(a) Pb^{2+} (b) Fe^{3+}
(c) Zn^{2+} (d) Cu^{2+}
57. Which of the following sulphate is insoluble in water [MNR 1995]
(a) $CuSO_4$ (b) $CdSO_4$
(c) $PbSO_4$ (d) $Bi(SO_4)_3$
58. A solution when treated with dimethyl glyoxime gives a rose red complex. The metal present is [AFMC 1982; BHU 1979]
(a) Ni (b) V
(c) Co (d) Mn
59. When bismuth chloride is poured into a large volume of water, the white precipitate produced is [MP PMT 1985; CPMT 1979]
(a) $Bi(OH)_3$ (b) Bi_2O_3
(c) $BiOCl$ (d) Bi_2OCl_3
60. Mark the compound which turns black with NH_4OH [AFMC 1981; MP PMT 1995]
(a) Lead chloride (b) Mercurous chloride
(c) Mercuric chloride (d) Silver chloride
61. Colour of cobalt chloride solution is [AFMC 1981]
(a) Pink (b) Black
(c) Colourless (d) Green
62. Sodium carbonate cannot be used in place of ammonium carbonate for the precipitation of the fifth group radicals because
(a) Sodium ions interfere with the detection of fifth group radicals
(b) Concentration of carbonate ions is very low
(c) Sodium will react with acidic radicals
(d) Magnesium will be precipitated
63. Nessler's reagent is used to detect
(a) CrO_4^{2-} (b) PO_4^{3-}
(c) MnO_4^- (d) NH_4^+
64. A light greenish coloured salt was soluble in water. On passing H_2S into the solution a black precipitate was obtained which dissolve readily in HCl [IIT 1996] the ion present is [BHU 1981]
(a) Co^{+2} (b) Fe^{2+}
(c) Ni^{+2} (d) Mn^{+2}
65. Yellow ammonium sulphide solution is a suitable reagent for the separation of [BHU 1987]
(a) HgS and PbS (b) PbS and Bi_2S_3
(c) Bi_2S_3 and CuS (d) CdS and As_2S_3
66. $Fe(OH)_3$ can be separated from $Al(OH)_3$ by addition of [BHU 1981]
(a) Dil. HCl (b) $NaCl$ solution
(c) $NaOH$ solution (d) NH_4Cl and NH_4OH
67. The reagents NH_4Cl and aqueous NH_3 will precipitate [IIT 1991]
(a) Ca^{2+} (b) Al^{+3}
(c) Mg^{2+} (d) Zn^{2+}
68. The aqueous solutions of the following salts will be coloured in the case of [IIT 1990]
(a) $Zn(NO_3)_2$ (b) $LiNO_3$
(c) $CrCl_3$ (d) Potash alum
69. A mixture containing Cu^{2+} and Ni^{2+} can be separated for identification by [MP PMT 1994]
(a) Passing H_2S in acid medium
(b) Passing H_2S in alkaline medium
(c) Passing H_2S in neutral medium
(d) Passing H_2S in dry mixture
70. Addition of $SnCl_2$ to $HgCl_2$ gives ppt [BVP 2003]
(a) White turning to red (b) White turning to gray
(c) Black turning to white (d) None of these
71. When dilute aqueous solution of $AgNO_3$ (excess) is added to KI solution, positively charged sol. Particles of AgI are formed due to adsorption of ion [BHU 2003]
(a) NO_3^- (b) O_2^-
(c) Ag^+ (d) K^+
72. Haemoglobin is a complex of [CPMT 2003]
(a) Fe^{3+} (b) Fe^{2+}
(c) Fe^{4+} (d) Cu^{2+}
73. A colourless crystalline salt 'X' is soluble in dilute HCl . On adding $NaOH$ solution, it gives a white precipitate which is insoluble in excess of $NaOH$. 'X' is [AIIMS 1980; KCET 2003]
(a) $Al_2(SO_4)_3$ (b) $ZnSO_4$
(c) $MgSO_4$ (d) $SnCl_4$
74. Precipitate of group IV cations takes place when H_2S is [RPET 2003]
(a) Highly ionised (b) Less ionised
(c) Not ionised (d) None of these

75. In Nessler's reagent for the detection of ammonia the active species is [Kerala (Med.) 2003]
 (a) Hg_2Cl_2 (b) Hg^{2+}
 (c) Hg_2I_2 (d) HgI_4^{2-}
76. On addition of aqueous $NaOH$ to a salt solution, a white gelatinous precipitate is formed, which dissolves in excess alkali. The salt solution contains [MP PMT 1994]
 (a) Chromium ions (b) Aluminium ions
 (c) Barium ions (d) Iron ions
77. A solution prepared in conc. HCl sometimes gives white turbidity even in the absence of I⁻ group, when water is added to it. It is due to the presence of
 (a) Hg^{2+} (b) Sb^{3+}
 (c) Ag^{3+} (d) Sb^{3+} or Bi^{3+} or both
78. Which of the following pairs of ions when mixed in dilute solutions may give precipitate [CPMT 1976; NCERT 1987; Kurukshetra CEE 1998]
 (a) Na^+, SO_4^{2-} (b) NH_4^+, CO_3^{2-}
 (c) Na^+, S^{2-} (d) Fe^{3+}, PO_4^{3-}
79. Which one of the following sulphides is only completely precipitated when the acidic solution is made dilute [MP PET 2000]
 (a) HgS (b) PbS
 (c) CdS (d) CuS
80. A reagent used to test the presence of Fe^{2+} ion is [KCET 1998]
 (a) H_2S (b) NH_4CNS
 (c) $K_4Fe(CN)_6$ (d) $K_3Fe(CN)_6$
81. Identify the statement which is not correct regarding copper sulphate [UPSEAT 2001]
 (a) It reacts with KI to give iodine
 (b) It reacts with KCl to give $CuCl$
 (c) It reacts with $NaOH$ and glucose to give CuO
 (d) It gives CuO on strong heating in air
82. Mark the correct statement [MP PMT 2002]
 (a) I group basic radicals precipitate as chlorides
 (b) IV group basic radicals precipitate as sulphides
 (c) V group basic radicals precipitate as carbonates
 (d) All of these statement are correct
83. The following four solutions are kept in separate beakers and copper metal is put in each of them. Which solution will become blue after some time [MP PMT 2003]
 (a) $AgNO_3$ solution (b) $Zn(NO_3)_2$ solution
 (c) $Ba(NO_3)_2$ solution (d) $NaNO_3$ solution
84. Cu^{2+} ions will be reduced to Cu^+ ions by the addition of an aqueous solution of [AIIMS 1992]
 (a) KF (b) KCl
 (c) KI (d) KOH
85. Which radicals are precipitated in $(NH_4)_2CO_3$ in presence of alkali
 (a) Ca, Ba, Sr (b) Mg
 (c) Both (d) None
86. Which of the following is soluble in yellow ammonium sulphide
 (a) CuS (b) CdS
 (c) SnS (d) PbS
87. Which mixture is separated by conc. aqueous solution of sodium hydroxide [UPSEAT 1999]
 (a) Al and Sr (b) Al and Fe
 (c) Al and Zn (d) Zn and Pb
88. H_2S is passed through an acidified solution of Ag, Cu and Zn . Which forms precipitate [BHU 1998]
 (a) Ag (b) Zn
 (c) Cu (d) None of these
89. The presence of NH_4Cl in the test solution while precipitating group III-A hydroxides (in qualitative inorganic analysis) helps in
 (a) Lowering $[OH^-]$ (b) Lowering $[NH_4OH]$
 (c) Increasing $[OH^-]$ (d) Increasing $[NH_4OH]$
90. On saturating aqueous solution of Cu (II), Pb (II) and Zn (II) ions with H_2S will precipitate
 (a) Only CuS (b) Only PbS
 (c) Both CuS and PbS (d) CuS, PbS and ZnS
91. A chloride dissolves appreciably in cold water when placed on a platinum wire in Bunsen flame, no distinctive colour is noted, which cation could be present [Pb. PMT 1998]
 (a) Mg^{2+} (b) Ba^{2+}
 (c) Pb^{2+} (d) Ca^{2+}
92. A solid (A) which has photographic effect reacts with the solution of a sodium salt (B) to give a pale yellow ppt. (C). Sodium salt on heating gives brown vapour. Identify A, B and C.
 (a) $AgNO_3, NaBr, AgBr$ (b) $AgNO_3, NaCl, AgCl_2$
 (c) $AgNO_3, NaBr, AgCl_2$ (d) $AgCl, NaBr, AgBr_2$
93. In qualitative analysis, in order to detect second group basic radical, H_2S gas is passed in the presence of dilute HCl to [KCET 2004]
 (a) Increase in dissociation of H_2S
 (b) Decrease the dissociation of salt solution
 (c) Decrease the dissociation of H_2S
 (d) Increase the dissociation of salt solution
94. H_2S gas when passed through a solution of a contains HCl precipitate the cations of group of qualitative analysis but not those belonging to the fourth group. It is because [CBSE PMT 2005]
 (a) Presence of HCl decreases the sulphide ion concentration
 (b) Presence of HCl increases the sulphide ion concentration
 (c) Solubility product of group II sulphides is more than that of group IV sulphides
 (d) Sulphides of group IV Cations are in HCl
95. A metal nitrate reacts with KI to give a black precipitate which on addition of excess of KI convert into orange colour solution. The cation of the metal nitrate is [IIT-JEE (Screening) 2005]
 (a) Hg^{2+} (b) Bi^{3+}
 (c) Pb^{2+} (d) Cu^+
96. Which of the following basic radicals will not be precipitated by H_2S gas in the presence of NH_3 [Pb. PMT 2001] [Pb. CET 2003]
 (a) Mn^{2+} (b) Ni^{2+}
 (c) Al [MP PET 1994, 97] (d) Ca^{2+}
97. On passing H_2S black ppt. of II group is obtained. The mixture may not contain [CPMT 1989]
 (a) Pb^{++} (b) Cd^{++}
 (c) Hg^{++} (d) Cu^{++}

98. Ferrous and ferric ions in solution may be distinguished by using
(a) Silver nitrate solution
(b) Lead acetate solution
(c) Acidified solution of potassium permanganate
(d) Sodium chloride solution
99. Solution of II A group precipitate in dil. HNO_3 when treated with NH_4OH becomes blue because of the presence of
(a) Mg (b) Cd
(c) Bi (d) Cu
100. When calomel react with NH_4OH solution the compound formed is [BCECE 2005]
(a) $NH_2 - Hg - Cl$ (b) $Hg_2Cl_2NH_3$
(c) $Hg(NH_3)_2Cl_2$ (d) $HgCl_2NH_3$
101. Copper sulphate solution react with KCM [BCECE 2005]
(a) $K_3[Cu(CN)_4]$ (b) $CuCN$
(c) $Cu(CN)_2$ (d) $K_2[Cu(CN)_4]$
102. A metal nitrate reacts with KI to give a black precipitate which on addition of excess of KI convert into orange colour solution. The cation of the metal nitrate is [IIT 2005]
(a) Hg (b) Bi
(c) Pb (d) Cu
103. H_2S gas when passed through a solution of a contains HCl precipitates the cations of group of qualitative analysis but not those belonging to the fourth group. It is because [CBSE PMT 2005]
(a) Presence of HCl decreases the sulphides ion concentration
(b) Presence of HCl increases the sulphide ion concentration
(c) Solubility product of group II sulphides is more than that of group IV sulphides
(d) Sulphides of group IV cations are in HCl .
104. Sodium nitroprusside when added to an alkaline solution of sulphide ions produce a [AFMC 2005]
(a) Red colouration (b) Blue colouration
(c) Purple colouration (d) Brown colouration
- (a) $N/5$ (b) $N/10$
(c) $N/8$ (d) N
5. A 100 ml solution of 0.1 N - HCl was titrated with 0.2 N - $NaOH$ solution. The titration was discontinued after adding 30 ml of $NaOH$ solution. The remaining titration was completed by adding 0.25 N - KOH solution. The volume of KOH required for completing the titration is [MP PMT 1997]
(a) 16 ml (b) 32 ml
(c) 35 ml (d) 70 ml
6. In 1 gram of a metal oxide, metal precipitated is 0.68 gram. what is the equivalent weight of metal [JIPMER 2002]
(a) 17 (b) 34
(c) 68 (d) 52
7. If 20 ml of 0.25 N strong acid and 30 ml of 0.2 N of strong base are mixed, then the resulting solution is [KCET 2002]
(a) 0.25 N basic (b) 0.2 N acidic
(c) 0.25 N acidic (d) 0.2 N basic
8. What volume at N.T.P. of gaseous NH_3 will be required to be passed into 30 ml of NH_4SO_4 solution to bring down the acid strength of this solution to 0.2 N [UPSEAT 2001]
(a) 357.2 ml (b) 444.4 ml
(c) 537.6 ml (d) 495.6 ml
9. 8 ml of $\frac{N}{10}$ HCl are required to neutralize 20 ml solution of Na_2CO_3 in water. Normality of Na_2CO_3 solution is
(a) 0.40 N (b) 0.040 N
(c) 4.0 N (d) 1.4 N
10. Required amount of crystalline oxalic acid (eq. wt. = 63) to prepare N/10 250 ml oxalic acid solution is [MP PMT 1996]
(a) 0.158 g (b) 1.575 g
(c) 15.75 g (d) 6.3 g
11. 15 ml of 0.2 N alkali is required to complete neutralization of 30 ml acid solution. Concentration of the acid solution is [NCERT 1985; CPMT 1986]
(a) 0.1 N (b) 0.3 N
(c) 0.15 N (d) 0.4 N
12. 200 ml 0.6 N H_2SO_4 and 100 ml of 0.3N HCl are mixed together. Acidic normality of the resultant solution is [DPMT 1991]
(a) 0.5 N (b) 0.9 N
(c) 0.3 N (d) 0.6 N

Volumetric Analysis

1. What weight of sodium hydroxide is required to neutralise 100 ml of 0.1 N - HCl [MP PMT 1994]
(a) 4.0 gm (b) 0.04 gm
(c) 0.4 gm (d) 2.0 gm
2. The range of methyl orange as an indicator is in between pH
(a) 6 - 8 (b) 8 - 9
(c) 3 - 5 (d) 2 - 4
3. Phenolphthalein is not a good indicator for titrating [NCERT 1977]
(a) $NaOH$ against oxalic acid
(b) Ferrous sulphate against $KMnO_4$
(c) $NaOH$ against HCl
(d) $NaOH$ against H_2SO_4
4. 15 ml of N/10 $NaOH$ solution completely neutralises 12 ml of H_2SO_4 solution. The normality of H_2SO_4 solution will be
(a) 0.1 N (b) 0.3 N
(c) 0.15 N (d) 0.4 N
5. 100 ml solution of 0.1 N - HCl was titrated with 0.2 N - $NaOH$ solution. The titration was discontinued after adding 30 ml of $NaOH$ solution. The remaining titration was completed by adding 0.25 N - KOH solution. The volume of KOH required for completing the titration is [MP PMT 1997]
(a) 16 ml (b) 32 ml
(c) 35 ml (d) 70 ml
6. In 1 gram of a metal oxide, metal precipitated is 0.68 gram. what is the equivalent weight of metal [JIPMER 2002]
(a) 17 (b) 34
(c) 68 (d) 52
7. If 20 ml of 0.25 N strong acid and 30 ml of 0.2 N of strong base are mixed, then the resulting solution is [KCET 2002]
(a) 0.25 N basic (b) 0.2 N acidic
(c) 0.25 N acidic (d) 0.2 N basic
8. What volume at N.T.P. of gaseous NH_3 will be required to be passed into 30 ml of NH_4SO_4 solution to bring down the acid strength of this solution to 0.2 N [UPSEAT 2001]
(a) 357.2 ml (b) 444.4 ml
(c) 537.6 ml (d) 495.6 ml
9. 8 ml of $\frac{N}{10}$ HCl are required to neutralize 20 ml solution of Na_2CO_3 in water. Normality of Na_2CO_3 solution is
(a) 0.40 N (b) 0.040 N
(c) 4.0 N (d) 1.4 N
10. Required amount of crystalline oxalic acid (eq. wt. = 63) to prepare N/10 250 ml oxalic acid solution is [MP PMT 1996]
(a) 0.158 g (b) 1.575 g
(c) 15.75 g (d) 6.3 g
11. 15 ml of 0.2 N alkali is required to complete neutralization of 30 ml acid solution. Concentration of the acid solution is [NCERT 1985; CPMT 1986]
(a) 0.1 N (b) 0.3 N
(c) 0.15 N (d) 0.4 N
12. 200 ml 0.6 N H_2SO_4 and 100 ml of 0.3N HCl are mixed together. Acidic normality of the resultant solution is [DPMT 1991]
(a) 0.5 N (b) 0.9 N
(c) 0.3 N (d) 0.6 N
13. 10 ml of 10 M H_2SO_4 is mixed to 100 ml 1M $NaOH$ solution. The resultant solution will be [NCERT 1971]
(a) Acidic (b) Neutral
(c) Weakly alkaline (d) Strongly alkaline
14. Volume of 0.1 M H_2SO_4 required to neutralize 30 ml of 0.2 N $NaOH$ is [EAMCET 1978; MP PMT 2001]
(a) 30 ml (b) 15 ml
(c) 40 ml (d) 60 ml
15. 5N H_2SO_4 was diluted from 1 litre to 10 litres. Normality of the solution [MP PMT 1995]
(a) 0.5 N (b) 0.9 N
(c) 0.3 N (d) 0.6 N

- (a) 10 N (b) 5 N
(c) 1 N (d) 0.5 N
16. 0.45 g of an acid (mol wt. = 90) required 20 ml of 0.5 N KOH for complete neutralization. Basicity of acid is [CPMT 1979]
(a) 1 (b) 2
(c) 3 (d) 4
17. Equivalent weight of crystalline oxalic acid is [MP PMT 1995]
(a) 12 (b) 63
(c) 53 (d) 40
18. Volume of $\frac{N}{10}$ H_2SO_4 required to neutralize 10 ml 5 N Na_2CO_3 is
(a) 100 ml (b) 50 ml
(c) 500 ml (d) 1000 ml
19. The equivalent weight of $KMnO_4$ in alkaline medium will be [MP PMT 2001]
(a) 31.60 (b) 52.66
(c) 79.00 (d) 158.00
20. An aqueous solution of 6.3g oxalic acid dehydrate is made up to 250 ml. The volume of 0.1N NaOH required to completely neutralize 10 ml of this solution is [IIT-JEE (Screening) 2001]
(a) 40 ml (b) 20 ml
(c) 10 ml (d) 4 ml
21. In the standardization of Na_2SO_3 using $K_2Cr_2O_7$ by iodometry, the equivalent weight of $K_2Cr_2O_7$ is [IIT-JEE (Screening) 2001]
(a) (Molecular weight)/2
(b) (Molecular weight)/6
(c) (Molecular weight)/3
(d) Same as molecular weight
22. 25 ml of a solution of Na_2CO_3 having a specific gravity of 1.25 required 32.9 ml of a solution of HCl containing 109.5 grams of the acid per litre for complete neutralization. Calculate the volume of 0.84 N H_2SO_4 that will be completely neutralized by 125 grams of the Na_2CO_3 solution [UPSEAT 2001]
(a) 460 ml (b) 540 ml
(c) 480 ml (d) 470 ml
23. The volume of 0.05 M H_2SO_4 required to neutralise 80 ml of 0.13 N NaOH will be [CPMT 1989]
(a) 104 ml (b) 52 ml
(c) 10.4 ml (d) 26 ml
24. How many grams of NaOH will be required to prepare 250 ml of 0.1 M solution [EAMCET 1978]
(a) 1 gm (b) 4 gms
(c) 40 gms (d) 10 gms
25. Molecular weight of oxalic acid is 126. The weight of oxalic acid required to neutralise 100 cc of normal solution of NaOH is
(a) 6.3 gm (b) 126 gm
(c) 530 gm (d) 63 gm
26. Concentrated HCl is 10 N, 1000 cc of 1N HCl can be obtained by diluting [EAMCET 1978]
(a) 1 cc of conc. HCl to 1000 cc
(b) 10 cc of conc. HCl to 1000 cc
(c) 20 cc of conc. HCl to 1000 cc
(d) 100 cc of conc. HCl to 1000 cc
27. The equivalent weight of an acid is equal to [AIIMS 1998]
(a) Molecular weight $\times$ acidity
(b) Molecular weight $\times$ basicity
(c) Molecular weight / basicity
(d) Molecular weight / acidity
28. A metal oxide is reduced by heating it in a stream of hydrogen. It is found that after complete reduction, 3.15 g of the oxide have yielded 1.05 g of the metal. We may deduce that
(a) The eq. weight of the metal is 8
(b) The atomic weight of the metal is 8
(c) The atomic weight of the metal is 4
(d) The eq. weight of the metal is 4
29. The molecular weight of a tribasic acid is M. What will be its equivalent weight [CPMT 1974, 79; MP PMT 2003]
(a) $\frac{M}{2}$ (b) M
(c) $\frac{M}{3}$ (d) $\sqrt{\frac{M}{3}}$
30. Which of the following plot represents the graph of pH against volume of alkali added in the titration of NaOH and HCl
- 

(a)

(b)
- 

(c)

(d)
31. Phenolphthalein is not suitable for the titration of [MP PMT 2003]
(a) NaOH vs (COOH) (b) KOH vs H_2SO_4
(c) K_2CO_3 vs HCl (d) None of these
- In order to prepare one litre normal solution of $KMnO_4$, how many gm of $KMnO_4$ are required, if the solution is to be used in acid medium for oxidation [MP PET 2002]
(a) 158 gm (b) 31.60 gm
(c) 62.0 gm (d) 790 gm
33. 20 ml of a solution of a weak monobasic acid neutralizes 22.18 ml of a solution of NaOH and 20 ml of N/10 HCl neutralizes 21.5 ml of the same NaOH solution. The normality for the acid is nearly [MP PET 2002]
(a) 10 N (b) 1 N
(c) 0.10 N (d) 100 N
34. How many ml of 1 (M) H_2SO_4 is required to neutralise 10 ml of 1(M) NaOH solution [NCERT 1973] [MP PET 1997; MP PMT 1999]
(a) 2.5 (b) 5.0
(c) 10.0 (d) 20.0
35. The maximum amount of $BaSO_4$ precipitated on mixing $BaCl_2$ (0.5M) with H_2SO_4 (1M) will correspond to [AIIMS 1997]
(a) 0.5 M (b) 1.0 M
(c) 1.5 M (d) 2.0 M

36. How many grams of NaOH are equivalent to 100 ml of 0.1 N oxalic acid
(a) 0.2 (b) 2.0
(c) 0.4 (d) 4.0
37. How much of NaOH is required to neutralize 1500 cm of 0.1 N HCl (At. wt. of $\text{Na} = 23$) [KCET (Med.) 2001]
(a) 4 g (b) 6 g
(c) 40 g (d) 60 g
38. 0.126 g of an acid requires 20 ml of 0.1 N NaOH for complete neutralization. The equivalent weight of the acid is [MP PET 2001]
(a) 45 (b) 53
(c) 40 (d) 63
39. The ratio of amounts of HS needed to precipitate all the metal ions from 100 ml of 1 M AgNO_3 and 100 ml of 1 M CuSO_4 is
(a) 1 : 2 (b) 2 : 1
(c) Zero (d) Infinity
40. The equivalent weight of a divalent metal is 31.82. The weight of a single atom is [MH CET 2000]
(a) 63.64 (b) $\frac{63.64}{6.02 \times 10^{23}}$
(c) $32.77 \times 6.02 \times 10^{23}$ (d) $63.64 \times 6.02 \times 10^{23}$
41. For the preparation of sodium thiosulphate by "Springs reaction", the reactants used are [EAMCET 2003]
(a) $\text{Na}_2\text{S} + \text{Na}_2\text{SO}_3 + \text{Cl}_2$
(b) $\text{Na}_2\text{S} + \text{SO}_2$
(c) $\text{Na}_2\text{SO}_3 + \text{S}$
(d) $\text{Na}_2\text{S} + \text{Na}_2\text{SO}_3 + \text{I}_2$
42. Phenolphthalein is most suitable indicator for the titration of [MP PMT 2000]
(a) CH_3COOH and NH_4OH
(b) CH_3COOH and NaOH
(c) HCl and NH_4OH
(d) H_2CO_3 and NH_4OH
43. The simplest formula of a compound containing 50% of element X (at. wt. 10) and 50% of element Y (at. wt. 20) is [DPMT 2000]
(a) XY_2 (b) XY
(c) X_2Y (d) X_2Y_2
44. The equivalent weight of a metal is 4.0. The vapour density of its chloride is 59.25. Its atomic weight is [DPMT 2000]
(a) 12 (b) 8
(c) 36 (d) 24
45. Indicator for the titration of HCl and Na_2CO_3 would be [RPMT 1999]
(a) $\text{K}_4\text{Fe}(\text{CN})_6$ (b) $\text{K}_3\text{Fe}(\text{CN})_6$
(c) Phenolphthalein (d) Methyl orange
46. 20 ml of a N solution of KMnO_4 just reacts with 20 ml of a solution of oxalic acid. The weight of oxalic acid crystals in 1N of the solution is [JIPMER 1999]
(a) 31.5 g (b) 126 g
(c) 63 g (d) 6.3 g
47. 0.53 gm of Na_2CO_3 has been dissolved in 100 ml of a sodium carbonate solution. The normality of the solution will be
(a) $\frac{N}{5}$ (b) $\frac{N}{2}$
- (c) $\frac{N}{10}$ (d) N
48. 2 N - HCl will have the same molar concentration as [CPMT 1996]
(a) 0.5 N - H_2SO_4 (b) 1.0 N - H_2SO_4
(c) 2 N - H_2SO_4 (d) 4 N - H_2SO_4
49. Which of the following pair does not distinguish by passing H_2S
(a) Hg , Pb (b) Cd , Pb
(c) As , Cu (d) Zn , Mn
50. If 100 ml of 1 N sulphuric acid were mixed with 100 ml of 1 M sodium hydroxide, the solution will be [MP PET 1999]
(a) Acidic (b) Basic
(c) Neutral [MP PET 2001] (d) Slightly acidic
51. 100 cm³ of 0.1 N HCl solution is mixed with 100 cm³ of 0.2 N NaOH solution. The resulting solution is [MP PET 1996]
(a) 0.1 N and the solution is basic
(b) 0.05 N and the solution is basic
(c) 0.1 N and the solution is acidic
(d) 0.05 N and the solution is acidic
52. For preparing 0.1 N solution of a compound from its impure sample, of which the percentage purity is known, the weight of the substance required will be [MP PET 1996]
(a) More than the theoretical weight
(b) Less than the theoretical weight
(c) Same as theoretical weight
(d) None of these
53. The equivalent weight of $\text{Zn}(\text{OH})_2$ in the following reaction is equal to its, $[\text{Zn}(\text{OH})_2 + (\text{NO}) \rightarrow \text{Zn}(\text{OH})(\text{NO}) + \text{H}_2\text{O}]$ [MH CET 1999]
(a) $\frac{\text{Formula wt.}}{2}$ (b) $\frac{\text{Formula wt.}}{1}$
(c) $3 \times \text{formula wt.}$ (d) $2 \times \text{formula wt.}$
54. In the titration of strong acid and weak base, the indicator used is
(a) Thymol blue (b) Phenolphthalein
(c) Thymolphthalein (d) Methyl orange
55. To neutralize 25 ml of 0.25 M Na_2CO_3 solution how much volume of 0.5 M HCl is required [MP PET 1994]
(a) 12.5 ml (b) 25 ml
(c) 37.5 ml (d) 50 ml
56. 0.16 gm of a dibasic acid required 25 ml of decinormal NaOH solution for complete neutralization. The molecular weight of the acid is [CPMT 1989; MP PET 1993]
(a) 32 (b) 64
(c) 128 (d) 256
57. When 100 ml N - NaOH solution and 10 ml of 10 N sulphuric acid solution are mixed together, the resulting solution will be [DPMT 1982; MP PET 1996]
(a) Alkali (b) Weakly acidic
(c) Strongly acidic (d) Neutral
58. Cosin [MP PET 1996] end point of precipitation titration by adsorption is called [KCET (Med.) 2000]
(a) Absorption indicator (b) Adsorption indicator
(c) Chemical indicator (d) Normal indicator

59. 0.1914 g of an organic acid is dissolved in approx. 20 ml of water. 25 ml of 0.12 N NaOH required for the complete neutralization of the acid solution. The equivalent weight of the acid is
(a) 65 (b) 64
(c) 63.80 (d) 62.50
60. Molecular weight of a tribasic acid is W , its equivalent weight is
(a) $2W$ (b) $W/3$
(c) $3W$ (d) $W - 3$
61. Approximate atomic weight of an element is 26.89. If its equivalent weight is 8.9, the exact atomic weight of element would be
(a) 26.89 (b) 8.9
(c) 17.8 (d) 26.7
62. 1 gm of hydrogen is found to combine with 80 gms of bromine. 1 gm of calcium (valency 2) combines with 4 gms of bromine. The equivalent weight of calcium is
[NCERT 1982]
(a) 10 (b) 20
(c) 40 (d) 80
63. 4.0 gram caustic soda is dissolved in 100 cc solution. The normality of solution is
[MP PMT 1995]
(a) 1.0 (b) 0.1
(c) 0.5 (d) 4.0
64. Which of the following is required to neutralize 1 litre N – NaOH
(a) 1 l – N – H_2SO_4 (b) 1 l – M – H_2SO_4
(c) 1 l – 2N – H_2SO_4 (d) 1 l – 0.5N – H_2SO_4
65. What will be the volume of CO_2 at S.T.P., obtained by heating 9.85 g of $BaCO_3$ (Atomic number of Ba = 137)
[MP PMT 2003]
(a) 1.12 litre (b) 0.84 litre
(c) 2.24 litre (d) 4.06 litre
66. Which indicator can be used in the titration of strong acid and strong base
[CBSE PMT 1988]
(a) Only phenolphthalein (b) Only methyl orange
(c) Either of the two (d) Red litmus
67. The indicator used in titrating weak acid (e.g. oxalic acid) with a strong base (e.g. caustic soda) solution is
[IIT-JEE 1985; CPMT 1990; MNR 1980; NCERT 1973, 77; MP PMT 1994]
(a) Methyl orange (b) Methyl red
(c) Fluorescein (d) Phenolphthalein
68. The pink colour of phenolphthalein in alkaline medium is
[CPMT 1990]
(a) Due to negative form
(b) Due to positive form
(c) Due to OH^- ions
(d) Due to neutral form
69. Phenolphthalein does not act as an indicator for the titration between
[NCERT 1976]
(a) KOH and H_2SO_4
(b) $Ba(OH)_2$ and HCl
(c) NaOH and acetic acid
(d) Oxalic acid and $KMnO_4$
70. If we use phenolphthalein as an indicator in a titration of Na_2CO_3 with HCl, the usual result is
[CBSE PMT 1989]
[MP PET 2000]
(a) No visible change will occur
(b) The indicator reacts with the acid
(c) The indicator reacts with the base
(d) Sodium chloride and carbonic acid will be formed
[CPMT 1994, 179]
71. Methyl orange gives red colour in
[NCERT 1972]
(a) Sodium carbonate solution
(b) Sodium chloride solution
(c) Hydrochloric acid solution
(d) Potassium hydroxide solution
[DPMT 1984]
72. A 0.1 N solution of Na_2CO_3 is titrated with 0.1 N HCl solution. The best indicator to be used is
[NCERT 1971; DPMT 1983; AFMC 1992; CPMT 1983, 97]
(a) Potassium ferricyanide (b) Phenolphthalein
(c) Methyl red (d) Litmus paper
73. When $KMnO_4$ solution is titrated with a solution containing Fe^{2+} ion, the indicator used in this titration is
[CPMT 1989; AIIMS 1996]
(a) Phenolphthalein (b) Methyl orange
(c) $K_3[Fe(CN)_6]$ (d) None of these
74. The strength of a solution (S) in gram/litre, is related to its normality (N) and equivalent weight of solute (E) by the formula
(a) $S = \frac{N}{E}$ (b) $S = \frac{E}{N}$
(c) $S = N.E$ (d) All of these
75. The normality of 1 M solution of H_3PO_4 will be
[AIIMS 1983, 91]
(a) 1 N (b) 0.5 N
(c) 2 N (d) 3 N
76. In the reaction $I_2 + 2S_2O_3^{2-} \rightarrow 2I^- + S_4O_6^{2-}$; the equivalent weight of iodine will be equal to
[MNR 1985; UPSEAT 2000]
(a) Molecular weight
(b) 1/2 the molecular weight
(c) 1/4 the molecular weight
(d) Twice the molecular weight
77. To what extent must a given solution of concentration of 40 mg silver nitrate per ml be diluted to yield a solution of concentration of 16 mg $AgNO_3$ per ml
[NCERT 1977]
(a) Each ml must be diluted to 2.5 ml
(b) To each ml of solution 2.5 ml of water should be added
(c) To 2.5 ml of solution 2 ml of water should be added
(d) To 1.5 ml of solution 1.5 ml of water should be added
78. 10 ml of conc. H_2SO_4 (18 molar) is diluted to 1 litre. The approximate strength of dilute acid could be
[CPMT 1971]
(a) 0.18 N (b) 0.36 N
(c) 0.09 N (d) 18.00 N
79. For preparing one litre N/10 solution of H_2SO_4 , we need
[DPMT 1982]
(a) 98 gms (b) 10 gms
(c) 100 gms (d) 4.9 gms
80. What is the concentration of nitrate ions if equal volumes of 0.1 M $AgNO_3$ and 0.1 M NaCl are mixed together
[NCERT 1981; CPMT 1983]
(a) 0.1 N (b) 0.2 M

- (c) 0.05 M (d) 0.25 M
81. To neutralise 10 ml of $M/5$ NaOH the volume of $M/20$ HCl required is [EAMCET 1980]
(a) 10 ml (b) 15 ml
(c) 40 ml (d) 25 ml
82. To change the strength of 25 ml of 0.15 M HCl to 0.1 M the quantity of water that is to be added is [EAMCET 1979]
(a) 37.5 ml (b) 12.5 ml
(c) 25.0 ml (d) 18.75 ml
83. The volume of 0.1 M H_2SO_4 that is needed to completely neutralise 40 ml of 0.2 M NaOH is [EAMCET 1979]
(a) 10 ml (b) 20 ml
(c) 40 ml (d) 80 ml
84. What volume of water is to be added to 50 ml of 4 N NaOH solution to obtain a 1 N solution [MP PET 2002]
(a) 100 ml (b) 150 ml
(c) 200 ml (d) 250 ml
85. In alkaline condition $KMnO_4$ reacts as follows,
 $2KMnO_4 + 2KOH \rightarrow 2KMnO_2 + H_2O + O_2$
The eq. wt. of $KMnO_4$ is [DPMT 2000]
(a) 79 (b) 31.6
(c) 158 (d) 52.7
86. When a standard solution of NaOH is left in the air for a few hours,
(a) A precipitate will form.
(b) Strength will decrease.
(c) The concentration of Na^+ ions will decrease.
(d) All are wrong.
87. In the iodometric estimation in laboratory, which process is involved? [Orissa JEE 2004]
(a) $Cr^{2+}O_7^{2-} + H^+ + I^- \rightarrow 2Cr^{3+} + I_2$,
 $I_2 + S_2O_3^{2-} \rightarrow S_4O_6^{2-} + I^-$
(b) $MnO_4^- + H^+ + I^- \rightarrow MnO_2 + I_2$
 $I_2 + S_2O_3^{2-} \rightarrow S_4O_6^{2-} + I^-$
(c) $MnO_4^- + OH^- + I^- \rightarrow MnO_2 + I_2$
 $I_2 + S_2O_3^{2-} \rightarrow S_4O_6^{2-} + I^-$
(d) $Cr_2O_7^{2-} + OH^- + I^- \rightarrow 2Cr^{3+} + I_2$
 $I_2 + S_2O_3^{2-} \rightarrow S_4O_6^{2-} + I^-$
88. What is the volume of 0.1 N-HCl required to react completely with 1.0 gm of pure calcium carbonate. [DPMT 2004]
(a) 100 cm³ (b) 150 cm³
(c) 250 cm³ (d) 200 cm³
89. The weight of a residue obtained by heating 2.76 g of silver carbonate is [Pb. PMT 2004]
(a) 2.76 g (b) 2.98 g
(c) 2.16 g (d) 2.44 g
90. What is the molarity of H_2SO_4 solution if 25 ml is exactly neutralised with 32.63 ml of 0.164 M, NaOH [DCE 2003]
(a) 0.107 M (b) 0.126 M
(c) 0.214 M (d) -0.428 M
91. Weight of $Ca(OH)_2$ needed to prepare 250 ml of solution with pH = 13 [BVP 2004]
(a) 0.925 g (b) 0.0125 g
- (c) 0.25 g (d) 1 g
92. What will be the volume of a 12 M solution, if it is equivalent to 240 ml 18 M solution [BVP 2004]
(a) 6 litre (b) 600 litre
(c) 400 litre (d) 0.36 litre
93. The volume of $\frac{N}{10}$ NaOH require to neutralise 100 ml of $\frac{N}{25}$ HCl is [Pb. CET 2000]
(a) 30 ml (b) 100 ml
(c) 40 ml (d) 25 ml
94. The volume of 0.6 M NaOH required to neutralise 30 cm³ of 0.4 M HCl is [Pb. CET 2001]
(a) 40 cm³ (b) 30 cm³
(c) 20 cm³ (d) 10 cm³
95. Solubility of iodine in water may be increased by adding [DCE 2004]
(a) Chloroform (b) Potassium iodide
(c) Carbon disulphate (d) Sodium Thiosulphate
96. If 30 ml of H_2 and 20 ml of O_2 reacts to form water, what is left at the end of the reaction [Kerala PMT 2004] [AFMC 2005]
(a) 10 ml of H_2 (b) 5 ml of H_2
(c) 10 ml of O_2 (d) 5 ml of O_2
97. The primary standard solution for estimation of $Na_2S_2O_3$ is
(a) I_2 solution (b) $KMnO_4$
(c) $K_2Cr_2O_7$ (d) Oxalic acid
98. Acidic solution of $S_2O_3^{2-}$ is converted to in presence of I_2
(a) $S_4O_6^{2-} + I^-$ (b) $SO_4^{2-} + I^-$
(c) $SO_3 + I^-$ (d) $S_4O_6^{2-} + I_3^-$

Critical Thinking

Objective Questions

- A white solid 'A' on heating gives off a gas which turns lime water milky. The residue is yellow when hot but turns white on cooling. This solid 'A' is [MP PMT 1999]
(a) Zinc sulphate (b) Zinc carbonate
(c) Lead sulphate (d) Lead carbonate
- A salt on treatment with dil. HCl gives a pungent smelling gas and a yellow precipitate. The salt gives green flame when tested. The salt solution gives a yellow precipitate with potassium chromate. The salt is [MP PET 1996]
(a) $NiSO_4$ (b) BaS_2O_3
(c) PbS_2O_3 (d) $CuSO_4$
- The salt used for performing 'bead' test in qualitative inorganic analysis is [UPSEAT 2001]
(a) $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$
(b) $FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$
(c) $Na(NH_4)HPO_4 \cdot 4H_2O$
(d) $CaSO_4 \cdot 2H_2O$

4. Where chlorine water is added to an aqueous solution of potassium halide in presence of chloroform, a violet colour is obtained. On adding more of chlorine water, the violet colour disappears, and a colourless solution is obtained. This test confirms the presence of the following in aqueous solution [CPMT 1990]
 (a) Iodide (b) Bromide
 (c) Chloride (d) Iodide and bromide
5. Upon the addition of a solution A to a strongly acidified solution of barium nitrate, a white precipitate was obtained which did not dissolve even after large addition of water. Solution A contained
 (a) Sodium phosphate (b) Sodium carbonate
 (c) Sodium sulphate (d) Sodium chloride
6. To an acid solution of an anion a few drops of $KMnO_4$ solution are added. Which of the following, if present will not decolourise the $KMnO_4$ solution [MP PMT 1997]
 (a) NO_2^- (b) S^{2-}
 (c) Cl^- (d) CO_3^{2-}
7. The brown ring test for NO and NO_3^- is due to the formation of complex ion with the formula [KCET (Eng./Med.) 2000; Kerala PMT 2004]
 (a) $[Fe(H_2O)]^+$ (b) $[Fe(NO)(CN)]^+$
 (c) $[Fe(H_2O)NO]^+$ (d) $[Fe(H_2O)(NO)]^+$
8. Mixture is heated with dil. H_2SO_4 and the lead acetate paper turns black by the evolved gases. The mixture contains
 (a) Sulphite (b) Sulphide
 (c) Sulphate (d) Thiosulphate
9. To a solution of a substance, gradual addition of ammonium hydroxide results in a black precipitate which does not dissolve in excess of NH_4OH . However, when HCl is added to the original solution, a white precipitate is formed. The solution contained [BHU 1973]
 (a) Lead salt (b) Silver salt
 (c) Mercurous salt (d) Copper salt
10. If $NaOH$ is added to an aqueous solution of zinc ions, a white precipitate appears and on adding excess $NaOH$, the precipitate dissolves. In this solution zinc exists in the [NCERT 1981; MP PET 1993]
 (a) Cationic part
 (b) Anionic part
 (c) Both in cationic and anionic parts
 (d) There is no zinc in the solution
11. On performing a borax-bead test with a given inorganic mixture for qualitative analysis, the colour of the bead was found to be emerald green both in oxidising and reducing flame. It indicates the possibility of the presence of [MP PMT 2001]
 (a) Co (b) Ni
 (c) Cr (d) Cr
12. A red solid is insoluble in water. However it becomes soluble if some KI is added to water. Heating the red solid in a test tube results in liberation of some violet coloured fumes and droplets of a metal appear on the cooler parts of the test tube. The red solid is [AIIEE 2003]
 (a) $(NH)_2Cr_2O_7$ (b) HgI_2
 (c) HgO (d) PbO_2
13. An aqueous solution of $FeSO_4$, $Al_2(SO_4)_3$ and chrome alum is heated with excess of Na_2O_2 and filtered. The materials obtained are [IIT 1996]
 (a) A colourless filtrate and a green residue
 (b) A yellow filtrate and a green residue
 (c) A yellow filtrate and a brown residue
 (d) A green filtrate and a brown residue
14. Phosphoric acid (H_3PO_4) is tribasic acid and one of its salts is sodium dihydrogen phosphate (NaH_2PO_4). What volume of 1 M $NaOH$ solution should be added to 12 g of sodium dihydrogen phosphate (mol. wt. 120) to exactly convert it into trisodium phosphate Na_3PO_4 [Kurukshetra CET 1998]
 (a) 80 ml (b) 100 ml
 (c) 200 ml (d) 300 ml
15. Three separate samples of a solution of a single salt gave these test results : One formed a white precipitate with excess ammonia solution, one formed a white precipitate with dil. $NaCl$ solution and one formed a black precipitate with H_2S . The salt could be [Pb. PMT 1998]
 (a) $AgNO_3$ (b) $Pb(NO_3)_2$
 (c) $Hg(NO_3)_2$ (d) $MnSO_4$
16. 10 ml of concentrated HCl were diluted to 1 litre. 20 ml of this diluted solution required 25 ml of 0.1 N sodium hydroxide solution for complete neutralization, the normality of the concentrated hydrochloric acid will be
 (a) 8.0 (b) 9.5
 (c) 12.5 (d) 15.0
17. To a 25 ml of H_2O solution, excess of acidified solution of KI was mixed. The liberated I_2 require 20 ml of 0.3M hypo solution for neutralization. The volume strength of H_2O will be [MP PET 2003]
 (a) 1.34 ml (b) 1.44 ml
 (c) 1.60 ml (d) 2.42 ml
18. A chemistry student trying to detect the metallic ion in a salt, makes a paste on a clean platinum wire loop of the salt with concentrated HCl . When he takes a small amount of this paste and keeps it in a non-luminous Bunsen flame, the colour of the flame changes to grassy green. He should, therefore, conclude that the metal is [Manipal MEE 1995]
 (a) Barium (b) Calcium
 (c) Potassium (d) Strontium
19. A white crystalline substance dissolves in water. On passing H_2S in this solution, a black precipitate is obtained. The black precipitate dissolves completely in hot HNO_3 . On adding a few drops of conc. H_2SO_4 a white precipitate is obtained. This precipitate is that of [CPMT 1990]
 (a) $BaSO_4$ (b) $SrSO_4$
 (c) $PbSO_4$ (d) $CdSO_4$
20. The best explanation for the solubility of MnS in dil. HCl is that [UPSEAT 2001]
 (a) Solubility product of $MnCl$ is less than that of MnS
 (b) Concentration of Mn^{2+} is lowered by the formation of complex ions with chloride ions
 (c) Concentration of sulphide ions is lowered by oxidation to free sulphur
 (d) Concentration of sulphide ions is lowered by formation of the weak acid HS^-

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

1. Assertion : Lime water becomes turbid on passing CO_2 but becomes clear on passing more CO_2 .
Reason : Lime water is calcium hydroxide, $Ca(OH)_2$.
[AIIMS 2000]
2. Assertion : $Sb(III)$ is not precipitated as sulphide when in its alkaline solution H_2S is passed.
Reason : The concentration of S^{2-} ion in alkaline medium is inadequate for precipitation.
[AIIMS 2004]
3. Assertion : CuS will give H_2S in dilute acid test.
Reason : All sulphides react with dil. H_2SO_4 , on heating, to give H_2S .
4. Assertion : $PbCl_2$ will give HCl in conc. H_2SO_4 test.
Reason : All chlorides react with conc. H_2SO_4 , on heating, to give HCl .
5. Assertion : $ZnCO_3$ will not give any gas when treated with conc. H_2SO_4 .
Reason : CO_3^{2-} can only be detected in dil. acid test.
6. Assertion : CdS is yellow in colour.
Reason : Cd salts are yellow in colour.
7. Assertion : A brown gas which intensifies on adding Cu -turnings in conc. H_2SO_4 test is NO_2 .
Reason : Copper reacts with conc. HNO_3 to give NO_2 .
8. Assertion : CuS is blue in colour.
Reason : All Cu^{2+} salts are blue in colour.
9. Assertion : Acidified $K_2Cr_2O_7$ is turned green when SO_2 is passed through it.
Reason : In this reaction SO_2 acts as a reducing agent.
10. Assertion : White ppt. of $AgCl$ is soluble in NH_4OH .
Reason : It is due to the formation of soluble complex.
11. Assertion : All soluble sulphides gives white ppt. with $BaCl_2$ solution.
Reason : BaS is insoluble in water.
12. Assertion : A solution of $BiCl_3$ in conc. HCl when diluted with water gives white ppt.
Reason : $BiCl_3$ is insoluble in dil. HCl .
13. Assertion : Addition of NH_4OH to an aqueous solution of $BaCl_2$ in the presence of NH_4Cl (excess) precipitates $Ba(OH)_2$.
Reason : $Ba(OH)_2$ is insoluble in water.

AS Answers and Solutions

Preliminary Test

- $$\text{(a) } \text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O} \xrightarrow{-10\text{H}_2\text{O}} \text{Na}_2\text{B}_4\text{O}_7 \xrightarrow{\Delta} 2\text{NaBO}_2 + \text{B}_2\text{O}_3$$

$$\text{CuO} + \text{B}_2\text{O}_3 \rightarrow \text{Cu}(\text{BO}_2)_2$$

(Copper meta borate blue)
- (c) Borax bead test is generally given by transition elements.
- (a) Ba^{2+} imparts green colour to the flame.
- (d) As Mn^{+2} has all its electrons (5) unpaired in its d -orbital, so its extra stable configuration requires high excitation energy and so it gives violet colour.
- (b) $2\text{NO} + \text{O}_2 \rightarrow 2\text{NO}_2$

(Deep brown gas)
- (c) CoAlO_2 is formed which is blue. Follow cobalt nitrate-charcoal test.
- (c) Metals which form basic compounds and have coloured salts give the borax bead test.

11. (d) $2KNO_3 + H_2SO_4 \rightarrow 2KHSO_4 + 2NO_2 \uparrow$
(Brown gas)
12. (a) Barium salt gives green coloured flame as it has low ionization energy
13. (d) Calcium oxalate will not dissolve in acetic acid (weak acid) but only in strong acid
14. (b) $Na_2S + \text{dil. } 2HCl \rightarrow 2NaCl + H_2S$
 $H_2S + H_2SO_4 + K_2Cr_2O_7 \xrightarrow{\text{acidic}} K_2SO_4 + Cr_2(SO_4)_3 + S$
(green)
15. (a) Starch Iodide paper is used for the test of Iodine, as
Starch + Iodine $\rightarrow$ Starch Iodide
(Blue)
16. (b) Flame colour of Ba salt is green
 $2AgNO_3 + BaCl_2 \rightarrow 2AgCl + Ba(NO_3)_2$
White ppt.
17. (c) $NH_3 + HCl \rightarrow NH_4Cl$
dense white fumes
18. (b) $CoO + B_2O_3 \xrightarrow{\text{Heat}} Co(BO_2)_2$
Copper metaborate (blue)
20. (b) In laboratory burners, oil gas is generally used. Oil gas is mixture of $CH_4 + CO + CO_2 + H_2$
21. (b) $H_2S \rightarrow$ colourless gas with unpleasant odour of rotten eggs.
 $SO_2 \rightarrow$ colourless gas with a pungent suffocating odour
 $PH_3 \rightarrow$ colourless gas with unpleasant garlic like odour or rotten fish odour.
22. (b) $NO(g) + NO(g) \xrightarrow{-30^\circ C} N_2O(l)$
(BLUE)
23. (a) Yellowish-green gas of chlorine with suffocating odour is evolved when the solid chloride mixed with manganese dioxide is heated with concentrated H_2SO_4 .
 $NaCl + H_2SO_4 \rightarrow NaHSO_4 + HCl$
 $MnO_2 + 4HCl \rightarrow MnCl_2 + 2H_2O + Cl_2$
8. (d) $CrO_2Cl_2 \xrightarrow{NaOH} Na_2CrO_4 \xrightarrow[CH_3COOPb]{CH_3COOH} [(CH_3COO)_2Pb] \xrightarrow{CrO_2Cl_2} PbCrO_4$
yellow ppt.
9. (a) $2AgNO_3 + H_2S \rightarrow Ag_2S + 2HNO_3$
Black ppt.
10. (b) Iodine vapours are violet $\therefore$ the salt must contain I^- as
 $KI + H_2SO_4 \rightarrow KHSO_4 + HI$
 $2HI + H_2SO_4 \rightarrow I_2 + 2H_2O + SO_2$
violet vapour
11. (b) As Cl^- is more electronegative than Br^- and I^- $\therefore$ it replaces them from their salt as
 $2I^- + Cl_2 \rightarrow I_2 + 2Cl^- \Rightarrow$ Violet vapour
 $2Br^- + Cl_2 \rightarrow Br_2 + 2Cl^- \Rightarrow$ Brown vapour
12. (d) The salt must have SO_4^{2-} group which is also present in the acid so reaction is not takes place.
13. (c) Phosphates give canary yellow precipitate with ammonium molybdate in the presence of conc. HNO_3
 $H_3PO_4 + 12(NH_4)_2MoO_4 + 21HNO_3 \rightarrow (NH_4)_3PO_4 \cdot 12MoO_3 + 21NH_4NO_3 + 12H_2O$
ammonium phosphomolybdate
(canary yellow ppt.)
15. (c) Nitrates and acetates of all metals are water soluble.
16. (b) When NO_3^- is passed through $FeSO_4$ (neutral) and then few drops of conc. H_2SO_4 is added then the brown ring is obtained.
 $FeSO_4 + NO \rightarrow Fe(NO)SO_4$
(Brown ring)
Nitroso Ferrousulphate
17. (c) $AgCl$ and $AgBr$ dissolve in NH_4OH and form complexes but AgI doesn't react with NH_4OH . e.g.
 $AgCl + 2NH_4OH \rightarrow [Ag(NH_3)_2]Cl + 2H_2O$
complex

Wet Test for Acid Radical

1. (abd) Chromyl chloride test
 $4NaCl + K_2Cr_2O_7 + 3H_2SO_4 \xrightarrow{\text{heat}} K_2SO_4 + 2Na_2SO_4 + 2CrO_2Cl_2 + 3H_2O$
chromyl chloride (orange red)
 $4NaOH + CrO_2Cl_2 \rightarrow 2NaCl + Na_2CrO_4 + 2H_2O$
Sod. chromate (Yellow)
 $Na_2CrO_4 + (CH_3COO)_2Pb \rightarrow 2CH_3COONa + PbCrO_4 \downarrow$
Lead chromate (yellow ppt.)
2. (c) Starch is colourless but
Starch + Iodine $\rightarrow$ Starch Iodine
(violet) (blue-black)
3. (b) Brown ring test with ($FeSO_4NO$)
4. (d) $Na_4[Fe(CN)_5NO] + S^{2-} \rightarrow Na_4[Fe(CN)_5NOS]$
Sodium thio-nitroprusside (violet)
6. (a) With F^- , no precipitate is obtained because of low lattice energy of AgF , so it remains in ionized state
7. (b) $NaCl + H_2SO_4 \rightarrow NaHSO_4 + HCl$
 $K_2Cr_2O_7 + 2H_2SO_4 \rightarrow 2KHSO_4 + 2CrO_3 + H_2O$
 $CrO_3 + 2HCl \rightarrow CrO_2Cl_2$
(orange red vapour)
18. (a) When Cl^- , Br^- and F^- are treated with $AgNO_3$ solution in presence of dilute HNO_3 , corresponding silver halide is obtained which is soluble in NH_4OH , $NaCN$, and $Na_2S_2O_3$
 $AgNO_3 + NaCl \rightarrow AgCl \downarrow + NaNO_3$
white
 $AgCl + \text{dil. } 2NH_4OH \rightarrow [Ag(NH_3)_2]Cl + 2H_2O$
complex
19. (b) $Ca(OH)_2 + CO_2 \rightarrow CaCO_3(s) + H_2O$
lime water white precipitate
 $CaCO_3 + CO_2(\text{excess}) + H_2O \rightarrow Ca(HCO_3)_2$
soluble
20. (a) It is a lab method for the preparation of Br_2 e.g.
 $2KBr + MnO_2 + H_2SO_4 \rightarrow Br_2 + 2KHSO_4 + MnSO_4$
Brown gas
21. (c) $Na_2SO_3 + 2HCl(\text{dil.}) \rightarrow 2NaCl + H_2O + SO_2$
 $K_2Cr_2O_7 + H_2SO_4 + 3SO_2 \rightarrow K_2SO_4 + Cr_2(SO_4)_3 + H_2O$
(Green)

22. (d) As the sulphate radical is a strong oxidising agent, it is insoluble in acids and so detection of sulphate radical requires no other reagent.
23. (d) Sulphite radical will give a burning sulphur odour. Acetate radical will give a sweet, vinegar odour. Nitrite will give a reddish brown gas. Carbonate will give a colourless, odourless gas, i.e. CO_2 .
24. (c) $PbSO_4$ and $PbCl_2$ are insoluble in cold water hence the reagent $Pb(NO_3)_2$ is used to remove SO_4^{2-} and Cl^-
25. (b) $2KI + 2H_2SO_4 \text{ (Conc.)} \rightarrow 2KHSO_4 + 2HI$
 $MnO_2 + H_2SO_4 \rightarrow MnSO_4 + H_2O + (O)$
 $2HI + (O) \rightarrow H_2O + I_2$
 $2KI + MnO_2 + 3H_2SO_4 \rightarrow I_2 + MnSO_4 + 2H_2O + 2KHSO_4$
26. (c) It is a test for chloride ion.
27. (b) Dil. H_2SO_4 doesn't react with chloride but reacts with peroxide
28. (b) $Ba(OH)_2$ is not highly basic and bond is not easily broken
29. (b) Ozone reacts with KI solution to liberate I_2 gas.
30. (a) $2KBr + MnO_2 + 3H_2SO_4 \rightarrow MnSO_4 + 2KHSO_4 + 2H_2O + Br_2 \uparrow$
 (reddish brown gas)
32. (c) $NH_3 + 3Cl_2 \rightarrow NCl_3 + 3HCl$
33. (a) At the junction of salt solution and $FeSO_4$ solution with conc. H_2SO_4 a brown ring is obtained ($FeSO_4 \cdot NO$)
 Brown ring
34. (b) $2KMnO_4 + 3H_2SO_4 + 5H_2S \rightarrow K_2SO_4 + 2MnSO_4 + 8H_2O + 5S$
35. (a) $3FeSO_4 + NO_2 + 3H_2SO_4 \rightarrow Fe_2(SO_4)_3 + FeSO_4 \cdot NO + H_2O$
 (Black brown)
36. (b) As most of the nitrates are soluble in water.
37. (a) SO_3^{2-} , S^{2-} and SO_4^{2-} salts from comparatively stronger acids (than H_2CO_3) in solution hence evolve CO_2 with Na_2CO_3 solution and give effervescence. While CO_3^{2-} does not react with Na_2CO_3 solution
38. (a) $Na_2CO_3 + 2H_2O \rightarrow 2NaOH + H_2CO_3$
 and $2NaOH \rightleftharpoons 2Na^+ + 2OH^-$
 (ionisation)
 Hence, it is clear that $2OH^-$ ions will be formed on hydrolysis of one molecule of sodium carbonate.
39. (d) According to the equation,
 $Ca(OH)_2 + CO_2 \xrightarrow{\Delta} CaCO_3 + H_2O$
 $CaCO_3 + H_2O + CO_2 \longrightarrow Ca(HCO_3)_2$
 $Ca(HCO_3)_2 \xrightarrow{\Delta} CaO + H_2O + 2CO_2$
 Hence, the gas A and B are CO_2 and CO_2 respectively
40. (b) $2KMnO_4 + 3H_2SO_4 \rightarrow K_2SO_4 + 2MnSO_4 + 5S + 8H_2O$
41. (a) It doesn't provide free Br^- ions to react with $AgNO_3$.
3. (b) $SnS + (NH_4)_2S_2 \xrightarrow{HCl} (NH_4)_2S + SnS_2$
4. (b) For the solution to become milky H_2S must be oxidised to SO_2
5. (b) HNO_3 oxidises Fe to Fe^{3+} otherwise Fe is not completely precipitated as hydroxide
6. (b) Sr^{2+} give bright red colour to the flame
7. (c) Calcium oxalate will not dissolve in acetic acid (weak acid) but only in strong acid
8. (a) $2Hg + 2HCl \rightarrow Hg_2Cl_2 + H_2 \uparrow$
 white ppt.
9. (d) It is an acidic salt
10. (b) In presence of NH_4OH , dissociation of H_2S is remarkably high so increases the solubility product of IV^- group sulphides
 $H_2S \rightleftharpoons 2H^+ + S^{2-}$
 $NH_4OH \rightarrow NH_4^+ + OH^-$
 $OH^- + H^+ \rightarrow H_2O$
11. (d) As cadmium belongs to the II^- group and is precipitated as sulphide and not as chloride.
12. (d) Aluminium is in III^- group and is precipitated as hydroxide $[Al(OH)_3]$.
13. (c) Due to common ion effect as
 $HCl \rightarrow H^+ + Cl^-$; $H_2S \rightarrow 2H^+ + S^{2-}$.
14. (d) Oxalate of these metals are insoluble
15. (a) Both will precipitate as sulphide.
16. (b) Both Pb and Ag form white ppt. of their chlorides. But $PbCl_2$ is soluble in hot water while $AgCl$ does not dissolve in hot water.
19. (c) $(CH_3COO)_2Pb + H_2S \rightarrow 2CH_3COOH + PbS \downarrow$
 black ppt.
20. (a) $(NH_4)SCN$ is a red colour substance.
21. (abcd) $FeCl_3 + K_4[Fe(CN)_6] \rightarrow Fe_4[Fe(CN)_6]_3$
 Ferri ferrocyanide (Blue)
 $2FeCl_3 + 3H_2S \rightarrow Fe_2S_3 + 6HCl$
 $3NH_4CNS + FeCl_3 \rightarrow Fe(CNS)_3 + 3NH_4Cl$
 (Blood red)
 $FeCl_3 + 3KCNS \rightarrow Fe(CNS)_3 + 3KCl$
 (Blood red)
24. (c) (Conc. $H_2SO_4 + K_2Cr_2O_7$) mixture is called as chromic acid.
26. (a) $NaCl > MgCl_2 > Na_2S > MgS$
 Solubility decreasing order
30. (d) Cobalt sulphide does not ppt. in second group.
36. (b) $BaCO_3 + 2HCl \rightarrow BaCl_2 + H_2O + CO_2$
 $ZnS + 2HCl \rightarrow ZnCl_2 + H_2S$
 (dil.)
37. (c) Cd^{2+} is not precipitated by H_2S in concentrated acid solution that is why the solution is diluted before passing H_2S through it.
39. (d) $AgCl + 2NH_3 \rightarrow [Ag(NH_3)_2]Cl = [Ag(NH_3)_2]^+ + Cl^-$
 complex
40. (b) $Fe^{3+} + K_4[Fe(CN)_6] \rightarrow K[F_4Fe(CN)_6] + 3K^+$
 Prussian blue
41. (c) As Na_2CO_3 is a strong electrolyte it will cause the precipitation of $MgCO_3$. So $(NH_4)_2CO_3$ is used as it's a weaker electrolyte than Na_2CO_3 .

