strength of } HA_2} = \sqrt{\frac{K_{a1}}{K_{a2}}}$$

Similarly, relative strengths of any two weak bases at the same concentration are given by the ratio of the square-roots of their dissociation constants. i.e.,

$$\frac{\text{Basic strength of } BOH_1}{\text{Basic strength of } BOH_2} = \sqrt{\frac{K_{b1}}{K_{b2}}}$$

(i) Relative strength of Inorganic acids

(i) Hydrides

(a) The acidic strength increases with the increase in the electronegativity of the element directly attached with the hydrogen.

(b) The acidic strength increases with the increase in atomic size,

(ii) Oxyacids

(a) Among oxyacids of the same type formed by different elements, acidic nature increases with increasing electronegativity,

(b) In oxyacids of the same element, acidic nature increases with its oxidation number

(c) The strength of oxyacids increases from left to right across a period

(d) For the same oxidation state and configuration of the elements, acid strength decreases with increase in size of the atom.

(2) Relative strength of organic acids

(i) A compound is acidic in nature, if its conjugate base can stabilize through resonance. Thus phenol is acidic while ethanol is neutral because the

conjugate base of phenol ($C_6H_5O^-$) can be stabilized through resonance while that of alcohol ($C_2H_5O^-$) can not.

(ii) Hydrogen atom attached to sp -hybridized carbon is more acidic than that on sp^2 hybridized carbon which in turn is more acidic than that on sp^3 hybridized carbon.

(3) Relative strength of Inorganic bases

(i) The basicity of a compound decreases with increase in electronegativity of the atom holding the electron pair,

(ii) The larger the size of the atom holding the unshared electrons, the lesser is the availability of electrons.

(iii) Presence of negative charge on the atom holding the electron pair increases the basicity, while the presence of positive charge on the atom holding the electron pair decreases the basicity.

(iv) Among alkali and alkaline earth hydroxides (oxides) the basic nature increases with electropositivity

$CsOH$ is the strongest known base

(v) On going down the group, basic nature decreases with size of the central atom due to decrease in the ability to donate the lone pair.

(4) Relative strength of Organic bases

(i) Higher the electron density on nitrogen, more is the basic character of amine.

(ii) A compound is basic in nature, if its conjugate acid can be

stabilized through resonance. Thus guanidine ($NH_3 - \overset{NH_2}{\underset{|}{C}} = NH$) is as strong alkali as metal hydroxides because its conjugate acid ($H_3N^+ - \overset{NH_2}{\underset{|}{C}} = NH$) is very much stabilised through resonance.

The acid-base neutralisation and Salt

The reaction between an acid and a base to form salt and water is termed *neutralisation*

The process of neutralisation does not produce the resulting solution always neutral; no doubt it involves the interaction of H^+ and OH^- ions. The nature of the resulting solution depends on the particular acid and the particular base involved in the reaction.

Salts : Salts are regarded as compounds made up of positive and negative ions. *The positive part comes from a base while negative part from an acid.* Salts are ionic compounds. The salts can be classified into following classes,

(1) **Simple salts** : The salt formed by the interaction between acid and base, is termed as simple salt. These are of three types,

(i) **Normal salts** : the salts formed by the loss of all possible protons (replaceable hydrogen atoms as H^+) are called normal salts. Such a salt does not contain either replaceable hydrogen or a hydroxyl group.

Examples : $NaCl$, $NaNO_3$, K_2SO_4 , $Ca_3(PO_4)_2$, Na_3BO_3 , Na_2HPO_3 (one H atom is not replaceable as H_3PO_2 is a dibasic acid) NaH_2PO_2 (both H atoms are not replaceable as H_3PO_2 is a monobasic acid) etc.

(ii) **Acidic salts** : Salts formed by incomplete neutralisation of polybasic acids are called acidic salts. Such salts still contain one or more replaceable hydrogen atoms. These salts when neutralised by bases form normal salts.

Examples : $NaHCO_3$, $NaHSO_4$, NaH_2PO_4 , Na_2HPO_4 , etc.

(iii) **Basic salts** : Salts formed by incomplete neutralisation of polyacidic bases are called basic salts. Such salts still contain one or more hydroxyl groups. These salts when neutralised by acids form normal salts.

Examples : $Zn(OH)Cl$, $Mg(OH)Cl$, $Fe(OH)_2Cl$, $Bi(OH)_2Cl$

(2) **Double salts** : The addition compounds formed by the combination of two simple salts are termed double salts. Such salts are stable in solid state only.

Examples : Ferrous ammonium sulphate, Potash alum and other alums.

(3) **Complex salts** : These are formed by combination of simple salts or molecular compounds. These are stable in solid state as well as in solutions.

(4) **Mixed salts** : The salt which furnishes more than one cation or more than one anion when dissolved in water is called a mixed salt.

Ionic product of water

Water is a weak electrolyte and undergoes self-ionisation to a small extent.

"The product of concentrations of H^+ and OH^- ions in water at a particular temperature is known as ionic product of water." It is designated as K_w .

$$K = \frac{[H^+][OH^-]}{[H_2O]} ; K[H_2O] = [H^+][OH^-] ; K_w = [H^+][OH^-]$$

The value of K_w increases with the increase of temperature, i.e., the concentration H and OH ions increases with increase in temperature.

The value of K_w at $25^\circ C$ is 1×10^{-14} mole/litre. Since pure water is neutral in nature, H^+ ion concentration must be equal to OH^- ion concentration.

$$[H^+] = [OH^-] = x \quad \text{or} \quad [H^+][OH^-] = x^2 = 1 \times 10^{-14} \quad \text{or} \quad x = 1 \times 10^{-7} M \quad \text{or} \quad [H^+] = [OH^-] = 1 \times 10^{-7} \text{ mole litre}^{-1}$$

This shows that at $25^\circ C$, in 1 litre only 10^{-7} mole of water is in ionic form out of a total of approximately 55.5 moles.

Thus when, $[H^+] = [OH^-]$; the solution is neutral

$[H^+] > [OH^-]$; the solution is acidic

$[H^+] < [OH^-]$; the solution is basic

Hydrogen ion concentration – pH scale

Sorensen, a Danish biochemist developed a scale to measure the acidity in terms of concentrations of H^+ in a solution. As defined by him,

"pH of a solution is the negative logarithm to the base 10 of the concentration of H ions which it contains."

$$pH = -\log[H^+] \quad \text{or} \quad pH = \log \frac{1}{[H^+]}$$

Just as pH indicates the hydrogen ion concentration, the pOH represents the hydroxyl ion concentration, i.e.,

$$pOH = -\log[OH^-]$$

Considering the relationship, $[H^+][OH^-] = K_w = 1 \times 10^{-14}$

Taking log on both sides, we have

$$\log[H^+] + \log[OH^-] = \log K_w = \log(1 \times 10^{-14}) \quad \text{or}$$

$$-\log[H^+] - \log[OH^-] = -\log K_w = -\log(1 \times 10^{-14})$$

$$\text{or} \quad pH + pOH = pK_w = 14$$

	$[H]$	$[OH^-]$	pH	pOH
Acidic solution	$> 10^{-7}$	$< 10^{-7}$	< 7	> 7
Neutral solution	10^{-7}	10^{-7}	7	7
Basic solution	$< 10^{-7}$	$> 10^{-7}$	> 7	< 7

pH of some materials

Material	pH	Material	pH
Gastric juice	1.4	Rain water	6.5
Lemon juice	2.1	Pure water	7.0
Vinegar	2.9	Human saliva	7.0
Soft drinks	3.0	Blood plasma	7.4
Beer	4.5	Tears	7.4
Black coffee	5.0	Egg	7.8
Cow's milk	6.5	Household ammonia	11.9

Limitations of pH scale

(i) pH values of the solutions do not give us immediate idea of the relative strengths of the solutions. A solution of $pH = 1$ has a hydrogen ion concentration 100 times that of a solution $pH = 3$ (not three times). A $4 \times 10^{-5} N HCl$ is twice concentrated of a $2 \times 10^{-5} N HCl$ solution, but the pH values of these solutions are 4.40 and 4.70 (not double).

(ii) pH value zero is obtained in $1N$ solution of strong acid. If the concentration is $2N, 3N, 10N$, etc. the respective pH values will be negative.

(iii) A solution of an acid having very low concentration, say $10^{-8} N$, can not have pH 8, as shown by pH formula but the actual pH value will be less than 7.

pK value : p stands for negative logarithm. Just as H^+ and OH^- ion concentrations range over many negative powers of 10, it is convenient to express them as pH or pOH , the dissociation constant (K) values also range over many negative powers of 10 and it is convenient to write them as pK . Thus, pK is the negative logarithm of dissociation constant.

$$pK_a = -\log K_a \quad \text{and} \quad pK_b = -\log K_b$$

Weak acids have higher pK_a values. Similarly weak bases have higher pK_b values

For any conjugate acid-base pair in aqueous solution, $K_a \times K_b = K_w$

$$pK_a + pK_b = pK_w = 14 \quad (\text{at } 298 \text{ K})$$

Calculation of the pH of $10^{-8} M HCl$ & $10^{-8} M NaOH$

If we use the relation $pH = -\log[H_3O^+]$ we get pH equal to 8, but this is not correct because an acidic solution cannot have pH greater than 7. In this condition H^+ concentration of water cannot be neglected.

$$\text{Therefore, } [H^+]_{\text{total}} = H^+_{\text{Acid}} + H^+_{\text{water}}$$

Since HCl is strong acid and completely ionised,

$$[H^+]_{HCl} = 1 \times 10^{-8}, [H^+]_{H_2O} = 10^{-7}$$

$$[H^+]_{\text{total}} = [H^+]_{HCl} + [H^+]_{H_2O} = 10^{-8} + 10^{-7} = 10^{-8} [1 + 10] = 10^{-8} \times 11$$

$$pH = -\log 10^{-8} + \log 11 = 6.958$$

Similarly if $NaOH$ concentration is $10^{-8} M$

$$\text{Then, } [OH^-]_{\text{total}} = [10^{-8}]_{NaOH} + [10^{-7}]_{H_2O}$$

$$[OH^-] = 10^{-8} \times 11; pOH = 6.96 \quad pH = 7.04$$

Buffer solutions

A solution whose pH is not altered to any great extent by the addition of small quantities of either strong acid (H^+ ions) or a strong base (OH^- ions) is called the buffer solution. It can also be defined as a solution of reserve acidity or alkalinity which resists change of pH upon the addition of small amount of acid or alkali.

(i) **Types of buffer solutions** : There are two types of buffer solutions,

(i) **Solutions of single substances** : The solution of the salt of a weak acid and a weak base.

Example : ammonium acetate (CH_3COONH_4), NH_4CN act as a buffer.

(ii) **Solutions of Mixtures** : These are further of two types,

(a) **Acidic buffer** : It is the solution of a mixture of a weak acid and a salt of this weak acid with a strong base.

Example : $CH_3COOH + CH_3COONa$

(b) **Basic buffer** : It is the solution of a mixture of a weak base and a salt of this weak base with a strong acid.

Example : $NH_4OH + NH_4Cl$

(2) **Buffer action** : Buffer action is the mechanism by which added H^+ ions or OH^- ions are almost neutralised; so that pH practically remains constant. Reserved base of buffer neutralises the added H^+ ions while the reserved acid of buffer neutralises the added OH^- ions.

(3) **Examples of buffer solutions**

(i) Phthalic acid + potassium hydrogen phthalate

(ii) Citric acid + sodium citrate.

(iii) Boric acid + borax (sodium tetraborate).

(iv) Carbonic acid (H_2CO_3) + sodium hydrogen carbonate ($NaHCO_3$). This system is found in blood and helps in maintaining pH of the blood close to 7.4 (pH value of human blood lies between 7.36 – 7.42; a change in pH by 0.2 units may cause death).

(v) $NaH_2PO_4 + Na_3PO_4$

(vi) $NaH_2PO_4 + Na_2HPO_4$

(vii) Glycerine + HCl

(viii) The pH value of gastric juice is maintained between 1.6 and 1.7 due to buffer system.

(4) **Henderson - Hasselbalch equation** : pH of an acidic or a basic buffer can be calculated by Henderson- Hasselbalch equation.

$$\text{For acidic buffers, } pH = pK_a + \log \frac{[salt]}{[acid]}$$

$$\text{When } \frac{[salt]}{[acid]} = 10, \text{ then, } pH = 1 + pK_a \text{ and}$$

$$\text{when } \frac{[salt]}{[acid]} = \frac{1}{10}, \text{ then, } pH = pK_a - 1$$

So weak acid may be used for preparing buffer solutions having pH values lying within the ranges $pK_a + 1$ and $pK_a - 1$. The acetic acid has a pK_a of about 4.8; it may, therefore, be used for making buffer solutions with pH values lying roughly within the range 3.8 to 5.8.

$$\text{For basic Buffers, } pOH = pK_b + \log \frac{[salt]}{[base]}$$

Knowing pOH , pH can be calculated by the application of formula, $pH + pOH = 14$

pH of a buffer solution does not change with dilution but it varies with temperature because value of K_w changes with temperature.

(5) **Buffer capacity** : The property of a buffer solution to resist alteration in its pH value is known as *buffer capacity*. It has been found that if the ratio $\frac{[salt]}{[acid]}$ or $\frac{[salt]}{[base]}$ is unity, the pH of a particular buffer does

not change at all. Buffer capacity is defined quantitatively as number of moles of acid or base added in one litre of solution as to change the pH by unity, i.e.,

$$\text{Buffer capacity } (\phi) = \frac{\text{Number of moles of acid or base added to 1 litre}}{\text{Change in } pH}$$

Thus greater the buffer capacity, the greater is its capacity to resist change in pH value. Buffer capacity is greatest when the concentration of salt and weak acid/base are equal, or when $pH = pK_a$ or $pOH = pK_b$.

(6) **Significance of buffer solutions**

(i) Buffer solutions are used for comparing colorimetrically the hydrogen ion concentration of unknown solutions.

(ii) Acetic acid-sodium acetate is used in the removal of phosphate radical during the qualitative analysis of the mixture.

(iii) NH_4Cl / NH_4OH buffer is used for the precipitation of hydroxides of third group of qualitative analysis.

(iv) In industries, buffer solutions are used in the alcoholic fermentation (pH 5 to 6.5), tanning of leather, electroplating, manufacture of sugar, paper manufacturing etc.,

(v) In bacteriological research culture media are generally buffered to maintain the pH required for the growth of the bacteria being studied.

(vi) In biological systems buffer system of carbonic acid and sodium bicarbonate is found in our blood. It maintains the pH of blood to a constant value (about 7.4) in spite of various acid and base-producing reactions going on in our body.

Salt hydrolysis

It is the reaction of the cation or the anion or both the ions of the salt with water to produce either acidic or basic solution. Hydrolysis is the reverse of neutralization.

(1) **Hydrolysis constant** : The general equation for the hydrolysis of a salt (BA), $BA + H_2O \rightleftharpoons HA + BOH$

Applying the law of chemical equilibrium, we get

$$\frac{[HA][BOH]}{[BA][H_2O]} = K, \text{ where } K \text{ is the equilibrium constant.}$$

Since water is present in very large excess in the aqueous solution, its concentration $[H_2O]$ may be regarded as constant so,

$$\frac{[HA][BOH]}{[BA]} = K[H_2O] = K_h$$

where K_h is called the hydrolysis constant.

(2) **Degree of hydrolysis** : It is defined as the fraction (or percentage) of the total salt which is hydrolysed at equilibrium. For example, if 90% of a salt solution is hydrolysed, its degree of hydrolysis is 0.90 or as 90%. It is generally represented by 'h'.

$$h = \frac{\text{Number of moles of the salt hydrolysed}}{\text{Total number of moles of the salt taken}}$$

Types of salt	Exp. for K_h	Exp. for h	Exp. for pH
(i) Salt of weak acid and strong base	$K_h = K_w / K_a$	$h = \sqrt{\left(\frac{K_h}{C}\right)}$	$pH = \frac{1}{2} [\log K_w + \log K_a - \log C]$
(ii) Salt of strong acid and weak base	$K_h = K_w / K_b$	$h = \sqrt{\left(\frac{K_h}{C}\right)}$	$pH = \frac{1}{2} [\log K_w - \log K_b - \log C]$
(iii) Salt of weak acid and weak base	$K_h = \frac{K_w}{K_a K_b}$	$h = \sqrt{(K_h)}$	$pH = \frac{1}{2} [\log K_a + \log K_b - \log K_w]$

(iv) Salts of strong acids and strong bases do not undergo hydrolysis (they undergo only ionization) hence the resulting aqueous solution is neutral.

Indicators

An indicator is a substance, which is used to determine the end point in a titration. In acid-base titrations, organic substance (weak acids or weak bases) are generally used as indicators. They change their colour within a certain pH range. The colour change and the pH range of some common indicators are tabulated below

Table : 9.2 Colour changes of indicators with pH

Indicator	pH range	Colour	
		Acid solution	Base solution
Cresol red	1.2 – 1.8	Red	Yellow
Thymol blue	1.2 – 2.8	Red	Yellow
Methyl yellow	2.9 – 4.0	Red	Yellow
Methyl orange	3.1 – 4.4	Pink	Yellow
Methyl red	4.2 – 6.3	Red	Yellow
Litmus	5.0 – 8.0	Red	Blue
Bromothymol blue	6.0 – 7.6	Yellow	Blue
Phenol red	6.4 – 8.2	Yellow	Red
Thymol blue (base)	8.1 – 9.6	Yellow	Blue
Phenolphthalein	8.3 – 10.0	Colourless	Pink
Thymolphthalein	8.3 – 10.5	Colourless	Blue
Alizarin yellow R	10.1 – 12.0	Blue	Yellow
Nitramine	10.8 – 13.0	Colourless	Orange, Brown

Two theories have been proposed to explain the change of colour of acid-base indicators with change in pH .

(i) *Ostwald's Theory* (ii) *Quinonoid theory*

(1) **Selection of suitable indicator or choice of indicator** : In order to choose a suitable indicator, it is necessary to understand the pH changes in

the titrations. The change in pH in the vicinity of the equivalence point is most important for this purpose. The curve obtained by plotting pH as ordinate against the volume of alkali added as abscissa is known as neutralisation or titration curve. The suitable indicators for the following titrations are,

(i) **Strong acid Vs strong base** : Phenolphthalein (pH range 8.3 to 10.5), methyl red (pH range 4.4 – 6.5) and methyl orange (pH range 3.2 to 4.5).

(ii) **Weak acid Vs strong base** : Phenolphthalein.

(iii) **Strong acid Vs weak base** : Methyl red and methyl orange.

(iv) **Weak acid vs. weak base** : No suitable indicator can be used for such a titration.

Reason for use of different indicators for different systems :

Indicators are either weak acids or weak bases and when dissolved in water their dissociated form acquires a colour different from that of the undissociated form. Consider a weak acid indicator of the general formula HIn , where In represents indicator. The equilibrium established in aqueous solution will be

Let K_{In} be the equilibrium constant

$$K_{In} = \frac{[H^+][In^-]}{[HIn]} \quad \text{or} \quad \frac{[HIn]}{[In^-]} = \frac{[H^+]}{K_{In}}$$

The human eye can detect the change in colour if the ratio of the two forms of indicator ranges between 0.1 to 10.

If, $\frac{[HIn]}{[In^-]} = 1.0$, the colour visible will be yellow

$\frac{[HIn]}{[In^-]} = 10$, the colour visible will be red.

$\frac{[HIn]}{[In^-]} = 0.1$, the colour visible will be green.

In other words,

The colour visible will be red, when $pH = pK_{In} - 1$

The colour visible will be yellow, when $pH = pK_{In}$

The colour visible will be green, when $pH = pK_{In} + 1$

Thus, our imaginary indicator will be red at any pH which just falls below $pK_{In} - 1$ and green at any pH which just exceeds $pK_{In} + 1$. The indicator changes its colour in the narrow pH range $pK_{In} - 1$ to $pK_{In} + 1$ from red to (red-yellow, yellow, yellow-green) green. We can therefore use this indicator to locate this narrow pH range. In other words, in order to use the indicator effectively in this range, we should have a solution for which pH is very near to pK_{In} of the indicator. The colour change of an indicator can, therefore, be summarised as,

	First change of colour	Mid point of change	Colour change complete
$[H^+]$	$10 K_{In}$	K_{In}	$0.1 K_{In}$
pH	$pK_{In} - 1$	pK_{In}	$pK_{In} + 1$

It is for this reason that we use different indicators for different systems.

Tips & Tricks

pH of boiling water is 6.5625. It does not mean that boiling water

is not neutral. It is due to greater dissociation of H_2O into H^+ and OH^- .

- ✍ pH values of solutions do not give the exact idea of their relative strengths *eg.*, (i) A solution with $pH = 1$ had $[H^+]$ 100 times than that with $pH = 3$ and not 3 times. (ii) A $4 \times 10^{-4} M HCl$ solution is twice concentrated as compared to $2 \times 10^{-4} M HCl$ solution but pH values of these solutions are 4.4 and 4.7 respectively and not double.
- ✍ pH can be zero in $1M HCl$ or it can be negative for more concentrated solutions like $2M, 3M, 10M$ etc.
- ✍ At the temperature of the human body which is nearly $37^\circ C$, pH of neutral solution is 6.8.
- ✍ Buffer solutions have reserve acidity and reserve alkalinity.
- ✍ The greater the buffer capacity, the greater is its capacity to resist change in pH value.
- ✍ Buffers cannot withstand the addition of large amounts of acids or alkalies. The addition of $0.1mol$ per litre of $[H^+]$ or OH^- is about the maximum that any buffer can be expected to withstand.

Ordinary Thinking

Objective Questions

Electrical conductors, Arrhenius theory and Ostwald's dilution law

- Which of the following is non-electrolyte [CPMT 2001]
 - NaCl
 - CaCl_2
 - $\text{C}_{12}\text{H}_{22}\text{O}_{11}$
 - CH_3COOH
- Ammonium hydroxide is a [CPMT 1977]
 - Strong electrolyte
 - Weak electrolyte
 - Both under different conditions
 - Non-electrolyte
- Ammonium hydroxide is a weak base because [MP PET 2000]
 - It has low vapour pressure
 - It is only slightly ionized
 - It is not a hydroxide of any metal
 - It has low density
- Electrolytes when dissolved in water dissociate into their constituent ions. The degree of dissociation of an electrolyte increases with [CPMT 1974]
 - Increasing concentration of the electrolyte
 - Decreasing concentration of the electrolyte
 - Decreasing temperature
 - Presence of a substance yielding a common ion
- An electrolyte [MP PMT/PET 1988; CPMT 1974]
 - Gives complex ions in solution
 - Dissolves in water to give ions
 - Is ionized in the solid state
 - Generates ions on passing electric current
- A monoprotic acid in 1.00 M solution is 0.01% ionised. The dissociation constant of this acid is [BVP 2003]
 - 1×10^{-8}
 - 1×10^{-4}
 - 1×10^{-6}
 - 10^{-5}
- Molten sodium chloride conducts electricity due to the presence of
 - Free electrons
 - Free ions
 - Free molecules
 - Atoms of sodium and chlorine
- An example for a strong electrolyte is [KCET 2002]
 - Urea
 - Ammonium hydroxide
 - Sugar
 - Sodium acetate
- Which one is strongest electrolyte in the following [CPMT 1990]
 - NaCl
 - CH_3COOH
 - NH_4OH
 - $\text{C}_6\text{H}_{12}\text{O}_6$
- The equivalent conductance at infinite dilution of a weak acid such as HF [Pb. PMT 1998]
 - Can be determined by measurement of very dilute HF solution
 - Can be determined by extrapolation of measurements on dilute solutions of HCl, HBr and HI
 - Can best be determined from measurements on dilute solutions of NaF, NaCl and HCl
 - Is an undefined quantity
- If α is the degree of ionization, C the concentration of a weak electrolyte and K_a the acid ionization constant, then the correct relationship between α , C and K_a is [CET Pune 1998; Pb. PMT 1998; RPMT 2002]
 - $\alpha^2 = \sqrt{\frac{K_a}{C}}$
 - $\alpha^2 = \sqrt{\frac{C}{K_a}}$
 - $\alpha = \sqrt{\frac{K_a}{C}}$
 - $\alpha = \sqrt{\frac{C}{K_a}}$
- Theory of ionization was given by [AMU 1983; DPMT 1985]
 - Rutherford
 - Graham
 - Faraday
 - Arrhenius
- An ionizing solvent has
 - Low value of dielectric constant
 - High value of dielectric constant
 - A dielectric constant equal to 1
 - Has a high melting point
- The extent of ionization increases [MNR 1982]
 - With the increase in concentration of solute
 - On addition of excess water to solution
 - On decreasing the temperature of solution
 - On stirring the solution vigorously
- Which is generally true about ionic compounds [Pb. PMT 2002]
 - Have low boiling point
 - Have low melting point
 - Soluble in non polar solvents
 - Conduct electricity in the fused state
- At infinite dilution, the percentage ionisation for both strong and weak electrolytes is [CPMT 1999]
 - 1%
 - 20%
 - 50%
 - 100%
- The degree of ionization of a compound depends on [MNR 1980]
 - Size of solute molecules
 - Nature of solute molecules
 - Nature of vessel used
 - Quantity of electricity passed
- For a weak acid HA, Ostwald's dilution law is represented by the equation
 - $K_a = \frac{\alpha c}{1 - \alpha^2}$
 - $K_a = \frac{\alpha^2 c}{1 - \alpha}$
 - $\alpha = \frac{K_a c}{1 - c}$
 - $K_a = \frac{\alpha^2 c}{1 - \alpha^2}$
- Acetic acid is a weak electrolyte because [CPMT 1974]
 - Its molecular weight is high
 - It is covalent compound
 - It does not dissociate much or its ionization is very less
 - It is highly unstable
- In which of the following dissociation of NH_4OH will be minimum [MP PET 2000]
 - NaOH
 - H_2O
 - NH_4Cl
 - NaCl

21. Vant hof factor of $BaCl_2$ of conc. $0.01M$ is 1.98. Percentage dissociation of $BaCl_2$ on this conc. Will be
[Kerala CET 2005]
(a) 49 (b) 69
(c) 89 (d) 98
(e) 100
22. In which of the following solutions, ions are present
[NCERT 1981]
(a) Sucrose in water (b) Sulphur in CS_2
(c) Caesium nitrate in water (d) Ethanol in water
23. The following equilibrium exists in aqueous solution, $CH_3COOH \rightleftharpoons CH_3COO^- + H^+$ if dil HCl is added, without change in temperature, the
[UPSEAT 2000, 02]
(a) Concentration of CH_3COO^- will increase
(b) Concentration of CH_3COO^- will decrease
(c) The equilibrium constant will increase
(d) The equilibrium constant will decrease
24. Which will not affect the degree of ionisation
[MP PMT 1994]
(a) Temperature (b) Concentration
(c) Type of solvent (d) Current
25. The addition of a polar solvent to a solid electrolyte results in [NCERT 1973]
(a) Polarization (b) Association
(c) Ionization (d) Electron transfer
26. The degree of dissociation of $0.1M HCN$ solution is 0.01%. Its ionisation constant would be
[RPMT 1999]
(a) 10^{-3} (b) 10^{-5}
(c) 10^{-7} (d) 10^{-9}
27. The hydrogen ion concentration in weak acid of dissociation constant K_a and concentration c is nearly equal to
[CBSE PMT 1989; RPMT 2000]
(a) $\sqrt{K_a / c}$ (b) c / K_a
(c) $K_a c$ (d) $\sqrt{K_a c}$
28. Degree of dissociation of $0.1N CH_3COOH$ is
(Dissociation constant $= 1 \times 10^{-5}$) [MP PET 1997]
(a) 10^{-5} (b) 10^{-4}
(c) 10^{-3} (d) 10^{-2}
29. Which of the following substance is an electrolyte
[MADT Bihar 1980]
(a) Chloroform
(b) Benzene
(c) Toluene
(d) Magnesium chloride
30. In weak electrolytic solution, degree of ionization
(a) Will be proportional to dilution
(b) Will be proportional to concentration of electrolyte
(c) Will be proportional to the square root of dilution
(d) Will be reciprocal to the dilution
31. 0.2 molar solution of formic acid is ionized 3.2%. Its ionization constant is
[MP PMT 1991]
(a) 9.6×10^{-3} (b) 2.1×10^{-4}
(c) 1.25×10^{-6} (d) 4.8×10^{-5}
32. The best conductor of electricity is a $1.0 M$ solution of
[NCERT 1973]
(a) Boric acid (b) Acetic acid
(c) Sulphuric acid (d) Phosphoric acid
33. The colour of an electrolyte solution depends on
[DPMT 1985]
(a) The nature of the anion
(b) The nature of the cation
(c) The nature of both the ions
(d) The nature of the solvent
34. Ionisation depends upon
[CPMT 2004]
(a) Pressure (b) Volume
(c) Dilution (d) None of these
35. The values of dissociation constants of some acids (at $25^\circ C$) are as follows. Indicate which is the strongest acid in water
(a) 1.4×10^{-2} (b) 1.6×10^{-4}
(c) 4.4×10^{-10} (d) 4.3×10^{-7}
36. Concentration CN^- in $0.1M HCN$ is [$K_a = 4 \times 10^{-10}$]
[RPET 2000]
(a) $2.5 \times 10^{-6} M$ (b) $4.5 \times 10^{-6} M$
(c) $6.3 \times 10^{-6} M$ (d) $9.2 \times 10^{-6} M$

Acids and Bases

1. Which of the following is not a Lewis acid [MP PET 2002]
(a) CO (b) $SiCl_4$
(c) SO_3 (d) Zn^{2+}
2. Review the equilibrium and choose the correct statement
 $HClO_4 + H_2O \rightleftharpoons H_3O^+ + ClO_4^-$ [RPMT 2000]
(a) $HClO_4$ is the conjugate acid of H_2O
(b) H_3O^+ is the conjugate base of H_2O
(c) H_2O is the conjugate acid of H_3O^+
(d) ClO_4^- is the conjugate base of $HClO_4$
3. A solution of $FeCl_3$ in water acts as acidic due to
[BVP 2003]
(a) Hydrolysis of Fe^{3+} (b) Acidic impurities
(c) Dissociation (d) Ionisation
4. A white substance having alkaline nature in solution is
[BVP 2003]
(a) $NaNO_3$ (b) NH_4Cl
(c) Na_2CO_3 (d) Fe_2O_3
5. Which of the following can act both as Bronsted acid and Bronsted base
[MP PET 1995; MP PET/PMT 1998]
(a) Cl^- (b) HCO_3^-
(c) H_3O^+ (d) OH^-
6. Lewis acid [MP PMT 1987]
(a) Presence of H atom is necessary
(b) Is a electron pair donor
(c) Always a proton donor
(d) Is a electron pair acceptor

7. For two acids A and B , $pK_a = 1.2$, $pK_b = 2.8$ respectively in value, then which is true [Bihar MEE 1998]
 (a) A and B both are equally acidic
 (b) A is stronger than B
 (c) B is stronger than A
 (d) Neither A nor B is strong
 (e) None of these
8. Aq. solution of sodium cyanide is [BHU 1981]
 (a) Acidic (b) Amphoteric
 (c) Basic (d) Neutral
9. Which of the following is the strongest conjugate base [MADT Bihar 1983; CBSE PMT 1999; KCET (Med.) 2001]
 (a) Cl^- (b) CH_3COO^-
 (c) SO_4^{--} (d) NO_2^-
10. $NaOH$ is a strong base because [AIIMS 2001]
 (a) It gives OH^- ion (b) It can be oxidised
 (c) It can be easily ionised (d) Both (a) and (c)
11. Which one of the following can be classified as a Bronsted base
 (a) NO_3^- (b) H_3O^+
 (c) NH_4^+ (d) CH_3COOH
12. Which one of the following substance has the highest proton affinity [AIEEE 2003]
 (a) H_2O (b) H_2S
 (c) NH_3 (d) PH_3
13. Which of the following is the strongest Lewis acid [EAMCET 1998]
 (a) BI_3 (b) BBr_3
 (c) BCl_3 (d) BF_3
14. An aqueous solution of ammonia consists of [MP PET 2001]
 (a) H^+ (b) OH^-
 (c) NH_4^+ (d) NH_4^+ and OH^-
15. Which of the following is not a Lewis acid [CBSE PMT 1996]
 (a) BF_3 (b) $FeCl_3$
 (c) SiF_4 (d) C_2H_4
16. The conjugate base of NH_2^- is [EAMCET 1998]
 (a) NH_3 (b) NH^{2-}
 (c) NH_4^+ (d) N_3^-
17. The strength of an acid depends on its tendency to [MP PET 1996]
 (a) Accept protons (b) Donate protons
 (c) Accept electrons (d) Donate electrons
18. Which is not a electrophile [RPET 1999]
 (a) $AlCl_3$ (b) BF_3
 (c) $(CH_3)_3C^+$ (d) NH_3
19. Ammonia gas dissolves in water to give NH_4OH . In this reaction water acts as [CPMT 1990; MP PMT 1990]
 (a) An acid (b) A base
 (c) A salt (d) A conjugate base
20. In the equilibrium
 $CH_3COOH + HF \rightleftharpoons CH_3COOH_2^+ + F^-$ [BHU 1987]
 (a) F^- is the conjugate acid of CH_3COOH
 (b) F^- is the conjugate base of HF
 (c) CH_3COOH is the conjugate acid of $CH_3COOH_2^+$
 (d) $CH_3COOH_2^+$ is the conjugate base of CH_3COOH
21. The compound that is not a Lewis acid [IIT 1985]
 (a) BF_3 (b) $AlCl_3$
 (c) $BeCl_2$ (d) NH_3
22. Which of the following dissolves in water to give a neutral solution [Bihar MADT 1994]
 (a) $(NH_4)_2SO_4$ (b) $Ba(NO_3)_2$
 (c) $CrCl_3$ (d) $CuSO_4$
23. Which of the following is the strongest acid [AMU 1982]
 (a) H_3PO_4 (b) H_2SO_4
 (c) HNO_3 [KCET 2001] (d) CH_3COOH
24. An example of a Lewis acid is [MADT Bihar 1982; AMU 1982; MNR 1994; RPMT 1997; KCET 2000; Orissa JEE 2005]
 (a) $NaCl$ (b) $MgCl_2$
 (c) $AlCl_3$ (d) $SnCl_4$
25. In the equilibrium $HClO_4 + H_2O \rightleftharpoons H_3O^+ + ClO_4^-$ [BHU 1981, 86]
 (a) $HClO_4$ is the conjugate acid of H_2O
 (b) H_2O is the conjugate acid of H_3O^+
 (c) H_3O^+ is the conjugate base of H_2O
 (d) ClO_4^- is the conjugate base of $HClO_4$
26. Which of the following would be expected to form ionic solution in water [CPMT 1976; Kurukshetra CEE 1998]
 (a) CCl_4 (b) O_2
 (c) $NaBr$ (d) $CHBr_3$
27. A solution of sodium bicarbonate in water turns [NCERT 1971]
 (a) Phenolphthalein pink (b) Methyl orange yellow
 (c) Methyl orange red (d) Blue litmus red
28. Accepting the definition that an acid is a proton donor, the acid in the following reaction $NH_3 + H_2O \rightarrow NH_4^+ + OH^-$ is [Kerala (Med.) 2003]
 (a) NH_3 (b) H^+
 (c) NH_4^+ (d) H_2O
29. With reference to protonic acids, which of the following statements is correct [CPMT 1990]
 (a) PH_3 is more basic than NH_3
 (b) PH_3 is less basic than NH_3
 (c) PH_3 is equally basic as NH_3
 (d) PH_3 is amphoteric while NH_3 is basic
30. NH_4OH is weak base because [CPMT 1979]
 (a) It has low vapour pressure
 (b) It is only slightly ionized
 (c) It is not a hydroxide of metal
 (d) It has low density

31. HNO_3 in liquid hydrogen fluoride behaves
(a) As an acid
(b) As a base
(c) Neither as a base nor as an acid
(d) As a base and as an acid
32. Aqueous solution of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ changes blue litmus paper to red due to [CPMT 1979; MP PMT 1989]
(a) Presence of Cu^{++} ions
(b) Presence of SO_4^{--} ions
(c) Hydrolysis taking place
(d) Reduction taking place
33. In the following reaction
 $\text{HC}_2\text{O}_4^- + \text{PO}_4^{--} \rightleftharpoons \text{HPO}_4^{--} + \text{C}_2\text{O}_4^{--}$
Which are the two Bronsted bases [MP PMT 1991]
(a) HC_2O_4^- and PO_4^{--} (b) HPO_4^{--} and $\text{C}_2\text{O}_4^{--}$
(c) HC_2O_4^- and HPO_4^{--} (d) PO_4^{--} and $\text{C}_2\text{O}_4^{--}$
34. Which of the following is the weakest acid [CPMT 2001]
(a) HF (b) HCl
(c) HBr (d) HI
35. The degree of dissociation in a weak electrolyte increases [CBSE PMT 1989; MP PMT 1997]
(a) On increasing dilution (b) On increasing pressure
(c) On decreasing dilution (d) None of these
36. H^+ is a [MADT Bihar 1983]
(a) Lewis acid (b) Lewis base
(c) Bronsted-Lowry base (d) None of the above
37. Dissociation of H_3PO_4 takes place in following steps [CPMT 1976; NCERT 1987]
(a) 1 (b) 2
(c) 3 (d) 4
38. The aqueous solution of disodium hydrogen phosphate is [MADT Bihar 1982]
(a) Acidic (b) Neutral
(c) Basic (d) None
39. Which of the following is a conjugated acid-base pair [MADT Bihar 1984; DPMT 2001]
(a) HCl , NaOH (b) NH_4Cl , NH_4OH
(c) H_2SO_4 , HSO_4^- (d) KCN , HCN
40. The solution of strong acid and weak base (FeCl_3) is [MADT Bihar 1981; CPMT 1979, 83, 84]
(a) Acidic (b) Basic
(c) Neutral (d) None of the above
41. The conjugate acid of HPO_3^{2-} is [EAMCET 1989]
(a) H_3PO_4 (b) H_3PO_3
(c) H_2PO_3^- (d) PO_4^{3-}
42. What name is given to the reaction between hydrogen ion and hydroxyl ion [MP PMT 1990]
(a) Hydrogenation (b) Hydroxylation
(c) Hydrolysis (d) Neutralization
43. Among the following, the weakest Lewis base is [NCERT 1981]
(a) H^- (b) OH^-
(c) Cl^- (d) HCO_3^-
44. The pK_a for acid A is greater than pK_a for acid B. The strong acid is [DPMT 2000]
(a) Acid B (b) Acid A
- (c) Both A and B (d) Neither A nor B
45. The conjugate acid of NH_2^- is [IIT 1985; Roorkee 1995; EAMCET 1997; CBSE PMT PMT 2000; MP PET 1996, 2000]
(a) NH_3 (b) NH_4^+
(c) NH_2OH (d) N_2H_4
46. Correct statement is [CPMT 1985]
(a) NH_4Cl gives alkaline solution in water
(b) CH_3COONa gives acidic solution in water
(c) CH_3COOH is a weak acid
(d) NH_4OH is a strong base
47. pK_a of a weak acid is defined as [JIPMER 1999]
(a) $\log_{10} K_a$ (b) $\frac{1}{\log_{10} K_a}$
(c) $\log_{10} \frac{1}{K_a}$ (d) $-\log_{10} \frac{1}{K_a}$
48. A salt 'X' is dissolved in water ($\text{pH} = 7$), the resulting solution becomes alkaline in nature. The salt is made of [CPMT 1983]
(a) A strong acid and strong base
(b) A strong acid and weak base
(c) A weak acid and weak base
(d) A weak acid and strong base
49. Which one is not an acid salt [MNR 1984]
(a) NaH_2PO_2 (b) NaH_2PO_3
(c) NaH_2PO_4 (d) None
50. A white substance was alkaline in solution. Which of the following substances could it be [CPMT 1989]
(a) Fe_2O_3 (b) Na_2CO_3
(c) NH_4Cl (d) NaNO_3
51. An aqueous solution of ammonium carbonate is [MP PMT 1989]
(a) Weakly acidic (b) Weakly basic
(c) Strongly acidic (d) Neither acidic nor basic
52. 100 ml of 0.2 M H_2SO_4 is added to 100 ml of 0.2 M NaOH . The resulting solution will be [BHU 1996]
(a) Acidic (b) Basic
(c) Neutral (d) Slightly basic
53. H_3BO_3 is [IIT Screening 2003]
(a) Monobasic and weak Lewis acid
(b) Monobasic and weak Bronsted acid
(c) Monobasic and strong Lewis acid
(d) Tribasic and weak Bronsted acid
54. In the reaction $\text{SnCl}_2 + 2\text{Cl}^- \rightarrow \text{SnCl}_4$, Lewis acid is [EAMCET 1987]
(a) SnCl_2 (b) Cl^-
(c) SnCl_4 (d) None of these
55. Lewis base is [RPMT 1997]
(a) CO_2 (b) SO_3
(c) SO_2 (d) ROH
56. 10 ml of 1 M H_2SO_4 will completely neutralise
(a) 10 ml of 1 M NaOH solution

- (b) 10 ml of 2 M NaOH solution
(c) 5 ml of 2 M KOH solution
(d) 5 ml of 1 M Na₂CO₃ solution
57. Which of the following compounds are diprotic [Pb. PMT 2000]
(a) H₂PO₅ (b) H₂S
(c) HClO₃ (d) H₃PO₃
58. When 100 ml of 1M NaOH solution is mixed with 10 ml of 10 M H₂SO₄, the resulting mixture will be [AMU 2002]
(a) Acidic (b) Alkaline
(c) Neutral (d) Strongly alkaline
59. The pH indicators are [KCET 1996]
(a) Salts of strong acids and strong bases
(b) Salts of weak acids and weak bases
(c) Either weak acids or weak bases
(d) Either strong acids or strong bases
60. Which of the following is not Lewis acid [BHU 1997]
(a) BF₃ (b) AlCl₃
(c) FeCl₃ (d) PH₃
61. A solution of sodium acetate in water will [MNR 1979]
(a) Turn red litmus blue (b) Turn blue litmus red
(c) Not effect litmus (d) Decolourises litmus
62. Cl⁻ is the conjugate base of [NCERT 1979; CPMT 1976; MP PET/PMT 1988]
(a) HClO₄ (b) HCl
(c) HOCl (d) HClO₃
63. Which of the following behaves as both Lewis and Bronsted base
(a) BF₃ (b) Cl⁻
(c) CO (d) None of these
64. The conjugate acid of a strong base is a [EAMCET 1979]
(a) Strong acid (b) Weak acid
(c) Strong base (d) Weak base
65. Which one is the weakest acid [DPMT 2002]
(a) HNO₃ (b) HClO₄
(c) H₂SO₄ (d) HBr
66. Conjugate base of HPO₄²⁻ is [MP PMT 1995]
(a) PO₄³⁻ (b) H₂PO₄⁻
(c) H₃PO₄ (d) H₄PO₃
67. Which of the following is not Lewis acid [RPET/PMT 2002]
(a) FeCl₃ (b) AlCl₃
(c) BCl₃ (d) NH₃
68. (i) A strong acid has a weak conjugate base
(ii) An acid is an electron pair acceptor
The above statements (i) and (ii)
(a) Correct
(b) Wrong
(c) (i) Correct and (ii) Wrong
(d) (i) Wrong and (ii) Correct
69. The pH is less than 7, of the solution of [Pb. PMT 2002; MP PMT 2003]
(a) FeCl₃ (b) NaCN
(c) NaOH (d) NaCl
70. In the reaction I₂ + I⁻ → I₃⁻, the Lewis base is [CPMT 1997; RPMT 2002; BCECE 2005]
(a) I₂ (b) I⁻
(c) I₃⁻ (d) None of these
71. The strength of an acid depends on its tendency to [UPSEAT 2001]
(a) Accept protons (b) Donate protons
(c) Accept electrons (d) Donate electrons
72. In Lewis acid-base theory, neutralization reaction may be considered as [NCERT 1977]
(a) Formation of salt and water
(b) Competition for protons by acid and base
(c) Oxidation reduction
(d) Coordinate covalent bond formation
73. The salt that forms neutral solution in water is [EAMCET 1981]
(a) NH₄Cl (b) NaCl
(c) Na₂CO₃ (d) K₃BO₃
74. Which of the following cannot act as a Lewis or Bronsted acid
(a) BF₃ (b) AlCl₃
(c) SnCl₄ (d) CCl₄
75. Which one of the following salts gives an acidic solution in water
(a) CH₃COONa (b) NH₄Cl
(c) NaCl (d) CH₃COONH₄
76. Which of the anhydrous salts when come in contact with water turns blue [AMU 1981, 82]
(a) Ferrous sulphate (b) Copper sulphate
(c) Zinc sulphate (d) Cobalt sulphate
77. The species among the following, which can act as an acid and a base is [AIEEE 2002; KCET 2005]
(a) HSO₄⁻ (b) SO₄²⁻
(c) H₃O⁺ (d) Cl⁻
78. The strongest base from the following species is [KCET 1996]
(a) NH₂⁻ (b) OH⁻
(c) O²⁻ (d) S²⁻
79. Which one is Lewis acid [CPMT 1997]
(a) Cl⁻ (b) Ag⁺
(c) C₂H₅OH (d) S²⁻
80. The conjugate acid of H₂PO₄⁻ is [MP PET 1990]
(a) H₃PO₄ (b) H₂PO₄⁻
(c) PO₄³⁻ (d) H₃O⁺
81. The conjugate acid of S₂O₈²⁻ is [EAMCET 1984]
(a) H₂S₂O₈ (b) H₂SO₄
(c) HSO₄⁻ (d) HS₂O₈⁻
82. In the reaction BCl₃ + PH₃ → Cl₃B - PH₃, Lewis base is [EAMCET 1986]
(a) BCl₃ (b) PH₃
(c) Cl₃B - PH₃ (d) None of these
83. Which of the following statement is true [MP PMT 1996]

- (a) The conjugate base of a strong acid is a strong base
(b) The conjugate base of a weak acid is a strong base
(c) The conjugate base of a weak acid is a weak base
(d) The base and its conjugate acid react to form a neutral solution
84. What is the conjugate base of OH^- [AIEEE 2005]
(a) O_2 (b) H_2O
(c) O^- (d) O^{2-}
85. Which of the following is a Lewis base [BHU 1995]
(a) CH_4 (b) $\text{C}_2\text{H}_5\text{OH}$
(c) Acetone (d) Secondary amine
86. The correct order of acid strength is [CBSE PMT 2005]
(a) $\text{HClO} < \text{HClO}_2 < \text{HClO}_3 < \text{HClO}_4$
(b) $\text{HClO}_4 < \text{HClO} < \text{HClO}_2 < \text{HClO}_3$
(c) $\text{HClO}_2 < \text{HClO}_3 < \text{HClO}_4 < \text{HClO}$
(d) $\text{HClO}_4 < \text{HClO}_3 < \text{HClO}_2 < \text{HClO}$
87. The strongest acid is [DPMT 2000]
(a) H_3AsO_4 (b) H_3AsO_3
(c) H_3PO_3 (d) H_3PO_4
88. Which of the following is the strongest base [Roorkee 2000]
(a) C_2H_5^- (b) $\text{C}_2\text{H}_5\text{COO}^-$
(c) $\text{C}_2\text{H}_5\text{O}^-$ (d) OH^-
89. The aqueous solution of which one of the following is basic [MP PMT 2001]
(a) HOCl (b) NaHSO_4
(c) NH_4NO_3 (d) NaOCl
90. Which of the following is the weakest base [IIT 1980]
(a) NaOH (b) $\text{Ca}(\text{OH})_2$
(c) NH_4OH (d) KOH
91. The suitable indicator for strong acid and weak base is [RPMT 1997; UPSEAT 2002]
(a) Methyl orange (b) Methyl red
(c) Phenol red (d) Phenolphthalein
92. Among the following acids, the weakest one is [NCERT 1984]
(a) HF (b) HCl
(c) HBr (d) HI
93. The compound HCl behaves as in the reaction,
 $\text{HCl} + \text{HF} \rightarrow \text{H}_2\text{Cl}^+ + \text{F}^-$ [JIPMER 2001]
(a) Weak base (b) Weak acid
(c) Strong base (d) Strong acid
94. The conjugate base of a strong acid is a [EAMCET 1978]
(a) Strong base (b) Strong acid
(c) Weak acid (d) Weak base
95. Which among the following is strongest acid [BHU 2005]
(a) $\text{H}(\text{ClO})\text{O}$ (b) $\text{H}(\text{ClO})\text{O}$
(c) $\text{H}(\text{ClO})\text{O}$ (d) $\text{H}(\text{ClO})$
96. In the reaction $2\text{H}_2\text{O} \rightleftharpoons \text{H}_3\text{O}^+ + \text{OH}^-$, water is [MP PET 1989]
(a) A weak base
(b) A weak acid
(c) Both a weak acid and a weak base
(d) Neither an acid nor a base
97. In the reaction $\text{HCl} + \text{H}_2\text{O} \rightleftharpoons \text{H}_3\text{O}^+ + \text{Cl}^-$ [NCERT 1978; EAMCET 1982, 89]
(a) H_2O is the conjugate base of HCl acid
(b) Cl^- is the conjugate base of HCl acid
(c) Cl^- is the conjugate acid of H_2O base
(d) H_3O^+ is the conjugate base of HCl
98. According to Lewis concept, an acid is a substance which [EAMCET 1981; NCERT 1981; CPMT 1986; MP PMT 1987]
(a) Accepts protons
(b) Donates protons
(c) Accepts a lone pair of electrons
(d) Donates a lone pair of electrons
99. Water is a [KCET 2002]
(a) Amphoteric acid (b) Aprotic solvent
(c) Protophobic solvent (d) None of these
100. Conjugate base of NH_3 is [RPMT 2002]
(a) NH_4^+ (b) NH_2^+
(c) NH_2^- (d) N_2
101. Which of the following species is an acid and also a conjugate base of another acid [NCERT 1981]
(a) HSO_4^- (b) H_2SO_4
(c) OH^- (d) H_3O^+
102. Which of the following is Lewis acid [NCERT 1978; EAMCET 1987; MP PET 1994; CPMT 1990; AFMC 1997; RPMT 1999]
(a) BF_3 (b) Cl^-
(c) H_2O (d) NH_3
103. According to Bronsted-Lowry concept, base is a substance which is [NCERT 1982]
(a) A proton donor
(b) An electron pair acceptor
(c) A proton acceptor
(d) An electron pair donor
104. Which of the following is known as hydronium ion [NCERT 1976]
(a) H^+ (b) H_2O^+
(c) H_3O^+ (d) H_2O_2^+
105. An aqueous solution of aluminium sulphate would show [NCERT 1977]
(a) An acidic reaction
(b) A neutral reaction
(c) A basic reaction
(d) Both acidic and basic reaction
106. The aqueous solution of aluminium chloride is acidic due to [MNR 1986, 88]
(a) Cation hydrolysis
(b) Anion hydrolysis
(c) Hydrolysis of both anion and cation
(d) Dissociation
107. HSO_4^- is the conjugate base of [NCERT 1977]
(a) H^+ (b) H_2SO_3
(c) SO_4^{2-} (d) H_2SO_4
108. An acid is a compound which furnishes (Bronsted-Lowry concept) [EAMCET 1977]

- (a) An electron (b) A proton
(c) An electron and a proton (d) None of the above
109. The conjugate base of sulphuric acid is [EAMCET 1974]
(a) Sodium hydroxide (b) Hydrochloric acid
(c) Bisulphate ion (d) Barium hydroxide
110. Which is strongest Lewis base [CPMT 1994]
(a) SbH_3 (b) AsH_3
(c) PH_3 (d) NH_3
111. According to Bronsted principle, an aqueous solution of HNO_3 will contain [MP PMT/PET 1988]
(a) NO_2^- (b) NO_3^-
(c) NO_2^+ (d) NO^+
112. Aqueous solution of an acid is characterised by the presence of [NCERT 1977]
(a) H^+ ions (b) H_2^+ ions
(c) H_3O^+ ions (d) H_4O^+ ions
113. Ammonium ion is [RPMT 1999; KCET 2002]
(a) Neither an acid nor base (b) Both an acid and a base
(c) A conjugate acid (d) A conjugate base
114. Aqueous solution of $AlCl_3$ is [RPMT 2002]
(a) Acidic (b) Basic
(c) Amphoteric (d) None of these
115. The species which acts as a Lewis acid but not a Bronsted acid is [MP PMT 1999; Kurukshetra CET 2002]
(a) NH_2^- (b) O^{2-}
(c) BF_3 (d) OH^-
116. Among the following, the weakest base is [MP PMT 2002]
(a) H^- (b) CH_3^-
(c) CH_3O^- (d) Cl^-
117. Which of the following is not Lewis base [EAMCET 1975; RPMT 2002]
(a) NH_3 (b) PH_3
(c) $(CH_3)_3N$ (d) HN_3
118. pK_a value of the strongest acid among the following is [MP PMT 1990]
(a) 3.0 (b) 4.5
(c) 1.0 (d) 2.0
119. The most acidic compound in water is [CBSE PMT 2001]
(a) $AlCl_3$ (b) $BeCl_2$
(c) $FeCl_3$ (d) None of these
120. BF_3 is used as a catalyst in several industrial processes due to its
(a) Strong reducing agent
(b) Weak reducing agent
(c) Strong Lewis acid nature
(d) Weak Lewis acid character
121. The aqueous solution of $AlCl_3$ is acidic due to the hydrolysis of
(a) Aluminium ion
(b) Chloride ion
(c) Both aluminium and chloride ion
(d) None of these
122. Which shows weak ionisation in water [MH CET 2001]
(a) H_2SO_4 (b) $NaCl$
(c) HNO_3 (d) NH_3
123. An organic dye, cosine used to detect end point of precipitation titration by adsorption is called [MH CET 1999]
(a) Absorption indicator (b) Adsorption indicator
(c) Chemical indicator (d) None of these
124. The indicator used in the titration of iodine against sodium thiosulphate is [AFMC 2002]
(a) Starch (b) $K_3Fe(CN)_6$
(c) K_2CrO_4 (d) Potassium
125. Phenolphthalein does not act as an indicator for the titration between [Pb. PMT 2002]
(a) $NaOH$ and CH_3COOH
(b) $H_2C_2O_4$ and $KMnO_4$
(c) $Ba(OH)_2$ and HCl
(d) KOH and H_2SO_4
126. Which is not example of Bronsted Lowry theory [AIEEE 2003]
(a) $AlCl_3$ (b) H_2SO_4
(c) SO_2 (d) HNO_3
127. An aqueous solution of sodium carbonate is alkaline because sodium carbonate is a salt of [MP PET 2002]
(a) Weak acid and weak base
(b) Strong acid and weak base
(c) Weak acid and strong base
(d) Strong acid and strong base
128. The acid that results when a base accepts a proton is called [Kerala (Med.) 2002]
(a) Conjugate base of the acid
(b) Conjugate protonated base
(c) Lewis base
(d) Conjugate acid of the base
(e) None of these
129. Ammonia gas dissolves in water to form NH_4OH . In this reaction water acts as [KCET (Engg./Med.) 1999]
(a) A conjugate base (b) A non-polar solvent
(c) An acid (d) A base
130. The conjugate base in the following reaction [DCE 1999]
 $H_2SO_4 + H_2O \rightleftharpoons H_3O^+ + HSO_4^-$
(a) H_2O (b) HSO_4^-
(c) H_3O^+ (d) SO_2
131. An aqueous solution of aluminium sulphate shows [Kerala (Med.) 2002]
(a) A basic nature
(b) An acidic nature
(c) A neutral nature
(d) Both acidic and basic nature
132. Neutralization of an acid with a base invariably results in the production of [UPSEAT 2001, 02]
(a) H_3O^+ (b) OH^-

- (c) H_2O (d) H^+ and OH^-
133. The conjugate acid of HPO_4^{2-} is [MP PMT 1987, 90, 91; EAMCET 1993]
 (a) $H_2PO_4^-$ (b) PO_4^{3-}
 (c) H_3PO_4 (d) H_3PO_3
134. Which of the following is not used as a Lewis acid [MP PET 2000]
 (a) $SnCl_4$ (b) $FeCl_3$
 (c) KCl (d) BF_3
135. Orthoboric acid in aqueous medium is [AMU 2000]
 (a) Monobasic (b) Dibasic
 (c) Tribasic (d) All are correct
136. According to Lewis concept which one of the following is not a base [MP PET/PMT 1988; Pb. PMT 2003]
 (a) OH^- (b) H_2O
 (c) Ag^+ (d) NH_3
137. The aqueous solution of ammonium chloride is [CPMT 1987]
 (a) Neutral (b) Basic
 (c) Acidic (d) Amphoteric
138. In the process $BCl_3 + PH_3 \rightarrow BCl_3 : PH_3$ The Lewis acid is [RPMT 2000]
 (a) PH_3 (b) BCl_3
 (c) Both (d) None
139. The conjugate acid of NH_3 is [BHU Varanasi 1999; Pb. PMT 2004]
 (a) NH_3 (b) NH_4^+
 (c) N_2H_4 (d) NH_2OH
140. Which halide of nitrogen is least basic [DPMT 2001]
 (a) NBr_3 (b) NI_3
 (c) NCl_3 (d) NF_3
141. When $FeCl_3$ gets soluble in water, then its solution represents which of the characteristics [MP PET/PMT 1988]
 (a) Amphoteric (b) Acidic
 (c) Basic (d) Neutral
142. Lewis acid are those substances [MP PMT 1987]
 (a) Which accept electron pair
 (b) Which provide H^+ ion in the solution
 (c) Which give electron pair
 (d) Which accept OH^- ion
143. The conjugate base of HCO_3^- is
 (a) H_2CO_3 (b) CO_3^{2-}
 (c) CO_2 (d) H_2O
144. In the reaction $NH_3 + BF_3 \rightleftharpoons NH_3 \rightarrow BF_3$, BF_3 is [MP PMT 1989; MHCET 2001]
 (a) Lewis acid
 (b) Lewis base
 (c) Neither Lewis acid nor Lewis base
 (d) Lewis acid and Lewis base both
145. The strongest Lewis base in the following [MP PET/PMT 1988]
 (a) CH_3^- (b) F^-
 (c) NH_2^- (d) OH^-
146. The aqueous solution of $CuSO_4$ is [CPMT 1985]
 (a) Acidic (b) Basic
 (c) Neutral (d) Amphoteric
147. The acid having the highest pK_a value among the following is
 (a) $HCOOH$ (b) CH_3COOH
 (c) $ClCH_2COOH$ (d) FCH_2COOH
148. The indicator used in the titration of sodium carbonate with sulphuric acid is [DPMT 2001]
 (a) Phenolphthalein
 (b) Methyl orange
 (c) Potassium ferricyanide
149. According to Bronsted law, water is a/an [MP PET/PMT 1988]
 (a) Base (b) Acid
 (c) Acid and base both (d) Salt
150. Which of the following can give base OH^- [MP PET/PMT 1988]
 (a) H_2O (b) H_3O^+
 (c) H_2 (d) HCl
151. Conjugate base of HBr is [MP PET/PMT 1988]
 (a) H_2Br^+ (b) H^+
 (c) Br^- (d) Br^+
152. Molar heat of neutralization of $NaOH$ with HCl in comparison to that of KOH with HNO_3 is [MP PMT 1989]
 (a) Less (b) More
 (c) Equal (d) Depends on pressure
153. Which of the following is not a Lewis acid [J & K 2005]
 (a) BF_3 (b) $AlCl_3$
 (c) HCl (d) $LiAlH_4$
154. The solvent which neither accepts proton nor donates proton is called [RPMT 2000]
 (a) Amphoteric (b) Neutral
 (c) Aprotic (d) Amphiprotic
155. For the reaction in aqueous solution $Zn^{2+} + X^- \rightleftharpoons ZnX^+$, the K_{eq} is greatest when X is [Pb. PMT 1998]
 (a) F^- (b) NO_3^-
 (c) ClO_4^- (d) I^-
156. Why are strong acids generally used as standard solutions in acid-base titrations [Pb. PMT 1998]
 (a) The pH at the equivalence point will always be 7
 (b) They can be used to titrate both strong and weak bases
 (c) Strong acids form more stable solutions than weak acids
 (d) The salts of strong acids do not hydrolyse
157. For an aqueous solution, the characteristic species of acid is [RPMT 1999]
 (a) H^+ ion (b) H_3O^+ ion

- (c) H_2^+ ion (d) H_4O^+ ion
158. Which is a Lewis base [CPMT 1988; JEE Orissa 2004]
(a) B_2H_6 (b) $LiAlH_4$
(c) AlH_3 (d) NH_3
159. For a weak acid, the incorrect statement is [Pb. PMT 2004]
(a) Its dissociation constant is low
(b) Its pK_a is very low
(c) It is partially dissociated
(d) Solution of its sodium salt is alkaline in water
160. Boron halides behave as Lewis acids, because of their [CBSE PMT 1996; BHU 2004]
(a) Ionic nature (b) Acidic nature
(c) Covalent nature (d) Electron deficient nature
161. Would gaseous HCl be considered as an Arrhenius acid [UPSEAT 2004]
(a) Yes
(b) No
(c) Not known
(d) Gaseous HCl does not exist
162. Which one of the following is called amphoteric solvent [UPSEAT 2004]
(a) Ammonium hydroxide (b) Chloroform
(c) Benzene (d) Water
163. Strongest conjugate base is [DPMT 2004]
(a) Cl^- (b) Br^-
(c) F^- (d) I^-
164. The conjugate base of $H_2PO_4^-$ is [AIEEE 2004]
(a) H_3PO_4 (b) P_2O_5
(c) PO_4^{3-} (d) HPO_4^{2-}
165. Conjugate base of HSO_4^- is [MH CET 2004]
(a) SO_4^{2-} (b) H_2SO_4
(c) $H_3SO_4^+$ (d) None of these
- (a) $2.0 \times 10^{-6} M$ (b) $1.0 \times 10^{-4} M$
(c) $1.6 \times 10^{-4} M$ (d) $4.0 \times 10^{-10} M$
4. In a saturated solution of electrolyte, the ionic product of their concentration are constant at constant temperature and this constant for electrolyte is known as [CPMT 1983]
(a) Ionic product (b) Solubility product
(c) Ionization constant (d) Dissociation constant
5. If the solubility product K_{sp} of a sparingly soluble salt MX_2 at $25^\circ C$ is 1.0×10^{-11} , the solubility of the salt in mole litre at this temperature will be [RPMT 2000]
(a) 2.46×10^{-14} (b) 1.36×10^{-4}
(c) 2.60×10^{-7} (d) 1.20×10^{-10}
6. The unit of ionic product of water K_w are [UPSEAT 2001, 02]
(a) $Mol^{-1}L^{-1}$ (b) $Mol^{-2}L^{-2}$
(c) $Mol^{-2}L^{-1}$ (d) Mol^2L^{-2}
7. A solution which is $10^{-3} M$ each in Mn^{2+} , Fe^{2+} , Zn^{2+} and Hg^{2+} is treated with $10^{-16} M$ sulphide ion. If K_{sp} of MnS , FeS , ZnS and HgS are 10^{-15} , 10^{-23} , 10^{-20} and 10^{-54} respectively, which one will precipitate first [IIT Screening 2003]
(a) FeS (b) MgS
(c) HgS (d) ZnS
8. Let the solubility of an aqueous solution of $Mg(OH)_2$ be x then its k_{sp} is [AIEEE 2002]
(a) $4x^3$ (b) $108x^5$
(c) $27x^4$ (d) $9x$
9. The solubility product of $BaSO_4$ at $25^\circ C$ is 1.0×10^{-9} . What would be the concentration of H_2SO_4 necessary to precipitate $BaSO_4$ from a solution of $0.01 M Ba^{2+}$ ions [RPMT 1999]
(a) 10^{-9} (b) 10^{-8}
(c) 10^{-7} (d) 10^{-6}
10. The solubility in water of a sparingly soluble salt AB_2 is $1.0 \times 10^{-5} mol l^{-1}$. Its solubility product number will be [AIEEE 2003]
(a) 4×10^{-15} (b) 4×10^{-10}
(c) 1×10^{-15} (d) 1×10^{-10}

Common ion effect, Isohydric solutions, Solubility product, Ionic product of water and Salt hydrolysis

1. The expression for the solubility product of $Al_2(SO_4)_3$ is
(a) $K_{sp} = [Al^{3+}][SO_4^{2-}]$ (b) $K_{sp} = [Al^{3+}]^2[SO_4^{2-}]^3$
(c) $K_{sp} = [Al^{3+}]^3[SO_4^{2-}]^2$ (d) $K_{sp} = [Al^{3+}]^2[SO_4^{2-}]^2$
2. On addition of ammonium chloride to a solution of ammonium hydroxide [CPMT 1976, 80, 81, 99; NCERT 1976, 77; MP PMT 1989, 99; DPMT 1983]
(a) Dissociation of NH_4OH increases
(b) Concentration of OH^- increases
(c) Concentration of OH^- decreases
(d) Concentration of NH_4^+ and OH^- increases
3. The solubility product of a salt having general formula MX_2 , in water is : 4×10^{-12} . The concentration of M^{2+} ions in the aqueous solution of the salt is [AIEEE 2005]
(a) $[Ag^+]^2[CrO_4^{2-}]$ (b) $[Ag^+][CrO_4^{2-}]$
11. The solubility of CaF_2 is a moles/litre. Then its solubility product is [Orissa JEE 2002]
(a) s^2 (b) $4s^3$
(c) $3s^2$ (d) s^3
12. On passing a current of HCl gas in a saturated solution of $NaCl$, the solubility of $NaCl$ [CPMT 1989; CBSE PMT 1989]
(a) Increases (b) Decreases
(c) Remains unchanged (d) $NaCl$ decomposes
13. Which is the correct representation of the solubility product constant of Ag_2CrO_4 [NCERT 1974, 75]
(a) $[Ag^+]^2[CrO_4^{2-}]$ (b) $[Ag^+][CrO_4^{2-}]$

- (c) $[2Ag^+][CrO_4^{2-}]$ (d) $[2Ag^+]^2[CrO_4^{2-}]$
14. The solubility of CaF_2 is 2×10^{-4} moles/litre. Its solubility product (K_{sp}) is [NCERT 1981; BHU 1983, 86; MP PET 1992; CBSE PMT 1999]
- (a) 2.0×10^{-4} (b) 4.0×10^{-3}
(c) 8.0×10^{-12} (d) 3.2×10^{-11}
15. Solubility product of a sulphide MS is 3×10^{-25} and that of another sulphide NS is 4×10^{-40} . In ammoniacal solution [NCERT 1981]
- (a) Only NS gets precipitated
(b) Only MS gets precipitated
(c) No sulphide precipitates
(d) Both sulphides precipitate
16. Which of the following salts when dissolved in water will get hydrolysed [MNR 1985; CPMT 1989; CBSE PMT 1989; MP PET 1999]
- (a) $NaCl$ (b) NH_4Cl
(c) KCl (d) Na_2SO_4
17. The aqueous solution of $FeCl_3$ is acidic due to [CPMT 1972, 79, 83, 84; MP PET/PMT 1988; RPMT 2000]
- (a) Acidic impurities (b) Ionisation
(c) Hydrolysis (d) Dissociation
18. A precipitate of $AgCl$ is formed when equal volumes of the following are mixed. [K_{sp} for $AgCl = 10^{-10}$] [KCET 2005]
- (a) $10^{-4} M AgNO_3$ and $10^{-7} M HCl$
(b) $10^{-5} M AgNO_3$ and $10^{-6} M HCl$
(c) $10^{-5} M AgNO_3$ and $10^{-4} M HCl$
(d) $10^{-6} M AgNO_3$ and $10^{-6} M HCl$
19. The solubility of silver chromate in $0.01 M K_2CrO_4$ is $2 \times 10^{-8} mol dm^{-3}$. The solubility product of silver chromate will be [MH CET 2000]
- (a) 8×10^{-24} (b) 16×10^{-24}
(c) 1.6×10^{-18} (d) 16×10^{-18}
20. Some salts although containing two different metallic elements give test for only one of them in solution. Such salts are [MNR 1979]
- (a) Double salts (b) Normal salts
(c) Complex salts (d) Basic salts
21. What is the pH value of $\frac{N}{1000} KOH$ solution [CPMT 1975; MNR 1986, 91; Pb. CET 2004]
- (a) 10^{-11} (b) 3
(c) 2 (d) 11
22. Mohr's salt is a [MNR 1986]
- (a) Normal salt (b) Acid salt
(c) Basic salt (d) Double salt
23. Aqueous solution of sodium acetate is [MNR 1978; CPMT 1971, 80, 81; MADT Bihar 1982; MP PMT 1985;]
- (a) Neutral (b) Weakly acidic
(c) Strongly acidic (d) Alkaline
24. Which is the correct alternate for hydrolysis constant of NH_4CN [CBSE PMT 1992]
- (a) $\sqrt{\frac{K_w}{K_a}}$ (b) $\frac{K_w}{K_a \times K_b}$
(c) $\sqrt{\frac{K_b}{c}}$ (d) $\frac{K_a}{K_b}$
25. Which of the following salts undergoes hydrolysis [CPMT 1972, 74, 78; DPMT 1985]
- (a) CH_3COONa (b) KNO_3
(c) $NaCl$ (d) K_2SO_4
26. What will happen if CCl_4 is treated with $AgNO_3$ [DPMT 1983]
- (a) A white ppt. of $AgCl$ will form
(b) NO_2 will be evolved
(c) CCl_4 will dissolve in $AgNO_3$
(d) Nothing will happen
27. The correct representation for solubility product of SnS_2 is [CPMT 1977; MP PET 1999; RPMT 2000]
- (a) $[Sn^{4+}][S^{2-}]^2$ (b) $[Sn^{2+}][S^{2-}]^2$
(c) $[Sn^{2+}][2S^{2-}]$ (d) $[Sn^{4+}][2S^{2-}]^2$
28. A precipitate of calcium oxalate will not dissolve in [CPMT 1971, 89; IIT 1986]
- (a) HCl (b) HNO_3
(c) Aquaregia (d) CH_3COOH
29. Baking soda is [RPMT 2000]
- (a) Basic salt (b) Acidic salt
(c) Complex salt (d) Double salt
30. Which one of the following substances will be a mixed salt [DPMT 1982; CPMT 1972]
- (a) $NaHCO_3$
(b) $Ca(OCl)Cl$
(c) $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$
(d) $Mg(OH)Br$
31. Solubility product of $BaCl_2$ is 4×10^{-9} . Its solubility in moles/litre would be [AFMC 1982; Roorkee 1990; BHU 2000]
- (a) 1×10^{-3} (b) 1×10^{-9}
(c) 4×10^{-27} (d) 1×10^{-27}
32. Which hydroxide will have lowest value of solubility product at normal temperature ($25^\circ C$) [IIT 1990; RPMT 1997]
- (a) $Mg(OH)_2$ (b) $Ca(OH)_2$
(c) $Ba(OH)_2$ (d) $Be(OH)_2$
33. Which will not be hydrolysed [MP PMT 1989]
- (a) Potassium nitrate
(b) Potassium cyanide
(c) Potassium succinate
(d) Potassium carbonate
34. Which pair will show common ion effect [MP PMT 1990, 99; Pb. PMT 2001]
- (a) $BaCl_2 + Ba(NO_3)_2$ (b) $NaCl + HCl$
(c) $NH_4OH + NH_4Cl$ (d) $AgCN + KCN$
35. Which is least soluble in water [UPSEAT 1999]

- (a) $AgCl$ (b) AgF
(c) AgI (d) Ag_2S
36. A white salt is readily soluble in water and gives a colourless solution with a pH of about 9. The salt would be [Pb. PMT 1998]
(a) NH_4NO_3 (b) CH_3COONa
(c) CH_3COONH_4 (d) $CaCO_3$
37. If acetic acid mixed with sodium acetate, then H^+ ion concentration will be [Roorkee 1995]
(a) Increased (b) Decreased
(c) Remains unchanged (d) pH decreased
38. Solubility of $AgCl$ will be minimum in [CBSE PMT 1995]
(a) $0.001 M AgNO_3$ (b) Pure water
(c) $0.01 M CaCl_2$ (d) $0.01 M NaCl$
39. In absence of formation of complex ions by the addition of a common ion, the solubility of a given salt is [BHU 1979]
(a) Increased
(b) Decreased
(c) Unaffected
(d) First increased and then decreased
40. At $298 K$, the solubility product of $PbCl_2$ is 1.0×10^{-6} . What will be the solubility of $PbCl_2$ in moles/litre [MP PMT 1990; CPMT 1985, 96]
(a) 6.3×10^{-3} (b) 1.0×10^{-3}
(c) 3.0×10^{-3} (d) 4.6×10^{-14}
41. Solubility product is [CET Pune 1998]
(a) The ionic product of an electrolyte in its saturated solution
(b) The product of the solubilities of the ions of the electrolyte
(c) The product of solubilities of the salts
(d) The product of the concentration of the ions
42. Ionic product of water increases, if [AMU 1983; MP PET 1986; MP PET/PMT 1988; JIPMER 2002]
(a) Pressure is reduced (b) H^+ is added
(c) OH^- is added (d) Temperature increases
43. Which one is a mixed salt [DPMT 1985]
(a) $NaHSO_4$ (b) $NaKSO_4$
(c) $K_4Fe(CN)_6$ (d) $Mg(OH)Cl$
44. If K_{sp} for $HgSO_4$ is 6.4×10^{-5} , then solubility of the salt is [AFMC 1997; KCET 2000; CPMT 2000; JIPMER 2001]
(a) 8×10^{-3} (b) 8×10^{-6}
(c) 6.4×10^{-5} (d) 6.4×10^{-3}
45. The solubility of $BaSO_4$ in water is $2.33 \times 10^{-3} \text{ gm/litre}$. Its solubility product will be (molecular weight of $BaSO_4 = 233$) [AIIMS 1998]
(a) 1×10^{-5} (b) 1×10^{-10}
(c) 1×10^{-15} (d) 1×10^{-20}
46. The solubility of $AgCl$ in $0.2 M NaCl$ solution (K_{sp} for $AgCl = 1.20 \times 10^{-10}$) is [MP PET 1996]
(a) $0.2 M$ (b) $1.2 \times 10^{-10} M$
(c) $0.2 \times 10^{-10} M$ (d) $6.0 \times 10^{-10} M$
47. The solubility of AgI in NaI solution is less than that in pure water because [UPSEAT 2001]
(a) AgI forms complex with NaI
(b) Of common ion effect
(c) Solubility product of AgI is less than that of NaI
(d) The temperature of the solution decreases
48. The solubility product of $BaSO_4$ is 1.5×10^{-9} . The precipitation in a $0.01 M Ba^{2+}$ solution will start, on adding H_2SO_4 of concentration [CPMT 1988]
(a) $10^{-9} M$ (b) $10^{-8} M$
(c) $10^{-7} M$ (d) $10^{-6} M$
49. At $20^\circ C$, the Ag^+ ion concentration in a saturated solution of Ag_2CrO_4 is $1.5 \times 10^{-4} \text{ mole/litre}$. At $20^\circ C$, the solubility product of Ag_2CrO_4 would be [MP PET 1997; MP PMT 1999]
(a) 3.3750×10^{-12} (b) 1.6875×10^{-10}
(c) 1.6875×10^{-12} (d) 1.6875×10^{-11}
50. The solubility of $PbCl_2$ is [MP PMT 1995; DCE 1999]
(a) $\sqrt{K_{sp}}$ (b) $\sqrt[3]{K_{sp}}$
(c) $\sqrt[3]{\frac{K_{sp}}{4}}$ (d) $\sqrt{8K_{sp}}$
51. The solubility product of $AgCl$ is 1.44×10^{-4} at $100^\circ C$. The solubility of silver chloride in boiling water may be [MP PMT 1994; Bihar MEE 1998]
(a) $0.72 \times 10^{-4} M$ (b) $1.20 \times 10^{-2} M$
(c) $0.72 \times 10^{-2} M$ (d) $1.20 \times 10^{-4} M$
52. If the solubility of a sparingly soluble salt of the type BA_2 (giving three ions on dissociation of a molecule) is x moles per litre, then its solubility product is given by [BHU 1987]
(a) x^2 (b) $2x^3$
(c) $4x^2$ (d) $4x^3$
53. The solubility product of Ag_2CrO_4 is 32×10^{-12} . What is the concentration of CrO_4^{2-} ions in that solution [BHU 1997; DPMT 2004]
(a) $2 \times 10^{-4} \text{ m/s}$ (b) $16 \times 10^{-4} \text{ m/s}$
(c) $8 \times 10^{-4} \text{ m/s}$ (d) $8 \times 10^{-8} \text{ m/s}$
54. The addition of HCl will not suppress the ionization of [MP PET 1993]
(a) Acetic acid (b) Benzoic acid
(c) H_2S (d) Sulphuric acid
- On the addition of a solution containing CrO_4^{2-} ions to the solution of Ba^{2+} , Sr^{2+} and Ca^{2+} ions, the precipitate obtained first will be of [MP PMT 1993]
(a) $CaCrO_4$ (b) $SrCrO_4$
(c) $BaCrO_4$ (d) Mixture of (a), (b), (c)
56. The solubility product of a sparingly soluble salt AB at room temperature is 1.21×10^{-6} . Its molar solubility is [CPMT 1987; MP PET 2001]
(a) 1.21×10^{-6} (b) 1.21×10^{-3}

- (c) 1.1×10^{-4} (d) 1.1×10^{-3}
57. The precipitation occurs if ionic concentration is [AFMC 1995; J & K 2005]
- (a) Less than solubility product
(b) More than solubility product
(c) Equal to solubility product
(d) None of these
58. If S and K_{sp} are respectively solubility and solubility product of a sparingly soluble binary electrolyte, then [CPMT 1988; MP PMT 1999]
- (a) $S = K_{sp}$ (b) $S = K_{sp}^2$
(c) $S = \sqrt{K_{sp}}$ (d) $S = \frac{1}{2} K_{sp}$
59. Any precipitate is formed when [AIIMS 1982; DPMT 1985; KCET 1999; MP PMT 2004]
- (a) Solution becomes saturated
(b) The value of ionic product is less than the value of solubility product
(c) The value of ionic product is equal to the value of solubility product
(d) The value of ionic product is greater than the value of solubility product
60. The solubility product of $AgCl$ is 4.0×10^{-10} at 298 K. The solubility of $AgCl$ in $0.04 M CaCl_2$ will be [KCET 1996]
- (a) $2.0 \times 10^{-5} M$ (b) $1.0 \times 10^{-4} M$
(c) $5.0 \times 10^{-9} M$ (d) $2.2 \times 10^{-4} M$
61. Hydrolysis of sodium acetate will give [MNR 1978]
- (a) Acidic solution (b) Basic solution
(c) Neutral solution (d) Normal solution
62. If the solubility product of $BaSO_4$ is 1.5×10^{-9} in water, its solubility in moles per litre, is [BHU 1995; MP PET 1995; UPSEAT 2004]
- (a) 1.5×10^{-9} (b) 3.9×10^{-5}
(c) 7.5×10^{-5} (d) 1.5×10^{-5}
63. On passing H_2S gas through a highly acidic solution containing Cd^{2+} ions, CdS is not precipitated because
- (a) Of common ion effect
(b) The solubility of CdS is low
(c) Cd^{2+} ions do not form complex with H_2S
(d) The solubility product of CdS is low
64. Which of the following will occur if a $0.1 M$ solution of a weak acid is diluted to $0.01 M$ at constant temperature [UPSEAT 2001, 02]
- (a) $[H^+]$ will decrease to $0.01 M$
(b) pH will decrease
(c) Percentage ionization will increase
(d) K_a will increase
65. If solubility of calcium hydroxide is $\sqrt{3}$, then its solubility product will be [MH CET 2002]
- (a) 27 (b) 3
(c) 9 (d) $12\sqrt{3}$
66. When NH_4Cl is added to NH_4OH solution, the dissociation of ammonium hydroxide is reduced. It is due to [MP PMT 1993]
- (a) Common ion effect (b) Hydrolysis
(c) Oxidation (d) Reduction
67. At 298 K, the solubility of $PbCl_2$ is $2 \times 10^{-2} mol/lit$, then $k_{sp} =$ [RPMT 2002]
- (a) 1×10^{-7} (b) 3.2×10^{-7}
(c) 1×10^{-5} (d) 3.2×10^{-5}
68. The solubility product of silver sulphide is 3.2×10^{-11} . Its solubility at the experimental temperature is
- (a) 2×10^{-4} moles per litre
(b) 6×10^{-6} moles per litre
(c) 1.2×10^{-5} moles per litre
(d) 8×10^{-4} moles per litre
69. The solubility of $CaCO_3$ in water is 3.05×10^{-4} moles/litre. Its solubility product will be [MP PMT 1997]
- (a) 3.05×10^{-4} (b) 10
(c) 6.1×10^{-4} (d) 9.3×10^{-8}
70. Solubility of BaF_2 in a solution $Ba(NO_3)_2$ will be represented by the concentration term [UPSEAT 2001, 02; CPMT 2002]
- (a) $[Ba^{++}]$ (b) $[F^-]$
(c) $\frac{1}{2}[F^-]$ (d) $2[NO_3^-]$
71. The solubility of $PbCl_2$ at $25^\circ C$ is 6.3×10^{-3} mole/litre. Its solubility product at that temperature is [NCERT 1979; CPMT 1985]
- (a) $(6.3 \times 10^{-3}) \times (6.3 \times 10^{-3})$
(b) $(6.3 \times 10^{-3}) \times (12.6 \times 10^{-3})$
(c) $(6.3 \times 10^{-3}) \times (12.6 \times 10^{-3})^2$
(d) $(12.6 \times 10^{-3}) \times (12.6 \times 10^{-3})$
72. Which of the following cannot be hydrolysed [MP PMT 1996]
- (a) A salt of weak acid and strong base
(b) A salt of strong acid and weak base
(c) A salt of weak acid and weak base
(d) A salt of strong acid and strong base
73. pH of water is 7. When a substance Y is dissolved in water, the pH becomes 13. The substance Y is a salt of [MP PMT 1997]
- (a) Strong acid and strong base
(b) Weak acid and weak base
(c) Strong acid and weak base
(d) Weak acid and strong base
74. Which is a basic salt [MP PMT 1985]
- (a) PbS (b) $PbCO_3$
(c) $PbSO_4$ (d) $2PbCO_3.Pb(OH)_2$
75. The saturated solution of Ag_2SO_4 is $2.5 \times 10^{-2} M$. Its solubility product (K_{sp}) is [NCERT 1980]

- (a) 62.5×10^{-6} (b) 6.25×10^{-4}
(c) 15.625×10^{-6} (d) 3.125×10^{-6}
76. K_{sp} for sodium chloride is $36 \text{ mol}^2/\text{litre}^2$. The solubility of sodium chloride is [BHU 1981]
(a) $\frac{1}{36}$ (b) $\frac{1}{6}$
(c) 6 (d) 3600
77. Sodium chloride is purified by passing hydrogen chloride gas in an impure solution of sodium chloride. It is based on [MP PMT 1996]
(a) Buffer action (b) Common ion effect
(c) Association of salt (d) Hydrolysis of salt
78. If the concentration of lead iodide in its saturated solution at 25°C be 2×10^{-3} moles per litre, then its solubility product is [CPMT 1984]
(a) 4×10^{-6} (b) 8×10^{-12}
(c) 6×10^{-9} (d) 32×10^{-9}
79. The precipitate of CaF_2 ($K_{sp} = 1.7 \times 10^{-10}$) is obtained when equal volumes of the following are mixed [IIT 1992; UPSEAT 2000]
(a) $10^{-4} \text{ M Ca}^{2+} + 10^{-4} \text{ M F}^-$
(b) $10^{-2} \text{ M Ca}^{2+} + 10^{-3} \text{ M F}^-$
(c) Both
(d) None of these
80. In the reaction: $\text{H}_2\text{S} \rightleftharpoons 2\text{H}^+ + \text{S}^{--}$, when NH_4OH is added, then [KCET (Med.) 1999; AFMC 2000]
(a) S^{--} is precipitate
(b) No action takes place
(c) Concentration of S^{--} decreases
(d) Concentration of S^{--} increases
81. What is the minimum concentration of SO_4^{2-} required to precipitate BaSO_4 in a solution containing $1.0 \times 10^{-4} \text{ mol Ba}^{2+}$? (K_{sp} for BaSO_4 is 4×10^{-10}) [MP PMT 2000]
(a) $4 \times 10^{-10} \text{ M}$ (b) $2 \times 10^{-7} \text{ M}$
(c) $4 \times 10^{-6} \text{ M}$ (d) $2 \times 10^{-3} \text{ M}$
82. Solubility product for salt AB_2 is 4×10^{-12} . Calculate solubility [RPET 2003]
(a) $1 \times 10^{-3} \text{ gm mol/litre}$
(b) $1 \times 10^{-5} \text{ gm mol/litre}$
(c) $1 \times 10^{-4} \text{ gm mol/litre}$
(d) $1 \times 10^{-2} \text{ gm mol/litre}$
83. Solubility product of a salt AB is 1×10^{-8} in a solution in which concentration of A is 10^{-3} M . The salt will precipitate when the concentration of B becomes more than [MP PET 1990; KCET 2003]
(a) 10^{-4} M (b) 10^{-7} M
(c) 10^{-6} M (d) 10^{-5} M
84. At equilibrium, if to a saturated solution of NaCl , HCl is passed, NaCl gets precipitated because [RPMT 1999]
(a) HCl is a strong acid
(b) Solubility of NaCl decreases
(c) Ionic product of NaCl becomes greater than its K_{sp}
(d) HCl is a weak acid
85. The solubility product of BaSO_4 is 1.3×10^{-9} . The solubility of this salt in pure water will be [MP PET 2002]
(a) $1.69 \times 10^{-9} \text{ mol litre}^{-1}$ (b) $1.69 \times 10^{-18} \text{ mol litre}^{-1}$
(c) $3.6 \times 10^{-18} \text{ mol litre}^{-1}$ (d) $3.6 \times 10^{-5} \text{ mol litre}^{-1}$
86. The solubility product of AgCl under standard conditions of temperature is given by [Kerala (Med.) 2003]
(a) 1.6×10^{-5} (b) 1.5×10^{-8}
(c) 3.2×10^{-10} (d) 1.5×10^{-10}
87. An aqueous solution of CH_3COONa will be [MP PET 2001]
(a) Acidic (b) Alkaline
(c) Neutral (d) None of these
88. In which of the following salt hydrolysis takes place [CPMT 1974, 78]
(a) KCl (b) NaNO_3
(c) CH_3COOK (d) K_2SO_4
89. At 90°C pure water has $[\text{H}_3\text{O}^+] = 10^{-6} \text{ M}$, the value of K_w at this temperature will be [IIT 1981; MNR 1990; CBSE PMT 1993; UPSEAT 1999]
(a) 10^{-6} (b) 10^{-12}
(c) 10^{-14} (d) 10^{-8}
90. Solubility of MX_2 type electrolyte is $0.5 \times 10^{-4} \text{ mole/litre}$. The value of K_{sp} of the electrolyte is [CBSE PMT 2002]
(a) 5×10^{-13} (b) 25×10^{-10}
(c) 1.25×10^{-13} (d) 5×10^{12}
91. According to the reaction $\text{PbCl}_2 = \text{Pb}^{2+} + 2\text{Cl}^-$, the solubility coefficient of PbCl_2 is [MP PET/PMT 1988]
(a) $[\text{Pb}^{2+}][\text{Cl}^-]^2$ (b) $[\text{Pb}^{2+}][\text{Cl}^-]$
(c) $[\text{Pb}^{2+}]^2[\text{Cl}^-]$ (d) None of these
92. K_{sp} value of $\text{Al}(\text{OH})_3$ and $\text{Zn}(\text{OH})_2$ are 8.5×10^{-23} and 1.8×10^{-14} respectively. If NH_4OH is added in a solution of Al^{3+} and Zn^{2+} , which will precipitate earlier [MP PMT 1989; CPMT 1989]
(a) $\text{Al}(\text{OH})_3$ (b) $\text{Zn}(\text{OH})_2$
(c) Both together (d) None
93. Why pure NaCl is precipitated when HCl gas is passed in a saturated solution of NaCl [NCERT 1977; MP PMT 1987; CPMT 1974, 78, 81]
(a) Impurities dissolves in HCl
(b) The value of $[\text{Na}^+]$ and $[\text{Cl}^-]$ becomes smaller than K_{sp} of NaCl
(c) The value of $[\text{Na}^+]$ and $[\text{Cl}^-]$ becomes greater than K_{sp} of NaCl
(d) HCl dissolves in the water
94. Pure NaCl is prepared by saturating a cold saturated solution of common salt in water with HCl gas. The principle used is
(a) Le Chatelier principle (b) Displacement law
(c) Common ion effect (d) Fractional distillation
95. What is the solubility of calcium fluoride in a saturated solution, if its solubility product is 3.2×10^{-11} [CPMT 1997]

- (a) 2.0×10^{-4} mole / litre (b) 12.0×10^{-3} mole / litre
(c) 0.2×10^{-4} mole / litre (d) 2×10^{-3} mole / litre
96. The following equilibrium exists in an aqueous solution of hydrogen sulphide :

$$H_2S \rightleftharpoons H^+ + HS^-$$
 If dilute HCl is added to an aqueous solution of H_2S without any change in temperature [NCERT 1989]
 (a) The equilibrium constant will change
 (b) The concentration of HS^- will increase
 (c) The concentration of undissociated H_2S will decrease
 (d) The concentration of HS^- will decrease
97. Solubility of a salt M_2X_3 is y mol dm^{-3} . The solubility product of the salt will be
 [IIT 1990, 97; AFMC 1991; RPMT 1999; MP PET 2001; MP PMT 2003; Orissa JEE 2005]
 (a) $6y^4$ (b) $64y^4$
 (c) $36y^5$ (d) $108y^5$
98. Which one of the following is most soluble
 [CBSE PMT 1994; RPMT 2000]
 (a) CuS ($K_{sp} = 8 \times 10^{-37}$) (b) MnS ($K_{sp} = 7 \times 10^{-16}$)
 (c) Bi_2S_3 ($K_{sp} = 1 \times 10^{-70}$) (d) Ag_2S ($K_{sp} = 6 \times 10^{-51}$)
99. The solubility product of $PbCl_2$ at $20^\circ C$ is 1.5×10^{-4} . Calculate the solubility [Bihar CEE 1995; BHU 2002]
 (a) 3.75×10^{-4} (b) 3.34×10^{-2}
 (c) 3.34×10^2 (d) None of these
100. Which one of the following compounds is a Lewis acid [EAMCET 1997]
 (a) PCl_3 (b) BCl_3
 (c) NCl_3 (d) $CHCl_3$
101. Which one of the following salt is most acidic in water [IIT 1995]
 (a) $NiCl_2$ (b) $BeCl_2$
 (c) $FeCl_3$ (d) $AlCl_3$
102. Which of the following aqueous solution will have a pH less than 7.0 [MP PMT 1991, 92]
 (a) KNO_3 (b) $NaOH$
 (c) $FeCl_3$ (d) $NaCN$
103. Hydrolysis constant for a salt of weak acid and weak base would be
 (a) $K_h = \frac{K_w}{K_a}$ (b) $K_h = \frac{K_w}{K_b}$
 (c) $K_h = \frac{K_w}{K_a K_b}$ (d) None of these
104. Which salt will give basic solution on hydrolysis [RPMT 1997]
 (a) KCN (b) KCl
 (c) NH_4Cl (d) CH_3COONH_4
105. Which of the following sulphides has the lowest solubility product [KCET 1996]
 (a) FeS (b) MnS
 (c) PbS (d) ZnS
106. The concentration of which ion is to be decreased, when NH_3 solution is added
 (a) OH^- (b) NH_4^+
 (c) H_3O^+ (d) O_2^-
107. The compound insoluble in acetic acid is [IIT 1986]
 (a) Calcium oxide
 (b) Calcium carbonate
 (c) Calcium oxalate
 (d) Calcium hydroxide
108. A saturated solution of Ag_2SO_4 is $2.5 \times 10^{-2} M$. The value of its solubility product is [Pb.CET 2004]
 (a) 62.5×10^{-6} (b) 6.25×10^{-4}
 (c) 15.625×10^{-6} (d) 3.125×10^{-6}
109. Solubility product of $AgCl$ is 1×10^{-6} at $298 K$. Its solubility in mole $litre^{-1}$ would be [Pb.CET 2001]
 (a) 1×10^{-6} mol / litre
 (b) 1×10^{-3} mol / litre
 (c) 1×10^{-12} mol / litre
 (d) None of these
110. A litre of solution is saturated with $AgCl$. To this solution if 1.0×10^{-4} mole of solid $NaCl$ is added, what will be the $[Ag^+]$, assuming no volume change [UPSEAT 2004]
 (a) More (b) Less
 (c) Equal (d) Zero
111. The concentration of KI and KCl in certain solution containing both is $0.001 M$ each. If $20 ml$ of this solution is added to $20 ml$ of a saturated solution of AgI in water? What will happen [MP PMT 2004]
 (a) $AgCl$ will be precipitated
 (b) AgI will be precipitated
 (c) Both $AgCl$ and AgI will be precipitated
 (d) There will be no precipitated
112. The solubility product of a sparingly soluble salt AX_2 is 3.2×10^{-11} . Its solubility (in moles / litres) is [CBSE PMT 2004]
 (a) 2×10^{-4} (b) 4×10^{-4}
 (c) 5.6×10^{-6} (d) 3.1×10^{-4}
113. $0.5 M$ ammonium benzoate is hydrolysed to 0.25 percent, hence its hydrolysis constant is [MH CET 2004]
 (a) 2.5×10^{-5} (b) 1.5×10^{-4}
 (c) 3.125×10^{-5} (d) 6.25×10^{-4}
114. The solubility of Sb_2S_3 in water is 1.0×10^{-5} mol / litre at $298 K$. What will be its solubility product [CPMT 2004]
 (a) 108×10^{-25} (b) 1.0×10^{-25}
 (c) 144×10^{-25} (d) 126×10^{-24}
115. The ionic product of water at $25^\circ C$ is 10^{-14} . The ionic product at $90^\circ C$ will be [CBSE PMT 1996]
 (a) 1×10^{-20} (b) 1×10^{-12}
 (c) 1×10^{-14} (d) 1×10^{-16}
116. In hydrolysis of a salt of weak acid and strong base, $A^- + H_2O \rightleftharpoons HA + OH^-$, the hydrolysis constant (K_h) is equal to...