Wet Test for Basic Radical

1. (b) As_2S_5 forms complex with $(NH_4)_2CO_3$
2. (b) $Cu(NH_3)_4(NO_3)_2 + 4CH_3COOH \rightarrow Cu(NO_3)_2 + 4CH_3COONH_4$

42. (b) As the concentration of OH^- ions is less due to common ion effect but enough to precipitate the III⁺ group radicals as hydroxides, as the solubility product of III group hydroxides is lower than IV, V and VI group hydroxides.
44. (a) As NH_4Cl is a strong electrolyte. It suppresses the ionization of NH_4OH , so the concentration of OH^- ions in the solution is decreased, but it is sufficient to precipitate the III group basic radicals because the solubility product of III group hydroxides is lower than IV, V and VI group hydroxides. As
- $$NH_4OH \rightleftharpoons NH_4^+ + OH^-$$
- $$NH_4Cl \rightarrow NH_4^+ + Cl^-$$
- Common ion effect
45. (b) $4FeCl_3 + 3K_4[Fe(CN)_6] \rightarrow Fe_4[Fe(CN)_6]_3 + 12KCl$
Prussian Blue colour
46. (b) ZnS is white.
47. (b) $Sb_2S_3 + 2(NH_4)_2S \rightarrow 2(NH_4)_2S + Sb_2S_5$
48. (a) The second group radicals will precipitate because their solubility product is very low so sulphates will be precipitated.
49. (a) As $Pb(NO_3)_2$ is an ionic compound so the reaction is easy.
 $Pb(NO_3)_2 + 2NaCl \rightarrow 2NaNO_3 + PbCl_2$, but $Ba(NO_3)_2$ has a higher lattice energy, so no reaction takes place.
50. (c) $4NH_4OH + CuSO_4 \rightarrow [Cu(NH_3)_4]SO_4 + 4H_2O$
(excess)
51. (a) $CuCl_2 + H_2S \rightarrow CuS + 2HCl$
(Black ppt)
52. (d) As they have low K_{sp} value.
53. (a) NH_4^+ ions are required to suppress the ionization of NH_4OH but sufficient to precipitate the III group radicals. $(NH_4)_2SO_4$ can't be used as SO_4^{2-} ions will precipitate Ba as $BaSO_4$.
54. (c) White precipitate obtained is of $BaCl_2$, as the Cl^- ion's concentration increases due to the addition of HCl , the ionic product becomes more than solubility product and thus, $BaCl_2$ is precipitated
55. (a) $HgS + HNO_3 \rightarrow$ No reaction
56. (a) Pb as it's precipitated as chloride and sulphide in I⁺ and II⁺ group respectively
57. (d) As $Bi_2(SO_4)_3$ is a covalent compound with high lattice energy and hence it is insoluble in water.
58. (a) The solution must contain Ni^{2+} as it forms a complex with DMG giving $[Ni(DMG)_2]$ which is red in colour.
59. (c) $BiCl_3 + H_2O \rightarrow BiOCl + 2HCl$
(white ppt)
60. (b) $Hg_2Cl_2 + 2NH_4OH \rightarrow \underbrace{NH_2 - Hg - Cl}_{\text{(Black ppt)}} + \underbrace{Hg}_{\text{(Black ppt)}} + NH_4Cl + 2H_2O$
61. (a) Colour of anhydrous $COCl_2$ is blue and when it comes in contact with moisture then it turns in pink.
62. (d) When $(NH_4)_2CO_3$ is used then the concentration of CO_3^{2-} is comparatively low but when Na_2CO_3 is added then concentration of CO_3^{2-} increases so Mg^{2+} will be precipitated along with other 5⁺ group radicals
63. (d) Nessler's reagent gives red precipitate with NH_4^+
 $NH_4Cl + 2K_2[HgI_4] + 4KOH \rightarrow$
 $NH_2 - Hg - O - Hg - I + 7KI + KCl + 3H_2O$
Iodide of Millon's base (Brown ppt)
64. (b) FeS is soluble in HCl . Also Fe^{2+} salts are green.
65. (d) Cd^{+2} belongs to II A group while As^{+3} to II B. All the sulphides of II B are soluble in yellow ammonium sulphide but those of II A are insoluble.
66. (c) As $Fe(OH)_3$ is soluble in $NaOH$ whereas $Al(OH)_3$ is not.
67. (b) $NH_3 + H_2O \rightarrow NH_4OH$ due to common ion effect
 NH_4^+ ion concentration increases which leads to the precipitation of $Al(OH)_3$.
68. (c) $CrCl_3$, as $Cr^{+3} \Rightarrow 3d^3$, has unpaired electron in d -orbital as a result it will show paramagnetism and thus forms coloured complexes.
69. (a) Cr will be precipitated as CuS in acidic medium where as Ni^{2+} is not precipitated.
70. (b) Even $SnCl_2$ added into $HgCl_2$ solution to give white gray colour.
76. (b) $Al^{+3} + (OH^-)_3 \rightarrow Al(OH)_3$
(white ppt.)
which is soluble in excess alkali.
77. (d) As the ionic product of Sb^{3+} and Bi^{3+} is very low and Cl^- is present in high concentration, therefore Sb and Bi get precipitated, as
 $Sb^{3+} + 3Cl^- \rightarrow SbCl_3$
78. (d) $Fe_3(PO_4)_2$ is insoluble in water.
79. (c) Sulphide having high ionic product are completely precipitated in acidic medium. CdS has maximum ionic product hence it is completely precipitated.
80. (d) $3FeCl_2 + 2K_3[Fe(CN)_6] \rightarrow Fe_3[Fe(CN)_6]_2 + 6KCl$
blue colour
83. (a) $Cu + 2AgNO_3 \rightarrow Cu(NO_3)_2 + 2Ag$
84. (c) $2CuSO_4 + 4KI \rightarrow 2CuI + 2K_2SO_4 + I_2$.
Cuprous iodide
85. (a) Ca, Ba, Sr these radicals are precipitated in basic medium.
88. (c) $Cu^{2+} + H_2S \rightarrow CuS \downarrow$
black ppt.
89. (a) $NH_4OH \rightleftharpoons NH_4^+ + OH^-$
 $NH_4Cl \rightarrow NH_4^+ + Cl^-$
 NH_4Cl decreases the dissociation of NH_4OH by common ion effect
93. (c) HCl suppresses ionisation of weakly dissociated H_2S , with the result only the ionic product of the sulphides of group II radicals exceed their corresponding solubility product and hence only these are precipitated.
97. (b) $Cd^{++} + H_2S \rightarrow \underbrace{CdS}_{\text{Yellow ppt}} + H_2O$
98. (c) Acidified solution of potassium permanganate.
 $Fe^{+2} \xrightarrow{KMnO_4} Fe^{+3}$
 $Fe^{+3} \xrightarrow{KMnO_4} \text{No reaction}$
99. (d) $CuCl_2 + 2HNO_3 \rightarrow Cu(NO_3)_2 + 2HCl$
 $Cu(NO_3)_2$ reacts with NH_4OH and gives $Cu(NH_3)_4^{2+}$ which has deep blue colour.
102. (b) $Bi(NO_3)_3(aq) + 3KI(aq) \longrightarrow BiI_3(s) + 3KNO_3(aq)$
Black
 $BiI_3(s) + KI(aq) \longrightarrow K[BiI_4]$
Orange colour
103. (a) HCl suppresses ionisation of weakly dissociated H_2S , with the result only the ionic product of the sulphides of group II

radicals exceed their corresponding solubility product and hence only these are precipitated.

Volumetric Analysis

1. (c) $0.1 = \frac{x \times 1000}{40 \times 100} \Rightarrow x = 0.45 \text{ gms.}$
2. (c) As methyl orange is a weak base.
3. (b) Phenolphthalein is an indicator for strong base and weak acid, but $KMnO_4$ oxidises it.
4. (c) $N_1 V_1 = N_2 V_2$, $\frac{1}{10} \times 15 = N_2 \times 12 \Rightarrow N_2 = \frac{1}{8} N$
5. (a) In the neutralization of acid and base $N \times V$ of both must be equivalent
 $N \times V \text{ of } HCl = 0.1 \times 100 = 10$
 $N \times V \text{ of } NaOH = 0.2 \times 30 = 6$
as to obtain 10 $N \times V$ of base
 $4 N \times V$ of base is required
 $N \times V \text{ of } KOH = 0.25 \times 16 = 4$
 $NV = \frac{N \times V}{NaOH} + \frac{N \times V}{KOH}$
 $0.1 \times 100 = 0.2 \times 30 + 0.25 \times V$
 $10 = 6 + 0.25 V$
 $V = \frac{400}{0.25} \Rightarrow V = 16 \text{ ml}$
6. (a) $1 - 0.68 = 0.32 \text{ g oxygen}$
 $\frac{0.68}{eq. wt.} = \frac{0.32}{8} \Rightarrow eq. wt. = \frac{0.68 \times 8}{0.32} = 17$
7. (d) $V_1 = 20 \text{ ml}$, $N_1 = 0.25 N$, $V_2 = 30 \text{ ml}$
 $N_2 = 0.2 N$
 $\therefore N = \frac{N_1 V_1 + N_2 V_2}{V_1 + V_2} = \frac{20(0.25) + 30(0.2)}{20 + 30}$
 $= \frac{5 + 6}{50} = \frac{11}{50} = 0.2 N \text{ basic}$
9. (b) $NV = NV \Rightarrow \frac{1}{10} \times 8 = N_2 \times 20$, $\therefore N_2 = 0.04 N$
10. (b) $N = \frac{W_B \times 1000}{E \times V} \Rightarrow \frac{N}{10} = \frac{x \times 1000}{63 \times 250}$
 $\therefore x = 1.575 \text{ grams}$
11. (a) $NV = NV$
 $15 \times 0.2 = 30 \times x \quad \therefore x = 0.1 N$
12. (a) $NV + NV = NV$
 $200 \times 0.6 + 100 \times 0.3 = N_3 V_3 \text{ and } V_3 = V_2 + V_1 = 300 \text{ ml}$
 $\therefore N_3 = 0.5 N$
13. (a) $10 M H_2SO_4 \Rightarrow 20 N H_2SO_4$
 $\therefore 20 \times 10 = 200 \text{ for } H_2SO_4 \text{ and}$
 $100 \times 1 = 100 \text{ for } NaOH$
 $\therefore \text{Acidity} > \text{Basicity}$
14. (a) $0.1 M \text{ of } H_2SO_4 \Rightarrow 0.2 N \text{ of } H_2SO_4$
 $\therefore NV = NV \quad [N = 2m \text{ for } H_2SO_4]$

$$0.2 \times V = 30 \times 0.2$$

$$\therefore V = 30 \text{ ml}$$

16. (b) Normality = $N = \frac{W_B \times 1000}{Eq. wt \times V}$

$$\therefore \text{Eq. Wt} = \frac{0.45 \times 1000}{0.5 \times 20} = 45$$

$$\therefore \text{Basicity} = \frac{\text{Molec. Wt}}{\text{Eq. Wt}} = \frac{90}{45} = 2$$

$$\therefore \text{Equivalent wt.} = \text{Molecular wt.} / 2 = 63$$

18. (c) $N_1 V_1 = N_2 V_2 \Rightarrow 5 \times 10 = \frac{1}{10x} \times x \therefore x = 500ml$

$$N \times 25 = \frac{109.5 \times 32.9}{36.5} \Rightarrow N = \frac{109.5 \times 32.9}{36.5 \times 25}$$

$$N_3 V_3 = N_4 V_4 \quad (V_3 = \frac{m}{d}, V_3 = \frac{125}{1.25})$$

$$\frac{109.5 \times 32.9}{36.5 \times 25} \times 100 = 0.84 \times V \Rightarrow V = 470 \text{ ml}$$

$$0.1 \times V_1 = 0.13 \times 80 \Rightarrow V_1 = 104 \text{ ml}$$

24. (a) $\text{Molarity} = \frac{\text{wt.} \times 1000}{\text{Eq. wt.} \times \text{vol.}}$

$$0.1 = \frac{wt. \times 1000}{40 \times 250}$$

$$\therefore \text{wt. required} = 1 \text{ gm}$$

$$2 \times 158 = \frac{316 \times 8}{80} = 31.6.$$

So, equivalent wt. of $KMnO_4$ in acidic medium is
 $= 31.6 \text{ gm}$

$$N_1 \times 20 = N_2 \times 22.18$$

$$N_1 = \frac{N_2 \times 22.18}{20} \dots\dots\dots(i)$$

$$NaOH \text{ solution} = HCl \text{ solution}$$

$$N_2 \times 21.5 = \frac{1}{10} \times 20$$

$$N_2 = \frac{20}{10 \times 21.5} \quad \dots\dots(ii)$$

by eq. (i) and (ii)

$$N_1 = \frac{20 \times 22.18}{20 \times 10 \times 21.5} = \frac{22.18}{215} = 0.1N$$

34. (b) $1M H_2SO_4 = 2N H_2SO_4$

$$\frac{H_2SO_4}{N_1 V_1} = \frac{NaOH}{N_2 V_2}$$

$$2 \times V_1 = 10 \times 1, \quad V_1 = \frac{10 \times 1}{2} = 5 \text{ ml}$$

36. (c) $N = \frac{W_B \times 1000}{\text{Eq.wt.} \times V}; W_B = \frac{N \times \text{Eq.wt.} \times V}{1000}$

$$= \frac{0.1 \times 40 \times 100}{1000} = 0.4$$

38. (d) 20 ml of 0.1N NaOH neutralize 20 ml of 0.1N acid
Weight of acid = 0.126 g

$$\text{Volume} = 20 \text{ ml} = \frac{20}{1000} \text{ litre}$$

$$\text{Normality} = 0.1 N$$

$$\text{Equivalent weight} = ?$$

$$\text{Equivalent weight} = \frac{\text{weight of acid}}{N \times V}$$

$$= \frac{0.126 \times 1000}{0.1 \times 20} = 63$$

40. (b) $2 \times 31.82, \therefore \text{wt of one atom} = \frac{2 \times 31.82}{N} = \frac{63.64}{N}$

43. (c) $X = \frac{50}{10} = 5; Y = \frac{50}{20} = 2.5$

$$\text{Ratio of } g \text{ atoms of } X \text{ and } Y = 2 : 1$$

47. (c) $N = \frac{0.53 \times 1000}{53 \times 100} \Rightarrow N = \frac{1}{10}$

$$\text{So normality of the solution will be } \frac{N}{10}.$$

51. (b) Acid = $0.1 \times 100 = 10$

$$\text{Base} = 0.2 \times 100 = 20$$

$\therefore$ solution will be basic. 0.1N of HCl is neutralised by 0.1 N of NaOH and the remaining 0.1N of NaOH is in 200 cm³ of solution.

$\therefore$ resulting normality = 0.05 N, basic.

53. (b) Equivalent weight of

$$Zn(OH)_2 = \frac{\text{Molecular weight}}{\text{acidity}} = \frac{M}{1}$$

Acidity of $Zn(OH)_2$ = 1, only one OH is replaced.

55. (a) $M_1 V_1 = M_2 V_2$

$$0.25M \times 25 = 0.5M \times V_2$$

$$V_2 = \frac{0.25M \times 25}{0.5M} = 12.5 \text{ ml}$$

56. (c) $\frac{0.16}{x} \times \frac{1000}{25} = \frac{1}{10} \Rightarrow \frac{6.4}{x} = \frac{1}{10} \therefore x = 64$

$$\text{Mol. wt.} = 64 \times 2 = 128$$

57. (d) If $N_1 V_1 = N_2 V_2$ then the solution will be neutral

$$\therefore 1 \times 100 = 10 \times 10$$

$$100 = 100 \Rightarrow \text{solution is neutral}$$

59. (c) Volume = $25 \text{ ml} = \frac{25}{1000} \text{ litre}$

$$\text{Normality} = \frac{\text{wt}}{\text{eq.wt} \times \text{Volume}} \Rightarrow 0.12 = \frac{0.1914 \times 1000}{E \times 25}$$

$$\text{eq.wt.} = \frac{0.1914 \times 1000}{0.12 \times 25} = 63.8$$

60. (b) $\text{Eq.wt} = \frac{\text{MolecularWt.}}{\text{basicity}} = \frac{W}{3}$

61. (d) Valency = $\frac{26.89}{8.9} = 3$

$$\text{at. mass} = \text{Eq.wt} \times \text{valency} = 8.9 \times 3 = 26.7$$

62. (b) $\therefore 4 \text{ gms of Br}_2 \text{ combines with } 1 \text{ gm of Ca}$

$$\therefore 80 \text{ gms of Br}_2 \text{ combines with } \frac{1}{4} \times 80 = 20$$

Therefore,

$$\text{equivalent wt of Ca} = 20$$

63. (a) $N = \frac{4 \times 1000}{40 \times 100} = 1N$

64. (d) $N_1 V_1 = N_2 V_2$

$$1 \times 1 = 0.5 \times 2 \times 1$$

as 0.5 N will give double the amount of H ions

$$\therefore 197 \text{ g } BaCO_3 \text{ on decompose gives } = 22.4 \text{ litre } CO_2$$

$$\therefore 1 \text{ g } BaCO_3 \text{ will give } = \frac{22.4}{197} = \text{litre } CO_2$$

$$= \frac{22.4 \times 9.85}{197} = 1.12 \text{ litre } CO_2$$

66. (c) As the resultant solution will be neutral so either of them can be used.

67. (d) Phenolphthalein is used as it is colourless and becomes pink only in basic medium.

69. (d) Here $KMnO_4$ itself works as an indicator.

70. (a) The resulting solution is colourless.

71. (c) As it is a weak aromatic base so it gives colour in acidic medium.

72. (c) As the resulting solution is acidic.

73. (d) Here $KMnO_4$ is used as an indicator as well as a reactant.

74. (c) Strength = $\frac{W}{V} = NE$

75. (d) As H_3PO_4 can donate 3 H^+ in the solution, as a result the normality of solution is 3N, as Molarity $\times$ basicity = Normality

$$\therefore \text{Eq. wt.} = \frac{1}{2} \times \text{molecular wt.}$$

77. (a) $40 \times 1 = 16 \times x \Rightarrow x = \frac{40}{16} = 2.5 \text{ ml}$

78. (b) 18 M of H_2SO_4 = 36 N of H_2SO_4

$$N_1 V_1 = N_2 V_2 \Rightarrow 36 \times 10 = N_2 \times 1000$$

$$\therefore N_2 = 0.36 N$$

79. (d) $\frac{1}{10} = \frac{W \times 1000}{\text{eq.wt} \times \text{vol.}} = \frac{W \times 1000}{49 \times 1000} \Rightarrow W = 4.9 \text{ gms}$

80. (c) $M_1 V_1 = M_2 V_2$

$$0.1 \times V = M_2 \times 2V \Rightarrow M_2 = \frac{1 \times V}{2V} = 0.05M$$

81. (c) $N_1 V_1 = N_2 V_2 \Rightarrow \frac{1}{5} \times 10 = \frac{1}{20} \times V_2 \Rightarrow V_2 = 40 \text{ ml}$
82. (b) $N_1 V_1 = N_2 V_2$
 $0.15 \times 25 = 0.1 V_2 \Rightarrow V_2 = 37.5 \text{ ml}$
 Water to be added = $37.5 - 25 = 12.5 \text{ ml}$
83. (c) $N_1 V_1 = N_2 V_2 \Rightarrow 0.2 \times V_1 = 0.2 \times 40 \Rightarrow V_1 = 40 \text{ ml}$
85. (c) $Mn^{+7} \rightarrow Mn^{+6} = \frac{158}{1} = 158$
88. (d) Given, $N = 0.1$, $w = 1.0 \text{ gm}$, equivalent weight = 50, $V = ?$

$$V = \frac{w \times 1000}{Eq.wt. \times N} = \frac{1 \times 1000}{50 \times 0.1} = 200 \text{ cm}^3$$
89. (c) $2Ag_2CO_3 \xrightarrow{\Delta} 4Ag + 2CO_2 + O_2$

$$\begin{array}{ccc} [(2 \times 108) + 12 + 48] & & 4 \times 108 \\ 2(216 + 12 + 48) & & 4 \times 108 \\ 2 \times 276 = 552 & & 4 \times 108 \end{array}$$

 $\therefore 552 \text{ gm silver carbonate gives silver} = 432 \text{ gm.}$
 $\therefore 2.76 \text{ gm silver carbonate gives } \frac{432 \times 2.76}{552} = 2.16 \text{ gm}$
90. (a) $0.164 \text{ M NaOH} \cong 0.164 \text{ N NaOH}$
 We know, $N_1 V_1 = N_2 V_2$; $N_1 \times 25 = 0.164 \times 32.63$
 $0.214 \text{ N H}_2\text{SO}_4 \cong \frac{0.214}{2} \text{ M H}_2\text{SO}_4$
 $(\because \text{basicity of H}_2\text{SO}_4 \text{ is } 2)$
 $\cong 0.107 \text{ M H}_2\text{SO}_4$
91. (a) We know, $[H^+] = 10^{-pH} = 10^{-13}$;
 $\therefore [OH^-] = \frac{10^{-14}}{10^{-13}} = 10^{-1}$
 Hence, normality of solution = 0.1
 We know, $w = \frac{NEV}{1000} = \frac{0.1 \times 74 \times 250}{2 \times 1000} = 0.925 \text{ gm}$
92. (d) $N_1 V_1 = N_2 V_2$ or $M_1 V_1 = M_2 V_2$
 $\therefore 12 \times V_1 = 18 \times 240$
 $V_1 = \frac{18 \times 240}{12} = 260 \text{ ml} = 0.36 \text{ litre}$
93. (c) For complete neutralisation,
 milli equivalent of base = milli equivalent of acid
 $N_1 V_1 = N_2 V_2 \Rightarrow \frac{1}{10} \times V_1 = \frac{1}{25} \times 100$; $V_1 = 40 \text{ ml.}$
94. (c) Normality = molarity $\times$ basicity or acidity (for HCl)
 $N_2 = 0.4 \times 1 = 0.4 \text{ N}$ basicity = 1 (for $NaOH$ acidity = 1)
 $N_1 = 0.6 \times 1 = 0.6 \text{ N}$ $V_1 = ?$ $V_2 = 30 \text{ cm}^3$
 From the equation, $N_1 V_1 = N_2 V_2$
 $0.6 \times V_1 = 0.4 \times 30$
 $V_1 = \frac{0.4 \times 30}{0.6} = 20 \text{ cm}^3$
95. (b) The solubility of I in water increases by the addition of KI due to formation of polyhalide ion, i.e., I_3^-
 $KI + I_2 \rightarrow KI_3$
96. (d) $H_2 + \frac{1}{2} O_2 \rightarrow H_2O$
 1 mole $\frac{1}{2}$ mole 1 mole
 1 volume $\frac{1}{2}$ volume

1 ml H_2 reacts with $\frac{1}{2}$ ml O_2

30 ml of H_2 reacts with $= \frac{1}{2} \times 30 = 15 \text{ ml } O_2$

(20–15) = 5 ml of O_2 will left at the end of the reaction.

97. (a) Standard solution of I_2 is used to estimate sulphite, thiosulphite, arsenite etc.
98. (a) $I_2 + Na_2S_2O_3 \rightarrow 2NaI + Na_2S_4O_6$
 $I_2 + S_2O_3^{2-} \rightarrow 2I^- + S_4O_6^{2-}$

Critical Thinking Questions

1. (b) $ZnCO_3 \xrightarrow{\Delta} ZnO + CO_2$
 Turns lime water milky
 (Hot) ZnO $\square$ ZnO (Cool)
 yellow White
2. (b) $Ba^{+2} + 2CH_3COO^- \rightarrow (CH_3COO)_2 Ba$
 BaS_2O_3 gives SO_2 gas with dil. HCl and also yellow ppt. of Barium chromate.
 $(CH_3COO)Ba + K_2CrO_4 \rightarrow 2CH_3COOK + BaCrO_4 \downarrow$
 (yellow ppt.)
3. (c) $Na(NH_4)HPO_4 \xrightarrow{\Delta} NaPO_3 + NH_3 + H_2O$
 Microcosmic salt Sodium meta phosphate (transparent)
4. (a) It is a test for iodide.
5. (c) $Ba(NO_3)_2 + Na_2SO_3 \rightarrow Ba(NO_3)_2 + Na_2SO_4$
 Na_2SO_4 is insoluble in water.
6. (d) Except CO_3^{2-} all other ions are reduced by $KMnO_4$ solution.
7. (c) The brown ring test for NO_2^- and NO_3^- is due to formation of $[Fe(H_2O)_5 NO]^{2+}$
8. (b) It must be sulphide as
 $Pb(CH_3COO)_2 + H_2S \rightarrow PbS + 2CH_3COOH$
 (Black ppt.)
9. (c) Hg_2Cl_2 is white insoluble salt.
 $Hg_2Cl_2 + 2NH_4OH \rightarrow Hg + \underbrace{Hg(NH_2)Cl + NH_4Cl}_{\text{Black}} + 2H_2O$
10. (d) $Zn^{2+} + 2NaOH \rightarrow Zn(OH)_2 + 2Na^+$
 $Zn(OH)_2 + 2NaOH \rightarrow Na_2ZnO_2 + 2H_2O$.
11. (c) Chromium ion gives in hot and cold. Oxidising and reducing flame green-colour.
12. (b) $HgI_2 + 2KI \rightarrow K_2(HgI_4)$ soluble
 Red solid
 $HgI_2 \rightarrow Hg + I_2$ violet foams.
13. (c) Yellow filtrate is due to chromate ions (CrO_4^{2-}) and green residue is due to $Fe(OH)_2$.
14. (c) $1 \times V = \frac{12}{120} \times 2 = 200 \text{ ml.}$
15. (a) $AgNO_3$ react with all conditions and gives corresponding result.
 $AgNO_3 + 2NH_3 \rightarrow [Ag(NH_3)_2]NO_3 + H_2O$
 White ppt
 $AgNO_3 + NaCl \rightarrow AgCl + NaNO_3$
 White ppt

16. (c) $\frac{HCl}{N_1 V_1} = \frac{NaOH}{N_2 V_2}$

$$N_1 \times 20ml = 0.1 \times 25$$

$$N_1 = \frac{0.1 \times 25}{20} = 0.125$$

If one litre HCl present in 0.125

$$\text{Therefore in } 10 \text{ ml } \frac{0.125}{1000} \times 10 = 12.5$$

The normality of conc. HCl is 12.5N.

17. (a) 20 ml of 0.3N $Na_2S_2O_3$

$$= 20ml \text{ of } 0.3N I_2 \text{ Solution}$$

$$= 20ml \text{ of } 0.3N H_2O_2 \text{ solution}$$

$$\equiv 25ml \text{ of } 0.08N H_2O_2 \text{ solution}$$

$$\text{Mass of } H_2O_2 \text{ 100ml solution} = \frac{0.08 \times 17 \times 100}{1000}$$

$$= 0.136 \text{ gm}$$

$$\% = 0.136$$

$$68 \text{ gm } H_2O_2 \text{ evolve oxygen at NTP} = 22400 \text{ ml}$$

$$0.00136 \text{ gm } H_2O_2 \text{ evolve oxygen at NTP}$$

$$= \frac{22400}{68} \times 0.00136 = 0.448$$

For 0.1N, the solution is of 0.448 volume.

$$\therefore 3N, \text{ volume} = 0.448 \times 3 = 1.344 \text{ ml}.$$

18. (a) 'Ba' gives characteristic green flame in Bunsen burner.

20. (d) It is a characteristic property of IV group concentration of sulphide ions is lowered by formation of the weak acid H_2S .

4. (d) $PbCl_2$ does not react with conc. H_2SO_4 as $PbSO_4$ is insoluble in water.

5. (e) $ZnCO_3$ will react with conc. H_2SO_4 to give CO_2
Radicals of dil. acid test are decomposed by conc. H_2SO_4 in cold.

6. (c) Cd^{2+} salts are generally white in colour, however, CdS is yellow in colour.

7. (a) Both assertion and reason are correct and reason is the correct explanation of assertion.

8. (d) Cu^{2+} salts are generally blue in colour, however, CuS is black in colour.

9. (a) Both assertion and reason are correct and reason is the correct explanation of assertion.

10. (a) Both assertion and reason are correct and reason is the correct explanation of assertion.

11. (e) Sulphides do not give any test with $BaCl_2$ (aq.) as BaS is soluble in water.

12. (c) It is due to the formation of insoluble $BiOCl$ on hydrolysis.
 $BiCl_3 + H_2O \rightarrow BiOCl + 2HCl$
White ppt.

Assertion and Reason

1. (b) Lime water become turbid on passing CO_2 into it because both reacts to produce insoluble calcium carbonate.

If more CO_2 is passed than soluble calcium bicarbonate is formed which clear the solution

The reason that lime water is $Ca(OH)_2$ is also correct. Here, both assertion and reason are correct but reason is not a correct explanation of assertion.

2. (c) Assertion is true but reason is false.

$Sb(III)$ is a basic radical of IIB group for which group reagent is H_2O is presence of dilute HCl . It is necessary to maintain the proper hydrogen ion concentration for the precipitation of IV group cations.

3. (d) CuS is one such exception which is not decomposed by dil. H_2SO_4

Chemical Analysis

SET Self Evaluation Test - 21

- What volume of a solution of hydrochloric acid containing 73 g of acid per litre would be sufficient for the exact neutralization of sodium hydroxide obtained by allowing 0.46 g metallic sodium to act upon water
($Cl = 35.5$, $Na = 23.0$, $O = 16$) [UPSEAT 2001]
(a) 10 ml (b) 15 ml
(c) 20 ml (d) 8 ml
- A white sodium salt dissolves readily in water to give a solution which is neutral to litmus. When silver nitrate solution is added to the solution, a white precipitate is formed which does not dissolve in dilute nitric acid. The anion could be
(a) SO_4^{2-} (b) CO_3^{2-}
(c) S^{2-} (d) Cl^-
- Sometimes yellow turbidity appears on passing H_2S gas even in the absence of the second group radicals. This happens because
(a) Sulphur is present in the mixture as an impurity
(b) The fourth group radicals are precipitated as sulphides
(c) The H_2S is oxidized by some acid radicals
(d) The third group radicals are precipitated
- The colour of $CuCr_2O_7$ solution in water is green because [Bihar CEE 1995]
(a) $Cr_2O_7^{2-}$ ions are green
(b) Cu^{++} ions are green
(c) Both ions are green
(d) Cu^{++} ions are blue and $Cr_2O_7^{2-}$ ions are yellow
- Pb^{++} , Cu^{++} , Zn^{++} , and Ni^{++} ions are present in a given acidic solution. On passing hydrogen sulphide gas through this solution the available precipitate will contain [MP PMT 1996; MP PET/PMT 1998]
(a) PbS and NiS (b) PbS and CuS
(c) CuS and ZnS (d) CuS and NiS
- In acidic medium, dichromate ion oxidises ferrous ion to ferric ion. If the gram molecular weight of potassium dichromate is 294 grams, its gram equivalent weight is.....grams
(a) 294 (b) 127
(c) 49 (d) 24.5
- Metallic tin in the presence of HCl is oxidised $K_2Cr_2O_7$ to stannic chloride. What volume of decinormal dichromate solution would be reduced by 1 g of tin [UPSEAT 2001]
(a) 168.49 ml (b) 175.49 ml
(c) 170.50 ml (d) 162.38 ml
- 50 ml 10 N H_2SO_4 , 25 ml 12 N HCl and 40 ml 5 N HNO_3 were mixed together and the volume of the mixture was made 1000 ml by adding water. The normality of the resultant solution will be [MP PET/PMT 1998; MP PMT 2002]
(a) 1 N (b) 2 N
(c) 3 N (d) 4 N
- An aqueous solution of colourless metal sulphate M , gives a white precipitate with $NaOH$. This was soluble in excess of $NaOH$. On passing H_2S through this solution a white precipitate is formed. [AIIMS 1983] M in the salt is [KCET 1990]
(a) Ca (b) Ba
(c) Al (d) Zn
- A compound is soluble in water. If ammonia is added, a red precipitate appears which is soluble in dilute HCl . The compound has [CPMT 1974]
(a) Aluminium (b) Zinc
(c) Iron (d) Cadmium
- Nessler's reagent is [CPMT 1997; MP PET/PMT 1998]
(a) $KHgI_4$ (b) $K_2HgI_4 + NH_4OH$
(c) $K_2HgI_4 + KOH$ (d) $KHgI_4 + NH_4OH$
- Neutral ferric chloride is added to the aqueous solution of acetate. The blood red colour is obtained, it is due to the compound
(a) $Fe(OH)_2$ (b) $Fe(OH)_3$
(c) $Fe(CH_3COO)_3$ (d) $Fe(OH)_2(CH_3COO)$
- Mark the gas which turns lime water milky
(a) H_2S (b) SO_2
(c) Cl_2 (d) CO_2
- Which of the following reactions with H_2S does not produce metallic sulphide [EAMCET 2003] [AIIMS 1997]
(a) $ZnCl_2$ (b) $CdCl_2$
(c) $COCl_2$ (d) $CuCl_2$

1. (a) $\frac{0.46}{23} = \frac{73}{36.5} \times V(l)$
 $V = 10 \text{ ml}$
2. (d) $\text{NaCl} + \text{H}_2\text{O} \rightarrow \text{NaCl}_{(aq)}$
 $\text{NaCl}_{(aq)} + \text{AgNO}_3 \rightarrow \text{AgCl}_{\text{white ppt}} \xrightarrow[\text{dil}]{\text{HNO}_3} \text{Insoluble}$
3. (b) This is due to the precipitation of fourth group radical as sulphides due to high concentration of S^{2-} in the solution as a result yellow turbidity is obtained
4. (d) Cu^{++} ions are blue and $\text{Cr}_2\text{O}_7^{--}$ ions are yellow, yellow and blue combination gives-green colour.
5. (b) As both Pb^{2+} and Cu^{2+} require acidic medium and low concentration of S^{2-} to be precipitated as sulphide and low concentration of S^{2-} is provided by common ion effect of HCl and HS .
6. (c) In acidic medium potassium dichromate shows + 6 oxidation state
 $\frac{M}{6} = \frac{294}{6} = 49$
7. (a) $0.1 \times V = \frac{2}{119}$
 $V = 168.06 \text{ ml}.$
9. (d) $\text{Zn}^{+2} + 2\text{NaOH} \rightarrow \text{Na}_2\text{ZnO}_2 + 2\text{H}_2\text{O}$
 (white ppt.)
 $\text{Na}_2\text{ZnO}_2 + \text{H}_2\text{S} \rightarrow \text{ZnS} + 2\text{NaOH}$
 (White ppt.)
10. (c) $\text{FeCl}_3 + 3\text{NH}_4\text{OH} \rightarrow \text{Fe}(\text{OH})_3 + 3\text{NH}_4\text{Cl}$
 (red)
 $2\text{Fe}(\text{OH})_3 + 6\text{HCl} \rightarrow 2\text{FeCl}_3 + 6\text{H}_2\text{O}$
 (soluble in HCl)
11. (c) Nessler's reagent = $\text{K}_2\text{HgI}_4 + \text{KOH}.$
12. (c) $3\text{CH}_3\text{COONa} + \text{FeCl}_3 \rightarrow \text{Fe}(\text{CH}_3\text{COO})_3 + 3\text{NaCl}$
 Blood red ppt.
13. (bd) CO_2 and SO_2 turns lime water milky, as
 $\text{Ca}(\text{OH})_2 (aq.) + \text{CO}_2 \rightarrow \text{CaCO}_3 \downarrow + \text{H}_2\text{O}$
 (milky)
 $\text{Ca}(\text{OH})_2 + \text{SO}_2 \rightarrow \text{CaSO}_3 \downarrow + \text{H}_2\text{O}$
 (milky)
14. (c) In COCl_2 metal is not present.

8. (a) H_2SO_4 HCl HNO_3 Total volume
 $N_1V_1 + N_2V_2 + N_3V_3 = N \times 1000 \text{ ml}$
 $N = \frac{N_1V_1 + N_2V_2 + N_3V_3}{1000}$
 $= \frac{50 \times 10 + 25 \times 12 + 40 \times 5}{1000}$
 $N = \frac{500 + 300 + 200}{1000} = \frac{1000}{1000} = 1N$

Chapter 22

Purification, Classification and Nomenclature of Organic compounds

The word '*organic*' signifies *life*. Therefore, all substances which were obtained directly or indirectly from living organisms, plants and animals were called *organic compounds* and the branch of chemistry which deals with these compounds was called *organic chemistry*.

Modern definition of organic chemistry : Organic chemistry is a chemistry of hydrocarbons and their derivatives in which covalently bonded carbon is an essential constituent.

Berzelius put forward a theory in 1815 known as *vital force theory*. According to this theory, "*organic compounds could be prepared only by living organism under the influence of a mysterious force known as vital force*". Accidental synthesis of urea by **Wohler** and synthesis of acetic acid by **Kolbe** led to the fall of this theory.

Berthelot prepared *methane* in laboratory and the most abundant organic compound is *cellulose* which is a polymer of glucose. **Kekule** and **Couper** proposed the tetravalency of carbon and wrote the first structural formula. In 1874, **Van't Hoff** and **Le Bell** suggested a tetrahedron model of carbon.

Purification and Characterisation of organic compounds

The study of organic compounds starts with the characterisation of the compound and the determination of its molecular structure. The procedure generally employed for this purpose consists of the following steps :

- (1) Purification of organic compounds
- (2) Qualitative analysis of organic compounds
- (3) Quantitative analysis of organic compounds
- (4) Determination of molecular mass of organic compounds
- (5) Calculation of Empirical formula and Molecular formula of organic compounds

(6) Determination of structure of organic compounds by spectroscopic and diffraction methods

(i) **Purification of organic compounds** : A large number of methods are available for the purification of substances. The choice of method, however, depends upon the nature of substance (whether solid or liquid) and the type of impurities present in it. Following methods are commonly used for this purpose,

- (i) Simple crystallisation
- (ii) Fractional crystallisation,
- (iii) Sublimation
- (iv) Simple distillation
- (v) Fractional distillation
- (vi) Distillation under reduced pressure
- (vii) Steam distillation
- (viii) Azeotropic distillation
- (ix) Chromatography
- (x) Differential extraction
- (xi) Chemical methods

(i) **Simple crystallisation** : This is the most common method used to purify organic solids. It is based upon the fact that whenever a crystal is formed, it tends to leave out the impurities. For crystallisation, a suitable solvent is one (a) which dissolves more of the substance at higher temperature than at room temperature (b) in which impurities are either insoluble or dissolve to an extent that they remain in solution (in the mother liquor) upon crystallisation, (c) which is not highly inflammable and (d) which does not react chemically with the compound to be crystallized. The most commonly used solvents for crystallisation are : water, alcohol, ether, chloroform, carbon- tetrachloride, acetone, benzene, petroleum ether etc.

Examples : (a) Sugar having an impurity of common salt can be crystallized from hot ethanol since sugar dissolves in hot ethanol but common salt does not.

(b) A mixture of benzoic acid and naphthalene can be separated from hot water in which benzoic acid dissolves but naphthalene does not.

(ii) **Fractional crystallisation** : The process of separation of different components of a mixture by repeated crystallisations is called fractional crystallisation. The mixture is dissolved in a solvent in which the two components have different solubilities. When a hot saturated solution of this

mixture is allowed to cool, the less soluble component crystallises out first while the more soluble substance remains in solution. The mother liquor left after crystallisation of the less soluble component is again concentrated and then allowed to cool when the crystals of the more soluble component are obtained. The two components thus separated are recrystallized from the same or different solvent to yield both the components of the mixture in pure form.

Fractional crystallisation can be used to separate a *mixture of* $KClO_3$ (less soluble) and KCl (more soluble).

(iii) **Sublimation** : Certain organic solids on heating directly change from solid to vapour state without passing through a liquid state, such substances are called *sublimable* and this process is called *sublimation*.

The *sublimation process* is used for the separation of sublimable volatile compounds from non sublimable impurities. The process is generally used for the *purification of camphor, naphthalene, anthracene, benzoic acid* $NH_4Cl, HgCl_2$, solid SO_2 , Iodine and salicylic acid etc containing non-volatile impurities.

(iv) **Simple distillation** : Distillation is the joint process of vapourisation and condensation. This method is used for the purification of liquids which boil without decomposition and contain non-volatile impurities. This method can also be used for separating liquids having sufficient difference in their boiling points. This method can be used to separate a mixture of

(a) chloroform (b. p. 334 K) and aniline (b. p. 457 K)

(b) ether (b. p. 308 K) and toluene (b. p. 384 K)

(v) **Fractional distillation** : This process is used to separate a mixture of two or more miscible liquids which have boiling points close to each other. Since in this process, the distillate is collected in fractions under different temperatures, it is known as fractional distillation. This process is carried out by using *fractionating columns*. Fractionating column is a special type of long glass tube provided with obstructions to the passage of the vapour upwards and that of liquid downwards. This method may be used to *separate a mixture of acetone* (b. p. 330 K) and *methyl alcohol* (b. p. 338 K) or *a mixture of benzene and toluene*. One of the technological applications of fractional distillation is to separate different *fractions of crude oil in petroleum industry into various useful fractions such as gasoline, kerosene oil, diesel oil, lubricating oil etc.*

(vi) **Distillation under reduced pressure** : This method is used for the purification of high boiling liquids and liquids which decompose at or below their boiling points.

The crude liquid is heated in distillation flask fitted with a water condenser, receiver and vacuum pump. As the pressure is reduced, the liquid begins to boil at a much lower temperature than its normal boiling point. The vapour is condensed by water condenser and the pure liquid collects in the receiver.

Glycerol which decomposes at its boiling point (563 K) under atmospheric pressure can be distilled without decomposition at 453 K under 12 mm of Hg. Similarly, sugarcane juice is concentrated in sugar industry by evaporation under reduced pressure which saves a lot of fuel.

(vii) **Steam distillation** : This method is applicable for the separation and purification of those organic compounds (solids or liquids) which (a) are insoluble in water (b) are volatile in steam (c) possess a high vapour pressure (10-15 mm Hg) at 373 K and (d) contain non-volatile impurities.

Aniline (b. p. 457 K) can be purified by steam distillation since it boils at a temperature of 371.5 K in presence of steam. Other compounds which can be purified by steam distillation are: nitrobenzene, bromobenzene, *o*-nitrophenol, salicylaldehyde, *o*-hydroxyacetophenone, essential oils, turpentine oil etc.

(viii) **Azeotropic distillation** : Azeotropic mixture is a mixture having constant boiling point. The most familiar example is a mixture of ethanol and water in the ratio of 95.87 : 4.13 (a ratio present in rectified spirit). It boils at 78.13°C. The constituents of an azeotropic mixture can't be separated by fractional distillation. Hence a special type of distillation (azeotropic distillation) is used for separating the constituents of an azeotropic mixture.

In this method a third compound is used in distillation. The process is based on the fact that dehydrating agents like C_6H_6 , CCl_4 , diethyl ether etc. depress the partial pressure of one of the original components. As a result, the boiling point of that component is raised sufficiently and thus the other component will distil over.

Dehydrating agents having low boiling point (e.g. C_6H_6 , CCl_4 , ether) depress the partial pressure of alcohol more than that of water; on the other hand, dehydrating agents having high boiling point (glycerol, glycol) depress the partial pressure of water more than that of alcohol.

(ix) **Chromatography** : This is a modern method used for the separation of mixtures into its components, purification of compounds and also to test the purity of compounds. The name chromatography is based on the Greek word '*chroma*' meaning colour and '*graphy*' for writing because the method was first used for the separation of coloured substances found in plants. This method was described by **Tswett** in 1906.

(a) **Principle of chromatography** : The technique of chromatography is based on the difference in the rates at which the components of a mixture move through a porous medium (called *stationary phase*) under the influence of some solvent or gas (called *moving phase*). Thus, this technique consists of two phases- one is a stationary phase of large surface area while the second is a moving phase which is allowed to move slowly over the stationary phase. *The stationary phase is either a solid or a liquid while the moving phase may be a liquid or a gas.*

(b) **Types of chromatography** : Depending upon the nature of the stationary and the mobile phases, the different types of chromatographic techniques commonly used are in a given table,

Table : 22.1

Type of Chromatography	Mobile/Stationary Phase	Uses
Adsorption or column chromatography	Liquid/Solid	Large scale separations
Thin-layer chromatography	Liquid/Solid	Qualitative analysis (identification and characterization of organic compounds)
High performance liquid chromatography	Liquid/Solid	Qualitative and quantitative analysis
Gas-liquid chromatography (GLC)	Gas/Liquid	Qualitative and quantitative analysis
Partition chromatography or ascending paper chromatography	Liquid/Liquid	Qualitative and quantitative analysis of polar organic compounds (sugars, α -amino acids and inorganic compounds)

It is constant for a given substance (component) under a given set of conditions. Therefore, it is possible to identify the various components by determining their R_f values.

(x) **Differential extraction** : This method is used for the separation of an organic compound (solid or liquid) from its aqueous solution by shaking with a suitable solvent (e.g. ether, benzene, chloroform, carbon tetrachloride etc.) in a separating funnel. The selected solvent should be immiscible with water but should dissolve the organic compound to an appreciable extent.

It is important to note that extraction is more efficient (*i.e.*, more complete) when a given volume of the extracting solvent is used in several installments.

This method is normally applied to *nonvolatile compounds*. For example, *benzoic acid can be extracted from its water solution using benzene*.

(xi) **Chemical methods** : Besides these physical methods, a number of chemical methods have also been used to separate a mixture of organic compounds. These methods are based upon the distinguishing chemical properties of one class of organic compounds from the others. For example,

(a) Phenols can be separated from carboxylic acids on treatment with an aqueous solution of NaHCO_3 . Since carboxylic acids dissolve in NaHCO_3 solution evolving CO_2 but phenols usually do not react.

(b) Destructive distillation of wood gives *pyroligneous acid* which contains acetic acid (10%), acetone (0.5%) and methanol (3%). Acetic acid can be separated from this mixture by treating it with milk of lime when acetic acid forms the calcium salt. The reaction mixture on distillation gives a mixture of acetone and methanol (which can be further separated by fractional distillation into individual components as mentioned above) while the calcium salt remains as residue in the flask. The calcium salt is then decomposed with dil HCl and distilled to afford acetic acid.

(c) A mixture of 1, 2 and 3 amines can be separated using either benzenesulphonyl chloride (*Hinsberg's reagent*) or diethyl oxalate (*Hoffmann's method*).

(d) **Purification of commercial benzene** : Commercial benzene obtained from coal-tar distillation contains 3-5% thiophene as an impurity which can be removed by extraction with conc. H_2SO_4 . This purification is based upon the fact that thiophene undergoes sulphonation much more easily than benzene. Thus, when commercial benzene is shaken with conc. H_2SO_4 in a separating funnel, thiophene undergoes sulphonation to form thiophene-2-sulphonic acid which dissolves in conc. H_2SO_4 while benzene does not.

After this treatment, the benzene layer is removed, washed with water to remove unreacted H_2SO_4 , dried over anhyd. CaCl_2 and then distilled to give pure benzene.

(e) **Absolute alcohol from rectified spirit** : The rectified spirit (ethanol : H_2O , 95.87:4.13 by weight) is kept over a calculated amount of active quick lime (CaO) for few hours and then refluxed. During this process, water present in rectified spirit combines with CaO to form Ca(OH)_2 . When the resulting mixture is distilled, absolute alcohol distils over leaving behind, Ca(OH)_2 .

Drying of Organic Substances. (i) **For solids** : Most solids are dried first by pressing them gently between folds of filter papers. Compounds which neither decompose on heating nor melt below 100°C are dried by keeping them in steam or oven maintained at 110°C . Substances, which decompose on heating are dried by keeping them in a vacuum desiccator containing a suitable dehydrating agent like fused CaCl_2 , conc. H_2SO_4 , P_4O_{10} , solid KOH or NaOH , etc (desiccant).

(2) **For liquids** : Organic liquids are generally dried by keeping them over night in contact with a dehydrating (desiccating) agent which does not react chemically with the liquid to be dried. Commonly used *dehydrating agents* are quick lime, anhydrous CaCl_2 , fused CuSO_4 or CaSO_4 , KOH , metallic sodium or potassium, etc.

Criteria of purity of organic compounds : The purity of an organic compound can be ascertained by determining its some physical constants like m.p., b.p., specific gravity, refractive index and viscosity. In usual practice, sharp m.p. (in case of solids) and boiling point (in case of liquids) are used as criteria for purity because their determination is feasible in the laboratory. *A pure organic solid has a definite and sharp (sudden, rapid and complete) melting point, while an impure substance has a lower and indefinite melting point.*

(1) **Mixed melting point** : The melting point of two thoroughly mixed substances is called mixed melting point. This can also be used for ascertaining the purity of a compound.