- (a) $\frac{K_w}{K_a}$ (b) $\frac{K_w}{K_b}$
 (c) $\sqrt{\frac{K_a}{C}}$ (d) $\frac{K_w}{K_a \times K_b}$

Hydrogen ion concentration- pH scale and Buffer solution

- The pH of blood does not appreciably change by a small addition of an acid or a base because blood
 [CBSE PMT 1995]
 (a) Contains serum protein which acts as buffer
 (b) Contains iron as a part of the molecule
 (c) Can be easily coagulated
 (d) It is body fluid
- The pH of a 0.001 M NaOH will be
 [MP PMT 1995; UPSEAT 2001]
 (a) 3 (b) 2
 (c) 11 (d) 12
- pH value of a solution, whose hydronium ion concentration is $6.2 \times 10^{-9}\text{ mol/l}$, is
 [AFMC 1999; AIIMS 2000]
 (a) 6.21 (b) 7.21
 (c) 7.75 (d) 8.21
- 0.1 mole of CH_3NH_2 ($K_b = 5 \times 10^{-4}$) is mixed with 0.08 mole of HCl and diluted to one litre. What will be the H concentration in the solution?
 [IIT 2005]
 (a) $8 \times 10^{-7}\text{ M}$ (b) $8 \times 10^{-8}\text{ M}$
 (c) $1.6 \times 10^{-7}\text{ M}$ (d) $8 \times 10^{-8}\text{ M}$
- What will be the sum of pH and pOH in an aqueous solution?
 (a) 7 (b) pK_w
 (c) Zero (d) 1
- Hydrogen ion concentration in mol/L in a solution of $pH = 5.4$ will be
 [AIEEE 2005]
 (a) 3.98×10^8 (b) 3.88×10^6
 (c) 3.68×10^{-6} (d) 3.98×10^{-6}
- When solid potassium cyanide is added in water then
 [CPMT 2002; BHU 2002]
 (a) pH will increase
 (b) pH will decrease
 (c) pH will remain the same
 (d) Electrical conductivity will not change
- pH of a 10^{-3} M solution of hydrochloric acid will be
 [MP PET 2000]
 (a) 1.3 (b) 2.0
 (c) 3.0 (d) 4.5
- The pH of water at 25°C is nearly
 [CPMT 1986, 89, 90, 93; CBSE PMT 1989; MADT Bihar 1995]
 (a) 2 (b) 7
 (c) 10 (d) 12
- pH of a solution is 5. Its hydroxyl ion concentration is
 [JIPMER 1999]
 (a) 5 (b) 10
 (c) 10^{-5} (d) 10^{-9}
- The pH of a solution in which the $[H^+] = 0.01$, is
 [MADT Bihar 1980]
 (a) 2 (b) 1
 (c) 4 (d) 3
- At 25°C , the dissociation constant of a base BOH is 1.0×10^{-12} . The concentration of Hydroxyl ions in 0.01 M aqueous solution of the base would be
 [CBSE PMT 2005]
 (a) $2.0 \times 10^{-6}\text{ mol L}^{-1}$ (b) $1.0 \times 10^{-5}\text{ mol L}^{-1}$
 (c) $1.0 \times 10^{-6}\text{ mol L}^{-1}$ (d) $1.0 \times 10^{-7}\text{ mol L}^{-1}$
- Aqueous solution of HCl has the $pH = 4$. Its molarity would be
 (a) 4 M (b) 0.4 M
 (c) 0.0001 M (d) 10 M
- Which is a buffer solution
 [CPMT 1985, 88; AIIMS 1980; MP PMT 1994; AFMC 2004]
 (a) $\text{CH}_3\text{COOH} + \text{CH}_3\text{COONa}$
 (b) $\text{CH}_3\text{COOH} + \text{CH}_3\text{COONH}_4$
 (c) $\text{CH}_3\text{COOH} + \text{NH}_4\text{Cl}$
 (d) $\text{NaOH} + \text{NaCl}$
- The addition of solid sodium carbonate to pure water causes
 [NCERT 1973]
 (a) An increase in hydronium ion concentration
 (b) An increase in alkalinity
 (c) No change in acidity
 (d) A decrease in hydroxide ion concentration
- The aqueous solution of which of the following salt has the lowest pH
 [CBSE PMT 2002]
 (a) NaClO_2 (b) NaClO_2
 (c) NaClO_3 (d) NaClO_4
- The pH of a 10^{-10} M NaOH solution is nearest to
 [UPSEAT 2001, 02]
 (a) 10 (b) 7
 (c) 4 (d) -10
- Which will have maximum pH
 [NCERT 1979]
 (a) Distilled water
 (b) 1 M NH_3
 (c) 1 M NaOH
 (d) Water saturated by chlorine
- pH of a solution is 9.5. The solution is
 [MH CET 2000]
 (a) Neutral (b) Acidic
 (c) Basic (d) Amphoteric
- The pH of a 10^{-9} M solution of HCl in water is
 [UPSEAT 2000, 02]
 (a) 8 (b) -8
 (c) Between 7 and 8 (d) Between 6 and 7
- $pH + pOH$ equal to
 [NCERT 1975]
 (a) Zero (b) Fourteen
 (c) A negative number (d) Infinity
- Which of the following 0.1 M solution will contain the largest concentration of hydronium ions
 [NCERT 1971, 73]
 (a) NaHCO_3 (b) NH_4Cl

- (c) HCl (d) NH_3
23. Which one has pH 12 [Roorkee 1995]
 (a) $0.01 M KOH$ (b) $1 N KOH$ ml
 (c) $1 N NaOH$ ml (d) $1 N Ca(OH)_2$ ml
24. What is the correct relationship between the pH s of isomolar solutions of sodium oxide (pH_1), sodium sulphide (pH_2), sodium selenide (pH_3) and sodium telluride (pH_4)? [CBSE PMT 2005]
 (a) $pH_1 > pH_2 = pH_3 > pH_4$
 (b) $pH_1 < pH_2 < pH_3 < pH_4$
 (c) $pH_1 < pH_2 < pH_3 = pH_4$
 (d) $pH_1 > pH_2 > pH_3 > pH_4$
25. Given pH of a solution A is 3 and it is mixed with another solution B having pH 2. If both mixed then resultant pH of the solution will be [BHU 2005]
 (a) 3.2 (b) 1.9
 (c) 3.4 (d) 3.5
26. On adding solid potassium cyanide to water [MP PMT 1989]
 (a) pH will increase
 (b) pH will decrease
 (c) pH will not change
 (d) Electrical conductance will not change
27. A is an aqueous acid; B is an aqueous base. They are diluted separately, then [KCET 2002]
 (a) pH of A increases and pH of B decreases
 (b) pH of A increases and pH of B decreases till pH in each case is 7
 (c) pH of A and B increase
 (d) pH of B and A decrease
28. The compound whose $0.1 M$ solution is basic is [IIT 1986; MP PMT 1991]
 (a) Ammonium acetate
 (b) Calcium carbonate
 (c) Ammonium sulphate
 (d) Sodium acetate
29. The following reaction is known to occur in the body $CO_2 + H_2O \rightleftharpoons H_2CO_3 \rightleftharpoons H^+ + HCO_3^-$. If CO_2 escapes from the system [NCERT 1973; RPMT 1997]
 (a) pH will decrease
 (b) Hydrogen ion concentration will decrease
 (c) H_2CO_3 concentration will be unaltered
 (d) The forward reaction will be promoted
30. For preparing a buffer solution of pH 6 by mixing sodium acetate and acetic acid, the ratio of the concentration of salt and acid should be ($K_a = 10^{-5}$) [MP PET 1997]
 (a) 1 : 10 (b) 10 : 1
 (c) 100 : 1 (d) 1 : 100
31. Which is incorrect for buffer solution [CPMT 1985]
 (a) It contains weak acid and its conjugate base
 (b) It contains weak base and its conjugate acid
 (c) In this there is very less change in pH value when very less amount of acid and base is mixed
 (d) None of the above
32. pH values of HCl and $NaOH$ solutions each of strength $\frac{N}{100}$ will be respectively [MP PMT 1999]
 (a) 2 and 2 (b) 2 and 12
 (c) 12 and 2 (d) 2 and 10
33. When rain is accompanied by a thunderstorm, the collected rain water will have a pH value [AIIEE 2003]
 (a) Slightly lower than that of rain water without thunderstorm
 (b) Slightly higher than that when the thunderstorm is not there
 (c) Uninfluenced by occurrence of thunderstorm
 (d) Which depends on the amount of dust in air
34. Which of the following is the buffer solution of strong acidic nature [MP PET 2002]
 (a) $HCOOH + HCOO^-$
 (b) $CH_3COOH + CH_3COO^-$
 (c) $H_2C_2O_4 + C_2O_4^{2-}$
 (d) $H_3BO_3 + BO_3^{3-}$
35. The dissociation constant of an acid HA is 1×10^{-5} . The pH of 0.1 molar solution of the acid will be [KCET (Engg./Med.) 1999]
 (a) Five (b) Four
 (c) Three (d) One
36. The pH value of $1.0 \times 10^{-8} M HCl$ solution is less than 8 because
 (a) HCl is completely ionised at this concentration
 (b) The ionization of water is negligible
 (c) The ionization of water cannot be assumed to be negligible in comparison with this low concentration of HCl
 (d) The pH cannot be calculated at such a low concentration of HCl
37. What is the pH for a neutral solutions at the normal temperature of the human body [JIPMER 2000]
 (a) 7.2 (b) 14.0
 (c) 6.8 (d) 6.0
38. $1 M NaCl$ and $1 M HCl$ are present in an aqueous solution. The solution is [AIIEE 2002]
 (a) Not a buffer solution with $pH < 7$
 (b) Not a buffer solution with $pH > 7$
 (c) A buffer solution with $pH < 7$
 (d) A buffer solution with $pH > 7$
39. A solution has $pH = 5$, it is diluted 100 times, then it will become [NCERT 1973]
 (a) Neutral (b) Basic
 (c) Unaffected (d) More acidic
40. $0.02 M$ monobasic acid dissociates 2% hence, pH of the solution is [MH CET 2000]
 (a) 0.3979 (b) 1.3979
 (c) 1.699 (d) 3.3979
41. Components of buffer solution are $0.1 M HCN$ and $0.2 M NaCN$. What is the pH of the solution [RPET 2000]
 (a) 9.61 (b) 6.15
 (c) 2.0 (d) 4.2
42. pH of a solution of $10 ml$ $1 N$ sodium acetate and $50 ml$ $2 N$ acetic acid ($K_a = 1.8 \times 10^{-5}$), is approximately [MP PMT 2003]
 (a) 4 (b) 5
 (c) 6 (d) 7

43. By adding 20 ml 0.1 N HCl to 20 ml 0.001 N KOH, the pH of the obtained solution will be [KCET 2000]
(a) 2 (b) 1.3
(c) 0 (d) 7
44. The pH of the solution containing 10 ml of a 0.1 N NaOH and 10 ml of 0.05 N H_2SO_4 would be [Pb. PMT 2002, 04]
(a) 1 (b) 0
(c) 7 (d) > 7
45. The pH of 10^{-7} M NaOH is [MP PMT 2001]
(a) 7.01 (b) Between 7 and 8
(c) Between 9 and 10 (d) Greater than 10
46. The hydrogen ion concentration of 0.1 N solution of CH_3COOH , which is 30% dissociated, is [JIPMER 2002]
(a) 0.03 (b) 3.0
(c) 0.3 (d) 30.0
47. What is the pH of 0.1 M NH_3 [RPET 2000]
(a) 11.27 (b) 11.13
(c) 12.0 (d) 9.13
48. By adding a strong acid to the buffer solution, the pH of the buffer solution [DPMT 1996]
(a) Remains constant (b) Increases
(c) Decreases (d) Becomes zero
49. The pH of 0.1 M NaOH is [MP PET 2003]
(a) 11 (b) 12
(c) 13 (d) 14
50. pH of human blood is 7.4. Then H^+ concentration will be [RPMT 2002]
(a) 4×10^{-8} (b) 2×10^{-8}
(c) 4×10^{-4} (d) 2×10^{-4}
51. Assuming complete ionisation, the pH of 0.1 M HCl, is 1. The molarity of H_2SO_4 with the same pH is [Pb. PMT 2002]
(a) 0.1 (b) 0.2
(c) 0.05 (d) 2.0
52. Highest pH 14 is given by [DCE 1999]
(a) 0.1 M H_2SO_4 (b) 0.1 M NaOH
(c) 1 N NaOH (d) 1 N HCl
53. What will be the pH of a 10^{-8} M HCl solution [MP PET/PMT 1998; RPET 1999; MP PMT 2000]
(a) 8.0 (b) 7.0
(c) 6.98 (d) 14.0
54. When 10 ml of 0.1 M acetic acid ($pK_a = 5.0$) is titrated against 10 ml of 0.1 M ammonia solution ($pK_b = 5.0$), the equivalence point occurs at pH [AIIMS 2005]
(a) 5.0 (b) 6.0
(c) 7.0 (d) 9.0
55. Which on reaction with water will have pH less than 7 [MH CET 2001]
(a) BaO (b) CaO
(c) Na_2O (d) P_2O_5
56. A solution of $MgCl_2$ in water has pH [MP PMT 2002]
(a) < 7 (b) > 7
- (c) 7 (d) 14.2
57. pH of completely dissociated 0.005 M H_2SO_4 is [RPET 2003]
(a) 3 (b) 4
(c) 2 (d) 5
58. The pK_a of a weak acid is 4.8. What should be the ratio of [Acid]/[Salt] of a buffer if pH = 5.8 is required [MP PET 2003]
(a) 10 (b) 0.1
(c) 1 (d) 2
59. Which of the following salt is acidic [CPMT 1979, 81; NCERT 1979, 81; MP PET 1990; JIPMER 2002]
(a) Na_2SO_4 (b) $NaHSO_3$
(c) Na_2SO_3 (d) Na_2S
60. 20 ml of 0.5 N HCl and 35 ml of 0.1 N NaOH are mixed. The resulting solution will [KCET 2005]
(a) Be neutral
(b) Be basic
(c) Turn phenolphthalein solution pink
(d) Turn methyl orange red
61. The pH of a 0.02 M solution of hydrochloric acid is [MP PMT 1993]
(a) 2.0 (b) 1.7
(c) 0.3 (d) 2.2
62. A sample of $Na_2CO_3 \cdot H_2O$ weighing 0.62 g is added to 100 ml of 0.1 N $(NH_4)_2SO_4$ solution. What will be the resulting solution [BHU 1997]
(a) Acidic (b) Neutral
(c) Basic (d) None of these
63. The pH of the solution is 4. The hydrogen ion concentration of the solution in mol/litre is [UPSEAT 2000]
(a) 9.5 (b) 10^{-4}
(c) 10^4 (d) 10^{-2}
64. $NaOH_{(aq)}$, $HCl_{(aq)}$ and $NaCl_{(aq)}$ concentration of each is 10^{-3} M. Their pH will be respectively [BHU 2003]
(a) 10, 6, 2 (b) 11, 3, 7
(c) 10, 2, 6 (d) 3, 4, 7
65. The pH of 10^{-5} M aqueous solution of NaOH is [MP PET 1996]
(a) 5 (b) 7
(c) 9 (d) 11
66. The pH of 0.05 M solution of dibasic acid is [MH CET 2002]
(a) +1 (b) -1
(c) +2 (d) -2
67. A buffer solution contains 0.1 M of acetic acid and 0.1 M of sodium acetate. What will be its pH, if pK_a of acetic acid is 4.75
(a) 4.00 (b) 4.75
(c) 5.00 (d) 5.25
68. To obtain a buffer which should be suitable for maintaining a pH of about 4–5, we need to have in solution, a mixture of
(a) A strong base + its salt with a weak acid
(b) A weak base + its salt with a strong acid
(c) A strong acid + its salt with a weak base

- (d) A weak acid + its salt with a strong base
69. The concentration of NaOH solution is 10^{-8} M . Find out the (OH^-) concentration [CPMT 1993]
- (a) 10^{-8}
(b) Greater than 10^{-6}
(c) 10^{-6}
(d) Lies between 10^{-6} and 10^{-7}
70. The pH of 0.0001 N solution of KOH will be [BHU 1997; CET Pune 1998]
- (a) 4 (b) 6
(c) 10 (d) 12
71. Given that the dissociation constant for H_2O is $K_w = 1 \times 10^{-14} \text{ mole}^2 \text{ litre}^{-2}$, what is the pH of a 0.001 molar KOH solution [MP PET 1995; MP PET/PMT 1998]
- (a) 10^{-11} (b) 3
(c) 14 (d) 11
72. An acidic buffer solution can be prepared by mixing solution of [MNR 1983]
- (a) Ammonium acetate and acetic acid
(b) Ammonium chloride and hydrochloric acid
(c) Sulphuric acid and sodium sulphate
(d) Acetic acid and sulphuric acid
(e) NaCl and NaOH
73. Which of the following mixtures forms an acid buffer [MP PMT 1993; IIT 1981; CPMT 1989; CBSE PMT 1989]
- (a) $\text{NaOH} + \text{HCl}$
(b) $\text{CH}_3\text{COOH} + \text{CH}_3\text{COONa}$
(c) $\text{NH}_4\text{OH} + \text{NH}_4\text{Cl}$
(d) $\text{H}_2\text{CO}_3 + (\text{NH}_4)_2\text{CO}_3$
74. A buffer solution has equal volumes of $0.2 \text{ M NH}_4\text{OH}$ and $0.02 \text{ M NH}_4\text{Cl}$. The $\text{p}K_b$ of the base is 5. The pH is [CBSE PMT 1989; KCET 2005]
- (a) 10 (b) 9
(c) 4 (d) 7
75. The pH of a simple sodium acetate buffer is given by $\text{pH} = \text{p}K_a + \log \frac{[\text{Salt}]}{[\text{Acid}]}$
 K_a of acetic acid $= 1.8 \times 10^{-5}$
If $[\text{Salt}] = [\text{Acid}] = 0.1 \text{ M}$, the pH of the solution would be about [BHU 1987]
- (a) 7 (b) 4.7
(c) 5.3 (d) 1.4
76. Amongst the following solutions, the buffer solution is [MP PMT 1999]
- (a) $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$ solution
(b) $\text{NH}_4\text{Cl} + \text{NaOH}$ solution
(c) $\text{NH}_4\text{OH} + \text{HCl}$ solution
(d) $\text{NaOH} + \text{HCl}$ solution
77. The pH of solution having $[\text{OH}^-] = 10^{-7}$ is [AIIMS 1996]
- (a) 7 (b) 14
(c) Zero (d) -7
78. 50 ml water is added to a 50 ml solution of $\text{Ba}(\text{OH})_2$ of strength 0.01 M . The pH value of the resulting solution will be [MP PMT 1999]
- (a) 8 (b) 10
(c) 12 (d) 6
79. pH of a solution can be expressed as [CPMT 1999; UPSEAT 2001]
- (a) $-\log_e(\text{H}^+)$ (b) $-\log_{10}(\text{H}^+)$
(c) $\log_e(\text{H}^+)$ (d) $\log_{10}(\text{H}^+)$
80. The solution of sodium carbonate has pH [MP PET 2000]
- (a) Greater than 7 (b) Less than 7
(c) Equal to 7 (d) Equal to zero
81. The pH of 10^{-7} N HCl is [RPMT 2000]
- (a) 6.0 (b) 6.97
(c) 8.0 (d) 10.0
82. If the pH of a solution is 2, its normality will be [MADT Bihar 1982; MP PET 2000]
- (a) 2 N (b) $\frac{1}{2} \text{ N}$
(c) 0.01 N (d) None of these
83. The buffer solution of 100 ml having a pH value 4 when added to 1 ml dilute HCl , then the pH of buffer solution [NCERT 1976, 77]
- (a) Converts to 7 (b) Does not change
(c) Converts to 2 (d) Changes to 10
84. In a solution of acetic acid, sodium acetate is added, then its pH value [NCERT 1977; DPMT 1985; MP PMT 1994]
- (a) Decreases
(b) Increases
(c) Remains unchanged
(d) (a) and (b) both are correct
85. If pOH of a solution is 6.0, then its pH will be [MP PMT 1987]
- (a) 6 (b) 10
(c) 8 (d) 14
86. In a solution of $\text{pH} = 5$, more acid is added in order to reduce the $\text{pH} = 2$. The increase in hydrogen ion concentration is [MP PET 1989; CPMT 1993]
- (a) 100 times (b) 1000 times
(c) 3 times (d) 5 times
87. Which solution contains maximum number of H^+ ion
- (a) 0.1 M HCl (b) $0.1 \text{ M NH}_4\text{Cl}$
(c) 0.1 M NaHCO_3 (d) 0.1 M
88. A certain buffer solution contains equal concentration of X^- and HX . The K_b for X^- is 10^{-10} . The pH of the buffer is [IIT 1984; RPMT 1997; CPMT 1996; DPMT 2004]
- (a) 4 (b) 7
(c) 10 (d) 14
89. The definition of pH is [EAMCET 1980; UPSEAT 2001]
- (a) $\text{pH} = \log \frac{1}{[\text{H}^+]}$ (b) $\text{pH} = \log[\text{H}^+]$
(c) $\text{pH} = -\log \frac{1}{[\text{H}^+]}$ (d) $\text{pH} = -\log[\text{H}^+]$
90. Which of the following does not make any change in pH when added to 10 ml dilute HCl [NCERT 1975]
- (a) 5 ml pure water (b) 20 ml pure water
(c) 10 ml HCl (d) Same 20 ml dilute HCl
- A compound whose aqueous solution will have the highest pH [CPMT 1974, 75, 78; MP PET 1996; DPMT 1982, 83]

- (a) NaCl (b) Na_2CO_3
(c) NH_4Cl (d) NaHCO_3
92. At 80°C , distilled water has $[\text{H}_3\text{O}^+]$ concentration equal to 1×10^{-6} mole/litre. The value of K_w at this temperature will be [CBSE PMT 1994; RPMT 2000; AFMC 2001; AIIMS 2002; BHU 2002]
(a) 1×10^{-6} (b) 1×10^{-9}
(c) 1×10^{-12} (d) 1×10^{-15}
93. The pH value of 0.1 M NaOH solution is (when there is a given reaction $[\text{H}^+][\text{OH}^-] = 10^{-15}$) [CPMT 1997]
(a) 13 (b) 12
(c) 11 (d) 2
94. Which oxychloride has maximum pH [CPMT 1997]
(a) NaClO (b) NaClO_2
(c) NaClO_3 (d) NaClO_4
95. pH of HCl (10^{-12} M) is [CPMT 1997; Pb. PET/PMT 1999]
(a) 12 (b) -12
(c) ≈ 7 (d) 14
96. Which one is buffer solution [CPMT 1997]
(a) $[\text{PO}_4^{3-}]$ $[[\text{HPO}_4^{2-}]]$ (b) $[\text{PO}_3^{3-}]$ $[[\text{H}_2\text{PO}_4^-]]$
(c) $[\text{HPO}_4^{2-}]$ $[[\text{H}_2\text{PO}_4^-]]$ (d) All of these
97. When 100 ml of $M/10 \text{ NaOH}$ solution and 50 ml of $M/5 \text{ HCl}$ solution are mixed, the pH of resulting solution would be [RPMT 1997]
(a) 0 (b) 7
(c) Less than 7 (d) More than 7
98. How many millilitres of 6.0 M hydrochloric acid should be used to prepare 150 ml of a solution which is 0.30 M in hydrogen ion
(a) 3.0 (b) 7.5
(c) 9.3 (d) 30
99. The pH of 0.1 M acetic acid is 3, the dissociation constant of acid will be
(a) 1.0×10^{-4} (b) 1.0×10^{-5}
(c) 1.0×10^{-3} (d) 1.0×10^{-8}
100. The pH of a buffer solution containing 25 ml of $1 \text{ M CH}_3\text{COONa}$ and 25 ml of $1 \text{ M CH}_3\text{COOH}$ will be appreciably affected by 5 ml of [CPMT 1987]
(a) $1 \text{ M CH}_3\text{COOH}$ (b) $5 \text{ M CH}_3\text{COOH}$
(c) 5 M HCl (d) $1 \text{ M NH}_4\text{OH}$
101. The pH value of decinormal solution of NH_4OH which is 20% ionised, is [CBSE PMT 1998]
(a) 13.30 (b) 14.70
(c) 12.30 (d) 12.95
102. A physician wishes to prepare a buffer solution at $\text{pH} = 3.58$ that efficiently resists changes in pH yet contains only small concentration of the buffering agents. Which of the following weak acids together with its sodium salt would be best to use [CBSE PMT 1997]
(a) m -chlorobenzoic acid ($\text{p}K_a = 3.98$)
(b) p -chlorocinnamic acid ($\text{p}K_a = 4.41$)
(c) 2, 5-dihydroxy benzoic acid ($\text{p}K_a = 2.97$)
(d) Acetoacetic acid ($\text{p}K_a = 3.58$)
103. In a mixture of a weak acid and its salt, the ratio of concentration of acid to salt is increased ten-fold. The pH of the solution
(a) Decreases by one (b) Increases by one-tenth
(c) Increases by one (d) Increases ten-fold
104. When an acid or alkali is mixed with buffer solution, then pH of buffer solution [CPMT 1997]
(a) Not changes (b) Changes slightly
(c) Increases (d) Decreases
105. How much sodium acetate should be added to a 0.1 m solution of CH_3COOH to give a solution of $\text{pH} = 5.5$ ($\text{p}K_a$ of $\text{CH}_3\text{COOH} = 4.5$) [KCET 1996]
(a) 0.1 m (b) 0.2 m
(c) 1.0 m (d) 10.0 m
106. The pH of the aqueous solution containing 0.49 gm of H_2SO_4 in one litre is [EAMCET 1997]
(a) 2 (b) 1
(c) 1.7 (d) 0.3
107. Which of the following solutions can act as buffer [JIPMER 1997]
(a) $0.1 \text{ molar aq. NaCl}$
(b) $0.1 \text{ molar aq. CH}_3\text{COOH} + 0.1 \text{ molar NaOH}$
(c) $0.1 \text{ molar aq. ammonium acetate}$
(d) None of the above
108. The pH of a solution obtained by mixing 50 ml of 0.4 N HCl and 50 ml of 0.2 N NaOH is [KCET 1996]
(a) $-\log 2$ (b) $-\log 0.2$
(c) 1.0 (d) 2.0
109. Which of the following is a buffer [Pb. PMT 1998] [MP PMT 1991; BHU 1995]
(a) $\text{NaOH} + \text{CH}_3\text{COONa}$
(b) $\text{NaOH} + \text{Na}_2\text{SO}_4$
(c) $\text{K}_2\text{SO}_4 + \text{H}_2\text{SO}_4$
(d) $\text{NH}_4\text{OH} + \text{CH}_3\text{COONH}_4$
110. If 4.0 gm NaOH is present in 1 litre solution, then its pH will be [CPMT 1989]
(a) 6 (b) 13
(c) 18 (d) 24
111. The pOH of beer is 10.0. The hydrogen ion concentration will be
(a) 10^{-2} (b) 10^{-10}
(c) 10^{-8} (d) 10^{-4}
112. When a buffer solution of sodium acetate and acetic acid is diluted with water [CPMT 1985]
(a) Acetate ion concentration increases
(b) H^+ ion concentration increases
(c) OH^- ion concentration increases
(d) H^+ ion concentration remain unaltered
113. What is the pH of $\text{Ba}(\text{OH})_2$ if normality is 10 [CPMT 1996]
(a) 4 (b) 10
(c) 7 (d) 9

114. What will be the pH of a solution formed by mixing 40 ml of 0.10 M HCl with 10 ml of 0.45 M $NaOH$ [Manipal MEE 1995]
 (a) 12 (b) 10
 (c) 8 (d) 6
115. The pH of a solution having $[H^+] = 10 \times 10^{-4}$ moles/litre will be [BHU 1981]
 (a) 1 (b) 2
 (c) 3 (d) 4
116. If 0.4 gm $NaOH$ is present in 1 litre solution, then its pH will be [CPMT 1985; BHU 1980]
 (a) 2 (b) 10
 (c) 11 (d) 12
117. Which of the following is not a Bronsted acid [BHU 1997]
 (a) $CH_3NH_4^+$ (b) CH_3COO^-
 (c) H_2O (d) HSO_4^-
118. pH of 0.005 M H_2SO_4 solution will be [NCERT 1980]
 (a) 0.005 (b) 2
 (c) 1 (d) 0.01
119. A buffer solution is a mixture of [MP PMT 1987]
 (a) Strong acid and strong base
 (b) Weak acid and weak base
 (c) Weak acid and conjugate acid
 (d) Weak acid and conjugate base
120. When pH of a solution decreases, its hydrogen ion concentration
 (a) Decreases (b) Increases
 (c) Rapidly increases (d) Remains always constant
121. If the pH of a solution is 4.0 at $25^\circ C$, its pOH would be ($K_w = 10^{-14}$) [MP PMT 1989]
 (a) 4.0 (b) 6.0
 (c) 8.0 (d) 10.0
122. An aqueous solution whose $pH = 0$ is [CPMT 1976; DPMT 1982]
 (a) Alkaline (b) Acidic
 (c) Neutral (d) Amphoteric
123. In a solution of acid H^+ concentration is 10^{-10} M. The pH of this solution will be
 (a) 8 (b) 6
 (c) Between 6 and 7 (d) Between 3 and 6
124. The concentration of hydronium (H_3O^+) ion in water is [CET Pune 1998]
 (a) Zero (b) 1×10^7 gm ion/litre
 (c) 1×10^{-14} gm ion/litre (d) 1×10^{-7} gm ion/litre
125. A solution whose pH value is less than 7 will be
 (a) Basic (b) Acidic
 (c) Neutral (d) Buffer
126. When the pH of a solution is 2, the hydrogen ion concentration in moles per litre is [NCERT 1973; MNR 1979]
 (a) 1×10^{-14} (b) 1×10^{-2}
 (c) 1×10^{-7} (d) 1×10^{-12}
127. A base is dissolved in water yields a solution with a hydroxide ion concentration of 0.05 mol litre⁻¹. The solution is [AFMC 1997]
 (a) Basic (b) Acid
 (c) Neutral (d) Both (a) and (b)
128. The pH of a solution is increased from 3 to 6. Its H^+ ion concentration will be [EAMCET 1998]
 (a) Reduced to half
 (b) Doubled
 (c) Reduced by 1000 times
 (d) Increased by 1000 times
129. Pure water is kept in a vessel and it remains exposed to atmospheric CO_2 which is absorbed, then its pH will be [MADT Bihar 1984; DPMT 2002]
 (a) Greater than 7
 (b) Less than 7
 (c) 7
 (d) Depends on ionic product of water
130. The pH of a solution is 2. If its pH is to be raised to 4, then the $[H^+]$ of the original solution has to be [MP PET 1994]
 (a) Doubled
 (b) Halved
 (c) Increased hundred times
 (d) Decreased hundred times
131. Which of the following solutions cannot act as a buffer [EAMCET 1998]
 (a) $NaH_2PO_4 + H_3PO_4$
 (b) $CH_3COOH + CH_3COONa$ [MADT Bihar 1981]
 (c) $HCl + NH_4Cl$
 (d) $H_3PO_4 + Na_2HPO_4$
132. Assuming complete ionisation, the pH of 0.1M HCl is 1. The molarity of H_2SO_4 with the same pH is [KCET 1998]
 (a) 0.2 (b) 0.1
 (c) 2.0 (d) 0.05
133. The pH of blood is
 (a) 5.2 (b) 6.3
 (c) 7.4 (d) 8.5
134. The pH of 10^{-8} molar aqueous solution of HCl is [CPMT 1988; MNR 1983, 90; MP PMT 1987; IIT 1981; BHU 1995; AFMC 1998; MP PET 1989, 99; BCECE 2005]
 (a) -8
 (b) 8
 (c) $6 > 7$ (Between 6 and 7)
 (d) $7 > 8$ (Between 7 and 8)
135. As the temperature increases, the pH of a KOH solution [UPSEAT 2001]
 (a) Will decrease
 (b) Will increase
 (c) Remains constant
 (d) Depends upon concentration of KOH solution
136. The hydrogen ion concentration in a given solution is 6×10^{-4} . Its pH will be [EAMCET 1978]
 (a) 6 (b) 4
 (c) 3.22 (d) 2

137. The pH of $\frac{N}{100}$ HCl would be approximately
[CPMT 1971; DPMT 1982, 83; MP PMT 1991; Bihar MEE 1996]
(a) 1 (b) 1.5
(c) 2 (d) 2.5
138. A solution which is resistant to change of pH upon the addition of an acid or a base is known as [BHU 1979]
(a) A colloid (b) A crystalloid
(c) A buffer (d) An indicator
139. $10^{-6} M$ HCl is diluted to 100 times. Its pH is [CPMT 1984]
(a) 6.0 (b) 8.0
(c) 6.95 (d) 9.5
140. The pH of a 10^{-10} molar HCl solution is approximately [NCERT 1977]
(a) 10 (b) 7
(c) 1 (d) 14
141. The H^+ ion concentration is 1.0×10^{-6} mole/litre in a solution. Its pH value will be [MP PMT 1985; AFMC 1982]
(a) 12 (b) 6
(c) 18 (d) 24
142. The pH of a solution is the negative logarithm to the base 10 of its hydrogen ion concentration in [Manipal MEE 1995]
(a) Moles per litre (b) Millimoles per litre
(c) Micromoles per litre (d) Nanomoles per litre
143. When 10^{-8} mole of HCl is dissolved in one litre of water, the pH of the solution will be [CPMT 1973, 94; DPMT 1982]
(a) 8 (b) 7
(c) Above 8 (d) Below 7
144. The pH of the solution containing 10 ml of 0.1 N $NaOH$ and 10 ml of 0.05 N H_2SO_4 would be [CPMT 1987; Pb. PMT 2002,04]
(a) 0 (b) 1
(c) > 7 (d) 7
145. The pH of 0.001 molar solution of HCl will be [MP PET 1986; MP PET/PMT 1988; CBSE PMT 1991]
(a) 0.001 (b) 3
(c) 2 (d) 6
146. Which salt can be classified as an acid salt [CPMT 1989]
(a) Na_2SO_4 (b) $BiOCl$
(c) $Pb(OH)Cl$ (d) Na_2HPO_4
147. Given a 0.1 M solution of each of the following. Which solution has the lowest pH [MNR 1987]
(a) $NaHSO_4$ (b) NH_4Cl
(c) HCl (d) NH_3
148. Out of the following, which pair of solutions is not a buffer solution
(a) $NH_4Cl + NH_4OH$
(b) $NaCl + NaOH$
(c) $Na_2HPO_4 + Na_3PO_4$
(d) $CH_3COOH + CH_3COONa$
149. If the dissociation constant of an acid HA is 1×10^{-5} , the pH of a 0.1 molar solution of the acid will be approximately [NCERT 1979]
(a) Three (b) Five
(c) One (d) Six
150. pH value of $N/10$ $NaOH$ solution is [CBSE PMT 1996; Pb. CET 2001; Pb. PMT 2002]
(a) 10 (b) 11
(c) 12 (d) 13
151. A solution of sodium borate has a pH of approximately [JIPMER 2001]
(a) < 7 (b) > 7
(c) $= 7$ (d) Between 4 to 5
152. If pH of A , B , C and D are 9.5, 2.5, 3.5 and 5.5 respectively, then strongest acid is [AFMC 1995]
(a) A (b) C
(c) D (d) B
153. At $25^\circ C$ the pH value of a solution is 6. The solution is [AFMC 2001]
(a) Basic (b) Acidic
(c) Neutral (d) Both (b) and (c)
154. A certain buffer solution contains equal concentration of X^- and HX . The K_a for HX is 10^{-8} . The pH of the buffer is [UPSEAT 2001]
(a) 3 (b) 8
(c) 11 (d) 14
155. The dissociation constant of HCN is 5×10^{-10} . The pH of the solution prepared by mixing 1.5 mole of HCN and 0.15 moles of KCN in water and making up the total volume to $0.5 dm^3$ is
(a) 7.302 (b) 9.302
(c) 8.302 (d) 10.302
156. Which buffer solution out of the following will have $pH > 7$ [MP PET 2001]
(a) $CH_3COOH + CH_3COONa$
(b) $HCOOH + HCOOK$
(c) CH_3COONH_4
(d) $NH_4OH + NH_4Cl$
157. The pK_a of equimolecular sodium acetate and acetic acid mixture is 4.74. If pH is [DPMT 2001]
(a) 7 (b) 9.2
(c) 4.74 (d) 14
158. pH of $NaCl$ solution is [CET Pune 1998]
(a) 7 (b) Zero
(c) > 7 (d) < 7
159. A solution of sodium chloride in contact with atmosphere has a pH of about [NCERT 1972, 77]
(a) 3.5 (b) 5
(c) 7 (d) 14
160. Which would decrease the pH of $25 cm^3$ of a 0.01 M solution of hydrochloric acid [MH CET 2001]
(a) The addition of $25 cm^3$ 0.005 M hydrochloric acid
(b) The addition of $25 cm^3$ of 0.02 M hydrochloric acid
(c) The addition of magnesium metal
(d) None of these
161. The condition for minimum change in pH for a buffer solution is
(a) Isoelectronic species are added
(b) Conjugate acid or base is added

- (c) $pH = pK_a$
(d) None of these
162. A buffer solution with pH 9 is to be prepared by mixing NH_4Cl and NH_4OH . Calculate the number of moles of NH_4Cl that should be added to one litre of $1.0\text{ M } NH_4OH$.
[$K_b = 1.8 \times 10^{-5}$] [UPSEAT 2001]
(a) 3.4 (b) 2.6
(c) 1.5 (d) 1.8
163. The ionization constant of a certain weak acid is 10^{-4} . What should be the [salt] to [acid] ratio if we have to prepare a buffer with $pH = 5$ using this acid and one of the salts [CPMT 2000; KCET 2000; PMT 2000]
(a) 1:10 (b) 10:1
(c) 5:4 (d) 4:5
164. Which solution has the highest pH value [JIPMER 2000]
(a) 1 M KOH
(b) $1\text{ M } H_2SO_4$
(c) Chlorine water
(d) Water containing carbon dioxide
165. One weak acid (like CH_3COOH) and its strong base together with salt (like CH_3COONa) is a buffer solution. In which pair this type of characteristic is found [AIIMS 1982; CPMT 1994; MP PET 1994]
(a) HCl and $NaCl$ (b) $NaOH$ and $NaNO_3$
(c) KOH and KCl (d) NH_4OH and NH_4Cl
166. If the pH of a solution of an alkali metal hydroxide is 13.6, the concentration of hydroxide is [JIPMER 2000]
(a) Between 0.1 M and 1 M
(b) More than 1 M
(c) Less than 0.001 M
(d) Between 0.01 M and 1 M
167. The pK_a of acetylsalicylic acid (aspirin) is 3.5. The pH of gastric juice in human stomach is about 2-3 and the pH in the small intestine is about 8. Aspirin will be [IIT 1988; KCET 2003]
(a) Unionized in the small intestine and in the stomach
(b) Completely ionized in the small intestine and in the stomach
(c) Ionized in the stomach and almost unionized in the small intestine
(d) Ionized in the small intestine and almost unionized in the stomach
168. The concentration of hydrogen ion in water is [MP PET 1990]
(a) 8 (b) 1×10^{-7}
(c) 7 (d) $1/7$
169. pH of a 10 M solution of HCl is [CBSE PMT 1995]
(a) Less than 0 (b) 2
(c) 0 (d) 1
170. The pH of $1\text{ N } H_2O$ is [CPMT 1988]
(a) 7 (b) >7
(c) <7 (d) 0
171. If H^+ ion concentration of a solution is increased by 10 times its pH will be [DCE 2000]
(a) Increase by one (b) Remains unchanged
(c) Decrease by one (d) Increase by 10
172. The gastric juice in our stomach contains enough HCl to make the hydrogen ion concentration about 0.01 mole/litre . The pH of gastric juice is [NCERT 1974]
(a) 0.01 (b) 1
(c) 2 (d) 14
173. Addition of which chemical will decrease the hydrogen ion concentration of an acetic acid solution [MP PMT 1990]
(a) NH_4Cl (b) $Al_2(SO_4)_3$
(c) $AgNO_3$ (d) HCN
174. Which one has the highest value of pH is
(a) Distilled water
(b) NH_3 solution in water
(c) NH_3
(d) Water saturated with Cl_2
175. The solution of Na_2CO_3 has pH [AMU 1988]
(a) Greater than 7 (b) Less than 7
(c) Equal to 7 (d) Equal to zero
176. Which is not a buffer solution [CPMT 1990]
(a) $NH_4Cl + NH_4OH$
(b) $CH_3COOH + CH_3COONa$
(c) CH_3COONH_4
(d) Borax + Boric acid
177. What will be hydrogen ion concentration in moles litre^{-1} of a solution, whose pH is 4.58 [UPSEAT 2001]
(a) 2.63×10^{-5} (b) 3.0×10^{-5}
(c) 4.68 (d) None of these
178. Assuming complete dissociation, the pH of a 0.01 M $NaOH$ solution is equal to [NCERT 1975; CPMT 1977; DPMT 1982; BHU 1997]
(a) 2.0 (b) 14.0
(c) 12.0 (d) 0.01
179. 50 ml of 2 N acetic acid mixed with 10 ml of 1 N sodium acetate solution will have an approximate pH of [MP PMT/PET 1988]
(a) 4 (b) 5
(c) 6 (d) 7
180. The hydrogen ion concentration of 0.001 M $NaOH$ solution is
(a) $1 \times 10^{-2}\text{ mole/litre}$ (b) $1 \times 10^{-11}\text{ mole/litre}$
(c) $1 \times 10^{-14}\text{ mole/litre}$ (d) $1 \times 10^{-12}\text{ mole/litre}$
181. A weak monoprotic acid of 0.1 M , ionizes to 1% in solution. What will be the pH of solution [MNR 1988]
(a) 1 (b) 2
(c) 3 (d) 11
182. pH of a solution is 4. The hydroxide ion concentration of the solution would be [NCERT 1981; CBSE PMT 1991; MP PMT 1994]
(a) 10^{-4} (b) 10^{-10}
(c) 10^{-2} (d) 10^{-12}
183. The pH of an aqueous solution containing $[H^+] = 3 \times 10^{-3}\text{ M}$ is [MP PET 2001,04]
(a) 2.471 (b) 2.523
(c) 3.0 (d) -3

184. pH of blood is maintained constant by mechanism of [MH CET 2002]
 (a) Common ion effect (b) Buffer
 (c) Solubility (d) All of these
185. The pH of normal KOH is [MP PET 1990]
 (a) 1 (b) 0
 (c) 14 (d) 7
186. The concentration of hydrogen ion $[H^+]$ in $0.01\ M\ HCl$ is [EAMCET 1979]
 (a) 10^{12} (b) 10^{-2}
 (c) 10^{-1} (d) 10^{-12}
187. A solution of weak acids is diluted by adding an equal volume of water. Which of the following will not change [JIPMER 1997]
 (a) Strength of the acid
 (b) The value of $[H_3O^+]$
 (c) pH of the solution
 (d) The degree of dissociation of acid
188. K_a of H_2O_2 is of the order of [DCE 2004]
 (a) 10^{-12} (b) 10^{-14}
 (c) 10^{-16} (d) 10^{-10}
189. Equivalent weight of an acid [UPSEAT 2004]
 (a) Depends on the reaction involved
 (b) Depends upon the number of oxygen atoms present
 (c) Is always same
 (d) None of the above
190. pH scale was introduced by [UPSEAT 2004]
 (a) Arrhenius (b) Sorensen
 (c) Lewis (d) Lowry
191. Buffer solution is prepared by mixing [MH CET 2003]
 (a) Strong acid + its salt of strong base
 (b) Weak acid + its salt of weak base
 (c) Strong acid + its salt of weak base
 (d) Weak acid + its salt of strong base
192. The pH of millimolar HCl is [MH CET 2004]
 (a) 1 (b) 3
 (c) 2 (d) 4
193. Which of the following is a Lewis base [CPMT 2004]
 (a) $NaOH$ (b) NH_3
 (c) BCl_3 (d) All of these
194. What will be the pH value of $0.05\ M\ Ba(OH)_2$ solution [CPMT 2004]
 (a) 12 (b) 13
 (c) 1 (d) 12.96
195. In a mixing of acetic acid and sodium acetate the ratio of concentration of the salts to the acid is increased ten times. Then the pH of the solution [KCET 2004]
 (a) Increase by one (b) Decreases by one
 (c) Decrease ten fold (d) Increases ten fold
196. The rapid change of pH near the stoichiometric point of an acid-base titration is the basis of indicator detection. pH of the solution is related to ratio of the concentrations of the conjugate acid (HIn) and base (In^-) forms of the indicator by the expression
 (a) $\log \frac{[HIn]}{[In^-]} = pH - pK_{In}$ (b) $\log \frac{[In^-]}{[HIn]} = pH - pK_{In}$
 (c) $\log \frac{[In^-]}{[HIn]} = pK_{In} - pH$ (d) $\log \frac{[HIn]}{[In^-]} = pK_{In} - pH$
197. Which of the following statement(s) is(are) correct [IIT 1998]
 (a) The pH of $1.0 \times 10^{-8}\ M$ solution of HCl is 8
 (b) The conjugate base of $H_2PO_4^-$ is HPO_4^{2-}
 (c) Autoprotolysis constant of water increases with temperature
 (d) When a solution of a weak monoprotic acid is titrated against a strong base, at half neutralization point $pH = \frac{1}{2} pK_a$
198. An aqueous solution of sodium carbonate has a pH greater than 7 because [DCE 2003]
 (a) It contains more carbonate ions than H_2O molecules
 (b) Contains more hydroxide ions than carbonate ions
 (c) Na^+ ions react with water
 (d) Carbonate ions react with H_2O
199. A pH of 7 signifies [CPMT 1974; DPMT 1982]
 (a) Pure water (b) Neutral solution
 (c) Basic solution (d) Acidic solution
200. Assuming complete dissociation, which of the following aqueous solutions will have the same pH value [Roorkee Qualifying 1998]
 (a) 100 ml of $0.01\ M\ HCl$
 (b) 100 ml of $0.01\ M\ H_2SO_4$
 (c) 50 ml of $0.01\ M\ HCl$
 (d) Mixture of 50 ml of $0.02\ M\ H_2SO_4$ and 50 ml of $0.02\ M\ NaOH$
201. A buffer solution can be prepared from a mixture of [IIT 1999; KCET 1999; MP PMT 2002]
 (a) Sodium acetate and acetic acid in water
 (b) Sodium acetate and hydrochloric acid in water
 (c) Ammonia and ammonium chloride in water
 (d) Ammonia and sodium hydroxide in water
202. Which of the following will not function as a buffer solution [Roorkee 2000]
 (a) $NaCl$ and $NaOH$
 (b) $NaOH$ and NH_4OH
 (c) CH_3COONH_4 and HCl
 (d) Borax and boric acid
203. Which one of the following statements is not true [AIEEE 2003]
 (a) The conjugate base of $H_2PO_4^-$ is HPO_4^{2-}
 (b) $pH + pOH = 14$ for all aqueous solutions
 (c) The pH of $1 \times 10^{-8}\ M\ HCl$ is 8
 (d) 96,500 coulombs of electricity when passed through a $CuSO_4$ solution deposits 1 gram equivalent of copper at the cathode
204. The pH value of $0.1\ M\ HCl$ is approximately 1. What will be the approximate pH value of $0.05\ M\ H_2SO_4$ [MP PMT 1991]
 (a) 0.7 (b) 0.5
 (c) 1 (d) 2
205. The K_{sp} of $Mg(OH)_2$ is 1×10^{-12} , $0.01\ M\ Mg(OH)_2$ will precipitate at the limiting pH [DPMT 2005]
 (a) 3 (b) 9
 (c) 5 (d) 8

206. The pH of an aqueous solution having hydroxide ion concentration as 1×10^{-5} is [MP PMT 1991]
 (a) 5 (b) 9
 (c) 4.5 (d) 11

Critical Thinking

Objective Questions

- The K_{sp} of AgI is 1.5×10^{-16} . On mixing equal volumes of the following solutions, precipitation will occur only with [AMU 2000]
 (a) $10^{-7} M Ag^+$ and $10^{-19} M I^-$
 (b) $10^{-8} M Ag^+$ and $10^{-8} M I^-$
 (c) $10^{-16} M Ag^+$ and $10^{-16} M I^-$
 (d) $10^{-9} M Ag^+$ and $10^{-9} M I^-$
- The strongest Bronsted base in the following anion is [IIT 1981; MP PET 1992, 97; MP PMT 1994; RPMT 1999; KCET 2000; AIIMS 2001; UPSEAT 2002; AFMC 2002; Pb. CET 2004]
 (a) ClO^- (b) ClO_2^-
 (c) ClO_3^- (d) ClO_4^-
- Which one of the following compound is not a protonic acid [CBSE PMT 2003]
 (a) $SO_2(OH)_2$ (b) $B(OH)_3$
 (c) $PO(OH)_3$ (d) $SO(OH)_2$
- Calculate the hydrolysis constant of the salt containing NO_2 . Given the K_a for $HNO_2 = 4.5 \times 10^{-10}$ [UPSEAT 2001]
 (a) 2.22×10^{-5} (b) 2.02×10^5
 (c) 4.33×10^4 (d) 3.03×10^{-5}
- The molar solubility ($mol L^{-1}$) of a sparingly soluble salt MX_4 is 's'. The corresponding solubility product is K_{sp} . 's' is given in terms of K_{sp} by the relation [AIEEE 2004]
 (a) $s = (256K_{sp})^{1/5}$ (b) $s = (128K_{sp})^{1/4}$
 (c) $s = (K_{sp}/128)^{1/4}$ (d) $s = (K_{sp}/256)^{1/5}$
- Electrophiles are [RPET 2000]
 (a) Lewis acids (b) Lewis base
 (c) Bronsted acid (d) Bronsted base
- Total number of moles for the reaction $2HI \rightleftharpoons H_2 + I_2$, if α is degree of dissociation is [CBSE PMT 1996]
 (a) 2 (b) $2 - \alpha$
 (c) 1 (d) $1 - \alpha$
- Which one is a Lewis acid [RPMT 1997]
 (a) ClF_3 (b) H_2O
 (c) NH_3 (d) None of these
- Heat of neutralisation of weak acid and strong base is less than the heat of neutralisation of strong acid and strong base due to
 (a) Energy has to be spent for the total dissociation of weak acid
 (b) Salt of weak acid and strong base is not stable
 (c) Incomplete dissociation of weak acid
 (d) Incomplete neutralisation of weak acid
- pK_a values of two acids A and B are 4 and 5. The strengths of these two acids are related as [KCET 2001]
 (a) Acid A is 10 times stronger than acids B
 (b) Strength of acid A : strength of acid B = 4 : 5
 (c) The strengths of the two acids can not be compared
 (d) Acid B is 10 times stronger than acid A
- The dissociation constant of two acids HA_1 and HA_2 are 3.14×10^{-4} and 1.96×10^{-5} respectively. The relative strength of the acids will be approximately [RPMT 2000]
 (a) 1 : 4 (b) 4 : 1
 (c) 1 : 16 (d) 16 : 1
- An aqueous solution of ammonium acetate is [NCERT 1980, 81; RPMT 1999]
 (a) Faintly acidic (b) Faintly basic
 (c) Fairly acidic (d) Almost neutral
- The dissociation constant of a weak acid is 1.0×10^{-5} , the equilibrium constant for the reaction with strong base is [MP PMT 1990]
 (a) 1.0×10^{-5} (b) 1.0×10^{-9}
 (c) 1.0×10^9 (d) 1.0×10^{14}
- The pH of 0.1 M solution of the following salts increases in the order [IIT 1999]
 (a) $NaCl < NH_4Cl < NaCN < HCl$
 (b) $HCl < NH_4Cl < NaCl < NaCN$
 (c) $NaCN < NH_4Cl < NaCl < HCl$
 (d) $HCl < NaCl < NaCN < NH_4Cl$
- Which of the following is the strongest acid [AMU 1999; MH CET 1999, 2002]
 (a) $SO(OH)_2$ (b) $SO_2(OH)_2$
 (c) $ClO_3(OH)$ (d) $PO(OH)_3$
- The strongest of the four acids listed below is [NCERT 1984]
 (a) $HCOOH$ (b) CH_3COOH
 (c) $ClCH_2COOH$ (d) FCH_2COOH
- Which equilibrium can be described as an acid-base reaction using the Lewis acid-base definition but not using the Bronsted-Lowry definition [AIIMS 1980]
 (a) $2NH_3 + H_2SO_4 \rightleftharpoons 2NH_4^+ + SO_4^{2-}$
 (b) $NH_3 + CH_3COOH \rightleftharpoons NH_4^+ + CH_3COO^-$
 (c) $H_2O + CH_3COOH \rightleftharpoons H_3O^+ + CH_3COO^-$
 (d) $[Cu(H_2O)_4]^{2+} + 4NH_3 \rightleftharpoons [Cu(NH_3)_4]^{2+} + 4H_2O$
- The hydride ion H^- is stronger base than its hydroxide ion OH^- . Which of the following reaction will occur if sodium hydride (NaH) is dissolved in water [CBSE PMT 1997]
 (a) $H^-(aq) + H_2O \rightarrow H_2O$
 (b) $H^-(aq) + H_2O(l) \rightarrow OH^- + H_2$ [KCET 2002]

- (c) $H^- + H_2O \rightarrow$ No reaction
(d) None of these
19. Dissociation constant of a weak acid is 1×10^{-4} . Equilibrium constant of its reaction with strong base is [UPSEAT 2003]
(a) 1×10^{-4} (b) 1×10^{10}
(c) 1×10^{-10} (d) 1×10^{14}
20. Arrange the acids (I) H_2SO_3 (II) H_3PO_4 and (III) $HClO$ in the decreasing order of acidity [UPSEAT 2001]
(a) I > III > II (b) I > II > III
(c) II > III > I (d) III > I > II
21. Self-ionisation of liquid ammonia occurs as, $2NH_3 \rightleftharpoons NH_4^+ + NH_2^-$; $K = 10^{-10}$. In this solvent, an acid might be [JIPMER 2001]
(a) NH_4^+
(b) NH_3
(c) Any species that will form NH_4^+
(d) All of these
22. $\Delta H_f(H_2O) = X$; Heat of neutralisation of CH_3COOH and $NaOH$ will be [BHU 2003]
(a) Less than $2X$ (b) Less than X
(c) X (d) Between X and $2X$
23. Which of the following oxides will not give OH^- in aqueous solution [NCERT 1980]
(a) Fe_2O_3 (b) MgO
(c) Li_2O (d) K_2O
24. A precipitate of CaF_2 ($K_{sp} = 1.7 \times 10^{-10}$) will be obtained when equal volume of the following are mixed [MP PMT 1990, 95; IIT 1982; MNR 1992]
(a) $10^{-4} M Ca^{2+}$ and $10^{-4} M F^-$
(b) $10^{-2} M Ca^{2+}$ and $10^{-3} M F^-$
(c) $10^{-5} M Ca^{2+}$ and $10^{-3} M F^-$
(d) $10^{-3} M Ca^{2+}$ and $10^{-5} M F^-$
25. The degree of hydrolysis of a salt of weak acid and weak base in its $0.1 M$ solution is found to be 50%. If the molarity of the solution is $0.2 M$, the percentage hydrolysis of the salt should be [AMU 1999]
(a) 50% (b) 35%
(c) 75% (d) 100%
26. The pH of $0.1 M$ solution of a weak monoprotic acid 1% ionized is [UPSEAT 2001; Pb. PMT 2001]
(a) 1 (b) 2
(c) 3 (d) 4
27. Which one is the strongest acid [MH CET 1999; AMU 1999, 2000; Pb. CET 2001, 03; MP PET 2001]
(a) $HClO$ (b) $HClO_2$
(c) H_2SO_4 (d) $HClO_4$
28. Which of the following is Lewis acid [Pb. CET 2000]
(a) S (b) $:CH_2$
(c) $(CH_3)_3B$ (d) All of these
29. The solubility product of $Mg(OH)_2$ is 1.2×10^{-11} . The solubility of this compound in gram per $100 cm^3$ of solution is [Roorkee 2000]
(a) 1.4×10^{-4} (b) 8.16×10^{-4}
(c) 0.816 (d) 1.4
30. What is $[H^+]$ of a solution that is $0.01 M$ in HCN and $0.02 M$ in $NaCN$ (K_a for $HCN = 6.2 \times 10^{-10}$) [MP PMT 2000]
(a) 3.1×10^{10} (b) 6.2×10^5
(c) 6.2×10^{-10} (d) 3.1×10^{-10}
31. Which is nucleophile [DPMT 2001; RPMT 2002]
(a) BF_3 (b) NH_3
(c) $BeCl_2$ (d) H_2O
32. The solubility of $CuBr$ is $2 \times 10^{-4} mol/l$ at $25^\circ C$. The K_{sp} value for $CuBr$ is [AIIMS 2002]
(a) $4 \times 10^{-8} mol^2 l^{-2}$ (b) $4 \times 10^{-11} mol^2 l^{-1}$
(c) $4 \times 10^{-4} mol^2 l^{-2}$ (d) $4 \times 10^{-15} mol^2 l^{-2}$
33. A $0.004 M$ solution of Na_2SO_4 is isotonic with a $0.010 M$ solution of glucose at same temperature. The apparent degree of dissociation of Na_2SO_4 is [IIT JEE Screening 2004]
(a) 25% (b) 50%
(c) 75% (d) 85%
34. K_{sp} for $Cr(OH)_3$ is 2.7×10^{-31} . What is its solubility in moles / litre. [JEE Orissa 2004]
(a) 1×10^{-8} (b) 8×10^{-8}
(c) 1.1×10^{-8} (d) 0.18×10^{-8}
35. pK_a of acetic acid is 4.74. The concentration of CH_3COONa is $0.01 M$. The pH of CH_3COONa is [Orissa JEE 2004]
(a) 3.37 (b) 4.37
(c) 4.74 (d) 0.474
36. If the solubility product of $AgBrO_3$ and Ag_2SO_4 are 5.5×10^{-5} and 2×10^{-5} respectively, the relationship between the solubilities of these can be correctly represented as [EAMCET 1985]
(a) $S_{AgBrO_3} > S_{Ag_2SO_4}$ (b) $S_{AgBrO_3} < S_{Ag_2SO_4}$
(c) $S_{AgBrO_3} = S_{Ag_2SO_4}$ (d) $S_{AgBrO_3} \approx S_{Ag_2SO_4}$
37. The ionisation constant of phenol is higher than that of ethanol because [JIPMER 2002]
(a) Phenoxide ion is bulkier than ethanoxide
(b) Phenoxide ion is stronger base than ethanoxide
(c) Phenoxide ion is stabilised through delocalisation
(d) Phenoxide ion is less stable than ethoxide
38. A weak acid HX has the dissociation constant $1 \times 10^{-5} M$. It forms a salt NaX on reaction with alkali. The degree of hydrolysis of $0.1 M$ solution of NaX is [IIT JEE Screening 2004]
(a) 0.0001% (b) 0.01%
(c) 0.1% (d) 0.15%

39. In the equilibrium $A^- + H_2O \rightleftharpoons HA + OH^-$ ($K_a = 1.0 \times 10^{-5}$). The degree of hydrolysis of 0.001 M solution of the salt is [AMU 1999]
- (a) 10^{-3} (b) 10^{-4}
(c) 10^{-5} (d) 10^{-6}
40. The sulphide ion concentration $[S^{2-}]$ in saturated H_2S solution is 1×10^{-22} . Which of the following sulphides should be quantitatively precipitated by H_2S in the presence of dil. HCl
- | Sulphide | Solubility Product |
|----------|-----------------------|
| (I) | 1.4×10^{-16} |
| (II) | 1.2×10^{-22} |
| (III) | 8.2×10^{-46} |
| (IV) | 5.0×10^{-34} |
- (a) I, II (b) III, IV
(c) II, III, IV (d) Only I
41. When equal volumes of the following solutions are mixed, precipitation of $AgCl$ ($K_{sp} = 1.8 \times 10^{-10}$) will occur only with [IIT 1988; CBSE PMT 1992; DCE 2000]
- (a) $10^{-4} M Ag^+$ and $10^{-4} M Cl^-$
(b) $10^{-5} M Ag^+$ and $10^{-5} M Cl^-$
(c) $10^{-6} M Ag^+$ and $10^{-6} M Cl^-$
(d) $10^{-10} M Ag^+$ and $10^{-10} M Cl^-$
42. K_{sp} of an electrolyte AB is 1×10^{-10} . $[A^+] = 10^{-5} M$, which concentration of B^- will not give precipitate of AB [BHU 2003]
- (a) 5×10^{-6} (b) 1×10^{-5}
(c) 2×10^{-5} (d) 5×10^{-5}
43. One litre of water contains 10^{-7} mole hydrogen ions. The degree of ionization in water will be [CPMT 1985, 88, 93]
- (a) $1.8 \times 10^{-7}\%$ (b) $0.8 \times 10^{-9}\%$
(c) $3.6 \times 10^{-7}\%$ (d) $3.6 \times 10^{-9}\%$
44. If the solubility products of $AgCl$ and $AgBr$ are 1.2×10^{-10} and 3.5×10^{-13} respectively, then the relation between the solubilities (denoted by the symbol 'S') of these salts can correctly be represented as [MP PET 1994]
- (a) S of $AgBr$ is less than that of $AgCl$
(b) S of $AgBr$ is greater than that of $AgCl$
(c) S of $AgBr$ is equal to that of $AgCl$
(d) S of $AgBr$ is 10^6 times greater than that of $AgCl$
45. If the solubility product of lead iodide (PbI_2) is 3.2×10^{-8} , then its solubility in moles/litre will be [MP PMT 1990]
- (a) 2×10^{-3} (b) 4×10^{-4}
(c) 1.6×10^{-5} (d) 1.8×10^{-5}
46. Calculate the solubility of $AgCl$ (s) in 0.1 M $NaCl$ at $25^\circ C$. $K_{sp}(AgCl) = 2.8 \times 10^{-10}$ [UPSEAT 2001]
- (a) $3.0 \times 10^{-8} ML^{-1}$ (b) $2.5 \times 10^{-7} ML^{-1}$
(c) $2.8 \times 10^{-9} ML^{-1}$ (d) $2.5 \times 10^7 ML^{-1}$
47. The solubility product of a binary weak electrolyte is 4×10^{-10} at $298 K$. Its solubility in mol dm^{-3} at the same temperature is [KCET 2001]
- (a) 4×10^{-5} (b) 2×10^{-5}
(c) 8×10^{-10} (d) 16×10^{-20}
48. Solubility of $AgCl$ at $20^\circ C$ is 1.435×10^{-3} gm per litre. The solubility product of $AgCl$ is [CPMT 1989; BHU 1997; AFMC 2000; CBSE PMT 2002]
- (a) 1×10^{-5} (b) 1×10^{-10}
(c) 1.435×10^{-5} (d) 108×10^{-3}
49. pK_a value for acetic acid at the experimental temperature is 5. The percentage hydrolysis of 0.1 M sodium acetate solution will be
- (a) 1×10^{-4} (b) 1×10^{-2}
(c) 1×10^{-3} (d) 1×10^{-5}
50. At $30^\circ C$, the solubility of Ag_2CO_3 ($K_{sp} = 8 \times 10^{-12}$) would be greatest in one litre of [MP PMT 1990]
- (a) 0.05 M Na_2CO_3 (b) 0.05 M $AgNO_3$
(c) Pure water (d) 0.05 M NH_3
51. The values of K_{sp} for CuS , Ag_2S and HgS are 10^{-31} , 10^{-42} and 10^{-54} respectively. The correct order of their solubility in water is [MP PMT 2003]
- (a) $Ag_2S > HgS > CuS$ (b) $HgS > CuS > Ag_2S$
(c) $HgS > Ag_2S > CuS$ (d) $Ag_2S > CuS > HgS$
52. The pH of a soft drink is 3.82. Its hydrogen ion concentration will be [MP PET 1990]
- (a) $1.96 \times 10^{-2} \text{ mol/l}$ (b) $1.96 \times 10^{-3} \text{ mol/l}$
(c) $1.5 \times 10^{-4} \text{ mol/l}$ (d) $1.96 \times 10^{-1} \text{ mol/l}$
53. The pH of a solution at $25^\circ C$ containing 0.10 M sodium acetate and 0.03 M acetic acid is (pK_a for $CH_3COOH = 4.57$) [AIIMS 2002; BHU 2003]
- (a) 4.09 (b) 5.09
(c) 6.10 (d) 7.09
54. A weak acid is 0.1% ionised in 0.1 M solution. Its pH is [BVP 2004]
- (a) 2 (b) 3
(c) 4 (d) 1
55. The solubility product of As_2S_3 is 2.8×10^{-72} . What is the solubility of As_2S_3 [Pb. CET 2003]
- (a) $1.09 \times 10^{-15} \text{ mole/litre}$
(b) $1.72 \times 10^{-15} \text{ mole/litre}$
(c) $2.3 \times 10^{-16} \text{ mole/litre}$
(d) $1.65 \times 10^{-36} \text{ mole/litre}$
56. For a weak acid HA with dissociation constant 10^{-9} , pOH of its 0.1 M solution is [CBSE PMT 1989]
- (a) 9 (b) 3
(c) 11 (d) 10
57. The dissociation of water at $25^\circ C$ is $1.9 \times 10^{-7}\%$ and the density of water is 1.0 g/cm^3 . The ionisation constant of water is [IIT 1995]
- (a) 3.42×10^{-6} (b) 3.42×10^{-8}
(c) 1.00×10^{-14} (d) 2.00×10^{-16}
58. What is the pH of 0.01 M glycine solution? For glycine, $K_{a1} = 4.5 \times 10^{-3}$ and $K_{a2} = 1.7 \times 10^{-10}$ at $298 K$ [AIIMS 2004]

- (a) 3.0 (b) 10.0
(c) 6.1 (d) 7.2
59. The concentration of $[H^+]$ and concentration of $[OH^-]$ of a 0.1 aqueous solution of 2% ionised weak acid is
[Ionic product of water $= 1 \times 10^{-14}$]
[DPMT 2004; CBSE PMT 1999]
(a) $2 \times 10^{-3} M$ and $5 \times 10^{-12} M$
(b) $1 \times 10^{-3} M$ and $3 \times 10^{-11} M$
(c) $0.02 \times 10^{-3} M$ and $5 \times 10^{-11} M$
(d) $3 \times 10^{-2} M$ and $4 \times 10^{-13} M$
60. If solubility product of $HgSO_4$ is 6.4×10^{-5} , then its solubility is
[BHU 2004]
(a) $8 \times 10^{-3} \text{ mole/litre}$ (b) $6.4 \times 10^{-5} \text{ mole/litre}$
(c) $6.4 \times 10^{-3} \text{ mole/litre}$ (d) $2.8 \times 10^{-6} \text{ mole/litre}$
61. At 298K a 0.1 M CH_3COOH solution is 1.34% ionized. The ionization constant K_a for acetic acid will be
[AMU 2002; AFMC 2005]
(a) 1.82×10^{-5} (b) 18.2×10^{-5}
(c) 0.182×10^{-5} (d) None of these
62. Hydrogen ion concentration of an aqueous solution is $1 \times 10^{-4} M$. The solution is diluted with equal volume of water. Hydroxyl ion concentration of the resultant solution in terms of mol dm^{-3} is [KCET 2001]
(a) 1×10^{-8} (b) 1×10^{-6}
(c) 2×10^{-10} (d) 0.5×10^{-10}
63. Which one of the following is not a buffer solution
[AIIMS 2003]
(a) $0.8 M H_2S + 0.8 M KHS$
(b) $2 M C_6H_5NH_2 + 2 M C_6H_5NH_3^+ Br^-$
(c) $3 M H_2CO_3 + 3 M KHCO_3$
(d) $0.05 M KClO_4 + 0.05 M HClO_4$
64. The hydrogen ion concentration of a 0.006 M benzoic acid solution is ($K_a = 6 \times 10^{-5}$)
[MP PET 1994]
(a) 0.6×10^{-4} (b) 6×10^{-4}
(c) 6×10^{-5} (d) 3.6×10^{-4}
65. Calculate the amount of $(NH_4)_2SO_4$ in grams which must be added to 500 ml of 0.200 M NH_3 to yield a solution with $pH = 9.35$ (K_b for $NH_3 = 1.78 \times 10^{-5}$)
[UPSEAT 2001]
(a) 10.56 gm (b) 15 gm
(c) 12.74 gm (d) 16.25 gm
66. pH of a solution produced when an aqueous solution of pH 6 is mixed with an equal volume of an aqueous solution of pH 3 is about
[KCET 2001]
(a) 3.3 (b) 4.3
(c) 4.0 (d) 4.5
67. Calculate the H^+ ion concentration in a 1.00 (M) HCN litre solution ($K_a = 4 \times 10^{-10}$)
[Bihar CEE 1995]
(a) $4 \times 10^{-14} \text{ mole/litre}$
(b) $2 \times 10^{-5} \text{ mole/litre}$
(c) $2.5 \times 10^{-5} \text{ mole/litre}$
(d) None of these
68. The number of moles of hydroxide (OH^-) ion in 0.3 litre of 0.005 M solution of $Ba(OH)_2$ is
[JIPMER 2001]
(a) 0.0050 (b) 0.0030
(c) 0.0015 (d) 0.0075
69. The pH of pure water or neutral solution at $50^\circ C$ is ($pK_w = 13.26 = 13.26$ at $50^\circ C$)
[Pb. PMT 2002; DPMT 2002]
(a) 7.0 (b) 7.13
(c) 6.0 (d) 6.63
70. pH of 0.1 M solution of a weak acid (HA) is 4.50. It is neutralised with NaOH solution to decrease the acid content to half pH of the resulting solution
[JIPMER 2002]
(a) 4.50 (b) 8.00
(c) 7.00 (d) 10.00
71. If 50 ml of 0.2 M KOH is added to 40 ml of 0.5 M $HCOOH$, the pH of the resulting solution is ($K_a = 1.8 \times 10^{-4}$)
[MH CET 2000]
(a) 3.4 (b) 7.5
(c) 5.6 (d) 3.75
72. The Bronsted acids in the reversible reaction are
[DPMT 2002]
 $HCO_3^-(aq.) + OH^-(aq.) \rightleftharpoons CO_3^{2-}(aq.) + H_2O$
(a) OH^- and CO_3^{2-}
(b) OH^- and H_2O
(c) HCO_3^- and H_2O
(d) HCO_3^- and CO_3^{2-}
73. A 0.1N solution of an acid at room temperature has a degree of ionisation 0.1. The concentration of OH^- would be
[MH CET 1999]
(a) $10^{-12} M$ (b) $10^{-11} M$
(c) $10^{-9} M$ (d) $10^{-2} M$
74. Increasing order of acidic character would be
[RPMT 1999]
(a) $CH_3COOH < H_2SO_4 < H_2CO_3$
(b) $CH_3COOH < H_2CO_3 < H_2SO_4$
(c) $H_2CO_3 < CH_3COOH < H_2SO_4$
(d) $H_2SO_4 < H_2CO_3 < CH_3COOH$
75. The correct order of increasing $[H_3O^+]$ in the following aqueous solutions is
[UPSEAT 2000]
(a) 0.01 M H_2S < 0.01 M H_2SO_4 < 0.01 M $NaCl$ < 0.01 M $NaNO_2$
(b) 0.01 M $NaCl$ < 0.01 M $NaNO_2$ < 0.01 M H_2S < 0.01 M H_2SO_4
(c) 0.01 M $NaNO_2$ < 0.01 M $NaCl$ < 0.01 M H_2S < 0.01 M H_2SO_4
(d) 0.01 M H_2S < 0.01 M $NaNO_2$ < 0.01 M $NaCl$ < 0.01 M H_2SO_4
76. A base dissolved, in water, yields a solution with a hydroxyl ion concentration of $0.05 \text{ mol litre}^{-1}$. The solution is
[CBSE PMT 2000]
(a) Basic (b) Acid
(c) Neutral (d) Either (b) or (c)
77. In the given reaction, the oxide of sodium is
[Orissa JEE 2002]
$$4Na + O_2 \rightarrow 2Na_2O$$

$$Na_2O + H_2O \rightarrow 2NaOH$$

(a) Acidic (b) Basic
(c) Amphoteric (d) Neutral

78. What is the pH of a $1M$ CH_3COOH a solution K_a of acetic acid

$$= 1.8 \times 10^{-5}.$$

$$K = 10^{-14} \text{ mol}^2 \text{ litre}^{-2}$$

[DPMT 2002]

- | | |
|---------|---------|
| (a) 9.4 | (b) 4.8 |
| (c) 3.6 | (d) 2.4 |

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

- Assertion : pH of hydrochloric acid solution is less than that of acetic acid solution of the same concentration.
 Reason : In equimolar solutions, the number of titrable protons present in hydrochloric acid is less than that present in acetic acid. [NDA 1999]
- Assertion : A ionic product is used for any types of electrolytes whereas solubility product is applicable only to sparingly soluble salts.
 Reason : Ionic product is defined at any stage of the reaction whereas solubility product is only applicable to the saturation stage. [AIIMS 2001]
- Assertion : A solution of $FeCl_3$ in water produce brown precipitate on standing.
 Reason : Hydrolysis of $FeCl_3$ takes place in water
- Assertion : $BaCO_3$ is more soluble in HNO_3 than in plain water.
 Reason : Carbonate is a weak base and reacts with the H^+ from the strong acid, causing the barium salt to dissociate.
- Assertion : $CHCl_3$ is more acidic than CHF_3 .
 Reason : The conjugate base of $CHCl_3$ is more stable than CHF_3 .
- Assertion : Addition of silver ions to a mixture of aqueous sodium chloride and sodium bromide solution will first precipitate $AgBr$ rather than $AgCl$.
 Reason : K_{sp} of $AgCl < K_{sp}$ of $AgBr$. [AIIMS 2004]
- Assertion : The pK_a of acetic acid is lower than that of phenol.
 Reason : Phenoxide ion is more resonance stabilized. [AIIMS 2004]
- Assertion : $Sb(III)$ is not precipitated as sulphide when in its alkaline solution H_2S is passed.
 Reason : The concentration of S^{2-} ion in alkaline medium is inadequate for precipitation. [AIIMS 2004]
- Assertion : Ionic reactions are not instantaneous.
 Reason : Oppositely charged ions exert strong forces.

AS Answers and Solutions

Electrical conductors, Arrhenius theory and Ostwald's dilution law

- $$K = \frac{\alpha^2}{V}; \alpha = \sqrt{KV} = \sqrt{1 \times 10^{-5} \times 10}; \alpha = 1 \times 10^{-2}$$

29. (d) $MgCl_2 \rightleftharpoons Mg^{++} + 2Cl^-$ in aqueous solution it is dissociated into ions.
30. (c) Ostwald's dilution formula is $\alpha^2 = K(1-\alpha)/C$ but for weak electrolyte α is very small. So that $(1-\alpha)$ is neglected for weak electrolytes. So for weak electrolyte the dilution formula is $\alpha = \sqrt{\frac{K}{C}}$.
31. (b) $K_a = C\alpha^2 = 0.2 \times \left(\frac{32}{100}\right)^2 = 2.048 \times 10^{-4}$.
32. (c) $H_2SO_4 \rightleftharpoons H^+ + HSO_4^- \rightleftharpoons H^+ + SO_4^{--}$
Because of it is completely ionised.
33. (c) Colour of electrolyte depends on the nature of both ions.
e.g. $CuSO_4$ is blue because Cu^{2+} ions are blue.
34. (c) Ionisation depends upon dilution, when dilution increases then ionisation is also increased.
35. (a) More is K_a , lesser is pK_a ($pK_a = -\log K_a$) more is acidic strength.

1. (a) CO doesn't have a vacant d -orbital.
2. (d) $HClO_4 + H_2O \rightleftharpoons H_3O^+ + ClO_4^-$

$\underbrace{\hspace{10em}}$
 Conjugate acid and base pair
3. (a) $FeCl_3 + 3H_2O \rightleftharpoons Fe(OH)_3 + 3HCl$. Strong acid and weak base.
4. (c) $Na_2CO_3 + 2H_2O \rightleftharpoons 2NaOH + H_2CO_3$
5. (b) Those substance accept the proton are called Bronsted base and which is donate the proton are called Bronsted acid.
 $HCO_3^- + H^+ \rightleftharpoons H_2CO_3$ Bronsted base.
 $HCO_3^- \rightleftharpoons H^+ + CO_3^{2-}$ Bronsted acid.
7. (b) The value of pK_a for strong acid is less.
8. (c) Because it is a salt of strong base and weak acid.
9. (b) Because it is conjugate base of weak acid.
 $CH_3COOH \rightleftharpoons CH_3COO^- + H^+$.
11. (a) Those compound which accept H^+ is called bronstad base
 NO_3^- accept H^+ and form HNO_3 . So it is a base.
13. (a) Larger the size of halogen atom less is the back donation of electrons into empty $2p$ orbital of B .
14. (d) $H_2O + NH_3 \rightleftharpoons NH_4^+ + OH^-$
16. (b) $NH_2^- \rightleftharpoons NH^{-2} + H^+$
 Conjugate acid, base pair.
17. (b) Those substances which lose proton are called acid.
e.g. strong acid have a strong tendency to donate a proton.
18. (d) Electron donating species called nucleophile. NH_3 have a lone pair of electron.

19. (a) H_2O acts as acid as it provides H^+ to NH_3 .
20. (b) $CH_3COOH + HF \rightleftharpoons CH_3COOH_2^+ + F^-$. HF gives H^+ to the CH_3COOH . So it is a conjugate base of HF .
22. (b) $Ba(NO_3)_2$ does not undergo hydrolysis.
23. (b) H_2SO_4 is a mineral acid.
24. (c) Because it is an electron pair acceptor its central atom has a vacant d -orbital.
25. (d) $HClO_4$ is an acid and its conjugate base is ClO_4^- .
26. (c) It is completely ionised because its ionization is very high.
27. (c) $NaHCO_3$ in water is alkaline in nature due to hydrolysis of HCO_3^- ion. $NaCO_3 \rightleftharpoons Na^+ + HCO_3^-$
28. (d) In this reaction H_2O acts as an acid.
29. (b) The basic character of hydride decreases down the group.
30. (b) Its ionization is very less.
32. (c) Hydrolysis of Cu^{2+} produces H^+ ions in solution.
 $Cu^{2+} + 2H_2O \rightarrow Cu(OH)_2 + 2H^+$
33. (d) Both possess the tendency to accept proton.
34. (a) HF does not give proton easily.
35. (a) In weak electrolyte the degree of dissociation is very small. So it increases with increasing dilution.
36. (a) Because it is an electron pair acceptor.
37. (c) $H_3PO_4 \xrightleftharpoons{\text{I step}} H^+ + H_2PO_4^-$
 $H_2PO_4^- \xrightleftharpoons{\text{II step}} H^+ + HPO_4^{2-}$
 $HPO_4^{2-} \xrightleftharpoons{\text{III step}} H^+ + PO_4^{3-}$
38. (c) Na_2HPO_4 on hydrolysis of HPO_4^{2-} ion produces free OH^- ion in solution.
39. (c) $H_2SO_4 \rightleftharpoons H^+ + HSO_4^-$.
40. (a) $Fe^{3+} + 3H_2O \rightarrow Fe(OH)_3 + 3H^+$
41. (c) $H_2PO_4^- \rightleftharpoons H^+ + HPO_4^{2-}$ action.
 Conjugate acid
42. (d) $H^+ + OH^- \rightleftharpoons H_2O$, it is a neutralization reaction.
43. (c) It is a conjugate base of the strong acid.
44. (a) Because those acids have higher pK_a value are weak acids.
45. (a) Conjugate acid is obtained from the base by gain of H^+ .
46. (c) CH_3COOH is a weak acid shows dissociation equilibrium as
 $CH_3COOH \rightleftharpoons CH_3COO^- + H^+$
47. (c) $pK_a = \log_{10} \frac{1}{K_a}$
48. (d) A weak acid and strong base.
49. (a) In NaH_2PO_2 both hydrogens are bonded with 'P', so it is not replaceable.
50. (b) Aqueous solution of Na_2CO_3 is alkaline due to hydrolysis of CO_3^{2-} .
51. (b) Because they give CO_3^{2-} in solution.
52. (a) M.eq. of $0.2M H_2SO_4 = \frac{2 \times 0.2M}{1000} \times 100 = 0.04 \text{ ml}$
 M.eq. of $.2M NaOH = \frac{0.2}{1000} \times 100 = 0.02 \text{ ml}$
 left $[H^+] = .04 - .02 = .02$.
 Total volume = $200 = \frac{.02}{200} = .0001 = 10^{-4} M$
 $pH = 4$.
53. (a) H_3BO_3 is a weak monobasic acid it does not act as a H^+ donor but behaves as a Lewis acid.
54. (a) Because $SnCl_2$ is an electron acceptor according to Lewis concept.
55. (d) ROH is a Lewis base because it has a lone pair of electron.
56. (b) $H_2SO_4 + 2H_2O \rightleftharpoons 2H_3O^+ + SO_4^{2-}$
 $NaOH \rightleftharpoons Na^+ + OH^-$
 1 mole of H_2SO_4 acid gives 2 moles of H_3O^+ ions. So 2 moles of OH^- are required for complete neutralization.
57. (ab) Diprotic solvents give $2H^+$ ions or OH^- ions.
58. (a) $N_{NaOH} = 1 \times 1 = 1N$
 $N_{H_2SO_4} = 2 \times 10 = 20N$
 M.eq. of $NaOH = 1 \times 100 = 100$
 M.eq. of $H_2SO_4 = 20 \times 10 = 200$
 Thus M.eq. of acid are left and therefore $pH < 7$, so the resulting mixture will be acidic.
60. (d) PH_3 is a Lewis base.
61. (a) Because of CH_3COONa is a salt of weak acid and strong base.
62. (b) Acid $\xrightarrow{-H^+}$ conjugate base.
 Base $\xrightarrow{+H^+}$ conjugate acid.
63. (b) $\underset{\text{Acid}}{HCl} \rightarrow \underset{\text{Base}}{Cl^-}$
65. (a) $HClO_4 > H_2SO_4 > HCl > HNO_3$.
 Acidity character decreases
66. (a) Those substances which accept the H^+ are called conjugate bases.
67. (d) NH_3 is a Lewis base, which donates a lone pair of electron.
69. (a) $FeCl_3 + 3H_2O \rightleftharpoons Fe(OH)_3 + 3HCl$. Strong acids have less than 7 pH.
70. (b) It donates their e^- pair.
71. (b) The strength of the acid will depend upon the proton donation.
73. (b) Because it is a salt of strong acid and strong base.
 $H^+_{(aq)} + Cl^-_{(aq)} + Na^+_{(aq)} + OH^-_{(aq)} \rightleftharpoons$
 $H_2O_{(l)} + Na^+_{(aq)} + Cl^-$
74. (d) CCl_4 is not a Lewis or Brønsted acid. It does not contain H^+ .

75. (b) $NH_4Cl + H_2O \rightleftharpoons \underset{\text{Weak base}}{NH_4OH} + \underset{\text{Strong acid}}{HCl}$. So it is acidic in nature.
76. (b) $Cu(II)$ complexes are blue. The four water molecules are attached with secondary valencies of the metal atom e.g. $[Cu(H_2O)_4]SO_4 \cdot H_2O$.
77. (a) The species which can accept as well as donate H^+ can act both as an acid and a base.

$$\underset{\text{base}}{HSO_4^-} + H^+ \rightleftharpoons \underset{\text{acid}}{H_2SO_4}$$

$$\underset{\text{acid}}{HSO_4^-} \rightleftharpoons \underset{\text{base}}{SO_4^{2-}} + H^+$$
78. (a) NH_4^+ is the weakest acid. So its conjugate base is strongest.
79. (b) Ag^+ is an electron deficient compound and hence is a Lewis acid.
80. (a) $\underset{\text{Conjugate acid}}{H_3PO_4} \rightleftharpoons H^+ + \underset{\text{Conjugate base}}{H_2PO_4^-}$
81. (d) $\underset{\text{Conjugate acid}}{HS_2O_8^{2-}} \rightleftharpoons H^+ + \underset{\text{Conjugate base}}{S_2O_8^{2-}}$
82. (b) PH_3 donates electron pair to BCl_3 .
83. (b) The conjugate base of weak acid is a strong base.
84. (d) $OH^- \rightarrow \underset{\text{Conjugate base of } OH^-}{O^{2-}} + H^+$
85. (bd) Presence of lone pair of electron and they donate two electron pairs.
86. (a) On increasing oxidation number Acidic strength increases.
87. (d) H_3PO_4 shows +5 maximum oxidation state.
88. (a) $C_2H_5^-$ is a strongest base.
89. (d) $NaOCl$ is a mixture of strong base and weak acid.
90. (c) NH_4OH gives minimum OH^- ion. So it is a weak base.
91. (a) Solution become acidic and methyl orange act on acidic pH.
92. (a) Larger is bond length, more is acidic nature (for halogen acids). HF bond length is small.
93. (a) HCl is accepting proton in HF medium and acts as weak base.
95. (b) For oxoacids of the same element, the acidic strength increases with increase in the oxidation number of that element.

$$\overset{+1}{HClO} < \overset{+3}{HClO_2} < \overset{+5}{HClO_3} < \overset{+7}{HClO_4}$$
96. (c) Because their conjugate base and conjugate acids are strong.
97. (b) HCl is a strong acid and their conjugate base is a very weak base.
100. (c) $NH_3 \rightleftharpoons NH_2^- + H^+$
101. (a) $H_2SO_4 \rightleftharpoons H^+ + HSO_4^- \rightleftharpoons H^+ + SO_4^{2-}$
 HSO_4^- is conjugate base. But it is also an acid because it lose H^+ .
102. (a) BF_3 is a Lewis acid because 'B' has incomplete octet.
104. (c) H_3O^+ , however it exists as $H_9O_4^+$.
105. (a) $Al_2(SO_4)_3$ is a salt of weak base $Al_2(OH)_3$ and strong acid H_2SO_4 .
106. (a) Al^{+++} of $AlCl_3$ undergoes hydrolysis.
107. (d) $H_2SO_4 \rightleftharpoons H^+ + HSO_4^-$
109. (c) Conjugate base of H_2SO_4 is HSO_4^- .
110. (d) Presence of lone pair.
111. (b) According to Bronsted principle HNO_3 is acid they give H^+ in aqueous solution and form NO_3^- .
112. (c) $H_2O + H_2O \rightleftharpoons H_3O^+ + OH^-$.
113. (c) NH_4^+ is a conjugate acid;
 $NH_4^+ \rightleftharpoons NH_3 + H^+$
114. (a) $AlCl_3 + 3H_2O \rightleftharpoons Al(OH)_3 + \underset{\text{Strong acid}}{3HCl}$
116. (d) HCl is a strong acid its conjugate base means Cl^- is a weak base.
117. (d) Hydrazoic acid (HN_3) is a Lewis acid.
118. (c) Smaller the pK_a value than. Stronger the acid.
120. (c) BF_3 is acidic because due to Lewis concept it accept a lone pair of electron.
122. (d) Because it is a weak electrolyte.
126. (c) $AlCl_3$ and SO_2 both are example of Lewis theory.
127. (c) $Na_2CO_3 + 2H_2O \rightleftharpoons 2NaOH + H_2CO_3$. It is a strong base and weak acid so it is a basic.
129. (c) $\underset{\text{Acid}}{H_2O} + \underset{\text{base}}{NH_3} \rightleftharpoons \underset{\text{base}}{NH_4^+} + \underset{\text{acid}}{OH^-}$.
 In this reaction H_2O acts as acid because it donate a proton.
130. (b) $H_2SO_4 + H_2O \rightleftharpoons H_3O^+ + HSO_4^-$
 Conjugate acid and base pair
131. (b) $Al_2(SO_4)_3 \rightleftharpoons 2Al^{3+} + 3SO_4^{2-}$
 $Al(OH)_3 + H_2SO_4$
 Weak base Strong acid
132. (c) $NaOH + HCl \xrightleftharpoons[\text{Reaction}]{\text{Neutralization}} \underset{\text{Salt}}{NaCl} + H_2O$
133. (a) Conjugate acid is obtained from the base by gain of H^+ .
134. (c) KCl is a ionic compound.
135. (a) $H_3BO_3 + H_2O \rightleftharpoons [B(OH)_4]^- + H^+$
 H_3BO_3 is a weak monobasic acid if does not act as a H^+ donor but behaves as a Lewis acid.
136. (c) Because it is not accept the proton.
137. (c) NH_4Cl is a salt of weak base (NH_4OH) and strong acid (HCl).
138. (b) Because it accept electron pair from the PH_3
139. (b) $NH_4^+ \rightleftharpoons NH_3 + H^+$
141. (b) Hydrolysis of Fe^{3+}
 $Fe^{3+} + 3H_2O \rightarrow Fe(OH)_3 + 3H^+$
142. (a) According to the Lewis concept.
143. (b) Conjugate base is obtained from the acid by loss of H^+ .
144. (a) BF_3 accept electron pair from NH_3 so it is Lewis acid.
145. (a) CH_4 has almost no acidic nature and thus CH_3^- is strongest base.

146. (a) CuSO_4 is a salt of weak base, $(\text{Cu}(\text{OH})_2)$ and strong acid (H_2SO_4) .
147. (b) Weak acid consists of highest pK_a value and strongest acid consist of less pK_a value.
149. (c) Because it gain and also lose the proton
 $\text{H}_2\text{O} + \text{H}_2\text{O} \rightleftharpoons \text{H}_3\text{O}^+ + \text{OH}^-$
150. (a) $\text{H}_2\text{O} + \text{H}_2\text{O} \rightleftharpoons \text{H}_3\text{O}^+ + \text{OH}^-$
151. (c) $\text{HBr} + \text{H}_2\text{O} \rightleftharpoons \text{H}_3\text{O}^+ + \text{Br}^-$
152. (c) Because both are strong acid and strong base.
153. (d) LiAlH_4 is a nucleophilic and capable of donating electron pair, thus acts as a Lewis base.
154. (c) The solvent which neither accept proton nor donates.
155. (a) Because of F^- is a highly electronegative. So it is easily lose the electron and reaction occur rapidly.
156. (b) Strong acid can be used titrate both strong and weak base.
159. (b) For a weak acid value of pK_a will be vary high but in case of strong acid value of pK_a will be vary low.
160. (d) Boron halides behave as Lewis acid because of their electron deficient nature *eg.*, as

161. (b) Gaseous HCl does not give H^+ but liquid HCl gives H^+ in aqueous solution there for gaseous HCl is not a Arrhenius acid due to covalent bonding in gaseous condition.
162. (d) $\text{H}_2\text{O} \rightarrow \text{H}^+ + \text{OH}^-$ [Acid due to donation of proton]
 Acid
 $\text{H}_2\text{O} + \text{H}^+ \rightarrow \text{H}_3\text{O}^+$ [Basic due to gaining of proton]
 Base
163. (c) F^- strongest conjugate base due to it smallest size in a group and gain proton due to most electronegative capacity.
 $\text{H}^+ + \text{F}^- \rightarrow \text{HF}$
164. (d) $\text{H}_2\text{PO}_4^- \rightarrow \text{H}^+ + \text{HPO}_4^{2-}$
 Conjugate acid Conjugate base
165. (a) $\text{HSO}_4^- \rightarrow \text{H}^+ + \text{SO}_4^{2-}$
 Conjugate acid Conjugate base

Common ion effect, Isohydric solutions, Solubility product, Ionic product of water and Salt hydrolysis

1. (b) Solubility of $\text{Al}_2(\text{SO}_4)_3$
 $\text{Al}_2(\text{SO}_4)_3 \rightleftharpoons 2\text{Al}^{+++} + 3\text{SO}_4^{--}$
 $K_{sp} = [\text{Al}^{3+}]^2 [\text{SO}_4^{2-}]^3$
2. (c) Due to common ion effect.
3. (b) $\text{MX}_2 \rightleftharpoons \text{M}_s^{2+} + 2\text{X}_{2s}^-$
 $K_{sp} = (2S)^2(S) = 4S^3$
 $\Rightarrow S = 2 \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{4 \times 10^{-12}}{4}} = 1.0 \times 10^{-4} \text{ M}$
5. (b) $\text{MX}_2 \rightleftharpoons \text{M}_{(S)}^{+} + 2\text{X}_{(2S)}^-$; $K_{sp} = 4S^3$
8. (a) $\text{Mg}(\text{OH})_2 \rightleftharpoons \text{Mg}_{(X)}^{++} + 2\text{OH}_{(2X)}^-$
 $K_{sp} = 4X^3$
9. (c) $\text{BaSO}_4 \rightleftharpoons \text{Ba}_{(S)}^{++} + \text{SO}_{(S)}^{--}$
 $K_{sp} = S^2 = S \times S = 0.01 \times S$
 $S_{(\text{SO}_4^{2-})} = \frac{K_{sp}}{S_{(\text{Ba}^{++})}} = \frac{1 \times 10^{-9}}{0.01} = 10^{-7} \text{ mole/litre}$
10. (a) $\text{AB}_2 \rightleftharpoons \text{A}_{1 \times 10^{-5}}^{+} + 2\text{B}_{2 \times 10^{-5}}^-$
 $K_{sp} = [1 \times 10^{-5}] [2 \times 10^{-5}]^2 = 4 \times 10^{-15}$
11. (b) $\text{CaF}_2 \rightleftharpoons \text{Ca}_{(S)}^{++} + 2\text{F}_{(2S)}^-$; $K_{sp} = 4S^3$
12. (b) Due to common ion effect.
13. (a) $\text{Ag}_2\text{CrO}_4 \rightleftharpoons [2\text{Ag}^+] + [\text{CrO}_4^{--}]$
 Hence $K_{sp} = [\text{Ag}^+]^2 [\text{CrO}_4^{--}]$
14. (d) K_{sp} for $\text{CaF}_2 = 4S^3 = 4 \times [2 \times 10^{-4}]^3 = 3.2 \times 10^{-11}$.
15. (d) The concentration of S^{2-} ions in group II is lowered by maintaining acidic medium in the presence of NH_4Cl . The ionization of H_2S is suppressed due to common ion effect. So the ionic product is less than solubility product.
16. (b) NH_4Cl is hydrolysed and give $[\text{H}^+]$
 $\text{NH}_4\text{Cl} + \text{H.OH} \rightleftharpoons \text{NH}_4\text{OH} + \text{HCl}$
 $\text{NH}_4^+ + \text{H.OH} \rightleftharpoons \text{NH}_4\text{OH} + \text{H}^+$
17. (c) FeCl_3 is a salt of weak base $(\text{Fe}(\text{OH})_3)$ and strong acid (HCl) .
18. (c) For the precipitation of an electrolyte, it is necessary that the ionic product must exceed its solubility product.
19. (d) $K_{sp} = [\text{Ag}^+]^2 [\text{CrO}_4^{--}] = [2S]^2 [0.01]$
 $= 4S^2 [0.01] = 4[2 \times 10^{-8}]^2 \times 0.01 = 16 \times 10^{-18}$
20. (c) Complex salts contain two different metallic elements but give test for only one of them. *eg.* $\text{K}_4\text{Fe}(\text{CN})_6$ does not give test for Fe^{3+} ions.
21. (d) 10^{-3} N KOH will give $[\text{OH}^-] = 10^{-2} \text{ M}$
 $\text{pOH} = 2$
 $\therefore \text{pH} + \text{pOH} = 14, \text{pH} = 14 - 2 = 12$
22. (d) It is $\text{FeSO}_4(\text{NH}_4)_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$.
23. (d) Salt of a strong base with a weak acid.
24. (b) NH_4CN is a salt of weak acid and weak base and thus for it
25. (a) Because it is a salt of strong base with a weak acid.
26. (d) Because CCl_4 is a organic solvent and AgNO_3 is insoluble in organic solvent.
27. (a) $\text{SnS}_2 \rightleftharpoons \text{Sn}^{4+} + 2\text{S}^{2-}$

$$\therefore K_{sp} = [Sn^{4+}][S^{2-}]^2$$

28. (d) It does not dissociate much or its ionization is very less.

29. (b) $NaHCO_3$ has one replaceable hydrogen.

30. (b) $CaOCl_2$ has two anions Cl^- and OCl^- along with Ca^{2+} ions.

31. (a) $K_{sp} = 4S^3$, $S^3 = \frac{4 \times 10^{-9}}{4} = 10^{-9}$

$$\therefore S = 10^{-3} M$$

32. (d) $Be(OH)_2$ has lowest solubility and hence lowest solubility product.

33. (a) Because it is a salt of strong acid and strong base.

35. (d) It is a less ionic, so that least soluble in water.

36. (b) pH of 9 means the salt solution should be fairly basic.

On adding CH_3COONa , $[H^+]$ decreases.

38. (c) 0.01 M $CaCl_2$ gives maximum Cl^- ions to keep K_{sp} of $AgCl$ constant, decrease in $[Ag^+]$ will be maximum.

39. (b) Due to the common ion effect.

40. (a) $K_{sp} = 4S^3$

$$S = \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{1.0 \times 10^{-6}}{4}} = 6.3 \times 10^{-3}$$

42. (d) K_w increases with increase in temperature.

43. (b) It contains two cations and one anion.

44. (a) $HgSO_4$ of $K_{sp} = S^2$

$$S = \sqrt{K_{sp}}; S = \sqrt{6.4 \times 10^{-5}}; S = 8 \times 10^{-3} m/l$$

45. (b) The solubility of $BaSO_4$ in g/litre is given 2.33×10^{-3}

$$\therefore \text{in mole/litre, } n = \frac{W}{m.wt} = 1 \times 10^{-5} = \frac{2.33 \times 10^{-3}}{233}$$

Because $BaSO_4$ is a compound

$$K_{sp} = S^2 = [1 \times 10^{-5}]^2 = 1 \times 10^{-10}$$

$$K_{sp} AgCl = 1.20 \times 10^{-10}$$

$$K_{sp} AgCl = [Ag^+][Cl^-] = a \times [a + 0.2] = a^2 + 0.2a$$

a^2 is a very small so it is a neglected.

$$K_{sp} AgCl = 0.2a$$

$$1.20 \times 10^{-10} = 0.2a$$

$$a = \frac{1.20 \times 10^{-10}}{0.20} = 6 \times 10^{-10} \text{ mole}$$

47. (b) Solubility is decreased due to common ion effect.

48. (c) K_{sp} of $BaSO_4 = 1.5 \times 10^{-9}$; $Ba^{++} = 0.01 M$

$$SO_4^{--} = \frac{1.5 \times 10^{-9}}{0.01} = 1.5 \times 10^{-7}$$

$$K_{sp} = 4S^3 \text{ given } 2S = 1.5 \times 10^{-4}$$

$$\therefore K_{sp} = (2S)^2 \times S$$

$$= (1.5 \times 10^{-4})^2 \times \left(\frac{1.5 \times 10^{-4}}{2} \right) = 1.6875 \times 10^{-12}$$

$$K_{sp} \text{ of } PbCl_2 = [Pb^{2+}][Cl^-]^2; K_{sp} = S \times (2S)^2$$

$$K_{sp} = S \times 4S^2 = 4S^3; S^3 = \frac{K_{sp}}{4}; S = \sqrt[3]{\frac{K_{sp}}{4}}$$

$$S = \sqrt{K_{sp}} = \sqrt{1.44 \times 10^{-4}} = 1.20 \times 10^{-2} M$$

$$K_{sp} = 4x^3$$

$$K_{sp} = (2S)^2 S = 4S^3$$

$$S = \left(\frac{K_{sp}}{4} \right)^{\frac{1}{3}} = \left(\frac{32 \times 10^{-12}}{4} \right)^{\frac{1}{3}} = 2 \times 10^{-4} M$$

54. (d) Common ion effect is noticed only for weak electrolyte dissociation. H_2SO_4 is strong electrolyte.

55. (c) When we added barium ion in chromate ion solution we obtained yellow ppt of $BaCrO_4$.

56. (d) AB is a binary electrolyte.

$$S = \sqrt{K_{sp}} = \sqrt{1.21 \times 10^{-6}} = 1.1 \times 10^{-3} M$$

57. (b) Precipitation occurs when ionic product > solubility.

58. (c) For a binary electrolyte, so that

$$K_{sp} = S \times S = S^2$$

$$S = \sqrt{K_{sp}}$$

61. (b) CH_3COONa is a salt of weak acid and strong base. Hence its aqueous solution is alkaline.
62. (b) $BaSO_4 \rightleftharpoons Ba^{2+} + SO_4^{2-}$
Solubility constant $= S \times S$
 $1.5 \times 10^{-19} = S^2$; $S = \sqrt{1.5 \times 10^{-19}}$; $S = 3.9 \times 10^{-5}$
65. (d) $Ca(OH)_2 \rightleftharpoons Ca^{++}_{(S)} + 2OH^{-}_{(2S)^2}$
 $K_{sp} = 4S^3 = 4 \times \sqrt{3} \times \sqrt{3} \times \sqrt{3} = 12\sqrt{3}$
66. (a) Due to common ion effect.
67. (d) $PbCl_2 \rightleftharpoons Pb^{2+}_{(S)} + 2Cl^{-}_{(2S)^2}$
 $K_{sp} = 4S^3 = 4 \times (2 \times 10^{-2})^3 = 3.2 \times 10^{-5}$
68. (a) $Ag_2S \rightleftharpoons 2Ag^{+} + S^{2-}$
 $K_{sp} = 4S^3$
 $S = \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{3.2 \times 10^{-11}}{4}} = 2 \times 10^{-6}$
69. (d) $CaCO_3 \rightleftharpoons Ca^{++}_{(S)} + CO_3^{--}_{(S)}$
Solubility product of $CaCO_3$
 $K_{sp} = S^2$; $S = \sqrt{K_{sp}}$
It is a binary electrolyte.
 $S^2 = K_{sp}$; $(3.05 \times 10^{-4})^2 = K_{sp}$; $K_{sp} = 9.3 \times 10^{-8}$
71. (c) $PbCl_2 \rightarrow Pb^{++}_{(S)} + 2Cl^{-}_{(2S)}$
 $K_{sp} = S \times (2S)^2 = [6.3 \times 10^{-3}] \times [12.6 \times 10^{-3}]^2$.
72. (d) A salt of strong acid and strong base cannot be hydrolysed. In this case the equilibrium cannot be shifted towards the backward.
73. (d) If we mixed any substance into the solution. Then the value of pH is increased these substance is a salt of weak acid and strong base.
74. (d) It is a salt of strong base and weak acid.
75. (a) $K_{sp} = 4S^3 = 4 \times [2.5 \times 10^{-2}]^3 = 62.5 \times 10^{-6}$.
76. (c) $NaCl \rightleftharpoons Na^{+}_{(S)} + Cl^{-}_{(S)}$
 $K_{sp} = S^2$, $S = \sqrt{K_{sp}} = \sqrt{36} = 6$.
78. (d) $PbI_2 \rightleftharpoons Pb^{++}_{(S)} + 2I^{-}_{(2S)}$
 $K_{sp} = 4S^3 = 4 \times [2 \times 10^{-3}]^3 = 32 \times 10^{-9}$.
79. (b) When ionic product is greater than K_{sp} then precipitation occur
 $K_{sp} < 10^{-2} M Ca^{2+} + 10^{-3} M F^{-}$
80. (d) In IV⁺ group the S^{2-} concentration increase when added the NH_4OH because
 $NH_4OH \rightleftharpoons NH_4^{+} + OH^{-}$
 $H_2S \rightleftharpoons 2H^{+} + S^{2-}$
 $OH^{-} + H^{+} \rightleftharpoons H_2O$. So that S^{2-} is increased.
81. (c) $BaSO_4 \rightleftharpoons Ba^{2+} + SO_4^{2-}$
 $K_{sp} = S^2 \Rightarrow S = \sqrt{K_{sp}}$; $K_{sp} = [Ba^{2+}] \times [SO_4^{2-}]$
 $4 \times 10^{-10} = [1 \times 10^{-4}] \times [SO_4^{2-}]$
 $[SO_4^{2-}] = \frac{4 \times 10^{-10}}{1 \times 10^{-4}} = 4 \times 10^{-6}$.
82. (c) $AB_2 \rightleftharpoons A^{2+}_{(S)} + 2B^{-}_{(2S)^2}$
 $K_{sp} = 4S^3$
 $S = \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{4 \times 10^{-12}}{4}} = 1 \times 10^{-4} \text{ gm.mol / litre}$
83. (d) $[B] = \frac{K_{sp} AB}{[A]} = \frac{1 \times 10^{-8}}{10^{-3}} = 1 \times 10^{-5} M$
Where ionic product $> K_{sp}$, ppt formed
 $\therefore$ 8 should be more than $10^{-5} M$.
84. (c) $NaCl_{(s)} \rightleftharpoons Na^{+}_{(aq)} + Cl^{-}_{(aq)}$
 $HCl \rightleftharpoons H^{+} + Cl^{-}$. The increase in $[Cl^{-}]$ brings in an increase in $[Na^{+}] [Cl^{-}]$ which will lead for backward reaction because
 $K_{sp}(NaCl) = [Na^{+}] [Cl^{-}]$
means ionic product $\geq K_{sp}$
85. (d) $BaSO_4 \rightleftharpoons Ba^{++}_{(S)} + SO_4^{--}_{(S)}$
 $K_{sp} = S^2$; $S = \sqrt{K_{sp}} = \sqrt{1.3 \times 10^{-9}}$
 $= 3.6 \times 10^{-5} \text{ mol / litre}$
87. (b) Alkaline,
 $CH_3COONa + H_2O \rightleftharpoons \underset{\text{Weak acid}}{CH_3COOH} + \underset{\text{Strong base}}{NaOH}$
88. (c) Because it is a strong base.
89. (b) For pure water $[H^{+}] = [OH^{-}]$, $\therefore K_w = 10^{-12}$
90. (a) $MX_2 \rightleftharpoons M^{2+}_{(S)} + 2X^{-}_{(2S)^2}$; $4S^3 = 4 \times (0.5 \times 10^{-4})^3$
 $= 5 \times 10^{-13}$
91. (a) Solubility coefficient $= [Pb^{2+}] [Cl^{-}]^2$
92. (a) Solubility of $Al(OH)_3$ is lesser than $Zn(OH)_2$.
93. (c) $NaCl_{(s)} \rightleftharpoons Na^{+}_{(aq)} + Cl^{-}_{(aq)}$
 $HCl \rightleftharpoons H^{+} + Cl^{-}$
The increase in $[Cl^{-}]$ brings in an increase in $[Na^{+}] [Cl^{-}]$ which will lead for backward reaction because
 $K_{sp} NaCl = [Na^{+}] [Cl^{-}]$.
94. (c) Common ion effect.
95. (a) $CaF_2 \rightleftharpoons Ca^{++}_{(S)} + 2F^{-}_{(2S)^2}$
 $K_{sp} = 4S^3$

$$S = \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{3.2 \times 10^{-11}}{4}} = 2 \times 10^{-4} \text{ mol/l}$$

96. (d) In aqueous solution following equilibrium is exist.
 $H_2S \rightleftharpoons H^+ + HS^-$

While adding the dilute HCl solution

$(HCl \rightleftharpoons H^+ + Cl^-)$ equilibrium is shift to the left side in
 $H_2S \rightleftharpoons H^+ + HS^-$

97. (d) $M_2X_3 \rightleftharpoons 2M^{+++}_{(2y)^2} + 3X^{--}_{(3y)^3}$

Solubility product $K_{sp} = 108y^5 \text{ mol} \frac{d}{m^3}$

98. (b) Solubility is directly proportional to the K_{sp} .

99. (b) $PbCl_2 \rightleftharpoons Pb^{++}_S + 2Cl^-_{(2S)^2}$

$$K_{sp} = S \times (2S)^2 = 4S^3$$

$$S = \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{1.5 \times 10^{-4}}{4}} = 3.34 \times 10^{-2}$$

101. (d) $AlCl_3$ on hydrolysis gives weak base and strong acid among all.

102. (c) Fe^{3+} ions are hydrolysed to develop acidic nature.

103. (c) $K_h = \frac{K_w}{K_a \times K_b}$

104. (a) KCN is salt of strong base and weak acid.

105. (c) Sulphides of Group-II radicals have low solubility product.

106. (c) Because NH_3 acts as Lewis acid and they give electron pair to H_3O^+ ion. H_3O^+ is a Lewis base. Which accept the electron pair from NH_3 .

107. (c) Due to common ion effect.

108. (a) For $Ag_2SO_4 \rightarrow 2Ag^+_{2x} + SO^{--}_4_x$

$$K_{sp} = (2x)^2 \cdot x; K_{sp} = 4x^3; K_{sp} = 4 \times (2.5 \times 10^{-2})^3$$

$$K_{sp} = 62.5 \times 10^{-6}$$

109. (b) For $AgCl \rightarrow Ag^+_x + Cl^-_x$

$$K_{sp} = x^2; x = \sqrt{K_{sp}}; \sqrt{1 \times 10^{-6}} = 1 \times 10^{-3} \text{ mole/litre}$$

110. (b) $AgCl \rightarrow Ag^+_x + Cl^-_x$

After $NaCl$ is added $x \quad x + 1 \times 10^{-4}$

That is why Ag^+ will be less.

111. (b) Because of ionic product of $AgI \gg$ solubility product of its.

112. (a) $AX_2 \rightarrow A_x + 2X_{2x}$

$$K_{sp} = 4x^3; x = \sqrt[3]{\frac{3.2 \times 10^{-11}}{4}}; x = 2 \times 10^{-4} \text{ mole/litre}$$

113. (c) $C_6H_5COONH_4 \rightarrow C_6H_5COO^- + NH_4^+$

$$0.5 - \frac{.25}{100} \quad \frac{.25}{100} \quad \frac{.25}{100}$$

According to Ostwald dilution law.

$$K = \frac{\alpha^2 C}{1 - \alpha} \quad \left(\because \alpha = \frac{.25}{100} \right)$$

$$K = \alpha^2 C \quad (\because 1 - \alpha = \text{Very small})$$

$$K = \frac{.25}{100} \times \frac{.25}{100} \times .5; K = 3.125 \times 10^{-6}$$

114. (a) $Sb_2S_3 \rightarrow 2Sb^{++}_{2x} + 3S^{--}_{3x}; K_{sp} = (2x)^2 \cdot (3x)^3$

$$K_{sp} = 108x^5; K_{sp} = 108 \times (1 \times 10^{-5})^5 = 108 \times 10^{-25}$$

115. (b) When increasing the temperature the value of ionic product also increases.

116. (a) Hydrolysis constant $h = \frac{K_w}{K_a}$

Hydrogen ion concentration - pH scale and Buffer solution

1. (a) pH of blood does not change because it is a buffer solution.

2. (c) 0.001 M of $NaOH$ means $[OH^-] = .001$

$$= 10^{-3} M \Rightarrow pOH = 3$$

$$pH + pOH = 14 \Rightarrow pH = 14 - 3 = 11$$

3. (d) $[H_3O^+]$ means $[H^+] = 6.2 \times 10^{-9} \text{ mol/l}$

$$pH = -\log(6.2 \times 10^{-9}) = 8.21$$

4. (b) $CH_3NH_2 + HCl \longrightarrow CH_3NH_3^+Cl^-$

$$\begin{array}{ccc} 0.1 & 0.08 & 0 \\ 0.02 & 0 & 0.08 \end{array}$$

(Basic buffer solution)

$$pOH = pK_b + \log \frac{0.08}{0.02}$$

$$= pK_b + 0.602$$

$$= 3.30 + 0.602 = 3.902$$

$$\therefore pH = 10.09$$

$$[H] = 7.99 \times 10^{-11} \approx 8 \times 10^{-11} M$$

5. (b) $pH + pOH = pK_w$

6. (d) $pH = -\log[H^+]$

$$5.4 = -\log[H^+]; [H^+] = 3.98 \times 10^{-6}$$

7. (a) $KCN + H_2O \rightleftharpoons KOH + HCN$. KOH is a strong base and HCN is a weak acid.

8. (c) $[H^+] = 10^{-3} M$, $pH = -\log[10^{-3}]$, $pH = 3$

9. (b) $[H^+] = [OH^-]$

$$K_w = [H^+][OH^-] = 10^{-14}$$

$$\therefore [H^+] = 10^{-7}, pH = -\log[H^+] = 7$$

10. (d) $pH = 5$ means $[H^+] = 10^{-5}$

$$pOH = 14 - pH = 14 - 5 = 9$$

$$[OH^-] = 10^{-pOH} = 10^{-9}$$

11. (a) $pH = -\log[H^+]; [H^+] = 0.01 N$

$$pH = -\log[10^{-2}]; pH = 2$$

12. (d)
- | | | | | | |
|---------|---------------|----------------------|--------------|---|---------------|
| Initial | BOH | $\rightleftharpoons$ | B^+ | + | OH^- |
| At eq. | $C - C\alpha$ | | $C\alpha$ | | $C\alpha$ |
- $$K_b = \frac{C^2 \alpha^2}{C(1-\alpha)} = C\alpha^2 \text{ assuming } \alpha \ll 1; 1-\alpha \approx 1$$
- $$10^{-12} = 10^{-2} \times \alpha^2; \alpha^2 = 10^{-10}; \alpha = 10^{-5}$$
- $$[\text{OH}^-] = C\alpha = .01 \times 10^{-5} = 10^{-7}$$
13. (c) $pH = 4$ means; $[\text{H}^+] = 10^{-4} \text{ mol}$
14. (a) Buffer solution is a mixture of weak acid and its conjugate base.
15. (b) Adding Na_2CO_3 to water makes the solution basic and hence a pH increases from 7.
16. (d) NaClO is a salt of strong acid HClO_4 . So it is a strong acid salt.
17. (b) NaOH is a base, so that its $pH > 7$
18. (c) It is a strong base.
- 1 M NaOH has maximum $[\text{OH}^-]$ and minimum $[\text{H}^+]$ and maximum pH .
19. (c) When $pH = 7$ means neutral, $pH < 7$ means acidic, $pH > 7$ means basic.
20. (d) As the solution is acidic, $pH < 7$. This is because $[\text{H}^+]$ from H_2O $[10^{-7} M]$ cannot be neglected in comparison to $10^{-10} M$
22. (c) It is a strong acid and they lose proton in a solution.
23. (a) $[\text{OH}^-] = 10^{-2} M$; $pOH = 2$
 $pH + pOH = 14$; $pH = 14 - pOH$
 $pH = 14 - 2 = 12$
24. (d) Order of acidic strength is $\text{H}_2\text{Te} > \text{H}_2\text{Se} > \text{H}_2\text{S} > \text{H}_2\text{O}$
 Na_2O is a salt of $\text{NaOH} + \text{H}_2\text{O}$ and H_2O is least acidic among given acids hence pH in this case will be $\max^m$.
25. (b) pH of the solution $A = 3$
 $[\text{H}^+] = 10^{-3} M$
 pH of the solution $B = 2$
 $[\text{H}^+] = 10^{-2} M$
 $[\text{H}^+] = 10^{-3} + 10^{-2} = 10^{-3} + 10 \times 10^{-3} = 11 \times 10^{-3}$
 $pH = -\log(11 \times 10^{-3}) = 3 - \log 11$
 $= 3 - 1.04 = 1.95$
26. (a) $\text{CN}^- + \text{H}_2\text{O} \rightarrow \text{HCN} + \text{OH}^-$
 Because OH^- concentration is increased.
27. (a) On dilution the pH of acid A increases while pH of base B decreases.
28. (d) CH_3COONa is a salt of weak acid, (CH_3COOH) and strong base (NaOH) .
29. (b) The equilibrium will shift in the backward direction.
30. (b) $K_a = 10^{-5}$; $pH = 6$
 $pH = -\log K_a + \log \frac{[\text{Salt}]}{[\text{Acid}]}$; $6 = -\log 10^{-5} + \log \frac{[\text{Salt}]}{[\text{Acid}]}$
 $6 = 5 \log 10 + \log \frac{[\text{Salt}]}{[\text{Acid}]}$; $6 = 5 + \log \frac{[\text{Salt}]}{[\text{Acid}]}$
 $\log \frac{[\text{Salt}]}{[\text{Acid}]} = 6 - 5 = 1$; $\frac{[\text{Salt}]}{[\text{Acid}]} = \frac{10}{1}$
31. (d) All are true – (a) is true for acid buffer, (b) for basic buffer, (c) is called buffer solution.
32. (b) $\frac{N}{100} = 0.01 N \text{ HCl}$; $[\text{H}^+] = 10^{-2} M$; $pH = 2$
 $[\text{OH}^-] = 10^{-2} M$ for NaOH
 $pH + pOH = 14$; $pH = 14 - 2$; $pH = 12$
34. (a) It is a buffer solution of strong acid and its weak conjugate base.
35. (c) $\text{HA} \rightleftharpoons \text{H}^+ + \text{A}^-$
 $[\text{H}^+] = 0.1 M$; $[\text{H}^+]^2 = K_a \times C$
 $[\text{H}^+] = \sqrt{K_a \times C} = \sqrt{1 \times 10^{-5} \times 0.1} = \sqrt{10^{-6}}$
 $[\text{H}^+] = 10^{-3} M$; $pH = 3$
36. (c) As the solution is acidic, $pH < 7$. This is because $[\text{H}^+]$ from H_2O cannot be neglected in comparison to 10^{-8} .
37. (c) Human body contain buffer solution. Its $pH \approx 6.8$
38. (a) It is a neutral solution and its $pH = 7$
39. (a) $pH = 5$, means $[\text{H}^+] = 10^{-5} M$.
 After dilution $[\text{H}^+] = 10^{-5} / 100 = 10^{-7} M$
 $[\text{H}^+]$ from H_2O cannot be neglected.
 Total $[\text{H}^+] = 10^{-7} + 10^{-7} = 2 \times 10^{-7}$
 $pH = 7 - 0.3010 = 6.6990 = 7$ (neutral).
40. (d) $[\text{H}^+] = \alpha.C = \frac{2}{100} \times .02$; $[\text{H}^+] = 4 \times 10^{-4} M$
 $pH = -\log [\text{H}^+] = 4 - \log 4$; $pH = 3.3979$
41. (a) $pH = pK_a + \log \left[\frac{\text{salt}}{\text{acid}} \right]$
 $= 9.30 + \log \left[\frac{0.2}{0.1} \right] = 9.30 + 0.3010 = 9.6$.
42. (a) $pH = pK_a + \log \frac{[\text{Salt}]}{[\text{Acid}]}$
 $pH = -\log(1.8 \times 10^{-5}) + \log \frac{[10]}{[100]}$
 $= -\log 1.8 + 5 + \log 10^{-1}$
 $= -0.2553 + 5 - 1 = 3.7447$ or $= 4$
43. (b) 20 ml of $0.1 \text{ N HCl} = \frac{0.1}{1000} \times 20 g \text{ eq.} = 2 \times 10^{-3} g \text{ eq.}$
 20 ml of $0.001 \text{ KOH} = \frac{0.001}{1000} \times 20 g \text{ eq.}$
 $= 2 \times 10^{-5} g \text{ eq.}$
 $\therefore \text{HCl left unneutralised} = 2(10^{-3} - 10^{-5})$
 $= 2 \times 10^{-3}(1 - 0.01) = 2 \times 0.99 \times 10^{-3} = 1.98 \times 10^{-3} g \text{ eq.}$
 Volume of solution = 40 ml
 $\therefore [\text{HCl}] = \frac{1.98 \times 10^{-3}}{40} \times 1000 M = 4.95 \times 10^{-2}$
 $\therefore pH = 2 - \log 4.95 = 2 - 0.7 = 1.3$.
45. (b) $10^{-7} M \text{ NaOH}$ means $[\text{OH}^-] = 10^{-7}$; $pOH = 7$
 $pH = 14 - 7 = 7$

46. (a) $[H^+] = c \times \alpha = 0.1 \times \frac{30}{100} = 0.03 \text{ M}$
48. (a) The pH of buffer solution never changed.
49. (c) $[H^+] = \frac{10^{-14}}{10^{-1}} = 10^{-13} \text{ mol/litre } pH = 13.$
50. (a) $pH = -\log[H^+]; 7.4 = -\log[H^+]; [H^+] = 4 \times 10^{-8} \text{ M}$
51. (a) The pH of $0.1 \text{ M HCl} = 1$ Ionization of H_2SO_4 takes place in two steps.
 $H_2SO_4 \rightleftharpoons H^+ + HSO_4^-; HSO_4^- \rightleftharpoons H^+ + SO_4^{2-}$
52. (c) 1 N NaOH solution have highest pH
 $[OH^-] = 1; pOH = 0; pH + pOH = 14$
 $pH = 14 - 0 = 14$
53. (c) $H_2O \rightleftharpoons [H^+][OH^-]$
 $HCl \rightleftharpoons [H^+][Cl^-]$
 Total $[H^+] = [H^+]_{H_2O} + [H^+]_{HCl} = 10^{-7} + 10^{-8}$
 $= 10^{-7} [1 + 10^{-1}]$
 $[H^+] = 10^{-7} \times \frac{11}{10}$
 $pH = -\log[H^+] = -\log\left(10^{-7} + \frac{11}{10}\right); pH = 6.958$
54. (c) $pK_s = -\log K_s; pK_b = -\log K_b$
 $pH = -\frac{1}{2}[\log K_a + \log K_w - \log K_b]$
 $= -\frac{1}{2}[-5 + \log(1 \times 10^{-14}) - (-5)]$
 $= -\frac{1}{2}[-5 - 14 + 5] = -\frac{1}{2}(-14) = 7$
55. (d) BaO, CaO and Na_2O are shows more than 7 pH because of their basic nature.
56. (a) $MgCl_2 + 2H_2O \rightleftharpoons Mg(OH)_2 + 2HCl$
57. (c) H_2SO_4 ionized in two step.
58. (b) $pH = pK_a + \log \frac{[Salt]}{[Acid]}$
 $5.8 = 4.8 + \log \frac{[Salt]}{[Acid]}$ or $\log \frac{[Salt]}{[Acid]} = 1.0$
 $\frac{[Salt]}{[Acid]} = \text{antilog } 1.0 = 10$
 $\therefore \frac{[Acid]}{[Salt]} = \frac{1}{10} = 0.1$
59. (b) It contains replacable H atom.
60. (c) (i) 20 ml of 0.5 N HCl
 $0.5 \text{ N} \Rightarrow 1000 \text{ ml } 0.5 \text{ mole HCl}$ is present in 20 ml
 $= \frac{20 \times 0.5}{1000} = 1.0 \times 10^{-2}$
 (ii) 35 ml of 0.1 N NaOH
 $0.1 \text{ N} \Rightarrow 1000 \text{ ml}$ of 0.1 mole NaOH is 35 ml
 $= \frac{35 \times 0.1}{1000} = 0.35 \times 10^{-2}$
 Total = $20 + 35 = 55 \text{ ml}$
 $\Rightarrow (1.0 - 0.35)10^{-2} = 0.65 \times 10^{-2} \text{ mole HCl}$
 $HCl = H^+ + Cl^-$
 $\Rightarrow [HCl] = [H^+] + [Cl^-]$
 55 ml contains 0.65×10^{-2} mole of H ions
 $1000 \text{ ml} - \frac{0.65 \times 10^{-2} \times 10^3}{55} = \frac{6.5}{55}$
 $pH = -\log[H^+] = -\log(6.5/55)$
 $= \log 55 - \log 6.5 = 0.92$
 Due to acidic nature of solutions the colour of phenolphthalein becomes pink.
61. (b) $[H^+] = 2 \times 10^{-2} \text{ M}$
 $\therefore pH = -\log[2 \times 10^{-2}];$
 $pH = 1.7$ i.e. in between 1 and 2.
63. (b) $pH = 4, (H^+) = 10^{-pH} = 10^{-4} \text{ M}$
65. (c) $NaOH \rightleftharpoons Na^+ + OH^-$
 $[OH^-] = 10^{-5} \text{ M}; [H^+][OH^-] = 10^{-14}$
 $[H^+] = \frac{10^{-14}}{10^{-5}}; [H^+] = 10^{-9} \text{ M}; pH = 9.$
67. (b) $pH = pK_a + \log \frac{[Salt]}{[Acid]}; pH = 4.75 + \log \frac{0.1}{0.1}$
 $pH = 4.75 + \log 1; pH = 4.75$
68. (d) A weak acid and its salt with a strong base maintain pH 4 – 5
69. (a) $NaOH \rightleftharpoons Na^+ + OH^-; [OH^-] = 10^{-8} \text{ M}$
70. (c) $[OH^-] = 0.0001 \text{ N}, pOH = 4, pH + pOH = 14$
 $pH = 14 - pOH = 14 - 4 = 10$
71. (d) 0.001 M KOH solution
 $[OH^-] = 0.001 \text{ M} = 1 \times 10^{-3} \text{ M}$
 $[H^+] \times [OH^-] = 1 \times 10^{-14}$
 $[H^+] = \frac{1 \times 10^{-14}}{[OH^-]}$
 $[H^+] = \frac{1 \times 10^{-14}}{1 \times 10^{-3}} = 1 \times 10^{-14} \times 10^{+3}$
 $[H^+] = 10^{-11} \text{ M}$
 $pH = 11$
72. (a) An acid buffer solution consists of solution of weak acid with strong base of its salt.
73. (b) An acid buffer solution consists of a weak acid and its salt with strong base. i.e. $CH_3COOH + CH_3COONa$
74. (a) $pOH = pK_b + \log \frac{[salt]}{[base]}$

$$= 5 + \log \frac{0.02}{0.2} = 5 + \log \frac{1}{10} = 5 + (-1) = 4$$

$$pH = 14 - pOH = 14 - 4 = 10$$

75. (b) $[Salt] = 0.1 M$, $[Acid] = 0.1 M$

$$K_a = 1.8 \times 10^{-5}; \quad pH = -\log K_a + \log \frac{[Salt]}{[Acid]}$$

$$= -\log 1.8 \times 10^{-5} + \log \frac{0.1}{0.1} = -\log 1.8 \times 10^{-5}$$

$$pH = 4.7.$$

76. (a) NH_4Cl and NH_4OH is a buffer solution (weak base and salt of strong acid).

77. (a) $pH + pOH = 14$; $pH = 14 - pOH$

$$\therefore [OH^-] = 10^{-7}$$

$$pOH = 7$$

$$\therefore pH = 14 - 7 = 7.$$

78. (c) $0.01 M Ba(OH)_2 = 0.02 N Ba(OH)_2$

$$N_1 V_1 = N_2 V_2$$

$$[0.02 N] \times [50 ml] = N_2 \times 100 ml$$

$$N_2 = \frac{0.02 \times 50}{100} = 10^{-2} N; [OH^-] = 10^{-2} N$$

$$pOH = 2 \text{ or } pH = 12$$

79. (b) $pH = -\log [H^+]$.

80. (a) Na_2CO_3 is a mixture of weak acid and strong base, so it is a base.

81. (b) $10^{-7} N HCl$ means $(H^+) = 10^{-7} M$

$$pH = -\log(H^+), \quad pH = 7$$

82. (c) $pH = 2$; $pH = -\log [H^+]$; $2 = -\log [H^+]$

$$[H^+] = 10^{-2} = 0.01 N$$

83. (b) pH does not change on addition of some concentration of HCl .

84. (b) Solution of CH_3COONa on addition to acid shows a decrease in dissociation of acid due to common ion effect. To decrease in $[H^+]$ or increase pH .

85. (c) $pH + pOH = 14$; $pH = 14 - pOH$; $pH = 14 - 6 = 8$.

86. (b) $[H^+]_I = 10^{-5}$ $[H^+]_{II} = 10^{-2}$

$$\text{Thus increase in } [H^+] = \frac{10^{-2}}{10^{-5}} = 1000 \text{ times}$$

87. (a) The HCl is a strong acid and they lose easily H^+ in solution.

88. (a) $X^- + H_2O \rightleftharpoons OH^- + HX$

$$K_b = \frac{[OH^-][HX]}{[X^-]}$$

$$K_a = \frac{[H^+][X^-]}{[HX]}$$

$$\therefore K_a \times K_b = [H^+][OH^-] = K_w = 10^{-14}$$

$$\text{Hence } K_a = 10^{-4}$$

$$\text{Now as } [X^-] = [HX], \quad pH = pK_a = 4.$$

90. (d) Buffer solution is formed. So the pH will not change.

91. (b) Na_2CO_3 when react with water form strong base and weak acid. So its aqueous solution is basic.

92. (c) $K_w = [H_3O^+][OH^-]$

$$\text{Concentration of } H_3O^+ \text{ in distilled water} = 1 \times 10^{-6} \text{ mol/l}$$

$$\text{Now } [H_3O^+] = [OH^-]$$

$$K_w = [1 \times 10^{-6}] \times [1 \times 10^{-6}] = 1 \times 10^{-12}.$$

93. (a) $[OH^-] = 10^{-1} M$; $pOH = 1$

$$pH + pOH = 14; \quad pH = 14 - 1 = 13.$$

94. (a) Maximum pH $HClO$ is a weak acid all of these. So that the salt of weak acid is also weak.

95. (c) As the solution is acidic $pH < 7$. This is because $[H^+]$ from H_2O $[10^{-7}]$ cannot be neglected in comparison to $10^{-12} M$.

96. (b) [Normal salt + acidic salt] is a buffer solution.

97. (b) 100 ml of $\frac{M}{10} NaOH = 50 \text{ ml}$ of $\frac{M}{5} NaOH$. They exactly neutralise 50 ml $\frac{N}{5} HCl$. Hence pH of resulting solution = 7.

98. (b) $M_1 = 6.0 M$ of HCl ; $V_1 = ?$

$$M_2 = 0.30 M \text{ is } H^+ \text{ concentration in solution.}$$

$$V_2 = 150 \text{ ml of solution.}$$

$$M_1 V_1 = M_2 V_2; \quad 6.0 \times V_1 = .30 \times 150$$

$$V_1 = \frac{.30 \times 150}{6} = 7.5 \text{ ml.}$$

99. (b) $pH = 3$, $[H^+] = 10^{-3} M$

$$\therefore [H^+] = \sqrt{K \times c}$$

$$[10^{-3}]^2 = K \times c; \quad \frac{[10^{-6}]}{0.1} = K = 10^{-5}$$

100. (b) When ratio of concentration of acid to salt is increased pH decrease.

101. (c) For NH_4OH .

$$[OH^-] = C \cdot \alpha; \quad C = \frac{1}{10} M, \quad \alpha = 0.2$$

$$[OH^-] = \frac{1}{10} \times 0.2 = 2 \times 10^{-2} M$$

$$pOH = -\log [OH^-] = \log [2 \times 10^{-2}]; pOH = 1.7$$

$$pH = 14 - pOH = 14 - 1.7 = 12.30.$$

102. (c) $pH = pK_a + \log \frac{[Salt]}{[Acid]}$. For small concentration of buffering

agent and for maximum buffer capacity $\frac{[Salt]}{[Acid]} \approx 1$.

103. (a) $[H^+] =$ increased ten fold means pH of solution decreased by one.

$$pH = \log \frac{1}{[H^+]}$$

104. (a) Because the pH of buffer are not changed.

105. (c) $pH = pK_a + \log \frac{[Salt]}{[Acid]}$; $5.5 = 4.5 + \log \frac{[Salt]}{[0.1]}$

$$\log \frac{[Salt]}{0.1} = 5.5 - 4.5 = 1$$

$$\frac{[Salt]}{0.1} = \text{antilog } 1 = 10; [Salt] = 1$$

106. (a) Moles of $H_2SO_4 = \frac{0.49}{98} = 5 \times 10^{-3}$ moles of H_2SO_4

present per litre of solution (molarity) $= \frac{.005}{1} = .005 M$

one mole of H_2SO_4 give 2 moles of H_3O^+ ions.

$$H_3O^+ = 2 \times (H_2SO_4) = 2 \times 0.005 = 0.01 M$$

$$[H^+] = 10^{-2} M; pH = 2$$

107. (c) CH_3COONH_4 is a simple buffer and called salt of weak acid.

108. (c) N.eq. for $HCl = \frac{0.4}{1000} \times 50 = 0.02$

$$\text{N.eq. for } NaOH = \frac{0.2}{1000} \times 50 = 0.1$$

$$\text{Now } [OH^-] \text{ left} = 0.1 - 0.02$$

$$[OH^-] = .08 = 8 \times 10^{-2} M$$

$$pOH = -\log 8 \times 10^{-2} M; pOH = 1.0$$

109. (d) Buffer is mixture of weak base and its acid salt.

110. (b) $[NaOH] = 0.4/40 \text{ mole/l.} = 0.1 M$

$$[OH^-] = 10^{-1} M, [H^+] = 10^{-13} M, pH = 13$$

111. (d) $pH + pOH = 14, pH = 4, H^+ = 10^{-4} \text{ mole/litre.}$

112. (d) Buffer solution have constant pH . When we add the water into this buffer solution. So no effect on it.

One molecule on dissociation furnishes $2OH^-$ ions.

$$\text{So, } [OH^-] = 2 \times 10^{-4} N$$

$$N = M \times 2; M = \frac{N}{2} = \frac{2 \times 10^{-4}}{2} = 10^{-4}$$

$$pOH = -\log [OH^-] = -\log (1 \times 10^{-4}) = -4$$

$$pH + pOH = 14; pH = 14 - 4 = 10.$$

114. (a) M.eq. of $0.10 M HCl = \frac{0.10}{1000} \times 40 = 0.004 M$

$$\text{M.eq. of } 0.45 M NaOH = \frac{0.45 \times 10}{1000} = 0.0045 M$$

$$\text{Now left } [OH^-] = 0.0045 - 0.004 = 5 \times 10^{-4} M$$

$$\text{Total volume} = 50 \text{ ml}$$

$$[OH^-] = \frac{5 \times 10^{-4}}{50} \times 1000; [OH^-] = 1 \times 10^{-2}$$

$$pOH = 2; pH = 14 - pOH = 12.$$

115. (c) $0.001 M HCl = 10^{-3} M [H^+], pH = 3.$

116. (d) $[NaOH] = \frac{0.4}{40} = 0.01 M; [OH^-] = 10^{-2} M$

$$[H^+] = 10^{-12}, pH = -\log [H^+] = 12$$

117. (b) Those substance which give a proton is called Bronsted acid while CH_3COO^- doesn't have proton so it is not a Bronsted acid.

120. (c) $pH = -\log [H^+]$

121. (d) $pH + pOH = 14, pH = 4.0$

$$pOH = 14 - pH; pOH = 14 - 4.0 = 10.0$$

122. (b) $pH = 0$ means $[H^+] = 10^0 = 1 M$. Hence solution is strongly acidic.

123. (c) As the solution is acidic, $pH < 7$. This is because $[H^+]$ from H_2O ($10^{-7} M$) cannot be neglected in comparison to $10^{-10} M HCl$.

$$pOH + pH = 14; 7 + 7 = 14; [H^+] + [OH^-] = 10^{-14}$$

$$10^{-7} + 10^{-7} = 10^{-14}; [OH^-] = 10^{-7} \text{ gm ion/l.}$$

126. (b) When $pH = 2, [H^+] = 10^{-2} M$

127. (a) $[OH^-] \text{ ion conc.} = 0.05 \frac{\text{mol}}{l} = 5 \times 10^{-2} \frac{\text{mol}}{l}$

$$pOH = -\log [OH^-] = -\log [5 \times 10^{-2}]$$

$$pOH = 1.30; pH + pOH = 14$$

$$pH = 14 - pOH = 14 - 1.30 = 12.7$$

128. (c) When $pH = 3$, then $[H^+] = 10^{-3} M$

after that we increased the pH from 3 to 6 then $[H^+] = 10^{-6} M$ means reduced 1000 times.

129. (b) CO_2 is acidic oxide which on dissolution in water develops acidic nature.

130. (d) If pH of any solution is 2.

$$\text{Then } [H^+] = 10^{-2} M$$

If pH of any solution is just double then $pH = 4$ and $[H^+]$ will be 10^{-4} .

131. (c) A strong acid is not used to make a buffer.

132. (d) $pH = 1$ means $[H^+] = 10^{-1} M$

$$\text{Hence } [H_2SO_4] = \frac{10^{-1}}{2} = \frac{1}{20} = 0.05 M$$

133. (c) The pH of blood is 7.4 due to presence of bicarbonates ions

134. (c) As the solution is acidic, $pH < 7$. This is because $[H^+]$ from H_2O $[10^{-7}]$ cannot be neglected in comparison to 10^{-8}

135. (a) pH will decrease because $[OH^-]$ increased due to this pOH is decreased.

136. (c) $[H^+] = 6 \times 10^{-4} M$

$$pH = -\log [H^+] = -\log [6 \times 10^{-4}] = 3.22.$$

137. (c) $0.01 M HCl = 10^{-2} M [H^+]$, $pH = 2$.

138. (c) Because buffer solution have a constant pH .

139. (c) $10^{-6} M HCl = 10^{-8} M [H^+]$. Also from H_2O

$$[H^+] = 10^{-7} M$$

$$\text{Total } [H^+] = 10^{-7} + 10^{-8} = 10^{-7} [1 + 0.1] = 10^{-7} [1.1]$$

$$\text{Hence } pH = 7 - 0.0414 = 6.96.$$

140. (b) $10^{-10} M HCl = 10^{-10} M [H^+]$. But $pH \neq 10$ because solution is acidic. This is because H^+ from H_2O ($10^{-7} M$) cannot be neglected.

$$\text{Total } [H^+] = 10^{-7} + 10^{-10}$$

$$= 10^{-7} + (1 + 10^{-3}) = 10^{-7} (1.001)$$

That is why $pH = 7$ (slightly less than 7)

141. (b) $[H^+] = 1.00 \times 10^{-6} \text{ mole/litre}$

$$pH = -\log [1.00 \times 10^{-6}]; pH = 6.$$

142. (a) $[H^+]$ is in moles per litre.

143. (d) As the solution is acidic, $pH < 7$. This is because $[H^+]$ from H_2O ($10^{-7} M$) cannot be neglected in comparison to 10^{-8} .

145. (b) pH of $0.001 M HCl = 10^{-3} M [H^+]$, $pH = 3$.

146. (d) Because it can furnish H^+ ions in solutions.

147. (c) Because it is a strong acid.

$$H^+ = 10^{-1}$$

$$pH = -\log [H^+] = -\log [10^{-1}]; pH = 1.$$

148. (b) Buffer solution is a combination of weak acid and conjugate base. $NaCl$ is a salt and $NaOH$ is the base.

149. (a) $[H^+] = \sqrt{Kc} = \sqrt{10^{-5} \times 0.1} = 10^{-3}$, $pH = 3$.

150. (d) In $\frac{N}{10} NaOH$ have $[OH^-] = 10^{-1} M$ means $pOH = 1$ and then $pH + pOH = 14$
 $pH = 14 - pOH = 13$.

151. (b) Borate ions are hydrolyzed to develop alkaline nature in solution.

152. (d) Less the pH , more acidic is the solution.

154. (b) The equal conc. of salt and acid.

155. (c) $pH = -\log K_a + \log \frac{[KCN]}{[HCN]}$

$$pH = -\log [5 \times 10^{-10}] + \log \left(\frac{0.15}{1.5} \right) = 8.302$$

157. (c) $pH = pK_a + \log \frac{[Salt]}{[Acid]}$ equimolar means

$$\frac{[Salt]}{[Acid]} = 1; pH = 4.74 + 0 = 4.74$$

158. (a) Because of $NaCl$ is a salt of strong acid and strong base. So that it is neutral.

159. (c) When strong acid and strong base are react neutral salt are formed. So that $NaCl$ is a neutral salt.

162. (d) $pH = -\log K_b + \log \frac{[Salt]}{[Acid]}$

$$pH = -\log [1.8 \times 10^{-5}] + \log \frac{[Salt]}{1.0}$$

$$9 = 4.7 + \log \frac{[Salt]}{1.0}; \log \frac{[Salt]}{1.0} = 4.7 - 9 = -4.3$$

$$\frac{[Salt]}{1.0} = \text{Antilog} \frac{1}{4.3}; [Salt] = 1.8$$

163. (b) $pH = -\log K_b + \log \frac{[salt]}{[acid]}$

$$5 = -\log 10^{-4} + \log \frac{[salt]}{[acid]}$$

$$\log \frac{[salt]}{[acid]} = 1$$

$$\frac{[salt]}{[acid]} = \text{antilog} 1 = 10 : 1$$

164. (a) $1 M KOH$ show highest pH value because it is a strong base.

165. (d) NH_4OH is a weak acid and NH_4Cl is a strong base salt.

166. (a) $pH = 13.6$

$$pOH = 14 - 13.6 = 0.4$$

$$[OH^-] = \text{Antilog}(-0.4) = 0.3979. \text{ So the value of } [OH^-] \text{ between } 0.1 M \text{ and } 1 M$$

167. (d) Aspirin is a weak acid. Due to common ion effect it is unionised in acid medium but completely ionised in alkaline medium.

168. (b) $[H^+][OH^-] = 10^{-14}; (10^{-7})(10^{-7}) = 10^{-14}$

169. (c) $HCl = 10^0 M$ has $pH = 0$. The value of pH decreases as concentration further increases.

170. (a) Because pure water has a 7 pH .

171. (c) When concentration of $[H^+]$ increased then the value of pH is decreases.

$$pH = \log \frac{1}{[H^+]}$$

172. (c) The concentration of $[H^+] = 10^{-2}$ mole/litre
 $pH = -\log[H^+] = -\log[10^{-2}]; pH = 2$
173. (d) Due to common ion effect.
174. (b) In water solution.
 $NH_3 + H_2O \rightleftharpoons NH_4^+ + OH^-$
 concentration of OH^- is increased so that solution become more basic and the pH is increased.
175. (a) Na_2CO_3 is basic in nature. So its pH is greater than 7.
176. (c) It is not a mixture of weak acid or base and their strong salt.
177. (a) $[H^+] = \text{Antilog}(-4.58);$
 $[H^+] = 2.63 \times 10^{-5}$ moles/litre
178. (c) $10^{-2} M NaOH$ will give $[OH^-] = 10^{-2}$
 $\therefore pOH = 2$, Also $pH + pOH = 14$
 $\therefore pH = 12$.
179. (a) $pH = pK_a + \log \frac{[\text{Salt}]}{[\text{Acid}]} = -\log 2 \times 10^{-5} + \log \frac{10 \times 1}{50 \times 2} = 4$.
180. (b) $0.001 M NaOH$ means $[OH^-] = 10^{-3}; pOH = 3$
 $pH + pOH = 14; pH = 14 - 3$
 $pH = 11; [H^+] = 10^{-11}$ mole/litre
181. (c) $[H^+] = C \cdot \alpha$
 $[H^+] = 0.1 \times \frac{1}{100} = 10^{-3}$
 $pH = -\log[H^+] = -\log 10^{-3} = 3$
182. (b) $pH = 4$
 $pH + pOH = 14; pOH = 14 - pH$
 $pOH = 14 - 4 = 10; [OH^-] = 10^{-10} M$
183. (b) $pH = \log \frac{1}{[H^+]} = \log \frac{1}{[3 \times 10^{-3}]} = 2.523$
185. (c) It is a strong base.
186. (b) $[H^+]$ Concentration in $0.01 M HCl$ is $10^{-2} M$ because $0.01 M HCl$ have only H^+
 $HCl \rightleftharpoons H^+ + Cl^-$.
187. (b) The value of H_3O^+ ions will not changed.
 $CH_3COOH + H_2O \rightleftharpoons CH_3COO^- + H_3O^+$.
188. (a) H_2O_2 (Hydrogen peroxide) is a corrosive volatile liquid. It is slightly acidic in nature. Its pK_a value is approximately 10^{-12} .
192. (b) $pH = \log \frac{1}{H^+}; pH = \log \frac{1}{10^{-3}}; pH = 3$.
193. (b) NH_3 is Lewis base because of one lone pair of electron.
194. (b) $Ba(OH)_2 \rightarrow Ba^{+2} + 2OH^-$
 $.05M \quad 2 \times 0.5M$

$$pOH = \log \frac{1}{[OH^-]} = \log \frac{1}{.1} = 1$$

$$pH + pOH = 14; pH + 1 = 14; pH = 14 - 1 = 13$$

195. (a) If concentration of acid is increases ten times in a buffer then pH of the solution is increase by one.
198. (b) $pH > 7 = \text{Basic}$
 It means contain more hydroxide ions than carbonate ions.
199. (a) At $7pH$ the concentration of OH^- and H^+ are equal.
200. (a,d) M.eq. of $0.01 M HCl = \frac{.01 \times 100}{1000} = 1 \times 10^{-3}$
 $pH = 3$
 M.eq. of $.02 M H_2SO_4 = \frac{.04 \times 50}{1000} = 2 \times 10^{-3}$
 M.eq. of $.02 M NaOH = \frac{0.02 \times 50}{1000} = 1 \times 10^{-3}$
 Left $[H^+] = 2 \times 10^{-3} - 1 \times 10^{-3} = 1 \times 10^{-3}; pH = 3$
202. (a,b,c) Because buffer solution are mixture of weak acid or weak base and their salt.
203. (c) Because $pH = 8$ is basic nature but HCl is a strong acid.
204. (c) $H_2SO_4 = 0.05 \times 2$
 $\therefore [H^+] = 0.1$ and $pH = 1$
205. (b) $Mg(OH)_2 \rightleftharpoons Mg^{2+} + 2OH^-$
 $K_{sp} = [Mg^{2+}][OH^-]^2$
 $1 \times 10^{-12} = 0.01[OH^-]^2$
 $[OH^-]^2 = 1 \times 10^{-10} \Rightarrow [OH^-] = 10^{-5}$
 $[H^+] = 10^{-14} / 10^{-5} = 10^{-9}$
 $pH = -\log[H^+] = -\log[10^{-9}] = 9$
206. (b) $[OH^-] = 1 \times 10^{-5}$
 $pOH = -\log[OH^-] = 5$
 $pH + pOH = 14 \Rightarrow pH = 14 - 5 = 9$.

Critical Thinking Questions

1. (b) K_{sp} of $AgI = 1.5 \times 10^{-16}$
 $10^{-8} M Ag^+$ and $10^{-8} M I^-$
 Ionic product $= 10^{-16}$
 $K_{sp} = \text{Ionic product}$
2. (a) $HClO$ is the weakest acid. Its conjugate base ClO^- is the strongest base.
3. (b) $B(OH)_3$ not have H^+
4. (a) $h = \frac{k_w}{k_a} = \frac{1 \times 10^{-14}}{4.5 \times 10^{-10}} = 2.22 \times 10^{-5}$
5. (d) $MX_4 \rightarrow M + 4X$; $K_{sp} = (4s)^4 s$; $K_{sp} = 256s^5$
 $s = \left(\frac{K_{sp}}{256} \right)^{1/5}$.
6. (a) Lewis acid are electrophiles because they accept election pairs.

7. (c) Initial $\frac{2HI}{2} = \frac{H_2 + I_2}{0 + 0}$
- At equilibrium $2 - \alpha \quad \frac{\alpha}{2} \quad \frac{\alpha}{2} = 2 - \alpha + \frac{\alpha}{2} + \frac{\alpha}{2} = 2$.
8. (a) Because they have vacant d -orbital in central atom.
9. (a) Energy has to be spent for the total dissociation of weak acid.
10. (a) pK_a of acid $A = 4$; pK_a of acid $B = 5$
- We know that $pK_a = -\log K_a$
- $\therefore$ Acid A $K_a = 10^{-4}$
- Acid B $K_a = 10^{-5}$
- Hence A is ten times stronger than that of B .
11. (b) $\frac{\alpha_1}{\alpha_2} = \sqrt{\frac{K_{a1}}{K_{a2}}} = \sqrt{\frac{3.14 \times 10^{-4}}{1.6 \times 10^{-5}}} = 4 : 1$
12. (d) It is a salt of weak acid and weak base.
13. (c) $HA \rightleftharpoons H^+ + A^-$; $K_a = \frac{[H^+][A^-]}{[HA]}$ (i)
- neutralization of the weak acid with strong base is
- $HA + OH^- \rightleftharpoons A^- + H_2O$
- $K = \frac{[A^-]}{[HA][OH^-]}$ (ii)
- dividing (i) by (ii) $\frac{K_a}{K} = [H^+][OH^-] = K_w = 10^{-14}$
- $K = \frac{K_a}{K_w} = \frac{10^{-5}}{10^{-14}} = 10^9$.
14. (d) NH_4Cl undergoes cationic hydrolysis hence pH is > 7 because the solution due to cationic hydrolysis in acids.
- $NaCN$ undergoes anionic hydrolysis hence pH is > 7 .
- HCl is strong acid and $NaCl$ is neutral solution.
- Hence the pH of given solutions will increase.
- $HCl < NaCl < NaCN < NH_4Cl$
15. (c) It is a $HClO_4$
16. (d) Smaller the pK_a value, stronger the acid.
17. (d) It involves gain and loss of electron pair (Lewis concept).
18. (b) $H^-(aq.) + H_2O(l) \rightarrow OH^- + H_2$.
19. (b) $K_H = \frac{K_a}{K_w} = \frac{10^{-4}}{10^{-14}} = \frac{1}{10^{-10}} = 10^{10}$.
20. (d) Acidity is directly proportional to oxidation number. As the O.No. of S , P and Cl in H_2SO_3 , H_3PO_3 & $HClO_3$ is +4, +3 & +5 respectively so decreasing order of acidity will be III $>$ I $>$ II.
21. (a) A substance which can donate a proton is known as acid so NH_4^+ will be an acid.
22. (b) Acetic acid is a weak acid.
23. (a) Because it is an acidic oxide.
24. (b) $[Ca^{2+}][F^-]^2 = \left[\frac{10^{-2} \times V}{2V} \right]^2 \times \left[\frac{10^{-3} \times V}{2V} \right]^2 = 1.25 \times 10^{-9}$.
25. (a) The degree of hydrolysis of a salt of weak acid and weak base is independent of concentration of salt.
26. (c) $C = 0.1M$; $\alpha = 1\%$; $(H^+) = C \times \alpha$
- $= 0.1 \times \frac{1}{100} = 10^{-3}$; $(H^+) = 10^{-3}$; $pH = 3$.
27. (d) $HClO_4$ is a strong acid, because its oxidation no is +7.
28. (d) Acceptor of electron pair is known as Lewis acid. S , CH_2 , $(CH_3)_3B$ all can accept an electron pair so answer is (d).
29. (b) $Mg(OH)_2 \rightleftharpoons Mg_{(s)}^{2+} + 2OH_{(2s)}^-$
- $K_{sp} = 4S^3 \Rightarrow S = \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{1.2 \times 10^{-11}}{4}}$
- $S = 8.16 \times 10^{-4}$
30. (d) $K_a = \frac{[H^+][CN^-]}{[HCN]}$
- $6.2 \times 10^{-10} = \frac{[H^+][0.02]}{[0.01]}$
- $[H^+] = \frac{6.2 \times 10^{-10} \times 0.01}{0.02} = 3.1 \times 10^{-10}$
- $\therefore$
31. (b) $\ddot{N}H_3$ presence of lone pair of electrons.
32. (a) $CuBr_{(s)} \rightleftharpoons Cu_{(s)}^+ + Br_{(s)}^-$
- $K_{sp} = S^2 = (2 \times 10^{-4})^2 = 4 \times 10^{-8} \frac{mol^2}{l^2}$
33. (c) $Na_2SO_4 \rightleftharpoons 2Na_x^+ + SO_4^{2-}$
(0.004-x) $\quad 2x \quad \quad x$
- Since both the solutions are isotonic $0.004 + 2x = 0.01$
- $\therefore x = 3 \times 10^{-3}$
- $\therefore$ Percent dissociation $= \frac{3 \times 10^{-3}}{0.004} \times 100 = 75\%$.
34. (a) $Cr(OH)_3 \rightarrow Cr_x^{+3} + 3OH_{3x}^-$
- $K_{sp} = x \cdot (3x)^3 = 27x^4$
- $x = \sqrt[4]{\frac{K_{sp}}{27}} ; x = \sqrt[4]{\frac{2.7 \times 10^{-31}}{27}}$
- $x = 1 \times 10^{-8} \text{ mole/litre.}$
35. (a) $H^+ = c \cdot \alpha = \sqrt{K_a \cdot c}$
- $pH = -\log(\sqrt{K_a \cdot c})^{1/2} = \frac{1}{2}[-\log K_a - \log c]$

$$= \frac{1}{2}[4.74 - \log 10^{-2}] = \frac{1}{2}[4.74 + 2] = 3.37.$$

$$K_{sp} = 4S^3; K_{sp} = 2 \times 10^{-5}$$

$$S = \sqrt[3]{\frac{2 \times 10^{-5}}{4}} = 0.017 \text{ m/l} = 1.7 \times 10^{-2}$$

$$K_{sp} = S^2; K_{sp} = 5.5 \times 10^{-5}$$

$$S = \sqrt{5.5 \times 10^{-5}} = 7.4 \times 10^{-3} \text{ m/l}.$$

37. (c)

Phenol are more acidic than ethanol because of stabilization of phenoxide as compare to ethoxide ion.

$$K_h = \frac{10^{-14}}{10^{-5}} \text{ so } h = \sqrt{\frac{10^{-9}}{10^{-1}}} = 10^{-4}$$

$$100 \times 10^{-4} = 10^{-2}$$

So, 0.01%.

K_h = hydrolysis constant

$$K_h = \frac{K_w}{K_a} = \frac{10^{-14}}{10^{-5}} = 10^{-9}$$

$$\text{degree of hydrolysis } (h) = \sqrt{\frac{K_h}{C}}$$

$$= \sqrt{\frac{10^{-9}}{0.001}} = \sqrt{10^{-6}} = 10^{-3}; \quad h = 10^{-3}$$

40. (b) Basic radicals of group II & IV are precipitated by H_2S in the form of their sulphides. IInd group in acidic medium & IV group in alkaline medium. They precipitate when ionic product increases than solubility product.

43. (a) 1 litre of water contains 1000/18 mole.

$$\text{So degree of ionization} = \frac{10^{-7} \times 18}{1000} = 1.8 \times 10^{-7} \%$$

$$S = \sqrt{1.2 \times 10^{-10}}; S = 1.09 \times 10^{-5}$$

$$S = \sqrt{3.5 \times 10^{-13}} = 5.91 \times 10^{-6}$$

So that S of $AgBr$ is less than that of $AgCl$.

$$4S^3 = 3.2 \times 10^{-8}; S = 2 \times 10^{-3} \text{ M}.$$

$$S = \sqrt{K_{sp}} = \sqrt{4 \times 10^{-10}} = 2 \times 10^{-5}$$

$$K_{sp} = S \times S = 10^{-10}$$

$$\alpha = \sqrt{\frac{K_a}{C}} = \sqrt{\frac{1 \times 10^{-5}}{0.1}} = 1 \times 10^{-2}$$

50. (c) Presence of common ion decreases the solubility of salt.

$$\text{Solubility of } CuS = \sqrt{10^{-31}} = 3.16 \times 10^{-16} \text{ mol/lit}$$

Solubility of Ag_2S

$$= \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{10^{-42}}{4}} = 6.3 \times 10^{-5} \text{ mole/litre}$$

$$\text{Solubility of } HgS = \sqrt{K_{sp}} = \sqrt{10^{-54}} = 10^{-27} \text{ mol/litre}$$

$$\therefore [H^+] = 1.5 \times 10^{-4} \text{ mole/litre}.$$

54. (c) For a monobasic acid

$$[H^+] = C\alpha$$

$$= \frac{1}{10} \times 0.001 = 10^{-4} \Rightarrow pH = 4$$

$$= \sqrt[5]{\frac{2.8 \times 10^{-72}}{108}} = 1.09 \times 10^{-15}$$

$$[H^+] = \sqrt{\frac{K_a}{C}} = \sqrt{\frac{10^{-9}}{0.1}}; [H^+] = 10^{-4}$$

$$\therefore pH = 4$$

$$\therefore pH + pOH = 14$$

$$pOH = 14 - pH = 14 - 4; pOH = 10$$

57. (d) $\alpha = 1.9 \times 10^{-9}$; $C = \frac{1000}{18}$
- $$K = \frac{[H^+][OH^-]}{(H_2O)} = C\alpha^2$$
- $$= 1.9 \times 10^{-9} \times 1.9 \times 10^{-9} \times \frac{1000}{18} = 2.0 \times 10^{-16}.$$
58. (c) $K = K_{a1} \times K_{a2} = 4.5 \times 10^{-3} \times 1.7 \times 10^{10}$
- $$H^+ = \sqrt{K_C} = \sqrt{4.5 \times 10^{-3} \times 1.7 \times 10^{10} \times 0.01}$$
- $$= .87 \times 10^{-7}$$
- $$pH = -\log 0.87 \times 10^{-7} = 7 - 0.93 = 6.07.$$
59. (a) Given that
Concentration of solution = .1
Degree of ionisation = $2\% = \frac{2}{100} = .02$
Ionic product of water = 1×10^{-14}
Concentration of $[H^+] =$ Concentration of solution $\times$ degree of ionisation = $.1 \times .02 = 2 \times 10^{-3} M$
Concentration of $[OH^-] = \frac{\text{Ionic product of water}}{[H^+]}$
- $$= \frac{1 \times 10^{-14}}{2 \times 10^{-3}} = 0.5 \times 10^{-11} = 5 \times 10^{-12} M.$$
60. (a) $HgSO_4 \rightarrow Hg^{++} + SO_4^{--}$
- $$K_{sp} = x^2; x = \sqrt{K_{sp}}; x = \sqrt{6.4 \times 10^{-5}}$$
- $$x = 8 \times 10^{-3} \text{ mole/litre.}$$
61. (a) $K = C\alpha^2 = 0.1 \times \left(\frac{1.34}{100}\right)^2 = 1.8 \times 10^{-5}.$
62. (c) $[H^+] = 1 \times 10^{-4} M \Rightarrow [H^+][OH^-] = 1 \times 10^{-14}$
- $$\therefore [OH^-] = \frac{1 \times 10^{-14}}{0.5 \times 10^{-4}} = 2 \times 10^{-10} M$$
63. (d) Because $HClO_4$ is a strong acid. While buffer is a mixture of weak acid and their salt.
64. (b) Initial concentration = $0.006 M \Rightarrow K_a = 6 \times 10^{-5}$
equilibrium reaction.
- $$\underset{C(1-\alpha)}{C_6H_5COOH} \rightleftharpoons \underset{Ca}{C_6H_5COO^-} + \underset{Ca}{H^+} \text{ initial}$$
- $$K_a = C\alpha^2 \quad (\because 1 - \alpha \approx 1) \text{ for weak electrolyte}$$
- $$\alpha = \sqrt{\frac{K_a}{C}}; \alpha = \sqrt{\frac{6 \times 10^{-5}}{0.006}}; \alpha = 10^{-1}$$
- $$\therefore [H^+] = C\alpha = 0.006 \times 10^{-1} = 6 \times 10^{-4} M.$$
65. (a) $pOH = pK_b + \log \frac{[Salt]}{[Base]}$
- $$14 - 9.35 = -\log(1.78 \times 10^{-5}) + \log \frac{[Salt]}{100}$$
- $$[Salt] = 79.9 \Rightarrow \frac{w}{132} \times 1000 = 79.9 \Rightarrow w = 10.56$$
66. (a) $pH = 6$ means $[H^+] = 10^{-6} M$
 $pH = 3$ means $[H^+] = 10^{-3} M$
After mixing,
- $$\text{Total } [H^+] = \frac{(10^{-6} + 10^{-3})}{2} = \frac{1.001 \times 10^{-3}}{2}$$
- $$= 5.005 \times 10^{-4}$$
- $$pH = 4 - \log 5.005; pH = 3.301.$$
67. (b) $[H^+] = \sqrt{K \times C}$
- $$[H^+] = \sqrt{4 \times 10^{-10} \times 1}; [H^+] = 2 \times 10^{-5} \text{ mole/litre}$$
68. (b) Moles of $[OH^-] = M \times V$
Number of $NaOH = 0.3 \times 0.005 \times 2 = 0.0030$
69. (d) $[H^+][OH^-] = 10^{-13.26}$
 $\therefore [H^+] = [OH^-], \therefore [H^+]^2 = 10^{-13.26}$
- $$[H^+] = 10^{\frac{-13.26}{2}}$$
- $$pH = 6.63.$$
70. (b) $pH = pK_a + \log \frac{[Salt]}{[Acid]}$
- $$pH = pK_a$$
- $$K_a = 0.1 \times (10^{-3.5})^2 = 0.1 \times 10^{-7} = 10^{-8} \Rightarrow pH = 8$$
71. (a) $pH = -\log K_a + \log \frac{[Salt]}{[Acid]}$
- $$[Salt] = \frac{0.2 \times 50}{1000} = 0.01; [Acid] = \frac{0.5 \times 40}{1000} = 0.02$$
- $$pH = -\log(1.8 \times 10^{-4}) + \log \frac{0.01}{0.02}$$
- $$pH = 4 - \log(1.8) + \log 0.5$$
- $$pH = 4 - \log(1.8) - 0.301$$
- $$pH = 3.4$$
72. (c) HCO_3^- and H_2O
73. (a) $[H^+] = C \times \alpha = 0.1 \times 0.1 = 10^{-2} M$
- $$pH = 2; pOH = 12; [OH^-] = 10^{-12} M.$$
74. (c) Decreasing order of acidic character is
 $H_2SO_4 > CH_3COOH > H_2CO_3$
75. (c) The acidic nature increases in the order.
 $NaNO_2 < NaCl < H_2S < H_2SO_4$
76. (a) $[OH^-] = 0.05 = 5 \times 10^{-2} M$

$$pOH = 2 - \log 5 = 1.3$$

$$pH + pOH = 14$$

$$pH = 14 - 1.3 = 12.7$$

77. (b) Na_2O form $NaOH$. So that it is basic oxide.