The substance, whose purity is to be tested, is mixed with a pure sample of the same compound. The melting point of the mixture is determined. If the melting point of the mixture is sharp and comes out to be the same as that of pure compound, it is sure that the compound under test is pure. On the other hand, if the melting point of the mixture is less than the melting point of the pure compound, the compound in question is not pure.

(2) **Qualitative analysis** : (Detection of Elements)

The qualitative analysis of an organic compound involves the detection of all the elements present in it. Carbon is an essential constituent of an organic compound whereas hydrogen is nearly always present. On heating the organic compound with dry cupric oxide, carbon is oxidized to CO_2 and hydrogen to H_2O . CO_2 is detected by lime water which turns milky while H_2O is detected by anhydrous CuSO_4 (white) which turns it blue. This method is known as **copper oxide test**.

If the substance under investigation is a volatile liquid or gas, the vapours are passed over heated copper oxide kept in combustion tube and the gaseous products are tested as above.

Lassaigne method

This is used to detect nitrogen, halogen and sulphur. Organic compounds are fused with dry sodium in a fusion-tube and fused mass after extraction with H_2O is boiled and filtered. Filtrate called sodium extract (S.E.) is used to detect elements (other than C and H) and the tests are given in the table.

- Organic compounds being covalents normally do not have ionisable groups, hence direct test is not possible.
- Fusion with Na forms soluble salt (like NaCl , NaCN etc.) which can be easily detected.
- This test fails in case of diazo compounds.
- Sometimes when the amount of nitrogen present is small, the prussian blue is present in colloidal form and the solution looks green.

Table : 22.2 Lassaigne method (Detection of elements)

Element	Sodium Extract (S.E.)	Confirmed Test	Reaction
Nitrogen	$Na + C + N \xrightarrow{\Delta} NaCN$ (S.E.)	S.E. + $FeSO_4 + NaOH$, boil and cool + $FeCl_3 + conc.HCl$ Blue or green colour	$2NaCN + FeSO_4 \longrightarrow Fe(CN)_2 + Na_2SO_4$ $Fe(CN)_2 + 4NaCN \longrightarrow Na_4[Fe(CN)_6]$ Sodium ferrocyanide $3Na_4[Fe(CN)_6] + 4FeCl_3 \xrightarrow{HCl} Fe_4[Fe(CN)_6]_3 + 12NaCl$ Ferric ferrocyanide (Prussian blue)
Sulphur	$2Na + S \xrightarrow{\Delta} Na_2S$ (S.E.)	(i) S.E. + sodium nitro prusside (ii) S.E. + $CH_3CO_2H + (CH_3CO_2)_2Pb$ A black ppt.	(i) $Na_2S + Na_2[Fe(CN)_5NO] \longrightarrow Na_4[Fe(CN)_5NO.S]$ or Sodium nitroprusside (Purple) $Na_3[Fe(ONSNa)(CN)_5]$ Sodium thionitroprusside (Violet) (ii) $Na_2S + (CH_3COO)_2Pb \xrightarrow{CH_3COOH} PbS \downarrow + 2CH_3COONa$ black ppt.
Halogen	$Na + X \xrightarrow{\Delta} NaX$ (S.E.) (X = Cl, Br, I)	S.E. + $HNO_3 + AgNO_3$ (i) White ppt soluble in aq. NH_3 confirms Cl. (ii) Pale yellow ppt partially soluble in aq. NH_3 confirms Br. (iii) Yellow ppt insoluble in aq. NH_3 confirms I.	$NaX + AgNO_3 \xrightarrow{HNO_3} AgX \downarrow$ ppt $AgCl + 2NH_3(aq) \longrightarrow [Ag(NH_3)_2]Cl$ White ppt soluble $AgBr + 2NH_3(aq) \longrightarrow [Ag(NH_3)_2]Br$ Yellow ppt. Partially soluble $AgI + NH_3(aq) \longrightarrow$ Insoluble
Nitrogen and sulphur together	$Na + C + N + S \xrightarrow{\Delta} NaCNS$ (S.E.) with excess of Na the thiocyanate formed decomposes into cyanide and sulphide. $NaCNS + 2Na \rightarrow NaCN + Na_2S$	As in test for nitrogen; instead of green or blue colour, blood red colouration confirms presence of N and S both.	$3NaCNS + FeCl_3 \longrightarrow [Fe(SCN)_3] \text{ or } [Fe(SCN)]Cl_2 + 3NaCl$ Ferric sulphocyanide (Blood red colour)

Table : 22.3 Other methods for detection of elements

Element	Test
Nitrogen	Soda lime test : A pinch of an organic compound is heated strongly with soda lime ($NaOH + CaO$) in a test tube. If ammonia gas evolves, it indicates nitrogen. $CH_3CONH_2 + NaOH \xrightarrow{CaO} CH_3COONa + NH_3$. This test is, however, not reliable since certain compounds like nitro, azo etc do not evolve NH_3 when heated with soda lime. Acetamide
Sulphur	Oxidation test : Sulphur can also be tested by oxidation test. The organic compound is fused with fusion mixture (a mixture of sodium carbonate and potassium nitrate). The sulphur, if present in the organic compound, is oxidised to sodium sulphate. $Na_2CO_3 + S + 3O \longrightarrow Na_2SO_4 + CO_2$. The fused mass is dissolved in water and the solution is acidified with hydrochloric acid. Barium chloride solution is then added. The formation of a white precipitate indicates the presence of sulphur. $Na_2SO_4 + BaCl_2 \longrightarrow BaSO_4 + 2NaCl$. (White ppt.)
Halogens	Beilstein's test (copper wire test) : A clean copper wire is heated in the Bunsen flame till it does not impart any green colour to the flame. The heated end is dipped in the organic compound and heated again. The appearance of a green or bluish green flame due to the formation of volatile cupric halides indicates the presence of some halogen in the organic compound. Though this test is very sensitive yet it does not confirm the presence of halogens in an organic compound since certain organic compounds like urea, thiourea, pyridine, organic acids etc. which do not contain halogens give this test due to the formation of volatile cupric cyanide. It does not tell as to which halogen is present. Special test for bromine and iodine (layer test) : Boil a portion of the Lassaigne's extract with nitric acid. Add a few drops of CS_2 and then add chlorine water slowly with constant shaking. An orange colouration in CS_2 layer confirms the presence of bromine where as a violet colouration in the layer confirms the presence

	of iodine. $2NaBr + Cl_2 \longrightarrow 2NaCl + Br_2$; $2NaI + Cl_2 \longrightarrow 2NaCl + I_2$ turns CS ₂ layer orange turns CS ₂ layer violet
Phosphorus	Phosphorus is detected by fusing the organic compound with sodium peroxide when phosphorus is converted into sodium phosphate. $2P + 5Na_2O_2 \longrightarrow 2Na_3PO_4 + 2Na_2O$. The fused mass is extracted with H ₂ O, boiled with conc. HNO ₃ and then ammonium molybdate is added. Appearance of yellow ppt. or colouration due to the formation of ammonium phosphomolybdate indicates the presence of phosphorus. $Na_3PO_4 + 3HNO_3 \xrightarrow{\Delta} H_3PO_4 + 3NaNO_3$ $H_3PO_4 + 12(NH_4)_2MoO_4 + 21HNO_3 \longrightarrow (NH_4)_3PO_4 \cdot 12MoO_3 + 21NH_4NO_3 + 12H_2O$ Amm. molybdate Amm. Phosphomolybdate (yellow ppt.)
Oxygen	There is no satisfactory qualitative method for the detection of oxygen. However, its presence can be inferred indirectly. (i) If the organic compound is heated alone in a dry test tube in the presence of nitrogen, the formation of water drops on cooler parts of the tube may indicate the presence of oxygen. (ii) The presence of oxygen can be inferred by testing the presence of functional groups known to contain oxygen, e.g., hydroxyl (-OH), aldehydic (-CHO), carboxyl (-COOH) groups, etc.

(3) **Quantitative analysis** (Estimation of Elements) : After qualitative analysis of elements, the next step in the determination of molecular formula of an organic compound is the estimation of various elements by mass, *i.e.* finding the percentage composition of the elements by mass. The

various methods commonly employed for the estimation of principal elements are discussed in the table.

Table : 22.4 Quantitative estimation of elements in organic compounds

Element	Method and its principle	Formula
Carbon and Hydrogen	Liebig's combustion method : In this method, a known weight of organic compound is heated with pure and dry cupric oxide in a stream of pure and dry oxygen, when carbon is oxidised to carbon dioxide while hydrogen is oxidised to water. From the weight of CO_2 and H_2O, the percentage of C and H can be calculated. $C_xH_y + \left(x + \frac{y}{4}\right)O_2 \xrightarrow{\Delta} xCO_2 + \frac{y}{2}H_2O$	(i) % of $C = \frac{\text{Weight of } CO_2}{\text{Weight of org. compound}} \times \frac{12}{44} \times 100$ (ii) % of $H = \frac{\text{Weight of } H_2O}{\text{Weight of org. compound}} \times \frac{2}{18} \times 100$
Nitrogen	(i) Duma's method : Elemental nitrogen is converted into molecular nitrogen by a suitable chemical method and its volume is changed to STP data. $C + 2H + 3CuO \rightarrow CO_2 + H_2O + 3Cu$ $2N + 2CuO \rightarrow N_2 + \text{oxide of nitrogen}$ Oxides of nitrogen + $Cu \longrightarrow N_2 + CuO$ (ii) Kjeldahl's method : Nitrogen in organic compound is converted into NH_3 by suitable chemical method which, in turn, is absorbed by $V_1\text{ mL}$ of $N_1H_2SO_4$. $N(\text{from organic compound}) + \text{conc. } H_2SO_4 \xrightarrow{\Delta} (NH_4)_2SO_4$ $(NH_4)_2SO_4 + 2NaOH \longrightarrow Na_2SO_4 + 2H_2O + 2NH_3$	% of $N = \frac{28}{22400} \times \frac{V}{W} \times 100$ Where, V = volume of N_2 in nitrometer (in mL) at NTP, W = Weight of substance taken; % of $N = \frac{1.4 \times N \times V}{W}$ Note : This method is, however, not applicable to compounds containing nitrogen in the ring (e.g. Pyridine, quinoline etc) and compounds containing nitro and azo ($-N=N-$) groups since nitrogen in these compounds is not completely converted into $(NH_4)_2SO_4$ during digestion.
Halogens	(i) Carius method : The method is based on the fact that when an organic compound containing halogen (Cl, Br, or I) is heated in a sealed tube with fuming nitric acid in presence of silver nitrate, silver halide is formed. From the mass of silver halide formed, the percentage of the halogen can be calculated. (ii) Schiff's and Piria method : In this method the accurately weighed organic compound ($0.15 - 0.25 \text{ g}$) is taken in a small platinum crucible with a mixture of lime and sodium carbonate, ($CaO + Na_2CO_3$). It is now heated strongly and then cooled and dissolved in dilute nitric acid in a beaker. The solution is then filtered and the halide is precipitated with silver nitrate solution. Halogen is now calculated as in Carius method.	% of $Cl = \frac{35.5}{143.5} \times \frac{\text{Mass of } AgCl \text{ formed}}{\text{Mass of substance taken}} \times 100$ % of $Br = \frac{80}{188} \times \frac{\text{Mass of } AgBr \text{ formed}}{\text{Mass of substance taken}} \times 100$ % of $I = \frac{127}{235} \times \frac{\text{Mass of } AgI \text{ formed}}{\text{Mass of substance taken}} \times 100$

Sulphur	Carius method : When an organic compound containing sulphur is heated with fuming nitric acid, sulphur is oxidised to sulphuric acid. This is precipitated as barium sulphate by adding barium chloride solution. From the amount of barium sulphate, percentage of sulphur can be calculated. $S + HNO_3(\text{fuming}) \xrightarrow{\text{heat}} H_2SO_4$ $H_2SO_4 + BaCl_2 \longrightarrow BaSO_4 + 2HCl$ white ppt	$\% \text{ of S} = \frac{32}{233} \times \frac{\text{Mass of } BaSO_4 \text{ formed}}{\text{Mass of substance taken}} \times 100$
phosphorous	Carius method : The organic compound containing phosphorus is heated with fuming nitric acid. Phosphorus is oxidised to phosphoric acid. It is precipitated as magnesium ammonium phosphate, $MgNH_4PO_4$, by the addition of magnesia mixture ($MgSO_4 + NH_4OH + NH_4Cl$). The magnesium ammonium phosphate is washed, dried and ignited when it is converted to magnesium pyrophosphate ($Mg_2P_2O_7$). $2MgNH_4PO_4 \xrightarrow{\text{heat}} Mg_2P_2O_7 + 2NH_3 + H_2O$ From the mass of magnesium pyro-phosphate, the percentage of phosphorus in the compound can be calculated.	$\% \text{ of P} = \frac{62}{222} \times \frac{\text{Mass of } Mg_2P_2O_7 \text{ formed}}{\text{Mass of substance taken}} \times 100$
Oxygen	(i) The usual method of determining the percentage of oxygen in an organic compound is by the method of difference. All the elements except oxygen present in the organic compound are estimated and the total of their percentages subtracted from 100 to get the percentage of oxygen. (ii) Aluise's method : Organic compound containing oxygen is heated with graphite and CO formed is quantitatively converted into CO on reaction with I_2O_5. $\text{Org. compound} \xrightarrow{\text{Pyrolysis}} \text{Oxygen}$ $O_2 + 2C \xrightarrow{1100^\circ C} 2CO$ $5CO + I_2O_5 \longrightarrow I_2 + 5CO_2$	Percentage of oxygen = $100 - (\text{Sum of the percentages of all other elements})$ $\begin{array}{ccc} O & \equiv & CO \equiv CO_2 \\ 16 \text{ g} & & 44 \text{ g} \end{array}$ $\% \text{ of O} = \frac{16}{44} \times \frac{\text{mass of } CO_2}{\text{mass of org. compd.}} \times 100$

(4) **Determination of Molecular Mass** : The molecular mass of the organic compounds can be determined by various methods.

(i) **Physical methods for volatile compounds**

(a) **Victor Meyer's method** : Molecular mass of volatile liquids and solids can be easily determined from the application of **Avogadro hypothesis** according to which the mass of 22.4 litres or 22400 ml of the vapour of any volatile substance at NTP is equal to the molecular mass of the substance.

In Victor Meyer's method, a known mass of the volatile substance is vaporised in a Victor Meyer's tube. The vapours formed displace an equal volume of air into a graduated tube. The volume of air collected in graduated tube is measured under experimental conditions. This volume is converted to NTP conditions.

Calculations : Mass of the organic substance = W g

Let the volume of the air displaced be = V_1 ml ;

Temperature = T_1 K

Pressure (after deducting aqueous tension) = p_1 mm

Let the volume at NTP be = V_2 ml

Applying gas equation, $V_2 = \frac{p_1 \times V_1}{T_1} \times \frac{273}{760}$

$\therefore V_2$ ml of vapours weight at NTP = W g

$\therefore$ 22400 ml of vapour weight at NTP = $\frac{W}{V_2} \times 22400 = M$

Alternatemethod : Vapour density of substance

$$= \frac{\text{Mass of 1 ml of vapours at NTP}}{\text{Mass of 1 ml of hydrogen at NTP}}$$

$$\text{or } V.D. = \frac{W / V_2}{0.00009} \quad (\because \text{Mass of 1 ml of } H_2 \text{ at NTP} = 0.00009 \text{ g or } 2/22400)$$

$$\text{or } V.D. = \frac{W}{V_2 \times 0.00009} ;$$

$$\text{Mol. Mass, } M = 2 \times V.D. = \frac{2W}{V_2 \times 0.00009}$$

(b) **Hofmann's method** : The method is applied to those substances which are not stable at their boiling points, but which may be volatilised without decomposition under reduced pressure. A known mass of the substance is vaporised above a mercury column in a barometric tube and the volume of the vapour formed is recorded. It is then reduced to NTP conditions. The molecular mass of the organic substance can be calculated by the application of following relationship,

$$\text{Mol. Mass} = \frac{\text{Mass of the substance}}{\text{volume of the vapours at NTP}} \times 22400$$

(ii) **Physical methods for Non-volatile substances** : The molecular mass of a non-volatile organic compound can be determined by noting either the elevation in boiling point of the solvent (Ebullioscopic method) or the depression in freezing point of the solvent (Cryoscopic method) produced by dissolving a definite mass of the substance in a known mass of the solvent. The molecular mass of the compound can be calculated from the following mathematical relationships :

$$(a) \text{ Elevation in boiling point : Mol. Mass} = \frac{1000 K_b \times w}{W \times \Delta T}$$

Where, K_b = Molal elevation constant of the solvent, W = Mass of the compound, w = Mass of the solvent

ΔT = Elevation in boiling point of the solvent (determined experimentally)

$$(b) \text{ Depression in freezing point : Mol. Mass} = \frac{1000 K_f \times w}{W \times \Delta T}$$

Where, K_f = Molal depression constant of the solvent, w = Mass of the compound, W = Mass of the solvent

ΔT = Depression in freezing point of the solvent (determined experimentally)

(iii) Chemical methods

(a) *Silver salt method for acids* : It is based on the fact that silver salt of an organic acid on heating gives residue of metallic silver.

From the mass of the silver salt taken and the mass of the silver residue obtained, the equivalent mass of the silver salt can be calculated.

$$\frac{\text{Equivalent mass of silver salt}}{\text{Equivalent mass of silver}} = \frac{\text{Mass of silver salt}}{\text{Mass of silver}}$$

Knowing the equivalent mass of silver salt, the equivalent mass of the acid can be obtained. The molecular mass of an acid can be determined with the help of the following relationship,

$$\text{Mol. mass of the acid} = \text{Equivalent mass of the acid} \times \text{basicity}$$

Calculations : (i) Mass of silver salt taken = w g (ii) Mass of metallic silver = x g

$$\frac{\text{Eq. mass of silver salt}}{\text{Eq. mass of silver}} = \frac{w}{x}; \quad \text{Eq. mass of silver salt} = \frac{w}{x} \times 108$$

Let the equivalent mass of the acid be E . In the preparation of silver salt, a hydrogen atom of the carboxylic group is replaced by a silver atom.

$$\text{Thus, Equivalent mass of silver salt} = E - 1 + 108 = E + 107$$

$$\text{Thus, } E + 107 = \frac{w}{x} \times 108 \text{ or } E = \left[\frac{w}{x} \times 108 - 107 \right]$$

$$\text{If } n \text{ be the basicity of the acid, then Mol. Mass of the acid} = \left[\frac{w}{x} \times 108 - 107 \right] \times n$$

(b) *Platinichloride method for bases* : Organic bases combine with chloroplatinic acid, H_2PtCl_6 to form insoluble platinichlorides, which, on ignition, leave a residue of metallic platinum. Knowing the mass of platinum salt and the mass of metallic platinum, the molecular mass of the platinum salt can be determined. Let B represents one molecule of the base. If the base is mono-acidic, the formula of the salt will be $B_2H_2PtCl_6$.

$$\frac{\text{Molecular mass of the salt}}{\text{Atomic mass of platinum}} = \frac{\text{Mass of platinum salt}}{\text{Mass of platinum}}$$

Let E be the equivalent mass of the base.

Molecular mass of the salt

$$= 2E + 2 + 195 + 213 = 2E + 410$$

$$\text{So } \frac{2E + 410}{195} = \frac{w}{x} = \frac{\text{Mass of platinum salt}}{\text{Mass of platinum}};$$

$$2E = \left[\frac{w}{x} \times 195 - 410 \right]; \quad E = \frac{1}{2} \left[\frac{w}{x} \times 195 - 410 \right]$$

$$\text{Mol. mass of the base} = \text{Eq. mass} \times \text{acidity} = E \times n$$

where n is the acidity of the base.

(c) *Volumetric method for acids and bases* : Molecular mass of an acid can be determined by dissolving a known mass of the acid in water and titrating the solution against a standard solution of an alkali using phenolphthalein as an indicator. Knowing the volume of alkali solution used, the mass of the acid, which will require 1000 ml of a normal alkali solution for complete neutralisation can be calculated. This mass of the acid will be its equivalent mass.

$$\frac{1000 \text{ ml } 1N \text{ alkali solution}}{\text{One gram equivalent of alkali}} \equiv \text{One gram equivalent of the acid}$$

Calculations : Suppose w g of the organic acid requires V ml N alkali solution for complete neutralisation.

$$V \text{ ml } N \text{ alkali solution} \equiv w \text{ gm acid}$$

$$\text{So } 1000 \text{ ml } N \text{ alkali solution} \equiv \frac{w}{V \times N_1} \times 1000 \text{ g acid} \equiv \text{one gram equivalent acid}$$

$$\text{Equivalent mass of the acid} \equiv \frac{w}{V \times N_1} \times 1000$$

$$\text{Thus, Molecular mass of the acid} = \text{Eq. mass} \times \text{basicity}$$

In the case of organic bases, the known mass of the base is titrated against a standard solution of an acid. Knowing the volume of the acid solution used, the mass of the organic base which will require 1000 ml of a normal acid solution for complete neutralisation can be calculated. This mass will be the equivalent mass of the base.

$$\frac{1000 \text{ ml } N \text{ acid solution}}{\text{One gram equivalent of the acid}} \equiv \text{One gram equivalent of the base}$$

$$\text{Molecular mass of the base} = \text{Eq. mass} \times \text{acidity}$$

(5) Calculation of Empirical and Molecular formula

(i) **Empirical formula** : Empirical formula of a substance gives the simplest whole number ratio between the atoms of the various elements present in one molecule of the substance. For example, empirical formula of glucose is CH_2O , i.e. for each carbon atom, there are two H-atoms and one oxygen atom. Its molecular formula is however, $C_6H_{12}O_6$.

Calculation of empirical formula : The steps involved in the calculation are as follows,

(a) Divide the percentage of each element by its atomic mass. This gives the relative number of atoms.

(b) Divide the figures obtained in step (i) by the lowest one. This gives the simplest ratio of the various elements present.

(c) If the simplest ratio obtained in step (ii) is not a whole number ratio, then multiply all the figures with a suitable integer i.e., 2, 3, etc. to make it simplest whole number ratio.

(d) Write down the symbols of the various elements side by side with the above numbers at the lower right corner of each. This gives the empirical or the simplest formula.

(ii) **Molecular formula** : Molecular formula of a substance gives the actual number of atoms present in one molecule of the substance.

$$\text{Molecular formula} = n \times \text{Empirical formula}$$

Where, n is a simple integer 1, 2, 3,..... etc. given by the equation,

$$n = \frac{\text{Molecular mass of the compound}}{\text{Empirical formula mass of the compound}}$$

where the molecular mass of the compound is determined experimentally by any one of the methods discussed former, empirical formula mass is calculated by adding the atomic masses of all the atoms present in the empirical formula.

(iii) **Molecular formula of gaseous hydrocarbons (Eudiometry)**

Eudiometry is a direct method for determination of molecular formula of gaseous hydrocarbons without determining the percentage composition of various elements in it and without knowing the molecular weight of the hydrocarbon. The actual method used involves the following steps,

(a) A known volume of the gaseous hydrocarbon is mixed with an excess (known or unknown volume) of oxygen in the eudiometer tube kept in a trough of mercury.

(b) The mixture is exploded by passing an electric spark between the platinum electrodes. As a result, carbon and hydrogen of the hydrocarbon are oxidised to CO_2 and H_2O vapours respectively.

(c) The tube is allowed to cool to room temperature when water vapours condense to give liquid water which has a negligible volume as compared to the volume of water vapours. Thus, the gaseous mixture left behind in the eudiometer tube after explosion and cooling consists of only CO_2 and unused O_2 .

(d) Caustic potash or caustic soda solution is then introduced into the eudiometer tube which absorbs CO_2 completely and only unused O_2 is left behind.

$$2\text{NaOH} + \text{CO}_2 \longrightarrow \text{Na}_2\text{CO}_3 + \text{H}_2\text{O}$$

Thus, the decrease in volume on introducing NaOH or KOH solution gives the volume of CO_2 formed. Sometimes, the volume of O_2 left unused is found by introducing pyrogallol and noting the decrease in volume.

Calculation : From the volume of CO_2 formed and the total volume of O_2 used, it is possible to calculate the molecular formula of gaseous hydrocarbon with the help of the following equation.

(Negligible volume on condensation)

From the above equation, it is evident that for one volume of hydrocarbon,

(a) $(x + y/4)$ volume of O_2 is used

(b) x volume of CO_2 is produced

(c) $y/2$ volume of H_2O vapours is produced which condense to give liquid H_2O with negligible volume.

(d) Contraction on explosion and cooling

$$= [(1 + x + y/4) - x] = 1 + y/4$$

By equating the experimental values with the theoretical values from the above combustion equation, the values of x and y and hence the molecular formula of the gaseous hydrocarbon can be easily determined.

(6) **Determination of structure by spectroscopic and diffraction methods** : The structures of organic substances are determined by spectroscopic and diffraction methods.

Classification of organic compounds

Organic compounds have been classified on the basis of carbon skeleton (structure) or functional groups or the concept of homology.

(I) **Classification based on structure**

(i) **Acyclic or open-chain compounds** : Organic compounds in which all the carbon atoms are linked to one another to form open chains (straight or branched) are called acyclic or open chain compounds. These may be either saturated or unsaturated. For example,

These compounds are also called as aliphatic compounds.

(ii) **Cyclic or closed-chain compounds** : Cyclic compounds contain at least one ring or closed chain of atoms. The compounds with only one ring of atoms in the molecule are known as *monocyclic* but those with more than one ring of atoms are termed as *polycyclic*. These are further divided into two subgroups.

(a) **Homocyclic or carbocyclic** : These are the compounds having a ring or rings of carbon atoms only in the molecule. The carbocyclic or homocyclic compounds may again be divided into two types :

Alicyclic compounds : These are the compounds which contain rings of three or more carbon atoms. These resemble with aliphatic compounds than aromatic compounds in many respects. That is why these are named alicyclic, i.e., aliphatic cyclic. These are also termed as polymethylenes. Some of the examples are,

Cyclopropane

Cyclobutane

Cyclohexane

Aromatic compounds : These compounds consist of at least one benzene ring, i.e., a six-membered carbocyclic ring having alternate single and double bonds. Generally, these compounds have some fragrant odour and hence, named as aromatic (*Greek word aroma meaning sweet smell*).

Benzene (Monocyclic)

Naphthalene (Bicyclic)

These are also called benzenoid aromatics.

Non-benzenoid aromatics : There are aromatic compounds, which have structural units different from benzenoid type and are known as Non-benzenoid aromatics e.g. Tropolone, azulene etc.

(b) **Heterocyclic compounds :** Cyclic compounds containing one or more hetero atoms (e.g. O, N, S etc.) in the ring are called heterocyclic compounds. These are of two types :

Alicyclic heterocyclic compounds : Heterocyclic compounds which resemble aliphatic compounds in their properties are called *Alicyclic heterocyclic compounds*. For example,

Oxirane or Epoxyethane

Tetrahydrofuran (THF)

Organic compounds

(2) **Classification based on functional groups :** A functional group is an atom or group of atoms in a molecule that gives the molecule its characteristic chemical properties. Double and triple bonds are also considered as functional groups.

All compounds with the same functional group belong to the same class. Various classes of compounds having some of the common functional groups are listed in the table.

Table : 22.5

Class	Functional group	Class	Functional group
Olefins/Alkenes (ene)	>C=C<	Acid halides (Alkanoyl halides)	$\begin{array}{c} \text{O} \\ \parallel \\ -\text{C}-\text{X} \end{array}$ (Acylhalide)
Acetylenes/Alkynes (yne)	$-\text{C}\equiv\text{C}-$	Amides (Alkanamides)	$\begin{array}{c} \text{O} \\ \parallel \\ -\text{C}-\text{NH}_2 \end{array}$ (Amide)

Alkyl Halides	$-F, -Cl, -Br, -I$ (Halo)	Acid anhydrides (Alkanoic anhydrides)	$\begin{array}{c} O \quad O \\ \quad \\ -C-O-C- \end{array}$ (Anhydride)
Alcohols (Alkanols)	$-OH$ (Hydroxy)	Esters (Alkylalkanoates)	$\begin{array}{c} O \\ \\ -C-O-C- \\ \end{array}$ (Ester)
Ethers (Alkoxyalkanes)	$\begin{array}{c} \quad \\ -C-O-C- \\ \quad \end{array}$ (Alkoxy)	Cyanides/Nitriles (Alkanenitrile)	$-C \equiv N$ (Cyano)
Aldehydes (Alkanals)	$\begin{array}{c} -C-H \\ \\ O \end{array}$ (Aldehydic)	Isocyanides	$-N \equiv C$ (Isocyano)
Ketones (Alkanones)	$\begin{array}{c} O \\ \\ -C- \end{array}$ (Carbonyl)	Nitro compounds (Nitroalkanes)	$\begin{array}{c} O \\ // \\ -N \end{array}$ (Nitro)
Carboxylic acid (Alkanoic acid)	$\begin{array}{c} O \\ \\ -C-OH \end{array}$ (Carboxyl)	Amines	$\begin{array}{c} H \\ / \\ -N \\ \backslash \\ H \end{array}$ (Amino)

(3) **Homologous series** : A homologous series can be defined as a group of compounds in which the various members have similar structural features and similar chemical properties and the successive members differ in their molecular formula by CH_2 group.

Characteristics of homologous series

(i) All the members of a series can be represented by the general formula. For example, the members of the alcohol family are represented by the formula $C_nH_{2n+1}OH$ where n may have values 1, 2, 3,..... etc.

(ii) Two successive members differ in their formula by $-CH_2$ group or by 14 atomic mass units ($12 + 2 \times 1$).

(iii) Different members in a family have common functional group *e.g.*, the members of the alcohol family have $-OH$ group as the functional group.

(iv) The members in any particular family have almost identical chemical properties and their physical properties such as melting point, boiling point, density, solubility etc., show a proper gradation with the increase in the molecular mass.

(v) The members present in a particular series can be prepared almost by similar methods known as the general methods of preparation.

(4) **Saturated and unsaturated compounds** : If, in an organic compound containing two or more carbon atoms, there are only single bonds between carbon atoms, then the compound is said to be saturated, *e.g.* ethane, *n*-propyl alcohol, acetaldehyde etc.

On the other hand, if the compound contains at least one pair of adjacent carbon atoms linked by a multiple bond, then that compound is said to be **unsaturated**, *e.g.* ethylene, acetylene, vinyl alcohol, acraldehyde etc.

Table : 22.6 Common or trivial names of some organic compounds.

Compound	Common name	Compound	Common name
CH_4	Methane	$CHCl_3$	Chloroform

Nomenclature of organic compounds

Nomenclature means the assignment of names to organic compounds. There are two main systems of nomenclature of organic compounds.

(1) **Trivial system** : This is the oldest system of naming organic compounds. The trivial name was generally based on the source, some property or some other reason. Quite frequently, the names chosen had Latin or Greek roots. For example,

(i) Acetic acid derives its name from vinegar of which it is the chief constituent (Latin : *acetum* = vinegar).

(ii) Formic acid was named as it was obtained from red ants. The Greek word for the red ants is *formicus*.

(iii) The names oxalic acid (*oxalus*), malic acid (*pyrus malus*), citric acid (*citrus*) have been derived from botanical sources given in parentheses.

(iv) Urea and uric acid have derived their names from urine in which both are present.

(v) The liquid obtained by the destructive distillation of wood was named as wood spirit. Later on, it was named methyl alcohol (Greek : *methu* = spirit; *hule* = wood).

(vi) Names like glucose (sweet), pentane (five), hexane (six), etc. were derived from Greek words describing their properties or structures.

(vii) Methane was named as marsh gas because it was produced in marshes. It was also named as fire damp as it formed explosive mixture with air.

CH_3	Acetylene	CHI_3	Iodoform
$\text{H}_3\text{CCH}_2\text{CH}_2\text{CH}_3$	<i>n</i> -Butane	CH_3CN	Acetonitrile
$(\text{H}_3\text{C})_2\text{CHCH}_3$	Isobutane	CH_3COOH	Acetic acid
$(\text{H}_3\text{C})_4\text{C}$	Neopentane	C_6H_6	Benzene
HCHO	Formaldehyde	$\text{C}_6\text{H}_5\text{CH}_3$	Toluene
$(\text{H}_3\text{C})_2\text{CO}$	Acetone	$\text{C}_6\text{H}_5\text{NH}_2$	Aniline
CH_3CHOH	Ethyl alcohol	$\text{C}_6\text{H}_5\text{OH}$	Phenol
CH_3CONH_2	Acetamide	$\text{C}_6\text{H}_5\text{OCH}_3$	Anisole
CH_3OCH_3	Dimethyl ether	$\text{C}_6\text{H}_5\text{COCH}_3$	Acetophenone
$(\text{CH}_3\text{CH}_2)_2\text{O}$	Diethyl ether	$\text{C}_6\text{H}_5\text{CONH}_2$	Benzamide

(2) **IUPAC system** : In order to rationalise the system of naming, an *International Congress of Chemists* was held in Geneva in 1892. They adopted certain uniform rules for naming the compounds.

The system of nomenclature was named as *Geneva system*. Since then the system of naming has been improved from time to time by the *International Union of Pure and Applied Chemistry* and the new system is called *IUPAC system* of naming. This system of nomenclature was first introduced in 1947 and was modified from time to time. The most exhaustive rules for nomenclature were first published in 1979 and later revised and updated in 1993. The rules discussed in the present chapter are based on guide books published by IUPAC in 1979 (**Nomenclature of Organic Chemistry** by J. Rigand and S.P. Klesney) and 1993 (**A Guide to IUPAC Nomenclature for Organic Chemistry** by R. Panico, W.H. Powell and J.C. Richer). With the help of this system, an organic compound having any number of carbon atoms can be easily named.

IUPAC System of Naming Organic Compounds : In the IUPAC system, the name of an organic compound consist of three parts : (i) Word root (ii) Suffix (iii) Prefix

(i) **Word root** : The word root denotes the number of carbon atoms present in the chain.

Table : 22.7

Chain length	Word root	Chain length	Word root
C_1	Meth-	C_{11}	Undec-
C_2	Eth-	C_{12}	Dodec-
C_3	Prop-	C_{13}	Tridec-
C_4	But-	C_{14}	Tetradec-
C_5	Pent-	C_{15}	Pentadec-
C_6	Hex-	C_{16}	Hexadec-
C_7	Hept-	C_{17}	Heptadec-
C_8	Oct-	C_{18}	Octadec-
C_9	Non-	C_{19}	Nonadec-
C_{10}	Dec-	C_{20}	Eicos

(ii) **Suffix** : The word root is linked to the suffix which may be primary or secondary or both.

(a) **Primary suffix** : A primary suffix is added to the word root to indicate whether the carbon chain is saturated or unsaturated.

Table : 22.8

Type of carbon chain	Primary suffix	General name
Saturated ($\text{C} - \text{C}$)	-ane	Alkane

Unsaturated ($\text{C} = \text{C}$)	-ene	Alkene
Unsaturated ($\text{C} \equiv \text{C}$)	-yne	Alkyne

If the parent chain contains two, three or more double or triple bonds, then the numerical prefixes such as **di** (for two), **tri** (for three), **tetra** (for four), etc. are added to the primary suffix.

(b) **Secondary suffix** : A secondary suffix is then added to the word root after the primary suffix to indicate the functional group present in the organic compound.

Table : 22.9

Class of org. compound	Functional group	Secondary suffix
Alcohols	$-\text{OH}$	-ol
Aldehydes	$-\text{CHO}$	-al
Ketones	$> \text{C} = \text{O}$	-one
Carboxylic acids	$-\text{COOH}$	-oic acid
Esters	$-\text{COOR}$	alkyl... oate
Acid chlorides	$-\text{COCl}$	-oyl chloride
Acid amides	$-\text{CONH}_2$	-amide
Nitriles	$-\text{C} \equiv \text{N}$	-nitrile
Amines	$-\text{NH}_2$	-amine
Thiol	$-\text{SH}$	thiol

It may be noted that while adding the secondary suffix to the primary suffix, the terminal 'e' of the primary suffix (*i.e.* ane, ene and yne) is dropped if the secondary suffix begins with a vowel but is retained if the secondary suffix begins with a consonant. For example

Organic compound	CH_3CHOH	$\text{CH}_3\text{CH}_2\text{CN}$
Word root	Eth	Prop
Primary suffix	an (e)*	ane
Secondary suffix	ol	nitrile
IUPAC name	Ethanol	Propanenitrile

The terminal 'e' from the primary suffix has been dropped because the secondary suffix *i.e.* 'ol' begins with a vowel 'o'.

(iii) **Prefix** : There are many groups which are not regarded as functional groups in the *IUPAC* name of the compound. These are regarded as **substituents** or **side chains**. These are represented as **prefixes** and are

placed before the word root while naming a particular compound. These may be :

(a) **Alkyl groups** : These groups contain one hydrogen atom less than the alkane. These are named by substituting the suffix **ane** of the name of the corresponding alkane by **yl**. i.e. alkane – ane + yl = **alkyl**.

For example,

CH_4	:	Methane	becomes
$CH_3 -$	:	Methyl	
CH_3CH_3	:	Ethane	becomes
$CH_3CH_2 -$	:	Ethyl	
$CH_3CH_2CH_3$	:	Propane	becomes
$CH_3CH_2CH_2 -$	:	Propyl etc.	

(b) **Functional groups not regarded as principal functional groups** : If a compound contains more than one functional group, then one of the functional group is regarded as principal functional group and other is treated as secondary suffix. The other functional groups are regarded as substituents and are indicated by prefixes.

Table : 22.10

Substituent	Prefix
$-F$	Fluoro
$-Cl$	Chloro
$-Br$	Bromo
$-I$	Iodo
$-NO$	Nitroso
$-N=N-$	Diazo
$-OCH_3$	Methoxy
$-OCH_2CH_3$	Ethoxy
$-NO_2$	Nitro
$-NH_2$	Amino
$-OH$	Hydroxo

Thus, a complete IUPAC name of an organic compound may be represented as:

Prefix + word root + Primary suffix + Secondary suffix

Word root : Pent (five C – C – C – C – C)

Primary suffix : ene (double bond at C – 2)

Secondary suffix : oic acid (– COOH group)

Prefix : Bromo (– Br group at C – 4)

IUPAC name : Bromo + pent + ene + oic acid or 4-Bromopent –2-en-1-oic acid

Classification of carbon atoms in organic compounds

The carbon atoms in an alkane molecule may be classified into four types as *primary* (1^o), *secondary* (2^o), *tertiary* (3^o) and *quaternary* (4^o). The carbon atoms in an organic compound containing functional group can be designated as α , β , γ , δ .

Alkyl groups

These are univalent groups or radicals obtained by the removal of one hydrogen atom from a molecule of a paraffin. The symbol 'R' is often used to represent an alkyl group.

Alkyl groups are named by dropping -ane from the name of corresponding paraffin and adding the ending -yl.

Parent saturated hydrocarbon	Name of the alkyl group	Structure
Methane	Methyl	$CH_3 -$
Ethane	Ethyl	$CH_3 - CH_2 -$
Propane	<i>n</i> -Propyl	$CH_3 - CH_2 - CH_2 -$
Butane	<i>n</i> -Butyl	$CH_3 - CH_2 - CH_2 - CH_2 -$

Alkyl groups derived from saturated hydrocarbons having three or more carbon atoms exist in isomeric forms.

Similarly, removal of different H atoms in pentane gives the following radicals :

Table : 22.11 Unsaturated groups or radicals

Group	Common name	IUPAC name
$CH_2 = CH -$	Vinyl	Ethenyl
$CH_2 = \overset{2}{C}H - \overset{1}{C}H_2 -$	Allyl	2-Propenyl
$CH_3 - CH = \overset{1}{C}H -$	–	1-Propenyl
$HC \equiv C -$	Acetylide	Ethynyl
$HC \equiv \overset{2}{C} - \overset{1}{C}H_2 -$	Propargyl	2-Propynyl

General rules for naming organic compounds

In the common system, all the isomeric alkanes (having same molecular formula) have the same parent name. The names of various isomers are distinguished by prefixes. The prefix indicates the type of branching in the molecule. For example,

(1) **Prefix *n*-(normal)** is used for those alkanes in which all the carbon atoms form a continuous chain with no branching.

(2) **Prefix *iso*** is used for those alkanes in which one methyl group is attached to the next-to-end carbon atom (second last) of the continuous chain.

(3) **Prefix *neo*** is used for those alkanes which have two methyl groups attached to the second last carbon atom of the continuous chain.

IUPAC system of nomenclature of complex compounds

The naming of any organic compound depends on the name of normal parent hydrocarbon from which it has been derived. IUPAC system has framed a set of rules for various types of organic compounds.

(i) **Rules for Naming complex aliphatic compounds when no functional group is present (saturated hydrocarbon or paraffins or Alkanes)**

(i) **Longest chain rule** : The first step in naming an organic compound is to select the longest continuous chain of carbon atoms which may or may not be horizontal (straight). This continuous chain is called parent chain or main chain and other carbon chains attached to it are known as side chains (substituents). Examples :

If two different chains of equal length are possible, the chain with maximum number of side chains or alkyl groups is selected.

(ii) **Position of the substituent** : Number of the carbon atoms in the parent chain as 1, 2, 3,..... etc. starting from the end which gives lower number to the carbon atoms carrying the substituents. For examples,

The number that indicates the position of the substituent or side chain is called **locant**.

(iii) **Lowest set of locants** : When two or more substituents are present, then end of the parent chain which gives the lowest set of the locants is preferred for numbering.

This rule is called **lowest set of locants**. This means that when two or more different sets of locants are possible, that set of locants which when compared term by term with other sets, each in order of increasing magnitude, has the lowest term at the first point of difference. This rule is used irrespective of the nature of the substituent. For example,

The correct set of locants is 2, 3, 5 and not 2, 4, 5. The first set is lower than the second set because at the **first difference** 3 is less than 4. (Note that first locant is same in both sets 2; 2 and the first difference is with the second locant 3, 4. We can compare term by term as 2-2, 3-4 (first difference), 5-5. **Only first point of difference is considered for preference.** Similarly for the compounds,

First set of locants 2, 7, 8 is lower than second set 3, 4, 9 because at the first point of difference 2 is lower than 3.

Lowest sum rule : It may be noted that earlier, the numbering of the parent chain containing two or more substituents was done in such a way that **sum of the locants is the lowest**. This rule is called **lowest sum rule**. For example, the carbon chain of alkanes given below should be numbered as indicated in structures A and not according to structure B.

A (correct) Sum of locants = 3+4=7

B (wrong) Sum of locants = 4+5=9

According to latest IUPAC system of nomenclature, the lowest set of locants is preferred even if it violates the lowest sum rule. For example,

This compound is numbered as 2, 7, 8 and not as 3, 4, 9 in accordance with latest lowest set of locants rule, even though it violates lowest sum rule.

(iv) **Presence of more than one same substituent** : If the same substituent or side chain occurs more than once, the prefixes di, tri, tetraetc., are attached to the names of the substituents. For example,

(v) **Naming different substituents** : If two or more different substituents or side chains are present in the molecule, they are named in the alphabetical order along with their appropriate positions.

(vi) **Naming different substituents at equivalent position** : In case, there are different alkyl substituents at equivalent positions, then numbering of the parent chain is done in such a way that the alkyl group which comes first in the alphabetical order gets the lower number.

(vii) **Naming the complex substituents** (or substituted substituents) : If the substituent on the parent chain is complex (*i.e.* it is branched) it is named as substituted alkyl group by numbering the carbon atom of this group attached to the parent chain as 1. The name of such substituent is given in brackets in order to avoid confusion with the numbering of the parent chain. For example,

The name of the complex substituent is always written in brackets.

While deciding the alphabetical order of the various substituents, the name of the complex substituent is considered to begin with the first letter of the complete name. It may be **remembered** that in case of simple substituents, however, the multiplying prefixes are not considered. The names of simple substituents are first alphabetized and then multiplying prefixes are inserted. For example,

It may be noted that dimethyl propyl (a complex substituent) is alphabetized under **d** and not under **m**. Therefore, it is cited before ethyl (e).

The substituent dimethyl is cited first because it is alphabetized under **d**. Similarly,

When the names of two or more complex substituents are composed of identical words, priority for citation is given to the substituent which has lowest locant at the first cited point of difference within the complex substituent. For example,

The substituent (1-methylbutyl) is written first because it has lower locant than the substituent (2-methylbutyl).

When the same complex substituent (substituted in the same way) occurs more than once, it is indicated by the multiplying prefix *bis* (for two), *tris* (for three), *tetra kis* (for four) etc.

(viii) **Cyclic hydrocarbons** : These compounds contain carbon chain skeletons which are closed to form rings. The saturated hydrocarbons with ring of carbon atoms in the molecule are called *cycloalkanes*. These have the general formula C_nH_{2n} .

The cyclic compound is named by prefixing **cyclo** to the name of the corresponding straight chain alkane. For example,

section are applied. For example,

When more than one side chain is attached to the ring, numbering is done beginning with one side chain so that the next side chain gets the lower possible number. For example,

When a ring is attached to a single chain with a greater number of carbon atoms or when more than one ring system is attached to a single chain, then it is named as cycloalkylalkanes. For example,

In case of substituted cycloalkenes, the double bond is given the lowest possible number and numbering is done in such a way that the substituents get the lowest number.

According to the IUPAC system of nomenclature, certain trivial or semi-systematic names may be used for unsubstituted radicals. For example, the following names may be used,

$(CH_3)_2CH -$	Isopropyl
$CH_3 - CH_2 - \underset{\substack{ \\ CH_3}}{CH} -$	Sec-Butyl
$(CH_3)_2CH - CH_2 - CH_2 -$	Isopentyl
$CH_3 - CH_2 - \underset{\substack{ \\ CH_3}}{\overset{\substack{CH_3 \\ }}{C}} -$	tert-Pentyl
$(CH_3)_2CH - CH_2 -$	Isobutyl
$(CH_3)_3C -$	tert-Butyl
$(CH_3)_3C - CH_2 -$	Neopentyl
$(CH_3)_2CH - CH_2 - CH_2 - CH -$	Isohexyl

However, when these are substituted, these names cannot be used as such. For example,

It may be noted that while writing the substituent's name in alphabetical order, the prefixes *iso*- and *neo*- are considered to be part of the fundamental name. However, the prefixes *sec*- and *tert*- are not considered to be part of the fundamental name.

(2) Rules for IUPAC names of polyfunctional organic compounds

Organic compounds which contain two or more functional groups are called polyfunctional compounds. Their IUPAC names are obtained as follows,

(i) **Principal functional group** : If the organic compound contains two or more functional groups, one of the functional groups is selected as the principal functional group while all the remaining functional groups (also called the secondary functional groups) are treated as substituents. The following order of preference is used while selecting the principal functional group.

Sulphonic acids > *carboxylic acids* > *anhydrides* > *esters* > *acid chlorides* > *acid amides* > *nitriles* > *aldehydes* > *ketones* > *thiols* > *alcohols* > *alkenes* > *alkynes*.

All the remaining functional groups such as halo (fluoro, chloro, bromo, iodo), nitroso ($-NO$), nitro ($-NO_2$), amino ($-NH_2$) and alkoxy ($-OR$) are treated as substituents.

Table : 22.12

Order of preference	Prefix	Suffix (ending)
---------------------	--------	-----------------

– SO_3H	Sulpho	Sulphonic acid
– $COOH$	Carboxy	– oic acid
– $COOR$	Alkoxy carbonyl	Alkyl alkanoate
– COX	Haloformyl	Oyl halide
– $CONH_2$	Carbamoyl	– amide
– $C \equiv N$	Cyano	– nitrile
– CHO	Formyl	– al
> $C=O$	Keto	– one
– OH	Hydroxy	– ol
– NH_2	Amine	– amine
$C=C$	–	– ene
$C \equiv C$	–	– yne
– O –	Epoxy	–
– X	Halo	–
– NO_2	Nitro	–

(ii) **Selecting the principal chain** : Select the longest continuous chain of carbon atoms containing the principal functional group and maximum number of secondary functional groups and multiple bonds, if any.

(iii) **Numbering the principal chain** : Number the principal chain in such a way that the principal functional group gets the lowest possible number followed by double bond and triple bond and the substituents, i.e.

Principal functional group > double bond > triple bond > substituents

(iv) **Alphabetical order** : Identify the prefixes and the positional numbers (also called locants) for the secondary functional groups and other substituents and place them in alphabetical order before the word root.

(3) **Polyfunctional compounds containing more than two like functional groups** : According to latest convention (1993 recommendations for IUPAC nomenclature), if an unbranched carbon chain is directly linked to more than two like functional groups, the organic compound is named as a derivative of the parent alkane which does not include carbon atoms of the functional groups. For example,

Following the above rule, citric acid may be named as,

Bond-line Notation of organic compounds

Sometimes, the bonds between carbon atoms are represented by lines. For example, *n*-hexane has a continuous chain of six carbon atoms which may be represented as,

In this notation, the carbon atoms are represented by line ends and intersections. It is assumed that the required number of hydrogen atoms are present wherever they are necessary to satisfy the tetravalency of carbon. A single line represents a single bond ($C-C$), two parallel lines represent a double bond ($C=C$) and three parallel lines represent a triple bond ($C \equiv C$). For example,

1-Methyl-3-propylcyclohexane

3-Ethyl-1,1-dimethylcyclohexane
(Not 1-ethyl-3,3-dimethylcyclohexane)

3-Methyl cyclohex-1-ene

3-Cyclohexyl butan-2-ol

1,3-Dimethyl cyclohex-1-ene

4-Hydroxy-4-methyl pentan-2-one

3-Ethyl penta-1,3-diene

3,3,5-trimethylhex-1-en-2-ol

5,6-Dimethylcyclohex-2-en-1-one

Nomenclature of Bicyclic compounds

Many hydrocarbons and their derivatives contain two fused or bridged rings. The carbon atoms common to both rings are called bridge head atoms and each bond or chain of carbon atoms connecting both the bridge head atoms is called as bridge. The bridge may contain 0, 1, 2, etc. carbon atoms. For example,

These bicyclic compounds are named by attaching the prefix '*bicyclo*' to the name of the hydrocarbon having the same total number of carbon atoms as in the two rings. The number of carbon atoms in each of the three bridges connecting the two bridge head carbon atoms is indicated by arabic numerals, *i.e.*, 0, 1, 2.....etc. These arabic numerals are arranged in descending order; separated from one another by full stops and then enclosed in square brackets. The complete IUPAC name of the hydrocarbon is then obtained by placing these square brackets containing the arabic numerals between the prefix *bicyclo* and the name of alkane. For example,

If a substituent is present, the bicyclic ring system is numbered. The numbering begins with one of the bridge head atoms, proceeds first along the longest bridge to the second bridge head atom, continues along the next longest bridge to the first bridge head atom and is finally completed along the shortest path. For example,

Nomenclature of spiro compounds

Compounds in which one carbon atom is common to two different rings are called **spiro compounds**. The IUPAC name for a spiro compound

begins with the word *spiro* followed by square brackets containing the number of carbon atoms, in ascending order, in each ring connected to the common carbon atom and then by the name of the parent hydrocarbon corresponding to the total number of the carbon atoms in the two rings. The position of substituents are indicated by numbers; the numbering beginning with the carbon atom adjacent to the spiro carbon and proceeding first around the smaller ring and then to the spiro atom and finally around the larger ring. For example,

Nomenclature of special compounds

Unbranched assemblies consisting of two or more identical hydrocarbon units joined by a single bond are named by placing a suitable numerical prefix such as *bi* for two, *ter* for three, *quater* for four, *quinque* for five etc. before the name of the repetitive hydrocarbon unit. Starting from either end, the carbon atoms of each repetitive hydrocarbon unit are numbered with unprimed and primed arabic numerals such as 1, 2, 3....., 1', 2', 3' , 1'', 2'', 3''..... etc. The points of attachment of the repetitive hydrocarbon units are indicated by placing the appropriate locants before the name. For example,

As a special provision, unbranched assemblies composed of benzene rings are named by using appropriate prefix with the name phenyl instead of benzene. For example,

□ If two atoms/groups of same preference occupy identical positions from either end of the parent chain, the lower number must be given to the atom/group whose prefix comes first in the alphabetical order. For example,

□ When two or more prefixes consist of identical words, the priority for citation is given to that group which contains the lowest locant at the first point of difference. For example,

□ If a compound contains a benzene ring coupled to an alicyclic ring, it is named as a derivative of benzene, *i.e.* compound having lowest state of hydrogenation. For example,

In the common system of nomenclature, prefixes iso and neo are used only for compounds containing an isopropyl group, $(CH_3)_2CH$ and a tert-butyl group, $(CH_3)_3C$ respectively at the end of the carbon chain.

Nomenclature of simple aromatic compounds

Aromatic compounds are those which contain one or more benzene rings in them. An aromatic compound has two main parts : (1) Nucleus, (2) Side chain

(1) **Nucleus** : The benzene ring represented by regular hexagon of six carbon atoms with three double bonds in the alternate positions is referred to as **nucleus**. The ring may be represented by any of the following ways,

(2) **Side chain** : The alkyl or any other aliphatic group containing at least one carbon atom attached to the nucleus is called **side chain**. These are formed by replacing one or more hydrogen atoms in the ring by alkyl radicals *i.e.*, R (R may be $-CH_3$, $-C_2H_5$, $-C_3H_7$ etc.)

If one atom of hydrogen of benzene molecule is replaced by another atom or group of atoms, the derivative formed is called **monovalent substituted derivative**. It can exist only in one form because all the six hydrogens of benzene represent equivalent positions. For example, C_6H_5X , where X is a monovalent group.

When two hydrogen atoms of benzene are replaced by two monovalent atoms or group of atoms, the resulting product disubstituted benzene derivative can have three different forms. These forms are distinguished by giving the numbers. The position occupied by the principle functional group is given as 1 and the other position is numbered in a clockwise direction which gives lower locant to the substituents.

(i) **Ortho** (or 1, 2-) : The compound is said to be ortho (or 1, 2-) if the two substituents are on the adjacent carbon atoms.

(ii) **Meta** (or 1, 3-) : The compound is said to be meta or (1, 3-) if the two substituents are on alternate carbon atoms.

(iii) **Para** (or 1, 4-) : The compound is said to be para or (1, 4-) if the two substituents are on diagonally situated carbon atoms.

Ortho, meta and para are generally represented as *o*-, *m*- and *p*- respectively as shown below,

Aryl group : The radicals obtained by removal of one or more hydrogen atoms of the aromatic hydrocarbon molecules are known as aryl radicals or aryl groups. For example,

Nomenclature of different aromatic compounds : The names of few simple aromatic compounds are given below :

Hydrocarbons

The aromatic hydrocarbons may also contain two or more benzene rings condensed together.

Halogen derivatives

Nuclear substituted

Side chain substituted

Hydroxy derivatives

Phenol

2-Methyl phenol
o-Cresol

Benzyl alcohol

1, 2-Dihydroxybenzene
(Catechol)1, 3-Dihydroxybenzene

o-ToluidineBenzyl amine
or phenyl
methanamine**Sulphonic acids**

Benzenesulphonic acid

Nitro derivatives

Nitrobenzene

1, 3-Dinitrobenzene
(*m*-Dinitrobenzene)

Some tips for nomenclature of aromatic compounds : For IUPAC nomenclature of substituted benzene compounds, the substituent is placed as prefix to the word benzene. It may be noted that common names of many substituted benzene compounds are still universally used. Some important tips for nomenclature of organic compounds are given below,

(i) When the benzene ring is named as substituent on the other molecule, it is named as **phenyl group**. It is treated in the nomenclature just like the name of an alkyl group. It is abbreviated as Ph. For example,

or $\text{Ph}-\text{CH}_2\text{CH}_2\text{CHO}$ 3-Phenylpropanal

(ii) Disubstituted, trisubstituted or tetrasubstituted benzenes are named by using the numbers for the positions of the substituents.

1,3-Dimethyl benzene

1,2-Dichlorobenzene

1,3,5-Trinitrobenzene

(iii) If different groups are attached to the benzene ring, then the following rules are kept in mind,

- The principal group is fixed as number 1.
- The numbering of the chain is done in any direction (clockwise or anticlockwise) which gives lower number to the substituents.
- The substituents are written in alphabetical order. For example,

2-Chlorophenol

4-Aminobenzoic acid
(-COOH is principal group)

2,3-Dimethyl aniline

2-Bromo-5-hydroxy-3-nitrobenzoic acid

4-Methoxy benzaldehyde

1-Chloro, 2,4, dinitrobenzene

4-Ethyl-2-methylaniline

3-Chloro-4-methyl nitrobenzene

2-Chloro-4-methyl anisole

3,4-Dimethylphenol

4-Hydroxy-3-methoxy benzaldehyde

Tips & Tricks

- Steam distillation may be regarded analogous to distillation under reduced pressure.
- Seeding-sometimes crystal formation can be initiated by the addition of crystals of a substance. It is known as seeding.
- Vanillin can be extracted from vanilla beans by soxhlet extractor.
- Concentration of raw juice in sugar factories is done by vacuum distillation.
- Lithium is not used in Lassaigne's test because it reacts slowly and its compounds are covalent. Potassium is also not used because it reacts vigorously and cannot be handled properly.
- In the Lassaigne's test for nitrogen, if Fe^{3+} ions (with yellow colour) are in excess, it makes the blue colour of ferric ferrocyanide to appear green.
- In Kjeldahl's method for estimation of nitrogen, potassium sulphate is added to raise the boiling point of sulphuric acid.
- Ter Meulen's method is used for the estimation of nitrogen, Stepanow's method, Schiff's and Piria method for halogen and messenger's method for the estimation of sulphur.

✍ Microanalysis is for products available is small then boiling point can be determined by Siwolowoff's method.

✍ Carius method does not give satisfactory results with iodine as silver iodide is slightly soluble in nitric acid and some iodine is also produced even in the presence of excess of silver nitrate.

✍ Beilestein's test is not given by fluorine because copper fluoride is not volatile.

✍ **Nitrogen rule** : All compounds containing an odd number of nitrogen atoms (*i.e.* 1, 3, 5, 7..... etc.) have odd molecular masses while those compounds which contain an even number of nitrogen atoms (*i.e.* 2, 4, 6, 8..... etc.) have even molecular masses.

✍ Boiling point is not as reliable test of purity as is the melting point for the solid.

✍ In the messenger's method for estimation of sulphur. The given organic compound is heated with alkaline $KMnO_4$ solution when the sulphur present in the compound is oxidised to K_2SO_4 which is then estimated as $BaSO_4$.

✍ Name of an amine is always written as one word for *e.g.* CH_3NH_2 is written as methylamine and not methyl amine.

Ordinary Thinking

Objective Questions

Chemical analysis of organic compounds

- Formula which represents a simple ratio of atoms of different elements present in a molecule of the substance is called
(a) Molecular formula (b) Empirical formula
(c) Structural formula (d) Condensed formula
- Actual number of atoms of different elements present in a molecule of a compound is given by
(a) Molecular formula (b) Structural formula
(c) Empirical formula (d) None of these
- A compound contains $C = 90\%$ and $H = 10\%$. Empirical formula of the compound is
[NCERT 1976; EAMCET 1978]
(a) C_3H_{10} (b) CH_2
(c) C_3H_2 (d) C_3H_4
- An organic compound contains $C = 36\%$ $H = 6\%$ and rest oxygen. Its Empirical formula is
(a) CH_2O (b) $C_2H_3O_3$
(c) CH_2O_2 (d) $C_2H_2O_2$
- Empirical formula of a compound is CH_2O and its vapour density is 30. Molecular formula of the compound is
[MP PMT 1993; AIIMS 1998; CBSE PMT 2000; KCET (Med.) 2000; Pb. PMT 2000]
(a) $C_3H_6O_3$ (b) $C_2H_4O_2$
(c) C_2H_4O (d) CH_2O
- An organic compound on analysis gave $C = 48\%$, $H = 8\%$ and $N = 56\%$. Volume of 1.0 g of the compound was found to be 200 ml at NTP. Molecular formula of the compound is [MP PET 1986]
(a) $C_4H_8N_4$ (b) $C_2H_4N_2$
(c) $C_{12}H_{24}N_{12}$ (d) $C_{16}H_{32}N_{16}$
- Insulin contains 3.4% sulphur. The minimum molecular weight of insulin is [MP PET 1993]
(a) 350 (b) 470
(c) 560 (d) 940
- Which element is estimated by Carius method
(a) Carbon (b) Hydrogen
(c) Halogen (d) Nitrogen
- On complete combustion 1.4 g hydrocarbon gave 1.8 g water. Empirical formula of the hydrocarbon is
(a) CH (b) CH_2
(c) CH_3 (d) CH_4
- In the estimation of sulphur organic compound on treating with conc. HNO_3 is converted to
(a) SO_2 (b) H_2S
(c) H_2SO_4 (d) SO_3
- In Carius method 0.099 g organic compound gave 0.287 g $AgCl$. The percentage of chlorine in the compound will be
(a) 28.6 (b) 71.7
(c) 35.4 (d) 64.2
- 0.24 g of an organic compound gave 0.22 g CO_2 on complete combustion. If it contains 1.66 % hydrogen, then the percentage of C and O will be [MP PET 1986]
(a) 12.5 and 36.6 (b) 25 and 75
(c) 25 and 36.6 (d) 25 and 80
- An organic compound contains $C = 74.0\%$, $H = 8.65\%$ and $N = 17.3\%$. Its Empirical formula is [MP PMT 1986]
(a) C_5H_8N (b) $C_{10}H_{12}N$
(c) C_5H_7N (d) $C_{10}H_{14}N$
- An appropriate method for molecular weight determination of chloroform is
(a) Regnault's method
(b) Diffusion method
(c) Vapour pressure method
(d) Victor Meyer's method
- Molecular weight of an organic acid is given by
(a) Equivalent weight $\times$ basicity
(b) $\frac{\text{Equivalent weight}}{\text{Basicity}}$
(c) $\frac{\text{Basicity}}{\text{Equivalent weight}}$
(d) Equivalent weight $\times$ valency
- If two compounds have the same empirical formula but different molecular formulae they must have [IIT-JEE 1987; Kurukshetra CEE 1998]
(a) Different percentage composition
(b) Different molecular weight
(c) Same viscosity
(d) Same vapour density
- Empirical formula of a compound is C_2H_5O and its molecular weight is 90. Molecular formula of the compound is [NCERT 1971]
(a) C_2H_5O (b) $C_3H_6O_3$

- (c) $C_4H_{10}O_2$ (d) $C_5H_{14}O$
18. 60 g of a compound on analysis gave $C = 24$ g, $H = 4$ g and $O = 32$ g. Its Empirical formula is [CPMT 1971, 81]
 (a) $C_2H_4O_2$ (b) C_2H_2O
 (c) CH_2O_2 (d) CH_2O
19. An organic compound contains $C = 38.8\%$, $H = 16\%$ and $N = 45.2\%$. Empirical formula of the compound is [CPMT 1973, 83]
 (a) CH_3NH_2 (b) CH_3CN
 (c) C_2H_5CN (d) $CH_2(NH)_2$
20. In Kjeldahl's method for the estimation of nitrogen, the formula used is
 (a) $\%N = \frac{1.4 V W}{N}$ (b) $\%N = \frac{1.4 N W}{V}$
 (c) $\%N = \frac{V N W}{1.8}$ (d) $\%N = \frac{1.4 V N}{W}$
21. An organic compound on analysis gave the following results : $C = 54.5\%$, $O = 36.4\%$, $H = 9.1\%$. The Empirical formula of the compound is [CPMT 1977; KCET 1998; MP PET 2003; UPSEAT 2004; IIT-JEE (Screening) 2004]
 (a) CH_3O (b) C_2H_4O
 (c) C_3H_4O (d) C_4H_8O
22. An organic compound gave $C = 92.31\%$ and $H = 7.69\%$. If molecular weight of the compound is 78, its molecular formula is
 (a) C_6H_6 (b) C_7H_7
 (c) C_6H_{18} (d) C_8H_{20}
23. An organic compound gave the following results $C = 53.3\%$, $H = 15.6\%$, $N = 31.1\%$, mol. wt. = 45, What is molecular formula of the compound ?
 (a) $C_2H_5N_2$ (b) C_2H_5N
 (c) C_2H_7N (d) C_2H_6N
24. A compound gave 80% carbon and 20 % hydrogen on analysis. The compound is possibly [MADT Bihar 1984; MP PMT 1986]
 (a) C_6H_6 (b) C_2H_5OH
 (c) C_2H_6 (d) $CHCl_3$
25. A compound has 50% carbon, 50% oxygen and approximate molecular weight is 290. Its molecular formula is [MP PET 1995]
 (a) CO (b) C_4O_3
 (c) $C_{12}O_9$ (d) C_3O_3
26. On analysis, a saturated hydrocarbon is found to contain 83.70 percent carbon and 16.30% hydrogen. The empirical formula will be (at. wt. of $C=12$, at. wt. of $H=1$) [MP PMT 1995]
 (a) C_3H_6 (b) C_3H_8
 (c) C_3H_7 (d) C_6H_{12}
27. An organic compound has $C = 60\%$, $H = 13.3\%$ and $O = 26.7\%$. Its empirical formula will be
 (a) C_3H_6O (b) $C_2H_6O_2$
 (c) $C_4H_8O_2$ (d) C_3H_8O
28. A hydrocarbon has $C=85.72\%$ and remaining H . The hydrocarbon is [MP PET 1996]
 (a) C_2H_4 (b) C_2H_6
 (c) C_2H_2 (d) CH_4
29. 64 gm of an organic compound contains 24 gm of carbon, 8 gm of hydrogen and the rest oxygen. The empirical formula of the compound is [MP PMT 1996]
 (a) CH_2O (b) C_2H_4O
 (c) CH_4O (d) $C_2H_8O_2$
30. An organic compound contains C , H and O in the proportion of 6 : 1 : 8 by weight, respectively. Its vapour density is 30. Its molecular formula will be
 (a) $C_2H_4O_2$ (b) CH_4O
 (c) CH_2O (d) C_3HO
31. The vapour density of the methyl ester of an organic monocarboxylic acid is 37. What is the molecular weight of the acid
 (a) 46 (b) 60
 (c) 70 (d) 74
32. Empirical formula of a hydrocarbon containing 80% carbon and 20% hydrogen is [MP PET 1997; EAMCET 1998; JIPMER 2002]
 (a) CH (b) CH_2
 (c) CH_3 (d) CH_4
33. An organic compound with $C = 40\%$ and $H = 6.7\%$ will have the empirical formula [MP PET 1999; JIPMER 2002]
 (a) CH_2 (b) CH_2O
 (c) $C_3H_6O_3$ (d) $C_2H_4O_2$
34. Which of the following relations gives the value of n = [Bihar MEE 1996]
 (a) $\frac{\text{Molecular Mass}}{\text{Atomic Mass}}$ (b) $\frac{\text{Molecular Mass}}{\text{Empirical Mass}}$
 (c) $\frac{\text{Empirical Mass}}{\text{Molecular Mass}}$ (d) None of these
35. An organic compound containing C , H and N gave following analysis : $C = 40\%$, $H = 13.33\%$ and $N = 46.67\%$. Its empirical formula would be [CBSE PMT 1998, 99; AFMC 2000; KCET 2002; Pb. PMT 2004]
 (a) $C_2H_7N_2$ (b) CH_5N
 (c) CH_4N (d) C_2H_7N
36. If a compound on analysis was found to contain $C = 18.5\%$, $H = 1.55\%$, $Cl = 55.04\%$ and $O = 24.81\%$, then its empirical formula is [AIIMS 1998]
 (a) $CHClO$ (b) CH_2ClO
 (c) C_2H_2OCl (d) $ClCH_2O$
37. An organic compound has % of C and % of H in the ratio 6 : 1 and % of C and % of O in the ratio 3 : 4. The compound is [Roorkee 1999]
 (a) $HCHO$ (b) CH_3OH
 (c) CH_3CH_2OH (d) $(COOH)_2$
38. 0.2595g of an organic substance in a quantitative analysis yielded 0.35 g of the barium sulphate. The percentage of sulphur in the substance is [CPMT 2000; AFMC 2001; Pb. CET 2000]
 (a) 18.52g (b) 182.2 g
 (c) 17.5 g (d) 175.2g
39. In kjeldahl's method, $CuSO_4$ acts as [AFMC 2001]
 (a) Oxidising agent (b) Reducing agent
 (c) Hydrolysing agent (d) Catalytic agent
40. In the qualitative analysis of nitrate a brown ring is formed due to the formation of [AMU 2001]

- (a) NO_2 (b) $FeSO_4 \cdot NO_2$
(c) $N_2O \cdot FeSO_4$ (d) $FeSO_4 \cdot NO$
41. Percentage composition of an organic compounds is as follows:
 $C = 10.06$, $H = 0.84$, $Cl = 89.10$. Which of the following corresponds to its molecular formula if the vapour density is 60.0
(a) CH_2Cl_2 (b) $CHCl_3$
(c) CH_3Cl (d) None of these
42. The percentage of N_2 in urea is about [KCET (Med.) 2001]
(a) 18.05 (b) 28.29
(c) 46.66 (d) 85.56
43. A compound of carbon hydrogen and nitrogen contains three elements in the respective ratio of 9 : 1 : 35 grams. The Empirical formula for the compound is [DCE 2001]
(a) C_2H_4N (b) C_3H_4N
(c) C_3H_6N (d) C_2H_6N
44. Which of the following is the best scientific method to test the presence of water in a liquid [JIPMER 2001]
(a) Use of anhydrous copper sulphate
(b) Use of litmus paper
(c) Taste
(d) Smell
45. Chromatography is a valuable method for the separation, isolation, purification and identification of the constituents of a mixture and it is based on general principle of [Kerala (Med.) 2002]
(a) Phase rule
(b) Phase distribution
(c) Interphase separation
(d) Phase operation
46. To differentiate between carbon-12, carbon-13 and carbon-14, the instrument that you would use in [Kerala (Engg.) 2002]
(a) Infra-red spectrometer
(b) Atomic absorption spectrometer
(c) Mass spectrometer
(d) Ultraviolet spectrometer
47. Chromatography is used for the purification of [KCET 2002]
(a) Solids (b) liquids
(c) Gases (d) All of these
48. An organic compound has been found to possess the Empirical formula CH_2O and molecular weight 90. The molecular formula of it is ($C = 12$, $H = 1$, and $O = 16$) [CPMT 2000; MP PET 2002]
(a) $C_3H_6O_3$ (b) CH_2O
(c) $C_2H_6O_2$ (d) C_2H_2O
49. An organic compound containing carbon hydrogen and oxygen contains 52.20% carbon and 13.04% hydrogen. Vapour density of the compound is 23. Its molecular formula will be [MP PMT 2002]
(a) C_2H_6O (b) C_3H_8O
(c) C_4H_8O (d) $C_5H_{10}O$
50. Lassaigne's test is used to detect [Kerala (Engg.) 2002]
(a) Nitrogen and halogens (b) Sodium and halogens
(c) Halogens and sulphur (d) Nitrogen and sulphur
(e) All of the above
51. In Lassaigne's test the organic compound is fused with Na followed by extraction with distilled water. Which of the following is not the possible product of this fusion reaction [AMU 2002]
(a) NaX (b) $NaCN$
(c) $Na_4[AMU 2001]$ (d) Na_2S
52. The Empirical formula of a compound is CH_2O and its molecular weight is 120. The molecular formula of the compound is [Kerala (Med.) 2003]
(a) $C_2H_4O_2$ (b) $C_3H_6O_3$
(c) $C_4H_8O_4$ (d) CH_2O
53. In Victor Mayer's method 0.2 gm of an organic substance displaced 56 ml of air at STP the molecular weight of the compound is [Kerala (Med.) 2003]
(a) 56 (b) 112
(c) 80 (d) 28
54. If we want to study relative arrangement of atoms in a molecule we study [Orissa JEE 2003]
(a) Empirical formula (b) Molecular formula
(c) Structural formula (d) None of these
55. Which one of the following reagents is used for detection of unsaturation in alkenes [EAMCET 2003]
(a) $NaOH + CaO$
(b) Cold dilute alkaline $KMnO_4$
(c) Cl_2 / hv
(d) KOH / C_2H_5OH
56. The decomposition of organic compounds in the presence of oxygen and without formation of odoriferous substances, is called [CBSE PMT 1999]
(a) Decay (b) N_2 fixation
(c) Nitrification (d) Denitrification
57. Which of the following compounds is used as a refrigerants [Bihar CEE 1995]
(a) NH_3 (b) CH_2F_2
(c) CCl_4 (d) CH_3COONH_4
58. The latest technique for the purification of organic compounds is [Pb. CET 2002]
(a) Fractional distillation (b) Chromatography
(c) Vacuum distillation (d) Crystallisation
59. The presence of halogen, in an organic compounds, is detected by [Pb. CET 2002]
(a) Iodoform test (b) Silver nitrate test
(c) Beilstein's test (d) Millon's test
60. *p*-nitrophenol and *o*-nitrophenol are separated by [BVP 2004]
(a) Crystallisation (b) Fractional crystallisation
(c) Distillation (d) Steam distillation
61. Nitrating mixture is [MH CET 2004]
(a) Fuming nitric acid
(b) Mixture of conc. H_2SO_4 and conc. HNO_3
(c) Mixture of nitric acid and anhydrous zinc chloride
(d) None of these
62. Quantitative measurement of nitrogen in an organic compounds is done by the method [CPMT 2004]
(a) Berthelot method (b) Belstein method
(c) Lassaigne test (d) Kjeldahl's method
63. Which kind of fission is favoured by sunlight [CPMT 2004]
(a) Heterolytic fission (b) Homolytic fission
(c) Both (a) and (b) (d) None of these
64. The ammonia evolved from the treatment of 0.30 g of an organic compound for the estimation of nitrogen was passed in 100 mL of

0.1 M sulphuric acid. The excess of acid required 20 mL of 0.5 M sodium hydroxide solution for complete neutralization. The organic compound is

[AIEEE 2004]

- (a) Urea (b) Benzamide
(c) Acetamide (d) Thiourea

65. The best method for the separation of naphthalene and benzoic acid from their mixture is

[CBSE PMT 2005]

- (a) Chromatography (b) Crystallisation
(c) Distillation (d) Sublimation

66. A compound has an empirical formula C_2H_4O . An independent analysis gave a value of 132.16 for its molecular mass. What is the correct molecular formula

[Kerala PMT 2004]

- (a) $C_4H_4O_5$ (b) $C_{10}H_{12}$
(c) C_7O_3 (d) $C_6H_{12}O_3$
(e) $C_4H_8O_5$

67. An organic compound has an empirical formula CH_2O , its vapour density is 45. The molecular formula of the compounds is

[DCE 2004]

- (a) CH_2O (b) C_2H_5O
(c) C_2H_2O (d) $C_3H_6O_3$

68. The study of organic compounds even at present is done separate from other compounds because

[CPMT 1986]

- (a) The formation of organic compounds is not based on chemical combination
(b) Organic compounds are covalent
(c) Catenation is the main characteristics
(d) It is the easiest method of study

69. Which of the following pair of the species has the same percentage of carbon

[BHU 1999]

- (a) CH_3COOH and C_2H_5OH
(b) $C_6H_{12}O_6$ and $C_{12}H_{22}O_{11}$
(c) $HCOOCH_3$ and $C_{12}O_{22}O_{11}$
(d) CH_3COOH and $C_6H_{12}O_6$

70. In Kjeldahl's method of estimation of N, $CuSO_4$ acts as

[DCE 2002]

- (a) Oxidising agent (b) Reducing agent
(c) Catalytic agent (d) Hydrolysis agent

71. An organic compound having molecular mass 60 is found to contain C = 20%, H = 6.67% and N = 46.67% while rest is oxygen. On heating it gives NH_3 alongwith a solid residue. The solid residue give violet colour with alkaline copper sulphate solution. the compound is

[AIEEE 2005]

- (a) CH_3NCO (b) CH_3CONH_2
(c) $(NH_2)_2CO$ (d) $CH_3CH_2CONH_2$

72. How will you separate a solution (miscible) of benzene + $CHCl_3$

[AFMC 2005]

- (a) Sublimation (b) Filtration
(c) Distillation (d) Crystallisation

73. A mixture of camphor and benzoic acid can be separated by

[BHU 2005]

- (a) Chemical method (b) Sublimation
(c) Fractional distillation (d) Extraction with a solvent

74. Dumas method involves the determination of nitrogen content in the organic compound in the form of

[BHU 2005]

- (a) NH_4^+ (b) N
(c) $NaCN$ (d) $(NH_4)_2SO_4$

75. When 32.25 gm ethyl chloride dehydro halogenated, it gives 50% Alkene, what is the mass of product. (atomic mass of chlorine = 35.5)

[Kerala CET 2005]

- (a) 14 gm (b) 28 gm
(c) 64.5 gm (d) 56 gm
(e) 7 gm

76. How much sulphur is present in organic compound if on analysis 0.53 gm of this compound gives 1.158 gm of $BaSO_4$

[Kerala CET 2005]

- (a) 10% (b) 15%
(c) 20% (d) 25%
(e) 30%

Classification and nomenclature of organic compounds

1. The systematic name of $CH_3 - CHBr - CH_2OH$ is

[BHU 1982]

- (a) 3-hydroxy-2-bromopropane
(b) 2-bromopropanol-1
(c) 2-bromo-3-propanol
(d) 3-hydroxy isopropyl bromide

2. IUPAC name of acetyl salicylic acid is

[CPMT 1994]

- (a) *m*-benzoic acid (b) 2-acetoxy benzoic acid
(c) *p*-benzoic acid (d) *p*-acetyl benzoic acid

3. IUPAC name of CH_3CHO is

[NCERT 1981; CBSE PMT 1990; MP PMT 1989, 96]

- (a) Acetaldehyde (b) Methyl aldehyde
(c) Ethanol (d) Ethanal

4. IUPAC name of $CH_3CH(OH)CH_2CH_2COOH$ is

[MP PET 1990]

- (a) 4-hydroxy pentanoic acid
(b) 1-carboxy-3-butanoic acid
(c) 1-carboxy-4-butanol
(d) 4-carboxy-2-butanol

5. IUPAC name of $CH_3 - O - C_2H_5$ is

[MNR 1986; MP PET 2000]

- (a) Ethoxymethane (b) Methoxyethane
(c) Methyl ethyl ether (d) Ethylmethyl ether

6. Which of the following compound has the functional group $-OH$

- (a) 1, 2-ethandiol (b) 2-butanone
(c) Nitrobenzene (d) Ethanal

IUPAC name of the $(CH_3)_2CHCH(CH_3)_2$ is

[MP PMT 1986]

- (a) 1, 1, 2, 3-tetramethylethane
(b) 1, 2-di-isopropylethane
(c) 2, 3-dimethylbutane
(d) 2, 3, 3-trimethylbutane

8. IUPAC name of the compound is

[DPMT 1985; MP PMT 1987; AFMC 1997]

- (a) 4-ethyl-2-pentanol (b) 4-methyl-2-hexanol
(c) 2-ethyl-2-pentanol (d) 3-methyl-2-hexanol

9. IUPAC name of the compound is $\text{CH}_3 - \text{CH} = \text{C} - \text{CH}_3$
 $\quad \quad \quad |$
 $\quad \quad \quad \text{CH}_2 - \text{CH}_2$

[NCERT 1983; MP PMT 1989, 96; BHU 1997]

- (a) 2-ethyl-2-butene (b) 3-ethyl-2-butene
 (c) 3-Methyl-3-pentene (d) 3-methyl-2-pentene
10. The IUPAC name of $\text{CH}_3\text{C} \equiv \text{N}$ is [CPMT 1990]
 (a) Acetonitrile (b) Ethanenitrile
 (c) Methyl cyanide (d) Cyanoethane
11. Which compound is 2, 2, 3-trimethylhexane [IIT-JEE 1986]

12. The IUPAC name of $\text{CH}_3\text{CH}_2\text{COCH}_2\text{CH}_3$ is [EAMCET 1992]

- (a) 3-pentanone (b) 2-pentanone
 (c) Diethyl ketone (d) All the above

13. The IUPAC name of $\text{CH}_3\text{COOC}_2\text{H}_5$ will be [MP PMT/PET 1988; Kurukshetra CEE 1998]

- (a) Ethyl acetate (b) Ethyl ethanoate
 (c) Methyl propanoate (d) None of these

14. IUPAC name of $(\text{CH}_3)_2\text{CH} - \text{CH} = \text{CH} - \text{CH}_3$ is [CPMT 1987; AMU 1985]

- (a) 2-methyl-3-pentene
 (b) 4-methyl-2-pentene
 (c) 1, 2-isopropyl-1-propene
 (d) 3-isopropyl-2-propene

15. IUPAC name of $\text{CH}_2 = \text{CH} - \text{CH}(\text{CH}_3)_2$ is [IIT-JEE 1987; CBSE PMT 1988; CPMT 1989; MNR 1995; UPSEAT 2001; RPMT 2002]

- (a) 1, 1-dimethyl-2-propene
 (b) 3-methyl-1-butene
 (c) 2-vinyl propane
 (d) 1-isopropyl ethylene

16. Alicyclic compounds are [CPMT 1976]

- (a) Aromatic (b) Aliphatic
 (c) Heterocyclic (d) Aliphatic cyclic

17. The IUPAC name of $\text{CH}_3\text{CH}_2\text{CHCH}_2\text{CH}_2\text{CH}_3$ is
 $\quad \quad \quad |$
 $\quad \quad \quad \text{CH}_3$

[EAMCET 1991]

- (a) 4-methylhexane (b) 3-methylhexane
 (c) 2-propylbutane (d) 2-ethylpentane

18. The most appropriate statement regarding organic compounds is

- (a) They possess ionic and covalent bonds
 (b) Presence of carbon is not essential
 (c) They are found in a large number
 (d) Their reactions are fast

19. Correct name of the compound $\text{CH}_3 - \text{CH} - \text{CH}_3$ is
 $\quad \quad \quad |$
 $\quad \quad \quad \text{CH}_3$

[CPMT 1973; MP PMT 1994]

- (a) Butane (b) Isopropyl methane
 (c) 2-methyl propane (d) Dimethyl ethane

20. General formula of alkyne is [MNR 1983; CPMT 1975, 93; MP PET 1999]

- (a) $\text{C}_n\text{H}_{2n+2}$ (b) C_nH_{2n}
 (c) $\text{C}_n\text{H}_{2n-2}$ (d) C_nH_n

21. IUPAC name of $\begin{array}{c} \text{H} \quad \text{Cl} \\ | \quad | \\ \text{H} - \text{C} - \text{C} - \text{Cl} \\ | \quad | \\ \text{H} \quad \text{H} \end{array}$ is [CPMT 1973, 75, 85]

- (a) 1, 2-dichloroethane (b) 2, 2-dichloroethane
 (c) 1, 1-dichloroethane (d) Dichloroethane

22. Freon-114 used in refrigerator and air conditioners is 1, 2-dichlorotetrafluoroethane. Its structural formula is [CPMT 1979, 81; NCERT 1975]

23. IUPAC name of $\text{CH}_3 - \text{CH}_2 - \text{CH} - \text{NH}_2$ is
 $\quad \quad \quad |$
 $\quad \quad \quad \text{CH}_3$

[CPMT 1983, 84]

- (a) 1-methyl-1-aminopropane
 (b) 2-aminobutane
 (c) 2-methyl-3-aminopropane
 (d) None of the above

24. IUPAC name of the compound is

- (a) 3, 4-dimethyl-3-n-propyl nonane
 (b) 5, 7-dimethyl-7-n-propyl nonane
 (c) 4, 5-dimethyl-4-ethyl decane
 (d) 6, 7-dimethyl-7-ethyl decane

25. IUPAC name of $\text{CH}_3 - \text{CH} - \text{CH}_2 - \text{CH} = \text{CH}_2$ is

[DPMT 1982, 83; Manipal MEE 1995]

- (a) 2-methyl pentene (b) 4-methyl pentene-1
 (c) 1-hexene (d) 2-methyl pentene-1

26. In the structure

Which one is quarternary carbon atom

- (a) C-1 (b) C-2
 (c) C-3 (d) C-5

27. The IUPAC name of

[EAMCET 1992; Pb. PMT 99]

- (a) 2-methylbutene-1
 (b) 3-methylbutene-1
 (c) Vinyl methylethane
 (d) Propylethene-1

28. The IUPAC name of $\text{CH}_3\text{C} \equiv \text{CCH}(\text{CH}_3)_2$ is

[MNR 1993; Pb CET 2004]

- (a) 4-methyl-2-pentyne
 (b) 4, 4-dimethyl-2-butyne
 (c) Methyl isopropyl acetylene
 (d) 2-methyl-4-pentyne

29. The IUPAC name of the compound having structure

[AFMC 1990]

- (a) 3-methyl-2-ethyl butene-1
 (b) 2-ethyl-3-methyl butene-1
 (c) 3-ethyl-3-methyl butene-1
 (d) Ethyl isopropyl ethene

30. The IUPAC name of $(\text{C}_2\text{H}_5)_2\text{CHCH}_2\text{OH}$ is

[MP PMT 1986; AFMC 1990]

- (a) 2-ethyl butanol-1
 (b) 2-methyl pentanol-1
 (c) 2-ethyl pentanol-1
 (d) 3-ethyl butanol-1

31. IUPAC name of the following compound is

[MP PMT 1986]

- (a) 2-cyclohexylbutane (b) 2-phenylbutane
 (c) 3-cyclohexylbutane (d) 3-phenylbutane

32. The IUPAC name of $\text{CH}_3\text{CH}(\text{CH}_3)\text{COOH}$ is

[CPMT 1988; RPMT 2000]

- (a) Dimethyl acetic acid (b) 2-methyl propanoic acid
 (c) Propanoic acid (d) Butyric acid

33. IUPAC name of $\text{CH}_3 - \text{CH} - \text{CHO}$ is

[IIT-JEE 1993]

- (a) Butan-2-aldehyde
 (b) 2-methylbutanal
 (c) 3-methyl isobutyraldehyde
 (d) 2-ethylpropanal

34. The IUPAC name of the compound

[KCET 1990]

- (a) 1-pentanol (b) Pentanol
 (c) 2-methyl-4-butanol (d) 3-methyl-1-butanol

35. The IUPAC name of $\text{CH}_3 - \text{CH} - \text{CH}_2 - \text{CH} - \text{CHO}$ will be

[CBSE PMT 1992; JIPMER (Med.) 2002]

- (a) 4-hydroxy-1-methylpentanal
 (b) 4-hydroxy-2-methylpentanal
 (c) 3-hydroxy-2-methylpentanal
 (d) 3-hydroxy-3-methylpentanal

36. IUPAC name of tertiary butyl alcohol is

[CPMT 1994]

- (a) Butan-1-ol (b) Butan-2-ol
 (c) 2-methyl propan-1-ol (d) 2-methyl propan-2-ol

37. What is the correct IUPAC name for

[MP PET 1995]

- (a) 5-methyl-3-hexenoic acid
 (b) 5-carboxyl-2-methylpentene
 (c) 4-isopropyl-3-butenic acid
 (d) None of above

38. The IUPAC name of $\text{CH}_3 - \text{CH}_2\text{CH} = \text{CCH}_2\text{OH}$ will be

[MP PET/PMT 1988]

- (a) 2-methyl pentyl alcohol
 (b) 4-methyl-3-pentene-ol
 (c) 2-methyl pent-2-ene-1-ol
 (d) 4-methyl pentyl alcohol

39. The structure of 4-methyl pentene-2 is

[BHU 1988]

- (a) $(\text{CH}_3)_2\text{CH} - \text{CH}_2\text{CH} = \text{CH}_2$
 (b) $(\text{CH}_3)_2\text{CH} - \text{CH} = \text{CH} - \text{CH}_3$
 (c) $(\text{CH}_3)_2\text{CH} - \text{CH}_2\text{CH} = \text{CH} - \text{CH}_3$

- (d) $(CH_3)_2C = CHCH_2CH_3$
40. 2-methyl-2-butene will be represented as [CBSE PMT 1992]
- (a) $CH_3 - \underset{\substack{| \\ CH_3}}{CH} - CH_2 - CH_3$
- (b) $CH_3 - \underset{\substack{| \\ CH_3}}{C} = CH - CH_3$
- (c) $CH_3 - CH_2 - \underset{\substack{| \\ CH_3}}{C} = CH_2$
- (d) $CH_3 - \underset{\substack{| \\ CH_3}}{CH} - CH = CH_2$
41. $Cl - C - Cl$ angle in 1, 1, 2, 2 - tetrachloroethene and tetrachloromethane respectively are about [IIT-JEE 1988]
- (a) 120° and 109.5° (b) 90° and 109.5°
(c) 109.5° and 90° (d) 109.5° and 120°
42. The IUPAC name of succinic acid is [IIT-JEE 1994]
- (a) 1, 4-butanedioic acid (b) Dimethyl-2-acid
(c) 1, 2-dimethyldioic acid (d) None of these
43. IUPAC name of $(CH_3)_2CH - CH_2 - CH_2Br$ is [CBSE PMT 1996]
- (a) 1-bromopentane
(b) 2-methyl-4-bromobutane
(c) 1-bromo-3-methylbutane
(d) 2-methyl-3-bromopropane
44. The IUPAC name for $CH_3CH = CHCH_2CHCH_2COOH$ is [CBSE PMT 1995]
- $\underset{\substack{| \\ NH_2}}{CH}$
- (a) 5-aminohept-2-ene carboxylic acid
(b) 5-amino-2-heptenoic acid
(c) 3-amino-5-heptenoic acid
(d) β -amino- δ -heptenoic acid
45. The IUPAC name of $CH_2 = CH - CH_2Cl$ is [MP PMT 1995]
- (a) Allyl chloride (b) 1-chloro-3-propene
(c) Vinyl chloride (d) 3-chloro-1-propene
46. The IUPAC name of CH_3CH_2COCl is
- (a) Propanoyl chloride (b) Ethanoyl chloride
(c) Acetyl chloride (d) Chloroethane
47. IUPAC name of the compound $^4CH_2 = ^3CH - ^2CH_2 - ^1CH_2OH$ is
- (a) 1-buten-4-ol (b) 3-buten-1-ol
(c) 4-hydroxy-1-butene (d) 1-butenol-4
48. Which is the correct structure of the compound 3-hexyn-1-oic acid
- (a) $CH_3 - CH_2 - CH_2 - C \equiv C - COOH$
(b) $CH_3 - CH_2 - C \equiv C - CH_2 - COOH$
(c) $CH_3 - C \equiv C - CH_2 - CH_2 - COOH$
(d) $CH_3 - CH_2 - CH = CH - CH_2 - COOH$
49. The IUPAC name of
- $CH_3 - \underset{\substack{| \\ Cl}}{C} = \underset{\substack{| \\ CH_3}}{C} - \underset{\substack{| \\ C_2H_5}}{CH} - CH_2 - C \equiv CH$ is [MP PET 1997]
- (a) 6-chloro-4-ethyl-5-methyl-hept-5-en-1-yne
(b) 6-chloro-4-ethyl-5-methyl-hept-1-yn-5-ene
(c) 2-chloro-4-ethyl-3-methyl-hept-2-en-6-yne
(d) 2-chloro-4-ethyl-3-methyl-hept-6-yn-2-ene
50. The IUPAC name of the compound having the formula $Cl_3C.CH_2CHO$ is [MP PET/PMT 1998]
- (a) 3, 3, 3-trichloropropanal
(b) 1, 1, 1-trichloropropanal
(c) 2, 2, 2-trichloropropanal
(d) Chloral
51. The IUPAC name of the compound $CH_3 - \underset{\substack{| \\ CH_3}}{CH} - CH_2 - CH_2 - Cl$ is [MP PET 1999; MH CET 2001]
- (a) 1-chloro-3-methylbutane (b) 2-methyl-4-chlorobutane
(c) 2-methyl-1-chlorobutane (d) 1-chloropentane
52. The IUPAC name of crotonaldehyde is [MP PMT 1999]
- (a) Prop-2-ene-1-al (b) Propenal
(c) But-2-ene-1-al (d) Butenal
53. IUPAC name of the following compound will be $CH_3 - CH = C - CH_2 - CH_3$
- $\underset{\substack{| \\ CH_2 - CH_2 - CH_3}}{C}$ [CPMT 1999, 2002; Pb. CET 2001]
- (a) 3-ethyl-2-hexene (b) 3-propyl-2-hexene
(c) 3-propyl-3-hexene (d) 4-ethyl-4-hexene
54. The IUPAC name of the following compound is $CH_3 - CH - CH_2CH_2CH_3$
- $\underset{\substack{| \\ CH(CH_3)_2}}{CH}$ [Bihar CEE 1995]
- (a) 2-isopropylpentane (b) 2, 3-dimethylhexane
(c) Isononane (d) 2, 4-dimethylhexane
55. The IUPAC name of $CH_3 - \underset{\substack{| \\ OH}}{\underset{\substack{| \\ Cl}}{C}} - CH_2CH = CHCH_3$ is [DPMT 1996]
- (a) 5-chloro-2-hydroxyhexene
(b) 2-chloro-5-hydroxyhexene
(c) 2-chloro-2-hydroxy-5-hexene
(d) 2-chloro-4-hexenol-2
56. IUPAC name of $CH_3 - \underset{\substack{| \\ CH_3}}{C} - \underset{\substack{| \\ OH}}{C} - CH_2 - \underset{\substack{| \\ CH_3}}{CH} - CH_3$ is [CPMT 1996]
- (a) 2, 4-dimethyl pentanol-2
(b) 2, 4-dimethyl pentanol-4
(c) 2, 2-dimethyl butanol-2
(d) None of these

57. Which is correct IUPAC name of the following compound

[Orissa JEE 1997]

- (a) 3-isopropyl-2-methylpentane
(b) 3-ethyl-2,4-dimethylpentane
(c) 2,4-dimethyl-3-ethylpentane
(d) 3-isopropyl-4-methylpentane
58. IUPAC name of $\text{CH}_3 - \text{CH} = \text{CH} - \text{C} \equiv \text{CH}$ is

[CPMT 1997]

- (a) Pent-2-en-4-yne
(b) Pent-3-en-1-yne
(c) Pent-3-yne-1-en
(d) Pent-2-yne-1-en

59. The IUPAC name for the formula

[Pb. PMT 1998]

- (a) 2-methyl-2-butyric acid
(b) 3-methyl-3-butyric acid
(c) 3-methyl-2-butyric acid
(d) 2-methyl-3-butyric acid

60. IUPAC name of $\text{CH}_3 - \text{C}(\text{H})(\text{C}_2\text{H}_5) - \text{C}(\text{H})(\text{C}_4\text{H}_9) - \text{CH}_3$ is

[BHU 1998; KCET (Engg./Med.) 2000]

- (a) 2-butyl-2-methyl-3-ethylbutane
(b) 2-ethyl-3, 3-dimethylheptane
(c) 3, 4, 4-trimethylheptane
(d) 3, 4, 4-trimethyloctane

61. The IUPAC name of the compound

[AIIMS 1998]

- (a) Hydroxypentenoic acid
(b) 4-hydroxy-3-pentenoic acid
(c) 4-hydroxy-4-pentenoic acid
(d) 4-hydroxy-4-methyl-3-butyric acid

62. Which is the IUPAC name of $\text{CH}_3 - \text{C}(\text{C}_2\text{H}_5)_2 - \text{CH}_2\text{Cl}$

[KCET (Engg./Med.) 1999]

- (a) 1-chloro-2, 2-diethylpropane
(b) 3-chloro-2, 2-diethylpropane
(c) 1-chloro-2-ethyl-2 methylbutane
(d) 1-chloro-2, 2-diethyl-2 methylethane

63. The IUPAC name of the compound

[DCE 1999]

- (a) Hexan-1-al-6-oic acid
(b) Formyl-hexanoic acid

- (c) Hexanal-1-carboxylic acid
(d) Hexanoic acid 5-al-1

64. IUPAC name of $\text{CH}_3 - \text{CH} = \text{CH} - \text{COOH}$ [RPET 2000]

- (a) 2-butyric acid (b) 1-butyric acid
(c) β -butyric acid (d) 1-carboxy -1-propene

65. IUPAC name of $(\text{CH}_3)_2\text{CH} - \text{CHO}$ is: [RPET 2000]

- (a) 2-methyl propanal
(b) 1-methyl-2 propanal
(c) 2, 2-dimethyl propanal
(d) None of these

66. IUPAC name of the compound $\text{CH}_3 - \text{CH}_2 - \text{CH}_2(\text{CH}_3)_2 - \text{C} - \text{CH}_3$ [RPET 2000]

- (a) 1, 1-dimethyl pentane
(b) 2, 2-dimethyl pentane
(c) 1, 2-dimethyl pentane
(d) None of these

67. IUPAC name of the following are

[DCE 2000]

- (a) 3-dimethylamino-3-methyl pentane
(b) 3 (N, N-Trimethyl)-3-aminopentane
(c) 3, (N, N-Trimethyl) pentanamine
(d) 3-N, N dimethyl amino-3- methyl pentane

68. The correct IUPAC name of $\text{H}_2\text{C} = \text{CH} - \text{CH}(\text{CH}_3) - \text{CH}_2\text{C} \equiv \text{CH}$ [Roorkee 2000]

- (a) 3-methyl-1-hexen-5-yne
(b) 4-methyl-5-hexen-1-yne
(c) 4-(ethenyl)-1-pentyne
(d) 3-(2-propenyl) butene-1

69. The IUPAC name of $(\text{CH}_3)_2\text{CH} - \text{CH}_2 - \text{CH}_2\text{Br}$ is

[MH CET 2001; CBSE PMT 2001; Pb. PMT 2004]

- (a) 1-bromo pentane
(b) 2-methyl and 4 bromo butane
(c) 1-bromo and 3-methyl butane
(d) 2-methyl and 3 bromo propane

70. Which C-atoms is the most electronegative in this structure $\text{CH}_3 - \text{CH}_2 - \text{C} \equiv \text{CH}$ [CPMT 2001]

- (a) I
(b) II
(c) III
(d) All are equal electronegative

71. The IUPAC name of compound

[CPMT 2001]

- (a) 2, 2-dimethyl pent-4-ene
(b) 2, 2 dimethyl-2-pentene
(c) 1, 1, 1-trimethyl but-3-ene
(d) 4, 4-dimethyl pent-1-ene

72. Which of the following alkanes contains primary, secondary, tertiary and quaternary carbon atoms together

[MP PET 2001]

- (a) $(CH_3)_3CH$
 (b) $(C_2H_5)_3CH$
 (c) $(CH_3)_3CCH_2CH(CH_3)_2$
 (d) $(CH_3)_4C$
73. The number of tertiary carbon atoms in the compound $(CH_3)_2CHCH_2C(CH_3)_3$ is [MP PMT 2001]
 (a) 2 (b) 3
 (c) 1 (d) 4
74. The compound which has one isopropyl group is [IIT-JEE 1989; MP PMT 2001]
 (a) 2, 2, 3, 3-tetramethyl pentane
 (b) 3, 3-dimethyl pentane
 (c) 2, 2, 3-trimethyl pentane
 (d) 2-methyl pentane
75. Write the IUPAC name of

$$CH_3 - \underset{\substack{| \\ OH}}{C} - CH_2 - CH_2 - CH_2 - \underset{\substack{| \\ Br}}{C} - CH_3$$
 [DCE 2001]
 (a) 6, 6-dibromoheptane-2-ol
 (b) 2, 2-dibromoheptane-6-ol
 (c) 6, 6 dibromoheptane-2-ol
 (d) None of these
76. The IUPAC name of

$$CH_3 - \underset{\substack{| \\ CH_3}}{C} - CH_2 - \underset{\substack{| \\ OH}}{C} - CH_3$$
 is [KCET (Med.) 2001; UPSEAT 1999, 2002]
 (a) 4-methyl-2, 4, pentanediol
 (b) 1, 1-dimethyl 1, 1, 3 butanediol
 (c) 2-methyl-2, 4 pentanediol
 (d) 1, 2, 3-trimethyl-1, 3 propanediol
77. IUPAC name of the following compound is [AIIMS 2003]

 (a) 3-methyl cyclohexene
 (b) 1-methyl cyclohex-2-ene
 (c) 6-methyl cyclohexene
 (d) 1-methyl cyclohex-5-ene
78. The IUPAC name of the compound

$$CH_3 - \underset{\substack{| \\ CH_3}}{C} = CH_2CH_2OH$$
 is [BHU 2001]
 (a) 2-methyl-2-butenol
 (b) 2-methyl-3-butenol
 (c) 3-methyl-2-butenol
 (d) 3-methyl- but-2-ene-1-ol
79. The IUPAC name of $CH_3C \equiv CCH(CH_3)_2$ is [UPSEAT 2001]
 (a) 4 methyl-2 pentyne
 (b) 4, 4-dimethyl-2-butyne
 (c) Methyl isopropyl acetylene
 (d) 2-methyl-4-pentyne
80. Which of the following compound have wrong IUPAC name [AIEEE 2002]
 (a) $CH_3 - CH_2 - CH_2 - COO - CH_2CH_3$ → ethyl butanoate
 (b) $CH_3 - \underset{\substack{| \\ CH_3}}{CH} - CH_2 - CHO$ → 3-methyl-butanal
 (c) $CH_3 - \underset{\substack{| \\ OH}}{CH} - \underset{\substack{| \\ CH_3}}{CH} - CH_3$ → 2-methyl-3-butanol
 (d) $CH_3 - CH - \underset{\substack{| \\ CH_3}}{\overset{\substack{O \\ ||}}{C}} - CH_2 - CH_3$ → 2-methyl-3 pentanone
81. If CH_4 is known as methane, then C_9H_{20} is known as [Kerala (Med.) 2002]
 (a) Hexane (b) Nonane
 (c) Octane (d) Butane
82. The IUPAC name of *n*-butyl chloride is [Kerala (Med.) 2002]
 (a) 1-chlorobutane (b) *n*-chlorobutane
 (c) *ter*-butylchloride (d) 2-methylbutane
83. General formula of alkanes is [MP PET/PMT 2002]
 (a) C_nH_{2n+1} (b) C_nH_{2n+2}
 (c) C_nH_{2n-1} (d) C_nH_{2n}
84. General formula of alkene and alkane are [MP PMT 2002]
 (a) C_nH_{2n} and C_nH_{2n+1}
 (b) C_nH_{2n} and C_nH_{2n+2}
 (c) C_nH_{2n-1} and C_nH_{2n}
 (d) C_nH_{2n-1} and C_nH_{2n+2}
85. The IUPAC name of picric acid is [KCET 2002]
 (a) 2,4,6-trinitrophenol
 (b) 2,4,6-trinitrobenzoic acid
 (c) 4-nitrophenol
 (d) None of these
86. General formula of paraffin is [RPMT 2002]
 (a) C_nH_{2n} (b) C_nH_{2n-2}
 (c) C_nH_{2n+2} (d) $C_{2n}H_{2n}$
87. IUPAC name of compound is
 $CH_3 - CH_2 - CH(CH_3) - CH_2 - COCl$ [RPMT 2002]
 (a) 3-methyl pentanoyl chloride
 (b) 3-methyl butanoyl chloride
 (c) 1-chloro-3-methyl pentanol
 (d) None of these
88. The name of $H_3C - \underset{\substack{| \\ CH_3}}{CH} - \underset{\substack{| \\ OH}}{CH} - CH_3$
 IUPAC nomenclature system is [MP PMT 2002; MH CET 2002]
 (a) Butanol (b) 2-methyl butanol-3
 (c) 3-methyl butanol-2 (d) Pentanol
89. The name of $ClH_2C - \underset{\substack{| \\ Br}}{C} = \underset{\substack{| \\ Br}}{C} - CH_2Cl$ according to IUPAC nomenclature system is : [MP PMT 2002]
 (a) 2,3 dibromo-1, 4-dichlorobutene-2

- (b) 1, 4-dichloro-2, 3-bromobutene-2
(c) Dichlorodibromobutane
(d) Dichlorodibromobutane

90. The IUPAC name of acraldehyde is [MP PMT 2000]
(a) Prop-2-ene-1-al (b) Propenyl aldehyde
(c) But-2-ene-1-al (d) Propenal

91. IUPAC name of the compound
 $\text{CH}_3 - \underset{\text{OH}}{\text{CH}} - \text{CH}_2 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_3$ is..... [Orissa JEE 2002]
(a) 4-methyl pentene-2-ol (b) 2-methyl pentanol-4
(c) 4, 4-dimethyl butan-2-ol (d) 4-methyl pentane-2-ol

92. Cycloalkane has the formula [Kerala (Engg.) 2002]
(a) $C_n H_{2n+2}$ (b) $C_n H_{2n-2}$
(c) $C_n H_{2n}$ (d) $C_{2n} H_2$

93. The IUPAC name of the compound
 $\text{CH}_2 = \text{CH} - \text{CH}_2 - \text{CH}_2 - \text{C} \equiv \text{CH}$ is [CBSE PMT 2002; MP PMT 2003]
(a) 1, 5-hexenyne (b) 1-hexyne-5-ene
(c) 1, 5-hexynene (d) 1-hexene-5-yne

94. The IUPAC name of
 $\text{CH}_3 - \underset{\text{OH}}{\text{CH}} - \text{CH}_2 - \underset{\text{CH}_3}{\text{CH}}\text{CHO}$ is [JIPMER 2002]
(a) 4 Hydroxy-2-methylpentanal
(b) 2-hydroxy-4 methyl pentanal
(c) 2-methyl pent-4-ol-1-al
(d) None of these

95. The IUPAC name of the compound
 $\text{CH}_3 - \text{CH}(\text{C}_2\text{H}_5) - \text{CH} = \text{CH} - \text{CH}_3$ is [BHU 2002]
(a) 4-ethyl-2-pentene (b) 4-methyl 2-hexene
(c) 3-ethyl-2-pentene (d) 2-ethyl-3-pentene

96. IUPAC name of $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \underset{\text{CN}}{\text{CH}} - \text{CH}_3$ [AIIMS 2002]
(a) 2-cyano, 3-methyl, hexane
(b) 3-methyl, 5-cyanohexane
(c) 2-4 dimethyl, cyanopentane
(d) 2-cyano, 3-methylhexane

97. The IUPAC name of compound () is [Kerala CET 2005]
(a) (2Z, 4Z) -2, 4-hexa di-ene
(b) (2Z, 4E)-2, 4 hexa di ene
(c) (4Z, 4Z)-2, 4 hexa di ene
(d) (2E, 4Z)-2, 4 hexa di ene
(e) (2E, 4E)-2, 4 hexa di ene

98. Name the alkene with molecular formula $C_{10}H_{20}$ [Kerala (Med.) 2003]
(a) Dodecene (b) Undecene
(c) Decene (d) Heptene

99. The IUPAC name of following compounds is
 $\text{HOOC} - \text{CH}_2 - \underset{\text{COOH}}{\text{CH}} - \text{CH}_2 - \text{CH}_2 - \text{COOH}$ [Kerala CET 2005]
(a) 2-(Carboxy methyl)-pentane-1, 5-dioic acid
(b) 3-Carboxy hexane -1, 6 dioic acid

(c) Butane, 1, 2, 4-Tricarboxylic acid
(d) 4-Carboxy hexane-1, 6 dioic acid
(e) 1, 2 dicarboxypentanoic acid

100. Names of some compounds are given. Which one is not in IUPAC system [CBSE PMT 2005]
(a) $\text{CH}_3 - \underset{\text{OH}}{\text{CH}} - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_3$
3-Methyl-2-butanol
(b) $\text{CH}_3 - \text{C} \equiv \text{C} - \underset{\text{CH}_3}{\text{CH}} (\text{CH}_3)_2$
4-Methyl-2-pentyne
(c) $\text{CH}_3 - \text{CH}_2 - \underset{\text{CH}_2\text{CH}_3}{\text{C}} - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_3$
2-Ethyl-3-methyl-but-1-ene
(d) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \underset{\text{CH}_2\text{CH}_3}{\text{CH}} - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2\text{CH}_3$
3-Methyl-4-ethyl heptane

101. The IUPAC name of the compound
 $\text{CH}_3 - \text{CH}_2 - \underset{\text{OCH}_3}{\text{CH}} - \text{CH}_2 - \text{OH}$ is [BHU 2004]
(a) 2-methoxy-1-butanol (b) 3-methoxy-1-butanol
(c) 2-methoxy-1-butanol (d) 1, 2-methoxy-butanol

102. IUPAC name of
 $\text{CH}_3 - \underset{\text{NH}_2}{\text{CH}} - \text{CH}_3$ is [MH CET 2004]
(a) Dimethyl amine (b) 2-aminopropane
(c) Isopropylamine (d) 2-propanamine

103. The compound having only primary hydrogen atoms is [AIIMS 2004]
(a) Isobutene (b) 2,3-Dimethylbutene
(c) Cyclohexane (d) Propyne

104. The compound formed in the positive test for nitrogen with the lassaigle solution of an organic compounds is [AIEEE 2004]
(a) $\text{Fe}(\text{CN})_3$ (b) $\text{Na}_3[\text{Fe}(\text{CN})_6]$
(c) $\text{Fe}_4[\text{Fe}(\text{CN})_6]_3$ (d) $\text{Na}_4[\text{Fe}(\text{CN})_5\text{NOS}]$

105. The IUPAC name of Gamaxene is [MP PET 2004]
(a) Benzene hexachloride
(b) Hexachlorobenzene
(c) 1, 2, 3, 4, 5, 6, hexachlorobenzene
(d) 1, 2, 3, 4, 5, 6, hexachlorocyclohexane

106. The IUPAC name of $\text{CH}_3 - \underset{\text{Cl}}{\text{CH}} - \text{CH}_3$ is [Pb. CET 2000]
(a) 2-chloropropane (b) Chloropropane
(c) 1-chloropropane (d) 2-chlorobutane