78. (a) $CH_3COO^- + H_2O \rightleftharpoons CH_3COOH + OH^-$

$$\therefore [OH^-] = c \times h; \quad h = \sqrt{\frac{K_w}{K_a} \times c} = \sqrt{\frac{10^{-14}}{1.8 \times 10^{-5}} \times 1}$$

$$= 2.35 \times 10^{-5}$$

$$\therefore pOH = 4.62; \quad pH = 9.38 \approx 9.4$$

Assertion & Reason

1. (c) HCl is a strong electrolyte since it will produce more H^+ , comparison than that of CH_3COOH . Hence assertion is true but reason false.
2. (b) For sparingly soluble salts, reason is not a correct explanation. Hence both assertion and reason are true but reason is not a correct explanation of assertion.
3. (a) Aq. solution of $FeCl_3$ on standing produce brown ppt. Due to hydrolysis it produce ppt. of $Fe(OH)_3$ which is of brown colour. Hence both are correct and reason is a correct explanation.
4. (a) Barium carbonate is more soluble in HNO_3 than in water because carbonate is a weak base and reacts with the H^+ ion of HNO_3 causing the barium salt to dissociate.

$$BaCO_3 + HNO_3 \rightarrow Ba(NO_3)_2 + CO_2 + H_2O$$
5. (a) The conjugate base of $CHCl_3$ is more stable than conjugate base of $CHF_3(CF_3)$. CCl_3 stabilized by $-I$ effect of chlorine atoms as well as by the electrons. But conjugate base of $CH_3(CH_3)$ is stabilized only by $-I$ effect of fluorine atoms. Here both assertion and reason are true and reason is correct explanation of assertion.
6. (c) Ionic product of $AgBr$ is greater than that of $AgCl$ in comparison with their solubility product $AgBr$ will precipitate. First rather than that of $AgCl$.
9. (e) It is fact that ionic reactions are instantaneous due to the fact that oppositely charged ions exert strong forces and combine immediately.

Ionic Equilibrium

Self Evaluation Test - 9

- The most important buffer in the blood consists of
[BHU 1981]
(a) HCl and $Cl^{\oplus}$ (b) H_2CO_3 and $HCO_3^{\ominus}$
(c) H_2CO_3 and $Cl^{\ominus}$ (d) HCl and $HCO_3^{\ominus}$
- The solubility product of AgI at $25^{\circ}C$ is $1.0 \times 10^{-16} \text{ mol}^2 L^{-2}$. The solubility of AgI in $10^{-4} N$ solution of KI at $25^{\circ}C$ is approximately (in $\text{mol } l^{-1}$)
[CBSE PMT 2003]
(a) 1.0×10^{-8} (b) 1.0×10^{-16}
(c) 1.0×10^{-12} (d) 1.0×10^{-10}
- The pH of the solution: 5 mL of $\frac{M}{5} HCl$ + 10 mL of $\frac{M}{10} NaOH$ is
[MH CET 2004]
(a) 5 (b) 3
(c) 7 (d) 8
- Given that the dissociation constant for H_2O is $K_w = 1 \times 10^{-14} \text{ mole}^2 / \text{litre}^2$. What is the pH of a 0.001 molar KOH solution
[UPSEAT 2000; MP PET 2001]
(a) 10^{-11} (b) 10^{-3}
(c) 3 (d) 11
- The pH of $0.1 M$ solution of the following salts increases in the order
[Pb. CET 2004]
(a) $NaCl < NH_4Cl < NaCN < HCl$
(b) $HCl < NH_4Cl < NaCl < NaCN$
(c) $NaCN < NH_4Cl < NaCl < HCl$
(d) $HCl < NaCl < NaCN < NH_4Cl$
- The degree of hydrolysis in hydrolytic equilibrium $A^- + H_2O \rightleftharpoons HA + OH^-$ at salt concentration of $0.001 M$ is ($K_a = 1 \times 10^{-5}$)
[UPSEAT 2004]
(a) 1×10^{-3} (b) 1×10^{-4}
(c) 5×10^{-4} (d) 1×10^{-6}
- If pK_b for fluoride ion at $25^{\circ}C$ is 10.83, the ionisation constant of hydrofluoric acid in water at this temperature is
[IIT 1997]
(a) 1.74×10^{-3} (b) 3.52×10^{-3}
(c) 6.75×10^{-4} (d) 5.38×10^{-2}
- If the hydrogen ion concentration of a given solution is $5.5 \times 10^{-3} \text{ mol litre}^{-1}$, the pH of the solution will be
[AMU 1985]
(a) 2.26 (b) 3.40
(c) 3.75 (d) 2.76
- Henderson's equation is $pH = pK_a + \log \frac{[\text{salt}]}{[\text{acid}]}$. If the acid gets half neutralized the value of pH will be : [$pK_a = 4.30$]
[RPMT 2000]
(a) 4.3 (b) 2.15
(c) 8.60 (d) 7
- The pH of a $0.01 M$ solution of acetic acid having degree of dissociation 12.5% is
[JIPMER 2000]
(a) 5.623 (b) 2.903
(c) 3.723 (d) 4.509
- Which of the following solutions will have pH close to 1.0
[IIT 1992; MP PET 1993; AMU 1999]
(a) 100 mL of $\frac{M}{10} HCl$ + 100 mL of $\frac{M}{10} NaOH$
(b) 55 mL of $\frac{M}{10} HCl$ + 45 mL of $\frac{M}{10} NaOH$
(c) 10 mL of $\frac{M}{10} HCl$ + 90 mL of $\frac{M}{10} NaOH$
(d) 75 mL of $\frac{M}{5} HCl$ + 25 mL of $\frac{M}{5} NaOH$
- In which of the following solvents will $AgBr$ have the highest solubility
[CBSE PMT 1992]
(a) $10^{-3} M NaBr$ (b) $10^{-3} M NH_4OH$
(c) Pure water (d) $10^{-3} M HBr$
- How many grams of CaC_2O_4 will dissolve in distilled water to make one litre of saturated solution ? (Solubility product of CaC_2O_4 is $2.5 \times 10^{-9} \text{ mole}^2 \text{ litre}^{-2}$ and its molecular weight is 128)
[MP PET 1993; MP PMT 2000]
(a) 0.0064 gm (b) 0.0128 gm
(c) 0.0032 gm (d) 0.0640 gm
- The solubility product of CuS , Ag_2S , HgS are 10^{-31} , 10^{-44} , 10^{-54} respectively. The solubilities of these sulphides are in the order
[CBSE PMT 1997]
(a) $Ag_2S > CuS > HgS$ (b) $Ag_2S > HgS > CuS$
(c) $HgS > Ag_2S > CuS$ (d) $CuS > Ag_2S > HgS$
- The solubility product constant K_{sp} of $Mg(OH)_2$ is 9.0×10^{-12} . If a solution is $0.010 M$ with respect to Mg^{2+} ion, what is the maximum hydroxide ion concentration which could be present without causing the precipitation of $Mg(OH)_2$
(a) $1.5 \times 10^{-7} M$ (b) $3.0 \times 10^{-7} M$

[JIPMER 2000]

- (c) $1.5 \times 10^{-5} M$ (d) $3.0 \times 10^{-5} M$
16. If the K_b value in the hydrolysis reaction $B^+ + H_2O \rightleftharpoons BOH + H^+$ is 1.0×10^{-6} , then the hydrolysis constant of the salt would be [Roorkee Qualifying 1998]
- (a) 1.0×10^{-6} (b) 1.0×10^{-7}
(c) 1.0×10^{-8} (d) 1.0×10^{-9}
17. For a sparingly soluble salt A_pB_q , the relationship of its solubility product (L_s) with its solubility (S) is [IIT Screening 2001]
- (a) $L_s = S^{p+q} \cdot p^p \cdot q^q$ (b) $L_s = S^{p+q} \cdot p^q \cdot q^p$
(c) $L_s = S^{pq} \cdot p^p \cdot q^q$ (d) $L_s = S^{pq} \cdot (p \cdot q)^{p+q}$
18. Arrange NH_4^+ , H_2O , H_3O^+ , HF and OH^- in increasing order of acidic nature [BVP 2003]
- (a) $H_3O^+ < NH_4^+ < HF < OH^- < H_2O$
(b) $NH_4^+ < HF < H_3O^+ < H_2O < OH^-$
(c) $OH^- < H_2O < NH_4^+ < HF < H_3O^+$
(d) $H_3O^+ > HF > H_2O > NH_4^+ > OH^-$
19. How many grams of CaC_2O_4 (molecular weight = 128) on dissolving in distilled water will give a saturated solution [$K_{sp}(CaC_2O_4) = 2.5 \times 10^{-9} \text{ mol}^2 \text{ l}^{-2}$] [KCET 2003]
- (a) 0.0064 g (b) 0.1280 g
(c) 0.0128 g (d) 1.2800 g
20. If the concentration of CrO_4^{2-} ions in a saturated solution of silver chromate is 2×10^{-4} . Solubility product of silver chromate will be
- (a) 4×10^{-8} (b) 8×10^{-12}
(c) 12×10^{-12} (d) 32×10^{-12}
21. According to Bronsted-Lowry concept, the correct order of relative strength of bases follows the order [Pb. PMT 2001]
- (a) $CH_3COO^- > Cl^- > OH^-$
(b) $CH_3COO^- > OH^- > Cl^-$
(c) $OH^- > CH_3COO^- > Cl^-$
(d) $OH^- > Cl^- > CH_3COO^-$
22. $H_2SO_4 + OH^- \rightarrow SO_4^{2-} + H_2O$ Which is correct about conjugate acid base pair [JEE Orissa 2004]
- (a) HSO_4^{2-} is conjugate acid of base SO_4^{2-}
(b) HSO_4^- is conjugate base of acid SO_4^{2-}
(c) SO_4^{2-} is conjugate acid of base HSO_4^-
(d) None of these
23. Which may be added to one litre of water to act as a buffer
- (a) One mole of $HC_2H_3O_2$ and 0.5 mole of $NaOH$
(b) One mole of NH_4Cl and one mole of HCl
(c) One mole of NH_4OH and one mole of $NaOH$
(d) One mole of $HC_2H_3O_2$ and one mole of HCl
24. Which of the following base is weakest [DCE 2003]
- (a) $NH_4OH : K_b = 1.6 \times 10^{-6}$
(b) $C_6H_5NH_2 : K_b = 3.8 \times 10^{-10}$
(c) $C_2H_5NH_2 : K_b = 5.6 \times 10^{-4}$
(d) $C_6H_7N : K_b = 6.3 \times 10^{-10}$
25. $HClO$ is a weak acid. The concentration of H^+ ions in 0.1 M solution of $HClO$ ($K_a = 5 \times 10^{-8}$) will be equal to [CPMT 1993]
- (a) $7.07 \times 10^{-5} m$ (b) $5 \times 10^{-9} m$
(c) $5 \times 10^{-7} m$ (d) $7 \times 10^{-4} m$
26. Upto what pH must a solution containing a precipitate of $Cr(OH)_3$ be adjusted so that all of precipitate dissolves (When $Cr^{3+} = 0.1 \text{ mol/l}$, $K_{sp} = 6 \times 10^{-31}$) [MP PET 2003]
- (a) Upto 4.4 (b) Upto 4.1
(c) Upto 4.2 (d) Upto 4.0
27. NH_4Cl is acidic, because [JEE Orissa 2004]
- (a) On hydrolysis NH_4Cl gives weak base NH_4OH and strong acid HCl [MP PET 1992; CPMT 1993]
(b) Nitrogen donates a pair of electron
(c) It is a salt of weak acid and strong base
(d) On hydrolysis NH_4Cl gives strong base and weak acid
28. A solution of weak acid HA containing 0.01 moles of acid per litre of solutions has $pH = 4$. The percentage degree of ionisation of the acid and the ionisation constant of acid are respectively [UPSEAT 2001]
- (a) 1%, 10^{-6} (b) 0.01%, 10^{-4}
(c) 1%, 10^{-4} (d) 0.01%, 10^{-6}
29. The pH of a buffer solution containing 0.2 mole per litre CH_3COONa and 1.5 mole per litre CH_3COOH is (K_a for acetic acid is 1.8×10^{-5}) [CPMT 2001]
- (a) 4.87 (b) 5.8
(c) 2.4 (d) 9.2
30. 100 mL of 0.04 N HCl aqueous solution is mixed with 100 mL of 0.02 N $NaOH$ solution. The pH of the resulting solution is [UPSEAT 2004]
- (a) 1.0 (b) 1.7
(c) 2.0 (d) 2.3
31. An alcoholic drink substance $pH = 4.7$ then OH^- ion concentration of this solution is ($K_w = 10^{-14} \text{ mol}^2/\text{l}^2$)

[RPMT 2002]

- (a) 3×10^{-10} (b) 5×10^{-10}
(c) 1×10^{-10} (d) 5×10^{-8}
32. In its 0.2 M solution, an acid ionises to an extent of 60%. Its hydrogen ion concentration is
(a) 0.6 M (b) 0.2 M
(c) 0.12 M (d) None of these
33. pH of 0.1 M NH_3 aqueous solution is
($K_b = 1.8 \times 10^{-5}$) [UPSEAT 2004]
(a) 11.13 (b) 12.5
(c) 13.42 (d) 11.55
34. 40 mg of pure sodium hydroxide is dissolved in 10 litres of distilled water. The pH of the solution is [Kerala PMT 2004]
(a) 9.0 (b) 10
(c) 11 (d) 12
(e) 8
35. Solubility of PbI_2 is 0.005 M. Then, the solubility product of PbI_2 is [BVP 2004]
(a) 6.8×10^{-6}
(b) 6.8×10^6
(c) 2.2×10^{-9}
(d) None of these

36. A monoprotic acid in a 0.1 M solution ionizes to 0.001%. Its ionisation constant is

[MP PET 1985, 88, 99; MP PMT 1988; CPMT 2003]

- (a) 1.0×10^{-3} (b) 1.0×10^{-6}
(c) 1.0×10^{-8} (d) 1.0×10^{-11}
37. Select the pK_a value of the strongest acid from the following [KCET 2004]
(a) 1.0 (b) 3.0
(c) 2.0 (d) 4.5
38. At $90^\circ C$, pure water has H_3O^+ ion concentration of 10^{-6} mol/L . The K_w at $90^\circ C$ is [DCE 2004]
(a) 10^{-6} (b) 10^{-14}
(c) 10^{-12} (d) 10^{-8}
39. By adding 20 ml 0.1 N HCl to 20 ml 0.1 N KOH, the pH of the obtained solution will be [CPMT 1975, 86, 93]
(a) 0 (b) 7
(c) 2 (d) 9

AS Answers and Solutions

(SET -9)

1. (b) Blood consists of $H_2CO_3 + HCO_3^-$ buffer solution.

2. (c) $AgI \rightleftharpoons Ag^+ + I^-$; $K_{sp} = S^2 = 10^{-4} \times S$

$$S = \frac{1.0 \times 10^{-16}}{10^{-4}} = 1 \times 10^{-12} \frac{\text{mol}^2}{\text{L}^2}$$

3. (c) Milliequivalents of HCl = $5 \times \frac{1}{5} = 1$

$$\text{Milliequivalents of } NaOH = 10 \times \frac{1}{10} = 1$$

$$\therefore 5 \text{ ml } \frac{M}{5} HCl = 10 \text{ ml } \frac{M}{5} HCl$$

Hence the solution will be neutral i.e., $pH = 7$.

4. (d) $pH = 14 - pOH = 14 - 3 = 11$

5. (b) HCl is strong acid. In its .1M solution, $[H^+] = 0.1M$ and hence, $pH = 1$

$NH_4Cl_{(aq)}$ hydrolyses in solution and give acidic solution which is less acidic than .1M HCl . $NaCl$ is not hydrolysed in aqueous solutions. Its $pH = 7$ $NaCN$ undergoes hydrolysis in solution to give alkaline solution. So that pH increases in the order, $HCl < NH_4Cl < NaCl < NaCN$

6. (a) $K_h = \frac{K_w}{K_a} = \frac{10^{-14}}{1 \times 10^{-5}} = 10^{-9}$

$$K_h = \alpha^2 C; \alpha = \sqrt{\frac{K_h}{C}} = \sqrt{\frac{1 \times 10^{-9}}{.001}} = 1 \times 10^{-3}$$

7. (c) $K_a \times K_b = K_w$

$$\therefore K_a = \frac{K_w}{K_b} = \frac{10^{-14}}{1.48 \times 10^{-11}} = 6.75 \times 10^{-4}$$

8. (a) $[H^+] = 5.5 \times 10^{-3} \text{ mole/litre}$

$$pH = -\log[H^+]; pH = -\log[5.5 \times 10^{-3}]; pH = 2.26$$

9. (a) $pH = pK_a + \log \frac{[\text{Salt}]}{[\text{Acid}]}$

$$pH = 4.3 + \log \frac{1}{\frac{1}{2}} = 4.3 + \log 2 = 4.3 + 0.3 = 4.6$$

10. (b) $[H^+] = C\alpha = 0.01 \times \frac{1.25}{100}$

$$H^+ = 1.25 \times 10^{-3}; pH = \text{between } 2 \text{ or } 3 = 2.90$$

11. (d) M.eq. of $HCl = \frac{1}{5} \times 75 = 15$

$$\text{M.eq. of } NaOH = 25 \times \frac{1}{5} = 5$$

$$\text{Total No. of eq.} = 15 - 5 = 10$$

$$\text{Total volume} = 100$$

$$\text{Normality} = \frac{10}{100} = \frac{1}{10}, [H^+] = 10^{-1} M$$

12. (b) $AgBr$ are not dissolved in $NaBr$ and HBr due to common ion effect. And pure water is a neutral solvent. They do not have ions.

13. (a) CaC_2O_4 is a binary electrolyte. Then solubility is

$$S = \sqrt{K_{sp}} = \sqrt{2.5 \times 10^{-9}}$$

$$= 5 \times 10^{-5} \text{ mole/l.} = 0.0064 \text{ gm/l.}$$

14. (a)

15. (d) $Mg(OH)_2 \rightleftharpoons Mg^{++} + 2OH^-$

$$K_{sp} = S \times 4S^2$$

$$\frac{K_{sp}}{S \times 4} = S^2 = \frac{9 \times 10^{-12}}{.010 \times 4} = 2.25 \times 10^{-10}$$

$$S = \sqrt{2.25 \times 10^{-10}} = 1.5 \times 10^{-5} \text{ m/l}$$

16. (c) For hydrolysis of B^+ ; $K_H = \frac{K_w}{K_b} = \frac{10^{-14}}{10^{-6}} = 10^{-8}$.

17. (a) $A_p B_q \rightleftharpoons pA^{1+} + qB^{p-}$

$$L_s = [A^{q+}]^p [B^{p-}]^q = (p \times S)^p (q \times S)^q = S^{p+q} \cdot p^p \cdot q^q.$$

18. (c) $H_3O^+ > HF > NH_4^+ > H_2O > OH^-$.

Acidic nature is decreasing order.

19. (a) Solubility of $CaC_2O_4 = \sqrt{K_{sp}} = \sqrt{2.5 \times 10^{-9}}$

$$= 5 \times 10^{-5} \text{ mol/L}^{-1}$$

$$= 5 \times 10^{-5} \times 128 = 640 \times 10^{-5} = 0.0064g$$

20. (d) K_{sp} of $Ag_2CrO_4 = [Ag^+]^2 [CrO_4^{--}]$

$$CrO_4^{--} = 2 \times 10^{-4} \text{ then } Ag^+ = 2 \times 2 \times 10^{-4}$$

$$K_{sp} = (4 \times 10^{-4})^2 (2 \times 10^{-4}) = 32 \times 10^{-12}$$

21. (c) Relative strength of bases can be shown by their conjugated acids.

Conjugate acid of OH^- is H_2O which is a weak acid
conjugate acid of CH_3COO^- is CH_3COOH which is stronger than H_2O . while conjugate acid of Cl^- is HCl which is strongest out of there. so the order of relative strength of bases is $OH^- > CH_3COO^- > Cl^-$.

22. (a) $HSO_4^- + OH^- \rightarrow SO_4^{2-} + H_2O$
Conjugate acid Conjugate base

23. (a) One mole oxalic acid & 0.5 mole of $NaOH$ will make.

24. (b) Smallest value of K_b indicates that aniline ($C_2H_5NH_2$) is the weakest base.

25. (a) $[H^+]^2 = C \cdot \alpha = 0.1 \times 5 \times 10^{-8}$

$$H^+ = \sqrt{5 \times 10^{-9}} = 7.07 \times 10^{-5} M$$

26. (d) $K_{sp} = [Cr^{3+}][OH^-]^3$

$$[OH^-]^3 = K_{sp} / Cr^{3+} = \frac{6 \times 10^{-31}}{1 \times 10^{-1}} = 6 \times 10^{-30}$$

$$[OH^-] = 1.8 \times 10^{-10}$$

$$pOH = (\log 1.8 + \log 10^{10}) = 10 + 0.25 + 1 = 11.25$$

$$pH = 14 - 11.25 = 2.75$$

27. (a) $NH_3Cl + H_2O \rightleftharpoons NH_4OH + HCl$

NH_4Cl is a salt of weak base & strong acid so solution will be acidic.

28. (a) $H^+ = C\alpha$

$$\alpha = \frac{H^+}{C} = \frac{10^{-4}}{10^{-2}} = 10^{-6}$$

29. (a) $pH = -\log K_a + \log \frac{[\text{Salt}]}{[\text{Acid}]}$
 $= -\log [1.8 \times 10^{-5}] + \log \frac{0.2}{0.1} = 4.87$

30. (c) $N_1 V_1 = .04 \times 100 = 4$

$$N_2 V_2 = .02 \times 100 = 2$$

$$N_1 V_1 - N_2 V_2 = N_3 V_3$$

$$4 - 2 = N_3 \times 200, N_3 = 10^{-2} M$$

$$pH = \log_{10} \frac{1}{H^+} = \log_{10} \frac{1}{10^{-2}} = 2.$$

31. (b) $pH = 4.7$

$$pH + pOH = 14; pH = 14 - 4.7; pOH = 9.3$$

$$[OH^-] = \text{Antilog} [-pOH] = \text{Antilog} [-9.3]$$

$$[OH^-] = 5 \times 10^{-10}$$

32. (c) $[H^+] = C \cdot \alpha = 0.2 \times 0.60 = 0.12 M$

$$K_b = C\alpha^2; \frac{1.8 \times 10^{-5}}{.1} = \alpha^2; \alpha = 1.34 \times 10^{-3}$$

$$[OH^-] = \alpha \cdot C = 1.34 \times 10^{-3} \times .1$$

$$pOH = \log_{10} \frac{1}{1.34 \times 10^{-4}}; pOH = 2.87$$

$$pH + pOH = 14; pH + 2.87 = 14$$

$$pH = 14 - 2.87; pH = 11.13$$

34. (b) $M = \frac{\text{Solute in 1 litre solution}}{\text{Molecular weight of solute}}$

$$= \frac{40 \times 10^{-3}}{40} \times \frac{1}{10} = 10^{-4} M$$

$$pOH = \log_{10} \frac{1}{[OH^-]} = \log_{10} \frac{1}{10^{-4}} = 4$$

$$pH + pOH = 14; pH + 4 = 14 \Rightarrow pH = 10.$$

$$K_{sp} = 4x^3 = 4(.005)^3 = 4 \times .005 \times .005 = .4 \times 10^{-6}.$$

36. (d) $\therefore$ Monoprotic acid HA

Ionisation constant = ?

$$\alpha = 0.001\% = \frac{0.001}{100} = 10^{-5}$$

$$K = \frac{\alpha^2}{V} = \frac{[10^{-5}]^2}{10} = 10^{-11}.$$

37. (a) $pK_a \ll$ then strongest acid

$$pK_a \gg$$
 then weak acid

$$pK_a \propto \frac{1}{\text{Acid strength}}$$

$$K_w = [H_2O][H^+] = [10^{-6}][10^{-6}] = 10^{-12}$$

39. (b) Neutralization reaction will take place and form salt of strong acid and strong base. Which does not hydrolyse and thus $pH = 7$.

Chapter 10

Thermodynamics and Thermochemistry

Thermodynamics

Thermodynamics (Greek word thermo means heat and dynamics means motion) is the branch of science which deals with the study of different forms of energy and the quantitative relationships between them.

The complete study of thermodynamics is based upon three generalizations called first, second and third law of thermodynamics. These laws have been arrived purely on the basis of human experience and there is no theoretical proof for any of these laws.

Basic concepts

(1) **System, surroundings and Boundary** : A specified part of the universe which is under observation is called the *system* and the remaining portion of the universe which is not a part of the system is called the *surroundings*.

The system and the surroundings are separated by *real or imaginary boundaries*. The boundary also defines the limits of the system. The system and the surroundings can interact across the boundary.

(2) Types of systems

(i) **Isolated system** : This type of system has no interaction with its surroundings. The boundary is sealed and insulated. Neither matter nor energy can be exchanged with surrounding. A substance contained in an ideal thermos flask is an example of an isolated system.

(ii) **Closed system** : This type of system can exchange energy in the form of heat, work or radiations but not matter with its surroundings. The boundary between system and surroundings is sealed but not insulated. For example, liquid in contact with vapour in a sealed tube and pressure cooker.

(iii) **Open system** : This type of system can exchange matter as well as energy with its surroundings. The boundary is neither sealed nor insulated. Sodium reacting with water in an open beaker is an example of open system.

(iv) **Homogeneous system** : A system is said to be homogeneous when it is completely uniform throughout. A homogeneous system is made of one phase only. Examples: a pure single solid, liquid or gas, mixture of gases and a true solution.

(v) **Heterogeneous system** : A system is said to be heterogeneous when it is not uniform throughout, *i.e.*, it consist of two or more phases. Examples : ice in contact with water, two or more immiscible liquids, insoluble solid in contact with a liquid, a liquid in contact with vapour, etc.

(vi) **Macroscopic system** : A macroscopic system is one in which there are a large number of particles (may be molecules, atoms, ions etc.)

(3) Macroscopic properties of the system

Thermodynamics deals with matter in terms of bulk (large number of chemical species) behaviour. The properties of the system which arise from the bulk behaviour of matter are called *macroscopic properties*. The common examples of macroscopic properties are pressure, volume, temperature, surface tension, viscosity, density, refractive index, etc.

The macroscopic properties can be subdivided into two types,

(i) **Intensive properties** : The properties which do not depend upon the quantity of matter present in the system or size of the system are called *intensive properties*. Its examples are pressure, temperature, density, specific heat, surface tension, refractive index, viscosity, melting point, boiling point, volume per mole, concentration etc.

(ii) **Extensive properties** : The properties whose magnitude depends upon the quantity of matter present in the system are called *extensive properties*. Its examples are total mass, volume, internal energy, enthalpy, entropy etc. These properties are additive in nature.

Any extensive property if expressed as per mole or per gram becomes an intensive property.

(4) State of a system and State Variables

Macroscopic properties which determine the state of a system are referred to as *state variables* or *state functions* or *thermodynamic parameters*. The change in the state properties depends only upon the *initial and final states of the system*, but it is independent of the manner in which the change has been brought about. In other words, the state properties do not depend upon a path followed.

(5) **Thermodynamic equilibrium** : "A system is said to have attained a state of thermodynamic equilibrium when it shows no further tendency to change its property with time".

The criterion for thermodynamic equilibrium requires that the following three types of equilibrium exist simultaneously in a system,

(i) **Chemical Equilibrium** : A system in which the composition of the system remains fixed and definite.

(ii) **Mechanical Equilibrium** : No chemical work is done between different parts of the system or between the system and surrounding. It can be achieved by keeping pressure constant.

(iii) **Thermal Equilibrium** : Temperature remains constant *i.e.* no flow of heat between system and surrounding.

(6) **Thermodynamic process** : When the thermodynamic system changes from one state to another, the operation is called a **process**. The various types of the processes are

(i) **Isothermal process** : In this process operation is done at constant temperature. $dT = 0$ thus $\Delta E = 0$.

(ii) **Adiabatic process** : In this a process there is no exchange of heat takes place between the system and surroundings. The system is thermally isolated, i.e., $dQ = 0$ and its boundaries are insulated.

(iii) **Isobaric process** : In this process the pressure remains constant throughout the change i.e., $dP = 0$.

(iv) **Isochoric process** : In this process volume remains constant throughout the change, i.e., $dV = 0$.

(v) **Cyclic process** : When a system undergoes a number of different processes and finally return to its initial state, it is termed *cyclic process*. For a cyclic process $dE = 0$ and $dH = 0$.

(vi) **Reversible process** : A process which occurs infinitesimally slowly, i.e. opposing force is infinitesimally smaller than driving force and when infinitesimal increase in the opposing force can reverse the process, it is said to be *reversible process*.

(vii) **Irreversible process** : When the process occurs from initial to final state in single step in finite time and cannot be reversed, it is termed an *irreversible process*. Amount of entropy increases in irreversible process.

Irreversible processes are spontaneous in nature. All natural processes are irreversible in nature

Internal energy, heat and Work

(1) **Internal energy (E)** : "Every system having some quantity of matter is associated with a definite amount of energy. This energy is known as internal energy."

$$E = E_{\text{translational}} + E_{\text{rotational}} + E_{\text{vibrational}} + E_{\text{bonding}} + E_{\text{electronic}} + \dots$$

(i) Characteristics of internal energy

- Internal energy of a system is an extensive property.
- Internal energy is a state property.
- The change in the internal energy does not depend on the path by which the final state is reached.
- There is no change in internal energy in a cyclic process.
- The internal energy of an ideal gas is a function of temperature only.
- Internal energy of a system depends upon the quantity of substance, its chemical nature, temperature, pressure and volume.
- The unit of E is ergs in CGS or joules in SI

$$1 \text{ Joule} = 10^7 \text{ ergs.}$$

(ii) **Change in internal energy (ΔE)** : It is neither possible nor necessary to calculate the absolute value of internal energy of a system then, $\Delta E = E_f - E_{in}$; ΔE is positive if $E_f > E_{in}$ and negative if $E_f < E_{in}$.

(2) **Heat (q) and work (w)** : The energy of a system may increase or decrease in several ways but two common ways are *heat and work*.

Heat is a form of energy. It flows from one system to another because of the difference in temperature between them. Heat flows from higher temperature to lower temperature. Therefore, it is regarded as *energy on the move*.

Work is said to be performed if the point of application of force is displaced in the direction of the force. It is equal to the force multiplied by the displacement (distance through which the force acts).

There are three main types of work which we generally come across. These are, Gravitational work, electrical work and mechanical work.

$$\text{Mechanical work} = \text{Force} \times \text{displacement} = F.d$$

$$\text{Electrical work} = \text{potential difference} \times \text{charge} = V.q$$

$$\text{Gravitational work} = mgh$$

(i) **Units of heat and work** : The heat changes are measured in calories (cal), Kilo calories (kcal), joules (J) or kilo joules (kJ). These are related as, $1 \text{ cal} = 4.184 \text{ J}$; $1 \text{ kcal} = 4.184 \text{ kJ}$

The S.I. unit of heat is joule (J) or *kilojoule*. The Joule (J) is equal to *Newton – metre* ($1 \text{ J} = 1 \text{ Nm}$).

Work is measured in terms of ergs or joules. The S.I. unit of work is Joule.

$$1 \text{ Joule} = 10^7 \text{ ergs} = 0.2390 \text{ cal.}$$

$$1 \text{ cal} > 1 \text{ joule} > 1 \text{ erg}$$

(ii) Sign conventions for heat and work

Heat absorbed by the system = q positive

Heat evolved by the system = q negative

Work done on the system = w positive

Work done by the system = w negative.

Zeroth law of thermodynamics

This law forms the basis of concept of temperature. This law can be stated as follows,

"If a system A is in thermal equilibrium with a system C and if B is also in thermal equilibrium with system C, then A and B are in thermal equilibrium with each other whatever the composition of the system."

First law of thermodynamics

Helmholtz and Robert Mayer proposed first law of thermodynamics. This law is also known as *law of conservation of energy*. It states that,

"Energy can neither be created nor destroyed although it can be converted from one form into another."

$$E_2 - E_1 = \Delta E = q + w$$

i.e. (Change in internal energy) = (Heat added to the system) + (Work done on the system)

If a system does work (w) on the surroundings, its internal energy decreases. In this case, $\Delta E = q + (-w) = q - w$

i.e. (Change in internal energy) = (Heat added to the system) – (work done by the system)

The relationship between internal energy, work and heat is a mathematical *statement of first law of thermodynamics*.

Enthalpy and Enthalpy change

Heat content of a system at constant pressure is called *enthalpy* denoted by ' H '.

$$\text{From first law of thermodynamics, } q = E + PV \quad \dots\dots\dots(i)$$

Heat change at constant pressure can be given as

$$\Delta q = \Delta E + P\Delta V \quad \dots\dots\dots(ii)$$

At constant pressure heat can be replaced at enthalpy.

$$\Delta H = \Delta E + P\Delta V \quad \dots\dots\dots(iii)$$

$\therefore \Delta H$ = Heat change or heat of reaction (in chemical process) at constant pressure

ΔE = Heat change or heat of reaction at constant volume.

In case of solids and liquids participating in a reaction,

$$\Delta H = \Delta E (P\Delta V \approx 0)$$

Difference between ΔH and ΔE is significant when gases are involved in chemical reaction.

$$\Delta H = \Delta E + P\Delta V$$

$$\Delta H = \Delta E + \Delta nRT$$

$$P\Delta V = \Delta nRT$$

Here, $\Delta n = n_2 - n_1$

Specific and Molar heat capacity

(1) **Specific heat** (or specific heat capacity) of a substance is the quantity of heat (in *calories, joules, kcal, or kilo joules*) required to raise the temperature of 1g of that substance through 1°C . It can be measured at constant pressure (C_p) and at constant volume (C_v).

(2) **Molar heat capacity** of a substance is the quantity of heat required to raise the temperature of 1 *mole* of the substance by 1°C .

$\therefore$ Molar heat capacity = Specific heat capacity $\times$ Molecular weight, i.e., $C_v = c_v \times M$ and $C_p = c_p \times M$.

(3) Since gases on heating show considerable tendency towards expansion if heated under constant pressure conditions, an additional energy has to be supplied for raising its temperature by 1°C relative to that required under constant volume conditions, i.e.,

$$C_p > C_v \text{ or } C_p = C_v + \text{Work done in expansion, } P\Delta V (= R)$$

where, C_p = molar heat capacity at constant pressure

C_v = molar heat capacity at constant volume.

(4) **Some useful relations of C_p and C_v**

$$(i) C_p - C_v = R = 2 \text{ calories} = 8.314 \text{ J}$$

(ii) $C_v = \frac{3}{2}R$ (for monoatomic gas) and $C_v = \frac{3}{2} + x$ (for di and polyatomic gas), where x varies from gas to gas.

$$(iii) \frac{C_p}{C_v} = \gamma \text{ (Ratio of molar capacities)}$$

(iv) For monoatomic gas, $C_v = 3 \text{ calories}$ whereas, $C_p = C_v + R = 5 \text{ calories}$

$$(v) \text{ For monoatomic gas, } (\gamma) = \frac{C_p}{C_v} = \frac{\frac{5}{2}R}{\frac{3}{2}R} = 1.66$$

$$(vi) \text{ For diatomic gas } (\gamma) = \frac{C_p}{C_v} = \frac{\frac{7}{2}R}{\frac{5}{2}R} = 1.40$$

$$(vii) \text{ For triatomic gas } (\gamma) = \frac{C_p}{C_v} = \frac{8R}{6R} = 1.33$$

Expansion of an ideal gas

(1) **Isothermal Expansion** : For an isothermal expansion, $\Delta T = 0$; $\Delta E = 0$.

According to first law of thermodynamics,

$$\Delta E = q + w \quad \therefore q = -w$$

This shows that in isothermal expansion, the work is done by the system at the expense of heat absorbed.

Since for isothermal process, ΔE and ΔT are zero respectively, hence, $\Delta H = 0$

(i) **Work done in reversible isothermal expansion** : Consider an ideal gas enclosed in a cylinder fitted with a weightless and frictionless piston. The cylinder is not insulated. The external pressure, P_{ext} is equal to pressure of the gas, P_{gas} .

$$P_{\text{ext}} = P_{\text{gas}} = P$$

If the external pressure is decreased by an infinitesimal amount dP , the gas will expand by an infinitesimal volume, dV . As a result of expansion, the pressure of the gas within the cylinder falls to $P_{\text{gas}} - dP$, i.e., it becomes again equal to the external pressure and, thus, the piston comes to rest. Such a process is repeated for a number of times, i.e., in each step the gas expands by a volume dV .

Since the expansion is isothermal, the infinitesimal cooling produced due to expansion is balanced by the absorption of heat from the surroundings and the temperature remains constant throughout the expansion.

The work done by the gas in each step of expansion can be given as, $d_w = -(P_{\text{ext}} - dP)dV = -P_{\text{ext}}dV - dP \cdot dV$

$dP \cdot dV$, the product of two infinitesimal quantities, is negligible.

The total amount of work done by the isothermal reversible expansion of the ideal gas from volume V_1 to volume V_2 is, given as,

$$w = -nRT \log_e \frac{V_2}{V_1} \text{ or } w = -2.303nRT \log_{10} \frac{V_2}{V_1}$$

At constant temperature, according to Boyle's law,

$$P_1 V_1 = P_2 V_2 \text{ or } \frac{V_2}{V_1} = \frac{P_1}{P_2} \text{ So, } w = -2.303nRT \log_{10} \frac{P_1}{P_2}$$

Isothermal compression work of an ideal gas may be derived similarly and it has exactly the same value with positive sign.

$$w_{\text{compression}} = 2.303nRT \log \frac{V_1}{V_2} = 2.303nRT \log \frac{P_2}{P_1}$$

(ii) **Work done in irreversible isothermal expansion** : Two types of irreversible isothermal expansions are observed, i.e., (a) Free expansion and (b) Intermediate expansion. In free expansion, the external pressure is zero, i.e., work done is zero when gas expands in vacuum. In intermediate expansion, the external pressure is less than gas pressure. So, the work done when volume changes from V_1 to V_2 is given by

$$w = -\int_{V_1}^{V_2} P_{\text{ext}} \times dV = -P_{\text{ext}}(V_2 - V_1)$$

Since P_{ext} is less than the pressure of the gas, the work done during intermediate expansion is numerically less than the work done

during reversible isothermal expansion in which P_{ext} is almost equal to P_{gas} .

(2) **Adiabatic Expansion** : In adiabatic expansion, no heat is allowed to enter or leave the system, hence, $q = 0$.

According to first law of thermodynamics,

$$\Delta E = q + w \quad \therefore \Delta E = w$$

work is done by the gas during expansion at the expense of internal energy. In expansion, ΔE decreases while in compression ΔE increases.

The molar specific heat capacity at constant volume of an ideal gas is given by

$$C_v = \left(\frac{dE}{dT} \right)_v \text{ or } dE = C_v \cdot dT$$

and for finite change $\Delta E = C_v \Delta T$ So, $w = \Delta E = C_v \Delta T$

The value of ΔT depends upon the process whether it is reversible or irreversible.

(i) **Reversible adiabatic expansion** : The following relationships are followed by an ideal gas under reversible adiabatic expansion.

$$PV^\gamma = \text{constant}$$

where, P = External pressure, V = Volume

$$\gamma = \frac{C_p}{C_v}$$

where, C_p = molar specific heat capacity at constant pressure,

C_v = molar specific heat capacity at constant volume.

$$\left(\frac{T_1}{T_2} \right)^\gamma = \left(\frac{P_1}{P_2} \right)^{\gamma-1} = \left(\frac{P_2}{P_1} \right)^{1-\gamma}$$

knowing γ , P_1 , P_2 and initial temperature T_1 , the final temperature T_2 can be evaluated.

(ii) **Irreversible adiabatic expansion** : In free expansion, the external pressure is zero, i.e. work done is zero. Accordingly, ΔE which is equal to w is also zero. If ΔE is zero, ΔT should be zero. Thus, in free expansion (adiabatically), $\Delta T = 0$, $\Delta E = 0$, $w = 0$ and $\Delta H = 0$.

In intermediate expansion, the volume changes from V_1 to V_2 against external pressure, P_{ext} .

$$w = -P_{ext}(V_2 - V_1) = -P_{ext} \left(\frac{RT_2}{P_2} - \frac{RT_1}{P_1} \right)$$

$$= -P_{ext} \left(\frac{T_2 P_1 - T_1 P_2}{P_1 P_2} \right) \times R$$

$$\text{or } w = C_v(T_2 - T_1) = -R P_{ext} \left(\frac{T_2 P_1 - T_1 P_2}{P_1 P_2} \right)$$

Spontaneous and Non-spontaneous processes

A process which can take place by itself under the given set of conditions once it has been initiated if necessary, is said to be a *spontaneous process*. In other words, a spontaneous process is a process that can occur without work being done on it. The spontaneous processes are also called *feasible* or *probable processes*.

On the other hand, the processes which are forbidden and are made to take place only by supplying energy continuously from outside the system are called *non-spontaneous processes*. In other words, non spontaneous processes can be brought about by doing work.

Examples of Spontaneous and Non-spontaneous processes

(1) The diffusion of the solute from a concentrated solution to a dilute solution occurs when these are brought into contact is spontaneous process.

(2) Mixing of different gases is spontaneous process.

(3) Heat flows from a hot reservoir to a cold reservoir is spontaneous process.

(4) Electricity flows from high potential to low potential is spontaneous process.

(5) Expansion of an ideal gas into vacuum through a pinhole is spontaneous process.

All the above spontaneous processes becomes non-spontaneous when we reverse them by doing work.

Spontaneous process and Enthalpy change : A spontaneous process is accompanied by decrease in internal energy or enthalpy, i.e., work can be obtained by the spontaneous process. It indicates that only exothermic reactions are spontaneous. But the melting of ice and evaporation of water are endothermic processes which also proceeds spontaneously. It means, there is some other factor in addition to enthalpy change (ΔH) which explains the spontaneous nature of the system. This factor is entropy.

Second law of thermodynamics

All the limitations of the first law of thermodynamics can be remove by the second law of thermodynamics. This law is generalisation of certain experiences about heat engines and refrigerators. It has been stated in a number of ways, but all the statements are logically equivalent to one another.

(i) **Statements of the law**

(i) **Kelvin statement** : "It is impossible to derive a continuous supply of work by cooling a body to a temperature lower than that of the coldest of its surroundings."

(ii) **Clausius statement** : "It is impossible for a self acting machine, unaided by any external agency, to transfer heat from one body to another at a higher temperature or Heat cannot itself pass from a colder body to a hotter body, but tends invariably towards a lower thermal level."

(iii) **Ostwald statement** : "It is impossible to construct a machine functioning in cycle which can convert heat completely into equivalent amount of work without producing changes elsewhere, i.e., perpetual motions are not allowed."

(iv) **Carnot statement** : "It is impossible to take heat from a hot reservoir and convert it completely into work by a cyclic process without transferring a part of it to a cold reservoir."

(2) **Proof of the law** : No rigorous proof is available for the second law. The formulation of the second law is based upon the observations and has yet to be disproved. No deviations of this law have so far been reported. However, the law is applicable to cyclic processes only.

The Carnot cycle

Carnot, a French engineer, in 1824 employed merely theoretical and an imaginary reversible cycle known as carnot cycle to demonstrate the maximum convertibility of heat into work.

The system consists of one mole of an ideal gas enclosed in a cylinder fitted with a piston, which is subjected to a series of four successive operations.

For cyclic process, the essential condition is that net work done is equal to heat absorbed. This condition is satisfied in a carnot cycle.

$$\frac{w}{q_2} = \frac{T_2 - T_1}{T_2} = \text{Thermodynamic efficiency}$$

Thus, the larger the temperature difference between high and low temperature reservoirs, the more the heat converted into work by the heat engine.

Since $\frac{T_2 - T_1}{T_2} < 1$, it follows that $w < q_2$. This means that only a

part of heat absorbed by the system at the higher temperature is transformed into work. The rest of the heat is given out to surroundings. The efficiency of the heat engine is always less than 1. This has led to the following enunciation of the second law of thermodynamics.

It is impossible to convert heat into work without compensation.

Entropy and Entropy change

(1) **Definition** : Entropy is a thermodynamic state quantity which is a measure of randomness or disorder of the molecules of the system.

Entropy is represented by the symbol "S". It is difficult to define the actual entropy of a system. It is more convenient to define the change of entropy during a change of state.

The entropy change of a system may be defined as the integral of all the terms involving heat exchanged (q) divided by the absolute temperature (T) during each infinitesimally small change of the process carried out reversibly at constant temperature.

$$\Delta S = S_{\text{final}} - S_{\text{initial}} = \frac{q_{\text{rev}}}{T}$$

If heat is absorbed, then $\Delta S = +ve$ and if heat is evolved, then $\Delta S = -ve$.

(2) **Units of entropy** : Since entropy change is expressed by a heat term divided by temperature, it is expressed in terms of *calorie per degree*, i.e., cal deg^{-1} . In SI units, the entropy is expressed in terms of joule per degree Kelvin, i.e., JK^{-1} .

(3) **Characteristics of entropy** : The important characteristics of entropy are summed up below

(i) Entropy is an extensive property. Its value depends upon the amount of the substance present in the system.

(ii) Entropy of a system is a state function. It depends upon the state variables (T, p, V, n).

(iii) The change in entropy in going from one state to another is independent of the path.

(iv) The change in entropy for a cyclic process is always zero.

(v) The total entropy change of an isolated system is equal to the entropy change of system and entropy change of the surroundings. The sum is called *entropy change of universe*.

$$\Delta S_{\text{universe}} = \Delta S_{\text{sys}} + \Delta S_{\text{surr}}$$

(a) In a reversible process, $\Delta S_{\text{universe}} = 0$ and, therefore

$$\Delta S_{\text{sys}} = -\Delta S_{\text{surr}}$$

(b) In an irreversible process, $\Delta S_{\text{universe}} > 0$. This means that there is increase in entropy of universe is spontaneous changes.

(vi) Entropy is a measure of unavailable energy for useful work.

Unavailable energy = Entropy $\times$ Temperature

(vii) Entropy, S is related to thermodynamic probability (W) by the relation,

$$S = k \log_e W \text{ and } S = 2.303k \log_{10} W$$

where, k is Boltzmann's constant

(4) **Entropy changes in system & surroundings and total entropy change for Exothermic and Endothermic reactions** : Heat increases the thermal motion of the atoms or molecules and increases their disorder and hence their entropy. In case of an exothermic process, the heat escapes into the surroundings and therefore, entropy of the surroundings increases on the other hand in case of endothermic process, the heat enters the system

from the surroundings and therefore. The entropy of the surroundings decreases.

In general, there will be an overall increase of the total entropy (or disorder) whenever the disorder of the surroundings is greater than the decrease in disorder of the system. The process will be *spontaneous only when the total entropy increases*.

(5) **Entropy change during phase transition** : The change of matter from one state (solid, liquid or gas) to another is called *phase transition*. Such changes occur at definite temperature such as melting point (solid to liquid), boiling point (liquid to vapours) etc, and are accompanied by absorption or evolution of heat.

When a solid changes into a liquid at its fusion temperature, there is absorption of heat (latent heat). Let ΔH_f be the molar heat of fusion. The entropy change will be

$$\Delta S_f = \frac{\Delta H_f}{T_f}$$

Similarly, if the latent heat of vaporisation and sublimation are denoted by ΔH_{vap} and ΔH_{sub} , respectively, the entropy of vaporisation and sublimation are given by

$$\Delta S_{\text{vap}} = \frac{\Delta H_{\text{vap}}}{T_b} \quad \text{and} \quad \Delta S_{\text{sub}} = \frac{\Delta H_{\text{sub}}}{T_s}$$

Since ΔH_f , ΔH_{vap} and ΔH_{sub} are all positive, these processes are accompanied by increase of entropy and the reverse processes are accompanied by decrease in entropy.

(6) **Entropy change for an ideal gas** : In going from initial to final state, the entropy change, ΔS for an ideal gas is given by the following relations,

(i) When T and V are two variables,

$$\Delta S = nC_v \ln \frac{T_2}{T_1} + nR \ln \frac{V_2}{V_1} \text{ . Assuming } C_v \text{ is constant}$$

(ii) When T and p are two variables,

$$\Delta S = nC_p \ln \frac{T_2}{T_1} - nR \ln \frac{p_2}{p_1} \text{ . Assuming } C_p \text{ is constant}$$

(a) Thus, for an *isothermal process* (T constant),

$$\Delta S = nR \ln \frac{V_2}{V_1} \text{ or } -nR \ln \frac{p_2}{p_1}$$

(b) For *isobaric process* (p constant), $\Delta S = nC_p \ln \frac{T_2}{T_1}$

(c) For *isochoric process* (V constant), $\Delta S = nC_v \ln \frac{T_2}{T_1}$

(d) **Entropy change during adiabatic expansion** : In such process $q=0$ at all stages. Hence $\Delta S = 0$. Thus, reversible adiabatic processes are called *isentropic process*.

Free energy and Free energy change

Gibb's free energy (G) is a *state function* and is a measure of maximum work done or useful work done from a reversible reaction at constant temperature and pressure.

(1) **Characteristics of free energy**

(i) The free energy of a system is the enthalpy of the system minus the product of absolute temperature and entropy i.e., $G = H - TS$

(ii) Like other state functions E , H and S , it is also expressed as ΔG . Also $\Delta G = \Delta H - T\Delta S_{\text{system}}$ where ΔS is entropy change for system only. This is *Gibb's Helmholtz equation*.

(iii) At equilibrium $\Delta G = 0$

(iv) For a spontaneous process decrease in free energy is noticed i.e., $\Delta G = -ve$.

(v) At absolute zero, $T\Delta S$ is zero. Therefore if ΔG is $-ve$, ΔH should be $-ve$ or only exothermic reactions proceed spontaneously at absolute zero.

(vi) $\Delta G_{\text{system}} = T\Delta S_{\text{universe}}$, where $\Delta H = 0$

(vii) The standard free energy change,

$$\Delta G^\circ = -2.303RT \log_{10} K, \text{ where } K \text{ is equilibrium constant.}$$

(a) Thus if $K > 1$, then $\Delta G^\circ = -ve$ thus reactions with equilibrium constant $K > 1$ are thermodynamically spontaneous.

(b) If $K < 1$, then $\Delta G^\circ = +ve$ and thus reactions with equilibrium constant $K < 1$ are thermodynamically spontaneous in reverse direction.

(2) **Criteria for spontaneity of reaction** : For a spontaneous change $\Delta G = -ve$ and therefore use of $\Delta G = \Delta H - T\Delta S$, provides the following conditions for a change to be spontaneous.

Table 10.1 Criteria for spontaneity of reaction

ΔH	ΔS	ΔG	Reaction characteristics	Example
-	+	Always negative	Reaction is spontaneous at all temperatures	$2O_{3(g)} \rightarrow 3O_{2(g)}$
+	-	Always positive	Reaction is non spontaneous at all temperatures	$3O_{2(g)} \rightarrow 2O_{3(g)}$
-	-	Negative at low temperature but positive at high temperature	Reaction is spontaneous at low temperature but becomes non spontaneous at high temperature	$CaO_{(s)} + CO_{2(g)} \rightarrow CaCO_{3(s)}$
+	+	Positive at low temperature but negative at high temperature	Reaction is non spontaneous at low temperature but becomes spontaneous at high temperature	$CaCO_{3(s)} \rightarrow CaO_{(s)} + CO_{2(g)}$

Third law of thermodynamics

This law was first formulated by German chemist *Walther Nernst* in 1906. According to this law,

"The entropy of all perfectly crystalline solids is zero at the absolute zero temperature. Since entropy is a measure of disorder, it can be interpreted that at absolute zero, a perfectly crystalline solid has a perfect order of its constituent particles."

The most important application of the third law of thermodynamics is that it helps in the calculation of absolute entropies of the substance at any temperature T .

$$S = 2.303C_p \log T$$

Where C_p is the heat capacity of the substance at constant pressure and is supposed to remain constant in the range of 0 to T .

Limitations of the law

- (1) Glassy solids even at $0K$ has entropy *greater than zero*.
- (2) Solids having mixtures of *isotopes* do not have zero entropy at $0K$. For example, entropy of solid chlorine is not zero at $0K$.
- (3) Crystals of CO , N_2O , NO , H_2O , etc. do not have perfect order even at $0K$ thus their entropy is not *equal to zero*.

Thermochemistry

"Thermochemistry is a branch of physical chemistry which is concerned with energy changes accompanying chemical transformation. It is also termed as chemical energetics. It is based on the first law of thermodynamics."

Exothermic and Endothermic reactions

(1) **Exothermic reactions** : The chemical reactions which proceed with the *evolution of heat* energy are called exothermic reactions. The heat energy produced during the reactions is indicated by writing $+q$ or more precisely by giving the actual numerical value on the products side. In general exothermic reactions may be represented as, $A + B \rightarrow C + D + q$ (heat energy)

In the exothermic reactions the *enthalpy of the products will be less than the enthalpy of the reactants*, so that the enthalpy change is negative as shown below

$$\Delta H = H_p - H_r; H_p < H_r; \Delta H = -ve$$

Examples : (i) $C(s) + O_2(g) \rightarrow CO_2(g) + 393.5kJ$

(at constant temperature and pressure)

(iii) Fermentation is also an example of exothermic reaction.

(2) **Endothermic reactions** : The chemical reactions which proceed with the absorption of heat energy are called endothermic reactions. Since the heat is added to the reactants in these reactions, the heat absorbed is indicated by either putting $(-)$ or by writing the actual numerical value of heat on the reactant side

The heat absorbed at constant temperature and constant pressure measures enthalpy change. Because of the absorption of heat, the enthalpy of products will be more than the enthalpy of the reactants. Consequently, ΔH will be positive ($+ve$) for the endothermic reactions.

$$\Delta H = H_p - H_r; H_p > H_r; \Delta H = +ve$$

(iii) Preparation of ozone by passing silent electric discharged through oxygen is the example of endothermic reaction.

(iv) Evaporation of water is also the example of endothermic reaction.

For exothermic reaction : ΔH or $\Delta E = -ve$

For endothermic reaction : ΔH or $\Delta E = +ve$

Heat of reaction or Enthalpy of reaction

Heat of reaction is defined as the amount of heat evolved or absorbed when quantities of the substances indicated by the chemical equation have completely reacted. The heat of reaction (or enthalpy of reaction) is actually the difference between the enthalpies of the products and the reactants when the quantities of the reactants indicated by the chemical equation have completely reacted. Mathematically,

$$\text{Enthalpy of reaction (heat of reaction)} = \Delta H = \Sigma H_p - \Sigma H_r$$

(1) **Factors which influence the heat of reaction** : There are a number of factors which affect the magnitude of heat of reaction.

(i) **Physical state of reactants and products** : Heat energy is involved for changing the physical state of a chemical substance. For example in the conversion of water into steam, heat is absorbed and heat is evolved when steam is condensed. Considering the following two reactions

It is observed that there is difference in the value of ΔH if water is obtained in gaseous or liquid state. ΔH value in second case is higher because heat is evolved when steam condenses. Hence, physical state always affects the heat of reaction.

(ii) **Allotropic forms of the element** : Heat energy is also involved when one allotropic form of an element is converted into another. Thus, the value of ΔH depends on the allotropic form used in the reaction. For example, the value of ΔH is different when carbon in the form of diamond or in amorphous form is used.

The difference between the two values is equal to the heat absorbed when 12g of diamond is converted into 12g of amorphous carbon. This is termed as *heat of transition*.

(iii) **Temperature** : Heat of reaction has been found to depend upon the temperature at which reaction is occurring. The variation of the heat of reaction with temperature can be ascertained by using *Kirchhoff's equation*.

$$\frac{\Delta H_{T_2} - \Delta H_{T_1}}{T_2 - T_1} = \Delta C_p$$

Kirchhoff's equation at constant volume may be given as,

$$\frac{\Delta E_{T_2} - \Delta E_{T_1}}{T_2 - T_1} = \Delta C_v$$

(iv) **Reaction carried out at constant pressure or constant volume** :

When a chemical reaction occurs at constant volume, the heat change is called the internal energy of reaction at constant volume. However, most of the reactions are carried out at constant pressure; the enthalpy change is then termed as the enthalpy of reaction at constant pressure. The difference in the values is negligible when solids and liquids are involved in a chemical change. But, in reactions which involve gases, the difference in two values is considerable.

$$\Delta E + \Delta nRT = \Delta H \quad \text{or} \quad q_v + \Delta nRT = q_p$$

$$\Delta E = q_v = \text{heat change at constant volume;}$$

$$\Delta E \quad \Delta H = q_p = \text{heat change at constant pressure,}$$

$$\Delta n = \text{total number of moles of gaseous product} \\ - \text{total number of moles of gaseous reactants.}$$

(2) Types of heat of reaction

(i) **Heat of formation** : It is the quantity of heat evolved or absorbed (*i.e.* the change in enthalpy) when one mole of the substance is formed from its constituent elements under given conditions of temperature and pressure. It is represented by ΔH_f . When the temperature and pressure are as 25°C and 1 atmospheric pressure. The heat of formation under these conditions is called *standard heat of formation*. It is usually represented by ΔH_f^0 .

The standard heat of formation of 1 mole of $NH_3(g)$ and 1 mole of $HCl(g)$.

It may be calculated by

$$\Delta H^0 = [\Sigma \Delta H^0_{(\text{products})} - \Sigma \Delta H^0_{(\text{Reactants})}]$$

(ii) **Heat of combustion** : It is the amount of heat evolved or absorbed (*i.e.* change in enthalpy) when one mole of the substance is completely burnt in air or oxygen. For example

It may be calculated by

$$\Delta H^0 = [\Sigma \Delta H^0_{f(\text{Products})} - \Sigma \Delta H^0_{f(\text{Reactants})}]$$

The enthalpy or heat of combustion have a number of applications. Some of these are described below,

(a) **Calorific value of foods and fuels** : Energy is needed for the working of all machines. Even human body is no exception. Coal, petroleum, natural gas etc. serve as the principal sources of energy for man-made machines, the food which we eat serves as a source of energy to our body.

The energy released by the combustion of foods or fuels is usually compared in terms of their combustion energies per gram. It is known as *calorific value*. The amount of heat produced in calories or Joules when one gram of a substance (food or fuel) is completely burnt or oxidised.

When methane burns, $890.3 \text{ kJ mol}^{-1}$ of energy is released.

$$\text{So, the calorific value of methane} = -\frac{890.3}{16} = -55.6 \text{ kJ/g}$$

(b) **Enthalpies of formation** : Enthalpies of formation of various compounds, which are not directly obtained, can be calculated from the data of enthalpies of combustions easily by the application of Hess's law.

$$\text{Heat of reaction} = \Sigma \text{Heat of combustion of reactants} \\ - \Sigma \text{Heat of combustion of products.}$$

(iii) **Heat of neutralisation** : It is the amount of heat evolved (*i.e.*, change in enthalpy) when one equivalent of an acid is neutralised by one equivalent of a base in fairly dilute solution, *e.g.*, *Neutralisation reactions are always exothermic reaction and the value of ΔH is (-ve).*

$$\Delta H = -13.7 \text{ kcal}$$

The heat of neutralisation of a strong acid against a strong base is always constant ($13.7 \text{ kcal or } 57 \text{ kJ mole}^{-1}$). It is because in dilute solutions all strong acids and bases ionise completely and thus the heat of neutralisation in such cases is actually the heat of formation of water from H^+ and OH^- ions, *i.e.*,

In case of neutralisation of a weak acid or a weak base against a strong base or acid respectively, since a part of the evolved heat is used up in ionising the weak acid or base, it is always less than $13.7 \text{ kcal mole}^{-1}$ (57 kJ mole^{-1}). For example,

$$\Delta H = -2.9 \text{ kcal}$$

10.8 KCal of heat is absorbed for ionisation of HCN it is heat of dissociation or ionisation

(iv) **Heat of solution** : It is the amount of heat evolved or absorbed (i.e., change in enthalpy) when one mole of the solute is dissolved completely in excess of the solvent (usually water). For example,

(v) **Heat of hydration** : It is the amount of heat evolved or absorbed (i.e change in enthalpy) when 1 mole of an anhydrous or a partially hydrated salt combines with the required number of moles of water to form a specific hydrate. For example,

(vi) **Heat of vapourisation** : When a liquid is allowed to evaporate, it absorbs heat from the surroundings and evaporation is accompanied by increase in enthalpy. For example: 10.5 k cal is the increase in enthalpy

when one mole of water is allowed to evaporate at 25°C . When the vapours are allowed to condense to liquid state, the heat is evolved and condensation of vapour is accompanied by decrease in enthalpy.

The evaporation and condensation can be represented as,

Thus the change in enthalpy when a liquid changes into vapour state or when vapour changes into liquid state is called *heat of vapourisation*.

(vii) **Heat of fusion** : When a solid is allowed to melt, it changes into liquid state with the absorption of heat (increase in enthalpy) and when a liquid is allowed to freeze, it changes into solid with the evolution of heat (decrease in enthalpy). The change in enthalpy of such type of transformations is called *enthalpy of fusion*. For example,

(viii) **Heat of precipitation** : It is defined as the amount of heat liberated in the precipitation of one mole of a sparingly soluble substance when solutions of suitable electrolytes are mixed, for example

(ix) **Heat of sublimation** : Sublimation is a process in which a solid on heating changes directly into gaseous state below its melting point.

Heat of sublimation of a substance is the amount of heat absorbed in the conversion of 1 mole of a solid directly into vapour phase at a given temperature below its melting point.

Most solids that sublime are molecular in nature e.g. iodine and naphthalene etc.

$$\Delta H_{\text{sub.}} = \Delta H_{\text{fusion}} + \Delta H_{\text{vapourisation}}$$

(3) **Experimental determination of the heat of reaction** : The heat evolved or absorbed in a chemical reaction is measured by carrying out the reaction in an apparatus called *calorimeter*. The principle of measurement is that heat given out is equal to heat taken, i.e., $Q = (W + m) \times s \times (T_2 - T_1)$,

Where Q is the heat of the reaction (given out), W is the water equivalent of the calorimeter and m is the mass of liquid in the calorimeter and s its specific heat, T_2 is the final temperature and T_1 the initial temperature of the system. Different types of calorimeters are used but two of the common types are,

(i) Water calorimeter and (ii) Bomb calorimeter

Bomb calorimeter : This is commonly used to find the heat of combustion of organic substances.

Since the reaction in a bomb calorimeter proceeds at constant volume, the heat of combustion measured is ΔE

$$\Delta E = \frac{(W + m)(t_2 - t_1) \times s}{w_1} \times M \text{ kcal}$$

Where M is the molecular mass of the substance, w_1 is the weight of substance taken, W is the water equivalent of calorimeter, m is the mass of liquid in the calorimeter and s is the specific heat of liquid.

ΔH can be calculated from the relation, $\Delta H = \Delta E + \Delta nRT$

Laws of thermochemistry

(1) **Levoisier and Laplace law** : According to this law enthalpy of decomposition of a compound is numerically equal to the enthalpy of formation of that compound with opposite sign, For example,

(2) **Hess's law** (the law of constant heat summation) : This law was presented by Hess in 1840. According to this law "If a chemical reaction can be made to take place in a number of ways in one or in several steps, the total enthalpy change (total heat change) is always the same, i.e. the total enthalpy change is independent of intermediate steps involved in the change." The enthalpy change of a chemical reaction depends on the initial and final stages only. Let a substance A be changed in three steps to D with enthalpy change from A to B, ΔH_1 calorie, from B to C, ΔH_2 calorie and from C to D, ΔH_3 calorie. Total enthalpy change from A to D will be equal to the sum of enthalpies involved in various steps, Total enthalpy change $\Delta H_{\text{steps}} = \Delta H_1 + \Delta H_2 + \Delta H_3$

Now if D is directly converted into A, let the enthalpy change be ΔH_{direct} . According to Hess's law $\Delta H_{\text{steps}} + \Delta H_{\text{direct}} = 0$, i.e. ΔH_{steps} must be equal to ΔH_{direct} numerically but with opposite sign. In case it is not so, say ΔH_{steps} (which is negative) is more than ΔH_{direct} (which is positive), then in one cycle, some energy will be created which is not possible on the basis of first law of thermodynamics. Thus, ΔH_{steps} must be equal to ΔH_{direct} numerically.

(i) **Experimental verification of Hess's law**

(a) Formation of carbon dioxide from carbon

First method : carbon is directly converted into $\text{CO}_2(\text{g})$.

Second method : Carbon is first converted into $\text{CO}(\text{g})$ and then $\text{CO}(\text{g})$ into $\text{CO}_2(\text{g})$, i.e. conversion has been carried in two steps,

Total enthalpy change $\text{C}(\text{s})$ to $\text{CO}_2(\text{g})$; $\Delta H = -94.0 \text{ kcal}$

(b) *Formation of ammonium chloride from ammonia and hydrochloric acid:*

Second method

(ii) **Applications of Hess's law**

(a) For the determination of enthalpies of formation of those compounds which cannot be prepared directly from the elements easily using enthalpies of combustion of compounds.

(b) For the determination of enthalpies of extremely slow reactions.

(c) For the determination of enthalpies of transformation of one allotropic form into another.

(d) For the determination of bond energies.

$\Delta H_{\text{reaction}} = \sum \text{Bond energies of reactants} - \sum \text{Bond energies of products.}$

(e) For the determination of resonance energy.

(f) For the determination of lattice energy.

Bond energy or Bond enthalpies

When a bond is formed between atoms, energy is released. Obviously same amount of energy will be required to break the bond. The energy required to break the bond is termed *bond dissociation energy*. The more precise definition is,

"The amount of energy required to break one mole of bond of a particular type between the atoms in the gaseous state, i.e., to separate the atoms in the gaseous state under 1 atmospheric pressure and the specified temperature is called bond dissociation energy."

For example, $\text{H} - \text{H}(\text{g}) \rightarrow 2\text{H}(\text{g}); \Delta H = +433 \text{ kJ mol}^{-1}$

The bond dissociation energy of a diatomic molecule is also called *bond energy*. However, the bond dissociation energy depends upon the nature of bond and also the molecule in which the bond is present. When a molecule of a compound contains more than one bond of the same kind, the average value of the dissociation energies of a given bond is taken. *This average bond dissociation energy required to break each bond in a compound is called bond energy.*

Bond energy is also called, the heat of formation of the bond from gaseous atoms constituting the bond with reverse sign.

Bond energy of $\text{H} - \text{Cl} = -(\text{enthalpy of formation}) = -(-431) = +431 \text{ kJ mol}^{-1}$

Consider the dissociation of water molecule which consists of two $\text{O} - \text{H}$ bonds. The dissociation occurs in two stages.

The average of these two bond dissociation energies gives the value of bond energy of $\text{O} - \text{H}$.

Bond energy of $\text{O} - \text{H}$ bond

$$= \frac{497.8 + 428.5}{2} = 463.15 \text{ kJ mol}^{-1}$$

Similarly, the bond energy of $\text{N} - \text{H}$ bond in NH_3 is equal to one – third of the energy of dissociation of NH_3 and those of $\text{C} - \text{H}$ bond in CH_4 is equal to one – fourth of the energy of dissociation of CH_4 .

$$\text{Bond energy of } \text{C} - \text{H} = \frac{1664}{4} = 416 \text{ kJ mol}^{-1}$$

Applications of bond energy

(1) Heat of a reaction = $\sum \text{Bond energy of reactants} - \sum \text{Bond energy of products.}$

(2) **Determination of resonance energy** : When a compound shows resonance, there is considerable difference between the heat of formation as calculated from bond energies and that determined experimentally.

Resonance energy = Experimental or actual heat of formation – Calculated heat of formation.

Tips & Tricks

✍ Joule thomson coefficient $\mu = \left(\frac{\partial T}{\partial p} \right)_H$

For cooling $\mu = +ve$

For Heating $\mu = -ve$

Neither cooling nor heating $\mu = 0$

- ✍ The temperature at which a real gas shows neither cooling nor heating effect on adiabatic expansion (i.e., $\mu = 0$) is called inversion temperature.
- ✍ Hydrogen has highest calorific value.
- ✍ $13.7 \text{ Kcal/mol} = 57 \text{ KJ/mol}$ (be cause of $1 \text{ cal} = 4.2 \text{ Joule}$)
- ✍ Enthalpy of fusion of ice per mole is 6 KJ .
- ✍ Order of bond energy in halogen $\text{Cl}_2 > \text{Br}_2 > \text{F}_2 > \text{I}_2$.
- ✍ Heat of vapourisation of water per mole is 10.5 KCal .
- ✍ The heat of reaction is independent of the time consumed in the process.

7. Which of the following units represents the largest amount of energy
[CPMT 1989; MP PET 2000]
(a) Electron volt (b) Erg
(c) Joule (d) Calorie
8. Energy equivalent to one erg, one joule and one calorie is in the order
[NCERT 1980; CPMT 1997]
(a) $1 \text{ erg} > 1 \text{ joule} > 1 \text{ calorie}$ (b) $1 \text{ erg} > 1 \text{ calorie} > 1 \text{ joule}$
(c) $1 \text{ calorie} > 1 \text{ joule} > 1 \text{ erg}$ (d) $1 \text{ joule} > 1 \text{ calorie} > 1 \text{ erg}$

Ordinary Thinking

Objective Questions

Basic concepts

1. Internal energy of an ideal gas depends on
(a) Volume (b) Temperature
(c) Pressure (d) None of these
2. Any series of operations so carried out that at the end, the system is back to its initial state is called
(a) Boyle's cycle (b) Reversible process
(c) Adiabatic process (d) Cyclic process
3. One calorie is equal to [CPMT 1988]
(a) 0.4184 Joule (b) 4.184 Joule
(c) 41.84 Joule (d) 418.4 Joule
4. The total internal energy change for a reversible isothermal cycles is
(a) Always 100 calories per degree
(b) Always negative
(c) 0
(d) Always positive
5. A well stoppered thermos flask contains some ice cubes. This is an example of a [AIIMS 1992]
(a) Closed system
(b) Open system
(c) Isolated system
(d) Non-thermodynamic system
6. Identify the intensive quantity from the following [IIT JEE 1993]
(a) Enthalpy and temperature
(b) Volume and temperature
(c) Enthalpy and volume
(d) Temperature and refractive index

9. Heat produced in calories by the combustion of one gram of carbon is called
(a) Heat of combustion of carbon
(b) Heat of formation of carbon
(c) Calorific value of carbon
(d) Heat of production of carbon
10. Conditions of standard state used in thermochemistry is
(a) 0°C and 1 atm (b) 20°C and 1 atm
(c) 25°C and 1 atm (d) 0 K and 1 atm
11. The temperature of the system decreases in an [KCET 2005]
(a) Adiabatic compression (b) Isothermal compression
(c) Isothermal expansion (d) Adiabatic expansion
12. For the isothermal expansion of an ideal gas
(a) E and H increases
(b) E increases but H decreases
(c) H increases but E decreases
(d) E and H are unaltered
13. If a refrigerator's door is opened, then we get [CPMT 1980]
(a) Room heated
(b) Room cooled
(c) More amount of heat is passed out
(d) No effect on room
14. The cooling in refrigerator is due to [KCET 2005]
(a) Reaction of the refrigerator gas
(b) Expansion of ice
(c) The expansion of the gas in the refrigerator
(d) The work of the compressor
15. Point out the wrong statement in relation to enthalpy
(a) It is a state function
(b) It is an intensive property
(c) It is independent of the path followed for the change
(d) Its value depends upon the amount of substance in the system
16. Which of the following is zero for an isochoric process
(a) dP (b) dV
(c) dT (d) dE
17. Mark the *correct* statement [MP PET 1997]
(a) For a chemical reaction to be feasible, ΔG should be zero
(b) Entropy is a measure of order in a system
(c) For a chemical reaction to be feasible, ΔG should be positive
(d) The total energy of an isolated system is constant
18. In an isochoric process the increase in internal energy is [MP PMT 1997]
(a) Equal to the heat absorbed
(b) Equal to the heat evolved
(c) Equal to the work done
(d) Equal to the sum of the heat absorbed and work done
19. It is general principle that the less energy a system contains, it is [MH CET 1999]
(a) Less stable (b) More stable
(c) Unstable (d) More unstable
20. Internal energy is an example of [Pb. PMT 2000]
(a) Path function (b) State function
(c) Both (a) and (b) (d) None of these
21. The process, in which no heat enters or leaves the system, is termed as [Pb. PMT 1999; Kerala (Med.) 2002; J & K 2005]
(a) Isochoric (b) Isobaric
(c) Isothermal (d) Adiabatic
22. The intensive property among these quantities is [KCET 2002]
(a) Enthalpy (b) Mass/volume
(c) Mass (d) Volume
23. In thermodynamics which one of the following is not an intensive property [Kerala (Med.) 2002]
(a) Pressure (b) Density
(c) Volume (d) Temperature
24. If in a container neither mass and nor heat exchange occurs then it constitutes a [MP PMT 1993; AFMC 2003]
(a) Closed system (b) Open system
(c) Isolated system (d) Imaginary system
25. Which of the following is not a state function [DCE 2002]
(a) ΔS (b) ΔG
(c) ΔH (d) ΔQ
26. Which of the following is true for an adiabatic process [DCE 2002; MP PET 1995, 98, 2004; CPMT 1990; MP PMT 1998, 2002]
(a) $\Delta H = 0$ (b) $\Delta W = 0$
(c) $\Delta Q = 0$ (d) $\Delta V = 0$
27. Which of the following is not a state function [MH CET 2004; AIIMS 2001]
(a) Internal energy (b) Enthalpy
(c) Work (d) Entropy
28. Among them intensive property is [AFMC 2004]
(a) Mass (b) Volume
(c) Surface tension (d) Enthalpy

First law of thermodynamics and Hess law

1. The first law of thermodynamics is only
(a) The law of conservation of energy
(b) The law of conservation of mass
(c) The law of conservation of momentum
(d) Both (a) and (b)
2. A mixture of two moles of carbon monoxide and one mole of oxygen, in a closed vessel is ignited to convert the carbon monoxide to carbon dioxide. If ΔH is the enthalpy change and ΔE is the change in internal energy, then [KCET 2005]
(a) $\Delta H > \Delta E$
(b) $\Delta H < \Delta E$
(c) $\Delta H = \Delta E$
(d) The relationship depends on the capacity of the vessel
3. Which of the following is always negative for exothermic reaction? [BCECE 2005]
(a) ΔH (b) ΔS
(c) ΔG (d) None of these
4. The relation between ΔE and ΔH is [MP PET 1992; MP PMT 1996; MP PET/PMT 1998]
(a) $\Delta H = \Delta E - P \Delta V$ (b) $\Delta H = \Delta E + P \Delta V$
(c) $\Delta E = \Delta V + \Delta H$ (d) $\Delta E = \Delta H + P \Delta V$
5. At constant T and P , which one of the following statements is correct for the reaction, $\text{CO}(g) + \frac{1}{2} \text{O}_2(g) \rightarrow \text{CO}_2(g)$ [AIIMS 1982, 83; KCET 1988; BHU 1995; MP PET 1997, 99]
(a) ΔH is independent of the physical state of the reactants of that compound

- (b) $\Delta H > \Delta E$
 (c) $\Delta H < \Delta E$
 (d) $\Delta H = \Delta E$
6. For the reaction of one mole of zinc dust with one mole of sulphuric acid in a bomb calorimeter, ΔU and w correspond to [AIIMS 2005]
 (a) $\Delta U < 0, w = 0$ (b) $\Delta U = 0, w < 0$
 (c) $\Delta U > 0, w = 0$ (d) $\Delta U < 0, w > 0$
7. Which is not the correct relation between enthalpy (ΔH) and intrinsic energy (ΔE) [EAMCET 1992]
 (a) $\Delta H = \Delta E + P \Delta V$ (b) $\Delta H = \Delta E + n RT$
 (c) $\Delta H = \Delta E - P \Delta V$ (d) $\Delta E = \Delta H - P \Delta V$
8. The law of Lavoisier and Laplace illustrates [KCET 1989]
 (a) The principle of conservation of energy
 (b) Equivalence of mechanical and thermal energy
 (c) The principle of conservation of matter
 (d) Equivalence of mechanical and chemical energy
9. For the reaction $N_2 + 3H_2 \rightleftharpoons 2NH_3; \Delta H =$ [Roorkee 2000; CBSE PMT 1991, 2002]
 (a) $\Delta E - RT$ (b) $\Delta E - 2RT$
 (c) $\Delta E + RT$ (d) $\Delta E + 2RT$
10. If ΔH is the change in enthalpy and ΔE the change in internal energy accompanying a gaseous reaction [KCET 1989; CBSE PMT 1990]
 (a) ΔH is always greater than ΔE
 (b) $\Delta H < \Delta E$ only if the number of moles of the products is greater than the number of the reactants
 (c) ΔH is always less than ΔE
 (d) $\Delta H < \Delta E$ only if the number of moles of the products is less than the number of moles of the reactants
11. "The resultant heat change in a reaction is the same whether it takes place in one or several stages." This statement is called [MP PMT/PET 1988; MP PMT 1989]
 (a) Lavoisier and Laplace law
 (b) Hess's law
 (c) Joule's law
 (d) Le-chatelier's principle
12. Hess's law of constant heat summation is based on [MP PET 2001]
 (a) $E = mc^2$
 (b) Conservation of mass
 (c) First law of thermodynamics
 (d) None of the above
13. Consider the reaction : $N_2 + 3H_2 \rightarrow 2NH_3$ carried out at constant temperature and pressure. If ΔH and ΔU are the enthalpy and internal energy changes for the reaction, which of the following expression is true [AIEEE 2005]
 (a) $\Delta H = 0$ (b) $\Delta H = \Delta U$
 (c) $\Delta H < \Delta U$ (d) $\Delta H > \Delta U$
14. Which of the following is the correct equation [CBSE PMT 1996]
 (a) $\Delta U = \Delta Q - W$ (b) $\Delta W = \Delta U + \Delta Q$
 (c) $\Delta U = \Delta W + \Delta Q$ (d) None of these
15. Hess law is applicable for the determination of heat of [AIIMS 1998; Pb. PET/PMT 1999]
 (a) Reaction (b) Formation
 (c) Transition (d) All of these
16. Enthalpy for the reaction $C + O_2 \rightarrow CO_2$ is [DPMT 1987, 91]
 (a) Positive (b) Negative
 (c) Zero (d) None
17. During an isothermal expansion of an ideal gas its [CBSE PMT 1991]
 (a) Internal energy increases
 (b) Enthalpy decreases
 (c) Enthalpy remains unaffected
 (d) Enthalpy reduces to zero
18. The work done in ergs for the reversible expansion of one mole of an ideal gas from a volume of 10 litres to 20 litres at $25^\circ C$ is [CMC Vellore 1998]
 (a) $2.303 \times 298 \times 0.082 \log 2$
 (b) $298 \times 10^7 \times 8.31 \times 2.303 \log 2$
 (c) $2.303 \times 298 \times 0.082 \log 0.5$
 (d) $8.31 \times 10^7 \times 298 - 2.303 \log 0.5$
 (e) $2.303 \times 298 \times 2 \log 2$
19. The law of conservation of energy states that [NCERT 1984]
 (a) The internal energy of a system is constant
 (b) The heat content of a system is constant
 (c) Energy is neither created nor destroyed
 (d) There is an equivalence between energy and mass
20. The enthalpies of the elements in their standard states are assumed to be [MP PMT 1989]
 (a) Zero at 298 K
 (b) Unit at 298 K
 (c) Zero at all temperatures
 (d) Zero at 273 K
21. The heat Q for a reaction at constant volume is equal to
 (a) $H_P - H_R$ (b) $H_R - H_P$
 (c) $E_P - E_R$ (d) None of these
22. Which of the following expressions represents the first law of thermodynamics [MP PET 1996, 2000; AFMC 1997; BHU 1999; AMU 2000; KCET (Med.) 2000, 01; CBSE PMT 2000; MP PMT 2002]
 (a) $\Delta E = -q + W$ (b) $\Delta E = q - W$
 (c) $\Delta E = q + W$ (d) $\Delta E = -q - W$
23. In a reversible isothermal process, the change in internal energy is
 (a) Zero (b) Positive
 (c) Negative (d) None of these

24. A schematic plot of $\ln K_{eq}$ versus inverse of temperature for a reaction is shown below

The reaction must be

[AIEEE 2005]

- (a) Exothermic
(b) Endothermic
(c) One with negligible enthalpy change
(d) Highly spontaneous at ordinary temperature
25. Hess law of heat summation includes [AFMC 1992]
(a) Initial reactants only
(b) Initial reactants and final products
(c) Final products only
(d) Intermediates only
26. An ideal gas at constant temperature and pressure expands, then its [BHU 1998]
(a) Internal energy remains same
(b) Internal energy decreases
(c) Internal energy increases
(d) Entropy first increases and then decreases
27. The internal energy of a substance [KCET 1998; AFMC 2001; AIIMS 2001]
(a) Increases with increase in temperature
(b) Decreases with increase in temperature
(c) Can be calculated by the relation $E = mc^2$
(d) Remains unaffected with change in temperature
28. The relation between change in internal energy (ΔE), change in enthalpy (ΔH) and work done (W) is represented as [AFMC 1999]
(a) $\Delta H = \Delta E + W$ (b) $W = \Delta E - \Delta H$
(c) $\Delta E = W - \Delta H$ (d) $\Delta E = \Delta H + W$
29. The enthalpy of neutralization of which of the following acids and bases is nearly -13.6 Kcal [Roorkee 1999]
(a) HCN and NaOH (b) HCl and KOH
(c) HCl and NaOH (d) HCl and NH_4OH
30. Work done during isothermal expansion of one mole of an ideal gas from 10 atm to 1 atm at 300 K is (Gas constant = 2) [AIIMS 2000]
(a) 938.8 cal (b) 1138.8 cal
(c) 1381.8 cal (d) 1581.8 cal
31. Joule-Thomson expansion is [JIPMER 2000]
(a) Isobaric (b) Isoenthalpic
(c) Isothermal (d) None of these
32. In which of the following $\Delta E = \Delta H$ [MP PMT 2001]
(a) $\text{N}_2\text{O}_4(\text{g}) \rightleftharpoons 2\text{NO}_2(\text{g})$
(b) $2\text{SO}_2(\text{g}) + \text{O}_2(\text{g}) \rightleftharpoons 2\text{SO}_3(\text{g})$
(c) $\text{H}_2(\text{g}) + \text{I}_2(\text{g}) \rightleftharpoons 2\text{HI}(\text{g})$
(d) $\text{H}_2(\text{g}) + \frac{1}{2}\text{O}_2(\text{g}) \rightleftharpoons \text{H}_2\text{O}(\text{l})$
33. In an adiabatic expansion of an ideal gas [KCET (Med.) 2001; MH CET 2000]
(a) $W = -\Delta E$ (b) $W = \Delta E$
(c) $\Delta E = 0$ (d) $W = 0$

34. For the reaction

and 1 atm pressure, $\Delta H = -874 \text{ kJ}$. Then the change in internal energy (ΔE) is [Orissa JEE 2002]

- (a) -874 kJ (b) -871.53 kJ
(c) -876.47 kJ (d) $+874 \text{ kJ}$

35. In a closed insulated container, a liquid is stirred with a paddle to increase its temperature. In this process, which of the following is true [CBSE PMT 2002]

- (a) $\Delta E = W = Q = 0$ (b) $\Delta E \neq 0, Q = W = 0$
(c) $\Delta E = W \neq 0, Q = 0$ (d) $\Delta E = Q \neq 0, W = 0$

36. Hess law is based on [MH CET 2002]

- (a) Law of conservation of mass
(b) Law of conservation of energy
(c) Enthalpy is a state function
(d) None of these

37. For the reaction,

at constant temperature, $\Delta H - \Delta E$ is [CBSE PMT 2003]

- (a) $-RT$ (b) $+RT$
(c) $-3RT$ (d) $+3RT$

38. According to Hess's law, the heat of reaction depends upon [MP PMT 2003]

- (a) Initial condition of reactants
(b) Initial and final conditions of reactants
(c) Intermediate path of the reaction
(d) End conditions of reactants

39. The value of $\Delta H - \Delta E$ for the following reaction at 27°C will be $2\text{NH}_3(\text{g}) \rightarrow \text{N}_2(\text{g}) + 3\text{H}_2(\text{g})$ [Kerala (Med.) 2002]

- (a) $8.314 \times 273 \times (-2)$ (b) $8.314 \times 300 \times (-2)$
(c) $8.314 \times 27 \times (-2)$ (d) $8.314 \times 300 \times (2)$

40. For which of the following $\Delta E = \Delta H$ [MP PET 2003]

- (a) $\text{N}_2\text{O}_4(\text{g}) \rightleftharpoons 2\text{NO}_2(\text{g})$
(b) $2\text{SO}_2(\text{g}) + \text{O}_2(\text{g}) \rightleftharpoons 2\text{SO}_3(\text{g})$
(c) $\text{H}_2(\text{g}) + \text{Cl}_2(\text{g}) \rightleftharpoons 2\text{HCl}(\text{g})$
(d) $\text{H}_2(\text{g}) + \frac{1}{2}\text{O}_2(\text{g}) \rightleftharpoons \text{H}_2\text{O}(\text{l})$

41. One mole of an ideal gas is allowed to expand freely and adiabatically into vacuum until its volume has doubled. A statement which is not true concerning this expression is [Pb. PMT 1998]

- (a) $\Delta H = 0$ (b) $\Delta S = 0$
(c) $\Delta E = 0$ (d) $W = 0$

42. At 27°C , one mole of an ideal gas is compressed isothermally and reversibly from a pressure of 2 atm to 10 atm . The values of ΔE and q are ($R = 2$) [BHU 2001]

- (a) $0, -965.84 \text{ cal}$
(b) $-965.84 \text{ cal}, +965.84 \text{ cal}$
(c) $+865.58 \text{ cal}, -865.58 \text{ cal}$
(d) $-865.58 \text{ cal}, -865.58 \text{ cal}$

43. The work done by a system is 8 *joule*, when 40 *joule* heat is supplied to it. What is the increase in internal energy of system [BHU 2001]
- (a) 25 J (b) 30 J
(c) 32 J (d) 28 J
44. A system absorb 600J of heat and work equivalent to 300J on its surroundings. The change in internal energy is [Pb. PMT 2004]
- (a) 300 J (b) 400 J
(c) 500 J (d) 600 J
45. Work done during isothermal expansion of one mole of an ideal gas from 10 atm. to 1 atm at 300K is [BHU 2004]
- (a) 4938.8 J (b) 4138.8 J
(c) 5744.1 J (d) 6257.2 J
46. If gas, at constant temperature and pressure expands then its [MH CET 2003]
- (a) Entropy increases and then decreases
(b) Internal energy increases
(c) Internal energy remains the same
(d) Internal energy decreases
47. For the reaction
 $PCl_5(g) \rightarrow PCl_3(g) + Cl_2(g)$ [MH CET 2004]
- (a) $\Delta H = \Delta E$ (b) $\Delta H > \Delta E$
(c) $\Delta H < \Delta E$ (d) None of these
48. Enthalpy (*H*) is equal to [MH CET 2004]
- (a) Internal energy (*E*)
(b) Product of pressure (*P*) and volume (*V*) of gas
(c) Internal energy (*E*)+*PV*
(d) Work (*W*) done by a system
49. ΔE° of combustion of isobutylene is $-X \text{ kJ mol}^{-1}$. The value of ΔH° is [DCE 2004]
- (a) $= \Delta E^\circ$ (b) $> \Delta E^\circ$
(c) $= 0$ (d) $< \Delta E^\circ$
50. One mole of an ideal gas is allowed to expand reversibly and adiabatically from a temperature of 27°C . If the work done during the process is 3 kJ, then final temperature of the gas is ($C_V = 20 \text{ J / K}$) [Pb. CET 2002]
- (a) 100 K (b) 150 K
(c) 195 K (d) 255 K
51. Which of the following is correct regarding the internal energy of a substance [Pb. CET 2002]
- (a) It is a state function
(b) It increases with increase in temperature
(c) It can be calculated by experiment
(d) It remains unaffected with change in temperature
52. For the gaseous reaction,
 $N_2O_4 \rightarrow 2NO_2$ [Pb. CET 2003]
- (a) $\Delta H < \Delta E$ (b) $\Delta H = \Delta E$
(c) $\Delta H = 0$ (d) $\Delta H > \Delta E$
53. $2C + O_2 \rightarrow 2CO$; $\Delta H = -220 \text{ kJ}$
- Which of the following statement is correct for this reaction [BVP 2004]
- (a) Heat of combustion of carbon is 110 kJ
(b) Reaction is exothermic
(c) Reaction needs no initiation
(d) All of these are correct
54. An ideal gas expands in volume from $1 \times 10^{-3} \text{ m}^3$ to $1 \times 10^{-2} \text{ m}^3$ at 300 K against a constant pressure of $1 \times 10^5 \text{ Nm}^{-2}$. The work done is [AIEEE 2004]
- (a) 270 kJ (b) -900 kJ
(c) -900 J (d) 900 kJ
55. Internal energy is [AFMC 2004]
- (a) Partly potential and partly kinetic
(b) Totally kinetic
(c) Totally potential
(d) None of these
56. For which of the reaction $\Delta H = \Delta E$ [MP PET 2004]
- (a) $N_2 + 3H_2 \rightleftharpoons 2NH_3$ (b) $N_2 + O_2 \rightarrow 2NO$
(c) $2Na + Cl_2 \rightarrow 2NaCl$ (d) $PCl_5 \rightarrow PCl_3 + Cl_2$
57. The work done during the expansion of a gas from a volume of 4 dm^3 to 6 dm^3 against a constant external pressure of 3 atm is ($1 \text{ L atm} = 101.32 \text{ J}$) [CBSE PMT 2004]
- (a) +304 J (b) -304 J
(c) -6 J (d) -608 J
58. For the reaction, $A_{(s)} + 2B_{(g)} \rightarrow 4C_{(s)} + D_{(l)}$. ΔH and ΔU are related as [Orissa JEE 2004]
- (a) $\Delta H = \Delta U$ (b) $\Delta H = \Delta U + 3RT$
(c) $\Delta H = \Delta U + RT$ (d) $\Delta H = \Delta U - 3RT$

IInd & IIIrd Law of thermodynamics and Entropy

1. For a reversible spontaneous change ΔS is
- (a) $\frac{\Delta E}{T}$ (b) $\frac{P \Delta V}{T}$
(c) $\frac{q}{T}$ (d) $RT \log K$
2. When disorder of a system increases, the change is said to be
- (a) Exothermic (b) Non-spontaneous
(c) Endothermic (d) Spontaneous
3. The spontaneous flow of heat is always
- (a) From low to high pressure
(b) From high to high pressure
(c) Unidirectional from lower temperature to higher temperature
(d) Unidirectional from the higher to lower temperature
4. Mixing of non-reacting gases is generally accompanied by
- (a) Decrease in entropy
(b) Increase in entropy
(c) Change in enthalpy
(d) Change in free energy
5. An irreversible process occurring isothermally in an isolated system leads to
- (a) Zero entropy
(b) An increase in the total entropy of the system
(c) A decrease in the total entropy of the system
(d) None of these
6. The entropy values (in JK mol^{-1}) of $H_{2(g)} = 130.6$, $Cl_{2(g)} = 223.0$ and $HCl_{(g)} = 186.7$ at 298 K and 1 atm pressure. Then entropy change for the reaction

- $H_{2(g)} + Cl_{2(g)} \rightarrow 2HCl_{(g)}$ is [BHU 2005]
- (a) + 540.3 (b) + 727.3
(c) - 166.9 (d) + 19.8
7. Which of the following is the least random state of water
(a) Ice
(b) Liquid water
(c) Steam
(d) All present same random state
8. Which one of the following process is non-spontaneous
(a) Dissolution of $CuSO_4$ in water
(b) Reaction between H_2 and O_2 to form water
(c) Water flowing down hill
(d) Flow of electric current from low potential to high potential
9. Which of the following is zero during adiabatic expansion of the gas
(a) ΔT (b) ΔS
(c) ΔE (d) None of these
10. The entropy of crystalline substances at absolute zero going by the third law of thermodynamics should be taken as [J & K 2005]
(a) 100
(b) 50
(c) Zero
(d) Different for different substances
11. In which state, the matter have highest entropy
(a) Solid (b) Liquid
(c) Gas (d) Equal in all
12. Which of the following pairs of a chemical reaction is certain to result in spontaneous reaction? [CBSE PMT 2005]
(a) Exothermic and decreasing disorder
(b) Endothermic and increasing disorder
(c) Exothermic and increasing disorder
(d) Endothermic and decreasing disorder
13. When one mole of monoatomic ideal gas at T K undergoes adiabatic change under a constant external pressure of 1 atm changes volume from 1 litre to 2 litre. The final temperature in Kelvin would be [IIT 2005]
(a) $\frac{T}{2^{(2/3)}}$ (b) $T + \frac{2}{3 \times 0.0821}$
(c) T (d) $T - \frac{2}{3 \times 0.0821}$
14. 9.0 gm of H_2O is vaporised at $100^\circ C$ and 1 atm pressure. If the latent heat of vaporisation of water is x J/gm, then ΔS is given by
(a) $\frac{x}{373}$ (b) $\frac{18x}{100}$
(c) $\frac{18x}{373}$ (d) $\frac{1}{2} \times \frac{18x}{373}$
15. The ΔS for the vaporisation of 1 mol of water is 88.3 J/mole K. The value of ΔS for the condensation of 1 mol of vapour will be
(a) 88.3 J/mol K (b) $(88.3)^2$ J/mol K
(c) - 88.3 J/mol K (d) $\frac{1}{88.3}$ J/mol K
16. For which reaction from the following, ΔS will be maximum [AIIMS 1982, 83, 94; AMU 2000]
(a) $Ca(s) + \frac{1}{2} O_2(g) \rightarrow CaO(s)$
(b) $CaCO_3(s) \rightarrow CaO(s) + CO_2(g)$
(c) $C(s) + O_2(g) \rightarrow CO_2(g)$
(d) $N_2(g) + O_2(g) \rightarrow 2NO(g)$
17. The occurrence of a reaction is impossible if [AIIMS 1982, 91; MP PET 1997; MP PMT 1999; DPMT 2002]
(a) ΔH is +ve ; ΔS is also + ve but $\Delta H < T\Delta S$
(b) ΔH is - ve ; ΔS is also - ve but $\Delta H > T\Delta S$
(c) ΔH is - ve ; ΔS is + ve
(d) ΔH is + ve ; ΔS is - ve
18. If the enthalpy of vaporization for water is 186.5 kJ mol⁻¹, the entropy of its vaporization will be [CPMT 1988; DCE 2000]
(a) 0.5 JK⁻¹mol⁻¹ (b) 1.0 JK⁻¹mol⁻¹
(c) 1.5 JK⁻¹mol⁻¹ (d) 2.0 JK⁻¹mol⁻¹
19. Which of the following statement is true. The entropy of the universe [MP PMT 1993; CET Pune 1998]
(a) Increases and tends towards maximum value
(b) Decreases and tends to be zero
(c) Remains constant
(d) Decreases and increases with a periodic rate
20. When enthalpy and entropy change for a chemical reaction are -2.5×10^3 cal and 7.4 cal deg⁻¹ respectively. Predict the reaction at 298 K is [AFMC 1998; MH CET 1999; CBSE PMT 2000]
(a) Spontaneous (b) Reversible
(c) Irreversible (d) Non-spontaneous
21. The total entropy change for a system and its surroundings increases, if the process is
(a) Reversible (b) Irreversible
(c) Exothermic (d) Endothermic
22. For chemical reactions, the calculation of change in entropy is normally done
(a) At constant pressure
(b) At constant temperature
(c) At constant temperature and pressure both
(d) At constant volume
23. When the value of entropy is greater, then the ability of work
(a) Is maximum (b) Is minimum
(c) Is medium (d) None of these
24. Which of the following is true for the reaction $H_2O(l) \rightleftharpoons H_2O(g)$ at $100^\circ C$ and 1 atmosphere [KCET 1991; AIIMS 1996]
(a) $\Delta E = 0$ (b) $\Delta H = 0$
(c) $\Delta H = \Delta E$ (d) $\Delta H = T\Delta S$
25. The enthalpy change for the transition of liquid water to steam, $\Delta H_{vap} = 37.3$ kJ mol⁻¹ at 373 K. The entropy change for the process is [MP PET 1994]
(a) 111.9 J mol⁻¹K⁻¹ (b) 37.3 J mol⁻¹K⁻¹
(c) 100 J mol⁻¹K⁻¹ (d) 74.6 J mol⁻¹K⁻¹

26. When a solid is converted into liquid, entropy [MP PET 1993, 95; MP PMT 1996]
 (a) Becomes zero (b) Remains the same
 (c) Decreases (d) Increases
27. In a spontaneous process, the entropy of the system and its surroundings [MP PET 1996; NCERT 1975]
 (a) Equals zero (b) Decreases
 (c) Increases (d) Remains constant
28. The positive value of ΔS indicates that [MP PMT 1997]
 (a) The system becomes less disordered
 (b) The system becomes more disordered
 (c) The system is in equilibrium position
 (d) The system tends to reach at equilibrium position
29. For reaction $2Cl(s) \rightarrow Cl_2(s)$, the signs of ΔH and ΔS respectively are [KCET 1996]
 (a) +, - (b) +, +
 (c) -, - (d) -, +
30. The enthalpy of water is $386 kJ$. What is entropy of water [BHU 1997]
 (a) $0.5 kJ$ (b) $1.03 kJ$
 (c) $1.5 kJ$ (d) $22.05 kJ$
31. For which of the processes is ΔS negative [Pb. PMT 1998]
 (a) $H_2(g) \rightarrow 2H(g)$
 (b) $N_2(g) 1 atm \rightarrow N_2(g) 8 atm$
 (c) $2SO_3(g) \rightarrow 2SO_2(g) + O_2(g)$
 (d) $C_{(diamond)} \rightarrow C_{(graphite)}$
32. Identify the correct statement regarding entropy [CBSE PMT 1998; BHU 2001]
 (a) At $0^\circ C$, the entropy of a perfectly crystalline substance is taken to be zero
 (b) At absolute zero of temperature, the entropy of a perfectly crystalline substance is +ve
 (c) At absolute zero of temperature, the entropy of all crystalline substances is taken to be zero
 (d) At absolute zero of temperature, the entropy of a perfectly crystalline substance is taken to be zero
33. One mole of an ideal gas at $300 K$ is expanded isothermally from an initial volume of 1 litre to 10 litres. The change in energy for this process is ($R = 2 cal mol^{-1} K^{-1}$) [CBSE PMT 1998]
 (a) $163.7 cal$ (b) $850.2 cal$
 (c) $1381.1 cal$ (d) Zero
34. If $900 J/g$ of heat is exchanged at boiling point of water, then what is increase in entropy [BHU 1998]
 (a) $43.4 J/mole$ (b) $87.2 J/mole$
 (c) $900 J/mole$ (d) Zero
35. A container has hydrogen and oxygen mixture in ratio of 4 : 1 by weight, then [BHU 1998]
 (a) Internal energy of the mixture decreases
 (b) Internal energy of the mixture increases
 (c) Entropy of the mixture increases
 (d) Entropy of the mixture decreases
36. If $0.75 mole$ of an ideal gas expands isothermally at $27^\circ C$ from 15 litres to 25 litres, the maximum work obtained is [AFMC 1999]
 (a) $8.40 J$ (b) $9.34 J$
 (c) $10.86 J$ (d) $10.43 J$
37. In which of the following conditions a chemical reaction can not occur [AMU 1999]
 (a) ΔH and ΔS increase and $T\Delta S > \Delta H$
 (b) ΔH and ΔS decrease and $\Delta H > T\Delta S$
 (c) ΔH increases and ΔS decreases
 (d) ΔH decreases and ΔS increases
38. An engine operating between $150^\circ C$ and $25^\circ C$ takes $500 J$ heat from a higher temperature reservoir if there are no frictional losses, then work done by engine is [MH CET 1999]
 (a) $147.7 J$ (b) $157.75 J$
 (c) $165.85 J$ (d) $169.95 J$
39. The entropy of a perfectly crystalline solid at absolute zero is [AMU 2000]
 (a) Positive (b) Negative
 (c) Zero (d) Not definite
40. Which of the following conditions will always lead to a non-spontaneous change [AMU 2000; KCET (Med.) 2000]
 (a) Positive ΔH and positive ΔS
 (b) Negative ΔH and negative ΔS
 (c) Positive ΔH and negative ΔS
 (d) Negative ΔH and positive ΔS
41. Following data is known about melting of a compound AB
 $\Delta H = 9.2 kJ mol^{-1}$, $\Delta S = 0.008 kJ K^{-1} mol^{-1}$. Its melting point is [Pb. PMT 2000; AIIMS 2000]
 (a) $736 K$ (b) $1050 K$
 (c) $1150 K$ (d) $1150^\circ C$
42. The volume of a gas decreases from $500 cc$ to $300 cc$ when a sample of gas is compressed by an average pressure of $0.6 atm$. During this process $10 J$ of heat is liberated. The change in internal energy is [Pb. PMT 2000]
 (a) $-2.16 J$ (b) $12.156 J$
 (c) $2.16 J$ (d) $101.3 J$
43. The standard entropies of $CO_2(g)$, $C(s)$ and $O_2(g)$ are 213.5, 5.690 and $205 JK^{-1}$ respectively. The standard entropy of formation of $CO_2(g)$ is [CPMT 2001]
 (a) $1.86 JK^{-1}$ (b) $1.96 JK^{-1}$
 (c) $2.81 JK^{-1}$ (d) $2.86 JK^{-1}$
44. Which of the following endothermic processes are spontaneous [CBSE PMT 2001]
 (a) Melting of ice (b) Evaporation of water
 (c) Heat of combustion (d) Both (a) and (b)
45. For the reaction $H_2O(s) \rightleftharpoons H_2O(l)$ at $0^\circ C$ and normal pressure [KCET 2001]
 (a) $\Delta H > T\Delta S$ (b) $\Delta H = T\Delta S$
 (c) $\Delta H = \Delta G$ (d) $\Delta H < T\Delta S$
46. One mole of an ideal gas is allowed to expand reversibly and adiabatically from a temperature of $27^\circ C$. If the work done during the process is $3 kJ$, the final temperature will be equal to ($C_v = 20 JK^{-1}$) [KCET 2000; AFMC 2000; AIIMS 2001]
 (a) $150 K$ (b) $100 K$
 (c) $26.85^\circ C$ (d) $295 K$
47. The entropy change, in the conversion of one mole of liquid water at $373 K$ to vapour at the same temperature is (Latent heat of vaporization of water, $\Delta H_{vap} = 2.257 kJ/g$) [AFMC 2002; KCET 2002]

- (a) 105.9 J K^{-1} (b) 107.9 J K^{-1}
(c) 108.9 J K^{-1} (d) 109.9 J K^{-1}
48. A heat engine absorbs heat Q_1 at temperature T_1 and heat Q_2 at temperature T_2 . Work done by the engine is $(Q_1 + Q_2)$. This data [AIEEE 2002]
(a) Violates 1st law of thermodynamics
(b) Violates 1st law of thermodynamics if Q_1 is $-ve$
(c) Violates 1st law of thermodynamics if Q_2 is $-ve$
(d) Does not violate 1st law of thermodynamics
49. Equal volumes of monoatomic and diatomic gases at same initial temperature and pressure are mixed. The ratio of specific heats of the mixture (C_p / C_v) will be [AFMC 2002]
(a) 1 (b) 2
(c) 1.67 (d) 1.5
50. The law formulated by Dr. Nernst is [Kerala (Med.) 2002]
(a) First law of thermodynamics
(b) Second law of thermodynamics
(c) Third law of thermodynamics
(d) Both (a) and (b)
51. The unit of entropy is [CBSE PMT 2002]
(a) J mol^{-1} (b) J K mol^{-1}
(c) $\text{J mol}^{-1} \text{K}^{-1}$ (d) $\text{J}^{-1} \text{K}^{-1} \text{mol}^{-1}$
52. The entropy changed involved in the conversion of 1 mole of liquid water at 373 K to vapour at the same temperature will be [$\Delta H_{\text{vap}} = 2.257 \text{ kJ / gm}$] [MP PET 2002]
(a) 0.119 kJ (b) 0.109 kJ
(c) 0.129 kJ (d) 0.120 kJ
53. When a liquid boils, there is [JIPMER 2002]
(a) An increase in entropy
(b) A decrease in entropy
(c) An increase in heat of vaporization
(d) An increase in free energy
54. Which one of the following has ΔS° greater than zero [AIIMS 2003]
(a) $\text{CaO} + \text{CO}_2(\text{g}) \rightleftharpoons \text{CaCO}_3(\text{s})$
(b) $\text{NaCl}(\text{aq}) \rightleftharpoons \text{NaCl}(\text{s})$
(c) $\text{NaNO}_3(\text{s}) \rightleftharpoons \text{Na}^+(\text{aq}) + \text{NO}_3^-(\text{aq})$
(d) $\text{N}_2(\text{g}) + 3\text{H}_2(\text{g}) \rightleftharpoons 2\text{NH}_3(\text{g})$
55. The molar heat capacity of water at constant pressure is $75 \text{ J K}^{-1} \text{mol}^{-1}$. When 1.0 kJ of heat is supplied to 100 g of water which is free to expand the increase in temperature of water is [CBSE PMT 2003]
(a) 6.6 K (b) 1.2 K
(c) 2.4 K (d) 4.8 K
56. The work done to contract a gas in a cylinder, is 462 joules . 128 joule energy is evolved in the process. What will be the internal energy change in the process [MP PMT 2003]
(a) $+590 \text{ joules}$ (b) -334 joules
(c) $+334 \text{ joules}$ (d) -590 joules
57. Highest entropy is in [BVP 2003]
(a) Hydrogen (b) Water
(c) Graphite (d) Mercury
58.
$$\text{H}^+(\text{aq}) + \text{OH}^-(\text{aq}) \longrightarrow \text{H}_2\text{O}(\text{l})$$

$$S^\circ(298 \text{ K}) \text{ K}^{-1} \text{mol}^{-1} \quad -10.7 \quad +70$$

Standard entropy change for the above reaction is [DPMT 2004]
(a) $60.3 \text{ J K}^{-1} \text{mol}^{-1}$ (b) $80.7 \text{ J K}^{-1} \text{mol}^{-1}$
(c) $-70 \text{ J K}^{-1} \text{mol}^{-1}$ (d) $+10.7 \text{ J K}^{-1} \text{mol}^{-1}$
59. One mole of water at 100°C is converted into steam at 100°C at a constant pressure of 1 atm . The change in entropy is [heat of vaporisation of water at $100^\circ \text{C} = 540 \text{ cal / gm}$] [Pb. PMT 2004]
(a) 8.74 (b) 18.76
(c) 24.06 (d) 26.06
60. For a carnot engine, the source is at 500 K and the sink at 300 K . What is efficiency of this engine [BHU 2004]
(a) 0.2 (b) 0.4
(c) 0.6 (d) 0.3
61. Heat require to raise the temperature of 1 mol of a substance by 1°C is called [DCE 2002]
(a) Specific heat (b) Molar heat capacity
(c) Water equivalent (d) Specific gravity
62. Maximum entropy will be in which of the following [DCE 2004]
(a) Ice (b) Liquid water
(c) Snow (d) Water vapours
63. The standard entropies of $\text{CO}_2(\text{g})$, $\text{C}(\text{s})$ and $\text{O}_2(\text{g})$ are 213.5 , 5.740 and 205 J K^{-1} respectively. The standard entropy of formation of CO_2 is [Pb. CET 2001]
(a) 2.76 J K^{-1} (b) 2.12 J K^{-1}
(c) 1.12 J K^{-1} (d) 1.40 J K^{-1}
64. Which law of thermodynamics help in calculating entropy at different temperatures [Pb. CET 2003]
(a) First law (b) Second law
(c) Third law (d) Zeroth law
65. Entropy is maximum in case of [BVP 2004]
(a) Steam (b) Water at 0°C
(c) Water at 4°C (d) Ice
66. Considering entropy (S) as a thermodynamic parameter, the criterion for the spontaneity of any process is [CBSE PMT 2004]
(a) $\Delta S_{\text{system}} > 0$ only
(b) $\Delta S_{\text{surrounding}} > 0$ only
(c) $\Delta S_{\text{system}} + \Delta S_{\text{surrounding}} > 0$
(d) $\Delta S_{\text{system}} - \Delta S_{\text{surrounding}} > 0$
67. A process is taking place at constant temperature and pressure. Then [KCET 2004]
(a) $\Delta H = \Delta E$ (b) $\Delta H = T\Delta S$
(c) $\Delta H = 0$ (d) $\Delta S = 0$
68. The enthalpy of vapourization of a liquid is 30 kJ mol^{-1} and entropy of vapourization is $75 \text{ J mol}^{-1} \text{K}^{-1}$. The boiling point of the liquid at 1 atm is [IIT JEE (Screening) 2004]
(a) 250 K (b) 400 K
(c) 450 K (d) 600 K

Heat of reaction

1. If $C + O_2 \rightarrow CO_2 + 94.2 \text{ kcal}$
 $H_2 + \frac{1}{2} O_2 \rightarrow H_2O + 68.3 \text{ kcal}$
 $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O + 210.8 \text{ kcal}$
 then the possible heat of methane will be [MP PET 1990]
 (a) 47.3 kcal (b) 20.0 kcal
 (c) 45.9 kcal (d) -47.3 kcal
2. Molar heat of vaporisation of a liquid is 6 kJ mol^{-1} . If the entropy change is $16 \text{ J mol}^{-1} \text{ K}^{-1}$, the boiling point of the liquid is [KCET 2005]
 (a) 375°C (b) 375 K
 (c) 273 K (d) 102°C
3. The enthalpy of fusion of ice per mole
 (a) 18 kJ (b) 8 kJ
 (c) 80 kJ (d) 6 kJ
4. In which of the following neutralisation reactions, the heat of neutralisation will be highest [MP PMT 1989, 91; AIIMS 1999]
 (a) NH_4OH and CH_3COOH
 (b) NH_4OH and HCl
 (c) $NaOH$ and CH_3COOH
 (d) $NaOH$ and HCl
5. If $S + O_2 \rightarrow SO_2; (\Delta H = -298.2)$
 $SO_2 + \frac{1}{2} O_2 \rightarrow SO_3; (\Delta H = -98.2)$
 $SO_3 + H_2O \rightarrow H_2SO_4; (\Delta H = -130.2)$
 $H_2 + \frac{1}{2} O_2 \rightarrow H_2O; (\Delta H = -287.3)$
 then the enthalpy of formation of H_2SO_4 at 298K will be [DPMT 1983; Orissa JEE 2005]
 (a) -433.7 kJ (b) -650.3 kJ
 (c) +320.5 kJ (d) -813.9 kJ
6. From Kirchhoff's equation which factor affects the heat of reaction [MP PMT 1990]
 (a) Pressure (b) Temperature
 (c) Volume (d) Molecularity
7. The molar neutralization heat for KOH and HNO_3 as compared to molar neutralization heat of $NaOH$ and HCl [MP PMT 1989]
 (a) Less (b) More
 (c) Equal (d) Depends on pressure
8. An exothermic reaction is one in which the reacting substances [CPMT 1974, 79; Bihar MEE 1982; KCET 1992; JIPMER 2001]
 (a) Have more energy than the products
 (b) Have less energy than the products
 (c) Are at a higher temperature than the product
 (d) None of the above
9. The heat evolved in the combustion of benzene is given by
 $C_6H_6 + 7\frac{1}{2} O_2 \rightarrow 6CO_2(g) + 3H_2O(l); \Delta H = -3264.6 \text{ kJ}$
 Which of the following quantities of heat energy will be evolved when 39 g C_6H_6 are burnt [NCERT 1978; MP PET 1990; JIPMER 2001]
 (a) 816.15 kJ (b) 1632.3 kJ
 (c) 6528.2 kJ (d) 2448.45 kJ
10. Thermochemical reactions
 $C(\text{graphite}) + \frac{1}{2} O_2(g) \rightarrow CO(g); \Delta H = -110.5 \text{ kJ}$
 $CO(g) + \frac{1}{2} O_2(g) \rightarrow CO_2(g); \Delta H = -283.2 \text{ kJ}$
 From the above reaction, the heat of reaction for $C(\text{graphite}) + O_2(g) \rightarrow CO_2(g)$ will be [CPMT 1988; MP PMT 1989]
 (a) -393.7 kJ (b) +393.7 kJ
 (c) -172.7 kJ (d) +172.7 kJ
11. The following is (are) endothermic reaction [IIT JEE 1999]
 (a) Combustion of methane
 (b) Decomposition of water
 (c) Dehydrogenation of ethane to ethylene
 (d) Conversion of graphite to diamond
12. Evaporation of water is [CPMT 1973; DPMT 1982; MP PMT 1989; MP PET 1999]
 (a) An endothermic change
 (b) An exothermic change
 (c) A process where no heat change occurs
 (d) A process accompanied by chemical reaction
13. An exothermic reaction is one which [NCERT 1977; MP PMT 1990]
 (a) Takes place only on heating
 (b) Is accompanied by a flame
 (c) Is accompanied by a absorption of heat
 (d) Is accompanied by evolution of heat
14. An endothermic reaction is one in which [MNR 1980; NCERT 1976]
 (a) Heat is converted into electricity
 (b) Heat is absorbed
 (c) Heat is evolved
 (d) Heat is converted into mechanical work
15. Which of the following statement is correct [NCERT 1978]
 (a) ΔH is positive for exothermic reaction
 (b) ΔH is negative for endothermic reaction
 (c) The heat of neutralization of strong acid and strong base is always the same
 (d) The enthalpy of fusion is negative
16. The absolute enthalpy of neutralisation of the reaction $MgO(s) + 2HCl(aq) \rightarrow MgCl_2(aq) + H_2O(l)$ will be [CBSE PMT 2005]
 (a) Less than $-57.33 \text{ kJ mol}^{-1}$
 (b) $-57.33 \text{ kJ mol}^{-1}$
 (c) Greater than $-57.33 \text{ kJ mol}^{-1}$
 (d) $57.33 \text{ kJ mol}^{-1}$
17. ΔH_f° (298 K) of methanol is given by the chemical equation [AIIMS 2005]
 (a) $CH_4(g) + 1/2 O_2(g) \rightarrow CH_3OH(g)$
 (b) $C(\text{graphite}) + 1/2 O_2(g) + 2H_2(g) \rightarrow CH_3OH(l)$
 (c) $C(\text{diamond}) + 1/2 O_2(g) + 2H_2(g) \rightarrow CH_3OH(l)$
 (d) $CO(g) + 2H_2(g) \rightarrow CH_3OH(l)$
18. If ΔH_f° for H_2O_2 and H_2O are -188 kJ/mole and -286 kJ/mole . What will be the enthalpy change of the reaction $2H_2O_2(l) \rightarrow 2H_2O(l) + O_2(g)$ [MP PMT 1992]

- (a) -196 kJ/mole (b) 146 kJ/mole
(c) -494 kJ/mole (d) -98 kJ/mole
19. The heat of transition (ΔH_t) of graphite into diamond would be, where
 $C(\text{graphite}) + O_2(g) \rightarrow CO_2(g); \Delta H = x \text{ kJ}$
 $C(\text{diamond}) + C_2(g) \rightarrow CO_2(g); \Delta H = y \text{ kJ}$ [Pb. PET 1985]
 (a) $(x+y) \text{ kJ mol}^{-1}$ (b) $(x-y) \text{ kJ mol}^{-1}$
 (c) $(y-x) \text{ kJ mol}^{-1}$ (d) None of these
20. Correct relationship between heat of fusion (ΔH_{fus}), heat of vaporization (ΔH_{vap}) and heat of sublimation (ΔH_{sub}) is
 (a) $\Delta H_{\text{fus}} = \Delta H_{\text{vap}} + \Delta H_{\text{sub}}$
 (b) $\Delta H_{\text{vap}} = \Delta H_{\text{fus}} + \Delta H_{\text{sub}}$
 (c) $\Delta H_{\text{sub}} = \Delta H_{\text{vap}} + \Delta H_{\text{fus}}$
 (d) $\Delta H_{\text{sub}} = \Delta H_{\text{vap}} - \Delta H_{\text{fus}}$
21. Which of the following is an example of endothermic reaction [MP PMT 1980]
 (a) $C_2H_2 + 2H_2 \rightarrow C_2H_6; \Delta E = -314.0 \text{ kJ}$
 (b) $C + O_2 \rightarrow CO_2; \Delta E = -393.5 \text{ kJ}$
 (c) $N_2 + O_2 \rightarrow 2NO; \Delta E = -180.5 \text{ kJ}$
 (d) $2H_2 + O_2 \rightarrow 2H_2O; \Delta E = +571.8 \text{ kJ}$
22. If the enthalpy of B is greater than of A, the reaction $A \rightarrow B$ is [MP PMT 1997]
 (a) Endothermic (b) Exothermic
 (c) Instantaneous (d) Spontaneous
23. Given that
 $2C(s) + 2O_2(g) \rightarrow 2CO_2(g); \Delta H = -787 \text{ kJ}$
 $H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l); \Delta H = -286 \text{ kJ}$
 $C_2H_2(g) + 2\frac{1}{2}O_2(g) \rightarrow 2CO_2(g) + H_2O(l); \Delta H = -1301 \text{ kJ}$
 Heat of formation of acetylene is [KCET 1989; Orissa JEE 2005]
 (a) -1802 kJ (b) $+1802 \text{ kJ}$
 (c) -800 kJ (d) $+228 \text{ kJ}$
24. Enthalpy change for reaction, $\frac{1}{2}H_2 + \frac{1}{2}Cl_2 \rightarrow HCl$, is called
 (a) Enthalpy of combination (b) Enthalpy of reaction
 (c) Enthalpy of formation (d) Enthalpy of fusion
25. The enthalpy of neutralization is about 57.3 kJ for the pair
 (a) HCl and NH_4OH
 (b) NH_4OH and HNO_3
 (c) HCl and $NaOH$
 (d) CH_3COOH and $NaOH$
26. Conversion of oxygen to ozone represented by the equation $3O_2 \rightarrow 2O_3$ is an endothermic reaction. Enthalpy change ΔH accompanying the reaction [KCET 1988, 92]
 (a) Is negative (b) Is positive
 (c) Is zero (d) Depends on temperature
27. The mutual heat of neutralisation of 40 gm of $NaOH$ and 60 gm CH_3COOH will be [MP PET/PMT 1988]
 (a) 56.1 kcal (b) Less than 56.1 kcal
 (c) More than 56.1 kcal (d) 13.7 kcal
28. The heat of formations of $CO(g)$ and $CO_2(g)$ are -26.4 kcal and -94.0 kcal respectively. The heat of combustion of carbon monoxide will be [MP PET/PMT 1988; EAMCET 1993]
 (a) $+26.4 \text{ kcal}$ (b) -67.6 kcal
 (c) -120.6 kcal (d) $+52.8 \text{ kcal}$
29. The enthalpy of combustion at $25^\circ C$ of H_2 , cyclohexane (C_6H_{12}) and cyclohexene (C_6H_{10}) are -241 , -3920 and -800 kJ/mole respectively. The heat of hydrogenation of cyclohexene is [BHU 2005]
 (a) -121 kJ/mole (b) $+121 \text{ kJ/mole}$
 (c) -242 kJ/mole (d) $+242 \text{ kJ/mole}$
30. Heat of neutralisation of NH_4OH and HCl is [EAMCET 1980; Roorkee 1990; MP PMT 1994]
 (a) 13.7 kcal (b) $>13.7 \text{ kcal}$
 (c) $<13.7 \text{ kcal}$ (d) None of the above
31. Heat of combustion ΔH of CH_4 , C_2H_6 , C_2H_4 and C_2H_2 gases are -212.8 , -373.0 , -337.0 and -310.5 kcal respectively at the same temperature. The best fuel among these gases is
 (a) CH_4 (b) C_2H_6
 (c) C_2H_4 (d) C_2H_2
32. Heat of formation of $CO_2(g)$, $H_2O(l)$ and $CH_4(g)$ are -94.0 , -68.4 and -17.9 kcal respectively. The heat of combustion of methane is
 (a) -212.9 kcal (b) -136.8 kcal
 (c) -304.3 kcal (d) -105.2 kcal
33. The heat of reaction does not depend upon
 (a) Temperature of the reaction
 (b) Physical state of reactants and products
 (c) Whether the reaction is carried out at constant pressure or at constant volume
 (d) The method by which the final products are obtained from the reactants
34. Heat of neutralisation of a strong acid by a strong base is a constant value because [KCET 1984]
 (a) Salt formed does not hydrolyse
 (b) Only H^+ and OH^- ions react in every case
 (c) The strong base and strong acid react completely
 (d) The strong base and strong acid react in aqueous solution
35. Heat of neutralisation of an acid by a base is highest when [KCET 1985]
 (a) Both the acid and base are weak
 (b) Both the acid and base are strong
 (c) The acid is strong and the base is weak
 (d) The acid is weak and the base is strong
36. The standard molar heat of formation of ethane, CO_2 and water (l) are respectively -21.1 , -94.1 and -68.3 kcal . The standard molar heat of combustion of ethane will be [IIT JEE 1986; DPMT 2005]
 (a) -372 kcal (b) 162 kcal
 (c) -240 kcal (d) 183.5 kcal
37. Which of the following reaction is endothermic [AFMC 1988]
 (a) $CaCO_3 \rightarrow CaO + CO_2$
 (b) $Fe + S \rightarrow FeS$
 (c) $NaOH + HCl \rightarrow NaCl + H_2O$
 (d) $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$

38. In the reaction $CO_2(g) + H_2(g) \rightarrow CO(g) + H_2O(g); \Delta H = 80 \text{ kJ}$
 ΔH is known as [CPMT 1987; KCET 1993; Bihar CEE 1995]
 (a) Heat of formation (b) Heat of combustion
 (c) Heat of neutralization (d) Heat of reaction
39. Heat of combustion of a substance [CPMT 1987, 96; AFMC 1992]
 (a) Is always positive
 (b) Is always negative
 (c) Is equal to heat of formation
 (d) Nothing can be said without reaction
40. The heat change for the reaction $H_2 + \frac{1}{2}O_2 \rightarrow H_2O$ is called
 (a) Heat of reaction (b) Heat of formation
 (c) Heat of vaporisation (d) None of the above
41. The heat change ΔH for the reaction $2CO + O_2 \rightarrow 2CO_2; \Delta H = -135 \text{ kcal}$ is called
 (a) Heat of formation (b) Heat of reaction
 (c) Heat of combustion (d) Heat of solution
42. The heats of combustion of rhombic and monoclinic sulphur are respectively 70960 and 71030 calories. What will be the heat of conversion of rhombic sulphur to monoclinic [MP PMT/PET 1988]
 (a) 70960 calories (b) 71030 calories
 (c) -70 calories (d) +70 calories
43. The heat of formation of $H_2O(l)$ is -68.0 kcal, the heat of formation of $H_2O(g)$ is likely to be
 (a) -68.0 kcal (b) -67.4 kcal
 (c) 80.0 kcal (d) -58.3 kcal
44. Which of the following fuels will have the highest calorific value (kJ/kg) [MP PMT 1990]
 (a) Charcoal (b) Kerosene
 (c) Wood (d) Dung
45. The heat of combustion of carbon is -94 kcal at 1 atm pressure. The intrinsic energy of CO_2 is
 (a) +94 kcal (b) -94 kcal
 (c) +47 kcal (d) -47 kcal
46. The heat of neutralisation of a strong acid and a strong alkali is 57.0 kJ mol^{-1} . The heat released when 0.5 mole of HNO_3 solution is mixed with 0.2 mole of KOH is [KCET 1991; AIIMS 2002; AMU (Engg.) 2002]
 (a) 57.0 kJ (b) 11.4 kJ
 (c) 28.5 kJ (d) 34.9 kJ
47. A solution of 500 ml of 0.2 M KOH and 500 ml of 0.2 M HCl is mixed and stirred; the rise in temperature is T_1 . The experiment is repeated using 250 ml each of solution, the temperature raised is T_2 . Which of the following is true [EAMCET 1987; MP PET 1994]
 (a) $T_1 = T_2$ (b) $T_1 = 2T_2$
 (c) $T_1 = 4T_2$ (d) $T_2 = 9T_1$
48. Enthalpy of a compound is equal to its [CMC Vellore 1991]
 (a) Heat of combustion (b) Heat of formation
 (c) Heat of reaction (d) Heat of solution
- (e) Heat of dilution
49. Which is the best definition of "heat of neutralization" [CMC Vellore 1991]
 (a) The heat set free when one gram molecule of a base is neutralized by one gram molecule of an acid in dilute solution at a stated temperature
 (b) The heat absorbed when one gram molecule of an acid is neutralized by one gram molecule of a base in dilute solution at a stated temperature
 (c) The heat set free or absorbed when one gram atom of an acid is neutralized by one gram atom of a base at a stated temperature
 (d) The heat set free or absorbed when a normal solution containing one gram equivalent of an acid is neutralized by a normal solution containing one gram equivalent of a base at a stated temperature
 (e) The heat set free when one gram equivalent of an acid is neutralized by one gram equivalent of a base in dilute solution at a stated temperature
50. The compound with negative heat of formation are known as [DPMT 1981]
 (a) Endothermic compound
 (b) Exothermic compound
 (c) Heat of formation compound
 (d) None of the above
51. If $H^+ + OH^- \rightarrow H_2O + 13.7 \text{ kcal}$, then the heat of neutralization for complete neutralization of one mole of H_2SO_4 by base will be [MP PMT 1990]
 (a) 13.7 kcal (b) 27.4 kcal
 (c) 6.85 kcal (d) 3.425 kcal
52. The lowest value of heat of neutralization is obtained for [KCET 1988; MP PMT 1990]
 (a) $HCl + NaOH$
 (b) $CH_3COOH + NH_4OH$
 (c) $NH_4OH + HCl$
 (d) $NaOH + CH_3COOH$
53. Heat of neutralisation for the given reaction $NaOH + HCl \rightarrow NaCl + H_2O$ is 57.1 kJ mol^{-1} . What will be the heat released when 0.25 mole of $NaOH$ is titrated against 0.25 mole of HCl [CPMT 1990]
 (a) 22.5 kJ mol^{-1} (b) 57.1 kJ mol^{-1}
 (c) 14.3 kJ mol^{-1} (d) 28.6 kJ mol^{-1}
54. Reaction, $H_2(g) + I_2(g) \rightarrow 2HI(g)$ $\Delta H = -12.40 \text{ kcal}$. According to this, the heat of formation of HI will be [MP PET 1990]
 (a) 12.4 kcal (b) -12.4 kcal
 (c) -6.20 kcal (d) 6.20 kcal
55. All reactions with chemical dissociation are [MP PMT 1990]
 (a) Reversible
 (b) Reversible and endothermic
 (c) Exothermic
 (d) Reversible or irreversible and endothermic or exothermic
56. The heat of formation is the change in enthalpy accompanying the formation of a substance from its elements at 298 K and 1 atm pressure. Since the enthalpies of elements are taken to be zero, the heat of formation (ΔH) of compounds [NCERT 1978; KCET 1993]
 (a) Is always negative

- (b) Is always positive
(c) May be negative or positive
(d) Is zero
57. The heat of combustion of $CH_{4(g)}$, $C_{(graphite)}$ and $H_{2(g)}$ are 20 kcal , -40 kcal and -10 kcal respectively. The heat of formation of methane is [EAMCET 1998]
(a) -4.0 kcal (b) $+40\text{ kcal}$
(c) -80 kcal (d) $+80\text{ kcal}$
58. If a chemical reaction is accompanied by the evolution of heat, it is [BHU 1979]
(a) Catalytic (b) Photochemical
(c) Endothermic (d) Exothermic
59. A reaction that takes place with the absorption of energy is [EAMCET 1977]
(a) Burning of a candle (b) Rusting of iron
(c) Electrolysis of water (d) Digestion of food
60. Which of the following is an endothermic reaction [EAMCET 1980; MP PMT 1980; IIT JEE 1989; JIPMER 2002]
(a) $2H_2 + O_2 \rightarrow 2H_2O$
(b) $N_2 + O_2 \rightarrow 2NO$
(c) $2NaOH + H_2SO_4 \rightarrow Na_2SO_4 + 2H_2O$
(d) $3O_2 + C_2H_5OH \rightarrow 2CO_2 + 3H_2O$
61. One of the phenomena which cannot be described as combustion is [EAMCET 1979]
(a) Oxidation of coal in air
(b) Burning of magnesium in nitrogen
(c) Reaction of antimony in chlorine
(d) Lighting of an electric lamp
62. Which of the following statements is correct about heat of combustion [MADT Bihar 1982]
(a) It may be exothermic in some cases and endothermic in other cases
(b) It is applicable to gaseous substances only
(c) It is always an exothermic reaction
(d) Its value does not change with temperature
63. $H_2 + \frac{1}{2}O_2 \rightarrow H_2O; \Delta H = -68.39\text{ kcal}$
 $K + H_2O + \text{Water} \rightarrow KOH(aq) + \frac{1}{2}H_2; \Delta H = -48\text{ kcal}$
 $KOH + \text{Water} \rightarrow KOH(aq); \Delta H = -14\text{ kcal}$
The heat of formation of KOH is (in kcal) [CPMT 1988]
(a) $-68.39 + 48 - 14$ (b) $-68.39 - 48 + 14$
(c) $68.39 - 48 + 14$ (d) $68.39 + 48 + 14$
64. Which of the following reaction can be used to define the heat of formation of $CO_2(g)$ [MP PMT 1989; MH CET 2001]
(a) $C(\text{graphite}) + O_2(g) = CO_2(g)$
(b) $CH_4(g) + 2O_2(g) = CO_2(g) + 2H_2O(l)$
(c) $CO(g) + \frac{1}{2}O_2(g) = CO_2(g)$
(d) $C_6H_6(l) + 7\frac{1}{2}O_2(g) = 6CO_2 + 3H_2O(l)$
65. The enthalpy of formation of ammonia is -46.0 kJ mol^{-1} . The enthalpy change for the reaction $2NH_3(g) \rightarrow 2N_2(g) + 3H_2(g)$ is
(a) 46.0 kJ mol^{-1} (b) 92.0 kJ mol^{-1}
(c) -23.0 kJ mol^{-1} (d) -92.0 kJ mol^{-1}
66. The heat of combustion of benzene determined in a bomb calorimeter is $-870\text{ kcal mol}^{-1}$ at 25°C . The value of ΔE for the reaction is
(a) -1740 kcal (b) -870 kcal
(c) -872 kcal (d) -874 kcal
67. The formation of water from $H_2(g)$ and $O_2(g)$ is an exothermic reaction because [MP PMT/PET 1988]
(a) The chemical energy of $H_2(g)$ and $O_2(g)$ is more than that of water
(b) The chemical energy of $H_2(g)$ and $O_2(g)$ is less than that of water
(c) Not dependent on energy
(d) The temperature of $H_2(g)$ and $O_2(g)$ is more than that of water
68. In the reaction for the transition of carbon in the diamond form to carbon in the graphite form, ΔH is -453.5 cal . This points out that [BHU 1981; KCET 1986, 89]
(a) Graphite is chemically different from diamond
(b) Graphite is as stable as diamond
(c) Graphite is more stable than diamond
(d) Diamond is more stable than graphite
69. In the combustion of hydrocarbons, ΔH is [BHU 1981]
(a) Negative (b) Zero
(c) Positive (d) Undeterminate
70. The standard heats of formation in kcal mol^{-1} of $NO_2(g)$ and $N_2O_4(g)$ are 8.0 and 2.0 respectively. The heat of dimerization of NO_2 in kcal is
 $2NO_2(g) = N_2O_4(g)$ [NCERT 1983]
(a) 10.0 (b) -6.0
(c) -12.0 (d) -14.0
71. The difference between heats of reaction at constant pressure and at constant volume for the reaction
 $2C_6H_6(l) + 15O_2(g) \rightarrow 12CO_2(g) + 6H_2O(l)$ at 25°C in kJ is [IIT JEE 1991; Kerala PMT 2004]
(a) -7.43 (b) +3.72
(c) -3.72 (d) +7.43
72. $C(\text{diamond}) + C_2(g) \rightarrow CO_2(g); \Delta H = -395\text{ kJ}$
 $C(\text{graphite}) + O_2(g) \rightarrow CO_2(g); \Delta H = -393.5\text{ kJ}$
From the data, the ΔH when diamond is formed from graphite, is [CBSE PMT 1999]
(a) -1.5 kJ (b) $+1.5\text{ kJ}$
(c) $+3.0\text{ kJ}$ (d) -3.0 kJ
73. Which of the following values of heat of formation indicates that the product is least stable [MP PMT 1991]
(a) -94 kcal (b) -231.6 kcal
(c) $+21.4\text{ kcal}$ (d) $+64.8\text{ kcal}$
74. Which of the following equations correctly represents the standard heat of formation (ΔH_f°) of methane

[IIT JEE (Screening) 1992]

- (a) $C(\text{diamond}) + 2H_2(g) = CH_4(g)$
 (b) $C(\text{graphite}) + 2H_2(g) = CH_4(l)$
 (c) $C(\text{graphite}) + 2H_2(g) = CH_4(g)$
 (d) $C(\text{graphite}) + 4H = CH_4(g)$

75. In which of the following reactions does the heat change represent the heat of formation of water [EAMCET 1991]

- (a) $2H_2(g) + O_2(g) \rightarrow 2H_2O(l); \Delta H = -116 \text{ kcal}$
 (b) $H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l); \Delta H = -58 \text{ kcal}$
 (c) $H^+(aq.) + OH^-(aq.) \rightarrow 2H_2O(l); \Delta H = -13.7 \text{ kcal}$
 (d) $C_2H_2(g) + 2\frac{1}{2}O_2(g) \rightarrow 2CO_2(g) + H_2O(l);$

$$\Delta H = -310 \text{ kcal}$$

76. Values of heats of formation for SiO_2 and MgO are -48.4 and -34.7 kJ respectively. The heat of the reaction $2Mg + SiO_2 \rightarrow 2MgO + Si$ is [KCET 1990]

- (a) 21.16 kJ (b) -21.10 kJ
 (c) -13.62 kJ (d) 13.6 kJ

77. Based on the following thermochemical equations
 $H_2O(g) + C(s) \rightarrow CO(g) + H_2(g); \Delta H = 131 \text{ kJ}$

The value of X is [CBSE PMT 1992]

- (a) -393 kJ (b) -655 kJ
 (c) $+393 \text{ kJ}$ (d) $+655 \text{ kJ}$

78. Heat of transition is the heat evolved or absorbed when a substance is converted from [KCET 1984]

- (a) Solid to liquid
 (b) Solid to vapour
 (c) Liquid to vapour
 (d) One allotropic form to another allotropic form

79. For the allotropic change represented by equation $C(\text{diamond}) \rightarrow C(\text{graphite})$; the enthalpy change is $\Delta H = -1.89 \text{ kJ}$. If 6 g of diamond and 6 g of graphite are separately burnt to yield carbon dioxide, the heat liberated in the first case is [KCET 1988; DPMT 2000]

- (a) Less than in the second case by 1.89 kJ
 (b) More than in the second case by 1.89 kJ
 (c) Less than in the second case by 11.34 kJ
 (d) More than in the second case by 0.945 kJ

80. For an exothermic reaction

[MP PET 1994; Manipal MEE 1995]

- (a) H of the products is less than H of the reactants
 (b) H of the products is more than H of the reactants
 (c) H of the products is equal to H of the reactants

(d) ΔH is always positive

81. The energy evolved is highest for which of the following reactions [MP PET 1994]

- (a) $F + e^- \rightarrow F^{-1}$ (b) $Cl + e^- \rightarrow Cl^-$
 (c) $S + 2e^- \rightarrow S^{2-}$ (d) $O + 2e^- \rightarrow O^{2-}$

82. In the combustion of 2.0 gm of methane 25 kcal heat is liberated, heat of combustion of methane would be [MP PMT 1994]

- (a) 100 kcal (b) 200 kcal
 (c) 300 kcal (d) 400 kcal

83. Complete combustion of CH_4 gives [BHU 1995]

- (a) $CO_2 + H_2O$ (b) $CO_2 + H_2$
 (c) $COCl_2$ (d) $CO + CO_2 + H_2O$

84. If enthalpies of formation of $C_2H_4(g)$, $CO_2(g)$ and $H_2O(l)$ at $25^\circ C$ and 1 atm pressure be 52 , -394 and -286 kJ mol^{-1} respectively, the enthalpy of combustion of $C_2H_4(g)$ will be [CBSE PMT 1995; AIIMS 1998; Pb. PMT 1999]

- (a) $+1412 \text{ kJ mol}^{-1}$ (b) $-1412 \text{ kJ mol}^{-1}$
 (c) $+141.2 \text{ kJ mol}^{-1}$ (d) $-141.2 \text{ kJ mol}^{-1}$

85. Carbon and carbon monoxide burn in oxygen to form carbon dioxide according to the following reactions

The heat of formation of 1 mol of carbon monoxide is thus

[MP PET 1995]

- (a) $-219.0 \text{ kJ mol}^{-1}$ (b) $-109.5 \text{ kJ mol}^{-1}$
 (c) $-175.0 \text{ kJ mol}^{-1}$ (d) $-87.5 \text{ kJ mol}^{-1}$

86. Heat of formation in the reaction

- (a) 44 kcal (b) 44000 kcal
 (c) 22 kcal (d) 11 kcal

87. When water is added to quick lime, the reaction is

[MP PMT 1995]

- (a) Exothermic (b) Endothermic
 (c) Explosive (d) None of these

88. In an exothermic reaction ΔH is

[MP PMT 1995; CPMT 1999]

- (a) Positive (b) Negative
 (c) Zero (d) Both positive or negative

89. The heat change for the following reaction $C(s) + 2S(s) \rightarrow CS_2(l)$ is known as [MP PMT 1996]

- (a) Heat of vaporization (b) Heat of solution
 (c) Heat of fusion (d) Heat of formation

90. The enthalpy of combustion of benzene from the following data will be

- (a) $+3172.8 \text{ kJ}$ (b) -1549.2 kJ
(c) -3172.8 kJ (d) -3264.6 kJ
91. Enthalpy of formation of HF and HCl are -161 kJ and -92 kJ respectively. Which of the following statements is incorrect [KCET 2003]
(a) HCl is more stable than HF
(b) HF and HCl are exothermic compounds
(c) The affinity of fluorine to hydrogen is greater than the affinity of chlorine to hydrogen
(d) HF is more stable than HCl
92. The heat of reaction at constant pressure is given by [MP PMT 1997]
(a) $E_P - E_R$ (b) $E_R - E_P$
(c) $H_P - H_R$ (d) $H_R - H_P$
93. In an endothermic reaction, the value of ΔH is [CBSE PMT 1999; AIIMS 1998; BHU 2000; MP PMT 2000]
(a) Zero (b) Positive
(c) Negative (d) Constant
94. 2.2016 gm of acetaldehyde produced 13.95 kcal of heat on combustion in O_2 . Calculate the heat of combustion of CH_3CHO [Bihar CEE 1995]
(a) 279 kcal (b) 972 kcal
(c) 27.9 kcal (d) 2.79 kcal
95. $\text{C} + \frac{1}{2}\text{O}_2 \rightarrow \text{CO}; \Delta H = -42 \text{ kJ}$
 $\text{CO} + \frac{1}{2}\text{O}_2 \rightarrow \text{CO}_2; \Delta H = -24 \text{ kJ}$
The heat of formation of CO_2 is [CPMT 1996]
(a) -16 kJ (b) $+66 \text{ kJ}$
(c) $+16 \text{ kJ}$ (d) -66 kJ
96. Standard molar enthalpy of formation of CO_2 is equal to [IIT JEE 1997; BHU 2001]
(a) Zero
(b) The standard molar enthalpy of combustion of gaseous carbon
(c) The sum of standard molar enthalpies of formation of CO and O_2
(d) The standard molar enthalpy of combustion of carbon (graphite)
97. In the complete combustion of butanol $\text{C}_4\text{H}_9\text{OH}(\text{l})$, if ΔH is enthalpy of combustion and ΔE is the heat of combustion at constant volume, then [EAMCET 1997]
(a) $\Delta H < \Delta E$
(b) $\Delta H = \Delta E$
(c) $\Delta H > \Delta E$
(d) $\Delta H, \Delta E$ relation cannot be predicted
98. $\text{C} + \text{O}_2 \rightarrow \text{CO}_2; \Delta H = X$
 $\text{CO} + \frac{1}{2}\text{O}_2 \rightarrow \text{CO}_2; \Delta H = Y$
Then the heat of formation of CO is [BHU 1997; DPMT 2002]
(a) $X - Y$ (b) $Y - 2X$
(c) $X + Y$ (d) $2X - Y$
99. The values of heat of formation of SO_2 and SO_3 are -298.2 kJ and -98.2 kJ . The heat of reaction of the following reaction will be
 $\text{SO}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{SO}_3$ [BHU 1997; CBSE PMT 2000]
(a) -200 kJ (b) -356.2 kJ
(c) $+200 \text{ kJ}$ (d) -396.2 kJ
100. Calculate the standard heat of formation of carbon disulphide (l), given that the standard heat of combustion of carbon (s), sulphur (s) and carbon disulphide (l) are -393.3 , -293.72 and $-1108.76 \text{ kJ mol}^{-1}$ respectively [Roorkee 1989; BHU 1997]
(a) $-128.02 \text{ kJ mol}^{-1}$ (b) $+12.802 \text{ kJ mol}^{-1}$
(c) $+128.02 \text{ kJ mol}^{-1}$ (d) $-12.802 \text{ kJ mol}^{-1}$
101. Fermentation is a reaction called [RPMT 1997]
(a) Endothermic (b) Exothermic
(c) Isotemperature (d) Reversible
102. 8 gm of CH_4 is completely burnt in air. The number of moles of water produced are [Orissa JEE 1997]
(a) 0.5 (b) 1
(c) 2 (d) 18
103. For the reaction $\text{A}(\text{g}) + 2\text{B}(\text{g}) \rightarrow 2\text{C}(\text{g}) + 3\text{D}(\text{g})$, the value of ΔE at 27°C is 19.0 kcal . The value of ΔH for the reaction would be ($R = 2.0 \text{ cal K}^{-1} \text{ mol}^{-1}$) [Roorkee Qualifying 1998]
(a) 20.8 kcal (b) 19.8 kcal
(c) 18.8 kcal (d) 20.2 kcal
104. The enthalpy of solution of $\text{BaCl}_2(\text{s})$ and $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}(\text{s})$ are -20.6 and 8.8 kJ mol^{-1} respectively. The enthalpy change for the reaction $\text{BaCl}_2(\text{s}) + 2\text{H}_2\text{O} \rightarrow$ is [Roorkee Qualifying 1998]
(a) 29.4 kJ (b) -11.8 kJ
(c) -20.6 kJ (d) -29.4 kJ
105. The enthalpy change of a reaction does not depend on [AIIMS 1997]
(a) The state of reactants and products
(b) Nature of reactants and products
(c) Different intermediate reaction
(d) Initial and final enthalpy change of a reaction
106. $\text{S} + \frac{3}{2}\text{O}_2 \rightarrow \text{SO}_3 + 2x \text{ kcal}$
 $\text{SO}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{SO}_3 + y \text{ kcal}$
Find out the heat of formation of SO_2 [AIIMS 1997; CBSE PMT 1999; KCET 1999]
(a) $2x - y$ (b) $2x + y$
(c) $x + y$ (d) $2x / y$
107. The combustion enthalpies of carbon, hydrogen and methane are $-395.5 \text{ kJ mol}^{-1}$, $-285.8 \text{ kJ mol}^{-1}$ and $-890.4 \text{ kJ mol}^{-1}$ respectively at 25°C . The value of standard formation enthalpies of methane at that temperature is [Pb. PMT 1998]

- (a) $890.4 \text{ kJ mol}^{-1}$ (b) $-298.8 \text{ kJ mol}^{-1}$
(c) $-74.7 \text{ kJ mol}^{-1}$ (d) $-107.7 \text{ kJ mol}^{-1}$
108. Equal volumes of methanoic acid and sodium hydroxide are mixed. If x is the heat of formation of water, then heat evolved on neutralisation is [BHU 1998]
(a) More than x (b) Equal to x
(c) Twice of x (d) Less than x
109. The neutralisation of a strong acid by a strong base liberates an amount of energy per mole of H^+ that [BHU 1998]
(a) Depends upon which acid and base are involved
(b) Depends upon the temperature at which the reaction takes place
(c) Depends upon which catalyst is used
(d) Is always the same
110. When 0.5 g of sulphur is burnt to SO_2 , 4.6 kJ of heat is liberated. What is the enthalpy of formation of sulphur dioxide [KCET 1998; AFMC 2000]
(a) $+147.2 \text{ kJ}$ (b) -147.2 kJ
(c) -294.4 kJ (d) $+294.4 \text{ kJ}$
111. Ozone is prepared by passing silent electric discharge through oxygen. In this reaction [AFMC 1998]
(a) Energy is given out
(b) Energy is absorbed
(c) Oxygen is loaded with energy
(d) Oxygen is dissociated into atoms
112. Combustion of glucose takes place according to the equation,
 $C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O$, $\Delta H = -72 \text{ kcal}$. How much energy will be required for the production of 1.6 g of glucose (Molecular mass of glucose = 180 g) [AFMC 1999]
(a) 0.064 kcal (b) 0.64 kcal
(c) 6.4 kcal (d) 64 kcal
113. Given that
 $C(s) + O_2(g) \rightarrow CO_2(g)$, $\Delta H = -394 \text{ kJ}$
 $2H_2(g) + O_2(g) \rightarrow 2H_2O(l)$, $\Delta H = 568 \text{ kJ}$
 $CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(l)$, $\Delta H = -892 \text{ kJ}$
Heat of formation of CH_4 is [DCE 1999]
(a) -70 kJ (b) 71.8 kJ
(c) -244 kJ (d) $+782 \text{ kJ}$
114. Calculate the heat of formation of $PCl_5(s)$ from the following data
 $2P(s) + 3Cl_2(g) \rightarrow 2PCl_3(l)$; $\Delta H = -151.8 \text{ kcal}$
 $PCl_3(l) + Cl_2(g) \rightarrow PCl_5(s)$; $\Delta H = -32.8 \text{ kcal}$ [JIPMER 1999]
(a) -108.7 kcal (b) $+108.7 \text{ kcal}$
(c) -184.6 kcal (d) $+184.6 \text{ kcal}$
115. When 50 cm^3 of a strong acid is added to 50 cm^3 of an alkali, the temperature rises by 5°C . If 250 cm^3 of each liquid are mixed, the temperature rise would be [KCET 1999]
(a) 5°C (b) 10°C
(c) 25°C (d) 20°C
116. $H_2(g) + \frac{1}{2} O_2(g) \rightarrow H_2O(l)$;
 ΔH at $298 \text{ K} = -285.8 \text{ kJ}$
The molar enthalpy of vaporisation of water at 1 atm and 25°C is 44 kJ . The standard enthalpy of formation of 1 mole of water vapour at 25°C is [KCET 1999]
(a) -241.8 kJ (b) 241.8 kJ
(c) 329.8 kJ (d) -329.8 kJ
117. When 4 g of iron is burnt to ferric oxide at constant pressure, 29.28 kJ of heat is evolved. What is the enthalpy of formation of ferric oxide (At. Wt. of $Fe = 56$) [AIIMS 1999]
(a) -81.98 kJ (b) -819.8 kJ
(c) -40.99 kJ (d) $+819.8 \text{ kJ}$
118. When a strong acid, strong base or their salt are dissolved in water, they are completely ionised. If a strong acid is added to a strong base, H^+ ions from the former combine with OH^- ions of the latter forming water. The formation of each water molecule liberates a certain quantity of energy and the reaction is exothermic. The heat liberated when one mole of water is formed by combining hydrochloric acid and sodium hydroxide is 13.7 kcal . The heat liberated when one mole of water is formed by combining sulphuric acid and sodium hydroxide is [AMU (Engg.) 1999]
(a) 25.5 kcal (b) 8.5 kcal
(c) 13.7 kcal (d) 34 kcal
119. 2.1 g of Fe combines with S evolving 3.77 kJ . The heat of formation of FeS in kJ/mol is [AMU (Engg.) 1999]
(a) -1.79 (b) -100.5
(c) -3.77 (d) None of these
120. In the reaction: $H_2 + Cl_2 \rightarrow 2HCl$, $\Delta H = 194 \text{ kJ}$. Heat of formation of HCl is [KCET 2000; AFMC 2000; CPMT 2000]
(a) $+97 \text{ kJ}$ (b) $+194 \text{ kJ}$
(c) -194 kJ (d) -97 kJ
121. Enthalpy of neutralisation of acetic acid by $NaOH$ is -50.6 kJ/mol . and the heat of neutralisation of a strong acid with a strong base is -55.9 kJ/mol . What is the value of ΔH for the ionisation of CH_3COOH [AIIMS 2000]
(a) $+5.3 \text{ kJ/mol}$ (b) $+6.2 \text{ kJ/mol}$
(c) $+8.2 \text{ kJ/mol}$ (d) $+9.3 \text{ kJ/mol}$
122. Heat of neutralization of the acid-base reaction is 57.32 kJ for [JIPMER 2000]
(a) $HNO_3 + LiOH$ (b) $HCOOH + KOH$
(c) $HCl + NH_4OH$ (d) $CH_3COOH + NaOH$
123. The heat change for the following reaction at 298°K and at constant pressure is $+7.3 \text{ kcal}$
 $A_2B(s) \rightarrow 2A(s) + 1/2 B_2(g)$, $\Delta H = +7.3 \text{ kcal}$
The heat change at constant volume would be [DCE 2000]
(a) 7.3 kcal (b) More than 7.3
(c) Zero (d) None of these
124. The heat evolved in the combustion of benzene is given by the equation
 $C_6H_6(l) + 7\frac{1}{2} O_2(g) \rightarrow 3H_2O(l) + 6CO_2(g)$
 $\Delta H = 781.0 \text{ kcal mol}^{-1}$
Which of the following quantities of heat energy will be evolved when 39 g of benzene is burnt in an open container [MP PET 2000]
(a) $122.25 \text{ kcal mol}^{-1}$ (b) $390.5 \text{ kcal mol}^{-1}$

- (c) $1562.0 \text{ kcal mol}^{-1}$ (d) $586.75 \text{ kcal mol}^{-1}$
125. $\text{H}_2(\text{g}) + \text{Cl}_2(\text{g}) \rightarrow 2\text{HCl}(\text{g}), \Delta H = -44 \text{ kcal}$
 $2\text{Na}(\text{s}) + 2\text{HCl}(\text{g}) \rightarrow 2\text{NaCl}(\text{s}) + \text{H}_2(\text{g}), \Delta H = -152 \text{ kcal}$
 For the reaction $\text{Na}(\text{s}) + \frac{1}{2}\text{Cl}_2(\text{g}) \rightarrow \text{NaCl}(\text{s}), \Delta H =$ [KCET 2000]
 (a) -108 kcal (b) -196 kcal
 (c) -98 kcal (d) 54 kcal
126. The ΔH_f° for $\text{CO}_2(\text{g}), \text{CO}(\text{g})$ and $\text{H}_2\text{O}(\text{g})$ are -393.5 , -110.5 and -241.8 kJ/mol respectively. The standard enthalpy change (in kJ) for the reaction $\text{CO}_2(\text{g}) + \text{H}_2(\text{g}) \rightarrow \text{CO}(\text{g}) + \text{H}_2\text{O}(\text{g})$ is [IIT JEE (Screening) 2000]
 (a) 524.1 (b) 41.2
 (c) -262.5 (d) -41.2
127. Which of the following compounds will absorb the maximum quantity of heat when dissolved in the same amount of water? The heats of solution of these compounds at 25°C in kJ/mole of each solute is given in brackets [AMU (Engg.) 2000]
 (a) $\text{HNO}_3 (\Delta H = -33)$ (b) $\text{KCl} (\Delta H = +17.64)$
 (c) $\text{NH}_4\text{NO}_3 (\Delta H = +25.5)$ (d) $\text{HCl} (\Delta H = -74.1)$
128. In the reaction $\text{C} + 2\text{S} \rightarrow \text{CS}_2 + \Delta H, \Delta H$ is the [AMU (Engg.) 2000]
 (a) Heat of combustion (b) Heat of neutralisation
 (c) Heat of solution (d) None of these
129. The heat of formation of methane $\text{C}(\text{s}) + 2\text{H}_2(\text{g}) \rightarrow \text{CH}_4(\text{g})$ at constant pressure is 18500 cal at 25°C . The heat of reaction at constant volume would be [MH CET 2000]
 (a) 17904 cal (b) 18202 cal
 (c) 18798 cal (d) 19096 cal
130. The enthalpy of combustion of $\text{C}_6\text{H}_{6(\text{l})}$ is -3250 kJ . When 0.39 g of benzene is burnt excess of oxygen in an open vessel, the amount of heat evolved is [KCET 2000; AFMC 2000; DCE 2000]
 (a) 16.25 J (b) 16.25 kJ
 (c) 32.5 J (d) 32.5 kJ
131. $\text{C}(\text{s}) + \text{O}_2(\text{g}) \rightarrow \text{CO}_2; \Delta H = -94 \text{ kcal}$
 $\text{CO}(\text{g}) + \frac{1}{2}\text{O}_2(\text{g}) \rightarrow \text{CO}_2; \Delta H = 135.2 \text{ kcal}$
 Then heat of formation of $\text{CO}(\text{g})$ is [DCE 2001]
 (a) -26.4 kcal (b) 41.2 kcal
 (c) 26.4 kcal (d) -229.2 kcal
132. The heat of neutralization of HCl and NaOH is [MP PET 2001]
 (a) Zero (b) -57.3 kJ
 (c) $+57.3 \text{ kJ}$ (d) None of these
133. The following thermochemical reactions are given
 $\text{M} + \frac{1}{2}\text{O}_2 \rightarrow \text{MO} + 351.4 \text{ kJ}$
 $\text{X} + \frac{1}{2}\text{O}_2 \rightarrow \text{XO} + 90.8 \text{ kJ}$
 It follows that the heat of reaction for the following process
 $\text{M} + \text{XO} \rightleftharpoons \text{MO} + \text{X}$ is given by [AMU 2001]
 (a) 422.2 kJ (b) 268.7 kJ
 (c) -442.2 kJ (d) 260.6 kJ
134. If the heat of combustion of carbon monoxide at constant volume and at 17°C is -283.3 kJ , then its heat of combustion at constant pressure ($R = 8.314 \text{ J degree}^{-1} \text{mol}^{-1}$) [CPMT 2001]
 (a) -284.5 kJ (b) 284.5 kJ
 (c) 384.5 kJ (d) -384.5 kJ
135. Heat of formation of H_2O is -188 kJ/mole and H_2O_2 is -286 kJ/mole . The enthalpy change for the reaction $2\text{H}_2\text{O}_2 \rightarrow 2\text{H}_2\text{O} + \text{O}_2$ is [BHU 2001]
 (a) 196 kJ (b) -196 kJ
 (c) 984 kJ (d) -984 kJ
136. The values of ΔH for the combustion of ethene and ethyne are -1411 and -310.0 kcal respectively. Which of the following is a better fuel [BHU 2001]
 (a) C_2H_2 (b) C_2H_4
 (c) Both of these (d) None of these
137. For exothermic reaction, the equilibrium constant [JIPMER 2001]
 (a) Increases with increase of P
 (b) Decreases with increase of P
 (c) Increases with increase of temperature
 (d) Decreases with increase of temperature
138. In order to decompose 9 g water 142.5 kJ heat is required. Hence the enthalpy of formation of water is [KCET 2001]
 (a) -142.5 kJ (b) $+142.5 \text{ kJ}$
 (c) -285 kJ (d) $+285 \text{ kJ}$
139. What is Δn for combustion of 1 mole of benzene, when both the reactants and the products are gas at 298 K [Pb. PMT 2001]
 (a) 0 (b) $3/2$
 (c) $-3/2$ (d) $1/2$
140. If $\text{C} + \text{O}_2 \rightarrow \text{CO}_2 + 94.2 \text{ kcal}$
 $\text{H}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{H}_2\text{O} + 68.3 \text{ kcal}$
 $\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O} + 210.8 \text{ kcal}$
 Then the possible heat of methane will be [UPSEAT 2001]
 (a) 47.3 kcal (b) 20.0 kcal
 (c) 45.9 kcal (d) -47.3 kcal
141. Heat of neutralization of strong acid and weak base is [UPSEAT 2001]
 (a) 57.1 kJ mol^{-1}
 (b) 13.7 kJ mol^{-1}
 (c) Less than $13.7 \text{ kcal mol}^{-1}$
 (d) More than $13.7 \text{ kcal mol}^{-1}$
142. A system is changed from state A to state B by one path and from B to A another path. If E_1 and E_2 are the corresponding changes in internal energy, then [Pb. PMT 2001]
 (a) $E_1 + E_2 = -ve$ (b) $E_1 + E_2 = +ve$
 (c) $E_1 + E_2 = 0$ (d) None of these
143. The heat evolved during the combination of 24 g C and 128 g S following the change is [MH CET 2001]
 $\text{C} + \text{S}_2 \rightarrow \text{CS}_2; \Delta H = 22.0 \text{ kcal}$
 (a) 11 kcal (b) 32 kcal
 (c) 44 kcal (d) 22 kcal

144. When the aqueous solution of 0.5 mole HNO_3 is mixed with the 0.3 mole of OH^- solution, then what will be the liberated heat (Enthalpy of neutralization is = 57.1 kJ) [Kerala CET 2005]
- (a) 28.5 kJ (b) 17.1 kJ
(c) 45.7 kJ (d) 1.7 kJ
(e) 2.85 kJ
145. A cylinder of gas is assumed to contain 11.2 kg of butane (C_4H_{10}). If a normal family needs 20000 kJ of energy per day. The cylinder will last: (Given that ΔH for combustion of butane is = 2658 kJ) [AMU (Engg.) 2002]
- (a) 20 days (b) 25 days
(c) 26 days (d) 24 days
146. Compounds with high heat of formation are less stable because [KCET 2002]
- (a) High temperature is required to synthesise them
(b) Molecules of such compounds are distorted
(c) It is difficult to synthesis them
(d) Energy rich state leads to instability
147. The heat evolved in the combustion of methane is given by the following equations:
 $CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + H_2O(l)$; $\Delta H = -890.3 \text{ kJ}$
How many grams of methane would be required to produce 445.15 kJ of heat of combustion [AMU 2002]
- (a) 4 g (b) 8 g
(c) 12 g (d) 16 g
148. Heats of combustion (ΔH°) for $C(s)$, $H_2(g)$ and $CH_4(g)$ are -94, -68 and -213 kcal/mol. respectively. The value of ΔH° for the reaction,
 $C(s) + 2H_2(g) \rightarrow CH_4(g)$ is [CBSE PMT 2002]
- (a) -85 kcal (b) -111 kcal
(c) -17 kcal (d) -170 kcal
149. If the value of ΔH in a reaction is positive, then the reaction is called [BHU 2002]
- (a) Exothermic (b) Endothermic
(c) Polymorphic (d) Polytropic
150. Enthalpy of neutralisation of NH_4OH and HCl , is numerically [JIPMER 2002; Kurukshetra CEE 2002]
- (a) 57.1 kJ mol⁻¹ (b) < 57.1 kJ mol⁻¹
(c) > 57.1 kJ mol⁻¹ (d) Zero
151. The heat of neutralisation will be highest in [MP PMT 2002]
- (a) NH_4OH and CH_3COOH
(b) NH_4OH and HCl
(c) KOH and CH_3COOH
(d) KOH and HCl
152. If a mole of H_2 molecule is heated to high temperature the following reaction takes place [Kerala (Med.) 2002]
- (a) $H_2(g) + 436 \text{ kJ} = H(g) + H(g)$
(b) $H_2(g) + 820 \text{ kJ} = 2H_2(g)$
(c) $2H_2(g) + 436 \text{ J} = 2H_2$
(d) $H_2 + H_2 = H^+ + H^+$
153. Which of the following reactions is not exothermic [MP PET 2002]
- (a) $C(s) + O_2(g) \rightarrow CO_2(g)$
(b) $C(s) + 2S(s) \rightarrow CS_2(g)$
(c) $CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(l)$
(d) $CO(g) + \frac{1}{2} O_2(g) \rightarrow CO_2(g)$
154. On combustion, carbon forms two oxides CO and CO_2 , Heat of formation of CO_2 gas is 94.3 kcal and that of CO is 26.0 kcal. Heat of combustion of carbon is [JIPMER 2002]
- (a) 26.0 kcal (b) -94.3 kcal
(c) 68.3 kcal (d) -120.3 kcal
155. 1 mole of conc. HCl requires X moles of dilute $NaOH$ for neutralisation and 1 mole of concentrate H_2SO_4 requires Y moles of small dilute $NaOH$ then which of the following reaction is true [MH CET 2002]
- (a) $Y = \frac{1}{2} X$ (b) $X = \frac{1}{2} Y$
(c) $X = 2Y$ (d) None of these
156. Which of the reaction defines ΔH_f° [IIT -JEE (Screening) 2003]
- (a) $C_{(\text{diamond})} + O_2(g) \rightarrow CO_2(g)$
(b) $\frac{1}{2} H_2(g) + \frac{1}{2} F_2(g) \rightarrow HF(g)$
(c) $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$
(d) $CO(g) + \frac{1}{2} O_2(g) \rightarrow CO_2(g)$
157. One gram sample of NH_4NO_3 is decomposed in a bomb calorimeter. The temperature of the calorimeter increases by 6.12 K the heat capacity of the system is 1.23 kJ/deg. What is the molar heat of decomposition for NH_4NO_3 [AIIMS 2003]
- (a) -7.53 kJ/mol (b) -398.1 kJ/mol
(c) -16.1 kJ/mol (d) -602 kJ/mol
158. For which one of the following equations is $\Delta H_{\text{react}}^\circ$ equal to ΔH_f° for the product [CBSE PMT 2003]
- (a) $2CO(g) + O_2(g) \rightarrow 2CO_2(g)$
(b) $N_2(g) + O_3(g) \rightarrow N_2O_3(g)$
(c) $CH_4(g) + 2Cl_2(g) \rightarrow CH_2Cl_2(l) + 2HCl(g)$
(d) $Xe(g) + 2F_2(g) \rightarrow XeF_4(g)$
159. Enthalpy change for a reaction does not depend upon [AIEEE 2003]
- (a) The physical states of reactants and products
(b) Use of different reactants for the same product
(c) The nature of intermediate reaction steps
(d) The differences in initial or final temperatures of involved substances
160. $C_{\text{dia}} + O_2 \rightarrow CO_2$; $\Delta H = -395.3 \text{ kJ/mole}$
 $C_{\text{gr}} + O_2 \rightarrow CO_2$; $\Delta H = -393.4 \text{ kJ/mole}$
 $C_{\text{gr}} \rightarrow C_{\text{dia}}$; $\Delta H =$ [BHU 2003]
- (a) -3.8 (b) -1.9
(c) +3.8 (d) +1.9
161. What is the weight of oxygen that is required for the complete combustion of 2.8 kg of ethylene? [BVP 2003]

- (a) 9.6 kg (b) 96.0 kg
(c) 6.4 kg (d) 2.8 kg
162. For complete neutralization of HCl with $NaOH$, the heat of neutralization is [MP PET 2003]
(a) $+13.70 \text{ kJ mol}^{-1}$ (b) $-13.70 \text{ kJ mol}^{-1}$
(c) $-57.32 \text{ kJ mol}^{-1}$ (d) $+57.32 \text{ kJ mol}^{-1}$
163. The heat of combustion of carbon to CO_2 is -393.5 kJ/mol . The heat released upon formation of 35.2 g of CO_2 from carbon and oxygen gas is [UPSEAT 2004]
(a) $+315 \text{ kJ}$ (b) -31.5 kJ
(c) -315 kJ (d) $+31.5 \text{ kJ}$
164. Which of the following equations correctly represents the standard heat of formation (ΔH_f°) of methane [UPSEAT 2004]
(a) $C(\text{diamond}) + 4H_{(g)} \rightarrow CH_{4(g)}$
(b) $C(\text{diamond}) + 2H_{2(g)} \rightarrow CH_{4(g)}$
(c) $C(\text{graphite}) + 2H_{2(g)} \rightarrow CH_{4(g)}$
(d) $C(\text{graphite}) + 4H_{(g)} \rightarrow CH_{4(g)}$
165. If the heat of formation of CO_2 is -393 kJ . The amount of heat evolved in the formation of 0.156 kg of CO_2 is [MH CET 2004]
(a) -1357.9 kJ (b) -1275.9 kJ
(c) -1572.0 kJ (d) -1165.5 kJ
166. Which of the following pairs has heat of neutralisation equal to 13.7 Kcals [DCE 2003]
(a) HCl, NH_4OH (b) HNO_3, KOH
(c) $NaOH, CH_3COOH$ (d) H_2SO_4, NH_4OH
167. The enthalpies of combustion of carbon and carbon monoxide are -393.5 and -283 kJ/mol respectively. The enthalpy of formation of carbon monoxide per mole is [AIEEE 2004]
(a) -676.5 kJ (b) 676.5 kJ
(c) 110.5 kJ (d) -110.5 kJ
168. The enthalpy of combustion of methane at $25^\circ C$ is 890 kJ . The heat liberated when 3.2 g of methane is burnt in air is [KCET 2004]
(a) 445 kJ (b) 278 kJ
(c) -890 kJ (d) 178 kJ
169. If (i) $C + O_2 \rightarrow CO_2$, (ii) $C + 1/2 O_2 \rightarrow CO$, (iii) $CO + 1/2 O_2 \rightarrow CO_2$, the heats of reaction are $Q, -12, -10$ respectively. Then $Q =$ [Orissa JEE 2004]
(a) -2 (b) 2
(c) -22 (d) -16
170. How much energy is released when 6 mole of octane is burnt in air? Given ΔH_f° for $CO_2(g)$, $H_2O(g)$ and $C_8H_{18}(l)$ respectively are $-490, -240$ and $+160 \text{ kJ/mol}$ [AIIMS 2004]
(a) -6.2 kJ (b) -37.4 kJ

- (c) -35.5 kJ (d) -20.0 kJ

What is the ΔH of the reaction

[Orissa JEE 2005]

- (a) -1802 kJ (b) $+1802 \text{ kJ}$
(c) -800 kJ (d) $+228 \text{ kJ}$

172. The enthalpy change (ΔH) for the neutralisation of $1M HCl$ by caustic potash in dilute solution at $298K$ is

[DPMT 2005]

- (a) 68 kJ (b) 65 kJ
(c) 57.3 kJ (d) 50 kJ

Bond energy

- If the bond dissociation energies of XY, X_2 and Y_2 (all diatomic molecules) are in the ratio of $1 : 1 : 0.5$ and $\Delta_f H$ for the formation of XY is $-200 \text{ kJ mole}^{-1}$. The bond dissociation energy of X_2 will be [AIEEE 2005]
(a) 100 kJ mole^{-1} (b) 800 kJ mole^{-1}
(c) 300 kJ mole^{-1} (d) 400 kJ mole^{-1}
- Energy required to dissociate 4 gm of gaseous hydrogen into free gaseous atoms is 208 kcal at $25^\circ C$. The bond energy of $H-H$ bond will be [CPMT 1989; MP PET 2000; J & K 2005]
(a) 104 kcal (b) 10.4 kcal
(c) 1040 kcal (d) 104 cal
- The bond dissociation energy needed to form benzyl radical from toluene is than the formation of the methyl radical from methane [IIT 1994]
(a) Less (b) Much
(c) Equal (d) None of the above
- Which one of the following bonds has the highest average bond energy (kcal/mol) [CPMT 1994]
(a) $S=O$ (b) $C \equiv C$
(c) $C \equiv N$ (d) $N \equiv N$
- The bond dissociation energies of gaseous H_2, Cl_2 and HCl are 104, 58 and 103 kcal respectively. The enthalpy of formation of HCl gas would be [MP PET 1997; MP PMT 1999, 2001]
(a) -44 kcal (b) 44 kcal
(c) -22 kcal (d) 22 kcal
- The first ionization energy for Li is 5.4 eV and electron affinity of Cl is 3.61 eV. The ΔH (in kJ/mol) for the reaction $Li(g) + Cl(g) \rightarrow Li^+ + Cl^-$ is (if resulting ions do not combine with each other) ($1 \text{ eV} = 1.6 \times 10^{-19} \text{ J}$) [MP PMT 2000, 03]
(a) 70 (b) 100
(c) 170 (d) 270
- Given that $C(g) + 4H(g) \rightarrow CH_4(g); \Delta H = -166 \text{ kJ}$
The bond energy $C-H$ will be [AMU 2002]
(a) 208 kJ/mole
(b) -41.6 kJ/mole

- (c) 832 kJ/mole
(d) None of these
8. The $H-H$ bond energy is 430 kJ mol^{-1} and $Cl-Cl$ bond energy is 240 kJ mol^{-1} . ΔH for HCl is -90 kJ . The $H-Cl$ bond energy is about [BVP 2003]
- (a) 180 kJ mol^{-1} (b) 360 kJ mol^{-1}
(c) 213 kJ mol^{-1} (d) 425 kJ mol^{-1}
9. If enthalpies of methane and ethane are respectively 320 and 360 calories then the bond energy of $C-C$ bond is [UPSEAT 2003]
- (a) 80 calories (b) 40 calories
(c) 60 calories (d) 120 calories
10. If the bond energies of $H-H$, $Br-Br$ and HBr are 433, 192 and 364 kJ mol^{-1} respectively, the ΔH° for the reaction, $H_2(g) + Br_2(g) \rightarrow 2HBr(g)$ is [CBSE PMT 2004]
- (a) $+261 \text{ kJ}$ (b) -103 kJ
(c) -261 kJ (d) $+103 \text{ kJ}$