107. The IUPAC name of
 $\text{CH}_3 - \underset{\text{OH}}{\text{CH}} - \text{CH}_2 - \underset{\text{OH}}{\text{C}}(\text{CH}_3) - \text{CH}_3$ and $\text{CH}_2 - \underset{\text{CN}}{\text{CH}} - \underset{\text{CN}}{\text{CH}} - \underset{\text{CN}}{\text{CH}}_2$
[Pb. CET 2004; DCE 2002; MNR 1984; CPMT 1983, 93; RPMT 1999]
(a) 1, 1-dimethyl-2-butenediol and propanetricarbonitrile

- (b) 4-methyl-2, 4-pentanediol and 1, 2, 3 propanetrinitrile
(c) 2-methyl 2, 4-pentanediol and 3 cyano 1, 5-pentanedinitrile
(d) 1, 3, 3-trimethyl 1,3-propanediol and 1, 2, 3 tricyano propane
108. The IUPAC name of $\text{CH}_3\text{CH}_2\text{C}(\text{Br})=\text{CH}-\text{Cl}$ is

[CPMT 2004]

- (a) 2-bromo-1-chloro butene
(b) 1-chloro-2-bromo-butene
(c) 3-chloro-2-bromo butene-2
(d) None of these

109. IUPAC name for the compounds

[DPMT 2004]

- (a) α -Methyl cyclohexanone
(b) 2-Methyl cyclohexanone
(c) Heptanone-2
(d) Methyl cyclo-hexanone
110. Which of the following compounds is not chiral

[AIEEE 2004]

- (a) 1-chloro-2-methyl pentane
(b) 2-chloropentane
(c) 1-chloropentane
(d) 3-chloro-2-methyl pentane

111. IUPAC name of

[JEE Orissa 2004]

- (a) 4-bromo-3-ethyl-1, 4-pentadiene
(b) 2-bromo-3-ethyl-1, 4-pentadiene
(c) 2-bromo-3-ethyl-1, 5-pentadiene
(d) None of these

112. Write the IUPAC name of $\text{CH}_3\text{CH}_2\text{COOH}$

[AFMC 2004]

- (a) Ethyl formic acid
(b) Ethyl carboxylic acid
(c) Ethane methanoic acid
(d) Propanoic acid

113. IUPAC name of

[CPMT 1988, 93]

- (a) 1-chloro-4-methyl -2-hexanal
(b) 1-chloro--4-ethyl-2-pentanol
(c) 1-chloro-4-methyl-2-hexanol
(d) 1-chloro--2-hydroxy-4-methyl hexane

114. IUPAC name of $(\text{CH}_3)_3\text{C}-\text{CH}=\text{CH}_2$ is

[NCERT 1978, 81; IIT-JEE 1984; DPMT 1986; CPMT 1989;
CBSE PMT 1991; AIIMS 1997; MP PMT 2001; KCET 2003]

- (a) 3,3,3-trimethyl-1-propene
(b) 1,1,1-trimethyl-2-propene
(c) 3,3-dimethyl-1-butene
(d) 2,2-dimethyl-3-butene

115. The IUPAC name of $\text{CH}_3\text{COCH}(\text{CH}_3)_2$ is

[AIEEE 2003]

- (a) Isopropylmethyl ketone
(b) 2-methyl-3-butanone
(c) 4-methylisopropyl ketone

- (d) 3-methyl-2-butanone

116. What will be the IUPAC name of the given compound

[BHU 2005]

- (a) 2, 5 - diethyl - 4 - methylexane
(b) 3, 4, 6 - trimethyloctane
(c) 2, 5, 6 - trimethyloctane
(d) 3, 5 - dimethyl - 6 - ethylheptane

117. $\text{H}_3\text{C}-\underset{\text{Cl}}{\text{C}}=\text{CH}-\underset{\text{CH}_3}{\text{CH}}-\text{CH}_3$

[KCET 2005]

- (a) 2-chloro-4-methyl-2-pentene
(b) 4-chloro-2-methyl-3-pentene
(c) 4-methyl-2-chloro-2-pentene
(d) 2-chloro-4, 4-dimethyl-2-butene

118. The IUPAC name for $\text{CH}_3\text{CO}-\text{CH}_3$ is

[J & K 2005]

- (a) Dimethyl ketone (b) Acetone
(c) Propanal (d) Propanone

Critical Thinking

Objective Questions

- 116mg of a compound on vaporisation in a Victor Meyer's apparatus displaces 44.8 ml of air measured at S.T.P. The molecular weight of the compounds is [Kerala PMT 2004]
(a) 116 (b) 232
(c) 58 (d) 44.8
(e) 46.4
- An organic compound contains 49.3% carbon 6.84% hydrogen and its vapour density is 73. Molecular formula of the compound is [MP PET 2000; Kerala PMT 2004; Pb. CET 2004]
(a) $\text{C}_3\text{H}_5\text{O}_2$ (b) $\text{C}_6\text{H}_{10}\text{O}_4$
(c) $\text{C}_3\text{H}_{10}\text{O}_2$ (d) $\text{C}_4\text{H}_{10}\text{O}_2$
- If 0.228 g of silver salt of dibasic acid gave a residue of 0.162g of silver on ignition then molecular weight of the acid is [AIIMS 2000]
(a) 70 (b) 80
(c) 90 (d) 100
- 0.0833mol of carbohydrate of empirical formula CH_2O contain 1g of hydrogen. The molecular formula of the carbohydrate is [DCE 2003; BVP
(a) $\text{C}_5\text{H}_{10}\text{O}_5$ (b) $\text{C}_3\text{H}_4\text{O}_3$
(c) $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ (d) $\text{C}_6\text{H}_{12}\text{O}_6$
- A gas mixture contains 50% helium and 50% methane by volume. What is the percent by weight of methane in the mixture [Kerala PMT 2004]
(a) 19.97% (b) 20.05%
(c) 50% (d) 75%
(e) 80.03%

6. 0.5 g of hydrocarbon gave 0.9 g water on combustion. The percentage of carbon in hydrocarbon is

(a) 75.8 (b) 80.0
(c) 56.6 (d) 28.6

7. Lassaigne's test for the detection of nitrogen fails in

[CBSE PMT 1994]

(a) $\text{NH}_2\text{CONHNH}_2 \cdot \text{HCl}$
(b) $\text{NH}_2\text{NH}_2 \cdot \text{HCl}$
(c) NH_2CONH_2
(d) $\text{C}_6\text{H}_5\text{NHNH}_2 \cdot \text{HCl}$

8. Camphor is often used in molecular mass determination because [CBSE PMT 2004]

(a) It is volatile
(b) It is solvent for organic substances
(c) It is readily available
(d) It has a very high cryoscopic constant

9. In Kjeldahl's method, the nitrogen present in the organic compound is quantitatively converted into [DCE 2003]

(a) Gaseous ammonia
(b) Ammonium sulphate
(c) Ammonium phosphate
(d) Ammonia

10. How many H-atoms are present in 0.046 g of ethanol

[DCE 2003]

(a) 6×10^{20} (b) 1.2×10^{21}
(c) 3×10^{21} (d) 3.6×10^{21}

11. A hydrocarbon contains 10.5 gm carbon and 1 gm hydrogen. Its 2.4 gm has 1 litre volume at 1 atm and 127°C , hydrocarbon is

[UPSEAT 2003]

(a) C_6H_7 (b) C_6H_8
(c) C_5H_6 (d) None of these

12. IUPAC name of the compound

[Orissa JEE 2003]

(a) 4-isopropyl 1-methyl octane
(b) 3-methyl-5-(1'-methylethyl) octane
(c) 3-methyl-5-isopropyl octane
(d) 6-methyl-4-(1'-methylethyl) octane

13. What is the correct IUPAC name of

[MP PMT 2003]

(a) 4-methoxy-2-nitrobenzaldehyde
(b) 4-formyl-3-nitro anisole
(c) 4-methoxy-6-nitrobenzaldehyde
(d) 2-formyl-5-methoxy nitrobenzene

14. The IUPAC name of the compound is

[AIEEE 2004]

(a) 3,3-dimethyl-1-cyclohexanol
(b) 1,1-dimethyl-3-hydroxy cyclohexane
(c) 3,3-dimethyl-1-hydroxy cyclohexane
(d) 1,1-dimethyl-3-cyclohexanol

15. Name of the compound given below is

[CBSE PMT 2003]

(a) 5-ethyl-6-methyloctane
(b) 4-ethyl-3-methyloctane
(c) 3-methyl-4-ethyloctane
(d) 2,3-diethylheptane

16. The compound is known by which of the following names [MP PET 1999]

(a) Bicyclo-[2, 2, 2] heptane (b) Bicyclo-[2, 2, 1] octane
(c) Bicyclo-[1, 2, 1] octane (d) Bicyclo-[1, 1, 1] octane

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

- Assertion : A mixture of plant pigments can be separated by chromatography.
Reason : Chromatography is used for the separation of coloured substances into individual components.
- Assertion : Moving phase is liquid and stationary phase is solid in paper chromatography.
Reason : Paper chromatography is used for analysis of polar organic compounds.
- Assertion : During digestion with concentrated H_2SO_4 , nitrogen of the organic compound is converted into $(\text{NH}_4)_2\text{SO}_4$.
Reason : $(\text{NH}_4)_2\text{SO}_4$ on heating with alkali liberates NH_3 .
- Assertion : Thiophene present in commercial benzene as an impurity can be removed by shaking the mixture with cold concentrated H_2SO_4 .
Reason : Thiophene is a heterocyclic aromatic compound.
- Assertion :  is 3-methyl butanoic acid.
Reason : In poly functional group, the substituent should be given lower number than the principal functional group.

6. Assertion : Refining of petroleum involves fractional distillation.
Reason : Fractional distillation involves repeated distillation.
7. Assertion : Potassium can be used in lassaing test.
Reason : Potassium reacts vigorously. [AIIMS 1997]
8. Assertion :  is 3-methyl cyclopentene.
Reason : In numbering, double bonded carbon atoms gets preference to the alkyl group in cycloalkenes.
9. Assertion : During test for nitrogen with Lassaing extract on adding $FeCl_3$ solution sometimes a red precipitate is obtained.
Reason : Sulphur is also present. [AIIMS 2001]

AS Answers and Solutions

Chemical analysis of organic compounds

3. (d) Elements No. of Moles Simple ratio
 $C = 90\%$ $90/12 = 7.5$ $7.5/7.5 = 1 \times 3 = 3$
 $H = 10\%$ $10/1 = 10$ $10/7.5 = 1.33 \times 3 = 4$
 $\therefore$ Empirical formula = C_3H_4
4. (a) Element % No. of Moles Simple Ratio
 C 36 $36/12 = 3$ $3/3 = 1$
 H 6 $6/1 = 6$ $6/3 = 2$
 O 58 $58/16 = 3.62$ $3.62/3 = 1$
 Therefore, Empirical formula = CH_2O
5. (b) Empirical Formula = CH_2O
 Empirical formula mass = $12 + 2 + 16 = 30$
 Mol. Mass = $2 \times V.D. = 2 \times 30 = 60$

$$n = \frac{\text{Mol. mass}}{\text{Empirical mass}} = \frac{60}{30} = 2$$
 Molecular formula = (Empirical formula)_n
 $= (CH_2O)_2 = C_2H_4O_2$
6. (a) Element % No. of Moles Simple Ratio
 C 48 $48/12 = 4$ 1
 H 8 $8/1 = 8$ 2
 N 56 $56/14 = 4$ 1
 Empirical formula = CH_2N
 Empirical formula mass = 28
 Now, 200 ml of compound = 1 gm
 $22400 \text{ ml of compound} \times \frac{1}{200} \times 22400 = 112$

$$n = \frac{\text{Mol. mass}}{\text{Emp. formula mass}} = \frac{112}{28} = 4$$
 Therefore, Molecular formula = $(CH_2N)_4 = C_4H_8N_4$
7. (d) Minimum mass of sulphur = wt. of its one atom = 32
 $\therefore 3.4 \text{ gms of sulphur present in } 100 \text{ gms.}$
 $\therefore 32 \text{ gms of sulphur present in } = \frac{100 \times 32}{3.4} = 940$
8. (c) Halogen is estimated by carius method.
9. (b) $\therefore 1.8 \text{ gm water obtained from } 1.4 \text{ gm hydrocarbon}$
 $\therefore 18 \text{ gm water obtained from } = \frac{1.4}{1.8} \times 18 = 14 \text{ gm.}$
 Empirical formula Mass = 14
 $\therefore$ Empirical formula = CH_2
10. (c) In carius method sulphur of organic compound is converted in to H_2SO_4

11. (b) % of chlorine = $\frac{35.5}{143.5} \times \frac{\text{Mass of } AgCl}{\text{Mass of substance}} \times 100$
 $= \frac{35.5}{143.5} \times \frac{0.287}{0.099} \times 100 = 71.71\%$
12. (b) % of C = $\frac{12}{44} \times \frac{\text{Mass of } CO_2}{\text{Mass of substance}} \times 100$
 $= \frac{12 \times 0.22}{44 \times 0.24} \times 100 = 25; C = 25, H = 1.66$
 Total = $26.6 = 100 - 26.6 = 73.4$
13. (c) Element No. of Moles Simple Ratio
 $C = 74$ $74/12 = 6.1$ $6.1/1.2 = 5.08$ or 5
 $H = 8.65$ $8.65/1 = 8.65$ $8.6/1.2 = 7.16$ or 7
 $N = 17.3$ $17.3/14 = 1.2$ $1.2/1.2 = 1$ or 1
 Therefore Empirical formula = C_5H_7N
15. (a) Mol. mass of an acid = Equivalent wt. $\times$ basicity.
16. (b) If molecular formula is different than molecular weight is also different.
17. (c) Empirical formula mass = $C_2H_5O = 24 + 5 + 16 = 45$

$$n = \frac{\text{Mol. mass}}{\text{Emp. mass}} = \frac{90}{45} = 2$$
 Mol. formula = $(C_2H_5O)_2 = C_4H_{10}O_2$
18. (d) Element No. of Moles Simple Ratio
 $C = 24$ $24/12 = 2$ 1
 $H = 4$ $4/1 = 4$ 2
 $O = 32$ $32/16 = 2$ 1
 Therefore CH_2O
19. (a) Element No. of Moles Simple Ratio
 $C = 38.8$ $38.8/12 = 3.2$ 1
 $H = 16$ $16/1 = 16$ 5
 $N = 45.2$ $45.2/14 = 3.2$ 1
 Therefore, Empirical formula = CH_5N or CH_3NH_2
20. (d) % of N = $\frac{1.4 \times V \times N}{W}$
 where V = Volume of acid used
 N = Normality of acid, W = Weight of substance
21. (b) Element No. of Moles Simple Ratio
 $C = 54.5$ $54.5/12 = 4.54$ 2
 $H = 9.1$ $9.1/1 = 9.1$ 4
 $O = 36.4$ $36.4/16 = 2.27$ 1
 Hence, C_2H_4O
22. (a) Element No. of Moles Simple Ratio
 $C = 92.31$ $92.31/12 = 7.69$ 1
 $H = 7.69$ $7.69/1 = 7.69$ 1
 Hence, CH
 Empirical formula mass of CH = 13

$$n = \frac{\text{Mol. mass}}{\text{Emp. mass}} = \frac{78}{13} = 6$$

$$\text{Molecular formula} = (\text{CH})_6 = \text{C}_6\text{H}_6.$$

23.	(c)	Element	No. of Moles	Simple Ratio
		C = 53.3	53.3/12 = 4.44	2
		H = 15.6	15.6/1 = 15.6	7
		N = 31.1	31.1/14 = 2.22	1

$$\text{Hence, formula} = \text{C}_2\text{H}_7\text{N} \quad (\text{CH}_3\text{CH}_2\text{NH}_2).$$

24.	(c)	Element	No. of Moles	Simple Ratio
		C = 80	80/12 = 6.66	1
		H = 20	20/1 = 20	3

$$\text{Hence formula} = \text{CH}_3 \text{ or } \text{C}_2\text{H}_6.$$

25.	(c)	Elements	Simple ratio
		C = 50	50/12 = 4
		O = 50	50/16 = 3

$$\text{Empirical formula} = \text{C}_4\text{O}_3$$

$$\text{Empirical formula mass} = 96$$

$$n = \frac{290}{96} = 3$$

$$\text{Molecular formula} = (\text{C}_4\text{O}_3)_3 = \text{C}_{12}\text{O}_9.$$

26.	(c)	Element	No. of moles	Simple ratio
		C = 83.7%	83.7/12 = 6.9	6.9/6.9 = 1 × 3 = 3
		H = 16.3%	16.3/1 = 16.3	16.3/0.9 = 2.3 × 3 = 7

$$\text{Empirical formula} = \text{C}_3\text{H}_7.$$

27.	(d)	Elements	No. of moles	Simple ratio
		C 60%	60/12 = 5	3.01
		H 13.3%	13.3/1 = 13.3	8.01
		O 26.7%	26.7/16 = 1.66	1

$$\text{Empirical formula} = \text{C}_3\text{H}_8\text{O}.$$

28.	(a)	Element	No. of moles	Simple ratio
		C 85.72%	85.72/12	7.14 = 1
		H 14.18%	14.18/1	14.18 = 2

$$\text{Empirical formula} = \text{C}_2\text{H}_4.$$

29.	(c)	Elements	No. of moles	Simple ratio
		C (24 gm)	24/12 = 2	1
		H (8 gm)	8/1 = 8	4
		O (32 gm)	32/16 = 2	1

$$\text{Empirical formula} = \text{CH}_4\text{O}$$

30.	(a)	Elements	No. of moles	Simple ratio
		C 6	6/12 = 0.5 = 1	1
		H 1	1/1 = 1 = 2	2
		O 8	8/16 = 0.5 = 1	1

$$\text{Thus, Empirical formula} = \text{CH}_2\text{O}$$

$$\text{Empirical formula mass} = 30$$

$$\text{Mol. mass} = 2 \times \text{V.D.} = 2 \times 30 = 60$$

$$n = \frac{60}{30} = 2$$

$$\text{Mol. formula} = (\text{CH}_2\text{O})_2 = \text{C}_2\text{H}_4\text{O}_2.$$

$$31. \quad (d) \quad \text{Molecular mass} = 2 \times \text{V.D.} = 2 \times 37 = 74.$$

32.	(c)	Elements	No. of moles	Simple ratio
		C = 80%	80/12 = 6.66	1
		H = 20%	20/1 = 20	3

$$\text{Hence, Empirical Formula} = \text{CH}_3.$$

33.	(b)	Elements	No. of moles	Simple ratio
		C = 40%	40/12	3.33 1
		H = 6.7%	6.7/1	6.7 2
		O = 53.3%	53.3/16	3.33 1

$$\text{Thus, Empirical formula} = \text{CH}_2\text{O}.$$

$$34. \quad (b) \quad n = \frac{\text{Molecular mass}}{\text{Empirical mass}}$$

35.	(c)	Element	No. of moles	Simple ratio
		C = 40%	40/12	3.33 1
		H = 13.33%	13.33/1	13.33 4
		N = 46.67%	46.67/14	3.33 1

$$\text{Thus formula} = \text{CH}_4\text{N}.$$

36.	(a)	Elements	No. of moles	Simple ratio
		C = 18.5%	18.5/12	⇒ 1.54 1
		H = 1.55%	1.55/1	⇒ 1.55 1
		Cl = 55.04%	55.04/35.5	⇒ 1.55 1
		O = 24.81%	24.81/16	⇒ 1.55 1

$$\text{Hence, formula} = \text{CHClO}.$$

$$38. \quad (a) \quad \% \text{ of S} = \frac{32}{233} \times \frac{\text{wt. of BaSO}_4}{\text{wt. of organic compound}} \times 100$$

$$= \frac{32}{233} \times \frac{0.35}{0.2595} \times 100 = 18.52\% \text{ gm}.$$

39. (d) Kjeldahl's method depends upon the fact that most of the organic compounds containing nitrogen are quantitatively decomposed to give $(\text{NH}_4)_2\text{SO}_4$ when heated strongly with conc. H_2SO_4 . In this method CuSO_4 acts as catalytic agent.

40. (d) Nitrates on reaction with conc. H_2SO_4 and FeSO_4 give a brown ring due to formation of $\text{FeSO}_4 \cdot \text{NO}$ or $[\text{Fe}(\text{H}_2\text{O})_5\text{NO}]\text{SO}_4$.

41. (b) Molecular weight of CHCl_3 is 120

42. (c) Urea (NH_2CONH_2) has molecular wt. 60 and wt. of Nitrogen is 28

$$\text{In 60 gm of urea nitrogen present} = 28 \text{ gm}$$

$$\text{In 100 gm of urea nitrogen present} = \frac{2800}{60} = 46.66\%$$

44. (a) Anhydrous CuSO_4 is used to test presence of water in any liquid because it changes its colour white to blue.

48. (a) Molecular weight of $\text{C}_3\text{H}_6\text{O}_3$ is 90.

49. (a) Molecular weight = $\text{V.D.} \times 2 = 23 \times 2 = 46$

Molecular weight of $C_2H_6O = 46$

52. (c) Molecular weight of $C_4H_8O_4$ is 120.

53. (c) Molecular mass

$$= \frac{\text{wt. of organic substance taken}}{\text{air displaced at STP}} \times 22400$$

$$= \frac{0.2}{56} \times 22400 = 80.$$

57. (a) Liquid ammonia is used as a coolant in ice factories and cold storages.
58. (b) Chromatography is the latest technique for the purification of organic compounds. Chromatography are of various type viz. Column chromatography, gas chromatography, paper chromatography etc.
59. (c) Halogens are detected by Beilstein's test. In this test, a copper wire is dipped in original solution and heated in a bunsen burner flame. Green colour is imparted to the flame, due to the formation of a volatile copper halide. This proves the presence of halogen.
60. (d) *o*-nitro phenol has intra molecular hydrogen bonding, while *p*-nitrophenol has intermolecular hydrogen bonding (comparitively stronger). Due to this reason, the boiling point of *o*-nitrophenol is found quite less than that of *p*-nitrophenol. Hence, *o*-nitrophenol is steam volatile and can be separated from *p*-nitrophenol by steam distillation.
61. (b) The mixture of conc. H_2SO_4 and conc. HNO_3 is called nitrating mixture. It is used in the nitration of aryl compounds.

62. (d) Kjeldahl's and Duma's methods are used for the quantitative estimation of nitrogen in an organic compound. In the Kjeldahl method, the nitrogen element of organic compound is changed to the ammonia.
63. (b) Homolytic fission is favoured by sunlight. In it, each bonded atom takes away its shared electrons and thus free radicals are produced.

64. (a) Equivalent of NH_3 evolved

$$= \frac{100 \times 0.1 \times 2}{1000} - \frac{20 \times 0.5}{1000} = \frac{1}{100}$$

percent of nitrogen in the unknown organic compound

$$= \frac{1}{100} \times \frac{14}{0.3} \times 100 = 46.6\%$$

percent of nitrogen in urea $(NH_2)_2CO$

$$= \frac{14 \times 2}{60} \times 100 = 46.6\%$$

$\therefore$ The compound must be urea.

65. (b) Mixture of benzoic acid and naphthalene can be separated from hot water in which benzoic acid dissolves but naphthalene does not.

66. (d) Empirical formula weight C_2H_4O

$$= (12 \times 2 + 4 + 16) = 44$$

$$\text{Molecular formula} = \frac{\text{mol. wt}}{\text{eq. formula wt.}} \times \text{Emp. Formula}$$

$$= \frac{132.1}{44} \times \text{Empirical formula}$$

$$= 3 \times C_2H_4O = C_6H_{12}O_3$$

67. (d) Mol. wt = 2 $\times$ Vap. Density

$$= 2 \times 45 = 90$$

Empirical formula weight

$$= 12 + 2 + 16 = 30$$

$$\therefore n = \frac{\text{mol. wt.}}{\text{empirical formula wt.}}$$

$$= \frac{90}{30} = 3$$

$\therefore$ Molecular formula of the compounds

$$= (CH_2O)_3 = C_3H_6O_3$$

69. (d) CH_3COOH and $C_6H_{12}O_6$ both have same percentage of carbon i.e. 40%.

72. (c) Distillation particularly fractional distillation because the boiling point of benzene ($80^\circ C$) and chloroform ($61.5^\circ C$) are close.

Fractional distillation involves repeated distillations and condensations, in a fractionating column. As a result of distillation and condensation at each point of the fractionating column, the vapours rising up become richer in more volatile component and the liquid falling back into the flask becomes richer in less volatile component. Thus, the low boiling liquid distils first while the higher boiling liquid distils afterwards.

73. (a) Chemical method using $NaHCO_3$ solution.

75. (e) $C_2H_5Cl \xrightarrow{-HCl} C_2H_4$

$$\begin{array}{cc} 64.5 & 28 \\ 32.25 & 28 \end{array}$$

$$64.5 \text{ gm } C_2H_5Cl \text{ gives } 28 \text{ gm of } C_2H_4$$

$$32.25 \text{ gm } C_2H_5Cl \text{ gives } = \frac{28 \times 32.25}{64.5}$$

$$= 14 \text{ gm of } C_2H_4$$

Obtained product is 50% so mass of obtained alkene

$$= \frac{14}{2} = 7 \text{ gm}$$

76. (e) Percentage of sulphur

$$= \frac{32}{233} \times \frac{\text{mass of } BaSO_4}{\text{mass of organic compound}} \times 100$$

$$= \frac{32}{233} \times \frac{1.158}{0.53} \times 100 = 30\%$$

Classification and nomenclature of organic compounds

C-2 is quaternary carbon because it is attached to 4 other carbon atoms.

It consist 2 primary carbon (a carbon to which single carbon is bonded) and one secondary carbon. Its structure show that it contain only primary hydrogen.

Ketones are named by adding the suffix '-one' in place of '-e' of alkane. Thus IUPAC name is propanone.

Critical Thinking Questions

1. (c) 116 mg compounds means $116 \times 10^{-3} \text{ gm}$ compound since 1 mg contain 10^{-3} gm
Mol. wt. of compound
$$= \frac{\text{mass of the substance}}{\text{volume of the vapour at S.T.P.}} \times 22400$$

$$= \frac{116 \times 10^{-3}}{44.8} \times 22400 = 57.99\% \text{ or } 58.0\%$$

2. (b) Element.	No. of moles	Simple ratio
C	12 49.3/12 = 4.1	4.1/2.7 = 1.3 × 2 = 2.6 = 3
H	1 6.84/1 = 6.84	6.84/2.7 = 2.5 × 2 = 5
O	16 43.86/16 = 2.7	2.7/2.7 = 1 × 2 = 2

Empirical formula = $\text{C}_3\text{H}_5\text{O}_2$

E.F. wt. = $12 \times 3 + 1 \times 5 + 16 \times 2 = 73$

Molecular wt = V.D. × 2 = $73 \times 2 = 146$

$$n = \frac{M.wt}{E.F.wt} = \frac{146}{73} = 2$$

Molecular formula = (E.F.)₂ = $(\text{C}_3\text{H}_5\text{O}_2)_2 = \text{C}_6\text{H}_{10}\text{O}_4$.

3. (c) Mass of silver salt taken = 0.228 gm
Mass of silver left = 0.162 gm
Basicity of acid = 2
Step 1 – To calculate the equivalent mass of the silver salt (E)
$$\frac{\text{Eq. mass of silversalt}}{\text{Eq. mass of silver}} = \frac{\text{Mass of Acid taken}}{\text{Mass of silver left}}$$

$$= \frac{E}{108} = \frac{0.228}{0.162}$$

$$= E = \frac{0.228}{0.162} \times 108 = 152 (\text{Eq. mass of silversalt})$$

Step 2 – To calculate the eq. mass of acid.

Eq. mass of acid =

Eq. mass of silver salt – Eq. mass of Ag + Basicity

= $152 - 108 + 1 = 152 - 109 = 43$ (Eq. mass of acid)

Step 3 – To determine the molecular mass of acid.

Mol. mass of the acid = Eq. mass of acid × basicity = $43 \times 2 = 86$.

4. (d) $\therefore 0.0833$ mole carbohydrate has hydrogen = 1g
 $\therefore 1$ mole carbohydrate has hydrogen

$$= \frac{1}{0.0833} = 12g$$

Empirical Formula (CH_2O) has hydrogen = 2g

$$\text{Hence } n = \frac{12}{2} = 6$$

Hence molecular formula of carbohydrate = $(\text{CH}_2\text{O})_6$

$$= \text{C}_6\text{H}_{12}\text{O}_6$$

5. (e) Solution contain $\text{He} + \text{CH}_4$

Their mol. wt = $4 + 16 = 20$

$$\% \text{ wt of } \text{CH}_4 = \frac{\text{wt of } \text{CH}_4}{\text{Total wt}} \times 100 = \frac{16}{20} \times 100 = 80.0\%$$

6. (b)
$$\% \text{ of H} = \frac{2}{18} \times \frac{\text{wt. of } \text{H}_2\text{O}}{\text{wt. of organic compound}} \times 100$$

$$= \frac{2}{18} \times \frac{0.9}{0.5} \times 100 = 20\%$$

Since percentage of hydrogen is 20. Therefore, remaining is carbon i.e. 80 %.

7. (b) Some compound like hydrazine (NH_2NH_2) although contain nitrogen, they do not respond Lassaigne's test because they do not have any carbon & hence NaCN is not formed.
8. (a) Due to its volatile nature camphor is often used in molecular mass determination.
9. (d) In Kjeldahl's method, the nitrogen is estimated in the form of ammonia, which is obtained by heating compounds with NaOH .

10. (d) Mol. wt of $\text{C}_2\text{H}_5\text{OH}$
 $= 2 \times 12 + 5 + 16 + 1 = 64$
 $\therefore 48g \text{ C}_2\text{H}_5\text{OH}$ has H atom = $6 \times N_A$
 $\therefore 0.046g \text{ C}_2\text{H}_5\text{OH}$ has H atoms
$$= \frac{6 \times 6.02 \times 10^{23} \times 0.046}{46} = 3.6 \times 10^{21}$$

11. (a) $C = 10.5 \text{ gm} = \frac{10.5}{12} \text{ mol} = 0.87 \text{ mol}$

$$H = 1 \text{ gm} = \frac{1}{1} = 1 \text{ mol}$$

$$\therefore (\text{C}_{0.87}\text{H}_1)_7 = \text{C}_{6.09}\text{H}_7 \approx \text{C}_6\text{H}_7$$

$$PV = nRT; \quad PV = \frac{w}{m} RT$$

$$1 \times 1 = \frac{2.4}{m} \times 0.082 \times 400$$

$$m = 2.4 \times 0.082 \times 400 = 78.42 \approx 79$$

8. (a) In naming cycloalkenes, number the ring to give the double bonded carbons 1 and 2 and choose the direction of numbering so that the substituents get the lowest numbers. The position of the double bond is not indicated because it is known to bond between C-1 and C-2.

So,

9. (a) On adding FeCl_3 solution to sodium extract during testing for nitrogen a red precipitate is obtained. It is due to the presence of sulphur also.

Assertion and Reason

- (b) Chromatography is used to separate almost any given mixture. Whether coloured or colourless into its constituents and to test the purities of these constituents.
- (e) Paper chromatography is a liquid-liquid partition chromatography in which the water is adsorbed or chemically bond to cellulose of paper which acts as the stationary phase while the mobile phase is another liquid which is usually a mixture of two or three solvents in which water is one of the components.
- (b) On shaking with concentrated H_2SO_4 thiophene being more reactive undergoes sulphonation and the thiophene-2-sulphonic acid thus formed dissolves in concentrated H_2SO_4
- (c) As, the functional group is $-\text{COOH}$, the numbering is done from RHS to give minimum number to carbon atom bearing the functional group. Rewriting the above structure

$$\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3 - \text{CH} - \text{CH}_2 - \text{COOH} \end{array}$$
The chain consists of four carbon atoms. Hence it's a derivative of butane. The substituent is the methyl group. So the above compound is 3-methyl butanoic acid.
- (b) Petroleum can be refined by fractional distillation since it separate crude petroleum into useful fractions such as gasoline, kerosine oil, diesel oil, lubricating oil etc.,
- (e) In lassaing test potassium can not be used in place of sodium as potassium reacts vigorously and its use causes explosion.

Purification, Classification and
Nomenclature of Organic compounds

SET Self Evaluation Test -22

1. IUPAC name for the compound

[CBSE PMT 1998]

- (a) *trans* 3-iodo, 4-chloro, 3-pentene
 (b) *cis* 3-chloro, 3-iodo, 2-pentene
 (c) *trans* 2-chloro, 3-iodo, 2-pentene
 (d) *cis* 3-iodo, 4-chloro, 3-pentene

2. The IUPAC name of the following structure is

[RPMT 1997]

- (a) 3-ketobutanoic acid
 (b) 2-ketobutanoic acid
 (c) 4-ketobutanoic acid
 (d) 3-oxopropanoic acid

3. IUPAC name of the following compound

[UPSEAT 2001]

- (a) 1,2-epoxy butane
 (b) Ethyl methyl ether
 (c) Keto pentanone
 (d) None of these

4. The IUPAC name of

[CPMT 2000]

- (a) 2,2-diethyl-5-methyldecane
 (b) 3,3-ethyl-5-methyldecane
 (c) 3,3-diethyl-5-methylhexane
 (d) 3,3-diethyl-4-methyl octane
5. The empirical formula of compound is CH_2O . If its molecular weight is 180. The molecular formula of the compound is

[AIIMS 1999; CPMT 1999; AFMC 1999; BHU 1999]

- (a) $\text{C}_3\text{H}_6\text{O}_3$ (b) $\text{C}_4\text{H}_8\text{O}_4$
 (c) $\text{C}_6\text{H}_{12}\text{O}_6$ (d) $\text{C}_5\text{H}_{10}\text{O}_5$

6. Accurate determination of atomic masses is done with the instrument called as

[Kerala (Med.) 2002]

- (a) Spectrophotometer
 (b) Mass spectrometer
 (c) Atomic absorption spectrometer
 (d) Calorimeter

7. In a compound C, H and N atoms are present in 9 : 1 : 35 by weight. Molecular weight of compound is 108. Molecular formula of compound is

[AIEEE 2002]

- (a) $\text{C}_2\text{H}_6\text{N}_2$ (b) $\text{C}_3\text{H}_4\text{N}$
 (c) $\text{C}_6\text{H}_8\text{N}_2$ (d) $\text{C}_9\text{H}_{12}\text{N}_3$

8. An alkane has a C/H-ratio (by mass) of 5.1428. Its molecular formula is

[KCET (Engg./Med.) 1999]

- (a) C_5H_{12} (b) C_6H_{14}
 (c) C_8H_{18} (d) C_7H_{10}

9. 58 ml of
- $\frac{N}{5} \text{H}_2\text{SO}_4$
- are used to neutralize ammonia given by 1 g of organic compound. Percentage of nitrogen in the compound is

- (a) 34.3 (b) 82.7
 (c) 16.2 (d) 21.6

10. The IUPAC name for
- $\text{CH}_3\text{CHOHCH}_2 - \begin{array}{c} \text{CH}_3 \\ | \\ \text{C} - \text{OH} \\ | \\ \text{CH}_3 \end{array}$
- is

[AIIMS 1992; MNR 1992; JIPMER 1997]

- (a) 1,1-dimethyl-1,3-butanediol
 (b) 2-methyl-2,4-pentanediol
 (c) 4-methyl-2,4-pentanediol
 (d) 1,3,3-trimethyl-1,3-propanediol

11. Choose the correct IUPAC name of the compound

- (a) 2,3-dimethyl-4-hexyne
 (b) 4,5-dimethyl-2-hexyne
 (c) 5-propyl-2-pentyne
 (d) 2-propyl-3-pentyne

Trans 2-chloro, 3-iodo, 2-pentene

3-keto butanoic acid

1, 2 epoxy butane

3, 3 di ethyl -4-methyl octane.

5. (c) Molecular formula = (Emperical formula).

$$n = \frac{\text{Molecular weight}}{\text{Emperical formula wt.}} = \frac{180}{30} = 6$$

$$= (\text{CH}_2\text{O})_6 = \text{C}_6\text{H}_{12}\text{O}_6$$

6. (b) Atomic masses, determined by the mass spectrometer.

7. (c) Molecular weight of compound = 108

$$\text{C}^{12} \rightarrow 12 \times 6 = 72$$

$$\text{H}^1 \rightarrow 1 \times 8 = 8$$

$$\text{N}^{14} \rightarrow 14 \times 2 = 28$$

Total molecular weight = 108

$$\therefore \text{Molecular formula} = \text{C}_6\text{H}_8\text{N}_2$$

$$6n = 5.1428n + 5.1428 = 0.8572n + 5.1428$$

$$n = \frac{5.1428}{0.8572} = 6$$

$$\text{molecular formula} = \text{C}_6\text{H}_{2n+2} = \text{C}_6\text{H}_{14}.$$

9. (c) $\% \text{ of N} = \frac{1.4 \times \text{Normality of acid} \times \text{Volume of acid}}{\text{Mass of substance}}$

$$= \frac{1.4 \times 1 \times 58}{1 \times 5} = 16.2.$$

2-methyl -2, 4 - pentane diol

4, 5-di methyl -2-hexyne

8. (b) The ratio of C/H in an alkane is 5.1428.

Alkanes have General formula $\text{C}_n\text{H}_{2n+2}$

The mass ratio of $\frac{\text{C}}{\text{H}}$ is $\frac{12n}{2n+2}$ or $\frac{6n}{n+1}$

$$\frac{6n}{n+1} = 5.1428$$

Chapter 23

General Organic Chemistry

Carbon is an essential element of organic compounds, it has four electrons in its outer most shell.

According to the ground state electronic configuration of carbon, it is divalent. Tetravalency of carbon can be explained by promoting one of the $2s^2$ - electrons to the unoccupied $2p_{z1}$ atomic orbital.

The four valencies of carbon atom are similar and they are symmetrically arranged around the carbon atom. According to **Le Bell and Van't Hoff** the four valencies of carbon do not lie in one plane. They are directed towards the corners of a regular tetrahedron with carbon atom at the centre and the angle between any two valencies is 109.28° .

Hybridisation in Organic Compounds

(i) The process of mixing atomic orbitals to form a set of new equivalent orbitals is termed as **hybridisation**. There are *three types* of hybridisation,

- (i) sp^3 **hybridisation** (involved in saturated organic compounds containing only single covalent bonds),
- (ii) sp^2 **hybridisation** (involved in organic compounds having carbon atoms linked by double bonds) and
- (iii) sp **hybridisation** (involved in organic compounds having carbon atoms linked by a triple bonds).

Table : 23.1

Type of hybridisation	sp^3	sp^2	sp
Number of orbitals used	1s and 3p	1s and 2p	1s and 1p
Number of unused p-orbitals	Nil	One	Two
Bond	Four σ	Three σ One π	Two σ Two π
Bond angle	109.5°	120°	180°
Geometry	Tetrahedral	Trigonal planar	Linear
% s-character	25 or 1/4	33.33 or 1/3	50 or 1/2

(2) **Determination of hybridisation at different carbon atoms** : It can be done by two methods,

(i) **First method** : In this method hybridisation can be know by the number of π - bonds present on that particular atom.

Number of π - bond/s	0	1	2
--------------------------	---	---	---

Type of hybridisation

sp

sp

sp

Examples :

□ In diamond carbon is sp hybridised and in graphite carbon is sp^2 hybridised.

(ii) **Second method** : (Electron pair method)

$ep = bp + lp$; where ep = electron pair present in hybrid orbitals, bp = bond pair present in hybrid orbitals

Number of bp = Number of atoms attached to the central atom of the species

$$s > sp > sp^2 > sp^3 > p$$

% s-character and electronegativity in decreasing order.

(iii) **Bond length variation in hydrocarbons**

% of s orbital character

$$\propto \frac{1}{C-C \text{ bond length}} \propto \frac{1}{C-H \text{ bond length}}$$

Table : 23.2

Bond type (C – H)	Bond length	Bond type (C – C)	Bond length
$sp^3 - s$ (alkanes)	1.112 Å	$sp^3 - sp^3$ (alkanes)	1.54 Å
$sp^2 - s$ (alkenes)	1.103 Å	$sp^2 - sp^2$ (alkenes)	1.34 Å
$sp - s$ (alkynes)	1.08 Å	$sp - sp$ (alkynes)	1.20 Å

(iv) **Bond strength in hydrocarbons** : The shorter is the bond length, the greater is the compression between atomic nuclei and hence greater is the strength of that bond.

Table : 23.3

Bond type (C – H)	Bond energy (kcal/mole)	Bond type (C – C)	Bond energy (kcal/mole)
$sp^3 - s$ (in alkanes)	104	$sp^3 - sp^3$ (in alkanes)	80 – 90
$sp^2 - s$ (in alkenes)	106	$sp^2 - sp^2$ (in alkenes)	122 – 164
$sp - s$ (in alkynes)	121	$sp - sp$ (in alkynes)	123 – 199

(v) **Acidity of hydrocarbons**

(a) Hydrogen present on electronegative carbon is acidic in nature.

(b) Acidity of hydrogen is directly proportional to the electronegativity of the atom on which hydrogen is present.

Thus

Electronegativity of the atoms
Acidity of compounds in decreasing order

(c) Acidity of hydrocarbon $\propto$ % of s-character

	$CH \equiv CH$	$CH_2 = CH_2$	$CH_3 - CH_3$
% s-character	50	33.33	25
pKa	25	44	50

s-character and acidity in decreasing order

$$\text{Acidity} \propto K_a \text{ and } \text{Acidity} \propto \frac{1}{pK_a} (pK_a = -\log K_a)$$

Order of acidic nature of alkynes is,

The relative acidic character follows the order;

Number of lp 's can be determined as follows,

(a) If carbon has π - bonds or positive charge or odd electron, then lp on carbon will be zero.

(b) If carbon has negative charge, then lp will be equal to one.

Number of electron pairs (ep) tells us the type of hybridisation as follows,

ep	2	3	4	5	6
Type of hybridisation	sp	sp^2	sp^3	sp^3d	sp^3d^2

Example :

(3) **Applications of hybridisation**

(i) **Size of the hybrid orbitals** : Since s - orbitals are closer to the nucleus than p - orbitals, it is reasonable to expect that *greater the s character of an orbital the smaller it is*. Thus the decreasing order of the size of the three hybrid orbitals is opposite to that of the decreasing order of s orbital character in the three hybrid orbitals.

$$sp^3 > sp^2 > sp$$

(ii) **Electronegativity of different orbitals**

(a) Electronegativity of s -orbital is maximum.

(b) Electronegativity of hybrid orbital $\propto$ % s -character in hybrid orbitals

Orbital	sp	sp^2	sp^3
% s-character	50	33.33	25

s-character in decreasing order and electronegativity in decreasing order

Thus sp -hybrid carbon is always electronegative in character and sp^3 - hybrid carbon is electropositive in character. sp^2 -hybrid carbon can behave as electropositive (in carbocation) as well as electronegative (in carbanion) in character.

(c) Electronegativities of different hybrid and unhybrid orbitals in decreasing order is as follows

Obviously, the basic character of their conjugate bases follows the reverse order, i.e.,

Steric effect

On account of the presence of bulkier groups at the reaction centre, they cause mechanical interference and with the result the attacking reagent finds it difficult to reach the reaction site and thus slows down the reaction. This phenomenon is called **steric hindrance** or **steric effect**.

(1) Tertiary alkyl halides having bulky groups form tertiary carbocation readily when hydrolysed because of the presence of the three bulky groups on the carbon having halogen.

(2) Primary alkyl halide having quaternary β -carbon does not form transition state because of the steric strain around α -carbon by the β -carbon. To release the strain it converts into carbocation.

(3) Steric strain inhibits the resonance. This phenomenon is known as **steric inhibitions of resonance**.

Electronic displacement in covalent bonds

It is observed that most of the attacking reagents always possess either a positive or a negative charge, therefore for a reaction to take place on the covalent bond the latter must possess oppositely charged centres. This is made possible by displacement (partial or complete) of the bonding electrons. The electronic displacement in turn may be due to certain effects, some of which are **permanent** and others are **temporary**. The former effects are permanently operating in the molecule and are known as **polarisation effects**, while the latter are brought into play by the attacking reagent and as soon as the attacking reagent is removed, the electronic displacement disappears; such effects are known as the **polarisability effects**.

Inductive effect or Transmission effect

(1) When an electron withdrawing (X) or electron-releasing (Y) group is attached to a carbon chain, polarity is induced on the carbon atom and on the substituent attached to it. This permanent polarity is due to displacement of shared electron of a covalent bond towards a more electronegative atom. This is called **inductive effect** or simply as **I-effect**.

$C - C - C - C$ Non polar

(2) Carbon-hydrogen bond is taken as a standard of inductive effect. Zero effect is assumed for this bond. Atoms or groups which have a greater electron withdrawing capacity than hydrogen are said to have $-I$ effect whereas atoms or groups which have a greater electron releasing power are said to have $+I$ effect.

$-I$ power of groups in decreasing order with respect to the reference H

$ter. alkyl > sec. alkyl > pri. alkyl > CH_3 > H$

$+I$ power in decreasing order with respect to the reference H

$+I$ power $\propto$ number of carbon in the same type of alkyl groups

$+I$ power in decreasing order in same type of alkyl groups

(3) Applications of Inductive effect

(i) **Magnitude of positive and negative charges**: Magnitude of $+ve$ charge on cations and magnitude of $-ve$ charge on anions can be compared by $+I$ or $-I$ groups present in it.

$$\bullet \text{ Magnitude of } +ve \text{ charge} \propto \frac{1}{+I \text{ power of the group}} \propto -I$$

power of the group.

$$\bullet \text{ Magnitude of } -ve \text{ charge} \propto \frac{1}{-I \text{ power of the group}} \propto +I$$

power of the group.

(ii) **Reactivity of alkyl halide**: $+I$ effect of methyl group enhances $-I$ effect of the halogen atom by repelling the electron towards tertiary carbon atom.

Tertiary $>$ Secondary $>$ Primary $>$ Methyl

(iii) Relative strength of the acids:

(a) Any group or atom showing $+I$ effect decreases the acid strength as it increases the negative charge on the carboxylate ion which holds the hydrogen firmly. Alkyl groups have $+I$ effect.

Thus, acidic nature is,

Formic acid, having no alkyl group, is the most acidic among these acids.

(b) The group or atom having $-I$ effect increases the acid strength as it decreases the negative charge on the carboxylate ion. Greater is the number of such atoms or groups (having $-I$ effect), greater is the acid strength.

Thus, acidic nature is,

(c) Strength of aliphatic carboxylic acids and benzoic acid

Hence benzoic acid is stronger acid than aliphatic carboxylic acids but exception is formic acid. Thus,

□ Decreasing order of acids :

As compared to water, phenol is more acidic ($-I$ effect) but methyl alcohol is less acidic ($+I$ effect).

(vi) **Relative strength of the bases** (Basic nature of $-\text{NH}_2$)

The difference in base strength in various amines can be explained on the basis of inductive effect. The $+I$ effect increases the electron density while $-I$ effect decreases it. The amines are stronger bases than NH_3 as the alkyl groups increase electron density on nitrogen due to $+I$ effect while ClNH_2 is less basic due to $-I$ effect. "So more is the tendency to donate electron pair for coordination with proton, the more is basic nature, i.e., more is the negative charge on nitrogen atom (due to $+I$ effect of alkyl group), the more is basic nature".

Thus, the basic nature decreases in the order;

The order of basicity is as given below;

Alkyl groups ($R-$)	Relative base strength
CH_3	$\text{R}_2\text{NH} > \text{RNH}_2 > \text{R}_3\text{N} > \text{NH}_3$

C_2H_5	$\text{R}_2\text{NH} > \text{RNH}_2 > \text{NH}_3 > \text{R}_3\text{N}$
$(\text{CH}_3)_2\text{CH}$	$\text{RNH}_2 > \text{NH}_3 > \text{R}_2\text{NH} > \text{R}_3\text{N}$
$(\text{CH}_3)_3\text{C}$	$\text{NH}_3 > \text{RNH}_2 > \text{R}_2\text{NH} > \text{R}_3\text{N}$

□ The relative basic character of amines is not in total accordance with inductive effect ($t > s > p$) but it is in the following order: Secondary $>$ Primary $>$ Tertiary. The reason is the steric hindrance existing in the t -amines.

□ In gas phase or in aqueous solvents such as chlorobenzene etc, the solvation effect, i.e., the stabilization of the conjugate acid due to H -bonding are absent and hence in these media the basicity of amines depends only on the $+I$ effect of the alkyl group thus the basicity of amines follows the order : $3^\circ > 2^\circ > 1^\circ > \text{NH}_3$.

(vii) **Basicity of alcohols** : The decreasing order of base strength in alcohols is due to $+I$ effect of alkyl groups.

(viii) **Stability of carbonium ion** : $+I$ effect tends to decrease the (+ve) charge and $-I$ effect tends to increase the +ve charge on carbocation.

(ix) **Stability of carbanion** : Stability of carbanion increases with increasing $-I$ effect.

Resonance effect or mesomeric effect

(i) The effect in which π electrons are transferred from a multiple bond to an atom, or from a multiple bond to a single covalent bond or lone pair (s) of electrons from an atom to the adjacent single covalent bond is called **mesomeric effect** or simply as **M-effect**. In case of the compound with conjugated system of double bonds, the mesomeric effect is transmitted through whole of the conjugated system and thus the effect may better be known as **conjugative effect**.

(2) Groups which have the capacity to increase the electron density of the rest of the molecule are said to have $+M$ effect. Such groups possess lone pairs of electrons. Groups which decrease the electron density of the rest of the molecule by withdrawing electron pairs are said to have $-M$ effect, e.g.,

(a) The groups which donate electrons to the double bond or to a conjugated system are said to have $+M$ effect or $+R$ effect.

$+M$ effect groups :

(b) The groups which withdraw electrons from the double bond or from a conjugated system towards itself due to resonance are said to have $-M$ effect or $-R$ effect.

$-M$ effect groups :

(3) The inductive and mesomeric effects, when present together, may act in the same direction or oppose each other. The mesomeric effect is more powerful than the former. For example, in vinyl chloride due to $-I$ effect the chlorine atom should develop a negative charge but on account of mesomeric effect it has positive charge.

Application of mesomeric effect : It explains,

- (1) Low reactivity of aryl and vinyl halides,
- (2) The acidic nature of carboxylic acids,
- (3) Basic character comparison of ethylamine and aniline,
- (4) The stability of some free radicals, carbocations and carbanions.

Difference between Resonance and Mesomerism : Although both resonance and mesomerism represent the same phenomenon, they differ in the following respect : Resonance involves all types of electron displacements while mesomerism is noticeable only in those cases where a multiple bond is in conjugation with a multiple bond or lone pair of electron.

Example :

Both (i) and (ii) are the examples of mesomerism and resonance

effect. Let us consider the following example $\text{H}-\text{Cl} \longleftrightarrow \text{H}^+-\text{Cl}^-$.

Such an electron displacement is the example of resonance only (not the mesomerism).

Hyperconjugative effect

(1) When a $\text{H}-\text{C}$ bond is attached to an unsaturated system such as double bond or a benzene ring, the sigma (σ) electrons of the $\text{H}-\text{C}$ bond interact or enter into conjugation with the unsaturated system. *The interactions between the electrons of π systems (multiple bonds) and the adjacent σ bonds (single $\text{H}-\text{C}$ bonds) of the substituent groups in organic compounds is called **hyperconjugation**.* The concept of hyperconjugation was developed by Baker and Nathan and is also known as *Baker and Nathan effect*.

In fact hyperconjugation effect is similar to resonance effect. Since there is no bond between the α -carbon atom and one of the hydrogen atoms, the hyperconjugation is also called *no-bond resonance*.

(2) Structural requirements for hyperconjugation

(i) Compound should have at least one sp^2 -hybrid carbon of either alkene alkyl carbocation or alkyl free radical.

(ii) α -carbon with respect to sp^2 hybrid carbon should have at least one hydrogen.

If both these conditions are fulfilled then hyperconjugation will take place in the molecule.

(iii) Hyperconjugation is of three types

(iv) Resonating structures due to hyperconjugation may be written involving "no bond" between the alpha carbon and hydrogen atoms.

(v) Number of resonating structures due to the hyperconjugation = Number of α -hydrogens + 1.

Applications of hyperconjugation

(1) **Stability of alkenes :** Hyperconjugation explains the stability of certain alkenes over other alkenes.

Stability of alkenes $\propto$ Number of alpha hydrogens $\propto$ Number of resonating structures

(2) **Carbon-carbon double bond length in alkenes :** As we know that the more is the number of resonating structures, the more will be single bond character in carbon-carbon double bond.

(3) **Stability of alkyl carbocations :** Stability of alkyl carbocations $\propto$ number of resonating structures $\propto$ number of alpha hydrogens.

(4) **Stability of alkyl free radicals :** Stability of alkyl free radicals can be explained by hyperconjugation. Stability depends on the number of resonating structures.

(5) **Electron releasing (or donating) power of R in alkyl benzene :** CH_3 - (or alkyl group) is +R group, ortho-para directing group and activating group for electrophilic aromatic substitution reaction because of the hyperconjugation.

The electron donating power of alkyl group will depend on the number of resonating structures, this depends on the number of hydrogens present on α -carbon. The electron releasing power of some groups are as follows,

Increasing inductive effect

Electron donating power in decreasing order due to the hyperconjugation.

(6) **Heat of hydrogenation :** Hyperconjugation decreases the heat of hydrogenation.

(7) **Dipole moment :** Since hyperconjugation causes the development of charges, it also affects the dipole moment in the molecule.

The increase in dipole moment, when hydrogen of formaldehyde ($\mu = 2.27D$) is replaced by methyl group, i.e., acetaldehyde ($\mu = 2.72D$) can be referred to hyperconjugation, which leads to development of charges.

(8) **Orienting influence of alkyl group in *o*, *p* -positions and of $-\text{CCl}_3$ group in *m* -position** : Ortho-para directing property of methyl group in toluene is partly due to $+I$ effect and partly due to hyperconjugation.

Reverse Hyperconjugation : The phenomenon of hyperconjugation is also observed in the system given below,

In such system the effect operates in the reverse direction. Hence the hyperconjugation in such system is known as reverse hyperconjugation.

The *meta* directing influence and the deactivating effect of CX_3 group in electrophilic aromatic substitution reaction can be explained by this effect.

Inductomeric effect

Inductomeric effect is the temporary effect which enhances the inductive effect and it accounts only in the presence of an attacking reagent.

Example,

In methyl chloride the $-I$ effect of Cl group is further increased temporarily by the approach of hydroxyl ion.

Electromeric effect

(1) The phenomenon of movement of electrons from one atom to another in multibonded atoms at the demand of attacking reagent is called electromeric effect. It is denoted as E -effect and represented by a curved arrow () showing the shifting of electron pair.

(2) (i) When the transfer of electrons take place towards the attacking reagent, the effect is called $+E$ effect. The addition of acids to alkenes.