Free energy and Work function

1. The free energy change for a reversible reaction at equilibrium is [NCERT 1984; Kurukshetra CEE 1998; AMU 1999]
- (a) Large positive (b) Small negative
(c) Small positive (d) 0
2. For a spontaneous change, free energy change ΔG is [MNR 1983; BHU 1981, 95; AMU 1999; DCE 2000, 01; BHU 2000; MP PMT 2003]
- (a) Positive
(b) Negative
(c) Zero
(d) Can be positive or negative
3. A minus sign of the free energy change denotes that
- (a) The reaction tends to proceed spontaneously
(b) The reaction is non-spontaneous
(c) The system is in equilibrium
(d) The reaction is very much unlikely
4. The relation between ΔG and ΔH is [MP PMT 1994, 95, 97; AFMC 1997; Kurukshetra CEE 1998]
- (a) $\Delta H = \Delta G - T\Delta S$ (b) $\Delta G = \Delta H - T\Delta S$
(c) $T\Delta S - \Delta G = \Delta H$ (d) $\Delta H = T\Delta G + \Delta S$
5. At 300 K , the reactions which have following values of thermodynamic parameters occur spontaneously [Roorkee 1999]
- (a) $\Delta G^\circ = -400 \text{ kJ mol}^{-1}$
(b) $\Delta H^\circ = 200 \text{ kJ mol}^{-1}$, $\Delta S^\circ = -4 \text{ JK}^{-1}\text{mol}^{-1}$
(c) $\Delta H^\circ = -200 \text{ kJ mol}^{-1}$, $\Delta S^\circ = 4 \text{ JK}^{-1}\text{mol}^{-1}$
(d) $\Delta H^\circ = 200 \text{ J mol}^{-1}$, $\Delta S^\circ = 40 \text{ JK}^{-1}\text{mol}^{-1}$
6. The relation $\Delta G = \Delta H - T\Delta S$ was given by [MP PMT 2000; KCET 2002]
- (a) Boltzmann (b) Faraday
(c) Gibbs-Helmholtz (d) Thomson
7. For precipitation reaction of Ag^+ ions with $NaCl$, which of the following statements is correct [CPMT 1988]
- (a) ΔH for the reaction is zero
(b) ΔG for the reaction is zero
(c) ΔG for the reaction is negative
(d) $[\Delta G] = [\Delta H]$
8. At constant pressure and temperature, the direction to the result of any chemical reaction is where, there is less amount of
- (a) Entropy (b) Enthalpy
(c) Gibbs's free energy (d) None of the above
9. The dependence of Gibbs free energy on pressure for an isothermal process of an ideal gas is given by [MP PET 1996]
- (a) $\Delta G_T = nRT \ln \frac{P_2}{P_1}$ (b) $\Delta G_T = nRT \ln \frac{V_2}{V_1}$
(c) $\Delta G_T = nRT \log \frac{P_1}{P_2}$ (d) $\Delta G_T = nRT \log \frac{V_2}{V_1}$
10. For the change $H_2O(l) \rightarrow H_2O(g)$; $P = 1 \text{ atm}$, $T = 373 \text{ K}$, the free energy change $\Delta G = 0$. This indicates that
- (a) $H_2O(l)$ is in equilibrium with $H_2O(g)$
(b) Water boils spontaneously at 373 K
(c) Water does not boil spontaneously at 373 K
(d) Condensation of water vapour occurs spontaneously at 373 K
11. What is the free energy change ΔG when 1.0 mole of water at 100°C and 1 atm pressure is converted into steam at 100°C and 1 atm pressure [MP PET/PMT 1998]
- (a) 540 cal (b) -9800 cal
(c) 9800 cal (d) 0 cal
12. ΔG° for the reaction $X + Y \rightleftharpoons Z$ is -4.606 kcal . The value of equilibrium constant of the reaction at 227°C is ($R = 2.0 \text{ cal mol}^{-1} \text{K}^{-1}$) [Roorkee 1999]
- (a) 100 (b) 10
(c) 2 (d) 0.01
13. The standard enthalpy of the decomposition of N_2O_4 to NO_2 is 58.04 kJ and standard entropy of this reaction is 176.7 J/K . The standard free energy change for this reaction at 25°C is [AIIMS 1999]
- (a) 539 kJ (b) -539 kJ
(c) -5.39 kJ (d) 5.39 kJ
14. Spontaneity of a chemical reaction is decided by the negative change in [MP PET 2001]
- (a) Internal energy (b) Enthalpy
(c) Entropy (d) Free energy
15. For a reaction at 25°C enthalpy change and entropy changes are $-11.7 \times 10^3 \text{ J mol}^{-1}$ and $-105 \text{ J mol}^{-1} \text{K}^{-1}$ respectively. What is the Gibbs free energy [BHU 2001]
- (a) 15.05 kJ (b) 19.59 kJ
(c) 2.55 kJ (d) 22.55 kJ
16. Born-Haber cycle is used to determine [UPSEAT 2001]
- (a) Crystal energy (b) Electron affinity
(c) Lattice energy (d) All of these
17. Gibbs free energy G , enthalpy H and entropy S are interrelated as in [MP PMT 2002]
- (a) $G = H + TS$ (b) $G = H - TS$

- (c) $G - TS = H$ (d) $G = S = H$ [CBSE PMT 2004]
18. The essential condition for the feasibility of a reaction is that [JIPMER 2002]
 (a) The reaction should be exothermic
 (b) The entropy of products must be larger than that of reactants
 (c) The reaction is to be accompanied with free energy decrease
 (d) The reaction has to possess high activation energy
19. The correct relationship between free energy change in a reaction and the corresponding equilibrium constant K_c is [AIEEE 2003]
 (a) $\Delta G = RT \ln K_c$ (b) $-\Delta G = RT \ln K_c$
 (c) $\Delta G^\circ = RT \ln K_c$ (d) $-\Delta G^\circ = RT \ln K_c$
20. In an irreversible process taking place at constant T and P and in which only pressure-volume work is being done, the change in Gibbs free energy (dG) and change in entropy (dS), satisfy the criteria [AIEEE 2003]
 (a) $(dS)_{V,E} < 0, (dG)_{T,P} < 0$
 (b) $(dS)_{V,E} > 0, (dG)_{T,P} < 0$
 (c) $(dS)_{V,E} = 0, (dG)_{T,P} = 0$
 (d) $(dS)_{V,E} = 0, (dG)_{T,P} > 0$
21. The densities of graphite and diamond at 298 K are 2.25 and 3.31 g cm⁻³, respectively. If the standard free energy difference (ΔG°) is equal to 1895 J mol⁻¹, the pressure at which graphite will be transformed diamond at 298 K is [CBSE PMT 2003]
 (a) 9.92×10^5 Pa (b) 9.92×10^8 Pa
 (c) 9.92×10^7 Pa (d) 9.92×10^6 Pa
22. The free energy change for the following reactions are given below,
 $C_2H_2(g) + \frac{5}{2} O_2(g) \rightarrow 2CO_2(g) + H_2O(l); \Delta G^\circ = -1234$ kJ
 $C(s) + O_2(g) \rightarrow CO_2(g) \Delta G^\circ = -394$ kJ
 $H_2(g) + \frac{1}{2} O_2(g) \rightarrow H_2O(l) \Delta G^\circ = -237$ kJ
 What is the standard free energy change for the reaction
 $H_2(g) + 2C(s) \rightarrow C_2H_2(g)$ [Kerala (Med.) 2002]
 (a) -209 kJ (b) -2259 kJ
 (c) +2259 kJ (d) 209 kJ
23. The equilibrium concentration of the species in the reaction
 $A + B \rightleftharpoons C + D$ are 3, 5, 10 and 15 mole L⁻¹ respectively at 300 K the ΔG for the reaction is [Pb. PMT 2004]
 (a) 13.81 (b) -1381.8
 (c) -138.18 (d) 1391.6
24. Gibb's free energy (G) is defined as [Pb. CET 2001]
 (a) $\Delta G = \Delta H - T\Delta S$ (b) $\Delta G = \Delta H + \frac{T}{\Delta S}$
 (c) $\Delta H = \Delta G - T\Delta S$ (d) $\Delta G = \Delta H + T.C_p$
25. Standard enthalpy and standard entropy changes for the oxidation of ammonia at 298 K are -382.64 kJ mol⁻¹ and -145.6 JK⁻¹mol⁻¹, respectively. Standard Gibbs energy change for the same reaction at 298 K is
 (a) -439.3 kJ mol⁻¹ (b) -523.2 kJ mol⁻¹
 (c) -221.1 kJ mol⁻¹ (d) -339.3 kJ mol⁻¹
26. For spontaneity of a cell, which is correct [Orissa JEE 2004]
 (a) $\Delta G = 0, \Delta E = 0$
 (b) $\Delta G = -ve, \Delta E = 0$
 (c) $\Delta G = +ve, \Delta E = +ve$
 (d) $\Delta G = -ve, \Delta E = +ve$
27. The free energy for a reaction having $\Delta H = 31400$ cal; $\Delta S = 32$ cal K⁻¹ mol⁻¹ at 1000°C is [Orissa JEE 2005]
 (a) -9336 cal (b) -7386 cal
 (c) -1936 cal (d) +9336 cal
28. The ΔH and ΔS for a reaction at one atmospheric pressure are +30.558 kJ and 0.066 kJ K⁻¹ respectively. The temperature at which the free energy change will be zero and below of this temperature the nature of reaction would be [Kerala CET 2005]
 (a) 483 K, spontaneous
 (b) 443 K, non-spontaneous
 (c) 443 K, spontaneous
 (d) 463 K, non-spontaneous
 (e) 463 K, spontaneous

Critical Thinking

Objective Questions

1. Adsorption of gases on solid surface is generally exothermic because [IIT JEE (Screening) 2004]
 (a) Enthalpy is positive (b) Entropy decreases
 (c) Entropy increases (d) Free energy increase
2. Two mole of an ideal gas is expanded isothermally and reversibly from 1 litre to 10 litre at 300 K. The enthalpy change (in kJ) for the process is [IIT JEE (Screening) 2004]
 (a) 11.4 kJ (b) -11.4 kJ
 (c) 0 kJ (d) 4.8 kJ
3. Heat of neutralization of strong acid against strong base is constant and is equal to [EAMCET 1980; AFMC 1989; DPMT 1991; MP PET 1999; BHU 1999; MP PMT 1995]
 (a) 13.7 kcal (b) 57 kJ
 (c) 5.7×10^4 J (d) All of the above
4. The value of heat generated when 36.5 gm HCl and 40 gm of NaOH reacts during neutralization [NCERT 1984; CPMT 1993]
 (a) 76.5 kcal (b) 13.7 kcal
 (c) More than 13.7 kcal (d) 108 kcal
5. When a gas undergoes adiabatic expansion, it gets cooled due to [DCE 2002]
 (a) Loss of kinetic energy
 (b) Fall in temperature
 (c) Decrease in velocity
 (d) Energy used in doing work

6. The heat content of a system is called
(a) Internal energy (b) Entropy
(c) Free energy (d) Enthalpy
7. To calculate the amount of work done in joules during reversible isothermal expansion of an ideal gas, the volume must be expressed in [KCET (Med.) 2001]
(a) m^3 only (b) dm^3 only
(c) cm^3 only (d) Any one of them
8. In an isobaric process, the ratio of heat supplied to the system (dQ) and work done by the system (dW) for diatomic gas is [AFMC 2002].
(a) 1 : 1 (b) 7 : 2
(c) 7 : 5 (d) 5 : 7
9. The enthalpy change for the reaction of 50.00 ml of ethylene with 50.00 ml of H_2 at 1.5 atm pressure is $\Delta H = -0.31 \text{ kJ}$. The value of ΔE will be [DPMT 2004]
(a) -0.3024 kJ (b) 0.3024 kJ
(c) 2.567 kJ (d) -0.0076 kJ
10. Enthalpy of solution of $NaOH$ (solid) in water is $-41.6 \text{ kJ mol}^{-1}$. When $NaOH$ is dissolved in water, the temperature of water [UPSEAT 2004]
(a) Increase (b) Decreases
(c) Does not change (d) Fluctuates indefinitely
11. In which of the following entropy decreases?
[CPMT 1988, 94; MP PMT 2000]
(a) Crystallization of sucrose from solution
(b) Rusting of iron
(c) Melting of ice
(d) Vaporization of camphor
12. For conversion C (graphite) $\rightarrow C$ (diamond) the ΔS is [MP PMT 2001; MP PET 2003]
(a) Zero (b) Positive
(c) Negative (d) Unknown
13. For a reaction $\Delta H = 9.08 \text{ kJ mol}^{-1}$ and $\Delta S = 35.7 \text{ JK}^{-1} \text{ mol}^{-1}$
Which of the following statements is correct for the reaction [AMU (Engg.) 2000]
(a) Reversible and Isothermal
(b) Reversible and Exothermic
(c) Spontaneous and Endothermic
(d) Spontaneous and Exothermic
14. For a reaction to occur spontaneously [CBSE PMT 1995]
(a) $(\Delta H - T\Delta S)$ must be negative
(b) $(\Delta H + T\Delta S)$ must be negative
(c) ΔH must be negative
(d) ΔS must be negative
15. The total amount of energy in the universe is fixed, but [AMU (Engg.) 1999]
(a) Disorder is increasing (b) Lightning is increasing
(c) Matter is increasing (d) Gravitation is decreasing
16. If for a given substance melting point is T_B and freezing point is T_A , then correct variation shown by graph between entropy change and temperature is [DCE 2001]

In endothermic reaction, the value of change in enthalpy (ΔH) is [Pb. CET 2000]

- (a) Positive (b) Negative
(c) Zero (d) None of these

18. Which of the following would be expected to have the largest entropy per mole [MP PMT 2004]

- (a) $SO_2Cl_2(s)$ (b) $SO_2Cl_2(g)$
(c) $SO_2Cl_2(l)$ (d) $SO_2(g)$

19. The enthalpies of formation of Al_2O_3 and Cr_2O_3 are -1596 kJ and -1134 kJ respectively. ΔH for the reaction $2Al + Cr_2O_3 \rightarrow 2Cr + Al_2O_3$ is [KCET 2003]

- (a) -2730 kJ (b) -462 kJ
(c) -1365 kJ (d) $+2730 \text{ kJ}$

20. Heat of reaction at constant volume is measured in the apparatus

- (a) Bomb calorimeter (b) Calorimeter
(c) Pyknometer (d) Pyrometer

21. Which of the following gas has the highest heat of combustion

- (a) Methane (b) Ethane
(c) Ethylene (d) Acetylene

22. The amount of heat measured for a reaction in a bomb calorimeter is [AIIMS 1991]

- (a) ΔG (b) ΔH
(c) ΔE (d) $P\Delta V$

23. For an endothermic reaction where ΔH represents the enthalpy of the reaction in kJ/mole , the minimum value for the energy of activation will be [IIT JEE 1992; MP PET 1993]

- (a) Less than ΔH (b) Zero
(c) More than ΔH (d) Equal to ΔH

24. The heat of neutralization of a strong acid by a strong base is nearly equal to [MP PET 1993; BCECE 2005]

- (a) $+57.32 \text{ J}$ (b) -57.32 kJ
(c) $+13.7 \text{ J}$ (d) -13.7 kJ

25. A Beckmann thermometer is used to measure [Kurukshetra CEE 2002]

- (a) High temperature (b) Low temperature
(c) Normal temperature (d) All temperature

26. The heat required to raise the temperature of a body by 1 K is called [AIEEE 2002]

- (a) Specific heat (b) Thermal capacity
(c) Water equivalent (d) None of these

27. Mechanical work is specially important in system that contain [Kerala (Med.) 2000]

- (a) Solid-liquid (b) Liquid-liquid
(c) Solid-solid (d) Amalgam
(e) Gases

28. "The quantity of heat which must be supplied to decompose a compound into its element is equal to the heat evolved during the

formation of that compound from the elements." This statement is known as

- (a) Hess's law
- (b) Joule's law
- (c) Le-chatelier's principle
- (d) Lavoiser and Laplace law

29. Hess law deals with

[BHU 1979]

- (a) Changes in heat of reaction
- (b) Rate of reaction
- (c) Equilibrium constant
- (d) Influence of pressure on volume of a gas

30. For which one of the following reactions, ΔH is not equal to ΔE [IIT JEE 1995]

- (a) $H_{2(g)} + I_{2(g)} \rightleftharpoons 2HI_{(g)}$
- (b) $C_{(s)} + O_{2(g)} \rightleftharpoons CO_{2(g)}$
- (c) $N_{2(g)} + 3H_{2(g)} \rightleftharpoons 2NH_{3(g)}$
- (d) $HCl_{(aq)} + NaOH_{(aq)} \rightleftharpoons NaCl_{(aq)} + H_2O$

31. The heat liberated when 1.89 g of benzoic acid is burnt in a bomb calorimeter at $25^\circ C$ increases the temperature of 18.94 kg of water by $0.632^\circ C$. If the specific heat of water at $25^\circ C$ is 0.998 cal/g-deg , the value of the heat combustion of benzoic acid is [CPMT 1999; BHU 2009]

- (a) 771.1 kcal
- (b) 871.2 kcal
- (c) 881.1 kcal
- (d) 981.1 kcal

32. For a hypothetical reaction $A \rightarrow B$, the activation energies for forward and backward reactions are 19 kJ/mole and 9 kJ/mole respectively. The heat of reaction is

[CBSE PMT 2000]

- (a) 28 kJ
- (b) 19 kJ
- (c) 10 kJ
- (d) 9 kJ

33. The enthalpy of neutralization of HCN by $NaOH$ is $-12.13 \text{ kJ mol}^{-1}$. The enthalpy of ionisation of HCN will be

[BHU 1997]

- (a) 4.519 kJ
- (b) 45.10 kJ
- (c) 451.9 kJ
- (d) 45.19 kJ

34. In thermodynamics, a process is called reversible when

[AIIMS 2001]

- (a) Surroundings and system change into each other
- (b) There is no boundary between system and surroundings
- (c) The surroundings are always in equilibrium with the system
- (d) The system changes into the surroundings spontaneously

35. Which of the following unit represents largest amount of energy [AMU 2001]

- (a) Calorie
- (b) Joule
- (c) Erg
- (d) Electron volt

36. Which of the following will have the highest bond energy

[MP PMT 1990]

- (a) F_2
- (b) Cl_2
- (c) Br_2
- (d) I_2

37. $C_{(graphite)} + O_2(g) \rightarrow CO_2(g)$

$$\Delta H = -94.05 \text{ kcal mol}^{-1}$$

therefore

[DPMT 2001]

- (a) $C_{(graphite)} \rightarrow C_{(diamond)}; \Delta H_{298 K}^\circ = -450 \text{ cal mol}^{-1}$
- (b) $C_{(diamond)} \rightarrow C_{(graphite)}; \Delta H_{298 K}^\circ = +450 \text{ cal mol}^{-1}$
- (c) Graphite is the stabler allotrope
- (d) Diamond is harder than graphite

38. Enthalpy of formation of two compounds x and y are -84 kJ and -156 kJ respectively. Which of the following statements is correct [CBSE PMT 2001]

- (a) x is more stable than y
- (b) x is less stable than y
- (c) Both x and y are unstable
- (d) x and y are endothermic compounds

39. For the process dry ice $\longrightarrow CO_2(g)$

[KCET 2000]

- (a) ΔH is positive while Δp is negative
- (b) Both ΔH and Δp are negative
- (c) Both ΔH and Δp are positive
- (d) ΔH is negative while Δp is positive

40. For melting of 3 moles of water at $0^\circ C$ the ΔG° is

[MP PMT 2001]

- (a) Zero
- (b) +ve
- (c) -ve
- (d) Unpredictable

41. The equilibrium constant of a reaction at $298 K$ is 5×10^{-3} and

at $1000 K$ is 2×10^{-5} . What is the sign of ΔH for the reaction [Pb. CET 1999]

- (a) $\Delta H = 0$
- (b) ΔH is negative
- (c) ΔH is positive
- (d) None of these

42. Which of the following has lowest fusion temperature

[MP PET 2003]

- (a) Naphthalene
- (b) Diamond
- (c) $NaCl$
- (d) Mn

43. Consider the reactions

The bond energy of $C-H$ bond is [JIPMER 1997]

- (a) $y \text{ kcal mol}^{-1}$
- (b) $x_1 \text{ kcal mol}^{-1}$
- (c) $x/4 \text{ kcal mol}^{-1}$
- (d) $x_1/4 \text{ kcal mol}^{-1}$

44. Given the bond energies $N \equiv N$, $H-H$ and $N-H$ bonds are $945, 436$ and 391 kJ mole^{-1} respectively, the enthalpy of the following reaction $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$ is

[EAMCET 1992; JIPMER 1997]

- (a) -93 kJ
- (b) 102 kJ
- (c) 90 kJ
- (d) 105 kJ

45. The relation between ΔG and E for a cell is $\Delta G = -nFE$; the cell reaction will be spontaneous if [MP PET 1995]

- (a) G is negative
- (b) G is positive
- (c) E is negative
- (d) E is positive

46. Which of the following is not a correct statement?

[AMU (Engg.) 2002]

- (a) When ΔG is negative, the process is spontaneous
- (b) When ΔG is zero, the process is in a state of equilibrium
- (c) When ΔG is positive, the process is non-spontaneous
- (d) None of these

47. If at 298 K the bond energies of $C-H$, $C-C$, $C=C$ and $H-H$ bonds are respectively 414, 347, 615 and 435 kJ mol^{-1} , the value of enthalpy change for the reaction $H_2C=CH_2(g) + H_2(g) \rightarrow H_3C-CH_3(g)$ at 298 K will be

[AIEEE 2003]

- (a) + 250 kJ (b) - 250 kJ
(c) + 125 kJ (d) - 125 kJ

48. The equation

[CMC Vellore 1991]

- (a) The heat absorbed when one gram molecule of HCl is formed from its elements at $25^\circ C$ is 22.060 kcal
(b) The heat given out when one gram molecule of HCl is formed from its elements at 298 K is 22.060 kcal
(c) The heat absorbed when one atom of hydrogen reacts with one atom of chlorine to form one molecule of HCl at $25^\circ C$ and one atmospheric pressure is 22.060 kcal
(d) The heat absorbed when one gram equivalent of HCl is formed from its elements at 298 K is 22.060 kcal
(e) The intrinsic heat of one molecule of HCl is 22.060 kcal more than the intrinsic heats of one atom of hydrogen and one atom of chlorine

49. The $H_2O(g)$ molecule dissociates as

The average bond energy (in kJ) for water is

- (a) 490 (b) 424
(c) 914 (d) 914/2

50. When 50 cm^3 of $0.2 \text{ N } H_2SO_4$ is mixed with 50 cm^3 of 1 N KOH , the heat liberated is

[KCET 2004]

- (a) 11.46 kJ (b) 57.3 kJ
(c) 573 kJ (d) 573 J

51. Following reaction occurring in an automobile $2C_8H_{18}(g) + 25O_2(g) \rightarrow 16CO_2(g) + 18H_2O(g)$. The sign of ΔH , ΔS and ΔG would be

[CBSE PMT 1994; KCET 1999]

- (a) +, -, + (b) -, +, -
(c) -, +, + (d) +, +, -

52. For the reaction

$\Delta S = -0.163 \text{ kJ mol}^{-1} K^{-1}$. What is the value of free energy

change at $27^\circ C$ for the reaction [KCET 1999]

- (a) - 236.9 kJ mol^{-1} (b) - 281.4 kJ mol^{-1}
(c) - 334.7 kJ mol^{-1} (d) + 334.7 kJ mol^{-1}

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : The enthalpy of formation of gaseous oxygen molecules at 298K and under pressure of 1 atm is zero.
Reason : The entropy of formation of gaseous oxygen molecules under the same condition is zero. [AIIMS 1996]
2. Assertion : We feel cold on touching the ice.
Reason : Ice is a solid form of water. [AIIMS 1999]
3. Assertion : Entropy of ice is less than water.
Reason : Ice have cage like structure. [AIIMS 2000]
4. Assertion : The heat absorbed during the isothermal expansion of an ideal gas against vacuum is zero.
Reason : The volume occupied by the molecules of an ideal gas is zero. [AIIMS 2002]
5. Assertion : Absolute values of internal energy of substance can not be determined.
Reason : It is impossible to determine exact values of constituent energies of the substances. [AIIMS 2002]
6. Assertion : Mass and volume are extensive properties.
Reason : Mass / volume is also an extensive parameter. [AIIMS 2002]
7. Assertion : Molar entropy of vaporization of water is different from ethanol.
Reason : Water is more polar than ethanol.
8. Assertion : The increase in internal energy (ΔE) for the vaporization of one mole of water at 1 atm and 373K is zero.
Reason : For all isothermal processes $\Delta E = 0$. [AIIMS 2003]
9. Assertion : ΔH and ΔE are almost the same for the reaction. $N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$.
Reason : All reactants and products are gases. [AIIMS 2003]
10. Assertion : The enthalpies of neutralisation of strong acids and strong bases are always same.
Reason : Neutralisation is heat of formation of water. [AIIMS 1996]
11. Assertion : Zeroth law can also be termed as law of thermal equilibrium.
Reason : Two objects in thermal equilibrium with the third one, are in thermal equilibrium with each other.
12. Assertion : There is no reaction known for which ΔG is positive, yet it is spontaneous.
Reason : For photochemical reactions ΔG is negative.
13. Assertion : Heat of neutralisation of perchloric acid, $HClO_4$ with $NaOH$ is same as is that of HCl with $NaOH$.
Reason : Both HCl and $HClO_4$ are strong acids.
14. Assertion : Heat absorbed in a reaction at constant temperature and constant volume is $-\Delta G$.
Reason : ΔG should be negative for the reaction to be spontaneous.
15. Assertion : T, P and V are state variables or state functions.
Reason : Their values depends on the state of the system and how it is reached.
16. Assertion : Internal energy is an extensive property.

- Reason : Internal energy depends upon the amount of the system.
17. Assertion : For the combustion reactions, the value of ΔH is always negative.
- Reason : The combustions reactions are always endothermic.
18. Assertion : For an isothermal reversible process $Q = -w$ i.e. work done by the system equals the heat absorbed by the system.
- Reason : Enthalpy change (ΔH) is zero for isothermal process.
19. Assertion : Enthalpy of formation of graphite is zero but of diamond is not zero.
- Reason : Enthalpy of formation of most stable allotrope is taken as zero.
20. Assertion : If a refrigerator's door is kept open room gets cooled.
- Reason : Material kept inside the refrigerator remains cool.
21. Assertion : Enthalpy and entropy of any elementary substance in the standard state are taken as zero.
- Reason : At zero degree absolute, the constituent particles become completely motionless.
22. Assertion : A process is called adiabatic if the system does not exchange heat with the surroundings.
- Reason : It does not involve increase or decrease in temperature of the system.

AS Answers and Solutions

Basic concepts

- (b) Internal energy of an ideal gas is a function of temperature only.
- (d) In cyclic process, a system in a given state goes through a series of different processes, but in the end returns to its initial state.
- (c) $\Delta E = 0$ for isothermal reversible cycle.
- (c) In isolated system neither exchange of matter nor exchange of energy is possible with surroundings.
- (c) It is the definition of calorific value.
- (d) When a real gas is forced through a porous plug into a region of low pressure, it is found that due to expansion, the gas on the side of low pressure gets cooled.

The phenomenon of producing lowering of temperature when a gas is made to expand adiabatically from a region of high pressure into a region of low pressure is known as Joule-Thomson effect.

12. (d) In isothermal reversible process ideal gas has constant volume and so $\Delta E = 0$ and $\Delta H = \Delta E = 0$.
13. (a) The compressor has to run for longer time releasing more heat to the surroundings.
14. (c) This is based on Joule-Thomson effect.
15. (b) Enthalpy is an extensive property.
16. (b) $dV = 0$ for an isochoric process.
17. (d) Total energy of an isolated system is constant.
18. (a) For isochoric process $\Delta V = 0$ so $q_V = \Delta E$ i.e. heat given to a system under constant volume is used up in increasing ΔE .
19. (b) The less energy of a system and more is its stability.
20. (b) The functions whose value depends only on the state of a system are known as state functions.
21. (d) For adiabatic process $q = 0$.
22. (b) The intensive property is mass/volume.
23. (c) Volume is not an intensive property.
24. (c) An isolated system neither shows exchange of heat nor matter with surroundings.
25. (d) ΔQ is not a state function.
26. (c) For adiabatic process $\Delta Q = 0$.
27. (c) Work is not a state function as during a process its value depends on the path followed. The value of enthalpy, internal energy and entropy depends on the state and not on the path followed to get that state, hence these are state functions.
28. (c) Surface tension is an intensive property which do not depend upon the quantity of matter present in the system.

First law of thermodynamics and Hess law

1. (d) First law of thermodynamics is also known as Law of conservation of mass and energy.
2. (b) Formation of CO_2 from CO is an exothermic reaction; heat is evolved from the system, i.e., energy is lowered. Thus, exothermic reactions occur spontaneously on account of decrease in enthalpy of system. Thus, $\Delta E > \Delta H$.
4. (b) $\Delta H = \Delta E + P\Delta V$.
5. (c) $\Delta n_g = 1 - \frac{3}{2} = -\frac{1}{2}$, As Δn_g is negative, thus $\Delta H < \Delta E$.
6. (a) Bomb calorimeter is commonly used to find the heat of combustion of organic substances which consists of a sealed combustion chamber, called a bomb. If a process is run in a sealed container then no expansion or compression is allowed, so $w = 0$ and $\Delta U = q$.
 $\Delta U < 0$, $w = 0$
9. (b) $\Delta H = \Delta E + \Delta nRT$
Since $\Delta n = -2$
Then $\Delta H = \Delta E - 2RT$.
10. (d) If $\Delta n = -ve$ then $\Delta H < \Delta E$.
12. (c) Hess's law is an application of first law of thermodynamics.
13. (c) At constant P or T
 $\Delta H = \Delta U + \Delta nRT \Rightarrow \Delta n = n_p - n_R = 2 - 4 = -2$
 $\therefore \Delta H < \Delta U$.
16. (b) It is a combustion reaction, $\Delta H = -ve$.
17. (c) During isothermal expansion of ideal gas, $\Delta T = 0$

$$\Delta H = \Delta E + P\Delta V = \Delta E + nR\Delta T = 0 + 0 = 0.$$

18. (b) $W = 2.303 nRT \log \frac{V_2}{V_1}$
 $= 2.303 \times 1 \times 8.314 \times 10^7 \times 298 \log \frac{20}{10}$
 $= 298 \times 10^7 \times 8.314 \times 2.303 \log 2$.
20. (a) The enthalpies of all elements in their standard state at 25°C or 298K are zero.
21. (c) $\Delta E_V = E_P - E_R$.
22. (c) $\Delta E = q + w$.
23. (a) $\Delta E = 0$ for reversible isothermal process.
25. (b) Hess law includes initial reactants and final products.
26. (a) At constant T and P internal energy of ideal gas remains unaffected.
27. (a) ΔE increases with temperature.
28. (a) $\Delta H = \Delta E + W$ or $\Delta H = \Delta E + P\Delta V$.
29. (bc) Heat of neutralisation of a strong acid and strong base is equal to -13.7 kcal .
30. (c) $-W = +2.303 nRT \log \frac{p_1}{p_2}$
 $-W = 2.303 \times 1 \times 2 \times 300 \log \frac{10}{1} = 1381.8\text{ cal}$.
31. (b) Joule-Thomson expansion is isoenthalpic.
32. (c) Here $\Delta n = 0$ so, $\Delta E = \Delta H$.
33. (b) $q = \Delta E - W$ if $q = 0$ for adiabatic process, then $\Delta E = W$.
34. (a) For this reaction $\Delta n = 0$ then $\Delta E = \Delta H$.
35. (c) As the system is closed and insulated no heat enter or leave the system, i.e. $q = 0$; $\therefore \Delta E = Q + W = W$.
37. (c) $\Delta H - \Delta E = \Delta nRT$; $\Delta n = -3$
so, $\Delta H - \Delta E = -3RT$.
38. (b) According to Hess's law. The heat of reaction depends upon initial and final conditions of reactants.
39. (d) $\Delta H - \Delta E = \Delta nRT$
also, $2\text{NH}_{3(g)} \rightarrow \text{N}_{2(g)} + 3\text{H}_{2(g)}$
 $\Delta n = 2$.
40. (c) $\Delta n = 0$ for this reaction so, $\Delta E = \Delta H$.
41. (d) $W = 0$ is not true.
42. (a) $W = 2.303 nRT \log \frac{P_2}{P_1}$
 $= 2.303 \times 1 \times 2 \times 300 \log \frac{10}{2} = 965.84$
at constant temperature, $\Delta E = 0$.
 $\Delta E = q + w$; $q = -w = -965.84\text{ cal}$.
43. (c) $q = 40\text{ J}$
 $w = -8\text{ J}$ (work done by the system)
 $\Delta E = q + w = 40 - 8 = 32\text{ J}$.
44. (a) We know that $\Delta E = Q + W = 600 + (-300) = 300\text{ J}$
 $W = 300$, because the work done by the system.
45. (c) Given that
 $P_1 = 10\text{ atm}$, $P_2 = 1\text{ atm}$, $T = 300\text{K}$, $n = 1$

$$R = 8.314 \text{ J/K/mol}$$

Now, by using

$$W = 2.303nRT \log_{10} \frac{P_2}{P_1}$$

$$= 2.303 \times 1 \times 8.314 \times 300 \log_{10} \frac{1}{10}$$

$$W = 5744.1 \text{ Joule}$$

46. (c) We know that internal energy of a gas depends upon its pressure and temperature. Thus if a gas expands at constant temperature and pressure, then its internal energy remains same.

For this reaction $\Delta n_g = 2 - 1 = 1$

Δn_g is positive, i.e., there is an increase in the number of gaseous moles then $\Delta H > \Delta E$

48. (c) Enthalpy (H) is defined as the sum of internal energy $E + PV$, $H = E + PV$.

$$\Delta n_g = 4 - 6 = -2 \text{ (i.e., negative)}$$

we know that $\Delta H = \Delta E + \Delta n_g RT$

$$= \Delta E - (\Delta n_g)RT \text{ (}\because \Delta n_g = -ve\text{)}$$

$$\therefore \Delta H < \Delta E$$

50. (b) Given number of moles = 1

$$\text{Initial temperature} = 27^\circ\text{C} = 300\text{K}$$

$$\text{Work done by the system} = 3 \text{ KJ} = 3000\text{K}$$

It will be (–) because work is done by the system.

$$\text{Heat capacity at constant volume (Cv)} = 20 \text{ J/k}$$

We know that work done

$$W = -nC_V(T_2 - T_1); 3000 = -1 \times 20 (T_2 - 300)$$

$$3000 = -20T_2 + 6000$$

$$20T_2 = 3000; T_2 = \frac{3000}{20} = 150\text{K}$$

51. (a) Internal energy of a system is a state function and extensive property and is independent of the path by which it is obtained.

For this reaction $\Delta n_g = 2 - 1 = 1$

Δn_g is positive i.e., there is an increase in the number of gaseous moles then $\Delta H > \Delta E$

This reaction does not represent complete combustion of carbon, hence heat of combustion of carbon will not be equal to 110 kJ. The negative sign of ΔH indicates that this reaction is exothermic. Also, despite being spontaneous reaction, it requires initiation.

$$= -1 \times 10^5 \times 9 \times 10^{-3} = -900 \text{ J}$$

55. (a) The exact value of internal energy is not known as it includes all type of energies of molecules constituting the given mass of matter such as translational, vibrational, rotational. The kinetic & potential energy of the nuclei & electron within the individual molecules and the manner in which the molecule are linked together etc.

$$E = E_{\text{translational}} + E_{\text{rotational}} + E_{\text{vibrational}}$$

Thus, we can say that internal energy is partly potential and partly kinetic.

$$\Delta H = \Delta E + \Delta n_g RT; \Delta H = \Delta E + 0; \Delta H = \Delta E$$

$$W = -6 \times 101.32 \text{ (}\because 1 \text{ L atm} = 101.32 \text{ J)}$$

$$W = -608 \text{ J}$$

$$\Delta n_g = 0 - 3 = -3; \Delta H = \Delta E + \Delta n_g RT [\because \Delta E = \Delta U]$$

$$\therefore \Delta H = \Delta U + (-3)(RT)$$

$$\Delta H = \Delta U - 3(RT); \Delta H = \Delta U - 3RT$$

IInd & IIIrd Law of thermodynamics and Entropy

2. (d) When $\Delta S = +ve$ the change is spontaneous.

3. (d) Heat is always flow from the higher to lower temperature.

4. (b) Mixing of non-reacting gases increases randomness and so increase entropy.

5. (b) Entropy of the system increases as the process occur irreversibly and isothermally in an isolated system.

$$= 2 \times 186.7 - (130.6 + 223.0) = 19.8 \text{ JK}^{-1}\text{mol}^{-1}$$

9. (b) For adiabatic expansion $q = 0$ than according to following

$$\text{relation } \Delta S = \frac{q}{T}, \Delta S = 0.$$

10. (c) It is the third law of thermodynamics.

11. (c) Entropy of gases is highest.

for spontaneous process ΔG should be negative in option (3)

$$\Delta H = -ve \text{ and } \Delta S = +ve \text{ then}$$

$$\Delta G = (-ve) - T(+ve) = -ve$$

15. (c) For reverse reaction sign will be change.

16. (b) Solid $\longrightarrow$ Gas, ΔS is maximum.

17. (d) +ve ΔH and -ve ΔS both oppose the reaction.

20. (a) When $\Delta H = -ve$, $\Delta S = +ve$ and $\Delta G = -ve$ than reaction is spontaneous.

21. (d) For endothermic process ΔS increases.

22. (c) Calculation of change in entropy is done at constant temperature and pressure both.

23. (a) When the value of entropy is greater, then ability of work is maximum.

24. (d) At equilibrium, $\Delta G = 0$

$$\text{Hence } 0 = \Delta H - T\Delta S \text{ or } \Delta H = T\Delta S.$$

$$= 0.1 \text{ kJ mol}^{-1} \text{ K}^{-1} = 100 \text{ J mol}^{-1} \text{ K}^{-1}.$$

26. (d) Solid $\rightarrow$ Liquid, ΔS increases.

27. (c) $\Delta S = +ve$ than process is spontaneous.

28. (b) $\Delta S = +ve$ than the system is more disordered.

29. (c) Because solid $\rightarrow$ solid, ΔS is same and ΔH is -ve.

30. (b) $\Delta S_{vap} = \frac{\Delta H_{vap}}{T} = \frac{386}{298} = 1.2 \text{ kJ}.$
31. (b) Processes (a) and (c) take place with the increase of no. of moles of gaseous species and hence the disorder or entropy increases. (b) on increasing pressure, disorder or randomness decreases and so also the entropy (d) is endothermic process and ΔS is positive.
32. (d) This is the statement of third law of thermodynamics.
33. (d) For isothermal expansion of ideal gas, $\Delta E = 0.$
34. (a) $\Delta S_{vap} = \frac{(900 \times 18)}{373} = 43.4 \text{ JK}^{-1} \text{ mol}^{-1}.$
35. (c) Entropy of the mixture increases due to increase in impurity.
37. (c) If $\Delta H = +ve$ and $\Delta S = -ve$ then the reaction is non-spontaneous *i.e.* can not occur.
38. (a) $T_2 = 150 + 273 = 423 \text{ K}$
 $T_1 = 25 + 273 = 298 \text{ K}$
 $Q = 500 \text{ K}$
 $\frac{W}{Q} = \frac{T_2 - T_1}{T_2}; W = 500 \left(\frac{423 - 298}{423} \right) = 147.7 \text{ J}.$
39. (c) According to III law of thermodynamics.
40. (c) When $\Delta H = +ve$ and $\Delta S = -ve$ reaction is non-spontaneous.
41. (c) $T_m = \frac{\Delta H_{fusion}}{\Delta S_{fusion}} = \frac{9.2}{0.008} = 1150 \text{ K}.$
42. (c) Here: Change in
 Volume $(V) = 500 - 300 = 200 \text{ cc} = 0.2 \text{ litre}$
 Pressure $(P) = 0.6 \text{ atm}$ and heat liberated $(q) = 10 \text{ J}$
 Work done $(W) = P\Delta V = (0.2 \times 0.6) = 0.12 \text{ litre-atm}$
 But $1 \text{ litre-atm} = 101.3 \text{ J}.$
 hence $W = 0.12 \times 101.3 = 12.156 \text{ J}.$ We also know that heat is liberated, therefore it would be negative. Thus change in $\Delta E = q + W = -10 + 12.16 = 2.16 \text{ J}.$
43. (c) Formation of CO_2 is,
 $\text{C}_{(s)} + \text{O}_{2(g)} \rightarrow \text{CO}_{2(g)}$
 $\Delta S^\circ = 213.5 - 5.690 - 205 = 2.81 \text{ JK}^{-1}.$
45. (b) $\text{H}_2\text{O}_{(g)} \rightleftharpoons \text{H}_2\text{O}_{(l)}$
 we know $\Delta G = \Delta H - T\Delta S$
 at equilibrium $\Delta G = 0$
 Therefore $\Delta H = T\Delta S.$
46. (a) We know that work done, $W = C_v(T_1 - T_2)$
 $3 \times 1000 = 20(300 - T_2); \therefore 3000 = 6000 - 20 T_2$
 $\therefore T_2 = \frac{3000}{20} = 150 \text{ K}.$
48. (d) It does not violates the first law of thermodynamics but violates the II law of thermodynamics.
49. (d) $C_v = \frac{3}{2} RT; C_p = \frac{5}{2} RT$ for monoatomic gas
 $C_v = \frac{5}{2} RT; C_p = \frac{7}{2} RT$ for diatomic gas
- Thus for mixture of 1 mole each, $C_v = \frac{\frac{3}{2} RT + \frac{5}{2} RT}{2}$ and
 $C_p = \frac{\frac{5}{2} RT + \frac{7}{2} RT}{2}$
 Therefore, $C_p / C_v = \frac{3RT}{2RT} = 1.5.$
51. (c) $\Delta S = \frac{q_{rev}}{T} \therefore \text{unit of } S \text{ is } \text{JK}^{-1} \text{ mol}^{-1}.$
52. (b) $\text{H}_2\text{O}_{(l)} \rightleftharpoons \text{H}_2\text{O}_{(g)}, \Delta S = \frac{\Delta H_{vap}}{T},$
 $\Delta H_{vap} = 2.257 \text{ KJ/g}$
 or $\Delta H_{vap} = 2.257 \times 18 \text{ kJ/mol} = 40.7 \text{ KJ/mol}$
 hence, $\Delta S = \frac{40.7}{373} = 0.109 \text{ kJ/mol/K}.$
53. (a) Liquid $\longrightarrow$ Vapour, entropy increases.
54. (c) NaNO_3 is a solid, which is converted to liquid ions.
55. (c) Heat capacity of water per gram $= \frac{75}{18} = 4.17 \text{ J}$
 $Q = mst; 1000 = 100 \times 4.17 \times t$
 $t = \frac{1000}{100 \times 4.17} = 2.4 \text{ K}.$
56. (c) As the work is done on system, it will be positive *i.e.* $W = +462 \text{ joule}, E = -128 \text{ joule}$ (heat is evolving)
 From the Ist law of thermodynamics
 $\Delta E = q + w = (-128) + (+462) = +334 \text{ Joules}.$
57. (a) Gases show highest entropy.
58. (b) $\text{H}^+_{(aq)} + \text{OH}^-_{(aq)} \rightarrow \text{H}_2\text{O}_{(l)}$
 $S^\circ(298 \text{ K}) \text{ K}^{-1} \text{ mol}^{-1} \quad -10.7 \quad +70$
 $\Delta S^\circ(298 \text{ K}) = \Delta S_p - \Delta S_R = 70 - (-10.7 + 0)$
 $80.7 \text{ JK}^{-1} \text{ mol}^{-1}$
59. (d) The entropy change $= \frac{\text{heat of vaporisation}}{\text{temperature}}$
 Here, heat of vaporisation $= 540 \text{ cal/gm}$
 $= 540 \times 18 \text{ calmol}^{-1}$
 Temperature of water $= 100 + 273 = 373 \text{ K}$
 $\therefore \text{entropy change} = \frac{540 \times 18}{373} = 26.06 \text{ calmol}^{-1} \text{ K}^{-1}$
60. (b) Given that, $T_1 = 500 \text{ K}, T_2 = 300 \text{ K}$
 By using, $\eta = \frac{T_1 - T_2}{T_1} = \frac{500 - 300}{500} = \frac{200}{500} = 0.4.$
61. (b) It is molar heat capacity.
62. (d) Entropy is the measure of randomness in the molecules. Randomness is maximum in case of gases. Hence, entropy is maximum for water vapours.
63. (a) Standard entropy of formation of $\text{CO}_2(g)$ = standard entropy of $\text{CO}_2(g)$ - [Standard entropy of $\text{C}(s)$ - standard entropy of $\text{O}_2(g)$]
 $= 213.5 - [5.740 + 205] = 2.76 \text{ J/K}.$

64. (c) Third law of thermodynamics help in calculating entropy of different temperatures.
65. (a) In case of gas randomness is maximum therefore entropy is maximum in case of steam.
66. (c) $\Delta S_{\text{system}} + \Delta S_{\text{surrounding}} > 0$ (for spontaneity)

$$\text{Because of } \Delta S = R \ln \frac{V_2}{V_1}$$

Here the volume of gas increase from V_1 to V_2 at constant temperature T .

The total increase in entropy of the system and its surrounding during the spontaneous process of expansion considered above

is, thus $R \ln \left(\frac{V_2}{V_1} \right)$ since $V_2 > V_1$ it is obvious that the

spontaneous (irreversible) isothermal expansion of a gas is accompanied by an increase in the entropy of the system and its surrounding considered together.

$$\Delta S_{\text{system}} + \Delta S_{\text{surrounding}} > 0.$$

67. (b) $\Delta G = \Delta H - T\Delta S$
at constant temperature and pressure $\Delta G = 0$
 $0 = \Delta T - T\Delta S$ so $\Delta H = T\Delta S$

68. (b) $dS = \frac{dQ_{\text{rev.}}}{T}$; $T = \frac{30 \times 10^3}{75}$; $T = 400K$

Heat of reaction

1. (b) $C + O_2 \rightarrow CO_2 + 94.2 \text{ Kcal.}$ (i)

On multiplication of eq. (ii) by 2 and then adding in eq. (i)

On subtracting eq. (iii) by following eq.

2. (b) $\Delta S = 16J \text{ mole}^{-1} K^{-1}$

$$T_{b.p.} = \frac{\Delta H_{\text{vapour}}}{\Delta S_{\text{vapour}}} = \frac{6 \times 1000}{16} = 375K$$

4. (d) Heat of neutralisation between strong acid and a strong base is about -13.7 Kcal.

6. (b) Effect of temperature in heat of reaction is given by Kirchhoff's equation.

7. (c) Heat of neutralisation between strong acid and a strong base is about -13.7 Kcal.

8. (a) For exothermic reactions $H_p < H_R$.

For endothermic reactions $H_p > H_R$.

9. (b) 78g of benzene on combustion produces heat = -3264.6 kJ

$$\therefore 39g \text{ will produce } = \frac{-3264.6}{2} = -1632.3 \text{ kJ.}$$

10. (a) eq. (i) + eq. (ii) gives the required result.

11. (bcd) (b,c,d) are endothermic reactions because they proceed by the absorption of heat.

12. (a) Change of liquid to vapour takes energy in the form of heat so it is endothermic reaction.

13. (d) In exothermic reactions heat is evolved.

15. (c) $\Delta H = -ve$ for exothermic reaction.

$\Delta H = +ve$ for endothermic reaction

Enthalpy of fusion is $+ve$.

16. (a) Heat of neutralisation will be less than -57.33 kJ/mole because some amount of this energy will be required for the dissociation of weak base (MgO)

18. (a) $H_2 + O_2 \rightarrow H_2O_2 \quad \Delta H_f^\circ = -188 \text{ kJ/mole} \quad \text{.....(i)}$

eq. (i) - eq. (ii) $\times 2$ gives the required result.

19. (b) Graphite $\longrightarrow$ diamond $\Delta H_t = (x - y) \text{ kJ mol}^{-1}$.

21. (c) Heats of combustions are always exothermic except oxidation of N as,

22. (a) For exothermic reactions $H_p < H_R$.

For endothermic reactions $H_p > H_R$.

23. (d) Aim: $2C + H_{2(g)} \rightarrow C_2H_{2(g)}$.

eq. (ii) + eq. (iii) $\rightarrow$ eq. (iv) - eq. (i)
find the required result.

24. (c) Enthalpy of formation of HCl .

25. (c) Heat of neutralisation between strong acid and a strong base is about -13.7 Kcal.

26. (b) For endothermic reaction, $\Delta H = +ve$.

27. (b) Heat of neutralisation is less than 56.1 Kcal when a strong base and a weak acid reacts.

28. (b) Aim: $CO + \frac{1}{2} O_2 \rightarrow CO_2$

$$\Delta H = \Delta H_f^\circ(CO_2) - \left[\Delta H_f^\circ(CO) + \frac{1}{2} \Delta H_f^\circ(O_2) \right]$$

$$= -94.0 - (-26.4) = -67.6 \text{ kcal.}$$

29. (a)

Eq. (i) + Eq. (ii) - Eq. (iii)

$$\Delta H = -241 - 3800 - (-3920)$$

$$= -4041 + 3920 = -121 \text{ kJ}$$

30. (c) NH_4OH is a weak base. Heat of neutralisation $< 13.7 \text{ kcal.}$

31. (a) CH_4 is the best fuel because its calorific value $= \frac{-212.8}{16} = -13.3 \text{ kcal/g}$ is higher among the other gases.

32. (a) Find ΔH for $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O_{(g)}$.

34. (b) In neutralisation of a strong acid and base only H^+ and OH^- ions react.

35. (b) When both acid and base are strong than heat of neutralisation is 57.1 kJ mol^{-1} .
36. (a) $\text{C}_2\text{H}_6 + \frac{7}{2}\text{O}_2 \rightarrow 2\text{CO}_2 + 3\text{H}_2\text{O}$ substitute the values.
37. (a) Decomposition is an endothermic process.
38. (d) ΔH for this reaction is Heat of reaction.
40. (b) One mole of H_2O is formed from its initial components.
41. (c) One mole of a substance is completely oxidized in air.
42. (c) $\text{S (rhombic)} + \text{O}_2 \rightarrow \text{SO}_2$, $\Delta H = 70960 \text{ cal}$ (i)
 $\text{S (monoclinic)} + \text{O}_2 \rightarrow \text{SO}_2$, $\Delta H = 71030 \text{ cal}$ (ii)
 Aim: $\text{S (rhombic)} \rightarrow \text{S (monoclinic)}$
 $\text{eq. (i)} - \text{eq. (ii)}$ gives the required result.
43. (b) When $\text{H}_2\text{O}_{(l)}$ is convert to form $\text{H}_2\text{O}_{(g)}$, heat is absorbed hence $\Delta H_1 > \Delta H_2$.
44. (b) Out of given substances, kerosene oil has maximum calorific value.
45. (b) $\text{C}_{(s)} + \text{O}_{2(g)} \rightarrow \text{CO}_{2(g)}$, $\Delta n_g = 1 - 1 = 0$
 $\therefore \Delta E = \Delta H = -94 \text{ kcal}$
 $\Delta E = E_{\text{CO}_2} - (E_{\text{C}} + E_{\text{O}_2}) = E_{\text{CO}_2} - (0 + 0)$
 or $E_{\text{CO}_2} = \Delta E = -94 \text{ kcal}$.
46. (b) 0.2 mole will neutralize 0.2 mole of HNO_3 , heat evolved = $57 \times 0.2 = 11.4 \text{ kJ}$.
47. (a) Suppose heat evolved in Ist case is Q_1 and that in the IInd case it is Q_2 . Then $Q_2 = \frac{1}{2}Q_1$.
 But $Q_1 = 1000 T_1$ and $Q_2 = 500 T_2$
 $\therefore 500 T_2 = \frac{1}{2} \times 1000 T_1$ i.e. $T_2 = T_1$.
48. (c) Enthalpy of a compound = Heat of reaction of that compound.
49. (e) It is the definition of heat of neutralization.
50. (b) $\Delta H = -ve$ for exothermic compound.
51. (a) If acid or base or both are strong, heat of neutralization = 13.7 kcal .
52. (b) Both NH_4OH and CH_3COOH are weak.
53. (c) $57.1 \times 0.25 = 14.3 \text{ kJ mol}^{-1}$.
54. (c) Heat of formation is for 1 mole.
 Hence $\Delta H_f^\circ(\text{HI}) = -12.40 / 2 = -6.20 \text{ kcal}$.
55. (b) Chemical dissociations are reversible and endothermic.
57. (c) Given,
 (i) $\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}$, $\Delta H = +20 \text{ kcal}$
 (ii) $\text{C} + \text{O}_2 \rightarrow \text{CO}_2$, $\Delta H = -40 \text{ kcal}$.
 (iii) $\text{H}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{H}_2\text{O}$, $\Delta H = -10 \text{ kcal}$.
 Aim: $\text{C} + 2\text{H}_2 \rightarrow \text{CH}_4$
 (ii) + $2 \times$ (iii) - (i) gives.
 $\Delta H = -40 + 2(-10) - (+20) = -80 \text{ kcal}$.
58. (d) For exothermic reaction heat is evolved.
59. (c) $\text{H}_2\text{O}_{(l)} \xrightarrow{\text{electrolysis}} \text{H}_{2(g)} + \frac{1}{2}\text{O}_{2(g)}$.
61. (d) All other are combustion phenomena.
62. (c) $\Delta H_{\text{combustion}} = -ve$, so exothermic process.
63. (b) Aim: $\text{K}_{(s)} + \frac{1}{2}\text{O}_{2(g)} + \frac{1}{2}\text{H}_{2(g)} \rightarrow \text{KOH}_{(s)}$
 $\text{eq. (ii)} + \text{eq. (i)} - \text{eq. (iii)}$ gives
 $\Delta H = -48 + (-68.39) - (-14) = -68.39 - 48 + 14$.
64. (a) By definition of heat of formation.
68. (c) $\text{C}_D \rightarrow \text{C}_G$, $\Delta H = -453.5 \text{ cal}$.
 i.e. energy of C_G is less and thus more stable.
69. (a) $\Delta H_{\text{combustion}}$ is always negative.
70. (d) $\Delta H_{\text{reaction}} = \Delta H_f^\circ(\text{N}_2\text{O}_4) - 2\Delta H_f^\circ(\text{NO}_2)$
 $= 2 - 2(8) = -14 \text{ kcal}$.
71. (a) $\Delta H - \Delta E = \Delta nRT = 3 \times 8.314 \times 298$
 $= -7432 \text{ J} = -7.43 \text{ kJ}$.
72. (b) Aim: $\text{C}_{(\text{graphite})} \rightarrow \text{C}_{(\text{diamond})}$; $\text{eq. (i)} - \text{(ii)}$ gives the result.
73. (d) In the formation of a compound, more the heat absorbed, less stable is the compound.
74. (c) $\text{C}_{(\text{graphite})} + 2\text{H}_{2(g)} = \text{CH}_{4(g)}$.
75. (b) Heat of formation is the formation of one mole of the substance from its elements.
76. (b) $\Delta H_{(\text{reaction})} = 2\Delta H_f^\circ(\text{MgO}) - \Delta H_f^\circ(\text{SiO}_2)$
 $= 2(-34.7) - (-48.4) = -21 \text{ kJ}$.
77. (a) $\text{eq. (i)} + \text{eq. (ii)} + \text{eq. (iii)}$ gives
 $X = 131 - 282 - 242 = -393 \text{ kJ}$.
78. (d) It is the definition of heat of transition.
79. (d) $\text{C}_{(\text{graphite})} \rightarrow \text{C}_{(\text{diamond})}$, $\Delta H = 1.9 \text{ kJ}$
 $\text{C}_{(\text{graphite})} + \text{O}_2 \rightarrow \text{CO}_2$, $\Delta H = -\Delta H_1$
 $\text{C}_{(\text{diamond})} + \text{O}_2 \rightarrow \text{CO}_2$, $\Delta H = -\Delta H_2$
 $(-\Delta H_1) - (-\Delta H_2) = 1.9 \text{ kJ}$ or $\Delta H_2 = \Delta H_1 + 1.9$
 For combustion of 6g, $\Delta H_2 > \Delta H_1$ by $1.9 / 2 = 0.95 \text{ kJ}$.
80. (a) $H_{\text{product}} \times H_{\text{reactant}}$ for exothermic reaction.
81. (b) Due to high electron affinity of Cl the highest energy is evolved.
82. (b) $\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}$
 Molecular weight of $\text{CH}_4 = 12 + 4 = 16$
 $\therefore$ On the combustion of 2.0gm of methane = 25.0 kcal
 $\therefore$ On the combustion of 16.0gm = $\frac{25 \times 16}{2} = 200 \text{ kcal}$.
83. (a) $\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}$.
84. (b) $\text{C}_2\text{H}_4 + 3\text{O}_2 \rightarrow 2\text{CO}_2 + 2\text{H}_2\text{O}$
 $\Delta H_{\text{reaction}} = [2 \times \Delta H_f^\circ(\text{CO}_2) + 2 \times \Delta H_f^\circ(\text{H}_2\text{O})]$
 $- [\Delta H_f^\circ(\text{C}_2\text{H}_4) + 3 \times \Delta H_f^\circ(\text{O}_2)]$
 $= [2(-394) + 2(-286)] - [52 + 0] = -1412 \text{ kJ}$.
85. (b) $\text{C} + \text{O}_2 \rightarrow \text{CO}_2 + 394 \text{ kJ}$.
 $2\text{C} + 2\text{O}_2 \rightarrow 2\text{CO}_2 + 788 \text{ kJ}$ (i)
 $2\text{CO} + \text{O}_2 \rightarrow 2\text{CO}_2 + 569 \text{ kJ}$ (ii)
 $2\text{CO}_2 \rightarrow 2\text{CO} + \text{O}_2 - 569 \text{ kJ}$ (iii)
 $\text{eq. (i)} + \text{eq. (iii)} = -109.5 \text{ kJ mol}$.
86. (c) $\Delta H_f = \frac{44}{2} \text{ kcal} = 22 \text{ kcal}$.

87. (a) $\text{CaO}_{(s)} + \text{H}_2\text{O}_{(l)} \rightarrow \text{Ca}(\text{OH})_2$ is exothermic.
88. (b) $\Delta H = -ve$ in exothermic reaction.
89. (d) According to the definition of heat of formation.
90. (d) Multiplying eq. (ii) by (iii) and eq. (iii) by (vi), and then add
- $$6\text{C} + 3\text{H}_2 + \frac{15}{2}\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O}; \Delta H = 3218.7$$
- Subtract eq. (i) from the above equation and find the required result.
91. (a) HF is more stable than HCl.
92. (c) $\Delta H(H_P - H_R) = q_P$.
93. (b) $\Delta H = +ve$ for endothermic reaction.
94. (a) $\Delta H = \frac{13.95 \times 44}{2.2016} = 278.7 \text{ kcal}$.
95. (d) eq. (i) + eq. (ii) gives the required result.
96. (d) Standard molar heat enthalpy (H°) of a compound is equal to its standard heat of formation from most stable states of initial components.
97. (c) In the complete combustion of butanol $\Delta H > \Delta E$.
98. (a) $X - Y$ and find the required result.
99. (c) $\text{S} + \text{O}_2 \rightarrow \text{SO}_2 \quad \Delta H = -298.2 \text{ kJ} \quad \dots(i)$
- $$\text{SO}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{SO}_3 \quad \Delta H = -98.2 \text{ kJ} \quad \dots(ii)$$
- eq. (i) - (ii) and find the required result.
100. (c) $\text{C} + 2\text{S} \rightarrow \text{CS}_2 \quad \Delta H = ?$
- $$\text{C} + \text{O}_2 \rightarrow \text{CO}_2 \quad \Delta H = -393.3 \text{ kJ} \quad \dots(i)$$
- $$\text{S} + \text{O}_2 \rightarrow \text{SO}_2 \quad \Delta H = -293.72 \text{ kJ} \quad \dots(ii)$$
- $$\text{CS}_2 + 3\text{O}_2 \rightarrow \text{CO}_2 + 2\text{SO}_2 \quad \Delta H = -1108.76 \text{ kJ} \quad \dots(iii)$$
- eq. (ii) $\times 2$ + eq. (i) - (iv) eq. (iii) - eq. (iv) and find required result.
101. (b) Fermentation is exothermic reaction.
102. (c) $\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}$.
103. (d) Use $\Delta H = \Delta E + \Delta n RT$
- $$\Delta H = 19 + 2 \times 2 \times 10^{-3} \times 300 = 20.2 \text{ kcal}; \Delta n = 2.$$
104. (d) $-20.6 - 8.8 \text{ KJ mol}^{-1} = -29.4 \text{ kJ}$.
106. (a) Subtract equation (ii) from (i).
107. (c) $\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}, \Delta H = -890.4 \text{ kJ} \quad \dots(i)$
- $$\text{C} + \text{O}_2 \rightarrow \text{CO}_2, \Delta H = -395.5 \text{ kJ} \quad \dots(ii)$$
- $$\text{C} + \text{O}_2 \rightarrow \text{CO}_2, \Delta H = -395.5 \text{ kJ} \quad \dots(ii)$$
- $$\text{H}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{H}_2\text{O}, \Delta H = -285.8 \text{ kJ} \quad \dots(iii)$$
- from (i), (ii), (iii).
- $$\Delta H_{\text{comb.}}(\text{CH}_4)$$
- $$= \Delta H_f(\text{CO}_2) + 2\Delta H_f(\text{H}_2\text{O}) - \Delta H_f(\text{CH}_4) - 2\Delta H_f(\text{O}_2)$$
- $$= -890.4 = -395.5 + 2(-285.5) - \Delta H_f(\text{CH}_4) - 2 \times 0$$
- $$\Delta H_f(\text{CH}_4) = -76.7 \text{ kJ mol}^{-1}.$$
108. (d) As methanoic acid is weak acid, heat of neutralization $< x$.
109. (d) Neutralization of a strong acid by a strong base is always same.
110. (c) $\text{S} + \text{O}_2 \rightarrow \text{SO}_2, \Delta H_f = -4.6 \text{ kJ}$
- $\therefore 0.5 \text{ gm. of sulphur on burning produce } 1 \text{ gm of } \text{SO}_2$
- $\therefore 32 \text{ gm of sulphur on burning produce } 64 \text{ gm. of } \text{SO}_2$
- $\therefore \Delta H = (-4.6 \text{ kJ}) \times 64 = -294.4 \text{ kJ}$.
111. (a) $3\text{O}_2 \rightleftharpoons 2\text{O}_3$ - energy is given out.
112. (b) $\Delta H \text{ per } 1.6 \text{ g} = \frac{72 \times 1.6}{180} = 0.64 \text{ kcal}$.
113. (a) $\text{C} + \text{O}_2 \rightarrow \text{CO}_2, \Delta H = -394 \text{ kJ} \quad \dots(i)$
- $$2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}, \Delta H = -568 \text{ kJ} \quad \dots(ii)$$
- $$\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}, \Delta H = -892 \text{ kJ} \quad \dots(iii)$$
- (i) + (ii) - (iii) and find the required result.
115. (a) No doubt heat evolved during neutralisation of 250 cm^3 of each acid and base is five time the heat evolved during neutralisation of 50 cm^3 of each acid and base but the quantity if solution taking heat is also five time thus same temperature rise is noticed.
116. (a) $\text{H}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{H}_2\text{O}_{(l)}; \Delta H = -285.8 \text{ KJ}$
- $$\text{H}_2\text{O}_{(l)} \rightarrow \text{H}_2\text{O}_{(g)}; \Delta H = 44 \text{ KJ}$$
- $$\therefore \text{H}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{H}_2\text{O}_{(g)}; \Delta H^\circ = -241.8 \text{ KJ}$$
117. (b) Given: Weight of iron burnt = 4 g ; Heat liberated = 29.28 KJ and atomic weight of iron (Fe) = 56 . We know that in ferric oxide (Fe_2O_3), 2 moles of iron or $2 \times 56 = 112 \text{ gram}$ of iron are burnt. We also know that when 4 grams of iron are burnt, then heat liberated = 29.28 kJ , therefore when 112 grams of the iron are burnt, then heat liberated = $\frac{29.28 \times 112}{4} = -819.8 \text{ kJ}$ (Minus sign due to liberation of heat).
118. (c) $\text{H}^+ + \text{OH}^- \rightarrow \text{H}_2\text{O}, \Delta H_{\text{neutralization}} = 13.7 \text{ kcal}$.
119. (b) $\Delta H / \text{mole of } \text{FeS} = \frac{3.77 \times 56}{2.1} = 100.5$.
120. (a) Heat of formation = $\frac{194}{2} = 97 \text{ kJ}$.
121. (a) $\Delta H = \Delta H_{\text{ioniz}} + \Delta H_{\text{neu}} = -50.6 = \Delta H_{\text{ioniz}} + (-55.9)$
- $$\Delta H_{\text{ioniz}} = +5.3 \text{ kJ/mol}$$
122. (a) Strong acid (HNO_3) and strong base (LiOH).
123. (d) $\Delta H = \Delta E + \Delta n RT$ or $\Delta E = \Delta H - \Delta n RT$
- $$\therefore \Delta E = +7.3 - \frac{1}{2} \times 0.002 \times 298 = 7.3 - 0.298 = 7 \text{ kcal}$$
124. (b) Heat evolved during burning of 39 g
- $$\text{C}_6\text{H}_6 = \frac{781.0 \times 39}{78} = 390.5 \text{ kcal mol}^{-1}$$
125. (b) By (i) + (ii); $\text{Na} + \frac{1}{2}\text{Cl}_2 \rightarrow \text{NaCl}, \Delta H = -196 \text{ kcal}$.
126. (b) $\text{C} + \text{O}_2 \rightarrow \text{CO}_{2(g)}, \Delta H_f^\circ = -393.5 \text{ kJ mol}^{-1} \quad \dots(i)$
- $$\text{C} + \frac{1}{2}\text{O}_2 \rightarrow \text{CO}_{(g)}, \Delta H_f^\circ = -110.5 \text{ kJ mol}^{-1} \quad \dots(ii)$$

By (ii) + (iii) - (i)

127. (c) More +ve is ΔH_s more is heat of solution.

128. (d) CS_2 is formed from its initial components carbon and sulphur so, ΔH is heat of formation of CS_2 .

129. (d) $\Delta H = 18500 = \Delta E + \Delta nRT$
or $18500 = \Delta E + (-1) \times 2 \times 298 = 19096 \text{ cal}.$

130. (b) Heat evolved during combustion of 0.39g

$$C_6H_6 = \frac{3250 \times 0.39}{78} = 16.25 \text{ kJ}.$$

131. (d) By (i) - (ii): $C + \frac{1}{2} O_2 \rightarrow CO$; $\Delta H = -229.2.$

132. (b) Strong acid (HCl) and strong base ($NaOH$) shows $\Delta H_{\text{neutralization}} = -57.3 \text{ kJ}.$

133. (d) By (i) - (ii) and find required result.

134. (a) $CO_{(g)} + \frac{1}{2} O_{2(g)} \rightarrow CO_{(g)}, \Delta n = 1 - 1 + \frac{1}{2} = -\frac{1}{2}$

$$\Delta H = \Delta E + \Delta nRT$$

$$\Delta H = -283.3 - \frac{1}{2} \times \frac{8.314}{1000} \times 290 = -284.5 \text{ kJ}.$$

135. (a) $H_2 + \frac{1}{2} O_2 \rightarrow H_2O \quad \Delta H = -188 \text{ kJ/mole} \quad \dots\dots(i)$

$H_2 + O_2 \rightarrow H_2O_2; \Delta H = -286 \text{ kJ/mole} \quad \dots\dots(ii)$

By $2 \times (i)$ and (ii)

$2H_2 + O_2 \rightarrow 2H_2O; \Delta H = -376 \text{ kJ/mole} \quad \dots\dots(iii)$

$2H_2 + 2O_2 \rightarrow 2H_2O_2 \quad \Delta H = -572 \text{ kJ/mole} \quad \dots\dots(iv)$

By (iii) - (iv)

136. (a) ΔH for $C_2H_6 = -341.1 \text{ Kcal}$

$$\text{its calorific value} = \frac{-341.1}{30} = -11.37 \text{ kcal/g}.$$

$$\Delta H \text{ for } C_2H_2 = -310.0 \text{ kcal}$$

$$\text{its Calorific value} = \frac{-310.0}{26} = -11.92,$$

hence C_2H_2 is a better fuel.

138. (c) For the decomposition of 9gm of water heat required = 142.5 kJ

we know $H_2O = 2 + 16 = 18$

Therefore heat required for decomposition of 18gm water
 $= \frac{18}{9} \times 142.5 = 285 \text{ KJ}$

Than, enthalpy of formation of water is reverse of heat required = - 285 kJ.

139. (d) $C_6H_{6(g)} + \frac{15}{2} O_{2(g)} \rightarrow 6CO_{2(g)} + 3H_2O_{(g)}$

$$\Delta n = 6 + 3 - 1 - \frac{15}{2} = +\frac{1}{2}.$$

140. (b) By $2 \times (i) + (ii) - (iii)$

$$\Delta H \text{ of methane} = 20.0 \text{ kcal}.$$

141. (c) Heat of neutralization of strong acid and weak base is less than $13.7 \text{ kcal mol}^{-1}.$

142. (d) $\Delta E = 0$ for a cyclic process.

143. (c) $22.0 \times 2 = 44 \text{ kcal}.$

144. (b) 0.3 mole OH^- , neutralize 0.3 mole of HNO_3

$$\text{Evolved heat,} = 57.1 \times 0.3 = 17.13 \text{ kJ}$$

146. (d) Compounds with high heat of formation are less stable because energy rich state leads to instability.

147. (b) CH_4 required = $\frac{445.15 \times 16}{890.3} = 8 \text{ gm}.$

148. (c) $C_{(s)} + 2H_{2(g)} \rightarrow CH_{4(g)} \quad \dots\dots(i)$

$C_{(s)} + O_{2(g)} \rightarrow CO_{2(g)} \quad \Delta H = -94 \text{ kcal mol}^{-1} \quad \dots\dots(ii)$

$H_{2(g)} + \frac{1}{2} O_{2(g)} \rightarrow H_2O_{(l)} \quad \Delta H = -68 \text{ kcal mol}^{-1} \dots\dots(iii)$

$$\Delta H = -213 \text{ kcal mol}^{-1} \quad \dots\dots(iv)$$

to obtain equation (i) operate-(ii) + $2 \times (iii) - (iv).$

149. (b) $\Delta H = +ve$ for endothermic reactions.

150. (b) It pertains to neutralization of strong acid weak base.

151. (d) Strong base (KOH) and strong acid (HCl)

153. (b) This reaction absorbed heat, so it is endothermic reaction.

154. (b) $C + O_2 \rightarrow CO_2, \Delta H = -94.3$

This is also heat of formation of CO_2

155. (b) $X = \frac{1}{2} Y.$

157. (a) Molecular weight of $NH_4NO_3 = 80$

$$\text{Heat evolved} = 1.23 \times 6.12$$

$$\therefore \text{Molar heat capacity} = 1.23 \times 6.12 \times C.$$

158. (d) Both X_e and F_2 are gaseous elements at $25^\circ C$ and in their standard states and form $XeF_{4(g)}$ hence $\Delta H_{(f)}^\circ = \Delta H_{\text{react}}^\circ.$

159. (c) According to Hess low, enthalpy change for a reaction does not depend on the nature of intermediate reaction steps.

160. (d) By (ii) - (i), $C_{gr} \rightarrow C_{dia}, \Delta H = +1.9.$

162. (c) Heat of neutralization of strong acid and strong base is equal to the $-57.32 \text{ KJ mol}^{-1}$

163. (c) $C + O_2 \rightarrow CO_2 \quad \Delta H = -393.5 \text{ KJ/mol}$

$\therefore 44 \text{ gm}$ of CO_2 form by which heat released

$$= -393.5 \text{ kJ}$$

$$\therefore 1\text{gm of } CO_2 \text{ form by which heat released} = -\frac{393.5}{44}$$

$$\therefore 35.2\text{gm (given) of } CO_2 \text{ form by which heat released}$$

$$= -\frac{393.5}{44} \times 35.2 = -315\text{kJ}$$

165. (c) Heat of formation of a substance is the heat exchanged when one mole of that substance is formed by its constituent elements.

$$\therefore \text{Heat evolved when 1 mole (44g) } CO_2 \text{ is formed} = 393\text{kJ}$$

$$\therefore \text{Heat evolved when 0.156 Kg (156g) is formed} = \frac{393 \times 156}{44}$$

$$\therefore \Delta H \text{ for the process} = 1572\text{kJ} = -1572.0\text{kJ}$$

166. (b) It is heat of neutralisation (13.7 Kcal) for strong acid and strong base.

$$\Delta H = -393.5\text{KJ mol}^{-1} \quad \text{.....(i)}$$

$$\Delta H = -283\text{KJ mol}^{-1} \quad \text{.....(ii)}$$

On subtracting equation (ii) from equation (i)

We get

The enthalpy of formation of carbon monoxide per mole = -110.5 KJ mol⁻¹

168. (d) 1 mole (i.e.,) 16gm of methane on combustion liberate 890 kJ

$$\therefore 3.2\text{gm will liberate} = \frac{890 \times 3.2}{16} = 178\text{KJ}$$

adding equation (i) and (ii) we can get

$$\Delta H = -12 + (-10) = -22$$

applying

$$(I) \times 8 + (II) \times 9 + (III)$$

$$\Delta H^\circ = -3920 - 2160 - 160 = 6240\text{KJ/mol}$$

$$\Delta H^\circ = \text{for 6 moles of octane} = 6240 \times 6$$

$$= 37440\text{KJ/mol} = -37.4\text{KJ}$$

On multiplying eq. (ii) by 3

Resulting equation can be obtained by subtracting eq. (i) from (iii)

Subtraction :

172. (c) HCl and KOH both are strong

Bond energy

$$\frac{1}{2} \times (ii) + \frac{1}{2} \times (iii) - (i), \text{ gives}$$

$$\Delta H = \left(+\frac{a}{2} + \frac{0.5a}{2} - a \right) \text{kJ/mole}$$

$$+ \frac{a}{2} + \frac{0.5a}{2} - a = -200$$

$$a = 800$$

2. (a) $4g H_2 = 2 \text{ moles}$. Bond energy for 1 mole of $H_2 = 208/2 = 104 \text{ kcal}$.

4. (d) By definition of Hess's law.

$$\Delta H = \sum B.E.(\text{Products}) - \sum B.E.(\text{Reactants})$$

$$= B.E.(HCl) - \left[\frac{1}{2} B.E.(H_2) + \frac{1}{2} B.E.(Cl_2) \right]$$

$$= -103 - \left[\frac{1}{2}(-104) + \frac{1}{2}(-58) \right]$$

$$= -103 - (-52 - 29) = -22 \text{ kcal}.$$

6. (c) First ionization potential of $Li = 5.4 eV$
Electron affinity of $Cl = 3.61 eV$
We have $\Delta H = I.P. - E.A.$
 $= 5.4 - 3.61 = 1.80 eV = 1.80 \times 1.6 \times 10^{-22} kJ$
 $\Delta H = 2.86 \times 10^{-22} kJ$,
for $1 mol$ Avogadro's number $= 6.02 \times 10^{23}$.
 $\Delta H = 2.86 \times 10^{-22} \times 6.02 \times 10^{23} = 170 kJ / mole.$
7. (b) $\frac{-166}{4} = -41.5 kJ / mole$.
8. (d) $\frac{1}{2} H_2 + \frac{1}{2} Cl_2 \rightarrow HCl$, $\Delta H = -90 kJ$
 $\therefore \Delta H = \frac{1}{2} E_{H-H} + \frac{1}{2} E_{Cl-Cl}$
or $-90 = \frac{1}{2} \times 430 + \frac{1}{2} \times 240 - E_{HCl}$
 $\therefore E_{H-Cl} = 425 kJ mol^{-1}$.
9. (b) $CH_4 \rightarrow C + 4H$, $\Delta H = 320$
 $E_{C-H} = 90 cal$
 $C_2H_6 \rightarrow 2C + 6H$, $\Delta H = 360$
 $\therefore 360 = E_{C-C} + 6E_{C-H}$
 $\therefore E_{C-C} = 360 - 320 = 40 cal$.
10. (b) $H-H + Br-Br \rightarrow 2H-Br$
 $\begin{array}{ccc} 433 + 192 & & 2 \times 364 \\ 625 & & 728 \end{array}$
Energy absorbed = Energy released
Net energy released $= 728 - 625 = 103 kJ$
 $i.e., \Delta H = -103 kJ$
14. (d) Spontaneous change shows $\Delta G = -ve$.
15. (b) $\Delta G = \Delta H - T\Delta S$, $T = 25 + 273 = 298 K$
 $= -11.7 \times 10^3 - 298 \times (-105) = 19590 J = 19.59 kJ$
18. (c) If $\Delta G = -ve$ reaction is spontaneous.
20. (b) $(dS)_{V,E} > 0, (dG)_{T,P} < 0$.
21. (b) Only high pressure favours the conversion.
22. (d) By $2 \times (ii) - (i) - (iii)$
 $H_{2(g)} + 2C_{(s)} \rightarrow C_2H_{2(g)}$, $\Delta G^\circ = 209 kJ$.
23. (b) $\Delta G = -2.303 RT \log K'$, Here $R = 2 cal$, $T = 300 K$
 $K' = \frac{10 \times 15}{3 \times 5} = 10$; $\Delta G = -2.303 \times 2 \times 300 \times \log_{10} 10$
 $= -2.303 \times 2 \times 300 \times 1 = -1381.8 cal$
24. (a) $\Delta G = \Delta H - T\Delta S$ (Gibb's free energy equation)
25. (d) $\Delta G = \Delta H - T\Delta S$
 $\Delta G = -382.64 - (-145.6) \times 10^{-3} \times 298$
 $= -339.3 kJ mol^{-1}$
26. (d) $\Delta G = \Delta H - T\Delta S$; $\Delta G = \Delta E + P\Delta V - T\Delta S$
For spontaneity ($\Delta G = -ve$)
 $\therefore \Delta G = -ve$, $\Delta E = +ve$
27. (a) $\Delta G = \Delta H - T\Delta S = 31400 - 1273 \times 32$
 $= 31400 - 40736 = -9336 cal$
28. (d) $\Delta G = \Delta H - T\Delta S$
 $0 = +30.558 - T \times 0.066$
or $T = \frac{30.558}{0.066} = 463 K$
If $(dG)_{T,P} = 0$ sign '=' mean. If is reversible process

Free energy and Work function

1. (d) ΔG at equilibrium = 0.
2. (b) For spontaneous change $\Delta G = -ve$.
3. (a) When $\Delta G = -ve$ than the reaction is spontaneous in nature.
5. (acd) When $\Delta H = +ve$ and $\Delta S = -ve$ than the reaction is non-spontaneous.
7. (c) Because the reaction is spontaneous.
8. (c) $\Delta G = -ve$.
9. (a) $\Delta G_T = nRT \ln \frac{P_2}{P_1}$.
10. (a) $\Delta G = 0$ for equilibrium.
11. (d) At equilibrium $\Delta G = 0$.
12. (a) $\Delta G^\circ = -2.303 RT \log K$
 $-4.606 = -2.303 \times 0.002 \times 500 \log K$
 $\log K = 2$, $K = 100$.
1. (b) Due to randomness of particles is reduced since entropy decreases.
2. (c) $\Delta H = nC_p \Delta T$
The process is isothermal therefore
 $\Delta G = 0$; $\therefore \Delta H = 0$
3. (d) $13.7 kcal = 57 kJ = 5.7 \times 10^4 J$.
4. (b) When strong acid and strong base neutralize each other than the value of heat generated is about $13.7 kcal$.
5. (b) Due to fall in temperature.
6. (d) $q_p = \Delta H$.
7. (d) $w = 2.303 RT \log \frac{V_2}{V_1}$. As it involves the ratio $\frac{V_2}{V_1}$, volume can be used in any units. (R should be in joules).
8. (b) $-\frac{dQ}{dW} = \frac{dQ}{dQ - dE}$; $dE = dW + dQ$; $-dW = dQ - dE$
 $= \frac{nc_p dT}{nc_p dT - nc_v dT} = \frac{c_p}{(c_p - c_v)}$

Critical Thinking Questions

$$= \frac{7R}{2R} \left\{ \text{for diatomic of gas } c_p = \frac{7R}{2} \right\}$$

$$\Delta n_g = 1 - 2 = -1; \Delta H = -0.31 \text{ KJ mol}^{-1}$$

$$P = 1.5 \text{ atm}, \Delta V = -50 \text{ mL} = -0.050 \text{ L}$$

$$\Delta H = \Delta E + P\Delta V$$

$$-0.31 = \Delta E - 0.0076; \Delta E = -0.3024 \text{ KJ}$$

10. (a) Since process is exothermic then heat is evolved due to this temperature of water increases.

11. (a) Because randomness is decreases.

12. (c) Conversion of graphite into diamond is an endothermic reaction. So, heat of diamond is higher than that of graphite. But ΔS would be negative for the conversion of graphite into diamond.

13. (c) ΔH and ΔS both are +ve for spontaneous change, and $\Delta H = +ve$ for endothermic reaction.

14. (a) $\Delta G = \Delta H - T\Delta S$ is negative for spontaneity.

15. (a) Entropy (a measure of disorder) of universe is increasing toward maximum. This is II law of thermodynamics.

16. (a) For a pure substance T_A and T_B represent the same temperature. Hence A is a correct choice.

17. (a) For endothermic reaction enthalpy of products (H_P) > enthalpy of reactant (H_R)

Hence, change in enthalpy,

$$\Delta H = H_P - H_R = \text{Positive}$$

18. (d) Suppose the no. of gm, 1gm for each case so the max. no of mole expected for $SO_2(g)$ which has to expected maximum entropy.

By (i) - (ii)

20. (a) Bomb calorimeter is used to measure heat of reaction.

21. (b) Larger the number of C and H atoms, greater is the heat of combustion.

22. (c) The bomb calorimeter is used to measure ΔE .

25. (b) Backmann thermometer is used to measure low temperature.

26. (b) Heat required to rise the temperature of a body by 1K called thermal capacity of the body.

27. (e) Mechanical work is important only in gases as they undergo appreciable change in volume.

28. (d) It is Lavoisier and Laplace law. This is another law of thermochemistry which was put forward before Hess's law.

29. (a) It is also known as "constant heat summation" law. It state that the total amount of heat evolved or absorbed in a reaction is same whether the reaction takes place in one step or in a number of steps.

30. (c) In this reaction $\Delta n = 2 - 4 = -2$ so $\Delta H \neq \Delta E$.

31. (a) $Q = \frac{18.94 \times 0.632 \times 0.998 \times 122}{1.89} = 771.1 \text{ Kcal}$

32. (c) $\Delta H = E_a$ for forward reaction $-E_a$ for backward reaction $= 19 - 9 = 10 \text{ kJ}.$

33. (d) $Q = 18.94 \times 0.632 \times 0.998 \times 1000$

$$-57.4 + x = -12.13$$

$$x = 45.2$$

34. (c) Thermodynamics is a reversible process in which surroundings are always equilibrium with system.

35. (a) $1 \text{ cal} = 4.18 \text{ J} = 4.18 \times 10^7 \text{ erg} = \frac{4.18}{1.602} \times 10^{19} \text{ eV}.$

36. (b) Order of bond energy : $Cl_2 > Br_2 > F_2 > I_2$.

37. (c) Heat energy is also involved when one allotropic form of an element is converted in to another. graphite is the stabler allotrope because the heat of transformation of $C_{(diamond)} \rightarrow C_{(graphite)}.$

$$\Delta H_{\text{transformation}} = -94.5 - (-94.0)$$

$$= -0.5 \text{ kcal}.$$

38. (b) The compound Y possess less energy than the X and thus Y is more stable than X.

39. (c) Both ΔH and Δp are positive.

40. (a) For equilibrium $\Delta G^0 = 0.$

41. (b) Equilibrium constant is decreases with temperature and ΔH is also decreases so it is -ve.

42. (a) The fusion temperature of naphthalene is minimum, because it is non-polar covalent compound and has less fusion temperature.

43. (a) The bond energy of C-H bond is $y \text{ kcal mol}^{-1}.$

$$\text{Net. energy released} = 2346 - 2253 = 93 \text{ kJ}$$

$$\text{i.e. } \Delta H = -93 \text{ kJ}.$$

45. (d) If $E = +ve$ then the cell reaction will be spontaneous.
46. (d) All are the correct statements.
47. (d) $CH_2 = CH_{2(g)} + H_{2(g)} \rightarrow H_3C - CH_{3(g)}$
- $$\begin{array}{rcl} 141 \times 4 & = & 1656 \\ 615 \times 1 & = & 615 \\ 435 \times 1 & = & \underline{435} \\ \hline & & 2706 \end{array} \quad \begin{array}{rcl} 141 \times 6 & = & 2484 \\ 347 \times 1 & = & \underline{347} \\ \hline & & 2831 \end{array}$$
- $$\Delta H = 2706 - 2831 = -125 \text{ KJ}$$
48. (b) It means that the heat absorbed when one gram molecule of HCl is formed from its elements at $298K$ is $= 22.060 \text{ kcal}$.
49. (d) eq. (i) + eq. (ii) find the required result and divide by 2.
50. (d) For complete neutralization of strong acid and strong base energy released is 57.32 KJ/mol
- $$\text{No. of mole of } H_2SO_4 = \frac{0.2 \times 50}{1000} = 10^{-2}$$
- $$\text{No. of mole of } KOH = \frac{1}{1000} \times 50 = 5 \times 10^{-2}$$
- $$\text{So } = 57.32 \times 10^{-2} = 0.5732 \text{ KJ} = 573.2 \text{ Joule.}$$
51. (b) For Combustion reaction, ΔH is negative, $\Delta n = (16 + 18) - (25 + 2) = +7$, so ΔS is $+ve$, reaction is spontaneous, hence ΔG is $-ve$.
52. (a) $\Delta G = \Delta H - T\Delta S$, $T = 27 + 273 = 300 \text{ K}$
- $$\Delta G = (-285.8) - (300)(-0.163) = -236.9 \text{ kJ mol}^{-1}$$

angular and show some polarity which is higher than that of ethanol so both assertion and reason are correct but reason is not explanation assertion.

8. (a) The assertion that the increase in internal energy for the vaporisation of one mole of water at 1 atm and 373 K is zero is true and this is because that for all isothermal process internal energy is zero.
9. (b) $N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$
- We know that $\Delta H = \Delta E + \Delta nRT$
- $$\Delta n = 2 - 2 = 0 \text{ hence, } \Delta nRT = 0$$
- Therefore, $\Delta H = \Delta E$
10. (a) The enthalpies of neutralisation of strong acids and strong bases are same they are 13.7 Kcal . The reason is that it is heat of formation of water from H^+ and OH^- ions. $H^+ + OH^- \rightarrow H_2O, \Delta H = 13.7 \text{ Kcal}$. Thus, both assertion and reason are true.
11. (a) Zeroth (law of temperature) can also be summarized as two objects at different temperature in thermal contact with each other tend to move towards the same temperature.
12. (d) Photo chemical reactions have $+ve \Delta G$.

Assertion & Reason

1. (b) Assertion and reason show, reaction at equilibrium state in which $\Delta G = 0$, $\Delta S = 0$, $\Delta H = 0$.
2. (b) It is correct that on touching the ice we feel cold because ice absorb heat from our hand.
3. (b) Entropy of ice is less than water because water molecules in solid state lose kinetic energy and hence their tendency of movement minimise. Hence entropy decrease in solid state. The reason that ice have cage like structure is also correct but reason is not or correct explanation for assertion.
4. (c) During isothermal expansion of an ideal gas against vacuum is zero because expansion is isothermal. The reason, that volume occupied by the molecules of an ideal gas is zero, is false.
5. (a) it is fact that absolute values of internal energy of substances can not be determined. It is also true that to determine exact values of constituent energies of the substance is impossible.
6. (b) Mass and volume are extensive properties. mass/volume is also an extensive parameter. Here, both assertion and reason are true.
7. (b) The molar entropy of vaporization of water it differ from ethanol due to hydrogen bonding according to VSEPR theory water molecule having two lone pair of electron by which it
14. (e) Heat absorbed in a reaction at constant temperature and constant volume $(Q_v) = E$.
15. (c) Values of state functions depend only on the state of the system and not on how it is reached.
16. (a) The properties whose magnitude depends upon the quantity of matter present in the system are called extensive properties.
17. (c) Combustion reactions are always accompanied by the evolution of heat therefore, for such reactions the value of ΔH is always negative.

18. (b) In an isothermal process change in internal energy (ΔE) is zero (as it is a function of temperature). $\therefore$ According to first law of thermodynamics

$$\therefore q + w = \Delta E, \text{ hence } Q = -W \text{ (if } \Delta E = 0)$$

If a system undergoes a change in which internal energy of the system remains constant (i.e., $\Delta E = 0$), then $-W = Q$.

This means that work done by the system equals the heat absorbed by the system.

20. (e) If a refrigerator's door is kept open room gets heated as heat energy is released to the surroundings.
21. (c) Enthalpy is zero but entropy is not zero. Vibrational motion exists even at absolute zero.
22. (c) It may involve increase or decrease in temperature of the system. Systems in which such process occur, are thermally insulated from the surroundings.

Thermodynamics and Thermochemistry

Self Evaluation Test -10

1. The internal energy change when a system goes from state *A* to state *B* is 40 kJ/mole. If the system goes from *A* to *B* by a reversible path and returns to state *A* by an irreversible path what would be the net change in internal energy

[CBSE PMT 2003]

- (a) 40 kJ (b) > 0 kJ
(c) < 40 kJ (d) Zero

2. The correct relationship is [DPMT 2002]

- (a) $\Delta H + P\Delta V = \Delta V$ (b) $\Delta H - \Delta nRT = \Delta E$
(c) $\Delta E + \Delta nRT = \Delta P$ (d) None of these

3. For $\text{CaCO}_3(\text{s}) \rightleftharpoons \text{CaO}(\text{s}) + \text{CO}_2(\text{g})$ at 977°C ; $\Delta H = 176 \text{ kJ mol}^{-1}$, then ΔE is [BVP 2003]

- (a) 180 kJ (b) 186.4 kJ
(c) 165.6 kJ (d) 160 kJ

4. Values of ΔH and ΔS for five different reactions are given below.

Reaction	$\Delta H (\text{kJ mol}^{-1})$	$\Delta S (\text{JK}^{-1} \text{mol}^{-1})$
I	+98.0	+14.8
II	-55.5	-84.6
III	+28.3	-17.0
IV	-40.5	+24.6
V	+34.7	0.0

On the basis of these values predict which one of these will be spontaneous at all temperature

[Kerala PMT 2004; KCET 1988,90]

- (a) Reaction I (b) Reaction II
(c) Reaction III (d) Reaction IV
(e) Reaction V

5. Molar heat capacity of water in equilibrium with ice at constant pressure is [IIT JEE 1997]

- (a) Zero (b) Infinity (∞)
(c) $40.45 \text{ kJ K}^{-1} \text{mol}^{-1}$ (d) 75.48 J K^{-1}

6. Internal energy does not include

[AIIMS 1999; CPMT 2000]

- (a) Nuclear energy
(b) Rotational energy
(c) Vibrational energy
(d) Energy arising by gravitational pull

7. Two moles of an ideal gas expand spontaneously into a vacuum. The work done is [AMU 2000]

- (a) 2 Joule (b) 4 Joule
(c) Zero (d) Infinite

8. Heat exchanged in a chemical reaction at constant temperature and constant pressure is called as

[BHU 1998; Pb. PET 2000; MP PET 2002]

- (a) Internal energy (b) Enthalpy

- (c) Entropy (d) Free energy

9. Which of the following statements is true [KCET 2002]

- (a) ΔE is always greater than ΔH
(b) ΔE is always less than ΔH
(c) ΔE may be lesser or greater or equal to ΔH
(d) ΔE is always proportional to ΔH

10. Mass and energy are conserved is demonstrated by

[MH CET 2002]

- (a) First law of thermodynamics
(b) Law of conservation of energy
(c) Law of conservation of mass
(d) Modified form of 1st law of thermodynamics

11. The enthalpy of the reaction,

- (a) $\Delta H_1 < \Delta H_2$ (b) $\Delta H_1 + \Delta H_2 = 0$
(c) $\Delta H_1 > \Delta H_2$ (d) $\Delta H_1 = \Delta H_2$

12. A reaction occurs spontaneously if

[MP PET 2002; CBSE PMT 2005]

- (a) $T\Delta S < \Delta H$ and both ΔH and ΔS are +ve
(b) $T\Delta S > \Delta H$ and both ΔH and ΔS are +ve
(c) $T\Delta S = \Delta H$ and both ΔH and ΔS are +ve
(d) $T\Delta S > \Delta H$ and ΔH is +ve and ΔS is -ve

13. Which expression is correct for the work done in adiabatic reversible expansion of an ideal gas [AMU 2002]

(a) $W = nRT \ln \frac{V_2}{V_1}$ (b) $W = n_e \ln \frac{T_2}{T_1}$

(c) $W = P\Delta V$ (d) $W = -\int_1^2 P dV$

14. If an endothermic reaction is non-spontaneous at freezing point of water and becomes feasible at its boiling point, then

[AIEEE 2002]

- (a) ΔH is -ve, ΔS is +ve
(b) ΔH and ΔS both are +ve

- (c) ΔH and ΔS both are $-ve$
(d) ΔH is $+ve$, ΔS is $-ve$
15. What is the entropy change (in $JK^{-1}mol^{-1}$) when one mole of ice is converted into water at $0^\circ C$ (The enthalpy change for the conversion of ice to liquid water is $6.0 kJ mol^{-1}$ at $0^\circ C$) [CBSE PMT 2003]
(a) 21.98 (b) 20.13
(c) 2.013 (d) 2.198
16. One mole of $NaCl$ (s) on melting absorbed $30.5 kJ$ of heat and its entropy is increased by $28.8 JK^{-1}$. The melting point of $NaCl$ is [DPMT 2004]
(a) 1059 K (b) 30.5 K
(c) 28.8 K (d) 28800 K
17. The enthalpy change (ΔH) for the process $N_2H_4(g) \rightarrow 2N(g) + 4H(g)$ is $1724 kJ mol^{-1}$. If the bond energy of $N-H$ bond in ammonia is $391 kJ mol^{-1}$. What is the bond energy of $N-N$ bond in N_2H_4 [MP PMT 2004]
(a) $160 kJ mol^{-1}$ (b) $391 kJ mol^{-1}$
(c) $1173 kJ mol^{-1}$ (d) $320 kJ mol^{-1}$
18. Liquid ammonia is used in refrigeration because of its [DCE 2003]
(a) High dipole moment
(b) High heat of vaporisation
(c) High basicity
(d) All of these
19. A cylinder of gas supplied by Bharat Petroleum is assumed to contain $14 kg$ of butane. It a normal family requires $20,000 kJ$ of energy per day for cooking, butane gas in the cylinder last for Days [Kerala PMT 2004]
(ΔH_c of $C_4H_{10} = -2658 kJ$ per mole)
(a) 15 days (b) 20 days
(c) 50 days (d) 40 days
(e) 32 days
20. The heat of neutralization of HCl by $NaOH$ under certain condition is $-55.9 kJ$ and that of HCN by $NaOH$ is $-12.1 kJ$. the heat of ionization of HCN is [MP PET 2001]
(a) $-68.0 kJ mol^{-1}$ (b) $-43.8 kJ mol^{-1}$
(c) $68.0 kJ mol^{-1}$ (d) $43.8 kJ mol^{-1}$
21. Equilibrium constant of a reaction is related to [AIIMS 1991]
(a) Standard free energy change ΔG°
(b) Free energy change ΔG
(c) Temperature T
(d) None
22. The standard Gibbs free energy change ΔG° is related to equilibrium constant K_p as [MP PET/PMT 1998]
(a) $K_p = -RT \ln \Delta G^\circ$ (b) $K_p = \left(\frac{e}{RT} \right)^{\Delta G^\circ}$
(c) $K_p = -\frac{\Delta G^\circ}{RT}$ (d) $K_p = e^{-\frac{\Delta G^\circ}{RT}}$
23. The standard enthalpy of the decomposition of N_2O_5 to NO_2 is $58.04 kJ$ and standard entropy of this reaction is $176.7 J/K$. The standard free energy change for this reaction at $25^\circ C$ is [DCE 2004]
(a) $-5.38 kJ$ (b) $5.38 kJ$
(c) $5.38 kJ$ (d) $-538 kJ$
24. For the equilibrium $H_2O(l) \rightleftharpoons H_2O(g)$ at 1 atm and 298 K [AIIMS 2004]
(a) Standard free energy change is equal to zero ($\Delta G^\circ = 0$)
(b) Free energy change is less than zero ($\Delta G < 0$)
(c) Standard free energy change is less than zero ($\Delta G^\circ < 0$)
(d) Standard free energy change is greater than zero ($\Delta G^\circ > 0$)
25. For reaction $Ag_2O(s) \rightarrow 2Ag(s) + (1/2)O_2(g)$ the value of $\Delta H = 30.56 kJ mol^{-1}$ and $\Delta S = 0.066 kJ K^{-1} mol^{-1}$. Temperature at which free energy change for reaction will be zero, is [MH CET 1999]
(a) 373 K (b) 413 K
(c) 463 K (d) 493 K

AS Answers and Solutions

(SET -10)

$$\Delta H = 40 - 40 = 0.$$

2. (b) $\Delta H = \Delta E + \Delta nRT$.

3. (c) $\Delta n = 1 - 0 = 1$

$$\Delta E = \Delta H + \Delta nRT$$

$$\Delta E = +176 - 1 \times \frac{8.314}{1000} \times 1240 = 165.6 \text{ kJ}.$$

4. (d) A spontaneous process is accompanied by decrease in enthalpy and increase in entropy means ΔH is negative and ΔS is positive.

5. (b) $C_p = \left(\frac{\partial H}{\partial T} \right)_p$, At equilibrium T is constant i.e. $\delta T = 0$,
thus $C_p = \infty$.

6. (d) $E = E_{\text{ele.}} + E_{\text{nucl.}} + E_{\text{chemical}} + E_{\text{potential}} + E_{\text{kinetic}}(E_t + E_v + E_r).$

7. (c) An ideal gas under going expansion in vacuum shows, $\Delta E = 0, W = 0$ and $q = 0$.

8. (b) $\Delta H = q_p$.

9. (c) ΔE may be greater or lesser or equal to ΔH .
 $\therefore \Delta H = \Delta E + P\Delta V = \Delta E + \Delta nRT$.

10. (d) It is a modified form of 1st law of thermodynamics. It is a conservation law of mass and energy.

11. (a) for reaction (i) $\Delta n_1 = 0.5$

for reaction (ii) $\Delta n_2 = 1.5$

So, $\Delta H_1 < \Delta H_2$

12. (b) For spontaneous reaction ΔG should be negative
 $\Delta G = \Delta H - T\Delta S = (+ve) - T(+ve)$

If $T\Delta S > \Delta H$ then ΔG will be negative and reaction will be spontaneous.

13. (b) $W = P\Delta V$.

14. (b) ΔH and ΔS both are +ve than reaction is spontaneous.

15. (a) $\Delta S = \frac{q_{\text{rev}}}{T} = \frac{6000}{273} = 21.98 \text{ JK}^{-1} \text{ mol}^{-1}$

16. (a) $\text{NaCl(s)} \rightleftharpoons \text{NaCl(l)}$

Given that : $\Delta H = 30.5 \text{ KJ mol}^{-1}$

$$\Delta S = 28.8 \text{ JK}^{-1} = 28.8 \times 10^{-3} \text{ KJ K}^{-1}$$

By using $\Delta S = \frac{\Delta H}{T}$

$$= \frac{30.5}{28.8 \times 10^{-3}} = 1059 \text{ K}$$

means their energy = $391 \times 4 = 1564$

so the bond energy of N-N in N_2H_4

$$= 1724 - 1564 = 160 \text{ KJ/mol}$$

18. (b) Ammonia has high heat of vaporisation hence is used in refrigeration.

19. (e) Calorific value of butane

$$= \frac{\Delta H_c}{\text{mol. wt.}} = \frac{2658}{58} = 45.8 \text{ KJ/gm}$$

Cylinder consist 14Kg of butane means 14000gm of butane

$$\therefore 1 \text{ gm gives } 45.8 \text{ KJ}$$

$$\therefore 14000 \text{ gm gives } 14000 \times 45.8$$

$$= 641200 \text{ KJ}$$

Family need 20,000 KJ/day

$$\text{So gas full fill the requirement for } \frac{641200}{20,000} = 32.06 \text{ days}$$

20. (d)

21. (a) $\Delta G^\circ = -2.303 \log k$.

22. (d) $K_p = e^{-\Delta G^\circ / RT}$.

23. (d)

24. (b) For reaction $\text{H}_2\text{O(l)} \rightleftharpoons \text{H}_2\text{O(g)}$

$$\Delta n = 1 \text{ means positive}$$

so when Δn is positive then $\Delta G < 0$.

25. (c) $\Delta G = \Delta H - T\Delta S$

$$\Delta G = 0 \text{ at equilibrium}$$

$$\therefore \Delta H = T\Delta S \text{ or } 30.56 = T \times 0.066$$

$$T = 463 \text{ K}.$$

Chapter 11 Chemical Kinetics

The branch of physical chemistry which deals with the rate at which the chemical reactions occur, the mechanism by which the chemical reactions take place and the influence of various factors such as concentration, temperature, pressure, catalyst etc., on the reaction rates is called the chemical kinetics.

Types of chemical reactions

On the basis of reaction rates, the chemical reactions have been classified into the following three types,

(1) **Very fast or instantaneous reactions** : These reactions occur at a very fast rate generally these reactions involve ionic species and known as ionic reactions. It is almost impossible to determine the rates of these reactions.

Examples

(2) **Moderate reaction** : These reactions proceed with a measurable rates at normal temperature and it is *these reactions are studied in chemical kinetics*. Mostly these reactions are molecular in nature.

Examples

(3) **Very slow reactions** : These reactions are extremely slow and take months together to show any measurable change.

Examples

Rate of a reaction

The rate (speed or velocity) of a reaction is the change in concentration in per unit time.

$$\frac{\Delta x}{\Delta t} \text{ or } \frac{dx}{dt} = \left(\frac{x_2 - x_1}{t_2 - t_1} \right)$$

where Δx or dx is the concentration change, i.e., $(x_2 - x_1)$ in the time interval Δt or dt , i.e., $(t_2 - t_1)$.

Concentration is generally expressed in active mass, i.e., mole L

- The rate measured over a long time interval is called *average rate* and the rate measured for an infinitesimally small time interval is called *instantaneous rate* and

$$\text{Instantaneous rate} = (\text{Average rate})_{\Delta t \rightarrow 0}$$

- For the reaction $aA + bB \rightarrow cC + dD$

Rate of disappearance of a reactant is negative

$$-\frac{d[A]}{dt} = \text{Rate of disappearance of A}$$

$$-\frac{d[B]}{dt} = \text{Rate of disappearance of B}$$

Rate of formation of a product is positive

$$\frac{d[C]}{dt} = \text{Rate of formation of C}$$

$$\frac{d[D]}{dt} = \text{Rate of formation of D}$$

- In terms of stoichiometric coefficient rate may be expressed as

$$\frac{dx}{dt} = -\frac{1}{a} \frac{d[A]}{dt} = -\frac{1}{b} \frac{d[B]}{dt} = \frac{1}{c} \frac{d[C]}{dt} = \frac{1}{d} \frac{d[D]}{dt}$$

- The rate of reaction is always **positive**.

- The rate of chemical reaction decreases as the reaction proceeds.

- Unit of rate of a reaction = $\frac{\text{Unit of conc.}}{\text{Unit of time}} = \text{mole } L^{-1} \text{ time}^{-1}$

In term of gaseous reaction the unit is *atm time* and

$$\text{Rate in atm time} = \text{Rate in mole } L^{-1} \text{ time}^{-1} \times RT$$

Factors affecting rate of a reaction

The rate of a chemical reaction depends on the following things

(1) **Nature of reactants**

(i) **Physical state of reactants** : This has considerable effect over rate of reaction.

Gaseous state > Liquid state > Solid state →

Decreasing rate of reaction

(ii) **Physical size of the reactants** : Among the solids, rate increases with decrease in particle size of the solid.

(iii) **Chemical nature of the reactants**

(a) Reactions involving polar and ionic substances including the proton transfer reactions are usually very fast. On the other hand, the reaction in which bonds are rearranged, or electrons transferred are slow.

(b) Oxidation-reduction reactions, which involve transfer of electrons, are also slow as compared to the ionic substance.

(c) Substitution reactions are relatively much slower.

(2) **Effect of temperature** : The rate of chemical reaction generally increases on increasing the temperature. The rate of a reaction becomes almost double or tripled for every 10°C rise in temperature.

Temperature coefficient of a reaction is defined as the ratio of rate constants at two temperatures differing by (generally 25°C and 35°C) 10°C .

$$\mu = \text{Temperature coefficient} = \frac{k \text{ at } (t + 10^\circ\text{C})}{k \text{ at } t^\circ\text{C}} = \frac{k_{35^\circ\text{C}}}{k_{25^\circ\text{C}}}$$

(3) **Concentration of reactants** : The rate of a chemical reaction is directly proportional to the concentration of the reactants means rate of reaction decreases with decrease in concentration.

(4) **Presence of catalyst** : The function of a catalyst is to lower down the activation energy. The greater the decrease in the activation energy caused by the catalyst, higher will be the reaction rate.

(5) **Effect of sunlight** : There are many chemical reactions whose rate are influenced by radiations particularly by ultraviolet and visible light. Such reactions are called photochemical reactions. For example, Photosynthesis, Photography, Blue printing, Photochemical synthesis of compounds etc.

The radiant energy initiates the chemical reaction by supplying the necessary activation energy required for the reaction.

Law of mass action and Rate constant

The rate at which a substance reacts is directly proportional to its active mass and the rate at which a reaction proceeds is proportional to the product of the active masses of the reacting substances.

- For a reaction, $aA + bB \rightarrow \text{product}$

$$\text{Rate} = \left(\frac{dx}{dt}\right) \propto [A]^a[B]^b ; \left(\frac{dx}{dt}\right) = k[A]^a[B]^b$$

Where k is called **rate constant** or **velocity constant**.

When $[A] = [B] = 1 \text{ mol/litre}$, then $\frac{dx}{dt} = k$

Thus, rate constant k is also called **specific reaction rate**.

- The value of rate constant depends on, nature of reactant, temperature and catalyst. It is independent of concentration of the reactants.

$$\bullet \text{ Unit of rate constant} = \left[\frac{\text{litre}}{\text{mol}}\right]^{n-1} \times \text{sec}^{-1} = \left[\frac{\text{mol}}{\text{litre}}\right]^{1-n} \times \text{sec}^{-1}$$

Where n = order of reaction.

Rate law : Molecularity and Order of a reaction

Molecularity is the sum of the number of molecules of reactants involved in the balanced chemical equation. Molecularity of a complete reaction has no significance and overall kinetics of the reaction depends upon the rate determining step. *Slowest step is the rate-determining step.* This was proposed by *Van't Hoff*.

Example : $\text{NH}_4\text{NO}_2 \rightarrow \text{N}_2 + 2\text{H}_2\text{O}$ (Unimolecular)

$\text{NO} + \text{O}_3 \rightarrow \text{NO}_2 + \text{O}_2$ (Bimolecular)

$2\text{NO} + \text{O}_2 \rightarrow 2\text{NO}_2$ (Trimolecular)

The total number of molecules or atoms whose concentration determine the rate of reaction is known as order of reaction.

Order of reaction = Sum of exponents of the conc. terms in rate law

For the reaction $x\text{A} + y\text{B} \rightarrow \text{Products}$

The rate law is $\text{Rate} = [\text{A}]^x[\text{B}]^y$

Then the overall order of reaction, $n = x + y$

where x and y are the orders with respect to individual reactants.

- If reaction is in the form of reaction mechanism then the order is determined by the slowest step of mechanism.

(Here, the overall order of reaction is equal to two.)

- Molecularity of a reaction is derived from the mechanism of the given reaction. Molecularity can not be greater than three because more than three molecules may not mutually collide with each other.

- Molecularity of a reaction can't be zero, *negative* or fractional. order of a reaction may be zero, negative, positive or in fraction and greater than three. Infinite and imaginary values are not possible.

- When one of the reactants is present in the large excess, the second order reaction conforms to the first order and is known as **pseudo unimolecular reaction**. (Table 11.1)

Table : 11.1 Order and molecularity of some reaction

S. No.	Chemical equation	Molecularity	Rate law	Order w.r.t.		
				First reactant	Second reactant	Overall
1.	$a\text{A} + b\text{B} \rightarrow \text{product}$	$a + b$	$\left(\frac{dx}{dt}\right) = k[\text{A}]^a[\text{B}]^b$	a	b	$a + b$
2.	$a\text{A} + b\text{B} \rightarrow \text{product}$	$a + b$	$\left(\frac{dx}{dt}\right) = k[\text{A}]^2[\text{B}]^0$	2	zero, if B is in excess	2
3.	$2\text{H}_2\text{O}_2 \xrightarrow{\text{Pt}, \Delta} 2\text{H}_2\text{O} + \text{O}_2$	2 (Bimolecular)	$\left(\frac{dx}{dt}\right) = k[\text{H}_2\text{O}_2]$	1*	-----	1

4.	$CH_3COOC_2H_5 + H_2O \xrightarrow{H^+} CH_3COOH + C_2H_5OH$	2 (Bimolecular)	$\left(\frac{dx}{dt}\right) = k[CH_3COOC_2H_5]$	1*	Zero, if H_2O is in excess	1
5.	$C_{12}H_{22}O_{11} + H_2O \xrightarrow{H^+}$ Sucrose $C_6H_{12}O_6 + C_6H_{12}O_6$ Glucose Fructose	2 (Bimolecular)	$\left(\frac{dx}{dt}\right) = k[C_{12}H_{22}O_{11}]$	1*	Zero, if H_2O is in excess	1
6.	$(CH_3)_3CCl + OH^- \rightarrow (CH_3)_3COH + Cl^-$	2 (Bimolecular)	$\left(\frac{dx}{dt}\right) = k[(CH_3)_3CCl]$	1*	Zero, if OH^- does not take part in slow step	1
7.	$CH_3Cl + OH^- \rightarrow CH_3OH + Cl^-$	2 (Bimolecular)	$\left(\frac{dx}{dt}\right) = k[CH_3Cl][OH^-]$	1	1	2
8.	$C_6H_5N_2Cl \xrightarrow{\Delta} C_6H_5Cl + N_2$	1 (Unimolecular)	$\left(\frac{dx}{dt}\right) = k[C_6H_5N_2Cl]$	1	---	1
9.	$CH_3CHO \xrightarrow{\Delta} CH_4 + CO$	1 (Unimolecular)	$\left(\frac{dx}{dt}\right) = k[CH_3CHO]^{3/2}$	1.5	---	1.5
10.	$H_2O_2 + 2I^- + 2H^+ \rightarrow 2H_2O + I_2$	5	$\left(\frac{dx}{dt}\right) = k[H_2O_2][I^-]$	1	1 (His medium)	2
11.	$2O_3 \rightarrow 3O_2$	2 (Bimolecular)	$\left(\frac{dx}{dt}\right) = k[O_3]^2[O_2]$	1	-1 with respect to O_3	1

*Pseudo-unimolecular reactions.

Table : 11.2 Rate constant and other parameters of different order reactions

Order	Rate constant	Unit of rate constant	Effect on rate by changing conc. to m times	(Half-life period) $T_{1/2}$
0	$k_0 = \frac{x}{t}$	conc. time (mol L ⁻¹ s)	No change	$\frac{a}{2k_0}$
1	$k_1 = \frac{2.303}{t} \log_{10} \left(\frac{a}{a-x} \right), C = C_0 e^{-k_1 t}$ $N = N_0 e^{-k_1 t}, k_1 = \frac{2.303}{(t_2 - t_1)} \log_{10} \frac{(a - x_1)}{(a - x_2)}$	time ⁻¹ (s)	m times	$\frac{0.693}{k_1}$
2	$k_2 = \frac{1}{t} \left[\frac{1}{(a-x)} - \frac{1}{a} \right] = \frac{x}{ta(a-x)}$ (for the case when each reactant has equal concentration) $k_2 = \frac{2.303}{t(a-b)} \log_{10} \left[\frac{b(a-x)}{a(b-x)} \right]$ (for the case when both reactants have different concentration)	conc. time ⁻¹ (mol L ⁻¹ s) L mol ⁻¹ s	m times	$\frac{1}{k_2 a}$
3	$k_3 = \frac{1}{2t} \left[\frac{1}{(a-x)^2} - \frac{1}{a^2} \right]$	conc. time ⁻¹ (mol L ⁻¹) ² s L ² mol ⁻² s	m times	$\frac{3}{2k_3 a^2}$
n	$k_n = \frac{1}{(n-1)t} \left[\frac{1}{(a-x)^{n-1}} - \frac{1}{a^{n-1}} \right]; n \geq 2$	conc. time ⁻¹ (mol L ⁻¹) ⁿ⁻¹ s L ⁿ⁻¹ mol ¹⁻ⁿ s	m times	$\frac{2^{n-1} - 1}{(n-1)k_n(a)^{n-1}}$

Methods for determination of order of a reaction(i) **Integration method** (Hit and Trial method)

(i) The method can be used with various sets of a, x and t with integrated rate equations.

(ii) The value of k is determined and checked for all sets of a, x and t .

(iii) If the value of k is constant, the used equation gives the order of reaction.

(iv) If all the reactants are at the same molar concentration, the kinetic equations are :

$$k = \frac{2.303}{t} \log_{10} \frac{a}{(a-x)} \quad (\text{For first order reactions})$$

$$k = \frac{1}{t} \left[\frac{1}{a} - \frac{1}{a-x} \right] \quad (\text{For second order reactions})$$

$$k = \frac{1}{2t} \left[\frac{1}{(a-x)^2} - \frac{1}{a^2} \right] \quad (\text{For third order reactions})$$

(2) **Half-life method** : This method is employed only when the rate law involved only one concentration term.

$$t_{1/2} \propto a^{1-n}; t_{1/2} = ka^{1-n}; \log t_{1/2} = \log k + (1-n) \log a$$

A plotted graph of $\log t_{1/2}$ vs $\log a$ gives a straight line with slope $(1-n)$, determining the slope we can find the order n . If half-life at different concentration is given then,

$$(t_{1/2})_1 \propto \frac{1}{a_1^{n-1}}; (t_{1/2})_2 \propto \frac{1}{a_2^{n-1}}; \frac{(t_{1/2})_1}{(t_{1/2})_2} = \left(\frac{a_2}{a_1}\right)^{n-1}$$

$$\log_{10} (t_{1/2})_1 - \log_{10} (t_{1/2})_2 = (n-1) [\log_{10} a_2 - \log_{10} a_1]$$

$$n = 1 + \frac{\log_{10} (t_{1/2})_1 - \log_{10} (t_{1/2})_2}{(\log_{10} a_2 - \log_{10} a_1)}$$

This relation can be used to determine order of reaction ' n '

Plots of half-lives Vs concentrations ($t_{1/2}$ vs a)

(3) **Graphical method**: A graphical method based on the respective rate laws, can also be used.

(i) If the plot of $\log(a-x)$ Vs t is a straight line, the reaction follows first order.

(ii) If the plot of $\frac{1}{(a-x)}$ Vs t is a straight line, the reaction follows second order.

(iii) If the plot of $\frac{1}{(a-x)^2}$ Vs t is a straight line, the reaction follows third order.

(iv) In general, for a reaction of n th order, a graph of $\frac{1}{(a-x)^{n-1}}$ Vs t must be a straight line.

Plots from integrated rate equations

Plots of rate Vs concentrations [$\text{Rate} = k(\text{conc.})^n$]

(4) **Van't Hoff differential method**: The rate of reaction varies as the n power of the concentration Where ' n ' is the order of the reaction. Thus for two different initial concentrations C_1 and C_2 equation, can be written in the form,

$$\frac{-dC_1}{dt} = kC_1^n \text{ and } \frac{-dC_2}{dt} = kC_2^n$$

Taking logarithms,

$$\log_{10} \left(\frac{-dC_1}{dt} \right) = \log_{10} k + n \log_{10} C_1 \quad \dots(i)$$

$$\text{and } \log_{10} \left(\frac{-dC_2}{dt} \right) = \log_{10} k + n \log_{10} C_2 \quad \dots(ii)$$

Subtracting equation (ii) from (i),

$$n = \frac{\log_{10} \left(\frac{-dC_1}{dt} \right) - \log_{10} \left(\frac{-dC_2}{dt} \right)}{\log_{10} C_1 - \log_{10} C_2} \quad \dots(iii)$$

$\frac{-dC_1}{dt}$ and $\frac{-dC_2}{dt}$ are determined from concentration Vs time

graphs and the value of ' n ' can be determined.

(5) **Ostwald's isolation method** (Initial rate method)

This method can be used irrespective of the number of reactants involved *e.g.*, consider the reaction, $n_1A + n_2B + n_3C \rightarrow \text{Products}$.

This method consists in finding the initial rate of the reaction taking known concentrations of the different reactants (A, B, C).

Suppose it is observed as follows,

(i) Keeping the concentrations of B and C constant, if concentration of A is doubled, the rate of reaction becomes four times. This means that, $\text{Rate} \propto [A]^2$ *i.e.*, order with respect to A is 2

(ii) Keeping the concentrations of A and C constant, if concentration of B is doubled, the rate of reaction is also doubled. This means that, $\text{Rate} \propto [B]$ *i.e.*, order with respect to B is 1

(iii) Keeping the concentrations of A and B constant, if concentration of C is doubled, the rate of reaction remains unaffected. This means that rate is independent of the concentration of C *i.e.*, order with respect to C is zero. Hence the overall rate law expression will be, $\text{Rate} = k[A]^2[B][C]^0$

$\therefore$ Overall order of reaction = 2 + 1 + 0 = 3.

Theories of reaction rate

(1) **Collision theory**

(i) The basic requirement for a reaction to occur is that the reacting species must collide with one another. This is the basis of **collision theory** for reactions.

(ii) The number of collisions that takes place per second per unit volume of the reaction mixture is known as **collision frequency** (Z). The value of collision frequency is very high of the order of 10^{25} to 10^{28} in case of binary collisions.

(iii) Every collision does not bring a chemical change. The collisions that actually produce the product are **effective collisions**. The effective collisions, which bring chemical change, are few in comparison to the total number of collisions. The collisions that do not form a product are **ineffective elastic collisions**, *i.e.*, molecules just collide and disperse in different directions with different velocities.

(iv) For a collision to be effective, the following two barriers are to be cleared,

(a) **Energy barrier**: "The minimum amount of energy which the colliding molecules must possess as to make the chemical reaction to occur, is known as **threshold energy**".

• In the graph ' E ' corresponds to minimum or threshold energy for effective collision.

• There is an energy barrier for each reaction. The reacting species must be provided with sufficient energy to cross the energy barrier.

(b) **Orientation barrier** : The colliding molecules should also have proper orientation so that the old bonds may break and new bonds are formed. For example, $\text{NO}_2(g) + \text{NO}_2(g) \rightarrow \text{N}_2\text{O}_4(g)$. During this reaction, the products are formed only when the colliding molecules have proper orientation at the time of collisions. These are called effective collisions.

(v) Thus, the main points of **collision theory** are as follows,

(a) For a reaction to occur, there must be collisions between the reacting species.

(b) Only a certain fraction of the total number of collisions is effective in forming the products.

(c) For effective collisions, the molecules should possess sufficient energy as well as orientation.

(vi) The fraction of effective collisions, under ordinary conditions may vary from nearly zero to about one for ordinary reactions. Thus, the rate of reaction is proportional to :

(a) The number of collisions per unit volume per second (Collision frequency, Z) between the reacting species

(b) The fraction of effective collisions (Properly oriented and possessing sufficient energy), *i.e.*, $\text{Rate} = \frac{-dx}{dt} = f \times Z$

Where f is fraction of effective collision and Z is the collision frequency.

(vii) The physical meaning of the activation energy is that it is the minimum relative kinetic energy which the reactant molecules must possess for changing into the products molecules during their collision. This means that the fraction of successful collision is equal to $e^{-E_a/RT}$ called **Boltzmann factor**.

(viii) It may be noted that besides the requirement of sufficient energy, the molecules must be properly oriented in space also for a collision to be successful. Thus, if Z_{AB} is the collision frequency, P is the **orientation factor** (Steric factor) then, $k = PZ_{AB} \cdot e^{-E_a/RT}$. If we compare this equation with Arrhenius equation, $k = Ae^{-E_a/RT}$

We know that pre-exponential form 'A' in Arrhenius equation is, $A = PZ_{AB}$.

Concept of activation energy

The excess energy (Over and above the average energy of the reactants) which must be supplied to the reactants to undergo chemical reactions is called **activation energy** (E_a),

$$E_a = E_{(\text{Threshold energy})} - E_{(\text{Reactants})}$$

Activation energy = Threshold energy – Average kinetic energy of the reacting molecules.

(a) **Zero activation energy** = Fraction of effective collision (f) will be very large = Very fast reaction (Instantaneous reaction).

(b) **Low activation energies** = Fraction of effective collision (f) will be large = Fast reactions.

(c) **High activation energies** = Fraction of effective collision (f) will be small = Slow reaction.

The activation energy (E_a) depends upon the nature of chemical bonds undergoing rupture and is independent of enthalpies of reactants and products.

According to the concept of activation energy, the reactants do not change directly into the products. The reactant first absorb energy equal to activation energy and form activated complex. At this state, the molecules must have energy at least equal to the threshold energy. This means that the reaction involves some energy barrier which must be overcome before products are formed. The energy barrier is known as **activation energy barrier**.

(2) Transition state theory

(i) According to transition state theory the activated complex is supposed to be in equilibrium with the reactant molecules.

(ii) Once the transition state is formed it can either return to the initial reactants or proceeds to form the products.

(iii) Assuming that once formed the transition state proceeds to products we can say that rate is proportional to concentration of transition state.

Mathematically, $\text{Rate} \propto \text{Transition state}$

Rate = Constant $\times$ Transition state

(iv) The activation energy for the forward reaction, (E_a^f) and the activation energy for the reverse reaction (E_a^r) are related to the enthalpy (ΔH) of the reaction by the equation $\Delta H = E_a^f - E_a^r$.

(a) For endothermic reactions, $\Delta H > 0$, so that $E_a^r < E_a^f$

(b) For exothermic reaction, $\Delta H < 0$, so that $E_a^r > E_a^f$.

Arrhenius equation

Arrhenius proposed a quantitative relationship between rate constant and temperature as,

$$k = Ae^{-E_a/RT} \quad \dots(i)$$

The equation is called **Arrhenius equation**.

In which constant A is known as **frequency factor**. This factor is related to number of binary molecular collision per second per litre.

E_a is the activation energy.

T is the absolute temperature and

R is the gas constant

Both A and E_a are collectively known as **Arrhenius parameters**.

Taking logarithm equation (i) may be written as,

$$\log k = \log A - \frac{E_a}{2.303 RT} \quad \dots(ii)$$

The value of activation energy (E_a) increases, the value of k decreases and therefore, the reaction rate decreases.

When $\log k$ plotted against $1/T$, we get a straight line. The intercept of this line is equal to $\log A$ and slope equal to $\frac{-E_a}{2.303 R}$.

Therefore $E_a = -2.303 R \times \text{slope}$.

Rate constants for the reaction at two different temperatures T_1 and T_2 ,

$$\log \frac{k_2}{k_1} = \frac{E_a}{2.303 R} \left[\frac{1}{T_1} - \frac{1}{T_2} \right] \quad \dots(iii)$$

where k_1 and k_2 are rate constant at temperatures T_1 and T_2 respectively ($T_2 > T_1$).

Mechanism of the reaction

(1) Reaction involving first order consecutive reactions

(i) In such reactions, the reactions form a stable intermediate compound before they are finally converted into the products.

(ii) For example, reactants (R) are first converted to intermediate (I) which is then converted to product (P) as

Therefore, the reaction takes place in two steps, both of which are first order i.e.,

This means that I is produced by step I and consumed by step II. In these reactions, each stage will have its own rate and rate constant the reactant concentration will always decrease and product concentration will always increase as shown in fig.

Concentration profile of reactants (R), intermediate (I) and products (P) as a function of time

(2) **Reaction involving slow step**: When a reaction occurs by a sequence of steps and one of the step is slow, then the rate determining step is the slow step. For example in the reaction

$$\frac{-d[R]}{dt} = \frac{d[P]}{dt} = k_1[R]$$

(3) **Parallel reactions**: In such type of reactions the reactants are more reactive, which may have different orders of the reactions taking place simultaneously. For example, in a system containing NO_2 and SO_2 , NO_2

is consumed in the following two reactions, $2\text{NO}_2 \xrightarrow{k_1} \text{N}_2\text{O}_4$;

The rate of disappearance of NO_2 will be sum of the rates of the

two reactions i.e., $-\frac{d[\text{NO}_2]}{dt} = 2k_1[\text{NO}_2]^2 + k_2[\text{NO}_2][\text{SO}_2]$

Photochemical reaction

Absorption of radiant energy by reactant molecules brings in photophysical as well as photochemical changes. According to **Einstein's law** of photochemical equivalence, the basic principle of photo processes, each reactant molecule is capable of absorbing only one photon of radiant energy. The absorption of photon by a reactant molecule may lead to any of the photo process.

The chemical reactions, which are initiated as a result of absorption of light, are known as photochemical reactions. In such cases, the absorbed energy is sufficient to activate the reactant molecules to cross the energy barrier existing between the reactants and products or in other words, energy associated with each photon supplies activation energy to reactant molecule required for the change.

(1) Characteristics of photochemical reactions

(i) Each molecule taking part in a photo process absorbs only one photon of radiant energy thereby increasing its energy level by $h\nu$ or $\frac{hc}{\lambda}$

(ii) Photochemical reactions do not occur in **dark**.

(iii) Each photochemical reaction requires a definite amount of energy which is characteristic of a particular wavelength of photon. For example, reactions needing more energy are carried out in presence of **UV** light (lower λ , more E/Photon). A reaction-taking place in **UV** light may not occur on exposure to yellow light (lower λ and lesser E/Photon)

(iv) The rate of photochemical reactions depend upon the intensity of radiation's absorbed.

(v) The ΔG values for light initiated reactions may or may not be **negative**.

(vi) The temperature does not have marked effect on the rate of light initiated reactions.

(2) Mechanism of some photochemical reactions

(i) **Photochemical combination of H_2 and Cl_2** : A mixture of H_2 and Cl_2 on exposure to light give rise to the formation of HCl , showing a chain reaction and thereby producing 10^6 to 10^8 molecules of HCl per photon absorbed.

The mechanism leading to very high yield of HCl as a result of chemical change can be as follows. Chlorine molecules absorb radiant energy to form an excited molecule which decomposes to chlorine free radicals (Cl) to give chain initiation step.

The chlorine free radical then combines with H_2 molecule to form HCl and $H^\bullet$ free radical. The $H^\bullet$ free radical so formed again combines with another Cl_2 molecule to give HCl and $Cl^\bullet$ free radical back resulting into chain propagation step.

The combination of two $Cl^\bullet$ free radicals leads to chain terminating step.

(ii) **Photochemical combination of H_2 and Br_2** : The combination of H_2 and Br_2 to form HBr in presence of light is also an example of chain reaction like photochemical combination of H_2 and Cl_2 . Here two Br_2 molecules absorb photon, however, inspite of chain reaction only one molecule of HBr is formed for each 100 photon absorbed by 100 molecules of Br_2 .

Mechanism

The lower values of HBr formation per photon of light absorbed has been attributed to the fact that step (III) is highly endothermic and thus before step (III) can take place most of the bromine free radicals recombine as per step (V) to give Br_2 molecule and thus providing less feasibility for step (IV) i.e. steps regenerating free radicals. Also the decomposition of HBr increases with increase in temperature.

(3) **Quantum yield** (or quantum efficiency) : The quantum efficiency or yield (ϕ) of a photochemical reaction may be expressed as,

$$\phi = \frac{\text{No. of molecules reacted or product formed}}{\text{No. of photon absorbed}}$$

(4) **Application of photochemistry** : Photochemistry has significant role in our daily life. Some of the photochemical reactions commonly known as cited below,

- (i) Photosynthesis in plants
- (ii) Photography
- (iii) The formation and destruction of ozone layer
- (iv) Photoetching in electronic industry
- (v) Many polymerization reactions.
- (vi) Modern printing technology
- (vii) Free radical combinations to obtain many compounds.

Tips & Tricks

✍ Different reactions have different rates because their activation energies are different. Lesser the activation energy faster is the reaction.

✍ The reaction, $NO + \frac{1}{2} O_2 \rightarrow NO_2$, exhibits a small negative temperature coefficient and the rate of reaction decreases with increase of temperature.

✍ Fuels in contact with oxygen do not burn by themselves. This is because they need activation energy (provided by the flame) to initiate the reaction. Thus, fuels are thermodynamically unstable (ΔG is -ve) but kinetically stable.

✍ Quantum efficiency of the photochemical reaction,

initiating step ($X_2 \xrightarrow{h\nu} 2X$) $Cl + H_2 \rightarrow HCl + H$ is exothermic whereas $Br + H_2 \rightarrow HBr + H$ is endothermic.

✍ **Draper's effect** : $H_2 + Cl_2 \rightarrow 2HCl$, Such reactions are accompanied by the increase in the volume. This is called Draper's effect. The reason is that the reaction is exothermic and heat released raises the temperature and gas expands resulting in the increase in volume.

✍ **Actinometer** : A device which is used to measure the intensity of radiation is known as actinometer. e.g., Uranyl oxalate actinometer.

$$\text{Amount of the substance left after 'n' half lives} = \frac{A_0}{2^n}.$$

✍ Free energy change (ΔG) for thermochemical reactions is always negative but remember, ΔG for photochemical reaction may not always be negative. It may be +ve also because a part of the light energy absorbed is converted into the free energy of the products.

✍ Negative catalysts or inhibitors are those substances which decrease the rate of a reaction.

✍ **Grothus-Draper law** : When light falls on a substance, a part of light is absorbed, a part is reflected and a part is transmitted. only that part of light which is absorbed causes a particular reaction to occur.

✍ **Stark's Einstein law of photochemical equivalence** According to this law, every atom or molecule taking part in photochemical reaction absorbs only one quantum of radiation.

✍ Kinetics of fast reactions can be studied by (i) Relaxation method (ii) Flash photolysis technique etc.

✍ Enzyme catalysed reactions are faster than metal catalysed reactions, the former has lower activation energy.

Ordinary Thinking

Objective Questions

Rate of a reaction

1. The rate of a chemical reaction

[MP PMT 1973; CPMT 1982]

- (a) Increases as the reaction proceeds
- (b) Decreases as the reaction proceeds
- (c) May increase or decrease during the reaction
- (d) Remains constant as the reaction proceeds

2. The rate of a reaction that not involve gases is not dependent on [CPMT 1988; AFMC 1995]
(a) Pressure (b) Temperature
(c) Concentration (d) Catalyst
3. The rate at which a substance reacts depends on its [MP PMT 1987; BHU 1999; KCET 2005]
(a) Atomic weight (b) Equivalent weight
(c) Molecular weight (d) Active mass
4. The rate law for the reaction
 $RCl + NaOH(aq) \rightarrow ROH + NaCl$ is given by Rate
 $= K_1[RCl]$. The rate of the reaction will be [IIT 1988]
(a) Doubled on doubling the concentration of sodium hydroxide
(b) Halved on reducing the concentration of alkyl halide to one half
(c) Decreased on increasing the temperature of the reaction
(d) Unaffected by increasing the temperature of the reaction
5. If doubling the concentration of a reactant 'A' increases the rate 4 times and tripling the concentration of 'A' increases the rate 9 times, the rate is proportional to [AIIMS 1991]
(a) Concentration of 'A'
(b) Square of concentration of 'A'
(c) Under root of the concentration of 'A'
(d) Cube of concentration of 'A'
6. The rate of chemical reaction at constant temperature is proportional to
(a) The amount of products formed
(b) The product of masses of the reactants
(c) The product of the molar concentration of the reactants
(d) The mean free path of the reaction
7. The concentration of a reactant decreases from 0.2 M to 0.1 M in 10 minutes. The rate of the reaction is
(a) 0.01 M (b) 10^{-2}
(c) $0.01 \text{ mol dm}^{-3} \text{ min}^{-1}$ (d) $1 \text{ mol dm}^{-3} \text{ min}^{-1}$
8. When a reaction is progressing
(a) The rate of the reaction goes on increasing
(b) The concentration of the products goes on decreasing
(c) The concentration of the reactants goes on decreasing
(d) The reaction rate always remains constant

9. In a catalytic conversion of N_2 to NH_3 by Haber's process, the rate of reaction was expressed as change in the concentration of ammonia per time is $40 \times 10^{-3} \text{ mol litre}^{-1} \text{ s}^{-1}$. If there are no side reaction, the rate of the reaction as expressed in terms of hydrogen is (in $\text{mol litre}^{-1} \text{ s}^{-1}$)
- (a) 60×10^{-3} (b) 20×10^{-3}
(c) 1.200 (d) 10.3×10^{-3}
10. If the concentration of the reactants is increased, the rate of reaction [MP PMT 1989]
- (a) Remains unaffected (b) Increases
(c) Decreases (d) May increase or decrease
11. Time required for completion of ionic reactions in comparison to molecular reactions is
- (a) Maximum (b) Minimum
(c) Equal (d) None
12. For reaction $2A + B \rightarrow$ products, the active mass of B is kept constant and that of A is doubled. The rate of reaction will then
- (a) Increase 2 times (b) Increase 4 times
(c) Decrease 2 times (d) Decrease 4 times
13. In a reaction $2A + B \rightarrow A_2B$, the reactant A will disappear at [MP PET 1993]
- (a) Half the rate that B will decrease
(b) The same rate that B will decrease
(c) Twice the rate that B will decrease
(d) The same rate that A_2B will form
14. The rate of a gaseous reaction is given by the expression $K[A][B]$. If the volume of the reaction vessel is suddenly reduced to $1/4$ th of the initial volume, the reaction rate relating to original rate will be [Roorkee 1992]
- (a) $1/10$ (b) $1/8$
(c) 8 (d) 16
15. A catalyst increases the rate of reaction because it [EAMCET 1992]
- (a) Increases the activation energy
(b) Decreases the energy barrier for reaction
(c) Decreases the collision diameter
(d) Increases the temperature coefficient
16. For the reaction $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$ under certain conditions of temperature and partial pressure of the reactants, the rate of formation of NH_3 is 0.001 kg h^{-1} . The rate of conversion of H_2 under the same conditions is [IIT 1994]
- (a) $1.82 \times 10^{-4} \text{ kg/hr}$ (b) 0.0015 kg/hr
(c) $1.52 \times 10^{-4} \text{ kg/hr}$ (d) $1.82 \times 10^{-14} \text{ kg/hr}$
17. In the reaction $2A + B \rightarrow A_2B$, if the concentration of A is doubled and of B is halved, then the rate of the reaction will
- (a) Increase by four times (b) Decrease by two times
(c) Increase by two times (d) Remain the same
18. The term $\left(-\frac{dc}{dt}\right)$ in a rate equation refers to the [MP PMT 1996]
- (a) Concentration of the reactant
(b) Decrease in concentration of the reactant with time
(c) Increase in concentration of the reactant with time
(d) Velocity constant of the reaction
19. The rate of a reaction depends upon the [Pb. PMT 1999]
- (a) Volume
(b) Force
(c) Pressure
(d) Concentration of reactant
20. For a given reaction $3A + B \rightarrow C + D$ the rate of reaction can be represented by [DCE 2000]
- (a) $-\frac{1}{3} \frac{d[A]}{dt} = -\frac{d[B]}{dt} = \frac{d[C]}{dt} = \frac{d[D]}{dt}$
(b) $-\frac{1}{3} \frac{d[A]}{dt} = \frac{d[C]}{dt} = K[A]^m[B]^n$
(c) $+\frac{1}{3} \frac{d[A]}{dt} = -\frac{d[C]}{dt} = K[A]^n[B]^m$
(d) None of these
21. For the reaction $N_2 + 3H_2 \rightarrow 2NH_3$ if $\frac{\Delta[NH_3]}{\Delta t} = 2 \times 10^{-4} \text{ mol l}^{-1} \text{ s}^{-1}$, the value of $\frac{-\Delta[H_2]}{\Delta t}$ would be [MP PET 1993] [MP PMT 2000]
- (a) $1 \times 10^{-4} \text{ mol l}^{-1} \text{ s}^{-1}$ (b) $3 \times 10^{-4} \text{ mol l}^{-1} \text{ s}^{-1}$
(c) $4 \times 10^{-4} \text{ mol l}^{-1} \text{ s}^{-1}$ (d) $6 \times 10^{-4} \text{ mol l}^{-1} \text{ s}^{-1}$
22. A gaseous hypothetical chemical equation $2A \rightleftharpoons 4B + C$ is carried out in a closed vessel. The concentration of B is found to increase by $5 \times 10^{-3} \text{ mol l}^{-1}$ in 10 second. The rate of appearance of B is [AFMC 2001]
- (a) $5 \times 10^{-4} \text{ mol l}^{-1} \text{ sec}^{-1}$ (b) $5 \times 10^{-5} \text{ mol l}^{-1} \text{ sec}^{-1}$
(c) $6 \times 10^{-5} \text{ mol l}^{-1} \text{ sec}^{-1}$ (d) $4 \times 10^{-4} \text{ mol l}^{-1} \text{ sec}^{-1}$
23. The rate of a chemical reaction depends upon [AFMC 2002]
- (a) Time (b) Pressure
(c) Concentration (d) All of these
24. The rate of disappearance of SO_2 in the reaction $2SO_2 + O_2 \rightarrow 2SO_3$ is $1.28 \times 10^{-3} \text{ g/sec}$ then the rate of formation of SO_3 is
- (a) $0.64 \times 10^{-3} \text{ g/sec}$ (b) $0.80 \times 10^{-3} \text{ g/sec}$
(c) $1.28 \times 10^{-3} \text{ g/sec}$ (d) $1.60 \times 10^{-3} \text{ g/sec}$
25. When the concentration of A in the reaction $A + B \rightleftharpoons AB$ is doubled, the rate of reaction will be [MP PMT 2002]
- (a) Doubled (b) Decreased by half
(c) Unchanged (d) Increased by four times
26. The velocity of the chemical reaction doubles every 10°C rise of temperature. If the temperature is raised by 50°C , the velocity of the reaction increases to about
- (a) 32 times (b) 16 times
(c) 20 times (d) 50 times
27. An increase in temperature by 10°C , generally increases the rate of a reaction by [MP PET 1994; CBSE PMT 2000]
- (a) 2 times (b) 10 times
(c) 9 times (d) 100 times
28. The temperature coefficient for reaction in which food deteriorates is 2. Then food deteriorates times as rapidly at 25°C as it does at 5°C
- (a) Two (b) Four
(c) Six (d) Twenty
29. The rate of a reaction is doubled for every 10° rise in temperature. The increase in reaction rate as a result of temperature rise from 10° to 100° is [KCET 1993; Kerala PET 2002; MP PET 2003]

- (a) 112 (b) 512
(c) 400 (d) 614
30. A catalyst increases the rate of a chemical reaction by [MNR 1988; CPMT 1999; Pb. PMT 2000]
(a) Increasing the activation energy
(b) Decreasing the activation energy
(c) Reacting with reactants
(d) Reacting with products
31. Velocity constant of a reaction at 290 K was found to be 3.2×10^{-3} . At 310 K it will be about [KCET 1989, 91]
(a) 1.28×10^{-2} (b) 9.6×10^{-3}
(c) 6.4×10^{-3} (d) 3.2×10^{-4}
32. The temperature coefficient of a reaction is
(a) Specific reaction rate at 25°C
(b) Rate of the reaction at 100°C
(c) Ratio of the rate constants at temperatures 35°C and 25°C
(d) Ratio of the rate constants at two temperatures differing by 1°C
33. The main function of a catalyst in speeding up a reaction is
(a) To increase the rate of the forward reaction
(b) To change the reaction path so as to decrease the energy of activation for the reaction
(c) To reduce the temperature at which the reaction can occur
(d) To increase the energy of the molecules of the reactants
34. The rate of a reaction [CPMT 1973]
(a) Increases with increase in temperature
(b) Decreases with increase in temperature
(c) Does not depend on temperature
(d) Does not depend on concentration
35. Which of the following statements is false in relation to enzyme
(a) pH affects their functioning
(b) Temperature affects their functioning
(c) They always increase activation energy
(d) Their reactions are specific
36. A reaction is catalysed by 'X'. Here 'X' [MP PMT 2003]
(a) Decreases the rate constant of reaction
(b) Does not affect the equilibrium constant of reaction
(c) Decreases the enthalpy of reaction
(d) Decreases the activation energy
37. Which reaction characteristics are changing by the addition of a catalyst to a reaction at constant temperature
(i) Activation energy (ii) Equilibrium constant
(iii) Reaction entropy (iv) Reaction enthalpy [DCE 2003]
(a) (i) Only (b) (iii) only
(c) (i) and (ii) only (d) All of these
38. The velocity constant of a reaction at 290 K was found to be 3.2×10^{-3} . At 300 K it will be [MP PMT 2004]
(a) 1.28×10^{-2} (b) 6.4×10^{-3}
(c) 9.6×10^{-3} (d) 3.2×10^{-4}
39. In which of the following cases, does the reaction go farthest to completion [UPSEAT 2001]
(a) $K = 10^3$ (b) $K = 10^{-2}$
(c) $K = 10$ (d) $K = 1$
40. Rate of reaction [Pb. CET 2004]
(a) Decreases with increase in temperature
(b) Increases with increase in temperature
(c) May increase or decrease with increase in temperature
(d) Does not depend on temperature
41. For the reaction $2\text{N}_2\text{O}_{5(g)} \rightarrow 4\text{NO}_{2(g)} + \text{O}_{2(g)}$, if concentration of NO_2 in 100 seconds is increased by $5.2 \times 10^{-3} \text{ m}$. Then rate of reaction will be [Kerala CET 2005]
(a) $1.3 \times 10^{-5} \text{ ms}^{-1}$ (b) $5 \times 10^{-4} \text{ ms}^{-1}$
(c) $7.6 \times 10^{-4} \text{ ms}^{-1}$ (d) $2 \times 10^{-3} \text{ ms}^{-1}$
(e) $2.5 \times 10^{-5} \text{ ms}^{-1}$
42. A first order reaction complete its 10% in 20 minutes then time required to complete its 19% is [Kerala CET 2005]
(a) 30 minutes (b) 40 minutes
(c) 50 minutes (d) 38 minutes
(e) 45 minutes

Rate law and Rate constant

1. Which of these does not influence the rate of reaction [KCET 2005]
(a) Nature of the reactants
(b) Concentration of the reactants
(c) Temperature of the reaction
(d) Molecularity of the reaction
2. The rate law for reaction $A + 2B \rightarrow C + 2D$ will be
(a) Rate = $K[A][B]$ (b) Rate = $K[A][2B]$
(c) Rate = $K[A][B]^2$ (d) Rate = $K \frac{[C][D]^2}{[A][B]^2}$
3. In the reaction $2\text{N}_2\text{O}_5 \rightarrow 4\text{NO}_2 + \text{O}_2$, initial pressure is 500 atm and rate constant K is $3.38 \times 10^{-5} \text{ sec}^{-1}$. After 10 minutes the final pressure of N_2O_5 is [Orissa JEE 2005]
(a) 490 atm (b) 250 atm
(c) 480 atm (d) 420 atm
4. The rate law for the reaction
 $\text{Sucrose} + \text{Water} \xrightarrow{[H^+]} \text{Glucose} + \text{Fructose}$ is given by
(a) Rate = $K [\text{sucrose}] [\text{water}]$
(b) Rate = $K [\text{sucrose}] [\text{water}]^0$
(c) Rate = $K [\text{sucrose}]^0 [\text{water}]$
(d) Rate = $K [\text{sucrose}]^{1/2} [\text{water}]^{1/2}$
5. $A + 2B \rightarrow C + D$. If $-\frac{d[A]}{dt} = 5 \times 10^{-4} \text{ mol l}^{-1} \text{ s}^{-1}$, then $-\frac{d[B]}{dt}$ is [DPMT 2005]
(a) $2.5 \times 10^{-4} \text{ mol l}^{-1} \text{ s}^{-1}$ (b) $5.0 \times 10^{-4} \text{ mol l}^{-1} \text{ s}^{-1}$
(c) $2.5 \times 10^{-3} \text{ mol l}^{-1} \text{ s}^{-1}$ (d) $1.0 \times 10^{-3} \text{ mol l}^{-1} \text{ s}^{-1}$
6. The data for the reaction $A + B \rightarrow C$ is [CBSE PMT 1994]

Exp.	$[A]_0$	$[B]_0$	Initial rate
(1)	0.012	0.035	0.10
(2)	0.024	0.070	0.80
(3)	0.024	0.035	0.10

(4)	0.012	0.070	0.80
-----	-------	-------	------

The rate law corresponds to the above data is

- (a) $\text{Rate} = k[B]^3$ (b) $\text{Rate} = k[B]^4$
 (c) $\text{Rate} = k[A][B]^3$ (d) $\text{Rate} = k[A]^2[B]^2$

7. The experimental data for the reaction $2A + B_2 \rightarrow 2AB$ is

[CBSE PMT 1997]

Exp.	$[A]_0$	$[B]_0$	Rate (mole s^{-1})
(1)	0.50	0.50	1.6×10^{-4}
(2)	0.50	1.00	3.2×10^{-4}
(3)	1.00	1.00	3.2×10^{-4}

The rate equation for the above data is

- (a) $\text{Rate} = k[B_2]$ (b) $\text{Rate} = k[B_2]^2$
 (c) $\text{Rate} = k[A]^2[B]^2$ (d) $\text{Rate} = k[A]^2[B]$

8. The reaction $2NO(g) + O_2(g) \rightleftharpoons 2NO_2(g)$ is of first order. If volume of reaction vessel is reduced to $1/3$, the rate of reaction would be [MP PMT 2001]

- (a) $1/3$ times (b) $2/3$ times
 (c) 3 times (d) 6 times

9. For a reaction $2A + B \rightarrow \text{Products}$, doubling the initial concentration of both the reactants increases the rate by a factor of 8, and doubling the concentration of B alone doubles the rate. The rate law for the reaction is

[MP PET 2001]

- (a) $\gamma = k[A][B]^2$ (b) $\gamma = k[A]^2[B]$
 (c) $\gamma = k[A][B]$ (d) $\gamma = k[A]^2[B]^2$

10. For a reactions $A + B \rightarrow \text{product}$, it was found that rate of reaction increases four times if concentration of ' A ' is doubled, but the rate of reaction remains unaffected. If concentration of ' B ' is doubled. Hence, the rate law for the reaction is [MP PET/PMT 1998; MP PMT 2003]

- (a) $\text{rate} = k[A][B]$ (b) $\text{rate} = k[A]^2$
 (c) $\text{rate} = k[A]^2[B]^1$ (d) $\text{rate} = k[A]^2[B]^2$

11. Velocity constant K of a reaction is affected by

- (a) Change in the concentration of the reactant
 (b) Change of temperature
 (c) Change in the concentration of the product
 (d) None of the above

12. Point out the wrong statement :

For a first order reaction

- (a) Time for half-change ($t_{1/2}$) is independent of initial concentration
 (b) Change in the concentration unit does not change the rate constant (K)
 (c) Time for half-change $\times$ rate constant = 0.693
 (d) The unit of K is $\text{mole}^{-1} \text{min}^{-1}$

13. The rate constant of a reaction depends on

[CPMT 1989; DPMT 2001]

- (a) Temperature (b) Mass
 (c) Weight (d) Time

14. In a first order reaction the concentration of reactant decreases from 800 mol/dm^3 to 50 mol/dm^3 is $2 \times 10^2 \text{ sec}$. The rate constant of reaction in sec^{-1} is

[IIT-JEE (Screening) 2003]

- (a) 2×10^4 (b) 3.45×10^{-5}
 (c) 1.386×10^{-2} (d) 2×10^{-4}

15. For a reaction $A \rightarrow B$, the rate of reaction quadrupled when the concentration of A is doubled. The rate expression of the reaction is $r = K(A)^n$. when the value of n is

- (a) 1 (b) 0
 (c) 3 (d) 2

16. The velocity constant of a reaction is K . Which of the following statements is not true regarding K

- (a) K is a constant for a reaction at a given temperature
 (b) The value of K changes when the temperature changes
 (c) K is the velocity of the reaction at unit concentrations of the reactant
 (d) K is a constant for all reactions

17. For the following reaction scheme (homogeneous), the rate constant has units : $A + B \xrightarrow{K} C$ [MP PET 1999]

- (a) $\text{sec}^{-1} \text{ mole}$ (b) sec^{-1}
 (c) $\text{sec}^{-1} \text{ litremole}^{-1}$ (d) sec

18. Which of the following oxides of nitrogen will be the most stable one [NCERT 1978]

- (a) $2NO_2(g) \rightleftharpoons N_2(g) + 2O_2(g); K = 6.7 \times 10^{16} \text{ mol l}^{-1}$
 (b) $2NO(g) \rightleftharpoons N_2(g) + O_2(g); K = 2.2 \times 10^{30} \text{ mol l}^{-1}$
 (c) $2N_2O_5(g) \rightleftharpoons 2N_2(g) + 5O_2(g); K = 1.2 \times 10^{34} \text{ mol l}^{-5}$
 (d) $2N_2O(g) \rightleftharpoons 2N_2(g) + O_2(g); K = 3.5 \times 10^{33} \text{ mol litre}^{-1}$

19. The rate of reaction is determined by slow step reaction. The step is called

- (a) Reaction rate (b) Activation step
 (c) Rate determining step (d) None of the above

20. The rate of the reaction

$CCl_3CHO + NO \rightarrow CHCl_3 + NO + CO$ is given by $\text{Rate} = K[CCl_3CHO][NO]$. If concentration is expressed in moles/litre, the units of K are [MP PET 1993]

- (a) $\text{litre}^2 \text{ mole}^{-2} \text{ sec}^{-1}$ (b) $\text{mole litre}^{-1} \text{ sec}^{-1}$
 (c) $\text{litre mole}^{-1} \text{ sec}^{-1}$ (d) sec^{-1}

21. Rate constant for a reaction $H_2 + I_2 \rightarrow 2HI$ is 49, then rate constant for reaction $2HI \rightarrow H_2 + I_2$ is [Bihar MEE 1997]

- (a) 7 (b) $1/49$
 (c) 49 (d) 21
 (e) 63

22. The reaction

- is of first order in N_2O_5 with rate constant $6.2 \times 10^{-1} s^{-1}$. What is the value of rate of reaction when $[N_2O_5] = 1.25 \text{ mole l}^{-1}$ [AFMC 1998]
- (a) $7.75 \times 10^{-1} \text{ mole l}^{-1} s^{-1}$ (b) $6.35 \times 10^{-3} \text{ mole l}^{-1} s^{-1}$
(c) $5.15 \times 10^{-5} \text{ mole l}^{-1} s^{-1}$ (d) $3.85 \times 10^{-1} \text{ mole l}^{-1} s^{-1}$
23. A reaction that is of the first order with respect to reactant A has a rate constant 6 min^{-1} . If we start with $[A] = 0.5 \text{ mol l}^{-1}$, when would $[A]$ reach the value 0.05 mol l^{-1} [KCET 2000]
- (a) 0.384 min (b) 0.15 min
(c) 3 min (d) 3.84 min
24. The rate constant for the reaction, $2N_2O_5 \rightarrow 4NO_2 + O_2$ is $3 \times 10^{-5} \text{ sec}^{-1}$. If the rate is $2.40 \times 10^{-5} \text{ mol litre}^{-1} \text{ sec}^{-1}$. Then the concentration of N_2O_5 (in mol litre) is [IIT Screening 2000]
- (a) 1.4 (b) 1.2
(c) 0.04 (d) 0.8
25. For the reaction $2N_2O_5 \rightarrow 4NO_2 + O_2$ rate of reaction and rate constant are 1.02×10^{-4} and $3.4 \times 10^{-5} \text{ sec}^{-1}$ respectively. The concentration of N_2O_5 at that time will be [BHU 2001]
- (a) 1.732 (b) 3
(c) 1.02×10^{-4} (d) 3.4×10^5
26. The rate law of the reaction $2N_2O_5 \rightarrow 4NO_2 + O_2$ is [MP PET 2002]
- (a) $r = K[N_2O_5]$ (b) $r = K[N_2O_5]^2$
(c) $r = K[N_2O_5]^0$ (d) $r = K[NO_2]^4 [O_2]$
27. If $R = K[NO]^2 [O_2]$, rate constant may be increased by [BHU 2003]
- (a) Increasing temperature
(b) Decreasing temperature
(c) Increasing concentration of O_2
(d) Increasing concentration of NO
28. The value of rate constant $A + B \rightarrow \text{products}$ depends on [BHU 2003]
- (a) Concentration of A and B
(b) Pressure
(c) Temperature
(d) All of these
29. The rate constant of a reaction depends upon [BHU 2004]
- (a) Extent of reaction
(b) Time of reaction
(c) Temperature of the system
(d) Concentration of the system
30. The rate equation for the reaction $2A + B \rightarrow C$ is found to be: rate $= k[A][B]$. The correct statement in relation to this reaction is that the [AIEEE 2004]
- (a) Rate of formation of C is twice the rate of disappearance of A
(b) $t_{1/2}$ is a constant
(c) Unit of k must be s^{-1}
(d) Value of k is independent of the initial concentrations of A and B
31. The specific rate constant of a first order reaction depends on the [IIT 1981, 83; DPMT 1991; Bihar MEE 1995; KCET 1998]
- (a) Concentration of the reactants
(b) Concentration of the products
(c) Time of reaction
(d) Temperature of reaction
32. If the concentration is expressed in moles per litre, the unit of the rate constant for a first order reaction is [MNR 1986; MP PET 1994, 2000, 01; Bihar MEE 1996; CPMT 1997; MP PMT 1995, 96, 99; AFMC 2002]
- (a) $\text{mole litre}^{-1} \text{ sec}^{-1}$ (b) mole litre^{-1}
(c) sec^{-1} (d) $\text{mole}^{-1} \text{ litre}^{-1} \text{ sec}^{-1}$
33. The dimension of rate constant of a second order reaction involves
- (a) Neither time nor concentration
(b) Only time
(c) Time and concentration
(d) Time and square of concentration
34. The unit of rate constant of second order reaction is usually expressed as [NCERT 1983, 84; MNR 1983; MP PMT 1994, 99]
- (a) $\text{mole litre sec}^{-1}$ (b) $\text{mole}^{-1} \text{ litre}^{-1} \text{ sec}^{-1}$
(c) $\text{mole litre}^{-1} \text{ sec}^{-1}$ (d) $\text{mole}^{-1} \text{ litre sec}^{-1}$
35. A zero order reaction is one whose rate is independent of [NCERT 1981]
- (a) Temperature of the reaction
(b) The concentrations of the reactants
(c) The concentration of the products
(d) The material of the vessel in which the reaction is carried out
36. The unit of rate constant for a zero order reaction is [NCERT 1981; MP PMT 2000; RPET 2000]
- (a) litre sec^{-1} (b) $\text{litre mole}^{-1} \text{ sec}^{-1}$
(c) $\text{mole litre}^{-1} \text{ sec}^{-1}$ (d) mole sec^{-1}
37. Which of the following rate laws has an overall order of 0.5 for reaction involving substances x, y and z [AIIMS 1983]
- (a) Rate $= K(C_x)(C_y)(C_z)$
(b) Rate $= K(C_x)^{0.5} (C_y)^{0.5} (C_z)^{0.5}$
(c) Rate $= K(C_x)^{1.5} (C_y)^{-1} (C_z)^0$
(d) Rate $= K(C_x)(C_z)^n / (C_y)^2$
38. The rates of a certain reaction (dc/dt) at different times are as follows
- | Time | Rate ($\text{mole litre}^{-1} \text{ sec}^{-1}$) |
|------|--|
| 0 | 2.8×10^{-2} |
| 10 | 2.78×10^{-2} |
| 20 | 2.81×10^{-2} |
| 30 | 2.79×10^{-2} |
- The reaction is [NCERT 1978]
- (a) Zero order (b) First order
(c) Second order (d) Third order
39. For a chemical reaction $A \rightarrow B$ it is found that the rate of reaction doubles, when the concentration of A is increased four times. The order in A for this reaction is [NCERT 1979; AIIMS 1997; J & K CET 2005]
- (a) Two (b) One
(c) Half (d) Zero
40. The following data are for the decomposition of ammonium nitrate in aqueous solution

Volume of N_2 in cc Time (minutes)

6.25	10
9.50	15
11.42	20
13.65	25
35.05	Finally

The order of the reaction is

[NCERT 1980]

- (a) Zero (b) One
(c) Two (d) Three

41. The hydrolysis of ethyl acetate is a reaction of

[MP PMT 1987]

- (a) First order (b) Second order
(c) Third order (d) Zero order

42. The rate of reaction between A and B increases by a factor of 100, when the concentration of A is increased 10 folds. The order of reaction with respect to A is

[CPMT 1985]

- (a) 10 (b) 1
(c) 4 (d) 2

43. Which of the following is a first order reaction

[MP PMT 1987]

- (a) $NH_4NO_2 \rightarrow N_2 + 2H_2O$
(b) $2HI \rightarrow H_2 + I_2$
(c) $2NO_2 \rightarrow 2NO + O_2$
(d) $2NO + O_2 \rightarrow 2NO_2$

44. The inversion of cane sugar is represented by

It is a reaction of

[AFMC 1982; MP PMT 1993; RPET 2000]

- (a) Second order (b) Unimolecular
(c) Pseudo unimolecular (d) None of the three

45. Which one of the following formula represents a first order reaction

- (a) $K = \frac{x}{t}$ (b) $K = \frac{1}{2t} \left[\frac{1}{(a-x)^2} - \frac{1}{a^2} \right]$
(c) $K = \frac{2.303}{t} \log_{10} \frac{a}{(a-x)}$ (d) $K = \frac{1}{t} \frac{x}{a(a-x)}$

46. The first order rate constant for the decomposition of N_2O_5 is $6.2 \times 10^{-4} \text{ sec}^{-1}$. The half life period for this decomposition in seconds is

[MNR 1991; MP PET 1997; UPSEAT 2000]

- (a) 1117.7 (b) 111.7
(c) 223.4 (d) 160.9

47. A first order reaction which is 30% complete in 30 minutes has a half-life period of

[AIIMS 1998]

- (a) 24.2 min (b) 58.2 min
(c) 102.2 min (d) 120.2 min

48. The order of a reaction which has the rate expression

$$\frac{dc}{dt} = K[E]^{3/2}[D]^{3/2} \text{ is}$$

- (a) 3/2 (b) 3
(c) 2 (d) 0

49. The reaction $2N_2O_5 \rightleftharpoons 2NO_2 + O_2$ follows first order kinetics. Hence, the molecularity of the reaction is

- (a) Unimolecular
(b) Pseudo-unimolecular
(c) Bimolecular
(d) None of the above

50. A reaction involving two different reactants

[KCET 1989; AIEEE 2005]

- (a) Can never be a second order reaction
(b) Can never be a unimolecular reaction
(c) Can never be a bimolecular reaction
(d) Can never be a first order reaction

51. By "the overall order of a reaction", we mean

- (a) The number of concentration terms in the equation for the reaction
(b) The sum of powers to which the concentration terms are raised in the velocity equation
(c) The least number of molecules of the reactants needed for the reaction
(d) The number of reactants which take part in the reaction

52. Catalyst decomposition of hydrogen peroxide is a order reaction

- (a) First (b) Second
(c) Third (d) Zero

53. The half life of a first order reaction is

- (a) Independent of the initial concentration of the reactant
(b) Directly proportional to the initial concentration of the reactants
(c) Inversely proportional to the initial concentration of the reactant
(d) Directly proportional to the square of the initial concentration of the reactant

54. The decomposition of N_2O_5 is a first order reaction represented

produced is 9 ml and at the end of the reaction 35 ml. The rate constant is equal to

[MP PMT 1999]

[MP PET 1995]

- (a) $\frac{1}{15} \ln \frac{35}{44}$ (b) $\frac{1}{15} \ln \frac{44}{26}$
(c) $\frac{1}{15} \ln \frac{44}{35}$ (d) $\frac{1}{15} \ln \frac{35}{26}$

55. The unit of specific reaction rate constant for a first order (if the concentration expressed in molarity) would be

[MNR 1988; UPSEAT 2000, 01]

- (a) $\text{mole litre}^{-1} \text{ s}^{-1}$ (b) mole litre^{-1}
(c) mole s^{-1} (d) s^{-1}

56. A first order reaction requires 30 minutes for 50% completion. The time required to complete the reaction by 75% will be

- (a) 45 minutes (b) 15 minutes
(c) 60 minutes (d) None of these

57. Inversion of canesugar in dilute acid (conversion into glucose and fructose) is a

- (a) Unimolecular reaction
(b) Bimolecular reaction
(c) Trimolecular reaction
(d) Pseudo-unimolecular reaction

58. The half life period of a first order reaction

[AMU 2000]

- (a) $\frac{0.693}{t}$ (b) $\frac{0.693}{K}$
(c) $\frac{2.303}{t}$ (d) $\frac{0.303}{K_1}$
59. The order of a reaction is said to be 2 with respect to a reactant X , when [DPMT 2000]
(a) The rate of the reaction is proportional to $[X]$
(b) The rate of the reaction is proportional $[X]^2$
(c) Two molecules of X are present in the stoichiometric equation
(d) The reaction occurs in two steps
60. Decay constant of a reaction is 1.1×10^{-9} /sec, then the half life of the reaction is
(a) 1.2×10^8 (b) 6.3×10^8
(c) 3.3×10^8 (d) 2.1×10^8
61. If the half life period of a reaction is inversely proportional to the initial concentration, the order of the reaction is
(a) Zero (b) One
(c) Two (d) Three
62. Which one of the following statements is wrong
(a) Molecularity of a reaction is always a whole number
(b) Order and molecularity of a reaction need not be same
(c) Order of a reaction may be zero
(d) Order of a reaction depends upon the mechanism of the reaction
63. The velocity constant of first order reaction is expressed in the units
(a) Concentration per unit time
(b) Time per unit concentration
(c) Per unit time
(d) Unit time per unit concentration
64. For reaction, $A + B \rightarrow$ products, it is found that the rate of the reaction is proportional to the concentration of A , but it is independent of the concentration of B , then
(a) The order of the reaction 2 and molecularity 1
(b) Molecularity of the reaction is 2 but order is 1
(c) Order is 2 and molecularity is 2
(d) Order of the reaction is 2 but molecularity is 0
65. For a zero order reaction
(a) The concentration of the reactant does not change during the reaction
(b) The concentration change only when the temperature changes
(c) The rate remains constant throughout
(d) The rate of the reaction is proportional to the concentration
66. If ' a ' is the initial concentration and ' n ' is the order of the reaction and the half life period is ' T ', then [MH CET 2000]
(a) $T \propto a^{n-1}$ (b) $T \propto a^n$
(c) $T \propto \frac{1}{a^n}$ (d) $T \propto \frac{1}{a^{n-1}}$
67. In presence of HCl , sucrose gets hydrolysed into glucose and fructose. The concentration of sucrose was found to reduce from 0.4 M to 0.2 M in 1 hour and 0.1 M in 2 hours. The order of the reaction is
(a) Zero (b) One
(c) Two (d) None of these
68. The time of half change of a first order reaction in initial concentration
(a) Proportional to
(b) Inversely proportional to
(c) Independent of
(d) Equal to
69. Half life period of a first order reaction is 138.6 minutes. The velocity constant of the reaction is
(a) 0.05 min^{-1} (b) 0.00005 min^{-1}
(c) 0.005 min^{-1} (d) 200 min^{-1}
70. An example of a pseudo –unimolecular reaction is
(a) Dissociation of hydrogen iodide
(b) Hydrolysis of methyl acetate in dilute solution
(c) Dissociation of phosphorus pentachloride
(d) Decomposition of hydrogen peroxide
71. About half life period of a first order reaction, which one of the following statements is generally false
(a) It is independent of initial concentration
(b) It is independent of temperature
(c) It decreases with the introduction of a catalyst
(d) It increases with increase of temperature
72. Decomposition of nitrogen pentoxide is known to be a first order reaction 75 percent of the oxide had decomposed in the first 24 minutes. At the end of an hour, after the start of the reaction, the amount of oxide left will be
(a) Nil (b) About 1%
(c) About 2% (d) About 3%
73. A reaction $2A \rightarrow$ products is found to follow zero order kinetics, then
(a) $\frac{dx}{dt} = k[A]^2$ (b) $\frac{dx}{dt} = k[A]^0$
(c) $\frac{dx}{dt} = k[A]$ (d) $\frac{dx}{dt} = k[2A]$
74. The alkaline hydrolysis of ethyl acetate is represented by the equation
 $CH_3COOC_2H_5 + NaOH \rightarrow CH_3COONa + C_2H_5OH$
Experimentally it is found that for this reaction
 $\frac{dx}{dt} = k[CH_3COOC_2H_5][NaOH]$
Then the reaction is [JIPMER 1999]
(a) Bimolecular and of first order
(b) Bimolecular and of second order
(c) Pseudo–bimolecular
(d) Pseudo–unimolecular
75. For the reaction $2HI \rightleftharpoons H_2 + I_2$, the rate of the reaction is proportional to $[HI]^2$. This means that the reaction is [AMU 1985; MP PET 2000]
(a) Unimolecular (b) Bimolecular
(c) Of first order (d) Of second order
76. Inversion of sucrose is [AMU 1988; MP PET 2000]
(a) Zero order reaction (b) First order reaction
(c) Second order reaction (d) Third order reaction
77. The one which is unimolecular reaction is [MP PMT 1999; UPSEAT 2001]
(a) $2HI \rightarrow H_2 + I_2$ (b) $N_2O_5 \rightarrow N_2O_4 + \frac{1}{2}O_2$

- (c) $H_2 + Cl_2 \rightarrow 2HCl$ (d) $PCl_3 + Cl_2 \rightarrow PCl_5$
78. Integrated velocity equation for first order reaction is
 (a) $[A]_0 = [A]e^{-Kt}$ (b) $K = [A]_0 e^{-A/t}$
 (c) $Kt = 2.303 \log \frac{[A]_0}{[A]}$ (d) $\log \frac{[A]_0}{[A]} = -2.303 Kt$
79. If the surface area of the reactants increases, then order of the reaction
 (a) Increases
 (b) Decreases
 (c) Remain constant
 (d) Sometimes increases and sometimes decreases
80. Half life period $t_{1/2}$ for first order reaction is
 (a) K (b) $\frac{1.303 \log 2}{K}$
 (c) $\frac{2.303 \log 2}{K}$ (d) $\frac{9}{K}$
81. Molecularity of reaction of inversion of sugar is
 (a) 3 (b) 2
 (c) 1 (d) 0
82. For any reaction, if we plot a graph between time ' t ' and $\log(a-x)$, a simple line is obtained. The order of reaction is
 (a) Zero (b) One
 (c) Two (d) Three
83. Value of velocity constant for first order reaction is $3.46 \times 10^{-3} \text{ min}^{-1}$, the time for half change is
 (a) 100 minutes (b) 400 minutes
 (c) 200 minutes (d) 346 minutes
84. The unit of the velocity constant in case of zero order reaction is [CPMT 1994]
 (a) $\text{Conc.} \times \text{time}^{-1}$ (b) $\text{Conc.}^{-1} \times \text{time}$
 (c) $\text{Conc.}^{-1} \times \text{time}^{-1}$ (d) $\text{Conc.} \times (\text{time})^2$
85. For the reaction $H_2(g) + Br_2(g) \rightarrow 2HBr(g)$, the experimental data suggest, rate $= K[H_2][Br_2]^{1/2}$. The molecularity and order of the reaction are respectively
 [CPMT 1988; MP PET 1993]
 (a) $2, \frac{3}{2}$ (b) $\frac{3}{2}, \frac{3}{2}$
 (c) 1, 1 (d) $1, \frac{1}{2}$
86. The incorrect order indicated against the rate of reaction $A + B \xrightarrow{K} C$ is [BHU 1990]

Rate	Order
(a) $\frac{d[C]}{dt} = K[A]$	1
(b) $\frac{d[C]}{dt} = K[A][B]$	2
(c) $\frac{-d[A]}{dt} = K[A][B]^0$	2
- (d) $\frac{-d[A]}{dt} K[A]$ 1
87. Which of the following statements regarding the molecularity of a reaction is wrong [CBSE PMT 1989]
 (a) It is the number of molecules of the reactants taking part in a single step chemical reaction
 (b) It is calculated from the reaction mechanism
 (c) It may be either a whole number or fractional
 (d) It depends on the rate determining step in the reaction
88. Diazonium salt decomposes as
 $C_6H_5N_2^+Cl^- \rightarrow C_6H_5Cl + N_2$
 At $0^\circ C$, the evolution of N_2 becomes two times faster when the initial concentration of the salt is doubled. Therefore, it is [MNR 1994; UPSEAT 2]
 (a) A first order reaction
 (b) A second order reaction
 (c) Independent of the initial concentration of the salt
 (d) A zero order reaction
89. In the reaction $A + B \rightarrow \text{Products}$, if B is taken in excess, then it is an example of [EAMCET 1992]
 (a) Second order reaction
 (b) Zero order reaction
 (c) Pseudounimolecular reaction
 (d) First order reaction
90. The half life of a first order reaction is 69.35 sec. The value of the rate constant of the reaction is [CBSE PMT 1990]
 (a) $1.0 s^{-1}$ (b) $0.1 s^{-1}$
 (c) $0.01 s^{-1}$ (d) $0.001 s^{-1}$
91. The half life for the reaction $N_2O_5 \rightleftharpoons 2NO_2 + \frac{1}{2}O_2$ in 24 hrs at $30^\circ C$. Starting with 10 g of N_2O_5 how many grams of N_2O_5 will remain after a period of 96 hours [KCET 1992]
 (a) 1.25 g (b) 0.63 g
 (c) 1.77 g (d) 0.5 g
92. The half life of a first order reaction is 10 minutes. If initial amount is 0.08 mol/litre and concentration at some instant is 0.01 mol/litre , then $t =$ [Roorkee 1990]
 (a) 10 minutes (b) 30 minutes
 (c) 20 minutes (d) 40 minutes
93. Half life period of second order reaction is [MP PMT 1994]
 (a) Proportional to the initial concentration of reactants
 (b) Independent of the initial concentration of reactants
 (c) Inversely proportional to initial concentration of reactants
 (d) Inversely proportional to square of initial concentration of reactants
94. The reaction $2H_2O_2 \rightarrow 2H_2O + O_2$ is a [Manipal MEE 1995]
 (a) Zero order reaction (b) First order reaction
 (c) Second order reaction (d) Third order reaction
95. In a reaction involving hydrolysis of an organic chloride in presence of large excess of water
 $RCI + H_2O \rightarrow ROH + HCl$ [MP PET 1995]
 (a) Molecularity is 2, order of reaction is also 2