Since, $-\text{CH}_3$ group is electron donating, the electrons are transferred in the direction shown.

The attacking reagent is attached to that atom on which electrons have been transferred.

(ii) When the transfer of electrons takes place away from the attacking reagent, the effect is called $-E$ effect. Example, The addition of cyanide ion to carbonyl compounds.

The attacking reagent is not attached to that atom on which electrons have been transferred.

(3) **Direction of the shift of electron pair** : The direction of the shift of electron pair can be decided on the basis of following points.

(i) When the groups linked to a multiple bond are similar, the shift can occur in either direction.

(ii) When the dissimilar groups are linked on the two ends of the double bond, the shift is decided by the direction of inductive effect.

In the case of carbonyl group, the shift is always towards oxygen, i.e., more electronegative atom.

In cases where inductive effect and electromeric effect simultaneously operate, usually electromeric effect predominates.

Cleavage (fission or breaking) of covalent bonds

Breaking of covalent bond of the compound is known as **bond fission**. A bond can be broken by two ways,

(1) **Homolytic bond fission or Homolysis**

(i) In homolysis, the covalent bond is broken in such a way that each resulting species gets its own electron. This leads to the formation of odd electron species known as **free radical**.

(ii) The factor which favours homolysis is that the difference in electronegativity between A and B is less or zero.

(iii) Homolysis takes place in gaseous phase or in the presence of non polar solvents (CCl_4, CS_2), peroxide, UV light, heat ($\geq 500^\circ C$), electricity and free radical.

(iv) Mechanism of the reaction in which homolysis takes place is known as homolytic mechanism or free radical mechanism.

(2) Heterolytic bond fission or heterolysis

(i) In heterolysis, the covalent bond is broken in such a way that one species (*i.e.*, less electronegative) is deprived of its own electron, while the other species gains both the electrons.

Thus formation of opposite charged species takes place. In case of organic compounds, if positive charge is present on the carbon then cation

is termed as **carbocation**. If negative charge is present on the carbon then anion is termed as **carbanion**.

(ii) The factor which favours heterolysis is greater difference of electronegativities between A and B .

(iii) Mechanism of the reaction in which heterolysis takes place is known as heterolytic mechanism or ionic mechanism.

(iv) The energy required for heterolysis is always greater than that for homolysis due to electrostatic forces of attraction between ions.

Reaction Intermediates

Short lived fragments called reaction intermediates result from homolytic and heterolytic bond fission. The important reaction intermediates are free radicals, carbocations, carbanions, carbenes, benzyne and nitrenes.

Table : 23.4

Characteristic	Free radical	Carbocation	Carbanion	Carbene
Nature	Neutral having odd electron	Positive charge on C	Negative charge on C	Neutral, divalent with 2 unshared electrons
Hybridisation	sp^2	sp^2	sp^3 (non-conjugated) sp^2 (Conjugated)	(i) sp^2 (singlet) (ii) sp (triplet)
Structure	Planar	Planar	Pyramidal/Planar	(i) Planar (singlet) (ii) Linear (triplet)
Magnetism	Paramagnetic	Diamagnetic	Diamagnetic	(i) Diamagnetic (ii) Paramagnetic
Stability order	$Ph_3\dot{C} > Ph_2\dot{C}H > Ph\dot{C}H_2 >$ $CH_2 = CH - \dot{C}H_2 > 3^\circ > 2^\circ >$ $1^\circ > \dot{C}H_2 > CH_2 = \dot{C}H$	$Ph_3C^+ > Ph_2CH^+ > PhCH_2^+ >$ $CH_2 = CH - CH_2^+ >$ $3^\circ > 2^\circ > 1^\circ > \dot{C}H_3$	$Ph_3C^- > Ph_2CH^- >$ $PhCH_2^- > Allyl^-$ $CH_2^- > 1^\circ > 2^\circ > 3^\circ$	Triplet > singlet

Benzyne

(1) 1, 2-Didehydrobenzene, C_6H_4 and its derivatives are called benzyne or arynes and the simplest member is benzyne.

(2) It is neutral reaction intermediate derived from benzene ring by removing two substituents, of *ortho* positions, one in the form of electrophile and other in the form of nucleophile leaving behind two electrons to be distributed between two orbitals.

(3) Benzyne intermediate is aromatic in character.

(4) When halobenzene is heated with sodamide formation of benzyne takes place.

(5) (i) It behaves as dienophile and gives Diels-Alder reaction with diene.

(ii) It reacts with strong nucleophile like NH_2

Nitrenes ($R - \ddot{N} :$)

(1) The nitrogen analogues of carbenes are called nitrenes.

(2) There is possibility of two spin states for nitrenes depending on whether the two non-bonding electrons (the normal nitrogen lone pair remains paired) have their spins paired or parallel.

These two may be paired or unpaired

(3) In general nitrenes obey Hunds rule and the ground state triplet with two degenerate sp -orbitals containing a single electron each.

(4) Nitrenes can be generated, in situ, by the following methods,

(i) **By action of Br_2 in presence of a base on a 1° amide** (Hofmann-bromamide reaction),

(ii) **By decomposition of azides in presence of heat or light.**

(iii) Unsubstituted nitrene ($\text{H}-\ddot{\text{N}}:$) can be obtained by photolysis of (or by passing electric discharge through) NH_3 , N_2H_4 or N_3H .

Attacking reagents

The fission of the substrate molecule to create centres of high or low electron density is influenced by attacking reagents. Most of the attacking reagents can be classified into two main groups.

Electrophiles or electrophilic reagents and Nucleophiles or nucleophilic reagents.

(i) **Electrophiles** : Electron deficient species or electron acceptor is an electrophile.

It can be classified into two categories :

(i) **Charged electrophiles** : Positively charged species in which central atom has incomplete octet is called charged electrophile.

All cations are charged electrophiles except cations of 1A, 11A group elements, Al^{+++} and NH_4^+

(ii) **Neutral electrophiles** : It can be classified into three categories,

(a) Neutral covalent compound in which central atom has incomplete octet is neutral electrophile,

(b) Neutral covalent compound in which central atom has complete or expended octet and central atom has unfilled $-d$ -sub-shell is neutral electrophile,

(c) Neutral covalent compound in which central atom is bonded only with two or more than two electronegative atoms is called neutral electrophile.

Cl_2 , Br_2 and I_2 also behave as neutral electrophiles.

Electrophiles are Lewis acids.

(2) **Nucleophiles** : Electron rich species or electron donors are called nucleophiles. Nucleophiles can be classified into three categories :

(i) **Charged nucleophiles** : Negatively charged species are called charged nucleophiles.

(ii) **Neutral nucleophiles** : It can be classified into two categories :

(a) Neutral covalent compound, in which central atom has complete octet, has at least one lone pair of electrons and all atoms present on central atom should not be electronegative, is neutral nucleophile.

(b) Organic compound containing carbon, carbon multiple bond/bonds behaves as nucleophile.

Alkenes, Alkynes, Benzene,

(iii) **Ambident nucleophiles** : Species having two nucleophilic centres out of which, one is neutral (complete octet and has at least one lone pair of electrons) and the other is charged (negative charge) behaves as ambident nucleophile

☐ Organometallic compounds are nucleophiles.

☐ Nucleophiles are Lewis bases.

Organic compounds which behave as an electrophile as well as a nucleophile : Organic compound in which carbon is bonded with electronegative atom (O, N, S) by multiple bond/bonds behaves as electrophile as well as nucleophile :

☐ During the course of chemical reaction electrophile reacts with nucleophile.

☐ Strong Lewis acid is stronger electrophile

$\text{CO}_2 < \text{N}_2\text{O} < \text{SO}_3\text{H}^+$. Stronger is an acid, weaker is its conjugated base or weaker is the nucleophile.

Increasing order of nucleophilicity.

Types of organic reactions

It is convenient to classify the numerous reactions of the various classes of organic compound into four types,

- Substitution reactions, • Addition reaction,
- Elimination reactions, • Rearrangement reactions,

Substitution reactions

Replacement of an atom or group of the substrate by any other atom or group is known as substitution reactions.

(Bromine atom is replaced by hydroxyl group)

Types of substitution reactions : On the basis of the nature of attacking species substitution reactions are classified into following three categories,

- (1) Nucleophilic substitution reactions
- (2) Electrophilic substitution reactions
- (3) Free radical substitution reactions

(1) Nucleophilic substitution reactions

(i) Many substitution reactions, especially at the saturated carbon atom in aliphatic compounds such as alkyl halides, are brought about by nucleophilic reagents or nucleophiles.

Such substitution reactions are called nucleophilic substitution reactions, i.e., S_N reactions (S stands for substitution and N for nucleophile).

(ii) The weaker the basicity of a group of the substrate, the better is its leaving ability.

$$\text{Leaving power of the group} \propto \frac{1}{\text{Basicity of the group}}$$

(iii) The leaving power of some nucleophilic groups are given below in decreasing order,

(iv) In these reactions leaving group of the substrate is replaced by another nucleophile. If reagent is neutral then leaving group is replaced by negative part of the reagent. Negative part of the reagent is always nucleophilic in character.

(v) In S_N reactions basicity of leaving group should be less than the basicity of incoming nucleophilic group. Thus strongly basic nucleophilic group replaces weakly basic nucleophilic group of the substrate.

Basicity of OH^- is more than Cl^- hence OH^- replaces Cl^- as Cl^- .

Basicity of Cl^- is less than OH^- , hence Cl^- will not replace OH^- as OH^- hence reaction (B) will not occur.

(vi) Unlike aliphatic compounds having nucleophilic group as leaving group, aromatic compounds having same group bonded directly with aromatic ring do not undergo nucleophilic substitution reaction under ordinary conditions.

The reason for this unusual reactivity is the presence of lone pair of electron or π bond on the key atom of the functional group. Another factor for the low reactivity is nucleophilic character of aromatic ring.

(vii) The S_N reactions are divided into two classes, S_N2 and S_N1 reactions.

Table : 23.5 Distinction between S_2 and S_1 reactions

Factors	S_2 Reactions	S_1 Reactions
Number of steps	One: $\text{R} : \text{L} + \text{Nu}^- \rightarrow \text{R} : \text{Nu} + \text{L}^-$	Two: (i) $\text{R} : \text{L} \xrightarrow{\text{Slow}} \text{R}^+ + \text{L}^-$ (ii) $\text{R}^+ + \text{Nu}^- \xrightarrow{\text{Fast}} \text{R} : \text{Nu}$
Reaction rate and order	Second order: Rate $\propto [\text{Substrate}] [\text{Nucleophile}]$ or Rate $= K_2 [\text{RL}] [\text{Nu}^-]$	First order: Rate $\propto [\text{Substrate}]$ or Rate $= K_1 [\text{RL}]$
Molecularity	Bimolecular	Unimolecular
TS of slow step	$\delta^- : \text{Nu} \cdots \cdots \text{C} \cdots \cdots \delta^- : \text{L}$	$\delta^+ : \text{Nu} \cdots \cdots \text{C} \cdots \cdots \delta^- \text{L} \cdots \cdots \text{Nu} :$
Reacting nucleophile	The nucleophile attacks the carbon of the substrate exclusively from the back side.	The nucleophile can attack the carbon of the substrate both from the back and front sides although the back side attack

		predominates.
Stereochemistry	Complete inversion of configuration takes place.	Inversion and retention takes place.
Reactivity order of alkyl halides	Methyl > 1° > 2° > 3° halides. ($I > Br > Cl > F$)	3° > 2° > 1° > methyl halides. ($I > Br > Cl > F$)
Rearrangement	No rearranged product is formed (except for allylic).	Rearranged products can be formed.
Nature of nucleophiles	Favoured by strong and high concentration of nucleophiles.	Favoured by mild and low concentration of nucleophiles.
Polarity	Favoured by solvents of low polarity.	Favoured by solvents of high polarity.
Reaction rate determining factor	By steric hindrance.	By electronic factor (stability of $R^{\oplus}$).
Catalysis	Not catalysed by any catalyst (phase transfer).	Catalysed by Lewis and Bronsted acids, e.g., $Ag^{\oplus}$, $AlCl_3$, $ZnCl_2$ and strong HA .

(2) **Electrophilic substitutions reactions** : Electrophilic substitution involves the attack by an electrophile. It is represented as S_E (S stands for substitution and E stands for electrophile). If the order of reaction is 1, it is

written as S_{E1} (unimolecular) and if the order is 2, it is S_{E2} (Bimolecular).

S_1 Reaction mechanism : Electrophilic substitution in aliphatic compounds are very rare; some of the important examples are:

(i) Replacement of the metal atom in an organometallic compound by hydrogen :

(ii) Decarboxylation of silver salt of carboxylic acid by means of bromine:

(iii) Isotopic exchange of hydrogen for deuterium or tritium:

S_2 Reaction mechanism : Electrophilic substitution is very common in benzene nucleus (aromatic compounds) in which π -electrons are highly delocalized and an electrophile can attack this region of high electron density.

In all electrophilic aromatic substitution reactions, it involves:

Step 1. The formation of an electrophile, $E^{\oplus}$, i.e.,

Step 2. The electrophile attacks the aromatic ring to form carbonium ion (or arenium ion) which is in resonance with three other structures.

Step 3. Carbonium ion loses the proton to form substitution product.

The bromination of benzene in the presence of $FeBr_3$ is an example of electrophilic substitution reaction.

Similarly, Nitration, sulphonation and Friedel-Crafts reaction, etc., in benzene nucleus are the other examples of electrophilic substitution reactions.

(3) **Free radical substitution reactions** : Free radical substitution reactions involve the attack by a free radical. These reactions occur by a free radical mechanism which involves Initiation, Propagation and Termination steps. *Examples,*

(i) **Chlorination of methane** : The chlorination of methane in the presence of ultraviolet light is an example of free radical substitution.

(ii) **Arylation of aromatic compounds** (Gomberg reaction) : The reaction of benzene diazonium halide with benzene gives diphenyl by a free radical substitution reaction.

(iii) **Wurtz reaction** : Ethyl bromide on treatment with metallic sodium forms butane, ethane and ethylene by involving free radical mechanism.

(iv) **Allylic bromination by NBS** (*N*-Bromosuccinimide) : NBS is a selective brominating agent and it normally brominates the ethylenic compounds in the allylic ($CH_2 = CH - CH_2 -$) position. This type of reaction involving substitution at the alpha carbon atom with respect to the double bond is termed Allylic substitution. It is also used for benzylic bromination. Some examples are:

Addition reactions

These reactions are given by those compounds which have at least one π bond,

i.e., ($>C=C<$, $-C \equiv C-$, $-\overset{\overset{O}{||}}{C}-$, $C \equiv N$). In such reaction there is loss of one π bond and gain of two σ bonds. Thus product of the reaction is generally more stable than the reactant. The reaction is a spontaneous reaction.

Types of addition reactions : Addition reactions can be classified into three categories on the basis of the nature of initiating species.

(1) Electrophilic additions

(2) Nucleophilic additions

(3) Free radical additions

(i) **Electrophilic addition reactions**

(i) Such reactions are mainly given by alkenes and alkynes.

(ii) Electrophilic addition reactions of alkenes and alkynes are generally two step reactions.

(iii) Alkenes and alkynes give electrophilic addition with those reagents which on dissociation gives electrophile as well as nucleophile.

(iv) If the reagent is a weak acid then electrophilic addition is catalysed by strong acids (Generally H_2SO_4).

(v) Unsymmetrical alkenes and alkynes give addition reactions with unsymmetrical reagents according to Markownikoff's rule.

The negative part of the addendum adds on that doubly bonded carbon of the alkene which has least number of hydrogen atom.

This rule can be used only in those alkenes which fulfil the following conditions:

(a) Alkene should be unsymmetrical.

(b) Substituent/substituents present on doubly bonded carbon/(s) should only be $+I$ group.

(c) If phenyl group is present on doubly bonded carbon, then both doubly bonded carbons should be substituted by phenyl groups.

For example, the following alkenes will give addition according to the Markownikoff's rule.

Following alkenes will not give addition reaction according to Markownikoff's rule.

(vi) Unsymmetrical alkenes having the following general structure give addition according to anti Markownikoff's rule.

Example:

(vii) Mechanism of electrophilic addition reactions is as follows,

(2) **Nucleophilic addition reactions** : When the addition reaction occurs on account of the initial attack of nucleophile, the reaction is said to be a nucleophilic addition reaction. Due to presence of strongly electronegative oxygen atom, the π -electrons of the carbon-oxygen double bond in carbonyl group ($C=O$) get shifted towards the oxygen atom and thereby such bond is highly polarised. This makes carbon atom of the carbonyl group electron deficient.

Example : The addition of HCN to acetone is an example of nucleophilic addition.

The mechanism of the reaction involves the following steps:

Step 1. HCN gives a proton (H) and a nucleophile, cyanide ion (CN^-).

Step 2. The nucleophile ($CN^{\ominus}$) attacks the positively charged carbon so as to form an anion [$H^{\oplus}$ does not initiate the negatively charged oxygen as anion is more stable than cation].

Step 3. The proton (H^+) combines with anion to form the addition product.

In $>C=O$ compounds, the addition of liquid HCN gives cyanohydrin and the addendum is $CN^{\ominus}$ ion and not HCN directly (addition is catalysed by bases or salts of weak acids and retarded by acids or unaffected by neutral compounds).

Nucleophilic addition (A) reactions on carbonyl compounds will be in order:

Decreasing order of nucleophilic addition in some species.

(3) **Free radical addition reactions** : Those reactions which involve the initial attack by a free radical are known as free radical reactions. Addition of hydrogen bromide to alkenes (say, propylene) in the presence of peroxide (radical initiator) follows free radical mechanism. Free radical reactions generally take place in non-polar solvents such as CCl_4 , high temperature, in presence of light or a free radical producing substance like O_2 and peroxides.

Elimination reactions

Elimination reactions are formally the reverse of addition reactions and involve the removal of the two groups (Generally, one being a proton) from one or two carbon atoms of a molecule to form an unsaturated linkage or centre.

Elimination reaction is given by those compounds which have a nucleophilic group as leaving group,

Elimination reactions are generally endothermic and take place on heating.

Elimination reactions are classified into two general types,

- (I) α -elimination reactions or 1, 1-elimination reactions.
- (II) β -elimination reaction or 1, 2-elimination reactions.

(I) **α -elimination reactions or 1, 1-elimination reactions**: A reaction in which both the groups or atoms are removed from the same carbon of the molecule is called α -elimination reaction. This reaction is mainly given by gem dihalides and gem trihalides having at least one α -hydrogen.

Product of the reaction is halocarbenes or dihalocarbenes, which are key intermediates in a wide variety of chemical and photochemical reactions.

(II) **β -elimination reactions or 1, 2-elimination reactions**: Consider the following reactions,

A reaction in which functional group (*i.e.*, leaving group) is removed from α -carbon and other group (Generally hydrogen atom) from the β -carbon is called β -elimination reaction. In this reaction there is loss of two σ bonds and gain of one π bond. Product of the reaction is generally less stable than the reactant.

(I) **Types of β -elimination reactions** : In analogy with substitution reactions, β -elimination reactions are divided into three types:

(i) E (Elimination unimolecular) reaction, (ii) E_c (Elimination bimolecular) reaction and (iii) E_{cb} (Elimination unimolecular conjugate base) reaction

(i) **E (Elimination unimolecular) reaction** : Consider the following reaction,

(a) Reaction velocity depends only on the concentration of the substrate; thus reaction is unimolecular reaction.

$$\text{Rate} \propto [\text{Substrate}]$$

(b) Product formation takes place by the formation of carbocation as reaction intermediate (R).

(c) Since reaction intermediate is carbocation, rearrangement is possible in E reaction.

(d) Reaction is carried out in the presence of polar protic solvent.

(e) The E reaction occurs in two steps,

Step 1.

Step 2.

(ii) **E_i** (Elimination bimolecular) **reaction** : Consider the following reaction,

(a) Reaction velocity depends only on the concentration of the substrate and the base used; thus reaction is bimolecular reaction. Rate $\propto [\text{Substrate}] [\text{Base}]$

(b) Since the reaction is a bimolecular reaction, the product formation will take place by formation of transition state (TS).

(c) Rearrangement does not take place in E_i reaction but in case of allylic compound rearrangement is possible.

(d) Reaction is carried out in the presence of polar aprotic solvent.

(e) The E reaction occurs in one step,

(2) **Orientation in β - elimination reactions** : If substrate is unsymmetrical, then this will give more than one product. Major product of the reaction can be known by two empirical rules.

(i) **Saytzeff rule** : According to this rule, major product is the most substituted alkene *i.e.*, major product is obtained by elimination of $H^{\oplus}$ from that β -carbon which has the least number of hydrogen. Product of the reaction in this case is known as Saytzeff product.

(ii) **Hofmann rule** : According to this rule, major product is always least substituted alkene *i.e.*, major product is formed from β -carbon which has maximum number of hydrogen. Product of the reaction in this case is known as Hofmann product.

❑ In E_1 reactions, product formation always takes place by Saytzeff rule.

❑ In E_{c} reactions, product formation always takes place by Hofmann rule.

□ In E_i reactions, product formation takes place by Saytzeff as well as Hofmann rule. In almost all E_i reactions product formation take place by Saytzeff rule.

(3) Examples of β - elimination reactions

(i) **Dehydrohalogenation** is removal of HX from alkyl halides with alcoholic KOH or KNH_2 or $t\text{-BuOK}$ (Potassium tertiary butoxide) and an example of $\alpha\text{-}\beta$ elimination,

(ii) **Dehydration** of alcohol is another example of elimination reaction. When acids like conc. H_2SO_4 or H_3PO_4 are used as dehydrating agents, the mechanism is E_1 . The proton given by acid is taken up by alcohol.

Dehydration is removal of H_2O from alcohols,

☐ Dehydration of alcohols is in the order:
Tertiary > Secondary > Primary
(3°) (2°) (1°)

□ 2° and 3° alcohol by *E* process and 1° alcohol by *E* process.
Alcohols leading to conjugated alkenes are more easily dehydrated than the alcohols leading to non-conjugated alkenes. $\text{CH}_2 = \text{CH} - \underset{\text{OH}}{\text{CH}} - \text{CH}_3$ is

easily dehydrated than

(iii) **Dehalogenation** : It is removal of halogens, e.g.,

$$\begin{array}{ccc} \text{CH}_3 - \underset{\substack{| \\ \text{OH}}}{\text{CH}} - \text{CH}_3 & \xrightarrow[\text{(-H}_2\text{)}]{\text{Cu, 300}^\circ\text{C}} & \text{CH}_3 - \underset{\substack{|| \\ \text{O}}}{\text{C}} - \text{CH}_3 \\ \text{Isopropyl alcohol} & & \text{Acetone} \end{array}$$

The reactions, which involve the migration of an atom or group from one site to another within the molecule (nothing is added from outside and nothing is eliminated) resulting in a new molecular structure, are known as rearrangement reactions. The new compound is actually the structural isomer of the original one.

(i) **Rearrangement or migration to electron deficient atoms**
(Nucleophilic rearrangement) : Those rearrangement reactions in which migrating group is nucleophilic and thus migrates to electron deficient centre which may be carbon, nitrogen and oxygen.

(2) **Rearrangement or migration to electron rich atoms** (Electrophilic rearrangement) : Those rearrangement reactions in which migrating group is electrophile and thus migrates to electron rich centre.

(4) **Aromatic rearrangement** : Those rearrangement reactions in which the migrating group moves to aromatic nucleus. Aromatic compounds of the type (I) undergo rearrangements in the manner mentioned below,

Isomerism

The difference in properties of isomers is due to the difference in the relative arrangements of various atoms or groups present in their molecules. Isomerism can be classified as follows:

Without referring to space, the isomers differ in the arrangement of atoms within the molecule is called structural isomerism. Thus structural isomers have:

The isomerism arises due to different arrangement of atoms or groups in space. It deals with the structure of molecules in three dimensions. Thus stereoisomers have:

(1) **Chain, nuclear or skeleton isomerism** : This type of isomerism arises due to the difference in the nature of the carbon chain (*i.e.*, straight or branched) which forms the nucleus of the molecule.

(i) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_3$, $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_3$
 n -Butane Isobutane

(ii) **C₅H₁₂**: (Three) $CH_3 - CH_2 - CH_2 - CH_2 - CH_3$,
 n -Pentane

❑ The isomers showing chain isomerism belong to the same homologous series, *i.e.*, functional group, class of the compound (Cyclic or open) remains unchanged.

❑ Chain and position isomerism cannot be possible together between two isomeric compounds. If two compounds are chain isomers then these two will not be positional isomers.

(2) **Position isomerism** : It is due to the difference in the position of the substituent atom or group or an unsaturated linkage in the same carbon chain.

☐ Aldehydes, carboxylic acids (and their derivatives) and cyanides do not show position isomerism.

☐ Monosubstituted alicyclic compounds and aromatic compounds do not show position isomerism.

☐ Structural isomers which differ in the position of the functional group are called regiomers. For example, (i) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{OH}$

(3) **Functional isomerism** : This type of isomerism is due to difference in the nature of functional group present in the isomers. The following pairs of compounds always form functional isomers with each other.

Examples :

(i) **Alcohols and ethers ($\text{C}_2\text{H}_6\text{O}$)**

(ii) **Aldehydes, ketones and unsaturated alcohols ...etc. ($\text{C}_3\text{H}_6\text{O}$)**

(iii) **Acids, esters and hydroxy carbonyl compounds ...etc. ($\text{C}_3\text{H}_6\text{O}_2$)**

(iv) **Alkynes and alkadienes (C_4H_6)**

(v) **Nitro alkanes and alkyl nitrites ($-\text{NO}_2$ and $-\text{O} - \text{N} = \text{O}$)**

(vi) **Amines** (Primary, secondary and tertiary)

(vii) **Alcohols and phenols**

(viii) **Oximes and amides**

(4) **Ring-chain isomerism** : This type of isomerism is due to different modes of linking of carbon atoms, i.e., the isomers possess either open chain or closed chain structures.

☐ Ring-chain isomers are always functional isomers.

(5) **Metamerism** : This type of isomerism is due to the difference in the nature of alkyl groups attached to the polyvalent atoms or functional group. Metamers always belong to the same homologous series. Compounds like ethers, thio-ethers ketones, secondary amines, etc. show metamerism.

☐ If same polyvalent functional group is there in two or more organic compounds, then chain or position isomerism is not possible, there will be metamerism e.g.,

☐ Alkenes does not show metamerism.

(6) Tautomerism

(i) The type of isomerism in which a substance exist in two readily interconvertible different structures leading to dynamic equilibrium is known as tautomerism and the different forms are called **tautomers** (or tautomerides).

The term **tautomerism** (Greek: *tauto* = same; *meros* = parts) was used by **Laar** in 1885 to describe the phenomenon of a substance reacting chemically according to two possible structures.

(ii) It is caused by the wandering of hydrogen atom between two polyvalent atoms. It is also known as **Desmotropism** (Desmos = bond and tropos = turn). If the hydrogen atom oscillates between two polyvalent atoms linked together, the system is a **dyad** and if the hydrogen atom travels from first to third atom in a chain, the system is a **triad**.

(a) **Dyad system** : Hydrocyanic acid is an example of dyad system in which hydrogen atom oscillates between carbon and nitrogen atoms. $\text{H}-\text{C}\equiv\text{N}\rightleftharpoons\text{C}\equiv\text{N}-\text{H}$

(b) **Triad system**

Keto-enol system : Polyvalent atoms are oxygen and two carbon atoms.

Examples :

Acetoacetic ester (Ethyl acetoacetate) :

Acetoacetic ester gives certain reactions showing the presence of keto group (Reactions with HCN , H_2NOH , $\text{H}_2\text{NNHC}_6\text{H}_5$, etc.) and certain reactions showing the presence of enolic group (Reactions with Na , CH_3COCl , NH_3 , PCl_5 , Br_2 water and colour with neutral FeCl_3 , etc.).

Enolisation is in order

Base catalysed conversion

(c) Triad system containing nitrogen : Examples

Nitrous acid exists in 2 forms

Nitro acinitro system

(iii) **Characteristics of tautomerism**

(a) Tautomerism (cantonotropy) is caused by the oscillation of hydrogen atom between two polyvalent atoms present in the molecule. The change is accompanied by the necessary rearrangement of single and double bonds.

(b) It is a reversible intramolecular change.

(c) The tautomeric forms remain in dynamic equilibrium. Hence, their separation is a bit difficult. Although their separation can be done by special methods, yet they form a separate series of stable derivatives.

(d) The two tautomeric forms differ in their stability. The less stable form is called the labile form. The relative proportion of two forms varies from compound to compound and also with temperature, solvent etc. The change of one form into another is also catalysed by acids and bases.

(e) Tautomers are in dynamic equilibrium with each other and interconvertible ($\rightleftharpoons$).

(f) Two tautomers have different functional groups.

(g) Tautomerism has no effect on bond length.

(h) Tautomerism has no contribution in stabilising the molecule and does not lower its energy.

(i) Tautomerism may occur in planar or nonplanar molecules.

☐ Keto-enol tautomerism is exhibited only by such aldehydes and ketones which contain at least one α -hydrogen.

For example

☐ Tautomerism is not possible in benzaldehyde ($\text{C}_6\text{H}_5\text{CHO}$), benzophenone ($\text{C}_6\text{H}_5\text{COC}_6\text{H}_5$), tri methyl acetaldehyde, $(\text{CH}_3)_3\text{C}-\text{CHO}$ and chloral CCl_3-CHO as they do not have α -H.

Number of structural isomers

Molecular formula	Number of isomers
Alkanes	
C_4H_{10}	Two
C_5H_{12}	Three
C_6H_{14}	Five
C_7H_{16}	Nine
C_8H_{18}	Eighteen
C_9H_{20}	Thirty five

$C_{10}H_{22}$	Seventy five
Alkenes and cycloalkanes	
C_3H_6	Two (One alkene + one cycloalkane)
C_4H_8	Six (Four alkene + 2 - cycloalkane)
C_5H_{10}	Nine (Five alkenes + 4 - cycloalkanes)
Alkynes	
C_3H_4	Two
C_4H_6	Six
Monohalides	
C_3H_7X	Two
C_4H_9X	Four
$C_5H_{11}X$	Eight
Dihalides	
$C_2H_4X_2$	Two
$C_3H_6X_2$	Four
$C_4H_8X_2$	Nine
$C_5H_{10}X_2$	Twenty one
Alcohols and ethers	
C_2H_6O	Two (One alcohol and one ether)
C_3H_8O	Three (Two alcohols and one ether)
$C_4H_{10}O$	Seven (Four alcohols and three ethers)
$C_5H_{12}O$	Fourteen (Eight alcohols and six ethers)
Aldehydes and ketones	
C_3H_6O	Two (One aldehyde and one ketone)
C_4H_8O	Three (Two aldehydes and one ketone)
$C_5H_{10}O$	Seven (Four aldehydes and three ketone)
Monocarboxylic acids and esters	
$C_2H_4O_2$	Two (One acid and one ester)
$C_3H_6O_2$	Three (One acid and two esters)
$C_4H_8O_2$	Six (Two acids and four esters)
$C_5H_{10}O_2$	Thirteen (Four acids and nine esters)
Aliphatic amines	
C_2H_7N	Two (One 1°-amine and one 2°-amine)
C_3H_9N	Four (Two 1°-amines, one 2°-amine and one 3°-amine)
$C_4H_{11}N$	Eight (Four 1°-amines, three 2°-amines and one 3°-amines)
Aromatic compounds	
C_8H_{10}	Four
C_9H_{12}	Nine
C_7H_8O	Five

The compounds which have same molecular formula but differ in the relative spatial arrangement of atoms or groups in space are known as geometrical isomers and the phenomenon is known as geometrical isomerism. The isomer in which same groups or atoms are on the same side of the double bond is known as *cis* form and the isomer in which same groups or atoms are on the opposite side is called *trans*-isomer.

Examples :

(i) **Conditions for geometrical isomerism** : Compound will show geometrical isomerism if it fulfils the following two conditions

(i) There should be frozen rotation about two adjacent atoms in the molecule.

(a)  frozen rotation about carbon, carbon double bond in alkenes.

(b)  frozen rotation about carbon, carbon single bond in cycloalkanes.

(c)  frozen rotation about carbon, nitrogen double bond in oxime and imine.

(ii) Both substituents on each carbon should be different about which rotation is frozen.

If these two conditions are fulfilled, then compound will show geometrical isomerism.

☐ The compounds of the following type will not show geometrical isomerism.

(2) **Distinction between *cis*- and *trans*- isomers**

(i) **By cyclization method** : Generally, the *cis*-isomer (e.g. maleic acid) cyclises on heating to form the corresponding anhydride while the *trans*-isomer does not form its anhydride.

☐ Note that the two reacting groups ($-COOH$) are near to each other.

☐ Note that the two reacting groups ($-COOH$) are quite apart from each other, hence cyclisation is not possible.

(ii) **By hydroxylation** (Oxidation by means of $KMnO_4$, OsO_4 or H_2O_2 in presence of OsO_4) : Oxidation (Hydroxylation) of alkenes by means of these reagents proceeds in the *cis*-manner. Thus the two geometrical isomers of an alkene leads to different products by these reagents. For example,

Geometrical or cis-trans isomerism

(iii) **By studying their dipole moments** : The *cis*-isomer of a symmetrical alkene (Alkenes in which both the carbon atoms have similar groups) has a definite dipole moment, while the *trans*-isomer has either zero dipole moment or less dipole moment than the *cis*-isomer. For example, 1,2-dichloroethylene and butene-2.

In *trans*-isomer of the symmetrical alkenes, the effect produced in one half of the molecule is cancelled by that in the other half of the molecule.

In case of unsymmetrical alkenes, the *cis*-isomer has higher dipole moment than the corresponding *trans*-isomer.

For Example,

Similar is the case with hexene-2.

(iv) **By studying other physical properties:** (a) The *cis*-isomer of a compound has higher boiling point due to higher polarity, higher density and higher refractive index than the corresponding *trans*-isomer (*Auwers-skita rule*).

(b) The *trans*-isomer has higher melting point than the *cis*-isomer due to symmetrical nature and more close packing of the *trans*-isomer.

(v) **Stability:** *Trans*-isomer is more stable than *cis*-isomer due to symmetrical structure.

□ Terminal alkenes such as propene, 1-butene and 2-methyl propene do not show geometrical isomerism.

□ *Cis-trans* isomers are configurational isomers but not mirror images, hence *cis* and *trans* isomers are always *diastereomers*.

□ Non-terminal alkenes with the same atoms or groups either on one or both the carbon atoms of the double bond such as 2-methyl-2-butene, 2,3-dimethyl-2-butene etc. do not show geometrical isomerism.

(3) **E and Z system of nomenclature:** '*Cis*' and '*Trans*' designations cannot be used if four different atoms or groups are attached to the carbon atoms of a double bond.

In such cases, *E* and *Z* system of nomenclature is used. This system is based on a priority system developed by *Cahn, Ingold and Prelog*.

In this system, the two atoms or groups attached to each of the doubly bonded carbon are put in order of preference on the basis of sequence rules.

The symbol '*E*' is assigned to an isomer in which the atoms or groups of higher preference are on the opposite side (*E* from German word *Entgegen* = across or opposite).

The symbol '*Z*' is assigned to an isomer in which the atoms or groups of higher preference are on the same side (*Z* from German word, *Zusammen* = together).

□ 1 signifies higher preference and 2 signifies lower preference. Preference in most of the cases '*Z*' corresponds to *cis*-form and '*E*' to *trans*-form. However, there are many exceptions.

The following rules are followed for deciding the precedence order of the atoms or groups;

(i) Higher priority is assigned to the atoms of higher atomic number. For example, the order of preference in the following atoms, *H, Cl, I, Br* is: *I* (at. no. 53) > *Br* (at. no. 35) > *Cl* (at. no. 17) > *H* (at. no. 1).

(ii) If isotopes of the same element are attached, the isotope with higher mass number is given higher order of preference. For example, deuterium (${}^2_1\text{D}$) is assigned higher priority in comparison to hydrogen (${}^1_1\text{H}$).

(iii) In the groups, the order of preference is also decided on the basis of atomic number of first atom of the group. For example, in the following set,

The order of the precedence is:

When the order of preference of the groups cannot be settled on the first atom, the second atom or the subsequent atoms in the groups are considered. For example, in the set $-\text{CH}_2-\text{CH}_3, -\text{CH}_3, -\text{COOH}$, the order cannot be decided on the basis of first atom as it is same in all the groups. However, in $-\text{CH}_2-\text{CH}_3$, the second atom is carbon, in $-\text{CH}_3$, the second atom is hydrogen while in $-\text{COOH}$, the second atom is oxygen. Hence, the order of preference is:

(iv) A doubly or triply bonded atom is considered equivalent to two or three such atoms. For example,

(4) **Number of geometrical isomers in polyenes**

(i) When a compound has *n* double bonds and ends of a polyene are different, the number of geometrical isomers = 2^n

The given compound has four double bonds and the two ends are different (One is C_6H_5 and other is Cl). Therefore, number of geometrical isomers = $2^n = 2^4 = 16$.

(ii) When the ends of polyene are same.

Case I: When number of double bonds (*n*) is even then the number of geometrical isomers = $2^{n-1} + 2^{[(n/2)-1]}$

Number of geometrical isomers = $2^{n-1} + 2^{(n/2)-1} = 2^3 + 2^1 = 8 + 2 = 10$.

Case II: When number of double bonds (*n*) is odd.

Number of geometrical isomers = $2^{n-1} + 2^{\left[\frac{n+1}{2}\right]-1}$

Number of geometrical isomers = $2^2 + 2^{2-1} = 2^2 + 2^1 = 4 + 2 = 6$.

(5) **Geometrical Isomerism in nitrogen compounds**

(i) Geometrical isomerism due to $C=N$ bond.

The important class of compounds exhibiting geometrical isomerism due to $C=N$ bond are oximes, nitrones, hydrazones and semicarbazones. But the most common compound is oxime.

Oximes : In aldoxime, when hydrogen and hydroxyl groups are on the same side, the isomer is known as syn. (analogous to *cis*) and when these groups are on the opposite side, the isomer is known as anti (analogous to *trans*)

In ketoximes the prefixes **syn** and **anti** indicate which group of ketoxime is syn or anti to hydroxyl group. For example:

(a) Syn-ethyl methyl ketoxime $\Rightarrow$ *HO* and C_2H_5 are syn or

(b) Anti-methyl ethyl ketoxime $\Rightarrow$ *HO* and C_2H_5 are anti.

Similarly consider the following structure

(ii) Geometrical isomerism due to $N=N$ bond.

(6) **Geometrical isomerism show by cumulatienes** : Cumulatienes (Trienes with three adjacent double bonds) show only geometric isomerism. This is because their molecule is planar, as such the terminal $-CH_3$ groups and H - atoms lie in the same plane. Therefore, in this case their planar structure can exist in two diastereoisomeric forms, *cis*- and *trans*- but no enantiomeric forms are possible.

(7) **Geometrical isomerism in cycloalkanes** : Disubstituted cycloalkanes show geometrical isomerism.

Certain compounds show geometrical as well optical isomerism. Such type of isomerism is known as **geometrical enantiomerism**.

Optical isomerism

(i) Compounds having similar physical and chemical properties but they have the ability to rotate the plane of polarised light either to the right (Clockwise) or to the left (Anticlockwise) are termed as optically active or optical isomers and the property is called optical activity or optical isomerism.

The optical activity was first observed in organic substances like quartz, rock-crystals and crystals of potassium chlorate ($KClO_3$), potassium bromate ($KBrO_3$) and sodium periodate ($NaIO_4$).

(2) **Measurement of optical activity** : The measurement of optical activity is done in terms of *specific rotation* which is defined as the rotation produced by a solution of length of 10 centimetres (One decimetre) and unit concentration (1 g/mL) for the given wavelength of the light at the given temperature.

$$\text{Specific rotation, } [\alpha]_{\text{wavelength}}^{t^\circ C} = \frac{\alpha_{\text{obs}}}{l \times C}$$

Where α_{obs} is the rotation observed, l is the length of the solution in decimeters and C is the number of grams in 1 mL of solution. The specific rotation of the sucrose at $20^\circ C$ using sodium light (*D*-line, $\lambda=5893\text{\AA}$) is $+66.5^\circ C$ and is denoted as: $[\alpha]_D^{20^\circ C} = +66.5^\circ C (C = 0.02 \text{ g/mL water})$

$+$ sign indicates the rotation in clockwise direction.

(3) On the basis of the study of optical activity, the various organic compounds were divided into four types :

(i) The optical isomer which rotates the plane of the polarised light to the right (Clockwise) is known as dextrorotatory isomer (Latin: *dextro* = *right*) or *d*-form or indicated by $+$ ve sign.

(ii) The optical isomer which rotates the plane of the polarised light to the left (Anticlockwise) is known as laevorotatory isomer (Latin; *laevo* = *left*) or *l*-form or indicated by $-$ ve sign.

(iii) The optical powers of the above two isomers are equal in magnitude but opposite in sign. An equimolar mixture of the two forms, therefore, will be optically inactive due to external compensation. This mixture is termed as racemic mixture or *dl*-form or ($\pm$) mixture.

(iv) Optical isomer with a plane of symmetry is called *meso* form. It is optically inactive due to internal compensation, i.e., the rotation caused by upper half part of molecule is neutralised by lower half part of molecule.

(4) **Chirality, (i) Definition** : A molecule (or an object) is said to be chiral or dissymmetric, if it does not possess any element of symmetry and not superimposable on its mirror image and this property of the molecule to show non-superimposability is called chirality.

On the other hand, a molecule (or an object) which is superimposable on its mirror image is called achiral (non-dissymmetric or symmetric).

To understand the term chiral and achiral let us consider the alphabet letters 'P' and 'A' whereas 'P' is chiral, 'A' is achiral as shown in fig.

Non-superimposable
(Chiral or dissymmetric)

Superimposable
(Achiral or non-dissymmetric)

(ii) **Elements of symmetry** : There are three elements of symmetry,

(a) **Plane of symmetry** : It may be defined as a plane which divides a molecule in two equal parts that are related to each other as an object and mirror image. e.g.,

(b) **Centre of symmetry** : It may be defined as a point in the molecule through which if a line is drawn in one direction and extended to equal distance in opposite direction, it meets another similar group or atom, eg.

Since *trans* form contains a centre of symmetry, it is optically inactive.

(c) **Alternating axis of symmetry** : A molecule is said to possess an alternating axis of symmetry if an orientation indistinguishable from the original is obtained when molecule is rotated Q degree around an axis passing through the molecule and the rotated molecule is reflected in a mirror that is perpendicular to the axis of rotation in step (1).

(iii) Symmetric, Asymmetric and Dissymmetric molecules

(a) **Symmetric molecules** : If any symmetry is present in the molecule then molecule will be symmetric molecule.

(b) **Dissymmetric molecules** : Molecule will be a dissymmetric molecule if it has no plane of symmetry, no centre of symmetry and no alternating axis of symmetry.

(c) **Asymmetric molecules** : Dissymmetric molecule having at least one asymmetric carbon is known as asymmetric molecule. All asymmetric molecules are also dissymmetric molecules but the reverse is not necessarily true.

(iv) **Chiral or asymmetric carbon atom** : A carbon bonded to four different groups is called a chiral carbon or a chirality centre. The chirality centre is indicated by asterisk. eg.,

☐ Carbons that can be chirality centres are sp^3 -hybridised carbons; sp^2 and sp -hybridised carbons cannot be chiral carbons because they cannot have four group attached to them.

☐ Isotopes of an atom behave as different group in stereoisomerism.

☐ Carbon of the following groups will not be a chiral carbon

☐ Maleic acid ($\text{HOOC} - \text{CH} = \text{CH} - \text{COOH}$) show geometrical isomerism while malic acid

($\text{HOOC} - \text{CH}_2 - \text{CHOH} - \text{COOH}$) show optical isomerism.

(5) Calculation of number of optical isomers

(i) If molecule is not divisible into two identical halves and molecule has n asymmetric carbon atoms then

$$\text{Number of optically active forms} = 2^n = a$$

$$\text{Number of enantiomeric pair} = a/2$$

$$\text{Number of racemic mixture} = a/2$$

$$\text{Number of meso form} = 0$$

(ii) If molecule is divisible into two identical halves, then the number of configurational isomers depends on the number of asymmetric carbon atoms.

Case I : When compound has even number of carbon atoms, i.e., $n = 2, 4, 8, 10, 12, \dots$:

$$(i) \text{ Number of optically active forms} = a = 2^{n-1}$$

$$(ii) \text{ Number of enantiomeric pairs} = a/2$$

$$(iii) \text{ Number of racemic mixture} = a/2$$

$$(iv) \text{ Number of meso forms} = m = 2^{(n/2)-1}$$

$$(v) \text{ Total number of configurational isomers} = a + m$$

Case II : When compound has odd number of carbon atoms, i.e., $n = 3, 5, 7, 9, 11, \dots$:

$$(i) \text{ Number of optically active forms} = a = 2^{n-1} - 2^{(n-1)/2}$$

$$(ii) \text{ Number of enantiomeric pairs} = a/2$$

$$(iii) \text{ Number of racemic mixture} = a/2$$

$$(iv) \text{ Number of meso forms} = m = 2^{(n-1)/2}$$

$$(v) \text{ Total number of configurational isomers} = a + m$$

(6) **Optical activity of compounds containing one asymmetric carbon**

Examples :

Any molecule having one asymmetric carbon atom exists in two configurational isomers which are nonsuperimposable mirror images.

(I) and (II) have the same molecular formula, the same structure but different configurations, hence (I) and (II) are known as configurational isomers. (I) and (II) are nonsuperimposable mirror images, hence (I) and (II) are optical isomers. Configurational isomers which are nonsuperimposable mirror images are known as **enantiomers**. Thus (I) and (II) are enantiomers. Pair of (I) and (II) is known as enantiomeric pair.

(i) **Properties of Enantiomers** : All chemical and physical properties of enantiomers are same except two physical properties.

Mode of rotation : One enantiomer rotates light to the right and the other by an **equal magnitude** to the left direction.

(ii) **Racemic Mixture** : An equimolar mixture of two enantiomers is called a racemic mixture (or racemate, $\pm$ form, (*dl*) form or racemic modification). Such a mixture is optically inactive because the two enantiomers rotate the plane polarised light equally in opposite directions and cancel each other's rotation. This phenomenon is called **external compensation**.

$\Rightarrow$ Racemic mixture can be separated into (+) and (–) forms. The separation is known as **resolution**.

$\Rightarrow$ The conversion of (+) or (–) form of the compound into a racemic mixture is called **racemisation**. It can be caused by heat, light or by chemical reagents.

$\Rightarrow$ Racemic mixture is designated as being ($\pm$) or (*dl*).

(7) Optical activity of compounds containing two asymmetric carbon

Case I : When molecule is not divisible into two identical halves.

The number of optical isomers possible in this case is four ($a = 2^2 = 4$). Further there will be two pairs of enantiomers and two racemic modifications. In practice also it is found to be so.

Configurational isomers which are not mirror images are known as **diastereomers**.

Properties of Diastereomers : Diastereomers have different physical properties, *e.g.*, melting and boiling points, refractive indices, solubilities in different solvents, crystalline structures and specific rotations. Because of differences in solubility they often can be separated from each other by fractional crystallisation; because of slight differences in molecular shape and polarity, they often can be separated by chromatography.

Diastereomers have different chemical properties towards both **chiral** and **achiral** reagents. Neither any two diastereomers nor their transition states are mirror images of each other and so will not necessarily have the same energies. However, since the diastereomers have the same functional groups, their chemical properties are not very dissimilar.

Case II : When molecule is divisible into two identical halves.

$$\text{Number of optical isomers} = a = 2^{2-1} = 2$$

$$\text{Number of meso forms} = m = 2^0 = 1$$

$$\text{Total number of configurational isomers} = 3$$

(8) Optical activity in compounds containing no asymmetric carbon

: Although the largest number of known optically active compounds are optically active due to the presence of chiral carbon atom, some compounds are also known which do not possess any chiral carbon atom, but on the whole their molecules are chiral (such molecules were earlier called **dissymmetric**); hence they are optically active. Various types of compounds belonging to this group are allenes, alkylidene cycloalkanes, spiro compounds (spirans) and properly substituted biphenyls.

(i) **Allenes** : Allenes are the organic compounds of the following general formulae.

Allenes exhibit optical isomerism provided the two groups attached to each terminal carbon atom are different, *i.e.*,

(ii) **Alkylidene cycloalkanes and spiro compounds** : When one or both of the double bonds in allenes are replaced by one and two rings, the resulting systems are respectively known as alkylidene cycloalkanes and spirans.

(iii) **Biphenyls** : Suitably substituted diphenyl compounds are also devoid of individual chiral carbon atom, but the molecules are chiral due to restricted rotation around the single bond between the two benzene nuclei and hence they must exist in two non-superimposable mirror images of each other. *Such types of stereoisomerism which is due to restricted rotation about single bond, is known as atropisomerism* and the stereoisomers are known and **atropisomers**. Examples

The above discussion leads to the conclusion that the **essential condition for optical isomerism is the molecular dissymmetry or molecular chirality** and not the mere presence of a chiral centre. However, it may be noted that the *molecules having only one chiral centre are always chiral and exhibit optical isomerism*.

(9) **Fischer projection formulae** : The arrangement of the atoms or groups in space that characterises a stereoisomer is called its configuration.

Emil Fischer (1891) provided an easy method to represent the three dimensional formulae of various organic molecules on paper. *Fischer projection is, thus, a planar representation of the three dimensional structure*.

By convention, the following points are followed in writing the Fischer formula.

(i) The carbon chain of the compound is arranged vertically, with the most oxidised carbon at the top.

(ii) The asymmetric carbon atom is in the paper plane and is represented at the intersection of crossed lines.

(iii) Vertical lines are used to represent bonds going away from the observer, *i.e.*, groups attached to the vertical lines are understood to be present behind the plane of the paper.

(iv) Horizontal lines represent bonds coming towards the observer, *i.e.*, groups attached to the horizontal lines are understood to be present above the plane of the paper.

(10) **Name of optical isomers** : Following three nomenclatures are used for optically active compounds,

(i) ***D, L* System of nomenclature** : This nomenclature is mainly used in sugar chemistry or optically active polyhydroxy carbonyl compounds. This nomenclature was given by Emil Fischer to designate the configurations of various sugars relative to the enantiomeric (+) and (–) glucose as reference.

All sugars whose Fischer projection formula shows the *OH* group on the chiral carbon atom adjacent to the terminal *CH₂OH* group on the right hand side belong to the *D*-series. Similarly if *OH* is on the left hand side, then the sugars belong to the *L*-series.

Examples :

⇒ It must be noted that there is no relation between the sign of rotation (+, – or *d, l*) and the configuration (*D* and *L*) of an enantiomer.

⇒ Any compound that can be prepared from, or converted into *D*(+) glyceraldehyde will belong to *D*-series and similarly any compound that can be prepared from, or converted into *L*(–) glyceraldehyde will belong to the *L*-series.

⇒ This nomenclature is also used in α -amino acids.

(ii) ***Erythro* and *Threo* system of nomenclature** : This nomenclature is used only in those compounds which have

(a) Only two chiral carbons and

(b) The following structure, $R' - Cab - Cbc - R''$

i.e., out of six substituents on two asymmetric carbons, at least two should be same.

When two like groups in Fischer projection formula are drawn on the same side of the vertical line, the isomer is called *erythro* form; if these are placed on the opposite sides, the isomer is said to be *threo* form.

(c) ***R, S* Nomenclature** (Absolute configuration)

The order of arrangement of four groups around a chiral carbon (stereocentre) atom is called the absolute configuration around that atom. System which indicates the absolute configuration was given by three chemists **R.S. Cahn, C.K. Ingold** and **V. Prelog**. This system is known as (R) and (S) system or the **Cahn-Ingold Prelog** system. The letter (R) comes from the latin **rectus** (means right) while (S) comes from the latin **sinister** (means left). Any chiral carbon atom has either a (R) configuration or a (S) configuration. Therefore, one enantiomer is (R) and other is (S). A racemic mixture may be designated (R) (S), meaning a mixture of the two. (R) (S) nomenclature is assigned as follows :

Step 1 : By a set of sequence rules given below the atoms or groups connected to the chiral carbon are assigned a priority sequence.

Sequence Rules for Order of Priority

Rule 1 : If all four atoms directly attached to the chiral carbon are different, priority depends on their atomic number. The atom having highest atomic number gets the highest priority, *i.e.*, (1). The atom with the lowest atomic number is given the lowest priority, *i.e.*, (2), the group with next higher atomic number is given the next higher priority (3) and so on. Thus,

Rule 2 : If two or more than two isotopes of the same element is present, the isotope of higher atomic mass receives the higher priority.

Rule 3 : If two or more of the atoms directly bonded to the chiral carbon are identical, the atomic number of the next atoms are used for priority assignment. If these atoms also have identical atoms attached to them, priority is determined at the first point of difference along the chain. The atom that has attached to it an atom of higher priority has the higher priority.

In this example the atoms connected directly to the chiral carbon are iodine and three carbons. Iodine has the highest priority. Connected, to the three carbons are 2H and Br ; 2H and C and 2H and C . Bromine has the highest atomic number among C, H and Br and thus CH_2Br has highest priority among these three groups (*i.e.*, priority no. 2). The remaining two carbons are still identical (C and 2H) connected to the second carbons of these groups are 2H and I and 2H and C . Iodine has highest priority among these atoms, so that $-\text{CH}_2-\text{CH}_2-\text{I}$ is next in the priority list and $\text{CH}_2-\text{CH}_2-\text{CH}_3$ has the last priority.

Rule 4 : If a double or a triple bond is linked to chiral centre the involved atoms are duplicated or triplicated respectively.

By this rule, we obtained the following priority sequence :

Increasing priority

Step 2 : The molecule is then visualised so that the group of lowest priority (4) is directed away from the observer (At this position the lowest priority is at the bottom of the plane). The remaining three groups are in a plane facing the observer. If the eye travels clockwise as we look from the group of highest priority to the groups of second and third priority (*i.e.*, $1 \rightarrow 2 \rightarrow 3$ with respect to 4) the configuration is designated as *R*. If arrangement of groups is in anticlockwise direction, the configuration is designated as *S*.

For example:

Clockwise arrangement of
 $1, 2$ and $3 \Rightarrow R$

Anticlockwise arrangement of
 $1, 2$ and $3 \Rightarrow S$

Let us apply the whole sequence to bromochlorofluoro methane.

In this Fischer projection the least priority number is not at the bottom of the plane.

In such cases the Fischer projection formula of the compound is converted into another equivalent projection formula in such a manner that atom or group having the lowest priority is placed vertically downward. This may be done by two **interchanges** between four priority numbers. The first interchange involves the two priority numbers, one is the least priority number and other is the priority number which is present at the bottom of the plane. In the above case first interchange will take place between 2 and 4.

First interchange of two groups at the chiral centre inverts the configuration and this gives enantiomer of the original compound. Thus (A) and (B) are enantiomer. The second interchange involves the remaining two groups.