- (b) Molecularity is 2, order of reaction is 1
(c) Molecularity is 1, order of reaction is 2
(d) Molecularity is 1, order of reaction is also 1
96. The thermal decomposition of a compound is of first order. If a sample of the compound decomposes 50% in 120 minutes, in what time will it undergo 90% decomposition
[MP PET 1996]
(a) Nearly 240 minutes (b) Nearly 480 minutes
(c) Nearly 450 minutes (d) Nearly 400 minutes
97. The order of a reaction with rate equals $kC_A^{3/2}C_B^{-1/2}$ is
[MP PET 1996, 2001]
(a) 2 (b) 1
(c) $-\frac{1}{2}$ (d) $\frac{3}{2}$
98. If the rate expression for a chemical reaction is given by Rate $= k[A]^m[B]^n$
[MP PMT 1996]
(a) The order of the reaction is m
(b) The order of the reaction is n
(c) The order of the reaction is $m+n$
(d) The order of the reaction is $m-n$
99. The half-life period of a first order reaction is 100 sec. The rate constant of the reaction is
[MP PMT 1997; MP PET 2001]
(a) $6.93 \times 10^{-3} \text{ sec}^{-1}$ (b) $6.93 \times 10^{-4} \text{ sec}^{-1}$
(c) 0.693 sec^{-1} (d) 69.3 sec^{-1}
100. For the first order reaction with rate constant k , which expression gives the half-life period? (Initial concentration $= a$) [MP PET/PMT 1998]
(a) $\frac{1^2}{k}$ (b) $\frac{1}{ka}$
(c) $\frac{0.693}{k}$ (d) $\frac{3}{2ka^2}$
101. The rate constant of a first order reaction whose half-life is 480 seconds, is
[MP PET 1999]
(a) $2.88 \times 10^{-3} \text{ sec}^{-1}$ (b) $1.44 \times 10^{-3} \text{ sec}^{-1}$
(c) 1.44 sec^{-1} (d) $0.72 \times 10^{-3} \text{ sec}^{-1}$
102. The conversion of $A \rightarrow B$ follows second order kinetics. Doubling the concentration of A will increase the rate of formation of B by a factor
[MP PET 1999; DCE 1999; KCET 2001; BCECE 2005]
(a) 1/4 (b) 2
(c) 1/2 (d) 4
103. The reaction $2FeCl_3 + SnCl_2 \rightarrow 2FeCl_2 + SnCl_4$ is an example of
[CBSE PMT 1996; MP PET 1999]
(a) First order reaction
(b) Second order reaction
(c) Third order reaction
(d) None of these
104. If reaction between A and B to give C shows first order kinetics in A and second order in B , the rate equation can be written as [MP PET 1999]
(a) Rate $= k[A][B]^{1/2}$ (b) Rate $= k[A]^{1/2}[B]$
(c) Rate $= k[A][B]^2$ (d) Rate $= k[A]^2[B]$
105. For a first order reaction, the half-life period is independent of
[CBSE PMT 1999]
(a) Initial concentration
(b) Cube root of initial concentration
(c) First power of final concentration
(d) Square root of final concentration
106. Order of a reaction can have
[DPMT 1996]
(a) +ve values (b) Whole number values
(c) Fractional values (d) All of the above
107. The order of the reaction occurring by following mechanism should be
[JIPMER 1997]
(i) $A_2 \rightarrow A + A$ (fast)
(ii) $A + B_2 \rightarrow AB + B$ (slow)
(iii) $A + B \rightarrow$ (fast)
(a) $1\frac{1}{2}$ (b) $3\frac{1}{2}$
(c) 2 (d) None of these
108. For the reaction $A \rightarrow B$, the rate law expression is: Rate $= k[A]$
Which of the following statements is incorrect
[Pb. PMT 1998]
(a) The reaction is said to follow first order kinetics
(b) The half life of the reaction will depend on the initial concentration of the reactant
(c) k is constant for the reaction at a constant temperature
(d) The rate law provides a simple way of predicting the concentration of reactants and products at any time after the start of the reaction
109. If initial concentration is reduced to its 1/4th in a zero order reaction, the time taken for half of the reaction to complete
[BHU 1998]
(a) Remains same (b) Becomes 4 times
(c) Becomes one-fourth (d) Doubles
110. For a reaction whose rate expression is:
Rate $= k[A]^{1/2}[B]^{3/2}$, the order would be
[Pune CET 1998]
(a) 1.5 (b) 2
(c) 3 (d) 1
111. For the reaction $A \rightarrow B$, the rate increases by a factor of 2.25 when the concentration of A is increased by 1.5. What is the order of the reaction
[KCET 1998]
(a) 3 (b) 0
(c) 2 (d) 1
112. For the reaction $H_2 + Cl_2 \xrightarrow{\text{Sunlight}} 2HCl$ taking place on water, the order of reaction is
[KCET 1998; AIIMS 2002; Pb. PMT 2002]
(a) 1 (b) 2
(c) 3 (d) 0
113. For a first order reaction, rate constant is 0.6932 hr^{-1} , then half-life for the reaction is
[Bihar MEE 1997]
(a) 0.01 hr (b) 1 hr
(c) 2 hr (d) 10 hr
(e) 0.1 hr
114. The rate constant of a reaction is $0.69 \times 10^{-1} \text{ min}^{-1}$ and the initial concentration is 0.2 mol l^{-1} . The half-life period is
[AIIMS 1998]

- (a) 400 sec (b) 600 sec
(c) 800 sec (d) 1200 sec
115. The rate constant of a first order reaction is 3×10^{-6} per second. If the initial concentration is 0.10 M, the initial rate of reaction is
[AFMC 1999 Pb. PMT 1999, 2000; BHU 1999; AIIMS 1999; KCET 2000; DCE 2004]
- (a) $3 \times 10^{-5} \text{ ms}^{-1}$ (b) $3 \times 10^{-6} \text{ ms}^{-1}$
(c) $3 \times 10^{-8} \text{ ms}^{-1}$ (d) $3 \times 10^{-7} \text{ ms}^{-1}$
116. Certain bimolecular reactions which follow the first order kinetics are called [KCET (Med.) 1999]
- (a) First order reactions
(b) Unimolecular reactions
(c) Bimolecular reactions
(d) Pseudounimolecular reactions
117. The rate law of the reaction $A + 2B \rightarrow \text{Product}$ is given by $\frac{d[B]}{dt} = k[B]^2$. If A is taken in excess, the order of the reaction will be [AMU (Engg.) 1999]
- (a) 1 (b) 2
(c) 3 (d) 0
118. For a first order reaction $A \rightarrow \text{product}$, the rate of reaction at $[A] = 0.2 \text{ mol l}^{-1}$ is $1.0 \times 10^{-2} \text{ mol l}^{-1} \text{ min}^{-1}$. The half life period for the reaction is [Roorkee 1999]
- (a) 832 s (b) 440 s
(c) 416 s (d) 13.86 s
119. For the reaction $A + B \rightarrow \text{products}$, doubling the concentration of A the rate of the reaction is doubled, but on doubling the concentration of B rate remains unaltered. The over all order of the reaction is [JIPMER 1999]
- (a) 1 (b) 0
(c) 2 (d) 3
120. Which among the following is a false statement [KCET 1999]
- (a) Half life of a third order reaction is inversely proportional to the square of initial concentration of the reactant.
(b) Molecularity of a reaction may be zero or fractional
(c) For a first order reaction $t_{1/2} = \frac{0.693}{K}$
(d) Rate of zero order reaction is independent of initial concentration of reactant
121. After how many seconds will the concentration of the reactants in a first order reaction be halved, if the decay constant is $1.155 \times 10^{-3} \text{ sec}^{-1}$ [CBSE PMT 2000]
- (a) 100 sec (b) 200 sec
(c) 400 sec (d) 600 sec
122. What is the order of a reaction which has a rate expression rate $= K[A]^{3/2}[B]^{-1}$ [DCE 2000]
- (a) 3/2 (b) 1/2
(c) 0 (d) None of these
123. Which of the following expression is correct for first order reaction? (CO) refers to initial concentration of reactant [DCE 2000]
- (a) $t_{1/2} \propto CO$ (b) $t_{1/2} \propto CO^{-1}$
(c) $t_{1/2} \propto CO^{-2}$ (d) $t_{1/2} \propto CO^0$
124. For a reaction $2NO(g) + Cl_2(g) \rightleftharpoons 2NOCl(g)$. When concentration of Cl_2 is doubled, the rate of reaction becomes two times of the original. When the concentration of NO is doubled the rate becomes four times. What is the order of the reaction
- (a) 1 (b) 2
(c) 3 (d) 4
125. The rate constant for a second order reaction is $8 \times 10^{-5} \text{ M}^{-1} \text{ min}^{-1}$. How long will it take a 1M solution to be reduced to 0.5 M [MH CET 2001]
- (a) $8 \times 10^{-5} \text{ min}$ (b) $8.665 \times 10^3 \text{ min}$
(c) $4 \times 10^{-5} \text{ min}$ (d) $1.25 \times 10^4 \text{ min}$
126. The rate for a first order reaction is $0.6932 \times 10^{-2} \text{ mol l}^{-1} \text{ min}^{-1}$ and the initial concentration of the reactants is 1M, $T_{1/2}$ is equal to [JIPMER (Med.) 2001]
- (a) 6.932 min (b) 100 min
(c) $0.6932 \times 10^{-3} \text{ min}$ (d) $0.6932 \times 10^{-2} \text{ min}$
127. For a given reaction $t_{1/2} = \frac{1}{Ka}$. The order of the reaction is [KCET 2001]
- (a) 1 (b) 0
(c) 3 (d) 2
128. 75% of a first order reaction is completed in 30 minutes. What is the time required for 93.75% of the reaction (in minutes)
- (a) 45 (b) 120
(c) 90 (d) 60
129. A First order reaction is half completed in 45 minutes. How long does it need 99.9% of the reaction to be completed [AIIMS 2001]
- (a) 5 hours (b) 7.5 hours
(c) 10 hours (d) 20 hours
130. A substance 'A' decomposes by a first order reaction starting initially with $[A] = 2.00 \text{ M}$ and after 200 min $[A] = 0.15 \text{ M}$. For this reaction what is the value of k [AIIMS 2001]
- (a) $1.29 \times 10^{-2} \text{ min}^{-1}$ (b) $2.29 \times 10^{-2} \text{ min}^{-1}$
(c) $3.29 \times 10^{-2} \text{ min}^{-1}$ (d) $4.40 \times 10^{-2} \text{ min}^{-1}$
131. Which of the following statements about zero order reaction is not true [DCE 2001]
- (a) Its unit is sec^{-1}
(b) The graph between log (reactant) versus rate of reaction is a straight line
(c) The rate of reaction increases with the decrease in concentration of reactants
(d) Rate of reaction is independent of concentration of reactants
132. The given reaction $2NO + O_2 \rightarrow 2NO_2$ is an example of [CBSE PMT 2001; JIPMER 2002]
- (a) First order reaction (b) Second order reaction
(c) Third order reaction (d) None of these
133. Order of a reaction is decided by [KCET 2002]
- (a) Pressure
(b) Temperature

- (c) Molecularity
(d) Relative concentration of reactants
134. From the following which is a second order reaction [AMU 2002]
- (a) $K = 5.47 \times 10^{-4} \text{ sec}^{-1}$
(b) $K = 3.9 \times 10^{-3} \text{ mole lit sec}^{-1}$
(c) $K = 3.94 \times 10^{-4} \text{ lit mole}^{-1} \text{ sec}^{-1}$
(d) $K = 3.98 \times 10^{-5} \text{ lit mole}^{-2} \text{ sec}^{-1}$
135. For the reaction $A + 2B \rightarrow C$, rate is given by $R = [A][B]^2$ then the order of the reaction is [AIEEE 2002]
- (a) 3 (b) 6
(c) 5 (d) 7
136. Units of rate constant of first and zero order reactions in terms of molarity M unit are respectively [AIEEE 2002]
- (a) sec^{-1} , $M \text{ sec}^{-1}$ (b) sec^{-1} , M
(c) $M \text{ sec}^{-1}$, sec^{-1} (d) M, sec^{-1}
137. The reaction $2N_2O_5 \rightleftharpoons 2N_2O_4 + O_2$ is [MP PMT 2002]
- (a) Bimolecular and second order
(b) Unimolecular and first order
(c) Bimolecular and first order
(d) Bimolecular and zero order
138. The half-life period for a first order reaction is 693 seconds. The rate constants for this reaction would be [MP PET 2002]
- (a) 0.1 sec^{-1} (b) 0.01 sec^{-1}
(c) 0.001 sec^{-1} (d) 0.0001 sec^{-1}
139. For an elementary reaction, $2A + B \rightarrow C + D$ the molecularity is
- (a) Zero (b) One
(c) Two (d) Three
140. If the order of the reaction $x + y \xrightarrow{h\nu} x + y$ is zero, it means that the rate of [Kurukshetra CEE 2002]
- (a) Reaction is independent of temperature
(b) Formation of activated complex is zero
(c) Reaction is independent of the concentration of reacting species
(d) Decomposition of activated complex is zero
141. For a first order reaction velocity constant, $K = 10^{-3} \text{ s}^{-1}$. Two third life for it would be [MP PET 2001; UPSEAT 2003]
- (a) 1100 s (b) 2200 s
(c) 3300 s (d) 4400 s
142. In a reaction, the concentration of reactant is increased two times and three times then the increases in rate of reaction were four times and nine times respectively, order of reaction is
- (a) Zero (b) 1
(c) 2 (d) 3
143. For a chemical reaction....can never be a fraction [EAMCET 2003]
- (a) Order (b) Half-life
(c) Molecularity (d) Rate constant
144. 75% of a first order reaction was completed in 32 minutes when was 50% of the reaction completed [AMU 1999; Kerala (Med.) 2003]
- (a) 16 min. (b) 24 min.
(c) 8 min. (d) 4 min.
145. The decomposition of N_2O_5 occurs as, $2N_2O_5 \rightarrow 4NO_2 + O_2$, and follows 1st order kinetics, hence [BVP 2003]
- (a) The reaction is unimolecular
(b) The reaction is bimolecular
(c) $T_{1/2} \propto a^0$
(d) None of these
146. Which equation is correct for first order reactions [MP PMT 2003]
- (a) $t_{1/2} \propto C^{-1}$ (b) $t_{1/2} \propto C$
(c) $t_{1/2} \propto C^0$ (d) $t_{1/2} \propto C^{1/2}$
147. For the reaction system $2NO(g) + O_2(g) \rightarrow 2NO_2(g)$ volume is suddenly produced to half its value by increasing the pressure on it. If the reaction is of first order with respect to O_2 and second order with respect to NO , the rate of reaction will [AIEEE 2003]
- (a) Diminish to one fourth of its initial value
(b) Diminish to one eighth of its initial value
(c) Increase to eight times of its initial value
(d) Increase to four times of its initial value
148. If the rate of the reaction is equal to the rate constant, the order of the reaction is [CBSE PMT 2003]
- (a) 3 (b) 0
(c) 1 (d) 2
149. The reaction $A \rightarrow B$ follows first order kinetics. The time taken for 0.8 mole of A to produce 0.6 mole of B is 1 hour. What is the time taken for conversion of 0.9 mole of A to produce 0.675 mole of B [Kurukshetra CEE 2002]
- (a) 2 hours (b) 1 hour
(c) 0.5 hour (d) 0.25 hour
150. The unit of velocity constant in case of zero order reaction is [MP PMT 2004]
- (a) Concentration $\times$ Time⁻¹ (b) Concentration⁻¹ $\times$ Time⁻¹
(c) Concentration $\times$ Time² (d) Concentration⁻¹ $\times$ Time
151. Which one of the following is wrongly matched [KCET 2004]
- (a) Saponification of $CH_3COOC_2H_5$ – Second order reaction
(b) Hydrolysis of CH_3COOCH_3 – Pseudo uni-molecular reaction
(c) Decomposition of H_2O_2 – First order reaction
(d) Combination of H_2 and Br_2 to give HBr – Zero order reaction
- [UPSEAT 2003]
152. Which of the following is an example of pseudo unimolecular reaction [Pb. CET 2001]
- (a) $CH_3COOCH_3 + H_2O \xrightarrow{H^+} CH_3COOH + CH_3OH$
(b) $CH_3COOCH_3 + H_2O \xrightarrow{OH^-} CH_3COOH + CH_3OH$
(c) $2FeCl_3 + SnCl_2 \rightarrow SnCl_4 + 2FeCl_2$
(d) $NaOH + HCl \rightarrow NaCl + H_2O$
153. Hydrolysis of DDT is a first order reaction, its half life is 10 years. Time to hydrolyse 10 g DDT to half is [BVP 2004]

- (a) 100 years (b) 50 years
(c) 5 years (d) 10 years
154. In a first order reaction, the concentration of the reactant, decreases from 0.8 M to 0.4 M in 15 minutes. The time taken for the concentration to change from 0.1 M to 0.025 M is [AIEEE 2004]
(a) 7.5 minutes (b) 15 minutes
(c) 30 minutes (d) 60 minutes
155. In the first order reaction, the concentration of the reactant is reduced to 25% in one hour. The half life period of the reaction is [DCE 2004]
(a) 2 hr (b) 4 hr
(c) 1/2 hr (d) 1/4 hr
156. For a reaction, $X(g) \rightarrow Y(g) + Z(g)$ the half life period is 10 min. In What period of time would the concentration of X be reduced to 10% of original concentration [DCE 2004]
(a) 20 min (b) 33 min
(c) 15 min (d) 25 min
157. A first order reaction with respect to the reactant A has a rate constant of 6 sec^{-1} . If we start with $[A] = 0.5 \text{ mol/litre}$, then in what time the concentration of A becomes 0.05 mol/litre [DCE 2004]
(a) 0.384 sec (b) 0.214 sec
(c) 3.84 sec (d) 0.402 sec
158. Order of radioactive disintegration reaction is [JEE Orissa 2004]
(a) Zero (b) First
(c) Second (d) Third
159. The rate of a first order reaction is $1.5 \times 10^{-2} \text{ mol L}^{-1} \text{ min}^{-1}$ at 0.5 M concentration of the reactant. The half life of the reaction is [CBSE PMT 2004]
(a) 8.73 min (b) 7.53 min
(c) 0.383 min (d) 23.1 min
160. A first order reaction was started with a decimolar solution of the reactant, 8 minutes and 20 seconds later its concentration was found to be $M/100$. So the rate of the reaction is [Kerala PMT 2004]
(a) $2.303 \times 10^{-5} \text{ sec}^{-1}$ (b) $2.303 \times 10^{-4} \text{ sec}^{-1}$
(c) $4.606 \times 10^{-3} \text{ sec}^{-1}$ (d) $2.606 \times 10^{-5} \text{ sec}^{-1}$
(e) $2.603 \times 10^{-4} \text{ sec}^{-1}$
161. Which is correct about zero order reaction [JEE Orissa 2004]
(a) Rate of reaction depends on decay constant
(b) Rate of reaction is independent of concentration
(c) Unit of rate constant is concentration
(d) Unit of rate constant is concentration $\cdot$ time
162. Decay of ${}_{92}\text{U}^{235}$ isorder reaction [JEE Orissa 2004]
(a) Zero (b) First
(c) Second (d) Third
163. The half-life of 2 sample are 0.1 and 0.4 seconds. Their respective concentration are 200 and 50 respectively. What is the order of the reaction [JEE Orissa 2004]
(a) 0 (b) 2
(c) 1 (d) 4
164. The following statements(s) is(are) correct [IIT 1999]
(a) A plot of $\log K_p$ versus $1/T$ is linear
(b) A plot of $\log[X]$ versus time is linear for a first order reaction $X \rightarrow P$
(c) A plot of $\log P$ versus $1/T$ is linear at constant volume
(d) A plot of P versus $1/V$ is linear at constant temperature
165. For a first order reaction [IIT 1998]
(a) The degree of dissociation is equal to $(1 - e^{-kt})$
(b) A plot of reciprocal concentration of the reactant vs time gives a straight line
(c) The time taken for the completion of 75% reaction is thrice the $t_{1/2}$ of the reaction
(d) The pre-exponential factor in the Arrhenius equation has the dimension of time T^{-1}
166. For reaction $a A \rightarrow x P$, when $[A] = 2.2 \text{ mM}$, the rate was found to be 2.4 mM s^{-1} . On reducing concentration of A to half, the rate changes to 0.6 mM s^{-1} . The order of reaction with respect to A is [AIIMS 2005]
(a) 1.5 (b) 2.0
(c) 2.5 (d) 3.0
167. Which one of the following statement for order of reaction is not correct [IIT 2005]
(a) Order can be determined experimentally.
(b) Order of reaction is equal to sum of the powers of concentration terms in differential rate law.
(c) It is not affected with the stoichiometric coefficient of the reactants.
(d) Order cannot be fractional.
168. $t_{1/4}$ can be taken as the time taken for the concentration of a reactant to drop to $\frac{3}{4}$ of its initial value. If the rate constant for a first order reaction is K , the $t_{1/4}$ can be written as [AIEEE 2005]
(a) $0.10 / K$ (b) $0.29 / K$
(c) $0.69 / K$ (d) $0.75 / K$
169. For a first order reaction $A \rightarrow B$ the reaction rate at reactant concentration of 0.01M is found to be $2.0 \times 10^{-5} \text{ mol L}^{-1} \text{ s}^{-1}$. The half life period of the reaction is [CBSE PMT 2005]
(a) 220 s (b) 30 s
(c) 300 s (d) 347 s
170. The rate of reaction between two reactants A and B decreases by a factor of 4 if the concentration of reactant B is doubled. The order of this reaction with respect to reactant B is
(a) -1 (b) -2
(c) 1 (d) 2
171. If a substance with half life 3 days is taken at other place in 12 days. What amount of substance is left now [AFMC 2005]
(a) 1/4 (b) 1/8
(c) 1/16 (d) 1/32
172. The half-life of a first order reaction having rate constant $K = 1.7 \times 10^3 \text{ s}$ is [BHU 2005]
(a) 12.1 h (b) 9.7 h
(c) 11.3 h (d) 1.8 h
173. For the reaction $A + B \rightarrow C$, it is found that doubling the concentration of A increases the rate by 4 times, and doubling the concentration of B doubles the reaction rate. What is the overall order of the reaction. [KCET 2005]

- (a) 4 (b) $3/2$
(c) 3 (d) 1

174. Which of the following reactions end in finite time

[DPMT 2005]

- (a) 0 order (b) 1st order
(c) 2nd order (d) 3rd order

Collision theory, Energy of activation and Arrhenius equation

1. A large increase in the rate of a reaction for a rise in temperature is due to [EAMCET 1980; MP PET 1995]

- (a) The decrease in the number of collisions
(b) The increase in the number of activated molecules
(c) The shortening of the mean free path
(d) The lowering of the activation energy

2. Which of the following statements is not true according to collision theory of reaction rates

- (a) Collision of molecules is a precondition for any reaction to occur
(b) All collisions result in the formation of the products
(c) Only activated collisions result in the formation of the products
(d) Molecules which have acquired the energy of activation can collide effectively

3. According to the collision theory of chemical reactions

- (a) A chemical reaction occurs with every molecular collision
(b) Rate is directly proportional to the number of collisions per second
(c) Reactions in the gas phase are always of zero order
(d) Reaction rates are of the order of molecular speeds

4. According to the collision theory of reaction rates, rate of reaction increases with temperature due to

- (a) Greater number of collisions
(b) Greater velocity of the reacting molecules
(c) Greater number of molecules have activation energy
(d) None of the above

5. The reaction rate at a given temperature becomes slower, then

[MP PMT 1993; DPMT 2000]

- (a) The free energy of activation is higher
(b) The free energy of activation is lower
(c) The entropy changes
(d) The initial concentration of the reactants remains constant

6. A rise in temperature increases the velocity of a reaction. It is because it results in

- (a) An increased number of molecular collisions
(b) An increased momentum of colliding molecules
(c) An increase in the activation energy
(d) A decrease in the activation energy

7. The number of collisions depend upon

- (a) Pressure (b) Concentration
(c) Temperature (d) All the above

8. If E_f and E_r are the activation energies of forward and reverse reactions and the reaction is known to be exothermic, then

(a) $E_f > E_r$

(b) $E_f < E_r$

(c) $E_f = E_r$

(d) No relation can be given between E_f and E_r as data are not sufficient

9. According to Arrhenius theory, the activation energy is

- (a) The energy it should possess so that it can enter into an effective collision
(b) The energy which the molecule should possess in order to undergo reaction
(c) The energy it has to acquire further so that it can enter into a effective collision
(d) The energy gained by the molecules on colliding with another molecule

10. The energy of activation is

- (a) The energy associated with the activated molecules
(b) Threshold energy – energy of normal molecules
(c) Threshold energy + energy of normal molecules
(d) Energy of products – energy of reactants

11. Which one of the following does not represent Arrhenius equation

(a) $k = Ae^{-E/RT}$

(b) $\log_e k = \log_e A - \frac{E}{RT}$

(c) $\log_{10} k = \log_{10} A - \frac{E}{2.303 RT}$

(d) $k = AE^{-RT}$

12. On increasing the temperature, the rate of the reaction increases because of [MP PMT 1997]

- (a) Decrease in the number of collisions
(b) Decrease in the energy of activation
(c) Decrease in the number of activated molecules
(d) Increase in the number of effective collisions

13. Energy of activation of a reactant is reduced by

- (a) Increased temperature (b) Reduced temperature
(c) Reduced pressure (d) Increased pressure

14. The minimum energy a molecule should possess in order to enter into a fruitful collision is known as

[Kurukshetra CEE 2002]

- (a) Reaction energy (b) Collision energy
(c) Activation energy (d) Threshold energy

15. Activation energy is

- (a) The amount of energy to be added to the actual energy of a molecule so that the threshold energy is reached
(b) The amount of energy the molecule must contain so that it reacts
(c) The energy which a molecule should have in order to enter into an effective collision
(d) The average kinetic energy of the molecule

16. The reason for almost doubling the rate of reaction on increasing the temperature of the reaction system by 10°C is

[J & K 2005]

- (a) The value of threshold energy increases
(b) Collision frequency increases

- (c) The fraction of the molecule having energy equal to threshold energy or more increases
(d) Activation energy decreases
17. The activation energy for a simple chemical reaction $A \rightarrow B$ is E_a in forward direction. The activation energy for reverse reaction
- (a) Is always double of E_a
(b) Is negative of E_a
(c) Is always less than E_a
(d) Can be less than or more than E_a
18. Arrhenius equation is
- (a) $\frac{d \ln K}{dT} = \Delta E^* / RT$ (b) $\frac{d \ln K}{dT} = \Delta E^* / RT^2$
(c) $\frac{d \ln K}{dT} = -\Delta E^* / RT^2$ (d) $\frac{d \ln K}{dT} = -\Delta E^* / RT$
19. Activation energy of any reaction depends on
- (a) Temperature
(b) Nature of reactants
(c) Number of collisions per unit time
(d) Concentration of reactants
20. Relation between rate constant and temperature by Arrhenius equation is
- (a) $\log_e A = \log_e K + \frac{E_a}{RT}$ (b) $\log K = A \frac{E_a}{RT}$
(c) $\log_e K = \log_e A - \frac{E_a}{RT^2}$ (d) $\log A = RT \ln E_a - \ln K$
21. An endothermic reaction $A \rightarrow B$ has an activation energy 15 kcal/mole and energy of reaction 5 kcal/mole . The activation energy of the reaction $B \rightarrow A$ is [Pb. CET 1985]
- (a) 20 kcal/mole (b) 15 kcal/mole
(c) 10 kcal/mole (d) None of these
22. Which of the following plots is in accordance with the Arrhenius equation

23. The Arrhenius Equation expressing the effect of temperature on the rate constant of a reaction is [MP PET 1997]
- (a) $k = e^{-E_a/RT}$ (b) $k = E_a / RT$
(c) $k = \log_e \frac{E_a}{RT}$ (d) $k = Ae^{-E_a/RT}$
24. For a reaction, activation energy (E_a) = 0 and rate constant (K) = $3.2 \times 10^6 \text{ s}^{-1}$ at 300 K. What is the value of the rate constant at 310 K [KCET (Med.) 1999]
- (a) $3.2 \times 10^{-12} \text{ s}^{-1}$ (b) $3.2 \times 10^6 \text{ s}^{-1}$
(c) $6.4 \times 10^{12} \text{ s}^{-1}$ (d) $6.4 \times 10^6 \text{ s}^{-1}$
25. Activation energy is given by the formula [DCE 1999]
- (a) $\log \frac{K_2}{K_1} = \frac{E_a}{2.303R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$

$$(b) \log \frac{K_1}{K_2} = -\frac{E_a}{2.303R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$$

$$(c) \log \frac{K_1}{K_2} = -\frac{E_a}{2.303R} \left[\frac{T_1 - T_2}{T_1 T_2} \right]$$

(d) None of these

26. A reaction having equal activation energies for forward and reverse reaction has [MP PMT 2002]
- (a) $\Delta H = 0$ (b) $\Delta S = 0$
(c) Zero order (d) None of these
27. Collision theory is applicable to [MP PMT 2002]
- (a) First order reactions (b) Zero order reactions
(c) Bimolecular reactions (d) Intra molecular reactions
28. A graph plotted between $\log K$ vs $1/T$ for calculating activation energy is shown by [MP PET 2002]

29. The rate constant of a reaction at temperature 200 K is 10 times less than the rate constant at 400 K. What is the activation energy (E_a) of the reaction (R = gas constant) [EAMCET 2003]
- (a) $1842.4 R$ (b) $921.2 R$
(c) $460.6 R$ (d) $230.3 R$
30. In respect of the equation $k = Ae^{-E_a/RT}$ in chemical kinetics, which one of the following statement is correct [AIEEE 2003]
- (a) k is equilibrium constant
(b) A is adsorption factor
(c) E_a is energy of activation
(d) R is Rydberg's constant

31. The rate constant is doubled when temperature increases from 27°C to 37°C . Activation energy in kJ is

- (a) 34 (b) 54
(c) 100 (d) 50

32. The activation energy of a reaction is zero. The rate constant of this reaction
- (a) Increases with increase of temperature
(b) Decreases with an increase of temperature
(c) Decreases with decrease of temperature
(d) Is independent of temperature

33. The rate constant is given by the equation $k = pze^{-E/RT}$. Which factor should register a decrease for the reaction to proceed more rapidly [MP PET/PMT 1998]

- (a) T (b) Z
(c) E (d) p

34. An endothermic reaction with high activation energy for the forward reaction is given by the diagram: [AIIMS 2005]

35. Consider an endothermic reaction $X \rightarrow Y$ with the activation energies E_b and E_f for the backward and forward reactions, respectively, in general [AIEEE 2005]

- (a) $E_b < E_f$
 (b) $E_b > E_f$
 (c) $E_b = E_f$
 (d) There is no definite relation between E_b and E_f

36. Temperature dependent equation can be written as

[Orissa JEE 2005]

- (a) $\ln k = \ln A - e^{E_a/RT}$ (b) $\ln k = \ln A + e^{E_a/RT}$
 (c) $\ln k = \ln A - e^{RT/E_a}$ (d) All of these

Photochemical reactions

- The formation of starch in plants results from
 - Photosynthesis
 - Photolysis
 - Flash photolysis
 - None of the above
- The photolysis of water gives the substance
 - $OH^- + H^+$
 - $H_2 + OH^-$
 - $H_2 + O_2$
 - $H_2O + H_2O_2$
- The law of photochemical equivalence was given by
 - Drapper
 - Grauths
 - Einstein
 - Labbert
- If I' is the intensity of absorbed light and C is the concentration of AB for the photochemical process $AB + h\nu \rightarrow AB^*$, the rate of formation of AB^* is directly proportional to
 - C
 - I
 - I^2
 - C/I

Critical Thinking

Objective Questions

1. For the reaction $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$, the rate of reaction is expressed as [CBSE PMT 1997; AIEEE 2002]

(a) $-\frac{\Delta[I_2]}{\Delta t} = -\frac{\Delta[H_2]}{\Delta t} = \frac{1}{2} \frac{\Delta[HI]}{\Delta t}$

(b) $\frac{\Delta[I_2]}{\Delta t} = \frac{\Delta[H_2]}{\Delta t} = \frac{\Delta[HI]}{2\Delta t}$

(c) $\frac{\Delta[H_2]}{\Delta t} = \frac{1}{2} \frac{\Delta[I_2]}{\Delta t} = -\frac{\Delta[HI]}{\Delta t}$

(d) None of these

2. If $3A \rightarrow 2B$, then the rate of reaction of $+\frac{d(B)}{dt}$ is equal to

[CBSE PMT 2002]

(a) $+2 \frac{d(A)}{dt}$ (b) $-\frac{1}{3} \frac{d(A)}{dt}$

(c) $-\frac{2}{3} \frac{d(A)}{dt}$ (d) $-\frac{3}{2} \frac{d(A)}{dt}$

3. The differential rate law for the reaction $H_2 + I_2 \rightarrow 2HI$ is

[AIEEE 2002]

(a) $-\frac{d[H_2]}{dt} = -\frac{d[I_2]}{dt} = +\frac{1}{2} \frac{d[HI]}{dt}$

(b) $\frac{d[H_2]}{dt} = \frac{d[HI]}{dt} = \frac{1}{2} \frac{d[HI]}{dt}$

(c) $\frac{1}{2} \frac{d[H_2]}{dt} = \frac{1}{2} \frac{d[I_2]}{dt} = -\frac{d[HI]}{dt}$

(d) $-2 \frac{d[H_2]}{dt} = -2 \frac{d[I_2]}{dt} = +\frac{d[HI]}{dt}$

4. The rate law for a reaction between the substances A and B is given by, rate $= k[A]^n[B]^m$. On doubling the concentration of A and halving the concentration of B , the ratio of the new rate to the earlier rate of the reaction will be as

(a) $\frac{1}{2^{(m+n)}}$ (b) $(m+n)$

(c) $(n-m)$ (d) $2^{(n-m)}$

5. If we plot a graph between $\log K$ and $\frac{1}{T}$ by Arrhenius equation, the slope is

[UPSEAT 2001]

(a) $-\frac{E_a}{R}$ (b) $+\frac{E_a}{R}$

(c) $-\frac{E_a}{2.303R}$ (d) $+\frac{E_a}{2.303R}$

6. For an endothermic reaction, where ΔH represents the enthalpy of the reaction in kJ/mol , the minimum value for the energy of activation will be

[IIT 1992]

- (a) Less than ΔH (b) Zero
 (c) More than ΔH (d) Equal to ΔH

7. The rate constant (K') of one reaction is double of the rate constant (K'') of another reaction. Then the relationship between the corresponding activation energies of the two reactions (E_a' and E_a'') will be

[MP PET 1994; UPSEAT 2001]

(a) $E_a' > E_a''$ (b) $E_a' = E_a''$

(c) $E_a' < E_a''$ (d) $E_a' = 4E_a''$

8. The rate constant, the activation energy and the arrhenius parameter of a chemical reaction at $25^\circ C$ are $3.0 \times 10^{-4} s^{-1}$,

$104.4 \text{ kJ mol}^{-1}$ and $6.0 \times 10^{14} \text{ s}^{-1}$ respectively. The value of the rate constant as $T \rightarrow \infty$ is

[IIT 1996]

- (a) $2.0 \times 10^{18} \text{ s}^{-1}$ (b) $6.0 \times 10^{14} \text{ s}^{-1}$
(c) Infinity (d) $3.6 \times 10^{30} \text{ s}^{-1}$

9. The ΔH value of the reaction $\text{H}_2 + \text{Cl}_2 \rightleftharpoons 2\text{HCl}$ is -44.12 kcal . If E_1 is the activation energy of the products, then for the above reaction

[EAMCET 1997]

- (a) $E_1 > E_2$
(b) $E_1 < E_2$
(c) $E_1 = E_2$
(d) ΔH is not related to E_1 and E_2
(e) None is correct

10. The temperature dependence of rate constant (k) of a chemical reaction is written in terms of Arrhenius equation, $K = A e^{-E^*/RT}$. Activation energy (E^*) of the reaction can be calculated by plotting

[CBSE PMT 2003]

- (a) $\log k$ vs $\frac{1}{\log T}$ (b) k vs T
(c) k vs $\frac{1}{\log T}$ (d) $\log k$ vs $\frac{1}{T}$

11. Activation energy of a chemical reaction can be determined by

[CBSE PMT 1998; AFMC 1999; BHU 2000]

- (a) Changing concentration of reactants
(b) Evaluating rate constant at standard temperature
(c) Evaluating rate constants at two different temperatures
(d) Evaluating velocities of reaction at two different temperatures

12. The activation energy for a reaction is 9.0 Kcal/mol . The increase in the rate constant when its temperature is increased from 298 K to 308 K is

[JIPMER 2000]

- (a) 63% (b) 50%
(c) 100% (d) 10%

13. Which of the following is the fastest reaction

[Pb. CET 2002]

- (a) $\text{C} + \frac{1}{2} \text{O}_2 \xrightarrow{250^\circ\text{C}} \text{CO}$ (b) $\text{C} + \frac{1}{2} \text{O}_2 \xrightarrow{500^\circ\text{C}} \text{CO}$
(c) $\text{C} + \frac{1}{2} \text{O}_2 \xrightarrow{750^\circ\text{C}} \text{CO}$ (d) $\text{C} + \frac{1}{2} \text{O}_2 \xrightarrow{1000^\circ\text{C}} \text{CO}$

14. The rate constant k , for the reaction $\text{N}_2\text{O}_5(\text{g}) \rightarrow 2\text{NO}_2(\text{g}) + \frac{1}{2} \text{O}_2(\text{g})$ is $2.3 \times 10^{-2} \text{ s}^{-1}$. Which equation given below describes the change of $[\text{N}_2\text{O}_5]$ with time? $[\text{N}_2\text{O}_5]_0$ and $[\text{N}_2\text{O}_5]_t$ correspond to concentration of N_2O_5 initially and at time, t

[AIIMS 2004]

- (a) $[\text{N}_2\text{O}_5]_t = [\text{N}_2\text{O}_5]_0 + kt$
(b) $[\text{N}_2\text{O}_5]_0 = [\text{N}_2\text{O}_5]_t e^{kt}$
(c) $\log_{10} [\text{N}_2\text{O}_5]_t = \log_{10} [\text{N}_2\text{O}_5]_0 - kt$
(d) $\ln \frac{[\text{N}_2\text{O}_5]_0}{[\text{N}_2\text{O}_5]_t} = kt$

15. For the reaction $\text{CH}_3\text{COOCH}_3 + \text{H}_2\text{O} \xrightarrow{\text{H}^+} \text{CH}_3\text{COOH} + \text{CH}_3\text{OH}$ The progress of the process of reaction is followed by

- (a) Finding the amount of methanol formed at different intervals

- (b) Finding the amount of acetic acid formed at different intervals
(c) Using a voltmeter
(d) Using a polarimeter

16. Half life of a reaction is found to be inversely proportional to the cube of its initial concentration. The order of reaction is

[KCET 2002]

- (a) 2 (b) 5
(c) 3 (d) 4

17. The integrated rate equation is $Rt = \log C_0 - \log C_t$. The straight line graph is obtained by plotting

[AIEEE 2002]

- (a) time v/s $\log C_t$ (b) $\frac{1}{\text{time}}$ v/s C_t
(c) time v/s C_t (d) $\frac{1}{\text{time}}$ v/s $\frac{1}{C_t}$

18. For which order reaction a straight line is obtained along with x -axis by plotting a graph between half life ($t_{1/2}$) and initial concentration 'a'

[RPET 2003]

- (a) 1 (b) 2
(c) 3 (d) 0

19. The reaction, $X \rightarrow \text{product}$ follows first order kinetics. In 40 minutes the concentration of X changes from 0.1 M to 0.025 M . Then the rate of reaction when concentration of X is 0.01 M

- (a) $1.73 \times 10^{-4} \text{ M min}^{-1}$ (b) $3.47 \times 10^{-5} \text{ M min}^{-1}$
(c) $1.73 \times 10^{-4} \text{ M min}^{-1}$ (d) $1.73 \times 10^{-5} \text{ M min}^{-1}$

20. A substance undergoes first order decomposition. The decomposition follows two parallel first order reactions as

The percentage distribution of B and C are

[Kerala PMT 2004]

- (a) 75% B and 25% C (b) 80% B and 20% C
(c) 60% B and 40% C (d) 90% B and 10% C
(e) 76.83% B and 23.17% C

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Instantaneous rate of reaction is equal to dx/dt .
Reason : It is the rate of reaction at any particular instant of time.
2. Assertion : Molecularity has no meaning for a complex reaction.

- Reason : The overall molecularity of a complex reaction is equal to the molecularity of the slowest step.
3. Assertion : If in a zero order reaction, the concentration of the reactant is doubled, the half-life period is also doubled.
- Reason : For a zero order reaction, the rate of reaction is independent of initial concentration.
4. Assertion : If the activation energy of a reaction is zero, temperature will have no effect on the rate constant.
- Reason : Lower the activation energy, faster is the reaction.
5. Assertion : According to steady state hypothesis, in a multistep reaction, the change in concentration with time for reactive intermediates is zero.
- Reason : The intermediates are so reactive that after a brief initial period their concentrations rise from zero to a small value and remains constant for most of the duration of the reaction.
6. Assertion : Half-life period of a reaction of first order is independent of initial concentration.
- Reason : Half-life period for a first order reaction

$$t_{1/2} = \frac{2.303}{K} \log 2.$$
7. Assertion : The photochemical reactions
 $H_2 + Cl_2 \rightarrow 2HCl$ and $H_2 + Br_2 \rightarrow 2HBr$
 have equal quantum efficiencies.
- Reason : Both the reactions proceed by similar mechanism.
8. Assertion : Vision is not a photochemical reaction.
- Reason : Halogenation of alkenes is a photochemical reaction.
9. Assertion : Glow worm shows chemiluminescence.
- Reason : Glow worm emits light due to oxidation of protein, luciferin present in it.
10. Assertion : The rate of reaction is always negative.
- Reason : Minus sign used in expressing the rate shows that concentration of product is decreasing.
11. Assertion : The kinetic of the reaction
 $mA + nB + pC \rightarrow m'X + n'Y + p'Z$ obeys
 the rate expression as $\frac{dx}{dt} = k[A]^m[B]^n$.
- Reason : The rate of the reaction does not depend upon the concentration of C.

Answers

Rate of a reaction

Rate of a reaction

1. (b) Rate of reaction continuously decreases with time.
2. (a) The rate of reaction depends upon conc. of reactant, surface area of reactant, temperature, presence of light and catalyst.
3. (d) According to law of mass action.
4. (b) $R = K[RCI]$, if $[RCI] = 1/2$, then rate = $R/2$.
5. (b) $2^2 = 4, 3^2 = 9$
6. (c) The rate of chemical reaction $\propto$ The product of the molar conc. of the reactants (at constant T)
7. (c) Rate of reaction = $\frac{dx}{dt} = \left[\frac{0.2 - 0.1}{10} \right] = \frac{0.1}{10}$
 $= 0.01 \text{ mol dm}^{-3} \text{ min}^{-1}$
8. (c) As reaction progressing the concentration of the reactants decreases and the concentration of the product increases.
9. (a) $-\frac{d(N_2)}{dt} = -\frac{1}{3} \frac{d(H_2)}{dt} = \frac{1}{2} \frac{d(NH_3)}{dt} = \frac{3}{2} \times 40 \times 10^{-3}$
 $= 60 \times 10^{-3}$.
10. (b) Greater are the concentrations of the reactants, faster is the reaction. Conversely, as the concentrations of the reactants decreases, the rate of reaction also decreases.
11. (b) Ionic reactions are very fast reactions i.e. take place instantaneously.
12. (b) Rate = $K(A)^2(B)^1$ on doubling the active mass of A the rate of reaction increase 4 times.
13. (c) ' A ' will disappear at twice the rate at which ' B ' will decrease.
14. (d) When volume is reduced to $\frac{1}{4}$, concentrations become four times.
16. (b) $-\frac{dN_2}{dt} = \frac{-1}{3} \frac{dH_2}{dt} = \frac{1}{2} \frac{dNH_3}{dt}$
 $\frac{dH_2}{dt} = \frac{3}{2} \times 0.001 = 0.0015 \text{ kg hr}^{-1}$.
18. (b) $-\frac{dc}{dt}$ refers as decrease in concentration of the reactant with time.
19. (d) The rate of a reaction depends upon concentration of reactant.
20. (a) $-\frac{1}{3} \frac{d[A]}{dt} = -\frac{d[B]}{dt} = \frac{+d[C]}{dt} = \frac{+d[D]}{dt}$.
21. (b) $N_2 + 3H_2 \rightleftharpoons 2NH_3$
 $\frac{-\Delta[N_2]}{\Delta t} = -\frac{1}{3} \frac{\Delta[H_2]}{\Delta t} = \frac{1}{2} \frac{\Delta[NH_3]}{\Delta t}$
 $\therefore \frac{\Delta[H_2]}{\Delta t} = \frac{3}{2} \times \frac{\Delta[NH_3]}{\Delta t} = \frac{3}{2} \times 2 \times 10^{-4}$
 $= 3 \times 10^{-4} \text{ mol litre}^{-1} \text{ sec}^{-1}$

22. (a) Increase in concentration of $B = 5 \times 10^{-3} \text{ mol l}^{-1}$
 Time = 10 sec

$$\text{Rate of appearance of B} = \frac{\text{Increase of conc. B}}{\text{Time taken}}$$

$$= \frac{5 \times 10^{-3} \text{ mol l}^{-1}}{10 \text{ sec}} = 5 \times 10^{-4} \text{ mol l}^{-1} \text{ Sec}^{-1}$$

24. (c) The rate of formation of SO_3 is $1.28 \times 10^{-3} \text{ g/sec}$.
26. (a) $\frac{K_t + 10}{K_t} = \frac{r_t + 10}{r_t} = 2$; For an increase of temperature to 50°C , i.e. 5 times, the rate increases by 2^5 times, i.e. 32 times.
28. (b) $\frac{K_t + 10}{K_t} = \frac{r_t + 10}{r_t} = 2$.
 For an increase of temperature to 20°C i.e. 2 times, the rate increase by 2^2 times, i.e. 4 times.
29. (b) $\frac{k_t + 10}{K_t} = \frac{r_t + 10}{r_t} = 2$
 For an increase of temperature to 90°C i.e. 9 times, the rate increases by 2^9 times i.e. 512.
30. (b) Catalyst increases the rate by decreasing the activation energy.
31. (a) For 10K rise in temperature, the rate of reaction nearly doubles.
32. (c) Temperature coefficient $\frac{K_{35^\circ \text{C}}}{K_{25^\circ \text{C}}} = \frac{K_{308 \text{K}}}{K_{298 \text{K}}} = 2$ and 3 for most reactions.
33. (b) Catalyst decrease energy of activation.
34. (a) Thus both rate and rate constant K increase with temperature, $r = k(\text{reactant})^n$ and $k = Ae^{-E_a/RT}$
35. (c) Enzymes does not always increase activation energy.
36. (d) Catalyst reduce the activation energy for reaction and thus increase the rate of reaction.
37. (a) Catalyst affect only activation energy. It brings down the activation energy of reaction.
38. (b) As we know that the velocity constant become double by increasing the temperature by 10°C so if at 290 K, velocity constant $= 3.2 \times 10^{-3}$ then at 300 K, velocity constant $= 2(K_{290}) = 2 \times 3.2 \times 10^{-3} = 6.4 \times 10^{-3}$.
39. (a) Higher the value of rate constant so, faster the reaction rate.
40. (c) Rate of reaction may increase or decrease with increase in temperature. If reaction is exothermic, rate decreases with increasing temperature while that of endothermic reactions increase with increasing temperature.
41. (a) $2N_2O_{5(g)} \rightarrow 4NO_{2(g)} + O_{2(g)}$
 Rate of reaction with respect to NO_2
 $= \frac{1}{4} \frac{d[NO_2]}{dt} = \frac{1}{4} \times \frac{5.2 \times 10^{-3}}{100} = 1.3 \times 10^{-5} \text{ ms}^{-1}$
42. (b) In first phase, $K = \frac{2.303}{20} \log \frac{90}{100}$ (i)
 In second phase $K = \frac{2.303}{t} \log \frac{81}{100}$ (ii)

$$\begin{aligned}\text{From eq. (i)} \quad \frac{2.303}{20} \log \frac{90}{100} &= \frac{2.303}{t} \log \frac{81}{100} \\ t &= \frac{20(\log 81 - \log 100)}{(\log 90 - \log 100)} \\ &= \frac{20(1.908 - 2)}{(1.954 - 2)} = \frac{20 \times (-0.092)}{(-0.046)} = 40 \text{ minutes}\end{aligned}$$

Rate law and Rate constant

- (d) Molecularity of the reaction does not influence the rate of reaction.
- (c) The rate law for an reaction can be given by; rate = $K(A)(B)^2$, i.e. the powers are raised which are given as coefficient of reactant.
- (a) $p_0 = 500 \text{ atm}$

$$K = \frac{2.303}{t} \log_{10} \frac{p_0}{p_t}$$

$$3.38 \times 10^{-5} = \frac{2.303}{10 \times 60} \log \frac{500}{p_t}$$
or $0.00880 = \log \frac{500}{p_t} \Rightarrow \frac{500}{p_t} = 1.02 = 490 \text{ atm}$
- (b) It is a pseudo-unimolecular reaction.
- (a) $A + 2B \rightarrow C + D$

$$\frac{-d[A]}{dt} = 5 \times 10^{-4}$$

$$-\frac{1}{2} \frac{d[B]}{dt} = \frac{5 \times 10^{-4}}{2} = 2.5 \times 10^{-4} \text{ mol}^{-1} \text{ sec}^{-1}$$
- (c) For following reaction, $2\text{NO}_{(g)} + \text{O}_{2(g)} \rightarrow 2\text{NO}_{2(g)}$
When the volume of vessel change into $\frac{1}{3}$ then concentration of reactant become three times.
The rate of reaction for first order reaction $\propto$ concentration.
So rate of reaction will increase three times.
- (b) $2A + B \rightarrow \text{Products}$
According to question : Rate of reaction of 'A' $\propto [B]$ as increase in rate is double when $[B]$ is doubled.
Rate of reaction $\propto [A][B]$ as increase in rate is 8 times when concentration of both reactant is doubled. It means that order of reaction is 3 and overall rate reaction should be $r = K[A]^2[B]$
- (b) Let the rate of reaction depends on x power of $[A]$. Then
 $r_1 = k[A]^x$ and $r_2 = k[2A]^x$

$$\therefore \frac{r_1}{r_2} = \frac{[A]^x}{[2A]^x} = \frac{1}{4} = \left(\frac{1}{2}\right)^2 \quad (\because r_2 = 4r_1)$$

$$\therefore x = 2.$$
As the reaction rate does not depend upon the concentration of B. Hence, the correct rate law will be rate = $K[A]^2[B]^0$ or $= K[A]^2$
- (b) Velocity constant ' K ' is characteristic constant of a reaction and depends only on temperature and catalyst.
- (d) Unit of K for 1st order reaction is Time^{-1} .
- (a) $K = Ae^{-E_a/RT}$ by this equation it is clear that rate constant of a reaction depends on temperature
- (c) $k = \frac{2.303}{t} \log_{10} \frac{a}{a-x}$; $t = 2 \times 10^2$, $a = 800$, $a-x = 50$

$$\begin{aligned}k &= \frac{2.303}{2 \times 10^2} \log_{10} \frac{800}{50} = \frac{2.303}{2 \times 10^2} \log_{10} 16 \\ &= \frac{2.303}{2 \times 10^2} \log_{10} 2^4 = \frac{2.303}{2 \times 10^4} \times 4 \times 0.301 \\ &= 1.38 \times 10^{-2} \text{ s}^{-1}\end{aligned}$$

- (d) Rate of reaction is quadrupled on doubling the concentration. Thus $r \propto [A]^2$.
- (d) K is not constant for all the reaction.
- (c) Rate determining step is a slow step by which rate of reaction can be determined.
- (c) It is a second order reaction and the unit of k for second order reaction is $\text{litre mol}^{-1} \text{ sec}^{-1}$.
- (b) For reversible reaction rate constant is also reverse.
- (a) Rate = $K(N_2O_5) = 6.2 \times 10^{-1} \times 1.25$
 $= 7.75 \times 10^{-1} \text{ mol l}^{-1} \text{ s}^{-1}$
- (a) We know that for first order kinetics

$$k = \frac{2.303}{t} \log \frac{a}{a-x}$$

$$(a-x) = 0.05 \text{ mol l}^{-1}, 6 = \frac{2.303}{t} \log \frac{0.5}{0.05}$$
or $t = \frac{2.303}{6} \log \frac{0.5}{0.05} = \frac{2.303}{6} = 0.384 \text{ min}$
- (d) Rate = $K(N_2O_5)$ hence $2.4 \times 10^{-5} = 3.0 \times 10^{-5} (N_2O_5)$
or $(N_2O_5) = 0.8 \text{ mol l}^{-1}$
- (b) $R = K[A]$, $1.02 \times 10^{-4} = 3.4 \times 10^{-5} [N_2O_5]$
or $(N_2O_5) = \frac{1.02 \times 10^{-4}}{3.4 \times 10^{-5}}, K = 3$
- (a) Rate law for the reaction
 $2N_2O_5 \rightarrow 4NO_2 + O_2$
is $r = k[N_2O_5]$ first order reaction.
- (c) Rate constant depends on temperature only.
- (c) According to Arrhenius concept
Rate constant $K = Ae^{-E_a/RT}$, Hence rate constant depends only upon temperature of the system.
- (d) For $2A + B \rightarrow C$
Rate = $K[A][B]$
Value of rate constant $K = Ae^{-E_a/RT}$ here K is independent of the initial concentration of A and B.
- (d) The specific rate constant of a first order reaction depends upon the temperature of reaction.
- (c) Unit of K for first order reaction = sec^{-1}
- (b) The rate of zero order reaction is not depend on the concentration of the reactants.
- (c) The unit of K for zero order reaction = $\text{mole litre}^{-1} \text{ sec}^{-1}$.
- (c) Order of reaction is sum of the power raised on concentration terms to express rate expression.
- (a) The concentration of reactant does not change with time for zero order reaction (unit of K suggests zero order) since reactant is in excess.
- (c) $r = K[A]^m$ also $2r = K[4A]^m$, $\frac{1}{2} = \left(\frac{1}{4}\right)^m$

$$\therefore m = \frac{1}{2}$$

40. (b) $K = \frac{2.303}{t} \log \frac{V_{\infty}}{V_{\infty} - V_t}$ gives constant value of K . With the given date. Hence it is 1st order.

42. (d) $r = K[A]^n$, $100r = K[10A]^n$

$$\text{Thus } \frac{1}{100} = \left(\frac{1}{10}\right)^n \text{ or } n = 2$$

43. (a) It is a standard example of first order because in that reaction rate of reaction affected by only one concentration term.
44. (c) Inversion of cane sugar is a Pseudo unimolecular reaction.
45. (c) For 1st order reaction

$$K = \frac{2.303}{t} \log_{10} \frac{a}{(a-x)}$$

46. (a) $t_{1/2} = \frac{0.693}{k} = \frac{0.693}{6.2 \times 10^{-4}} = 1117.7 \text{ sec.}$

47. (b) $k = \frac{2.303}{t} \log \frac{a}{a-x}$
 $\frac{0.693}{T} = \frac{2.303}{t} \log \frac{100}{100-30}$
 $\therefore T = 58.2 \text{ min.}$

48. (b) Order of reaction = $\frac{3}{2} + \frac{3}{2} = \frac{3+3}{2} = \frac{6}{2} = 3$

49. (c) Two molecules are taking part in elementary step.

50. (b) Because two molecules are taking part in elementary step.

51. (b) The overall order of a reaction is sum of powers T raised on concentration terms in order to write rate expression.

52. (a) It is a first order reaction as is clear from rate law expression, $r = k(H_2O_2)$

53. (a) For 1st order reaction half life is independent of concentration.

54. (d) $K = \frac{1}{t} \log e \left(\frac{a}{a-x} \right) = \frac{1}{15} \log e \left(\frac{35}{35-9} \right) = \frac{1}{15} \log e \left(\frac{35}{26} \right)$

56. (c) $k = \frac{0.693}{30} = 0.0231$; $t = \frac{2.303}{k} \log \left(\frac{100}{100-75} \right)$
 $t = \frac{2.303}{0.0231} \log 4 = 60 \text{ minutes}$

57. (d) $\text{Rate} = K(\text{sugar})(H_2O)^0$

58. (b) Derive $t_{1/2}$ from $K_t = 2.303 \log \frac{a}{a-x}$, putting $t = \frac{1}{2}$ and $x = \frac{a}{2}$. Therefore it is $\frac{0.693}{K}$.

59. (b) $r \propto [X]^2$ or $r = k[X]^2$

60. (b) $t_{1/2} = \frac{0.693}{k} = \frac{0.693}{1.1 \times 10^{-9}} = 6.3 \times 10^8 \text{ sec.}$

61. (c) $t_{1/2} \propto \frac{1}{(a)}$ for II order reaction.

62. (d) Order of reaction is an experimental value, while molecularity is a theoretical value.

63. (c) K for 1st order reaction = per unit time i.e. Time^{-1} .

64. (b) $R = K[A][B]^0$ so molecularity is two and order is two.

65. (c) Rate of zero order reaction is independent of the concentration of the reactant and remains constant throughout the reaction.

66. (d) $t_{1/2} \propto \frac{1}{(a)^{n-1}}$

67. (b) $t_{1/2} \propto \frac{1}{(C_o)^{n-1}}$ $\therefore$ reaction is of first order.

68. (c) For 1st order reaction half life is independent of concentration.

69. (c) $K = \frac{0.693}{t_{1/2}}$, $K = \frac{0.693}{138.6 \text{ min}} = 0.005 \text{ min}^{-1}$

70. (b) $CH_3COOCH_3 + H_2O \xrightarrow{H^+} CH_3COOH + CH_3OH$
It is a pseudo-unimolecular reaction.

71. (d) $t_{1/2} \propto \frac{1}{K}$ and $K \propto t$

73. (b) For zero order reactions $\frac{dx}{dt} = K(A)^0$

74. (b) It is an bimolecular and second order reaction.

75. (d) $\frac{dx}{dt} = (HI)^2$, then order of reaction = 2

76. (b) $\text{Rate} = K(\text{Sucrose})(H_2O)^0$

77. (b) Because in this reaction one molecule of N_2O_5 is used.

78. (c) Integrated velocity equation for first order reaction is:
 $k = \frac{2.303}{t} \log \frac{(A)_0}{(A)}$

80. (c) $t_{1/2} = \frac{2.303 \log 2}{K} = \frac{0.693}{K}$

81. (b) Inversion of sugar is a pseudo-unimolecular reaction.

82. (b) For 1st order reaction
 $\log(a-x) = \log a - \frac{kt}{2.303}$
 $y = c + mx$

83. (c) $t_{1/2} = \frac{0.693}{k} = \frac{0.693}{3.46 \times 10^{-3}} = 200 \text{ min}$

84. (a) $\frac{1}{\text{Time}} \times (\text{conc.}) = \frac{\text{moles l}^{-1}}{\text{Time}} = \text{moles l}^{-1} \text{time}^{-1}$ for zero order reaction.

85. (a) The order of reaction is $\frac{3}{2}$ and molecularity is 2.

87. (c) Molecularity can never be fractional.

88. (a) As doubling the initial conc. doubles the rate of reaction, order = 1.

89. (c) When B is in excess, it becomes a pseudo-unimolecular reaction.

90. (c) $k = \frac{0.693}{t_{1/2}} = \frac{0.693}{69.35} = 9.99 \times 10^{-3} = 0.01 \text{ s}^{-1}$

91. (b) $k = \frac{0.693}{24} \text{ hr}^{-1} = \frac{2.303}{96} \log \frac{10}{a-x}$

$$\text{or } \log \frac{10}{a-x} = 1.2036 \quad \text{or } 1 - \log(a-x) = 1.2036$$

$$\text{or } \log(a-x) = -0.2036 = 1.7964$$

$$\text{or } (a-x) = \text{antilog } 1.7964 = 0.6258 \text{ gm}$$

92. (b) 0.08 mol l^{-1} to 0.01 mol l^{-1} involves 3 half-life. So the t is 30 minutes
93. (c) $t_{1/2}$ of II order reaction is inversely proportional to initial concentration of reactants.
94. (b) As $r = k(H_2O_2)$, it is a reaction of Ist order.
97. (b) $r = k(C_A)^{3/2}(C_B)^{-1/2}$

$$\text{Order} = \frac{3}{2} + \left(-\frac{1}{2}\right) = \frac{2}{2} = 1$$
98. (c) If rate = $K(A)^m(B)^n$, then order of reaction = $m + n$.
99. (a) $k = \frac{0.693}{t_{1/2}} = \frac{0.693}{100 \text{ sec}} = 6.93 \times 10^{-3} \text{ sec}^{-1}$
100. (c) $t_{1/2} = \frac{0.693}{k}$
101. (b) $t_{1/2} = \frac{0.693}{k}$, $k = \frac{0.693}{480} = 1.44 \times 10^{-3} \text{ sec}^{-1}$.
102. (d) $r = k(A)^2$, when concentration is doubled
 $r = k(2A)^2 = k 4(A)^2$ the rate becomes 4 times.
103. (c) $r = K[FeCl_3]^2[SnCl_2]^1$. Order = $2 + 1 = 3$
105. (a) $t_{1/2}$ for I order reaction independent of initial concentration.
107. (a) The rate will be given by slowest step. Thus
 $r = K[A][B_2]$. $K_c = \frac{[A][A]}{[A_2]}$ or $[A] = [K_c]^{1/2}[A_2]^{1/2}$
 $r = K \times [K_c]^{1/2}[A_2]^{1/2}[B_2] = K[A_2]^{1/2}[B]$. Thus order is $0.5 + 1 = 1.5$
108. (b) For Ist order reaction half life is independent of concentration.
110. (b) Rate = $K[A]^{1/2}[B]^{3/2}$
 $\therefore O.R. = \frac{1}{2} + \frac{3}{2} = 2$
112. (d) The rate of this photochemical reaction is independent of the concentration, therefore, it is zero order reaction.
113. (b) $t_{1/2} = \frac{0.693}{k} = \frac{0.693}{0.6932 \text{ hr}^{-1}} = 1 \text{ hr}$.
114. (b) The unit of rate constant shows that reaction is of first order. For first order reaction, half life is independent of initial conc. of the reactant. Thus,
 $t_{1/2} = \frac{0.693}{0.69 \times 10^{-1}} = \frac{0.693 \times 60}{0.69 \times 10^{-1}} = 600 \text{ sec}$
115. (d) Given : Rate constant of the first order reaction (K) = 3×10^{-6} per sec and initial concentration $[A] = 0.10 M$. We know that initial rate constant
 $K[A] = 3 \times 10^{-6} \times 0.10 = 3 \times 10^{-7} \text{ ms}^{-1}$.
116. (d) It is the characteristic of pseudo-unimolecular reactions.
117. (b) It is a second order reaction.
118. (d) $r = K[\text{reactant}]$
 $\therefore K = \frac{1.0 \times 10^{-2}}{0.2} = 0.05$
 $t_{1/2} = \frac{0.693}{0.05} = 13.86 \text{ s}$
119. (a) For first order reactions rate is depend on the concentration of one reactant.
120. (b) Molecularity of a reaction never become zero or fraction.
121. (d) $t = \frac{2.303}{k} \log \frac{a}{a-x}$
 $t = \frac{2.303}{1.155 \times 10^{-3}} \log \frac{100}{100-50} = 600 \text{ sec}$
122. (b) Rate = $K[A]^{3/2}[B]^{-1}$
 $\therefore O.R. = \frac{3}{2} + (-1) = \frac{1}{2}$
123. (d) $t_{1/2} \propto (CO)^0$ i.e. half life for Ist order is independent of initial concentration.
124. (c) $2NO_{(g)} + Cl_{2(g)} \rightarrow 2NOCl_{(g)}$
Rate = $K[NO]^2[Cl_2]^1$, $\therefore O.R. = 2 + 1 = 3$
125. (d) $8 \times 10^{-5} = \frac{1}{t} \left[\frac{1}{0.5} - \frac{1}{1} \right]$; $8 \times 10^{-5} = \frac{1}{t} [2 - 1]$
 $t = \frac{1}{8 \times 10^{-5}} = 0.125 \times 10^5 = 1.25 \times 10^4 \text{ min}$.
126. (b) $r = k[\text{reactant}]^{-1} \therefore k = \frac{0.693 \times 10^{-2}}{1}$ also
 $t_{1/2} = \frac{0.693}{k} = \frac{0.693}{0.693 \times 10^{-2}} = 100 \text{ min}$.
127. (d) $t_{1/2} = \frac{1}{Ka}$ for second order reactions.
128. (d) $k = \frac{2.303}{t} \log \left(\frac{a}{a-x} \right)$; $k = \frac{2.303}{30} \log \left(\frac{100}{100-75} \right)$
 $k = \frac{2.303}{t} \log \left(\frac{100}{100-93.75} \right)$ Put the value of K from above equation we get the value of t therefore
 $\therefore t = 60 \text{ min}$.
129. (b) $k = \frac{0.693}{45} \text{ min}^{-1} = \frac{2.303}{t_{99.9\%}} \log \frac{a}{a-0.999a}$ or
 $t_{99.9\%} = \frac{2.303 \times 45}{0.693} \log 10^3 = 448 \text{ min} \approx 7.5 \text{ hrs}$
130. (a) Given $A(a) = 2.00 \text{ m}$, $t = 200 \text{ min}$ and $a(a-x) = 0.15 \text{ m}$ we know
 $k = \frac{2.303}{t} \log \frac{a}{a-x} = \frac{2.303}{200} \log \frac{2.00}{0.15}$
 $= \frac{2.303}{200} \times (0.301 + 0.824) = 1.29 \times 10^{-2} \text{ min}^{-1}$
131. (a,c) The unit for zero order reaction is $\text{mol litre}^{-1} \text{time}^{-1}$
132. (c) It is a third order reaction because
Rate = $K[NO]^2[O_2]^1$ $\therefore O.R. = 2 + 1 = 3$
133. (d) Order of a reaction is decided by relative concentration of reactants.
134. (c) Unit of rate constant for second order reaction is $\text{mol}^{-1} \text{litre time}^{-1}$
135. (a) $R = K[A]^2[B]$ order of reaction = $2 + 1 = 3$
136. (a) Units of Ist rate constant order reaction are sec^{-1} and for zero order reaction, these are $\text{mol litre}^{-1} \text{sec}^{-1}$ i.e. $M \text{ sec}^{-1}$.
137. (c) This reaction is bimolecular and first order of reaction.
138. (c) $t_{1/2} = \frac{0.693}{k}$ Given $t_{1/2} = 693 \text{ sec}$

$$693 = \frac{0.693}{k}, k = \frac{693 \times 10^{-3}}{693}; k = 10^{-3} = 0.001 \text{ sec}^{-1}.$$

$$\text{Rate} = k[A]^2[B]^1$$

$\therefore O.R. = 2 + 1 = 3$ and molecularity is $3[2A + B]$.

$$10^{-3} = \frac{2.303}{t} \log \frac{a}{(a - \frac{2a}{3})}, 10^{-3} = \frac{2.303}{t} \log 3$$

$$10^{-3} = \frac{2.303}{t} \times 0.4771, t = \frac{2.303 \times 0.4771}{10^{-3}} = 3300 \text{ sec}$$

$$R = K(A)^2, R' = K(3A)^2, \frac{R'}{R} = 9$$

$$k = \frac{2.303}{32} \log \left(\frac{100}{100-75} \right) \quad \dots (i)$$

$$k = \frac{2.303}{t} \log \left(\frac{100}{100-50} \right) \quad \dots (ii)$$

from the two equation (i) and (ii), $t = 16$ minutes.

order reaction ($n = 1$). $t_{1/2} \propto \frac{1}{C^{1-1}}$ or $t_{1/2} \propto C^0$.

$$R' = k \times 4[NO]^2[O_2] = k \times 8[NO]^2[O_2]$$

$$\frac{R'}{R} = \frac{k \times 8[NO]^2[O_2]}{k[NO]^2[O_2]} = 8$$

$$t = \frac{2.303}{k} \log \frac{0.9}{0.675} = \frac{2.303}{k} \log \frac{4}{3}; t = 1 \text{ hour.}$$

$$\text{Velocity constant} = \frac{dx}{dt} = \frac{\text{Concentration}}{\text{Time}}$$

Unit = concentration $\times$ time $^{-1}$.

$$\text{i.e., } K = [H_2][Br_2]^{1/2}.$$

in this reaction molecularity is 2 but order of reaction is found to be first order experimentally, so it is an example of pseudo unimolecular reaction.

If initial concentration $a = 10 \text{ gm}$ and final concentration

$$x = \frac{a}{2} = 5 \text{ gm}$$

$$\begin{aligned} \text{then, } t &= \frac{2.303}{K} \log \frac{a}{a-x} = \frac{2.303}{.693} \times 10 \times \log \frac{10}{5} \\ &= \frac{2.303 \times 10 \times \log 2}{.693} = \frac{2.303 \times 10 \times 0.301}{0.693} = 10 \text{ years.} \end{aligned}$$

$$\therefore \log 4 = \frac{1}{t} \log 2$$

$$\therefore 2 \log 2 = \frac{1}{t} \log 2; t = \frac{1}{2} \text{ hr.}$$

The reaction is a first order reaction hence,

$$K = \frac{0.693}{t_{1/2}} = \frac{2.303}{t} \log \frac{a}{a-x} = \frac{0.693}{10 \text{ min}}$$

$$= \frac{2.303}{t} \log \frac{a}{a/10} = \frac{0.693}{10} = \frac{2.303}{t} \log 10$$

$$\therefore t = \frac{2.303 \times 10}{.693} = 33 \text{ min.}$$

Given: $a = 0.5 \text{ mol / litre}$; $a - x = 0.05 \text{ mol / litre}$

$$K = 6 \text{ sec}^{-1}.$$

$$t = \frac{2.303}{6} \log \frac{0.5}{0.05} = \frac{2.303}{6} \log 10 = \frac{2.303}{6} = 0.384 \text{ sec.}$$

$$\text{For first order } K = \frac{1.5 \times 10^{-2}}{0.5} = 3 \times 10^{-2} \text{ min ute}^{-1}$$

$$t_{1/2} = \frac{.693}{K} = \frac{.693}{3 \times 10^{-2}} = 23.1 \text{ min ute.}$$

$$\text{Given: } a = \frac{1}{10} = .1m; a - x = \frac{1}{100} = .01m; t = 500 \text{ sec}$$

$$\therefore K = \frac{2.303}{500} \log \frac{.10}{.01} = \frac{2.303}{500} \log 10$$

$$= \frac{2.303}{500} = 0.004606 = 4.6 \times 10^{-3} \text{ sec}^{-1}.$$

161. (b) For zero order reaction, rate of reaction is independent of concentration $R = K[\text{Reactant}]^0$

162. (b) The radioactive disintegration reactions are of first order because in this rate of disintegration depends on the concentration term of radioactive material only.

163. (b) $t_{1/2} \propto a^{1-n} \Rightarrow \frac{0.1}{0.4} = \frac{(200)^{1-n}}{(50)^{1-n}} \Rightarrow \frac{1}{4} = \left[\frac{4}{1}\right]^{1-n} = \left[\frac{1}{4}\right]^{n-1}$
 $\Rightarrow \frac{1}{4^1} = \frac{1}{4^{n-1}} \therefore n-1=1; n=2.$

164. (abd) By Vant's Hoff equation, $\frac{d \ln k}{dt} = \frac{\Delta H^\circ}{RT^2}$

or $\ln k_p = -\frac{\Delta H^\circ}{RT} + I$. Hence (a) is correct (b) is also correct as plot of $\log (X)$ vs time is linear. (c) is wrong because $p \propto T$ at constant volume. (d) is correct by Boyle's law.

165. (ad) (a) is correct because degree of dissociation $= 1 - e^{-kt}$ at any time t .

(b) is wrong because plot of $\log [A]$ vs t is a straight line

(c) is wrong because time taken for 75% reaction is two half life.

(d) is correct because in $k = Ae^{-E_a/RT}$, E_a/RT is dimensionless hence A has the unit of K .

166. (b) $aA \rightarrow xP$

Rate of reaction $= [A]$

Order of reaction $= a$

$[A] = 2.2 \text{ mM}, r_i = 2.4 \text{ mM s}^{-1} \dots(i)$

$[A] = 2.2/2 \text{ mM}, r_i = 0.6 \text{ mM s}^{-1}, \frac{2.4}{4} \dots(ii)$

On reducing the concentration of A to half, the rate of reaction is decreased by four times.

Rate of reaction $= [A]$

Order of reaction $= 2$.

167. (d) Order of a reaction can be fractional.

168. (b) $t_{1/4} = \frac{2.303}{K} \log \frac{1}{1 - \frac{1}{4}} = \frac{0.29}{K}$

169. (d) $R = K[A]$

$2 \times 10^{-5} = K \times 10^{-2}$

$K = 2 \times 10^{-3} \text{ sec}^{-1}$

$t_{1/2} = \frac{.693}{K} = \frac{.693}{2 \times 10^{-3}} = \frac{693}{2} = 347 \text{ sec}$

170. (b) $R = k[B]^n; \frac{1}{4}R = k[2B]^n; 4 = \left(\frac{1}{2}\right)^n; 4 = 2^{-n}; n = -2.$

171. (c) $T = t_{1/2} \times n$ i.e. $12 = 3 \times n \Rightarrow n = 4$

$N = N_0 \left(\frac{1}{2}\right)^n \Rightarrow \frac{N}{N_0} = \left(\frac{1}{2}\right)^4 = \frac{1}{16}$

172. (c) $K = 1.7 \times 10^{-5} \text{ s}^{-1}$

$t_{1/2} = \frac{0.693}{K} = \frac{0.693}{1.7} \times 10^5 = 11.32 \text{ h}$

173. (c) $A + B \rightarrow C$

On doubling the concentration of A rate of reaction increases by four times. Rate $\propto [A]^2$

However on doubling the concentration of B , rate of reaction increases two times. Rate $\propto [B]$

Thus, overall order of reaction $= 2 + 1 = 3$.

174. (a) In case of zero order reaction, the concentration of reactant decreases linearly with time, as its rate is independent of the concentration of the reactants.

Collision theory, Energy of activation and Arrhenius equation

- (b) The increase in collision frequency brings in an increase in effective collisions and thus rate of reaction increases.
- (b) All collisions are not effective and does not result in the formation of the products
- (b) The increase in collision frequency brings in an increase in effective collisions and thus rate of reaction increases.
- (c) The increase in collision frequency brings in an increase in effective collisions and thus rate of reaction increases.
- (a) Slower reaction rate indicates higher energy of activation.
- (d) Energy of activation decreases, rate of reaction will increase.
- (d) Number of collision depend upon pressure, concentration and temperature.
- (c) The definition of activation energy.
- (b) Activation energy is the energy needed by reactant molecules to gain threshold energy level.
- (d) All other are different forms of Arrhenius equation.
- (d) Increase in the rate of reaction is determined by the increase in the number of effective collisions.
- (a) Energy of activation reduced by increasing temperature.
- (d) The definition of threshold energy.
- (a) The definition of activation energy.
- (b) When the temperature is increased, heat energy is supplied which increases the kinetic energy of the reacting molecules. this will increase the number of collisions and ultimately the rate of reaction will be enhanced.
- (d) In exothermic and endothermic reactions will be more and less than E_a respectively.
- (b) The value of activation energy for a chemical reaction primarily dependent on the nature of reacting species.

20. (a) Arrhenius equation is $\log k = \log A - \frac{E_a}{RT}$

22. (a) A graph plotted between $\log k$ vs $\frac{1}{T}$ for calculating activation energy.

24. (b) When $E_a = 0$ rate constant is independent of temperature.

25. (a) It is modified form of Arrhenius equation.

28. (b) A graph plotted between $\log k$ Vs $\frac{1}{T}$ for calculating activation energy is shown as from Arrhenius equation

$\log k = \log A - \frac{E_a}{2.303 RT}$

30. (c) It is Arrhenius equation.

31. (b) $\log \frac{K_2}{K_1} = \frac{E_a}{2.303R} \left[\frac{1}{T_1} - \frac{1}{T_2} \right]$

if $\frac{K_2}{K_1} = 2$

$\log 2 = \frac{E_a}{2.303 \times 8.314} \left[\frac{1}{300} - \frac{1}{310} \right]$

$$E_a = .3010 \times 2.303 \times 8.314 \left(\frac{300 \times 310}{10} \right) \\ = 53598.59 \text{ J mol}^{-1} = 54 \text{ kJ}.$$

32. (d) When $E_a = 0$, the rate of reaction becomes independent of temperature.

(E_a = Energy of activation).

33. (c) When k increases, rate of reaction also increases, $k = \frac{pz}{e^{E/RT}}$ for k to increase p , z , T should increase and E should decrease. ($e \approx 2.7$).

34. (c) Endothermic reactions are those which involve absorption of heat. High activation energy means potential energy of product must be much greater than reactants.

35. (a) For endothermic reaction $\Delta H = +ve$

Then from equation $\Delta H = E_{aF.R.} - E_{aB.R.}$; $E_{B.R.} < E_{F.R.}$.

36. (a) Arrhenius suggested an equation which describes rate constant (K) as a function of temperature.

$$K = Ae^{-E_a/RT}$$

$$\ln K = \ln A - e^{E_a/RT}$$

Photochemical reactions

2. (a) $H_2O \xrightarrow{\text{Photolysis}} OH^- + H^+$
3. (c) Stark - Einstein was given the law of photochemical equivalence.
4. (b) In photochemical reaction the rate of formation of product is directly proportional to the intensity of absorbed light.

Critical Thinking Questions

1. (a) For the given reaction :

$$-\frac{\Delta[I_2]}{\Delta t} = -\frac{\Delta[H_2]}{\Delta t} = \frac{1}{2} \frac{\Delta[HI]}{\Delta t}$$

2. (c) $-\frac{1}{3} \frac{d[A]}{dt} = \frac{1}{2} \frac{d[B]}{dt} \therefore \frac{d[B]}{dt} = -\frac{2}{3} \frac{d[A]}{dt}$

3. (a) Concentration of reactants decreases while concentration of product increases.

4. (d) $R = K(A)^n(B)^m$

$$R' = K(2A)^n \left(\frac{B}{2} \right)^m = K(A)^n 2^n (B)^m 2^{-m}$$

$$= K(A)^n (B)^m 2^{n-m}, \frac{R'}{R} = \frac{K(A)^n (B)^m 2^{n-m}}{K(A)^n (B)^m} = 2^{n-m}$$

5. (c) $\ln K = \ln A - \frac{E_a}{RT}$ is Arrhenius equation. Thus plots of $\ln K$ vs $1/T$ will give slope $= -E_a/RT$ or $-E_a/2.303R$.

6. (c) For a reaction E_a for forward reaction $= E_a$ for backward reaction $+\Delta H$.

7. (c) As $K' > K''$, $E_a' < E_a''$ (Greater the rate constant, less is the activation energy).

8. (b) $T_2 = T(\text{say}), T = 25^\circ C = 298K$,

$$E_a = 104.4 \text{ kJ mol}^{-1} = 104.4 \times 10^3 \text{ J mol}^{-1}$$

$$K_1 = 3 \times 10^{-4}, K_2 = ?,$$

$$\log \frac{K_2}{K_1} = \frac{E_a}{2.303R} \left[\frac{1}{T_1} - \frac{1}{T_2} \right]$$

$$\log \frac{K_2}{3 \times 10^{-4}} = \frac{104.4 \times 10^3 \text{ J mol}^{-1}}{2.303 \times (8.314 \text{ J K}^{-1} \text{ mol}^{-1})}$$

$$\left[\frac{1}{298K} - \frac{1}{T} \right] \text{ As } T \rightarrow \infty, \frac{1}{T} \rightarrow 0$$

$$\therefore \log \frac{K_2}{3 \times 10^{-4}} = \frac{104.4 \times 10^3 \text{ J mol}^{-1}}{2.303 \times 8.314 \times 298}$$

$$\log \frac{K_2}{3 \times 10^{-4}} = 18.297, \frac{K_2}{3 \times 10^{-4}} = 1.98 \times 10^{18} \text{ or}$$

$$K_2 = (1.98 \times 10^{18}) \times (3 \times 10^{-4}) = 6 \times 10^{14} \text{ s}^{-1}$$

9. (a) Because reaction is exothermic

10. (d) $k = Ae^{-E^0/RT}$ $\log K = \log A - \frac{E^0}{RT} \therefore \log K \text{ Vs } \frac{1}{T}$

11. (c) $\log \frac{K_2}{K_1} = \frac{E_a}{2.303R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$

12. (a) $2.303 \log \frac{K_2}{K_1} = \frac{E_a}{R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$

$$\log \frac{K_2}{K_1} = \frac{9.0 \times 10^3}{2.303 \times 2} \left[\frac{308 - 298}{308 \times 298} \right]$$

$$\frac{K_2}{K_1} = 1.63; K_2 = 1.63 K_1; \frac{1.63 K_1 - K_1}{K_1} \times 100 = 63.0\%$$

13. (d) Combustion is an exothermic process, which is expected to be favoured by low temperature, but it is not true. Combustion include burning of particles which takes place at higher temperature. Thus at high temperature due to combustion of more particles, the reaction proceeds at higher rate.

14. (d) Rate constant $= 2.3 \times 10^{-2} \text{ sec}^{-1}$
It means it is a first order reaction (because unit of rate constant is sec^{-1})

$$\text{For first order reaction } K = \frac{1}{t} \ln \frac{a}{a-x}$$

$$Kt = \ln \frac{a}{a-x} = \ln \frac{[N_2O_5]_0}{[N_2O_5]_t}$$

15. (b) Because as reaction progresses the amount of acetic acid increases.

16. (d) Half life of a reaction is found to be inversely proportional to the cube of initial concentration. The order of reaction is 4.

17. (a) It is similar to $y = mx + c$

18. (b) $r = K[A]^n$, $100r = K[10A]^n$

$$\text{Thus } \frac{1}{100} = \left(\frac{1}{10} \right)^n \text{ or } n = 2$$

19. (c) Concentration will fall from 0.1 M concentration to 0.025 M concentration within 2 half lives.

$$2 \times T_{1/2} = 40 \text{ min}$$

$$\therefore T_{1/2} = 20 \text{ min}$$

$$\text{Rate of reaction} = K \cdot c = \frac{0.693}{T_{1/2}} \cdot c$$

$$= \frac{0.693}{20} \times 10^{-2} \text{ M/min} = 3.47 \times 10^{-4} \text{ M/min}^{-1}.$$

20. (e) % distribution of B = $\frac{K_1}{K_1 + K_2} \times 100$

$$= \frac{1.26 \times 10^{-4}}{1.26 \times 10^{-4} + 3.8 \times 10^{-4}} \times 100$$

$$B\% = 76.83\%$$

%Distribution of C = $\frac{K_2}{K_1 + K_2} \times 100$

$$= \frac{3.8 \times 10^{-4}}{1.26 \times 10^{-4} + 3.8 \times 10^{-4}} \times 100$$

$$C\% = 23.17\%$$

Assertion and Reason

1. (b) Instantaneous rate of a reaction is equal to small change in concentration (dx) during a small interval of time (dt) at that particular instant of time divided by the time interval.
2. (b) Molecularity of a reaction can be defined only for an elementary reaction because complex reaction does not take place in one single step and it is almost impossible for all the total molecules of the reactants to be in a state of encounter simultaneously.
3. (b) For a zero order reaction, $t_{1/2} = [A_0] / 2K$.
4. (b) According to Arrhenius equation, $K = Ae^{-E_a/RT}$ when $E_a = 0$, $K = A$.
6. (a) For a first order reaction, $K = \frac{2.303}{t} \log \frac{a}{a-x}$, where a is initial concentration, and x is the amount reacted in time t . For half-life $x = a/2$, $t = t_{1/2}$

$$K = \frac{2.303}{t_{1/2}} \log \frac{a}{a-a/2}$$

$$t_{1/2} = \frac{2.303}{K} \log 2 = \frac{0.693}{K}.$$
7. (d) $H_2 + Cl_2 \rightarrow 2HCl$ has much higher quantum efficiency than $H_2 + Br_2 \rightarrow 2HBr$. The first step of secondary process of $H_2 + Cl_2 \rightarrow 2HCl$ is exothermic while the same for $H_2 + Br_2 \rightarrow 2HBr$ is endothermic.
8. (e) Vision is a fast photochemical reaction in which the compound, retinal, present in the eye undergoes isomerisation by absorbing a photon of light.
9. (a) The emission of cold light during a chemical reaction is called chemiluminescence.
10. (d) The rate reaction is never negative. Minus sign used in expressing the rate only shows that the concentration of the reactant is decreasing.
11. (a) Rate expression $\frac{dx}{dt} = K[A]^m[B]^n$

Shows that the total order of reactions is $m+n+O$
 $= m+n$ as the rate of reaction is independent of concentration of C, i.e. the order with respect to C is zero. This is the reason that C does not figure in the rate expression.

Chemical Kinetics

Self Evaluation Test - 11

- The temperature coefficient of most of the reactions lies between [MP PET 1999]
 - 1 and 3
 - 2 and 3
 - 1 and 4
 - 2 and 4
- The influence of temperature on the rate of reaction can be found out by [AFMC 2001]
 - Clapeyron–Claussius equation
 - Gibbs–Helmholtz equation
 - Arrhenius equation
 - Vander Waal's equation
- The mechanism for the reaction is given below

$$2P + Q \rightarrow S + T$$

$$P + Q \rightarrow R + S \text{ (slow)}$$