Example :

Arrangement of
clockwise, hence configuration is *R*

Anticlockwise

S-configuration

Glyceraldehyde (For example) has one asymmetric carbon, hence it has two configurational isomers (I) and (II).

One can draw a number other configurations for glyceraldehyde but each of them will be a repetition of either (I) or (II). In this connection it is

important to note that if two projection formulae differ by an odd number of interchanges (1, 3, 5, 7,) of positions of groups on the chiral carbon, they are different. But if the two differ by an even number of interchanges (2, 4, 6,) they are identical.

For example :

Thus (I), (III) and (V) are identical. Similarly (II) and (IV) are identical.

(11) **Resolution of racemic modifications** : The separation of racemic mixture into its enantiomers is known as resolution.

□ Group X reacts with group O to give new group W.

(12) **Asymmetric synthesis and Walden inversion**

(i) **Asymmetric synthesis** : The synthesis of an optically active compound (asymmetric) from a symmetrical molecule (having no asymmetric carbon) without resolution to form (+) or (–) isomer directly is termed **asymmetric synthesis**. For example the reduction of pyruvic acid

$\text{CH}_3 - \overset{\text{O}}{\parallel} \text{C} - \text{COOH}$ (Pyruvic acid) (2-Keto propanoic acid) in presence of nickel catalyst gives (±) lactic acid (racemic mixture). On the other hand, pyruvic acid is reduced to (–) lactic acid only by yeast.

(ii) **Walden inversion**: The conversion of (+) form into (–) form and vice-versa is called **Walden inversion**. When an atom or group directly linked to an asymmetric carbon atom is replaced; the configuration of the new compound may be opposite to (inverse) that of the original, i.e.,

Conformational isomerism

(1) **Definition** : The different arrangement of atoms in a molecule which can be obtained due to rotation about carbon-carbon single bond are called conformational isomers (conformers) or rotational isomers (rotamers). This type of isomerism is found in alkanes and cycloalkanes and their substituted derivatives.

It may be noted that rotation around a C–C sigma bond is not completely free. It is in fact hindered by an energy barrier of 1 to 20 kJ mol^{–1} in different bonds. There is a possibility of weak repulsive interactions between the bonds or electron pairs of the bonds on adjacent carbon atoms. Such type of repulsive interaction is known as **torsional strain**.

(2) **Difference between conformation and configuration** : The term conformation should not be confused with the *configuration* which relates to those spatial arrangements of the atoms of a molecule that can be changed only by the breaking and making of bonds whereas the spatial arrangements in conformation are changed simply by rotation about a single bond.

(3) **Representation of conformations** : Conformers can be represented in two simple ways. These are : (i) Saw horse representation and (ii) Newman projection

(i) **Saw horse representation** : In this projection, the molecule is viewed along the axis of the model from an oblique angle. The central carbon-carbon bond (C–C) is drawn as a straight line slightly tilted to right for the sake of clarity. The front carbon is shown as the lower left hand carbon and the rear carbon is shown as the upper right hand carbon. The three bonds around each carbon atom (C–H in ethane or C–C in higher alkanes) are shown by three lines.

(ii) **Newman projection** : This is a simple method to represent the conformations. In this method, the molecule is viewed from the front along the carbon-carbon bond axis. The two carbon atoms forming the σ-bond are represented by two circles; one behind the other so that only the front carbon is seen. The front carbon atom is shown by a point whereas the carbon further from the eye is represented by the circle. Therefore, the C–H bonds of the front carbon are depicted from the centre of the circle while C–H bonds of the back carbon are drawn from the circumference of the circle at an angle of 120° to each other.

(4) **Conformation in alkanes**

(i) **Conformations of ethane** : When one of the carbon atom is kept fixed and other is rotated about C–C bond an infinite numbers of isomers are possible. Out of all the conformations for ethane, only two extreme conformations are important and these are:

(a) Staggered conformation

(b) Eclipsed conformation

Staggered conformation of ethane is more stable than eclipsed.

(ii) **Conformations of propane** : The next higher member in alkane series, propane ($\text{CH}_3 - \text{CH}_2 - \text{CH}_3$) also has two extreme conformations, the energy barrier in propane is 4 kJ/mol , which is slightly higher than that in ethane.

Staggered propane

Eclipsed propane

Newman projection of propane

(iii) **Conformations of butane** : As the alkane molecule becomes larger, the conformation situation becomes more complex. In butane ($\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_3$), for example, the rotation about the single bond between two inner atoms (C_2 and C_3) is considered. In this case, all the staggered as well as eclipsed conformations will not have same stability and energy because of different types of interaction between $\text{C}-\text{C}$ (of methyl) and $\text{C}-\text{H}$ bonds.

The lowest energy conformation will be the one, in which the two methyl groups are as far apart as possible i.e., 180° away from each other.

This conformation will be maximum staggered, most stable and is called **anti or trans conformation** (marked I). Other conformations can be obtained by rotating one of the C_2 or C_3 carbon atoms through an angle of 60° as shown ahead.

I
AntiII
EclipsedIII
Skew or GaucheIV
Fully eclipsedV
Skew or GaucheVI
Eclipsed

As is clear from the above Newman projection, the anti and skew conformations (III and V) are also staggered. However, in these conformations, the methyl groups are so close that they repel each other. This repulsion causes gauche conformations, to have about 3.8 kJ/mol more energy than anti conformation. These conformations II and VI are **eclipsed conformations**. These are unstable because of repulsions. These are 16 kJ/mol less stable than anti conformation. Conformation IV is also eclipsed and it is least stable having energy 19 kJ/mol more than anti conformation. This is because of repulsion between methyl-methyl groups which are very close together. It is called **fully eclipsed conformation**.

The **order of stability** of these conformations is, Anti > Skew or Gauche > Eclipsed > Fully eclipsed.

(5) Conformations in cycloalkanes

(i) **Stability of cycloalkanes** : Compounds with three and four membered rings are not as stable as compounds with five or six membered rings.

The German chemist Baeyer was the first to suggest that the instability of these small rings compounds was due to angle strain. This theory is known as **Baeyer-strain theory**.

Baeyer strain theory was based upon the assumption that when an open chain organic compound having the normal bond angle 109.5° is convert into a cyclic compound, a definite distortion of this normal angle takes place leading to the development of a strain in the molecule.

Baeyer assumed that cyclic rings are planar. Assuming that the rings are planar, the amount of strain in various cycloalkanes can be expressed in terms of angle of deviation (d).

$$d = \frac{1}{2} \left[109.5 - \frac{2(n-2)}{n} \times 90 \right] \quad \text{or} \quad d = \frac{1}{2} [109.5 - \alpha]$$

Where n = number of carbon-carbon bonds in cycloalkane ring; α = inner bond angle in the cycloalkane ring.

$$\text{Angle strain} \propto d \propto \frac{1}{\text{inner angle}}; \text{Stability} \propto \frac{1}{d} \propto \text{inner angle}(\alpha)$$

Now let us take the case of three to eight membered cyclic compounds.

Cyclopropane
 $\alpha = 60^\circ$
 $d = 22.44^\circ$ Cyclobutane
 $\alpha = 90^\circ$
 $d = 9.4^\circ$ Cyclopentane
 $\alpha = 108^\circ$
 $d = 0.44^\circ$ Cyclohexane
 $\alpha = 120^\circ$
 $d = -5.16^\circ$ Cycloheptane
 $\alpha = 128.6^\circ$
 $d = -9.33^\circ$ Cyclooctane
 $\alpha = 135^\circ$
 $d = -12.46^\circ$

The positive and negative values of (d) indicate whether the inner angle is less than or more than the normal tetrahedral value.

Baeyer thus predicted that a five membered ring compound would be the most stable. He also predicted that six membered ring compounds would be less stable and as the cyclic compounds become larger than five membered ring, then they would become less and less stable.

Contrary to what Baeyer predicted, however cyclohexane is more stable than cyclopentane. Furthermore, cyclic compounds do not become less and less stable as the number of sides increase. Thus Baeyer strain theory is applicable only to **cyclopropane, cyclobutane and cyclopentane**.

The mistake that Baeyer made was to assume that all cyclic compounds are planar. But only cyclopropane is planar and other cycloalkanes are not planar. Cyclic compounds **twist** and **bend** in order to

achieve structure that minimises the three different kinds of strain and that can destabilise a cyclic compound.

(a) **Angle strain** is the strain that results when the bond angle is different from desired tetrahedral bond angle of 109.5° .

(b) **Torsional strain** is caused by repulsion of the bonding electrons of one substituent with bonding electrons of a nearby substituent.

(c) **Steric strain** is caused by atoms or groups of atoms approaching each other too closely.

(ii) **Conformation of cyclohexane** : Despite Baeyer's prediction that five-membered cyclic compounds would be the most stable, the six membered cyclic compound is the most stable. Six membered cyclic compound are most stable because they can exist in a conformation that is almost completely free of strain. This conformation is called the **chair conformation**. In a chair conformation of cyclohexane all bond angles are 109.38° which is very close to the 109.5° and all the adjacent carbon-hydrogen bonds are staggered.

Chair conformation of cyclohexane

Newmann projection of the chair conformation

⇒ Each carbon in chair conformation has an axial bond and an equatorial bond.

⇒ Axial bonds are perpendicular to the plane of the ring and equatorial bonds are in the plane of the ring.

⇒ If axial bond on carbon-1 is above the plane of the ring then axial bond on carbon-2 will be below the plane of the ring. Thus

$C-1, C-3$ and $C-5$ axial bonds are above the plane

$C-2, C-4$ and $C-6$ axial bonds are below the plane

⇒ Thus $C-1$ axial and $C-2$ axial are *trans* to each other. Similarly $C-1$ and $C-5$ axials are *cis* to each other.

⇒ If axial bond on carbon-1 will be above the plane then equatorial bond on this carbon will be below the plane.

(a) Thus $C-1$ equatorial and $C-2$ equatorial bonds are *trans*.

(b) $C-1$ axial and $C-2$ equatorial will be *cis*.

⇒ As a result of rotation about carbon-carbon single bonds cyclohexane rapidly interconverts between two stable chair conformations. This interconversion is known as ring-flip. When the two chair forms interconvert, axial bonds become equatorial and equatorial bonds become axial.

⇒ Cyclohexane can also exist in a boat conformation. Like the chair conformation, the boat conformation is free of angle strain. However, the boat conformation is less stable than the chair conformation by 11 kcal/mole . Boat conformation is less stable because some of the carbon-hydrogen bonds in boat conformation are eclipsed.

The boat conformation is further destabilised by the close proximity of the flagpole hydrogens. These hydrogens are $1.8 \text{ \AA}$ apart but the vander Waal's radii is $2.4 \text{ \AA}$. The flagpole hydrogens are also known as *trans* nuclear hydrogens.

□ The relative stabilities of the four conformations of cyclohexane decrease in the order:

Chair > twist boat > boat > half chair.

Tips & Tricks

✍ Wohler synthesised the first organic compound urea in the laboratory.

✍ The number of optical isomers of a compound depends on its structure and number of asymmetric carbon atoms present in its molecule.

✍ Stereoisomers that are not mirror images of each other are called diastereomers.

✍ Order of priority for both asymmetric carbon atoms using sequence rules is

✍ The nitration and sulphonation of alkanes involve free radicals.

✍ Carbenes undergo insertion reactions.

✍ Alkanes usually undergo free radical substitution when hydrogen is replaced by a halogen. It is catalysed by benzoyl peroxide (CH_3COO).

✍ The polymerisation of alkenes is free radical addition reaction.

✍ Allyl free radical ($CH_2=CH-CH_2$) is more stable than *n*-propyl free radical ($CH_3CH_2CH_2$).

✍ The stability of free radicals is explained on the basis of hyperconjugation or conjugation.

✍ Propene is more reactive than ethene towards electrophilic addition reaction due to the formation of more stable 2° carbocation.

✍ The reactivity of alkyl halides in *SN* is 3° > 2° > 1° > methyl while *SN* is methyl > 1° > 2° > 3°.

✍ Polar solvents favour *SN* while non polar solvents favour *SN* reactions.

✍ Dipole moment of $CHCl_3$ is less than that of CH_2Cl_2 . This is because in CH_2Cl_2 all bond moments reinforce each other while in $CHCl_3$ the bond moment of one of the *Cl* opposes the net moment of the other two.

✍ Low concentration of nucleophiles favour *SN* while high concentration favour *SN*.

✍ In *SN* the attack of the nucleophile may be from either side and so racemization takes place. However, in *SN* the attack of the nucleophile takes place from back side. So it leads to inversion of configuration.

✍ Hunsdieker reaction proceeds via free radical mechanism.

✍ Propene reacts with chlorine at 673 K to form allyl chloride and the intermediate is allyl free radical.

Ordinary Thinking

Objective Questions

Bonding and hybridisation in organic compounds

- In methane molecule, the hydrogen atoms around carbon are arranged as [DPMT 1980; MNR 1981; MP PET 1997, 99]
 - Square planar
 - Tetrahedral
 - Triangular
 - Octahedral
- In carbon tetrachloride, four valence of carbon are directed to four corners of [CPMT 1973, 77]
 - Rectangle
 - Square
 - Tetrahedron
 - None of these
- In alkene (ethene) number of sp^2 hybrid carbon atoms are
 - 1
 - 2
 - 3
 - 0
- Each carbon atom in benzene is in the state of hybridization [CPMT 1973, 83, 89; MP PMT 1993; KCET (Med.) 1999; DCE 2001]
 - sp^3
 - sp^2
 - sp
 - sp^3p
- Which of the following hybridisation has highest percentage of *s*-character [BHU 1986]
 - sp^3
 - sp^2
 - sp
 - None of these
- The hybridisation present in C_2H_2 is [EAMCET 1993]
 - sp
 - sp^2
 - sp^3
 - dsp^2
- What hybrid orbitals will form the following compound [AFMC 1991]

$$H_3C-CH=CH-CH_2-CH_3$$
 - sp and sp^3
 - sp^2 and sp^3
 - sp and sp^2
 - Only sp^3
- The compound in which carbon uses only its sp^3 hybrid orbitals for bond formation is [IIT-JEE 1989]
 - $HCOOH$
 - $(NH_2)_2CO$
 - $(CH_3)_3COH$
 - $(CH_3)_3CHO$
- A straight chain hydrocarbon has the molecular formula C_8H_{10} . The hybridisation for the carbon atoms from one end of the chain to the other are respectively $sp^3, sp^2, sp^2, sp^3, sp^2, sp^2, sp$ and sp . The structural formula of the hydrocarbon would be [CBSE PMT 1992]
 - $CH_3-C \equiv C-CH_2-CH=CH-CH=CH_2$
 - $CH_3-CH_2-CH=CH-CH_2-C \equiv C-CH=CH_2$
 - $CH_3-CH=CH-CH_2-C \equiv C-CH=CH_2$
 - $CH_3-CH=CH-CH_2-CH=CH-C \equiv CH$
- Which of the following has a bond formed by overlap of $sp-sp^3$ hybrid orbitals [MNR 1993; UPSEAT 2001, 02]
 - $CH_3-C \equiv C-H$
 - $CH_3-CH=CH-CH_3$
 - $CH_2=CH-CH=CH_2$
 - $HC \equiv CH$
- The bond between carbon atom (1) and carbon atom (2) in compound $N \equiv C-CH=CH_2$ involves the hybridised carbon as [IIT-JEE 1989]
 - sp^2 and sp^2
 - sp^3 and sp
 - sp and sp^2
 - sp and sp

12. Number of π bonds in $CH_2 = CH - CH = CH - C \equiv CH$ is
[Kurukshetra CEE 1991; KCET 2000]

(a) 2 (b) 3
(c) 4 (d) 5

13. Number of π electrons present in naphthalene is
[AFMC 1991]

(a) 4 (b) 6
(c) 10 (d) 14

14. Number of π electrons in cyclobutadienyl anion $(C_4H_4)^{-2}$ is [IIT-JEE 1992]
(a) 2 (b) 4
(c) 6 (d) 8

15. Homolytic fission of C - C bond in ethane gives an intermediate in which carbon is [IIT-JEE 1992]

(a) sp^3 hybridised (b) sp^2 hybridised
(c) sp hybridised (d) sp^2d hybridised

16. In the reaction

The hybridisation states of carbon atoms 1, 2, 3, 4 are
[MP PET 1994]

(a) 1 and 2 sp^2 ; 3 and 4 sp^3
(b) 1 and 2 sp^2 ; 3 and 4 sp
(c) 1, 2, 3 and 4 sp
(d) 1, 2 sp^3 ; 3, 4 sp^2

17. In which of the compounds given below is there more than one kind of hybridisation (sp , sp^2 , sp^3) for carbon

(i) $CH_3CH_2CH_2CH_3$
(ii) $CH_3 - CH = CH - CH_3$
(iii) $CH_2 = CH - CH = CH_2$

(iv) $H - C \equiv C - H$ [CBSE PMT 1995]
(a) (ii) and (iv) (b) (i) and (iv)
(c) (ii) and (iii) (d) (ii)

18. Examine the following common chemical structures to which simple functional groups are often attached

Which of these systems have essentially planar geometry
[CBSE PMT 1995]

(a) (i) and (v) (b) (ii) and (iii)
(c) (ii), (iii) and (iv) (d) (iv)

19. The structure of di-chloromethane is [MP PMT 1995]

(a) Tetrahedral (b) Trigonal
(c) Linear (d) Hexagonal

20. The numbers of sigma (σ) bonds in 1-butene is
[MP PMT 1995]

(a) 8 (b) 10
(c) 11 (d) 12

21. Which of the following statements is false for isopentane
[MP PET 1996]

(a) It has three CH_3 groups
(b) It has one CH_2 group
(c) It has one CH group
(d) It has a carbon which is not bonded to hydrogen

The number of σ bonds in *o*-xylene is [MP PET 1996]

(a) 6 (b) 9
(c) 12 (d) 18

23. In benzene the total number of σ bonds is [MP PMT 1997]

(a) 3 (b) 6
(c) 9 (d) 12

24. The number of sp^3 hybridized carbon atoms in cyclohexene are [MP PMT 1997]

(a) 2 (b) 3
(c) 4 (d) 6

25. The number of π bonds in 3-hexyne-1-ene is
[MP PMT 1999]

(a) 1 (b) 2
(c) 3 (d) 4

26. Example of sp^2 hybridization is [CPMT 1997]

(a) CH_3^+ (b) CH_3
(c) $C_2H_5^+$ (d) C_2H_5

27. Select the molecule which has only one π - bond
[Pb. PMT 1998]

(a) $CH \equiv CH$ (b) $CH_2 = CHCHO$
(c) $CH_3CH = CH_2$ (d) $CH_3CH = CHCOOH$

28. Carbon atoms in the compound $(CN)_4C_2$ are
[Roorkee 1999]

(a) sp hybridized
(b) sp^2 hybridized
(c) sp and sp^2 hybridized
(d) sp , sp^2 and sp^3 hybridized

29. Acetylene molecules contain [DCE 1999]

(a) 5 σ bond
(b) 4 σ bond and 1 π bond
(c) 3 σ and 2 π
(d) 3 σ and 3 π

30. Number of unhybridised orbitals in vinyl acetylene are
[RPMT 1999]

(a) 2 (b) 3
(c) 4 (d) 6

31. Maximum bond energy of C - H bonds is found in the compound [RPMT 1999]

(a) Ethane (b) Ethene
(c) Ethyne (d) Equal in all the three

32. Ethylene possess [RPET 1999]

(a) Two sigma and two pi bonds
(b) Two pi bonds
(c) Five sigma and one pi bond

- (d) Four sigma and one pi bond
33. The hybridization involved in the six carbon atoms of benzene is [BHU 1999]
- (a) $3sp^3, 3sp^2$ (b) $3sp^3, 3sp$
- (c) All $6sp$ (d) All $6sp^2$
34. 1, 3-butadiene has [JIPMER 2000]
- (a) sp and sp^2 hybridised C-atoms
- (b) sp, sp^2 and sp^3 hybridized C-atoms
- (c) Only sp^2 hybridised C-atoms
- (d) Only sp hybridised C-atoms
35. Which of the following C-H bond has the lowest bond dissociation energy [CBSE PMT 2000]
- (a) Primary (1°) C-H bond
- (b) Secondary (2°) C-H bond
- (c) Tertiary (3°) C-H bond
- (d) All of these
36. Number of σ and π bonds present in 1-butene-3-yne respectively are [RPMT 1999; MP PET 2000; DCE 2000]
- (a) $7\sigma, 3\pi$ (b) $5\sigma, 2\pi$
- (c) $8\sigma, 3\pi$ (d) $6\sigma, 2\pi$
37. Which is an acidic hydrocarbon [AMU 2000]
- (a) $CH_3CH_2CH_2CH_3$ (b) $CH_3C \equiv CCH_3$
- (c) $CH_3C \equiv CH$ (d) $CH_2 = CH - CH = CH_2$
38. A carbon-carbon triple bond in ethyne ($-C \equiv C-$) consists of [AMU 2000]
- (a) All σ bonds
- (b) Two σ bonds and one π -bond
- (c) One σ bond and two π bonds
- (d) All π bonds
39. Toluene has [MP PMT 2000; Kerala CET 2005]
- (a) 6σ and 3π bond (b) 9σ and 3π bond
- (c) 9σ and 6π bond (d) 15σ and 3π bond
40. In compound X, all the bond angles are exactly $109^\circ 28'$, X is [DPMT 2000]
- (a) Chloroform (b) Carbon tetrachloride
- (c) Chloromethane (d) Iodoform
41. Which of the following hybridization is known as trigonal hybridization [MH CET 2000]
- (a) sp^3 (b) sp
- (c) sp^2 (d) dsp^2
42. The types of hybridization present in 1, 2-butadiene are [MH CET 2000]
- (a) sp, sp^2 and sp^3 (b) sp^2 and sp^3
- (c) sp^2 and sp (d) sp and sp^3
43. The C-H bond distance is longest in [BHU 2001]
- (a) C_2H_2 (b) C_2H_4
- (c) C_2H_6 (d) C_6H_6
44. Conjugated double bond is present in [RPMT 1999; JIPMER 2001]
- (a) 1, 2-butadiene (b) 1, 3-butadiene
- (c) 1, 3-pentadiene (d) β -butylene
- In which of the following species is the underlined carbon having sp^3 hybridisation [AIEEE 2002]
- (a) $CH_3\text{C}\underline{O}OH$ (b) $CH_3\text{C}\underline{H}_2OH$
- (c) $CH_3\text{C}\underline{O}CH_3$ (d) $CH_2 = \text{C}\underline{H} - CH_3$
46. The H-C-H bond angle in CH_4 is [MP PET 2002]
- (a) $109^\circ 28'$ (b) $107^\circ 28'$
- (c) 90° (d) 180°
47. The hybridisation of carbons of C-C single bond of $HC \equiv C - CH = CH_2$ is [RPMT 2002]
- (a) $sp^3 - sp^3$ (b) $sp - sp^2$
- (c) $sp^3 - sp$ (d) $sp^2 - sp^3$
48. The shape of ethylene molecule is [AFMC 2002]
- (a) Square planar (b) Furan
- (c) Trigonal planar (d) Tetrahedral
49. Acetylene molecule has carbon in [Kerala (Engg.) 2002]
- (a) sp -hybridisation (b) sp^2 -hybridisation
- (c) sp^3 -hybridisation (d) sp^3d -hybridisation
50. In the formation of methane molecule, carbon makes use of [DPMT 2001; MP PMT 2002]
- (a) sp -hybridised orbitals (b) sp^2 -hybridised orbitals
- (c) sp^3 -hybridised orbitals (d) Unhybridised orbitals
51. In graphite C-atom is instate [CPMT 2002]
- (a) sp^3 (b) sp
- (c) sp^2 (d) None of these
52. How many π -bonds are present in naphthalene molecule [RPMT 2002]
- (a) 3 (b) 4
- (c) 5 (d) 6
53. Hybridisation state of C in diamond is [RPMT 2002]
- (a) sp (b) sp^2
- (c) sp^3 (d) sp^3d
54. The number of σ and π bonds present in pent-4-ene, 1-yne is [AIIMS 2002; CPMT 2002]
- (a) 10, 3 (b) 3, 10
- (c) 4, 9 (d) 9, 4
55. Which one of the following is more acidic [DPMT 2002]
- (a) Butane (b) 1-butene
- (c) 1-butyne (d) 2-butyne
56. Graphite is soft while diamond is hard because [BHU 2003]
- (a) Graphite is in powder form
- (b) Diamond has sp^2 hybridization but graphite has sp^3 hybridization
- (c) Graphite is in planar form while diamond is in tetrahedral form
- (d) Graphite is covalent and diamond is ionic
57. Hybridization of 1 and 2 carbon atoms in $\overset{1}{CH_2} = \overset{2}{C} = CH_2$ [BHU 2003]
- (a) sp, sp (b) sp^2, sp^2
- (c) sp^2, sp (d) sp^3, sp^2
58. Hydrogen bonding is maximum in [UPSEAT 2003]

- (a) C_2H_5OH (b) $CH_3 - O - CH_3$ (a) *Trans*-2-butene (b) 1, 3-Dimethylbenzene
(c) $(CH_3)_2C = O$ (d) CH_3CHO (c) Acetophenone (d) Ethanol
59. How many methyl group are present in 2, 5-dimethyl-4-ethylheptane [EAMCET 2003] [IIT-JEE 1984]
(a) 2 (b) 3
(c) 4 (d) 5
60. Which one of the following does not have sp^2 hybridised carbon [AIEEE 2004]
(a) Acetonitrile (b) Acetic acid
(c) Acetone (d) Acetamide
61. Allyl cyanide contain σ - and π -bonds [MP PET 2004]
(a) $9\sigma, 3\pi$ (b) $9\sigma, 9\pi$
(c) $3\sigma, 4\pi$ (d) $5\sigma, 7\pi$
62. Strongest acid is [MP PMT 2004]
(a) $HC \equiv CH$ (b) C_2H_6
(c) C_6H_6 (d) CH_3OH
63. $-C \equiv C-$ bond is found in [BHU 1982; MP PMT 1994]
(a) Ethene (b) Butene
(c) Ethyne (d) Glycerine
64. Number of σ bonds in  [CPMT 1994]
(a) 6 (b) 15
(c) 10 (d) 12
65. Number of bonds in benzene [DPMT 2005]
(a) 6σ and 3π (b) 12σ and 3π
(c) 3π and 12π (d) 6σ and 6π
66. Which is most acidic of the following [J & K 2005]
(a) Methane (b) Acetylene
(c) 1-butene (d) Neo-pentane
67. The enolic form of acetone contains [Pb. PMT 2002]
(a) 8σ bonds, 2π -bonds and 1 lone pairs
(b) 9σ -bonds, 1π -bond and 2 lone pairs
(c) 9σ -bonds, 2π -bonds and 1 lone pairs
(d) 10σ -bonds, 1π -bonds and 1 lone pairs

Dipole moment, resonance and reaction intermediates

1. Which has zero dipole moment [NCERT 1990; BHU 2001]
(a) *cis*-2-butene (b) *trans*-2-butene
(c) 1-butene (d) 2-methyl-1-propene
2. Dipole moment is shown by [DCE 1999]
(a) 1, 4-dichloro benzene
(b) *Cis*-1, 2-dichloro ethane
(c) *Trans*-1, 2-dichloro, 2-pentene
(d) *Trans*-1, 2-dichloro ether
3. Which compound shows dipole moment [RPMT 2002]
(a) 1,4-di-chloro benzene
(b) 1, 2-di-chloro benzene
(c) *Trans*-1, 2-di-chloro ethene
(d) *Trans*-2-butene
4. Which of the following is a polar compound [MH CET 2003]
(a) C_2H_6 (b) CCl_4
(c) HCl (d) CH_4
5. The dipole moment is the highest for [AIIMS 2004]
(a) N_2O_4 (b) NO_2^+
6. Resonance structure of molecule does not have
(a) Identical arrangement of atoms
(b) Nearly the same energy content
(c) The same number of paired electrons
(d) Identical bonding
7. All bonds in benzene are equal due to [Roorkee 1990; KCET 1998]
(a) Tautomerism (b) Inductive effect
(c) Resonance (d) Isomerism
8. Aromatic properties of benzene are proved by [MP PMT 1994]
(a) Aromatic sextet theory (b) Resonance theory
(c) Molecular orbital theory (d) All of these
9. Which of the following will show aromatic behaviour [KCET 1996]
(a)  (b) 
(c)  (d) 
10. Which one of the following orders is correct regarding the inductive effect of the substituents [CBSE PMT 1998]
(a) $-NR_2 < -OR > -F$ (b) $-NR_2 > -OR > -F$
(c) $-NR_2 < -OR < -F$ (d) $-NR_2 > -OR < -F$
11. Benzene is unreactive because [KCET 1998]
(a) It has double bonds
(b) It has carbon-carbon single bond
(c) Carbon are sp^2 hybridised
(d) π electrons are delocalised
12. Carboxylic acids are easily ionised. The main reason of this statement [UPSEAT 1999]
(a) Absence of α -hydrogen
(b) Resonance stabilisation of carboxylate ion
(c) Reactivity of α -hydrogen
(d) Hydrogen bond
13. 'C - C' bond length in benzene lies between single and double bond. The reason is [RPET 1999]
(a) Resonance (b) Isomerism
(c) Metamerism (d) Inductive effect
14. Credit for the ring structure of benzene goes to [RPET 1999]
(a) Wholer (b) Faraday
(c) Kekule (d) Baeyer
15. Polarisation of electrons in acrolein may be written as [DCE 2000]
(a) $CH_2^{\delta-} = CH - CH^{\delta+} = O$
(b) $CH_2^{\delta-} = CH - CH = O^{\delta+}$
(c) $CH_2^{\delta-} = CH^{\delta+} - CH = O$
(d) $CH_2^{\delta+} = CH - CH = O^{\delta-}$
16. In the mixture of conc. H_2SO_4 and HNO_3 the nitrating species is [MP PMT 2000]
(a) N_2O_4 (b) NO_2^+

- (c) NO_2 (d) NO_2^-
17. Which of the following are not aromatic [DCE 2001]
 (a) Benzene
 (b) Cyclo-octatetrayenyl dianion
 (c) Tropylium cation
 (d) Cyclopentadienyl cation
18. Arrangement of $(\text{CH}_3)_3\text{C} - \text{C} - (\text{CH}_2)_3 - \text{CH} - \text{CH}_3 - \text{CH}_2 - \text{CH}_3$ when attached to benzyl or an unsaturated group in increasing order of inductive effect is [AIIEE 2002]
 (a) $(\text{CH}_3)_3\text{C} - \text{C} < (\text{CH}_3)_2 - \text{CH} < \text{CH}_3 - \text{CH}_2 -$
 (b) $\text{CH}_3 - \text{CH}_2 - < (\text{CH}_3)_2 - \text{CH} < (\text{CH}_3)_3\text{C} -$
 (c) $(\text{CH}_3)_2 - \text{CH} < (\text{CH}_3)_3\text{C} - < \text{CH}_3 - \text{CH}_2 -$
 (d) $(\text{CH}_2)_3 - \text{C} < \text{CH}_3 - \text{CH}_2 - < (\text{CH}_3)_2 - \text{CH} -$
19. Which of the following is observed in ethylene molecule [MH CET 2002]
 (a) Electromeric effect (b) Inductive effect
 (c) Homolytic fission (d) None of these
20. Cyclopentadienyl anion is [Orissa JEE 2003]
 (a) Aromatic (b) Non-aromatic
 (c) Non-planar (d) Aliphatic
21. Orbital interaction between the sigma bonds of a substituent group and a neighbouring π orbital is known as [Kerala PMT 2004]
 (a) Hyperconjugation
 (b) Inductive effect
 (c) Steric effect
 (d) Dipole-dipole interactions
 (e) Electric quadruple interactions
22. Which of the following is the most stable compound [BHU 2004]
 (a) Ph_3C^+ (b) Ph_2CH^+
 (c) Ph_3CH_2^+ (d) PhCH_2^+
23. Which of the following will be most easily attacked by an electrophile [MP PET 2004]
 (a)  (b) 
 (c)  (d) 
24. Reactivity towards nucleophilic addition reaction of (I) HCHO , (II) CH_3CHO , (III) CH_3COCH_3 is [Orissa JEE 2004]
 (a) $\text{II} > \text{III} > \text{I}$ (b) $\text{III} > \text{II} > \text{I}$
 (c) $\text{I} > \text{II} > \text{III}$ (d) $\text{I} > \text{II} < \text{III}$
25. Which of the following resonating structures of 1-methoxy-1,3-butadiene is least stable [IIT Screening 2005]
 (a) $\text{CH}_2 = \text{CH} = \text{CH} - \text{CH} = \text{O}^+ - \text{CH}_3$
 (b) $\text{CH}_2 = \text{CH}_2 - \text{CH} = \text{CH} = \text{O}^+ - \text{CH}_3$
 (c) $\text{CH}_2 = \text{CH} - \text{CH} = \text{CH} = \text{O}^+ - \text{CH}_3$
 (d) $\text{CH}_2 = \text{CH} - \text{CH} = \text{CH} = \text{O}^+ - \text{CH}_3$
- (d) $\text{CH}_2 = \text{CH} - \text{CH} = \text{CH} - \text{O} - \text{CH}_3$
26. Which amongst the following is the most stable carbocation [CBSE PMT 2005]
 (a) $\text{CH}_3 - \text{C}^+ - \text{CH}_3$ (b) $\text{CH}_3 - \text{C}^+ - \text{CH}_3$
 (c) CH_3^+ (d) CH_3CH_3^+
27. Which is the decreasing order of stability [IIT-JEE (Screening) 1993]
 (i) $\text{CH}_3 - \text{C}^+ - \text{H} - \text{CH}_3$
 (ii) $\text{CH}_3 - \text{C}^+ - \text{H} - \text{O} - \text{CH}_3$
 (iii) $\text{CH}_3 - \text{C}^+ - \text{H} - \text{CO} - \text{CH}_3$
 (a) $(\text{i}) < (\text{ii}) < (\text{iii})$ (b) $(\text{i}) > (\text{ii}) > (\text{iii})$
 (c) $(\text{iii}) > (\text{ii}) > (\text{i})$ (d) $(\text{ii}) > (\text{iii}) > (\text{i})$
28. The order of decreasing stability of the carbanions
 (i) $(\text{CH}_3)_3\text{C}^-$ (ii) $(\text{CH}_3)_2\text{CH}^-$
 (iii) CH_3CH_2^- (iv) $\text{C}_6\text{H}_5\text{CH}_2^-$ is [KCET 1996]
 (a) $1 > 2 > 3 > 4$ (b) $4 > 3 > 2 > 1$
 (c) $4 > 1 > 2 > 3$ (d) $1 > 2 > 4 > 3$
29. Choose the chain terminating step
 (i) $\text{H}_2 \rightarrow \text{H}^\bullet + \text{H}^\bullet$
 (ii) $\text{Br}_2 \rightarrow \text{Br}^\bullet + \text{Br}^\bullet$
 (iii) $\text{Br}^\bullet + \text{HBr} \rightarrow \text{H}^\bullet + \text{Br}_2$
 (iv) $\text{H}^\bullet + \text{Br}_2 \rightarrow \text{HBr} + \text{Br}^\bullet$
 (v) $\text{Br}^\bullet + \text{Br}^\bullet \rightarrow \text{Br}_2$ [RPET 2000]
 (a) 1 (b) 3
 (c) 4 (d) 5
30. The compound, which gives the most stable carbonium ion on dehydrogenation [UPSEAT 2001]
 (a) $\text{CH}_3 - \text{CH} - \text{CH}_2\text{OH}$
 (b) $\text{CH}_3 - \text{C} - \text{OH}$
 (c) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_2\text{OH}$
 (d) $\text{CH}_3 - \text{CH} - \text{CH}_2 - \text{CH}_3$
31. Which of the following requires radical intermediate [Orissa JEE 2004]
 (a) $\text{CH}_3 - \text{CH} = \text{CH}_2 + \text{HBr} \rightarrow \text{CH}_3 - \text{CH} - \text{CH}_3$
 (b) $\text{CH}_3 - \text{CHO} + \text{HCN} \rightarrow \text{CH}_3 - \text{CH} - \text{CN}$
 (c) $\text{CH}_3 - \text{CH} = \text{CH}_2 + \text{HBr} \rightarrow \text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{Br}$
 (d) $\text{CH}_3\text{CHO} + \text{NH}_2\text{OH} \xrightarrow{\text{H}^+} \text{CH}_3 - \text{CH} = \text{N} - \text{OH}$

32. Which of the following species is paramagnetic in nature [NCERT 1984]
 (a) Free radical (b) Carbonium ion
 (c) Carbanion (d) All the above
33. In which of the following species the central C-atom is negatively charged [NCERT 1985]
 (a) Carbanion (b) Carbonium ion
 (c) Carbocation (d) Free radical
34. Which of the following free radicals is most stable [NCERT 1982]
 (a) Primary (b) Methyl
 (c) Secondary (d) Tertiary
35. Which of the following contains three pairs of electrons [BHU 1985]
 (a) Carbocation (b) Carbanion
 (c) Free radical (d) None of these
36. Which of the following carbanion is most stable [NCERT 1983]
 (a) Methyl (b) Primary
 (c) Secondary (d) Tertiary
37. Among the given cations, the most stable carbonium ion is [IIT-JEE 1981]
 (a) *sec*-butyl (b) *ter*-butyl
 (c) *n*-butyl (d) None of these
38. In the compound given below

 The correct order of the acidity of the positions (X), (Y) and (Z) is
 (a) (Z) > (X) > (Y) (b) (X) > (Y) > (Z)
 (c) (X) > (Z) > (Y) (d) (Y) > (X) > (Z)
39. C-C bond length in benzene is [MP PMT 1987; MP PMT 2001; AIIMS 2001]
 (a) 1.39 Å
 (b) 1.54 Å
 (c) 1.34 Å
 (d) Different in different bonds
40. Heterolysis of carbon-chlorine bond produces [MNR 1986; MP PET/PMT 1998]
 (a) Two free radicals
 (b) Two carbonium ions
 (c) Two carbanions
 (d) One cation and one anion
41. In $\text{CH}_3\text{CH}_2\text{OH}$, the bond that undergoes heterolytic cleavage most readily is [IIT-JEE 1988]
 (a) C - C (b) C - O
 (c) C - H (d) O - H
42. Which of the following intermediate have the complete octet around the carbon atom [Orissa JEE 2003]
 (a) Carbonium ion (b) Carbanion ion
 (c) Free radical (d) Carbene
43. A solution of D (+) - 2-chloro-2-phenylethane in toluene racemises slowly in the presence of small amount of SbCl_5 , due to the formation of [IIT-JEE 1999]
 (a) Carbanion (b) Carbene
 (c) Free radical (d) Carbocation
44. The reagent in Friedel Craft's reaction is [DPMT 2005]
 (a) Pyridine (b) RCOCl

- (c) RCOOH (d) HCl
45. Which gives monosubstituted product [DPMT 2005]
 (a) *o* -dinitrobenzene (b) *m* -dinitrobenzene
 (c) *p* -dinitrobenzene (d) Nitrobenzene
46. An aromatic compounds among other things should have a π - electron cloud containing electrons where n can't be [J & K 2005]
 (a) 1/2 (b) 3
 (c) 2 (d) 1
47. Which of the following is an electrophile [J & K 2005]
 (a) H_2O (b) SO_3
 (c) NH_3 (d) ROR
48. The presence of the chlorine atom on benzene ring makes the second substituent enter at a position [J & K 2005]
 (a) *ortho* (b) *meta*
 (c) *para* (d) *ortholpara*
49. Which is the most stable carbocation [J & K 2005]
 (a) *iso*-propyl (b) Triphenylmethyl cation
 (c) Ethyl cation (d) π -propyl cation

Organic reactions and their mechanism

1. To which of the following four types does this reaction belong
 $\text{B}^- + \text{R} - \text{A} \rightarrow \text{B} - \text{R} + \text{A}^-$ [Manipal MEE 1995]
 (a) Unimolecular electrophilic substitution
 (b) Bimolecular electrophilic substitution
 (c) Unimolecular nucleophilic substitution
 (d) Bimolecular nucleophilic substitution
2. An alkyl halide may be converted into an alcohol by [Pb. PMT 2000]
 (a) Elimination (b) Addition
 (c) Substitution (d) Dehydrohalogenation
3.

 The above reaction proceeds through [AMU 2000]
 (a) Nucleophilic substitution
 (b) Electrophilic substitution
 (c) Free radical substitution
 (d) More than one of the above processes
4. Geometry of reaction intermediate in SN^1 reaction is [MH CET 2001]
 (a) Tetrahedral (b) Planar
 (c) Triangular bipyramidal (d) None of these
5.

$$\begin{array}{c} \text{CH}_3 \\ | \\ \text{H}_3\text{C} - \text{C} - \text{Br} \\ | \\ \text{CH}_3 \end{array} + \text{KOH}(\text{Aq.}) \rightarrow \begin{array}{c} \text{CH}_3 \\ | \\ \text{H}_3\text{C} - \text{C} - \text{OH} \\ | \\ \text{CH}_3 \end{array} + \text{KBr}$$

 above reaction is [RPMT 2003]
 (a) SN^1 (b) SN^2
 (c) E_1 (d) Both (a) and (b)
6. In electrophilic substitution reaction nitrobenzene is [Kerala (Med.) 2003]
 (a) Meta-directing
 (b) Ortho-directing
 (c) Para-directing

- (d) Not reactive and does not undergo any substitution
(e) Non-selective
7. The most common type of reaction in aromatic compounds is [Orissa JEE 2003]
(a) Elimination reaction
(b) Addition reaction
(c) Electrophilic substitution reaction
(d) Rearrangement reaction
8. The function of $AlCl_3$ in Friedel-Craft's reaction is [KCET 2003]
(a) To absorb HCl (b) To absorb water
(c) To produce nucleophile (d) To produce electrophile
9. Which of the following can't be used in Friedel Craft's reactions [AFMC 2004]
(a) $FeCl_3$ (b) $FeBr_2$
(c) $AlCl_3$ (d) $NaCl$
10. The nitration of a compound is due to the [Pb. PMT 2004]
(a) NO_2 (b) NO_3
(c) NO (d) NO_2^+
11. Dehydrohalogenation of an alkyl halide is a/an [MH CET 2004]
(a) Nucleophilic substitution reaction
(b) Elimination reaction
(c) Both nucleophilic substitution and elimination reaction
(d) Rearrangement
12. Addition of HCl to vinyl chloride gives 1, 1-dichloroethane because of [MP PET 2004]
(a) Mesomeric effect of Cl
(b) Inductive effect of Cl
(c) Restricted rotation around double bond
(d) None of these
13. Formation of ethylene from acetylene is an example of
(a) Elimination reaction (b) Substitution reaction
(c) Addition reaction (d) Condensation reaction
14. Conversion of CH_4 to CH_3Cl is an example of which of the following reaction [Pb. CET 2001]
(a) Electrophilic substitution
(b) Free radical addition
(c) Nucleophilic substitution
(d) Free radical substitution
15. Following reaction, $(CH_3)_3CBr + H_2O \rightarrow (CH_3)_3COH + HBr$ is an example of [DCE 2002]
(a) Elimination reaction (b) Free radical substitution
(c) Nucleophilic substitution (d) Electrophilic substitution
16. Which is an electrophile [DCE 2002]
(a) BCl_3 (b) CH_3OH
(c) NH_3 (d) $AlCl_4^-$
17. The electrophile in the nitration of benzene is [Orissa JEE 2004]
(a) NO_2^+ (b) NO_2
(c) NO^+ (d) NO_2^-
18. The following compound will undergo electrophilic substitution more readily than benzene [UPSEAT 2004]
(a) Nitrobenzene (b) Benzoic acid
(c) Benzaldehyde (d) Phenol
19. Which represents nucleophilic aromatic substitution reaction [Orissa JEE 2004]
(a) Reaction of benzene with Cl_2 in sunlight
- (b) Benzyl bromide hydrolysis
(c) Reaction of $NaOH$ with dinitrofluorobenzene
(d) Sulphonation of benzene
- Which is an electrophile [DCE 2000]
(a) $AlCl_3$ (b) CN^-
(c) NH_3 (d) CH_3OH
21. Strongest nucleophile is [BHU 2003]
(a) RNH_2 (b) ROH
(c) $C_6H_5O^-$ (d) CH_3O^-
22. The major product obtained when Br_2 / Fe is treated with
- is
- [IIT-JEE Screening 2004]
- (a) (b) (c) (d)
23. Which one of the following is least reactive in a nucleophilic substitution reaction [CBSE PMT 2004]
(a) CH_3CH_2Cl (b) $CH_2=CHCH_2Cl$
(c) $(CH_3)_3C-Cl$ (d) $CH_2=CHCl$
24. Among the following the strongest nucleophile is [AIIMS 2005]
(a) C_2H_5SH (b) CH_3COO^-
(c) CH_3NH_2 (d) $NCCH_2^-$
25. The reaction [AIEEE 2005]
 $R-C \begin{smallmatrix} O \\ // \\ X \end{smallmatrix} + Nu \rightarrow R-C \begin{smallmatrix} O \\ // \\ Nu \end{smallmatrix} + X$, is fastest when X is
(a) Cl (b) NH_2
(c) OC_2H_5 (d) $OCOR$
26. Elimination of bromine from 2-bromobutane results in the formation of [AIEEE 2004, 05]
(a) Equimolar mixture of 1 and 2-butene
(b) Predominantly 2-butene
(c) Predominantly 1-butene
(d) Predominantly 2-butyne
27. Examine the following statements pertaining to an SN^2 reaction
(1) The rate of reaction is independent of the concentration of the nucleophile
(2) The nucleophile attacks the C^- atom on the side of the molecule opposite to the group being displaced
(3) The reaction proceeds with simultaneous bond formation and bond rupture/cleavage
Amongst the following which of the above were true [NCERT 1982]
(a) 1, 2 (b) 1, 3
(c) 1, 2, 3 (d) 2, 3
28. What is the decreasing order of reactivity amongst the following compounds towards aromatic electrophilic substitution [IIT-JEE 1995]

- I. Chlorobenzene
III. Anilinium chloride
(a) $I > II > III > IV$
(c) $II > I > III > IV$
- II. Benzene
IV. Toluene
(b) $IV > II > I > III$
(d) $III > I > II > IV$
29. Which of the following applies in the reaction,

$$\text{CH}_3\text{CHBrCH}_2\text{CH}_3 \xrightarrow{\text{alc. KOH}}$$
 (i) $\text{CH}_3\text{CH}=\text{CHCH}_3$ (major product)
 (ii) $\text{CH}_2=\text{CHCH}_2\text{CH}_3$ (minor product)
 [Orissa JEE 2005]
- (a) Markovnikov's rule (b) Saytzeff's rule
 (c) Kharasch effect (d) Hofmann's rule
30. Bromination of alkanes involves [J & K 2005]
 (a) Carbanions (b) Carbocations
 (c) Carbenes (d) Free radicals
31. Which of the following cannot undergo nucleophilic substitution under ordinary conditions [J & K 2005]
 (a) Chlorobenzene (b) *tert*-butylchloride
 (c) Isopropyl chloride (d) None of these
32. Which of the following alkyl groups has the maximum +I effect [KCET 2002]
 (a) CH_3- (b) $(\text{CH}_3)_2\text{CH}-$
 (c) $(\text{CH}_3)_3\text{C}-$ (d) CH_3CH_2-

Structural and stereo isomerism

1. Only two isomers of monochloro product is possible of [IIT-JEE 1986]
 (a) *n*-butane (b) 2,4-dimethyl pentane
 (c) Benzene (d) 1-methyl propane
2. Which is the example of branch isomerization [NCERT 1976]
- (a) $\begin{array}{c} \text{C} \\ | \\ \text{C}-\text{C}-\text{C}-\text{C}-\text{C} \end{array}$ and $\begin{array}{c} \text{C} \\ | \\ \text{C}-\text{C}-\text{C} \\ | \\ \text{C} \end{array}$
- (b) $\begin{array}{c} \text{C} \quad \text{C} \\ | \quad | \\ \text{C}-\text{C}-\text{C} \quad \text{and} \quad \text{C}-\text{C}-\text{C} \\ | \quad | \\ \text{C} \quad \text{C} \end{array}$
- (c) $\begin{array}{c} \text{C} \\ \diagup \quad \diagdown \\ \text{C}-\text{C}-\text{C} \end{array}$ and $\begin{array}{c} \text{C} \\ | \\ \text{C}-\text{C}-\text{C} \\ | \\ \text{C} \end{array}$
- (d) $\text{C}-\text{C}-\text{C}-\text{C}$ and $\begin{array}{c} \text{C} \\ | \\ \text{C}-\text{C}-\text{C} \\ | \\ \text{C} \end{array}$
3. The isomer of diethyl ether is [CPMT 1975]
 (a) $(\text{CH}_3)_2\text{CHOH}$ (b) $(\text{CH}_3)_3\text{C}-\text{OH}$
 (c) $\text{C}_3\text{H}_7\text{OH}$ (d) $(\text{C}_2\text{H}_5)_2\text{CHOH}$
4. Isomers have essentially identical [CBSE PMT 1988; MP PMT 1983, 86]
 (a) Structural formula (b) Chemical properties
 (c) Molecular formula (d) Physical properties
5. Which one of the following shows optical activity [NCERT 1984, 90]

6. In ethane and cyclohexane which one of the following pairs of conformations are more stable
 (a) Eclipsed and chair conformations
 (b) Staggered and chair conformations
 (c) Staggered and boat conformations
 (d) Eclipsed and boat conformations
7. Which of the following may exist in enantiomorphs [CBSE PMT 1988]

8. Which of the following compounds may not exist as enantiomers [CPMT 1987]
 (a) $\text{CH}_3\text{CH}(\text{OH})\text{CO}_2\text{H}$
 (b) $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$
 (c) $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_3$
 (d) $\text{C}_6\text{H}_5\text{CHClCH}_3$
9. Number of isomers of molecular formula $\text{C}_2\text{H}_2\text{Br}_2$ are [CPMT 1987]
 (a) 1 (b) 2
 (c) 3 (d) 0
10. Lactic acid shows which type of isomerism [CPMT 1987; MP PMT 1987; BHU 2003]
 (a) Geometrical isomerism (b) Tautomerism
 (c) Optical isomerism (d) Metamerism
11. Which one of the following is an optically active compound [CBSE PMT 1988; DPMT 1983]
 (a) *n*-propanol (b) 2-chlorobutane
 (c) *n*-butanol (d) 4-hydroxyheptane
12. Compounds with same molecular formula but different structural formulae are called [BHU 1979; AFMC 1989]
 (a) Isomers (b) Isotopes
 (c) Isobars (d) Isoelectronic
13. Which one of the following compounds shows optical isomerism [MP PET 1990]
 (a) $\text{CH}_3\text{CHCl}-\text{CH}_2-\text{CH}_3$
 (b) $\text{CH}_3-\text{CH}_2-\text{CHCl}-\text{CH}_2-\text{CH}_3$
 (c) $\text{ClCH}_2-\text{CH}_2-\text{CH}_2-\text{CH}_3$
 (d) $\text{ClCH}_2-\text{CH}_2-\text{CH}_3$
14. Which one of the following objects is 'achiral'
 (a) Letter P (b) Letter F
 (c) Ball (d) A pair of hand
15. Total number of isomers of a disubstituted benzene compound is
 (a) 1 (b) 2

- (c) 3 (d) 4
16. Separating of *d* and *l* enantiomorphs from a racemic mixture is called [CBSE PMT 1988; DPMT 1983; KCET 2002]
(a) Resolution (b) Dehydration
(c) Rotation (d) Dehydrohalogenation
17. Number of optical isomers of lactic acid are
(a) 1 (b) 2
(c) 3 (d) 4
18. Which one of the following contains asymmetric carbon atom [IIT-JEE 1989; Roorkee 2000]
- (a) $\begin{array}{c} \text{Cl} \quad \text{Br} \\ | \quad | \\ \text{H} - \text{C} - \text{C} - \text{H} \\ | \quad | \\ \text{H} \quad \text{H} \end{array}$ (b) $\begin{array}{c} \text{H} \quad \text{Cl} \\ | \quad | \\ \text{H} - \text{C} - \text{C} - \text{Cl} \\ | \quad | \\ \text{H} \quad \text{H} \end{array}$
- (c) $\begin{array}{c} \text{H} \quad \text{H} \\ | \quad | \\ \text{H} - \text{C} - \text{C} - \text{H} \\ | \quad | \\ \text{H} \quad \text{H} \end{array}$ (d) $\begin{array}{c} \text{H} \quad \text{H} \\ | \quad | \\ \text{H} - \text{C} - \text{C} - \text{CH}_3 \\ | \quad | \\ \text{Br} \quad \text{OH} \end{array}$
19. *n*-butane and isobutane are examples of
(a) Chain isomers (b) Geometrical isomers
(c) Position isomers (d) Tautomers
20. Which of the following has chiral structure
- (a) $\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3 - \text{CH} - \text{CH}_2\text{COOH} \end{array}$
(b) $\text{CH}_3 - \text{CH} = \text{CH} - \text{CH}_3$
- (c) $\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3 - \text{CH} - \text{CH}_2\text{OH} \end{array}$
(d) $\text{CH}_3 - \text{CHOH} - \text{CH}_2\text{CH}_3$
21. Which of the following pairs is an example of position isomerism
(a) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_3$ and $\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3 - \text{CH} - \text{CH}_3 \end{array}$
(b) $\text{CH}_3 - \text{CH}_2 - \text{CH} = \text{CH}_2$ and $\text{CH}_3 - \text{CH} = \text{CH} - \text{CH}_3$
(c) $\text{CH}_3 - \text{CH}_2\text{OH}$ and $\text{CH}_3 - \text{O} - \text{CH}_3$
(d) $\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3 - \text{C} - \text{CH}_3 \\ | \\ \text{CH}_3 \end{array}$ and $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_2 - \text{CH}_3$
22. Geometrical isomerism is shown by [IIT-JEE 1983; CPMT 1990, 94; CBSE PMT 1992; MP PET 1997; AMU (Engg.) 1999]
(a) 2-butene (b) 2-butyne
(c) 2-butanol (d) Butanal
23. An organic compound exhibits optical isomerism when [CPMT 1971, 78, 81; MP PET 1999]
(a) Four groups linked to carbon atom are different
(b) Three groups linked to carbon atom are different
(c) Two groups linked to carbon atom are different
(d) All the groups linked to carbon atom are same
24. Which one of the following exhibits geometrical isomerism [NCERT 1979; DPMT 1984; CBSE PMT 1990]
- (a) $\begin{array}{c} \text{H} \\ \diagup \\ \text{H}_3\text{C} \end{array} \text{C} = \text{C} \begin{array}{c} \diagdown \\ \text{H} \end{array}$ (b) $\begin{array}{c} \text{C}_2\text{H}_5 \\ \diagup \\ \text{H} \end{array} \text{C} = \text{C} \begin{array}{c} \diagdown \\ \text{H} \end{array}$
- (c) $\begin{array}{c} \text{CH}_3 \\ \diagup \\ \text{CH}_3 \end{array} \text{C} = \text{C} \begin{array}{c} \diagdown \\ \text{H} \end{array}$ (d) $\begin{array}{c} \text{CH}_3 \\ | \\ \text{H} - \text{C} - \text{C} = \text{C} \begin{array}{c} \diagdown \\ \text{H} \end{array} \\ | \quad | \\ \text{H} \quad \text{H} \end{array}$
25. Maximum number of isomers of alkene C_4H_8 are [IIT-JEE 1982; MP PMT 1985; MADT Bihar 1995; Kerala (Engg.) 2002]
(a) 2 (b) 3
(c) 4 (d) 6
26. Rotation of plane polarised light is measured by [CPMT 1985; DCE 2001]
(a) Manometer (b) Polarimeter
(c) Viscometer (d) Refractometer
27. An alkane forms isomers if the number of least carbon atom is [CPMT 1976; BHU 1979]
(a) 1 (b) 2
(c) 3 (d) 4
28. Which is not found in alkenes [AIIMS 1982; RPMT 1999]
(a) Chain isomerism (b) Geometrical isomerism
(c) Metamerism (d) Position isomerism
29. How many isomers of $\text{C}_5\text{H}_{11}\text{OH}$ will be primary alcohols [CBSE PMT 1992]
(a) 2 (b) 3
(c) 4 (d) 5
30. The compound $\text{C}_4\text{H}_{10}\text{O}$ can show [IIT-JEE 1981; MP PET 2000]
(a) Metamerism (b) Functional isomerism
(c) Positional isomerism (d) All types
31. The number of possible alcoholic isomers for $\text{C}_4\text{H}_{10}\text{O}$ are [DPMT 1984; MNR 1986]
(a) 4 (b) 2
(c) 3 (d) 5
32. How many isomers are possible for $\text{C}_4\text{H}_8\text{O}$ [MNR 1992; UPSEAT 2001, 02]
(a) 3 (b) 4
(c) 5 (d) 6
33. Which of the following can exhibit *cis-trans* isomerism [CBSE PMT 1989]
(a) $\text{HC} \equiv \text{CH}$ (b) $\text{ClCH} = \text{CHCl}$
(c) $\text{CH}_3\text{CHClCOOH}$ (d) $\text{ClCH}_2 - \text{CH}_2\text{Cl}$
34. The number of geometrical isomers in case of a compound with the structure $\text{CH}_3 - \text{CH} = \text{CH} - \text{CH} = \text{CH} - \text{C}_2\text{H}_5$ is [NCERT 1980]
(a) 4 (b) 3
(c) 2 (d) 5
35. The property by virtue of which a compound can turn the plane polarised light is known as [BHU 1979]
(a) Photolysis (b) Phosphorescence
(c) Optical activity (d) Polarization
36. Meso-tartaric acid is optically inactive due to the presence of [AIIMS 1982; MP PMT 1987]
(a) Molecular symmetry
(b) Molecular asymmetry
(c) External compensation
(d) Two asymmetric C-atoms
37. Which of the following compounds exhibits optical isomerism [BHU 1983; AFMC 1983]

MP PMT 1999, 2000]

- (a) $\text{CH}_3\text{CH}_2\text{COOH}$ (b) $\text{CH}_3\text{CHOHCOOH}$
(c) $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$ (d) $\text{CH}_3\text{CHOHCH}_3$
38. The maximum number of stereoisomers possible for 2-hydroxy-2-methyl butanoic acid is [Roorkee 1992]
(a) 1 (b) 2
(c) 3 (d) 4
39. Which one of the following pairs represents the stereoisomerism [AIIMS 1992]
(a) Geometrical isomerism, position isomerism
(b) Geometrical isomerism, conformational isomerism
(c) Optical isomerism, geometrical isomerism
(d) Optical isomerism, metamerism
40. Diethyl ether is not associated with which one of these isomers [AFMC 1993]
(a) Butanoic acid (b) Methyl propionate
(c) Stereoisomerism (d) None of these
41. Diethyl ether and methyl *n*-propyl ether are [MP PET 1994; AFMC 1999; MP PMT 2002]
(a) Position isomers (b) Functional isomers
(c) Metamers (d) Chain isomers
42. *n*-propyl alcohol and isopropyl alcohol are examples of [MP PMT 1994]
(a) Position isomerism (b) Chain isomerism
(c) Tautomerism (d) Geometrical isomerism
43. It is possible to distinguish between optical isomers by [Manipal MEE 1995; AFMC 1995]
(a) Infrared spectroscopy
(b) Mass spectrometry
(c) Melting point determination
(d) Polarimetry
44. The isomerism exhibited by alkyl cyanide and alkyl isocyanide is [AFMC 1995, 97]
(a) Functional (b) Positional
(c) Tautomerism (d) Metamerism
45. The following compound can exhibit

$$\begin{array}{c} \text{CH}_3 > \text{C} = \text{C} < \text{H} \\ \text{CH}_3 > \text{C} < \text{H} \\ \text{CH}_3 > \text{C} < \text{COOH} \end{array}$$
 [IIT-JEE 1995; DCE 2000]
(a) Tautomerism
(b) Optical isomerism
(c) Geometrical isomerism
(d) Geometrical and optical isomerisms
46. Name the compound, that is not isomer with diethyl ether [IIT-JEE 1981; CPMT 1989; MADT Bihar 1995]
(a) *n*-propylmethyl ether
(b) Butane-1-ol
(c) 2-methylpropane-2-ol
(d) Butanone
47. Which statement is true for cyclohexane [MP PET 1996]
(a) It has two possible isomers
(b) It has three conformations
(c) Boat conformation is most stable
(d) Chair and boat conformations differ in energy by 44 kJ/mol
48. Two compounds have the structural formulae $\text{CH}_3 - \text{O} - \text{CH}_2\text{CH}_3$ and $\text{CH}_3 - \text{CH}_2 - \text{CH}_2\text{OH}$. The above is an example of
(a) Metamerism (b) Functional isomerism
(c) Positional isomerism (d) Chain isomerism
49. Which of the following pairs are not isomeric compounds
(a) Ethyl ethanoate and methyl propanoate
(b) Butanone and butanal
(c) Ethoxy propane and propoxy ethane
(d) Methoxy methane and ethanol
50. Functional isomerism is exhibited by the following pair of compounds
(a) Acetone, propionaldehyde
(b) Diethyl ether, methyl propyl ether
(c) Butane, isobutane
(d) 1-butene, 2-butene
51. The total number of possible isomeric trimethyl benzene is [MP PET 1997]
(a) 2 (b) 3
(c) 4 (d) 6
- Optically active isomers but not mirror images are called [MP PET 1999]
(a) Enantiomers (b) Mesomers
(c) Tautomers (d) Diastereoisomers
53. $\text{C}_7\text{H}_9\text{N}$ has how many isomeric forms that contain a benzene ring [CPMT 1997, 99; JIPMER 2002; DCE 2003]
(a) 4 (b) 5
(c) 6 (d) 7
54. The total number of isomers formed by C_5H_{10} is [Bihar MEE 1996]
(a) 2 (b) 3
(c) 4 (d) 5
(e) None of these
55. Which of the following contains asymmetric centre [CPMT 1996]
(a) 2-butene (b) 2, 2-dimethylpropane
(c) 2-hexyne (d) Lactic acid
56. Which of the following cannot be given to exemplify chiral structure [JIPMER 1995]
(a) A shoe (b) A screw
(c) A screw driver (d) All of these
57. Which of the following is expected to be optically active [JIPMER 1997]
(a) $(\text{CH}_3)_4\text{C}$ (b) $\text{C}_2\text{H}_5\text{CH}(\text{CH}_3)\text{C}_3\text{H}_7$
(c) $(\text{C}_2\text{H}_5)_2\text{CHCH}_3$ (d) $\text{CH}_3\text{CH}=\text{CHCH}_3$
58. Which compound does not show geometrical isomerism [RPMT 1997]
(a) 2-butene (b) 2-pentene
(c) 2,3-dibromo-2-butene (d) 2-methyl propene
59. The isomers which can be converted into another forms by rotation of the molecules around single bond are [AIIMS 1997]
(a) Geometrical isomers (b) Conformers
(c) Enantiomers (d) Diastereomers
60. The number of enantiomers of the compound $\text{CH}_3\text{CHBrCHBrCOOH}$ is [AIIMS 1997]
(a) 0 (b) 1
(c) 3 (d) 4
61. $\text{C}_6\text{H}_5\text{C}\equiv\text{N}$ and $\text{C}_6\text{H}_5\text{N}\equiv\text{C}$ exhibit which type of isomerism [CPMT 1997]
(a) Position (b) Functional
(c) Dextro isomerism (d) Metamerism
62. Which of the following compounds is not chiral [CBSE PMT 1998; DPMT 2002]
(a) $\text{DCH}_2\text{CH}_2\text{CH}_2\text{Cl}$ (b) $\text{CH}_3\text{CH}_2\text{CHDCl}$
(c) $\text{CH}_3\text{CHDCH}_2\text{CH}_2\text{Cl}$ (d) $\text{CH}_2\text{CHClCH}_2\text{D}$
63. *cis* and *trans* 2-butene are [BHU 1998; DPMT 2002]

- (a) Conformational isomers (b) Optical isomers
(c) Position isomers (d) Geometrical isomers
64. Which one of the following is the chiral molecule [BHU 1998; 2005]
(a) CH_3Cl (b) CH_2Cl_2
(c) CHBr_3 (d) CHClBrI
65. Cyanide and isocyanide are isomers of type [AFMC 1997]
(a) Positional (b) Functional
(c) Tautomer (d) Structural
66. Glucose and fructose are [AMU (Engg.) 1999]
(a) Optical isomers (b) Functional isomers
(c) Position isomers (d) Chain isomers
67. Which of the following compounds which is an optically active compound [UPSEAT 1999]
(a) 1-butanol (b) 2-butanol
(c) 3-butanol (d) 4-heptanol
68. *d*-tartaric acid and *l*-tartaric acid are [MH CET 1999]
(a) Enantiomers (b) Tautomers
(c) Diastereoisomers (d) Structural isomers
69. Minimum resistance in bond rotation will be observed in the compound [RPMT 1999]
(a) Hexachloroethane (b) Ethylene
(c) Acetylene (d) Ethane
70. Which pair show cis-trans isomerism [RPET 1999]
(a) Maleic-fumaric acid (b) Lactic-tartaric acid
(c) Malonic-succinic acid (d) Crotonic-acrylic acid
71. 1, 2-Dichloroethene shows [RPET 1999]
(a) Geometrical isomerism (b) Optical isomerism
(c) Ring-chain isomerism (d) Resonance
72. Which compound is optically active [DCE 1999]
(a) 4-chloro, 1 hydroxy butane
(b) 3°-butyl alcohol
(c) Secondary butyl amine
(d) *n*-butyl alcohol
73. Choose the pair of chain isomer [RPMT 2000]
(a) CH_3CHBr_2 and $\text{CH}_2\text{BrCH}_2\text{Br}$
(b) 1-propanol and 2-propanol
(c) Neo-pentane and isopentane
(d) Diethyl ether and methyl-*n*-propyl ether
74. Optical isomerism arises due to the presence of [RPMT 2000]
(a) An asymmetric carbon atom
(b) Centre of symmetry
(c) Axis of symmetry
(d) Plane of symmetry
75. Least hindered rotation about carbon-carbon bond is observed in [RPMT 2000]
(a) Ethane (b) Ethylene
(c) Ethyne (d) Hexachloroethane
76. Which pair represents chain isomer [RPMT 2000]
(a) CH_3CHCl_2 and $\text{ClCH}_2\text{CH}_2\text{Cl}$
(b) *n*-propyl alcohol and isopropyl alcohol
(c) 2-methyl-1-propanol and 2-methyl-2-propanol
(d) 2-methyl butane and neopentane
77. Which of the following compounds will exhibit geometrical isomerism [IIT-JEE Screening 2000]
(a) 1-phenyl-2-butene (b) 3-phenyl-1-butene
(c) 2-phenyl-1-butene (d) 1, 1-Diphenyl-1-propene
78. On bromination, propionic acid yields two isomeric 2-bromopropionic acids. This pair is an important example of [BHU 2000]
(a) Chain isomers (b) Optical isomers
(c) Cis-trans isomers (d) Position isomers
79. Geometrical isomerism is not possible in [CPMT 2000]
(a) Propene (b) 3-hexane
(c) Butenedioic acid (d) Cyclic compound
80. Only two isomeric monochloro derivatives are possible for [Pb. PMT 2000]
(a) 2-methyl propane (b) *n*-pentane
(c) Benzene (d) 2, 4-dimethyl pentane
81. Lactic acid in which a methyl group, a hydroxyl group, a carboxylic acid group and a hydrogen atom are attached to a central carbon atom, shown optical isomerism due to the molecular geometry at the [Pb. PMT 2000]
(a) Central carbon atom
(b) Carbon atom of the methyl group
(c) Carbon atom of the carboxylic acid group
(d) Oxygen of the hydroxyl groups
82. The number of possible alkynes with molecular formula C_5H_8 is [MP PMT 2000]
(a) 2 (b) 3
(c) 4 (d) 5
83. Which of the following will not lose asymmetry on reduction with LiAlH_4 [Roorkee 2000]
- (a) $\text{HOH}_2\text{C} \begin{array}{c} \text{CHO} \\ | \\ \text{CH} = \text{CH}_2 \end{array} \text{CH}_2\text{CH}_3$
- (b) $\text{H}_2\text{C} = \text{HCO} \begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_2\text{CH}_3 \end{array} \text{CHO}$
- (c) $\text{HOH}_2\text{C} \begin{array}{c} \text{CH}_3 \\ | \\ \text{C} \equiv \text{CH} \end{array} \text{COOH}$
- (d) $\text{H}_3\text{C} \begin{array}{c} \text{CHO} \\ | \\ \text{CH}_2\text{NH}_2 \end{array} \text{C} \equiv \text{N}$
84. Reason for geometrical isomerism by 2-butene is [CBSE PMT 2000]
(a) Chiral carbon
(b) Free rotation about single bond
(c) Free rotation about double bond
(d) Restricted rotation about double bond
85. Stereoisomers which are not the mirror images of one another are called [RPMT 2000]
(a) Enantiomers (b) Mesomers
(c) Tautomers (d) Diastereoisomers
86. The isomerism shown by *n*-butyl alcohol and isobutyl alcohol is [RPMT 2000]
(a) Metamerism (b) Chain
(c) Position (d) Stereo
87. Which is optically active [MH CET 2001]
(a) CH_2Cl_2
(b) CHCl_3
(c) Meso form of tartaric acid
(d) Glyceraldehyde
88. Which of the following will show geometrical isomerism [CPMT 2001; BHU 2005]
(a) $\text{CH}_3\text{CH} = \text{CHCH}_3$ (b) $(\text{CH}_3)_2\text{C} = \text{C}(\text{CH}_3)_2$

- (c) $(CH_3)_2C = C(CH_3)_2$ (d) $CH_3 - CH = C(CH_3)_2$
89. What is the maximum number of open chain structures possible for C_4H_8 [MP PET 2001]
(a) 2 (b) 3
(c) 4 (d) 1
90. Glucose has optical isomers [DCE 2001]
(a) 8 (b) 12
(c) 16 (d) Cannot be predicted
91. An organic compound
 $^1CH_3 - ^2CH_2 - ^3CH_2 - ^4CH_2 - ^5CH_2 - ^6CH_2 - ^7CH_3$
To make it chiral compound the attack should be on which carbon atom [DCE 2001]
(a) 1 (b) 3
(c) 4 (d) 7
92. Which of the following statements is not true about enantiomers [DCE 2001]
(a) They have same physical properties
(b) They have different biological properties
(c) They have same chemical properties towards chiral compounds
(d) None of these
93. Meso-tartaric acid is [BHU 2001]
(a) Optically inactive
(b) Optically active because of molecular symmetry
(c) Optically inactive due to external compensation
(d) Optically active because of asymmetric carbon atom
94. The number of possible isomers of the compound with molecular formula C_7H_8O is [BHU 2001]
(a) 3 (b) 5
(c) 7 (d) 9
95. The number of isomers for the compound with molecular formula C_2BrClF_3 [IIT-JEE (Screening) 2001]
(a) 3 (b) 4
(c) 5 (d) 6
96. Hydrogenation of the adjoining compound in the presence of poisoned palladium catalyst gives [IIT-JEE (Screening) 2001]
-
- (a) An optically active compound
(b) An optically inactive compound
(c) A racemic mixture
(d) A diastereomeric mixture
97. The number of possible structural isomers for a compound with the molecular formula C_7H_{16} is [DCE 2001]
(a) 8 (b) 9
(c) 10 (d) 12
98. Which of the following molecule contains asymmetric carbon atom [JIPMER 2002]
(a) $CH_3CHClCOOH$ (b) CH_3CH_2COOH
(c) $ClCH_2CH_2COOH$ (d) $Cl_2CHCOOH$
99. A similarity between optical and geometrical isomerism is that [AIEEE 2002]
(a) Each forms equal number of isomers for a given compound
(b) If in a compound one is present then so is the other
(c) Both are included in stereoisomerism
(d) They have no similarity
100. If the light waves pass through a nicol prism then all the oscillations occur only in one plane, such beam of light is called as [Kerala (Med.) 2002]
(a) Non-polarised light (b) Plane polarised light
(c) Polarised light (d) Optical light
101. Racemic mixture is formed by mixing two [AIEEE 2002]
(a) Isomeric compounds (b) Chiral compounds
(c) Meso compounds (d) Optical isomers
102. Which of the following does not show geometrical isomerism [AIEEE 2002]
(a) 1, 2 dichloro-1-pentene
(b) 1, 3-dichloro-2-pentene
(c) 1, 1-dichloro-1-pentene
(d) 1, 4-dichloro-2-pentene
103.
$$\begin{array}{c} H_3C \\ \diagdown \\ C \\ \diagup \\ H \end{array} = \begin{array}{c} CH_3 \\ \diagup \\ C \\ \diagdown \\ H \end{array} \quad \text{and} \quad \begin{array}{c} H_3C \\ \diagdown \\ C \\ \diagup \\ H \end{array} = \begin{array}{c} H \\ \diagup \\ C \\ \diagdown \\ CH_3 \end{array}$$

exhibit which isomerism [MP PET 2002]
(a) Position isomerism (b) Geometrical isomerism
(c) Optical isomerism (d) Functional isomerism
104. Which compound is chiral [RPMT 2002]
(a) butane
(b) 1-chloro-2-methyl butane
(c) 2-methyl butane
(d) 2-methyl propane
105. Methyl acetate and propionic acid are [RPMT 2002]
(a) Functional isomer (b) Structural isomer
(c) Stereoisomer (d) Geometrical isomer
106. Which compound shows *cis-trans* isomerism [CPMT 2002]
(a) 1-butene (b) 2-propene
(c) 2-butene (d) Benzene
107. Isomers of propionic acid are [MP PMT 2002]
(a) $HCOOC_2H_5$ and CH_3COOCH_3
(b) $HCOOC_2H_5$ and $C_3H_7COOCH_3$
(c) CH_3COOCH_3 and C_3H_7OH
(d) C_3H_7OH and CH_3COCH_3
108. The functional isomer of ethyl alcohol is [MP PMT 2002]
(a) CH_3OCH_3 (b) CH_3COCH_3
(c) CH_3COOH (d) CH_3CH_2CHO
109. Disymmetric object is one which is [Kerala (Engg.) 2002]
(a) Superimposable on its mirror image
(b) Non-superimposable on its mirror image
(c) Optically inactive
(d) Achiral
110. Geometrical isomers differ in [CBSE PMT 2002]
(a) Position of atoms
(b) Length of carbon
(c) Spatial arrangement of atoms
(d) Position of functional group
111. Which of the following hydride is capable of showing conformations [JIPMER 2002]
(a) $NH_2 - NH_2$ (b) B_2H_6
(c) CH_4 (d) None of these
112. Which of the following is an chiral compound [AIIMS 2002]
(a) Hexane (b) Methane
(c) *n*-butane (d) 2,3,4-trimethyl hexane

113. What is the possible number of optical isomers for a compound containing 2-dissimilar asymmetric carbon atom

[CPMT 1999; UPSEAT 1999, 2000, 02]

- (a) 2 (b) 4
(c) 6 (d) 8

114. Which of the following compounds is optically active

[Pb. PMT 2001; AMU 2002; Kerala (Med.) 2003]

- (a) $(CH_3)_2CHCH_2OH$ (b) CH_3CH_2OH
(c) CCl_2F_2 (d) $CH_3CHOHC_2H_5$

115. Optically active compound is

[UPSEAT 2002]

- (a) 3-chloropentane (b) 2-chlorobutane
(c) 2-chloropropane (d) None of these

116. If a carbon atom is attached to $-H, -OH, -COOH$ and $-OCOC_2H_5$ number of chiral C-atoms in compound is

[RPMT 2003]

- (a) 1 (b) 2
(c) 3 (d) 4

117. Isomerism due to rotation round single bond of carbon-carbon is [UPSEAT 2003]

- (a) Conformation (b) Enantiomerism
(c) Diastereoisomerism (d) Position isomerism

118. Which of the following pairs of compounds are enantiomers

[CBSE PMT 2003]

How many structures of F is possible

[IIT-JEE (Screening) 2003]

- (a) 2 (b) 5
(c) 6 (d) 3

120. An enantiomerically pure acid is treated with racemic mixture of an alcohol having one chiral carbon. The ester formed will be [IIT-JEE (Screening) 2003]

- (a) Optically active mixture (b) Pure enantiomer
(c) Meso compound (d) Racemic mixture

121. Which one of the following will not show geometrical isomerism [MP PMT 2003]

122. Isomerism shown by

[RPMT 2003]

- (a) Position isomerism (b) Chain isomerism
(c) Metamerism (d) Optical isomerism

123. A compound whose molecules are superimposable on their mirror images even though they contain an asymmetric carbon atom is called [Kerala (Med.) 2003]

- (a) A meso compound (b) An erythro isomer
(c) A threo isomer (d) a glycol

124. Of the following, the compound possessing optical isomerism [Kerala (Med.) 2003]

- (a) CH_3CH_2OH (b) $CH_3CHClBr$
(c) CCl_2BrF (d) CCl_2F_2

125. Which of the following statement is wrong [EAMCET 2003]

- (a) Diethyl ketone and methyl propyl ketone are position isomers
(b) 2-chloropentane and 1-chloropentane are position isomers
(c) n-butane and 2-methylpropane are chain isomers
(d) Acetone and propionaldehyde are functional isomers

126. Dimethyl ether and ethyl alcohol are

[MH CET 2004; Pb. CET 2002]

- (a) Metamers (b) Homologues
(c) Functional isomers (d) Position isomers

127. The correct statement about the compounds A and B is

[DCE 2002; UPSEAT 2004; IIT-JEE 1997; DPMT 2005]

- (a) A and B are identical
(b) A and B are diastereomers
(c) A and B are enantiomers
(d) None of these

128. Ethyl acetoacetate shows, which type of isomerism

[Pb. CET 2003]

- (a) Chain (b) Optical
(c) Metamerism (d) Tautomerism

129. Which of the following will have a mesoisomer also

[AIEEE 2004]

- (a) 2, 3-Dichloropentane
(b) 2, 3-Dichlorobutane
(c) 2-Chlorobutane
(d) 2-Hydroxypropanoic acid

130. For which of the following parameters the structural isomers C_2H_5OH and CH_3OCH_3 would be expected to have the same values? (Assume ideal behaviour) [AIEEE 2004]

- (a) Boiling points
(b) Vapour pressure at the same temperature
(c) Heat of vaporization
(d) Gaseous densities at the same temperature and pressure

131. The geometrical isomerism is shown by

[AIIMS 2004]

- (a)  (b) 
132. Which of the following compounds will exhibit *cis-trans* isomerism [Kerala PMT 2004]
 (a) 2-butene (b) 2-butyne (c) 2-butanol (d) Butanone
133. Which of the following compounds exhibit stereoisomerism [MP PMT 2004]
 (a) 2-methyl-butane 1 (b) 3-methyl-butanoic acid
 (c) 3-methyl-butyne 1 (d) 2-methyl butanoic acid
134. The chirality of the compound [CBSE PMT 2005]

 (a) *R* (b) *S*
 (c) *Z* (d) *E*
135. Which of the following is most likely to show optical isomerism [UPSEAT 2004]
 (a) $\text{HC} \equiv \text{C} - \underset{\text{Cl}}{\overset{\text{H}}{\text{C}}} - \text{C} \equiv \text{CH}$ (b) $\text{HC} \equiv \text{C} - \underset{\text{Cl}}{\overset{\text{H}}{\text{C}}} - \text{CH}_3$
 (c) $\text{HC} \equiv \text{C} - \underset{\text{Cl}}{\overset{\text{H}}{\text{C}}} - \text{H}$ (d) $\text{HC} \equiv \text{C} - \underset{\text{Cl}}{\overset{\text{H}}{\text{C}}} = \text{CH}_2$
136. Nitroethane can exhibit one of the following kind of isomerism [DCE 2004]
 (a) Metamerism (b) Optical activity
 (c) Tautomerism (d) Position isomerism
137. $\text{CH}_3\text{CH}(\text{OH}).\text{COOH}$ shows [BVP 2004]
 (a) Geometrical isomerism (b) Optical isomerism
 (c) Both (d) None
138. Which will have enantiomer [BVP 2004]
 (a) $\text{CH}_3\text{CH}_2\underset{\text{Cl}}{\text{CH}} - \text{CH}_3$ (b) $\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{Cl}$
 (c) $\text{CH}_3\text{CH}_2\text{CH}_2\text{CHCl}_2$ (d) None
139. The total number of acyclic isomers including the stereoisomers with the molecular formula $\text{C}_4\text{H}_7\text{Cl}$ [Pb. CET 2004]
 (a) 11 (b) 12
 (c) 9 (d) 10
140. The number of possible enantiomeric pairs that can be produced during mono-chlorination of 2-methylbutane is [Pb. CET 2004]
 (a) 3 (b) 4
 (c) 1 (d) 2
141. Which one of the following pairs represents stereoisomerism [CBSE PMT 2005]
 (a) Chain isomerism and rotational isomerism
 (b) Structural isomerism and geometric isomerism
 (c) Linkage isomerism and geometric isomerism
 (d) Optical isomerism and geometric isomerism
142. When isomers have the same structural formula but differ in relative arrangement of atoms or groups are called [CPMT 2000; KCET (Med.) 2000]
 (a) Mesomers (b) Stereoisomers
 (c) Optical isomers (d) Geometrical mesomers
143. $\text{CH}_3\text{CH}_2\text{CH} = \text{CH}_2$ and $\text{CH}_3 - \text{CH} = \text{CH} - \text{CH}_3$ show
 (a) Chain isomerism (b) Position isomerism
 (c) Functional isomerism (d) Metamerism
144. The number of possible isomers of butene are [Kerala (Engg.) 2002]
 (a) 3 (b) 2
 (c) 4 (d) 5
 (e) 6
145. Which of the following show geometrical isomerism [BCECE 2005]
 (a) $\text{C}_2\text{H}_5\text{Br}$ (b) $(\text{CH}_2)(\text{COOH})_2$
 (c) $(\text{CH})_2(\text{COOH})_2$ (d) C_2H_6
146. Among the following the most stable compound is [AIIMS 2005]
 (a) *cis*-1,2-cyclohexanediol
 (b) *trans*-1,2-cyclohexanediol
 (c) *cis*-1,3-cyclohexanediol
 (d) *trans*-1,3-cyclohexanediol
147. Chirality of carbon compound is because of its [Kerala (Med.) 2002]
 (a) Tetrahedral nature of carbon
 (b) Monovalent nature of carbon
 (c) Divalent nature of carbon
 (d) Trivalent nature of carbon
148. Which kind of isomerism is possible for 1-chloro-2-nitroethene [J & K 2005]
 (a) Functional group isomerism
 (b) Position isomerism
 (c) *E/Z* isomerism
 (d) Optical isomerism
149. Which will give chiral molecule [DPMT 2005]
 (a) $\text{CH}_3\text{COCl} \xrightarrow{\text{LiAlH}_4}$
 (b) $\text{C}_2\text{H}_5\text{CHO} \xrightarrow[\text{H}^+/\text{H}_2\text{O}]{\text{CH}_3\text{MgBr}}$
 (c) $(\text{CH}_3)_2\text{CHC}_2\text{H}_5 \xrightarrow{\text{Cu}}$
 (d) $\text{H} \diagup \text{C} = \text{C} \diagdown \text{CH}_3 \xrightarrow{\text{Cl}_2}$
150. Which of the following will be chiral [J & K 2005]
 (a) CH_3CHCl_2 (b) CH_3CHBrCl
 (c) CD_2Cl_2 (d) CH_2ClBr
151. Which of the following fischer projection formula is same as *D*-Glyceraldehyde [Kerala CET 2005]
 (a) $\begin{array}{c} \text{CH}_2\text{OH} \\ | \\ \text{OH} - \text{C} - \text{CHO} \\ | \\ \text{H} \end{array}$
 (b) $\begin{array}{c} \text{CH}_2\text{OH} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{CHO} \end{array}$
 (c) $\begin{array}{c} \text{CHO} \\ | \\ \text{OH} - \text{C} - \text{CH}_2\text{OH} \\ | \\ \text{H} \end{array}$

Critical Thinking

Objective Questions

1. In the given conformation C_2 is rotated about $C_2 - C_3$ bond anticlockwise by an angle of 120° then the conformation obtained is [AIIMS 2004]

- (a) Fully eclipsed conformation
(b) Partially eclipsed conformation
(c) Gauche conformation
(d) Staggered conformation
2. The molecular formula of diphenyl methane, $\text{C}_6\text{H}_5 - \text{CH}_2 - \text{C}_6\text{H}_5$, is $\text{C}_{13}\text{H}_{12}$

How many structural isomers are possible when one of the hydrogens is replaced by a chlorine atom [CBSE PMT 2004]

- (a) 8 (b) 7
(c) 6 (d) 4
3. SN^1 reaction is faster in [Orissa JEE 2004]

4. How many enantiomer pairs are obtained by monochlorination of 2, 3-dimethylbutane [Kerala PMT 2004]
- (a) Nil (b) Four
(c) Two (d) Three
(e) One
5. Among the following compounds which can be dehydrated very easily is [AIEEE 2004]

6. Which of the following statements is not characteristic of free radical chain reaction [JIPMER 1997]
- (a) It gives major product derived from most stable free radical
(b) It is usually sensitive to change in solvent polarity
(c) It proceeds in three main steps like initiation, propagation and termination
(d) It may be initiated by U.V. light
7. Most stable carbanion is [BHU 2003]

8. Among the following the dissociation constant is highest for [AIIMS 2004]
- (a) $\text{C}_6\text{H}_5\text{OH}$ (b) $\text{C}_6\text{H}_5\text{CH}_2\text{OH}$
(c) $\text{CH}_3\text{C} \equiv \text{CH}$ (d) $\text{CH}_3\text{NH}_3^+\text{Cl}^-$
9. Which one of the following compounds is most acidic [CBSE PMT 2005]

10. Which one is electrophilic addition [AMU (Engg.) 1999]
- (a) $\text{CH}_3 - \text{CH}_3 + \text{Cl}_2 \rightarrow \text{C}_2\text{H}_5\text{Cl} + \text{HCl}$
(b) $\text{CH}_3\text{CH} = \text{O} + \text{HCN} \rightarrow (\text{CH}_3)_2\text{C}(\text{OH})\text{CN}$
(c) $(\text{CH}_3)_2\text{C} = \text{O} + \text{HCN} \rightarrow \text{CH}_3\text{CH}(\text{OH})\text{CN}$
(d) $\text{CH}_2 = \text{CH}_2 + \text{Br}_2 \rightarrow \text{CH}_2\text{BrCH}_2\text{Br}$

11. A compound has 3 chiral carbon atoms. The number of possible optical isomers it can have [DCE 2004]

- (a) 3 (b) 2
(c) 8 (d) 4

12. How many chiral isomers can be drawn from 2-bromo, 3-chloro butane [DCE 2003]

- (a) 2 (b) 3
(c) 4 (d) 5

13. Number of isomers of C_4H_{10} is [CBSE PMT 1996; AFMC 1997; RPMT 2002; MP PMT 1997]

- (a) 2 (b) 3
(c) 4 (d) Isomerism not exist

14. The number of possible isomers for compound $\text{C}_2\text{H}_3\text{Cl}_2\text{Br}$ is [MP PMT 1999]

- (a) 2 (b) 3
(c) 4 (d) 5

15. The optically active tartaric acid is named as D-(+)- tartaric acid because it has a positive [IIT-JEE 1999]

- (a) Optical rotation and is derived from *D*-glucose
 (b) pH in organic solvent
 (c) Optical rotation and is derived from *D*(+) glyceraldehyde
 (d) Optical rotation only when substituted by deuterium

16. Among the following compounds (I-III) the correct order of reaction with electrophilic reagent is [CBSE PMT 1997]

- (a) $II > III > I$ (b) $III < I < II$
 (c) $I > II > III$ (d) $I = II > III$

17. Carbocation which is most stable [BHU 2003]

- (a) $CH_3CH_2^+$ (b) CH_3^+
 (c) $C_6H_5CH_2^+$ (d) $CH_3CH_2CH_2^+$

18. Tautomerism is exhibited by

[CBSE PMT 1997; KCET 2002]

- (a) $(CH_3)_3CNO$ (b) $(CH_3)_2NH$
 (c) R_3CNO_2 (d) RCH_2NO_2

19. Which of the following will have geometrical isomers

[MP PET 1996; MP PMT 1997; AFMC 1997]

- (a) 2-methylpropene (b) 2-butene
 (c) 1-butene (d) Propene

20. Examine the following three pairs of possible isomers

Now state whether the pairs represent identical compounds or different isomers

- (a) All three pairs represent different compounds
 (b) (ia) and (ib) are identical; (iia) and (iib) are identical; and (iiaa) and (iibb) are identical
 (c) (ia) and (ib) are isomers; (iia) and (iib) are identical; and (iiaa) and (iibb) are isomers
 (d) (ia) and (ib) are identical; (iia) and (iib) are identical, and (iiaa) and (iibb) are isomers

21. Tautomerism is exhibited by [IIT-JEE 1998]

(c)

22. The following reaction is described as [CBSE PMT 1997]

- (a) SE^2 (b) SN^1
 (c) SN^2 (d) SN^0

23. Which one of the following represents eclipsed form of ethane

24. Which are the staggered forms of ethane

25. Which of the following is the most stable cation [CBSE PMT 1988; MNR 1988; AIIMS 1985]

- (a) $CH_3CH_2\dot{C}HCH_3$ (b) $CH_3-\dot{C}HCH_3$
 (c) $CH_3CH_2CH_2\dot{C}H_2$ (d) CH_3^+

26. In a reaction of C_6H_5Y , the major product (> 60%) is *m*-isomer, so the group *Y* is [AIIMS 1997; UPSEAT 2003]

- (a) $-COOH$ (b) $-NH_2$
 (c) $-OH$ (d) $-Cl$

27. Dehydrohalogenation in presence of OH^- is correctly represented by [Orissa JEE 2004]

28. Number of structural isomers of $C_4H_{10}O$ are

[CPMT 1983, 84, 89, 91; MADT Bihar 1984;
MNR 1984; MP PET 1997; Pb. PMT 1999; MH CET 2003]

29. Among the following the aromatic compound is [AIIMS 2004]

30. Which of the following compounds are not arranged in order of decreasing reactivity towards electrophilic substitution [DCE 2003]

- (a) Fluoro benzene > chloro benzene > bromo benzene
(b) Phenol > *n*-propyl benzene > benzoic acid
(c) Chloro toluene > para-nitro toluene > 2-chloro-4-nitro toluene
(d) Benzoic acid > phenol > *n*-propyl benzene

31. Most stable carbonium ion is [Pb. CET 2004]

- (a) $C_2H_5^+$ (b) $(CH_3)_3C^+$
(c) $(C_6H_5)_3C^+$ (d) $C_6H_5CH_2^+$

32. Which one of the following species is most stable [IIT-JEE 1995]

- (a) $p-O_2N-C_6H_4-\overset{+}{C}H_2$
(b) $p-CH_3O-C_6H_4-\overset{+}{C}H_2$
(c) $p-Cl-C_6H_4-\overset{+}{C}H_2$
(d) $C_6H_5-\overset{+}{C}H_2$

33. Which of the following gives most stable carbocation by dehydration [RPMT 2002]

- (a) $(CH_3)_2CH-OH$
(b) $(CH_3)_3C-OH$
(c) CH_3-CH_2-OH
(d) $CH_3-CH_2-O-CH_2-CH_3$

34. Which of the following orders regarding relative stability of free radicals is correct [UPSEAT 2004]

- (a) $3^\circ < 2^\circ < 1^\circ$ (b) $3^\circ > 2^\circ > 1^\circ$
(c) $1^\circ < 2^\circ < 3^\circ$ (d) $3^\circ > 2^\circ < 1^\circ$

35. The +I effect of alkyl groups is in the order [DCE 2002]

- (a) $2^\circ > 3^\circ > 1^\circ$ (b) $1^\circ > 2^\circ > 3^\circ$
(c) $3^\circ > 2^\circ > 1^\circ$ (d) None of these

36. Which one has asymmetric C-atom [Roorkee 1995]

37. Which of the following compounds will show metamerism [KCET 1996]

- (a) $CH_3COOC_2H_5$ (b) $C_2H_5-S-C_2H_5$
(c) CH_3-O-CH_3 (d) $CH_3-O-C_2H_5$

38. How many carbon atoms in the molecule $HCOO-(CHOH)_2-COOH$ are asymmetric [MP PET 2001]

- (a) 1 (b) 2
(c) 3 (d) None of these

39. Which of the following act as nucleophiles [Roorkee 1999]

- (a) CH_3NH_2 (b) RO^-
(c) $AlCl_3$ (d) CH_3MgBr

40. Which of the following has the highest nucleophilicity [IIT-JEE Screening 2000]

- (a) F^- (b) OH^-
(c) CH_3^- (d) NH_2^-

41. Keto-enol tautomerism is found in [IIT-JEE 1988; MADT Bihar 1995]

42. Which of the following compounds will show geometrical isomerism [IIT-JEE 1999]

- (a) 2-butene (b) Propene
(c) 1-phenylpropene (d) 2-methyl-2-butene

43. Which behaves both as a nucleophile and electrophile [IIT-JEE Screening 1991; Pb. CET 1985]

- (a) CH_3NH_2 (b) CH_3Cl
(c) CH_3CN (d) CH_3OH

44. The number of optical isomers of an organic compound having *n* asymmetric carbon atoms will be [MP PET 1994]

- (a) 2^{n+1} (b) n^2
(c) 2^n (d) 2^{n-1}

45. Total number of isomers of C_6H_{14} are [IIT-JEE 1987; DPMT 1983; CPMT 1991; MNR 1990; MP PET 1995; UPSEAT 2001]

- (a) 4 (b) 5
(c) 6 (d) 7

46. With a change in hybridisation of the carbon bearing the charge, the stability of a carbanion increase in the order [DCE 2003]

- (a) $sp < sp^2 < sp^3$ (b) $sp < sp^3 < sp^2$
(c) $sp^3 < sp^2 < sp$ (d) $sp^2 < sp < sp^3$

47. The C-C bond length of the following molecules is in the order [IIT-JEE 1991]

- (a) $C_2H_6 > C_2H_4 > C_6H_6 > C_2H_2$
(b) $C_2H_2 < C_2H_4 < C_6H_6 < C_2H_6$
(c) $C_2H_6 > C_2H_2 > C_6H_6 > C_2H_4$

48. In the reaction $CH_3CHO + HCN \rightarrow CH_3CH(OH)CN$ a chiral centre is produced. This product would be

[CBSE PMT 1995]

- (a) Laevorotatory (b) Meso compound
(c) Dextrorotatory (d) Racemic mixture

49. Cyclic hydrocarbon molecule 'A' has all the carbon and hydrogen in a single plane. All the carbon-carbon bonds are of same length less than $1.54\text{\AA}$, but more than $1.34\text{\AA}$. The $C-C$ bond angle will be [BVP 2003]

- (a) $109^\circ 28'$ (b) 100°
(c) 180° (d) 120°

50. How many structural isomers are possible for a compound with molecular formula C_3H_7Cl [CBSE PMT 2001]

- (a) 2 (b) 5
(c) 7 (d) 9

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

- Assertion : Aniline is better nucleophile than anilium ion.
Reason : Anilium ion have +ve charge. [AIIMS 1996]
- Assertion : Neopentane forms one mono substituted compound.
Reason : Neopentane is isomer of pentane. [AIIMS 2001]
- Assertion : *Trans*-2-butene on reaction with Br_2 gives *meso*-2, 3-dibromobutane.
Reason : The reaction involves syn-addition of bromine. [AIIMS 2003]
- Assertion : *Cis*-1, 3-dihydroxy cyclohexane exists in boat conformation.
Reason : In the chair form, there will not be hydrogen bonding between the two hydroxyl groups. [AIIMS 2003]
- Assertion : Hydroxyketones are not directly used in Grignard reaction.
Reason : Grignard reagents react with hydroxyl group. [AIIMS 2003]
- Assertion : Benzyl bromide when kept in acetone water it produces benzyl alcohol.
Reason : The reaction follows SN mechanism. [AIIMS 2003]
- Assertion : Carbon possesses property of catenation.
Reason : Carbon atoms form double as well as triple bonds during catenation.
- Assertion : Olefins have the general formula C_nH_{2n+1} .
Reason : There is one double bond between two carbon atoms in their molecules.
- Assertion : Saturated hydrocarbons are chemically less reactive.

- Reason : All isomeric paraffins have same parent name.
Assertion : A mixture of glucose and *m*-dinitrobenzene can be separated by shaking it with ether.
- Reason : Glucose is soluble in water.
Assertion : Tertiary carbonium ions are generally formed more easily than primary carbonium ions.
- Reason : Hyperconjugative as well as inductive effect due to additional alkyl groups stabilize tertiary carbonium ions.
Assertion : Heterolytic fission involves the breaking of a covalent bond in such a way that both the electrons of the shared pair are carried away by one of the atoms.
- Reason : Heterolytic fission occurs readily in polar covalent bonds.
Assertion : The order of reactivity of carbonium ions is $2^\circ > 3^\circ > 1^\circ$.
- Reason : Carbon atom in carbonium ions is in sp^3 state of hybridisation.
Assertion : Free radicals are short lived and highly reactive.
- Reason : Free radicals are highly unstable.
- Assertion : Each carbon in ethylene molecule is sp^2 hybridised.
Reason : The $H-C-H$ bond angle in ethylene molecule is 120° .
- Assertion : Cyclohexanone exhibits keto-enol tautomerism.
Reason : In cyclohexanone, one form contains the keto group ($C=O$) while other contains enolic group ($-C=C-OH$).
- Assertion : Staggered form is less stable than the eclipsed form.
Reason : The conformation in which the bond pairs of two central atoms are very far from one another is called staggered form.
- Assertion : *Trans* isomers are more stable than *cis* isomer.
Reason : The *cis* isomer is the one in which two similar groups are on the same side of double bond.
- Assertion : Propadiene is optically active.
Reason : Propadiene has a plane of symmetry.
- Assertion : Lactic acid is optically active.
Reason : A symmetry in the inner structure of the organic compound causes optical activity.
- Assertion : Same number of electron pairs are present in resonance structures.
Reason : Resonance structures differ in the location of electrons around the constituent atoms.
- Assertion : Carbon-oxygen bonds are of equal length in carbonate ion.
Reason : Bond length decreases with the multiplicity of bond between two atoms.

AS

Answers and Solutions

Bonding and hybridisation in organic compounds

3. (b) CH₂ = CH₂ both the carbon atoms are sp² hybridised.

5. (c) Type s-character
 sp³ 25%
 sp² 33.33%
 sp 50%

6. (a) $\overset{sp}{CH} \equiv \overset{sp}{CH}$

7. (b) sp² and sp³

All the carbon atoms are sp³ hybridized.

9. (d) $\underset{sp^3}{CH_3} - \overset{sp^2}{CH} = \underset{sp^2}{CH} - \overset{sp^3}{CH_2} - \underset{sp^2}{CH} = \overset{sp^2}{CH} - \underset{sp}{C} \equiv \underset{sp}{CH}$

10. (a) $\underset{sp^3}{CH_3} - \underset{sp}{C} \equiv \underset{sp}{C} - H$

11. (c) sp and sp²

13. (c)  π electrons = 10.

π bonds = 5

hence electrons are double

14. (d) Cyclobutadienyl anion (C₄H₄)²⁻

15. (b) $CH_3 - CH_3 \xrightarrow[\text{bond fission}]{\text{Homolytic}} \underset{\text{Methyl free radicals}}{CH_3^\bullet} + CH_3^\bullet$

free radical is formed which is sp²-hybridized.

16. (a) $Br - \underset{sp^2}{CH} = \underset{sp^2}{CH} - Br \xrightarrow[\text{Catalyst}]{H_2} Br - \underset{sp^3}{CH_2} - \underset{sp^3}{CH_2} - Br$

17. (d) (i) $\overset{sp^3}{CH_3} - \overset{sp^3}{CH_2} - \overset{sp^3}{CH_2} - \overset{sp^3}{CH_3}$

only sp³ hybridized carbon

(ii) $\overset{sp^3}{CH_3} - \overset{sp^2}{CH} = \overset{sp^2}{CH} - \overset{sp^3}{CH_3}$

Both sp² and sp³ hybridized carbon.

(iii) $\overset{sp^2}{CH_2} = \overset{sp^2}{CH} - \overset{sp^2}{CH} = \overset{sp^2}{CH_2}$

Only sp² hybridized carbon.

(iv) $H - \underset{sp}{C} \equiv \underset{sp}{C} - H$

Only sp hybridized carbon.

18. (a) (i) Benzene and its derivatives are always

planar because all the carbon in benzene are sp² hybridized.

Both the carbon are sp² hybridized. Therefore planar.

19. (a)  Tetrahedral structure
sp³ hybridization

20. (c) $H - \underset{H}{C} = \underset{H}{C} - \underset{H}{C} - \underset{H}{C} - H$; 11 σ bonds and 1 π bond.

21. (d) $CH_3 - \underset{CH_3}{CH} - CH_2 - CH_3$

It has 3 CH₃ groups, one CH₂ group and one CH group.

It has 18 σ bonds and 3 π bonds.

Cyclo hexene
Two carbon atoms are sp^2 -hybridized while remaining 4 are sp^3 hybridized.

Three π bonds.

26. (a, c) Carbonium ions are sp hybridized species.

31. (c) Bond energy is maximum for triple bond.

33. (d) In benzene all 6 carbons are sp^2 hybridised.

37. (c) Propyne has one acidic hydrogen.

40. (b) In CCl_4 all bond angles are same i.e. of $109^\circ 28'$ the carbon is sp^3 hybridised.

41. (c) Geometry in sp^2 -hybridisation is trigonal.

43. (c) Single bond has longest distance of bonds so C_2H_6 ethane is correct answer.

48. (c) In ethylene molecule carbons are sp hybridised so its structure is trigonal planar

Total 9 σ bond and 3 π bond.

62. (d) Because hydrogen is attached with high electronegative element.

64. (b) has 15 σ bonds.

66. (b) The 12π and 3π bonds character of $C-H$ bond of acetylene is higher in comparison to $C-H$ bond of ethene and ethane. The electrons of the $C-H$ bond in acetylene are strongly held by carbon nuclei. This facilitates the removal of hydrogen as proton.

Dipole moment, resonance and reaction intermediates

1. (b)
- $\mu = 0$ symmetrical structure.
2. (b) Due to presence of two chlorine atom on the same side of carbon atom produces dipole moment in molecule.
4. (c) We know that there is more difference in the electronegativities of hydrogen and chlorine. Therefore HCl is a polar compound.

The dipole moment is the highest for Acetophenone.

6. (d) Resonance structure of molecule does not have identical bonding.

All the bonds ($C-C$) are equal in benzene. The $C-C$ bond length is $1.39\text{ \AA}$ which is in between $C-C$ bond ($1.54\text{ \AA}$) and $C=C$ ($1.34\text{ \AA}$).

(2) 6π electrons are present.

11. (d) Benzene is unreactive instead of having 3π bonds because of resonance π -electrons are delocalized.
12. (b) Carboxylic acids are easily ionized because there is resonance in carboxylate ion due to π -electron shifting so H^+ get ionised very easily.

13. (a) Due to delocalisation of π electrons benzene has resonance.

19. (a)
21. (a) It is hyperconjugation process.
22. (a) Triphenyl methyl cation has three benzene resonating ring so it is most stable compound.
23. (b) Due to mesomeric effect (+) of $-OH$ group the electron density on benzene ring increase. So the electrophile easily attacked on these electron rich center.
24. (c) Carbonyl carbon become more reactive toward nucleophilic addition by increasing the +I effect of alkyl group so the reactivity order is as

25. (c) The octet of all atoms are complete in structures (a) and (b). In structure (d) electron deficiency of positively charged carbon is duly compensated by lone pair electrons of adjacent oxygen atom while such neighbour group support is not available in structure (c).

30. (b) 3° alcohol on dehydrogenation gives most stable carbonium ion.
32. (c) Without intermediate reaction take place as under

(According to markownikoff rule)

But the halogen bonded with terminal carbon so it take place in presence of peroxide by free radical mechanism.

33. (a)
- | Species | Valence electrons | Magnetic behaviour |
|------------------|-------------------|--------------------|
| 1. Free radical | 7 | Paramagnetic |
| 2. Carbonium ion | 6 | Diamagnetic |
| 3. Carbanion | 8 | Diamagnetic |
| 4. Carbene | 6 | Diamagnetic |
| 5. Nitrene | 6 | Diamagnetic |

Greater the no. of alkyl groups attached to the carbon atom carrying the odd electrons, greater is the delocalization of odd electron and hence more stable is the free radical.

Greater the no. of alkyl groups, greater would be the dispersal of the charge and hence more stable will be the carbonium ion.

tertiary alkyl > secondary alkyl > primary alkyl > methyl.
More the number of alkyl groups, the greater the dispersal of positive charge and therefore, more the stability of carbonium ion is observed.

Dispersal of positive charge increases with the increase in the number of benzene ring.

Organic reactions and their mechanism

The electrophile responsible for nitration is NO_2^+ ion.

It is addition reaction.

Which is according to Markownikoff rule.

That is called addition reaction.

22. (a) The phenyl ring having $H - N<$ group is activated while another one is deactivated due to $-C=$, so electrophilic

aromatic bromination will occur at para position with respect to $H - N<$ group inactivated ring.

23. (d) The non reactivity of the chlorine atom in vinyl chloride may be explained from the molecular orbital point of view as follows. If the chlorine atom has sp^2 hybridization the $C - Cl$ bond will be a σ -bond and the two lone pairs of electron would occupy the other two sp^2 orbitals. This would leave a p -orbital containing a lone pair and this orbital could not conjugate with the π bond of the ethylenic link. Thus two M.O.S. will be required to accommodate these four π electrons. Further more since chlorine is more electronegative than carbon, the electron will tend to be found in the chlorine atom has now lost full control of the lone pair and so, is less negative than it would have been had there been no conjugation. Since two carbon atoms have acquired a share in the lone pair, each atom acquires a small negative charge. Hence, owing to delocalisation of bonds (through conjugation), the vinyl chloride molecule has an increased stability. Before the chlorine atom can be displaced by some other group the lone pair must be localised again on the chlorine atom. This requires energy and so the chlorine is more firmly bound than has no conjugation occurred.

24. (a) Nucleophiles are those substances which can donate a pair of electrons. These can be neutral or negative. The nucleophilic power depends on the tendency of species to donate electrons. This is more, when an electron pushing group (+I group) is present. Among the alkyl groups, those having higher number of C-atoms will push more, hence ethyl > methyl.

25. (a) Conjugated acid of Cl^- is a stronger acid i.e., HCl .
26. (b) Saytzeffs product.
29. (b) If the dehydrohalogenation of an alkyl halide can yield more than one alkene, then according to the saytzeff rule, the main product is the most highly substituted alkene.

30. (d) Halogenation of alkanes takes place in presence of light (sunlight or UV) or at elevated temperature via free radical.
31. (d) All the given species undergo nucleophilic substitution reaction. This reactivity can be explained in terms of the nature of $C - X$ bond which is highly polarised covalent bond due to large difference in the electronegativities of carbon and halogen atoms.

32. (c) Increasing +I effect
 $(CH_3)_3C > (CH_3)_2CH > CH_3CH_2 > CH_3$

Structural and stereo isomerism

In this structure chiral carbon atom is present since it is optical active.

6. (b) In ethane staggered form and in cyclohexane chair form is more stable.

Chiral centre is present. Hence, it exists as optical isomers or enantiomorphs.

8. (c) In $C_6H_5CH_2CH_3$ chiral centre is absent.
9. (c) $C_2H_2Br_2$ has three isomers.

10. (c) Lactic acid shows optical isomerism

because they contain chiral carbon atom.

12. (a)

In other compounds chiral carbon is absent.

14. (c) Ball is achiral where other objects are chiral because objects and their mirror images are non-super imposable

Only one chiral centre. Hence two optical isomers are possible.

No. of optical isomer = 2^n (where n = no. of chiral carbon) = $2^1 = 2$.

23. (a) Four groups linked to carbon atom are different

25. (d) Five isomers of C_4H_8

26. (b) Polarimeter is an instrument used for measuring the optical rotation. It consists of two Nicol prisms, one called the polarizer (near the light source) and the other called the analyser (near the eye). In between the polarizer and analyser, a glass tube containing the solution of an optically active compound is placed.

28. (c) Metamerism is a special types of isomerism shown by secondary amines, ethers and ketones.

Functional isomers:

32. (d) $\text{C}_4\text{H}_{10}\text{O}$ have six isomers are possible

Butan-2-ol

2-Methyl propan-1-ol

2-Methyl-propan-2-ol

Methyl propyl ether

Diethylether

36. (a) Molecular symmetry

Mesotartaric acid is optically inactive due to internal compensation i.e. the effect one half of the molecule is neutralized by other.

One chiral centre. Therefore two forms are possible.

39. (c) Optical isomerism and geometrical isomerism.

Diethyl ether $\text{C}_2\text{H}_5 - \text{O} - \text{C}_2\text{H}_5$ is position isomer and not stereoisomer.

 41. (c) $\text{C}_2\text{H}_5 - \text{O} - \text{C}_2\text{H}_5$ and $\text{CH}_3 - \text{O} - \text{C}_3\text{H}_7$ are metamers.

are position isomers of each other.

 44. (a) $\text{R} - \text{N} \equiv \text{C}$ and $\text{R} - \text{C} \equiv \text{N}$ are functional isomers.

45. (b) Optical isomerism because chiral centre is present

isomer of $\text{C}_2\text{H}_5 - \text{O} - \text{C}_2\text{H}_5$ ($\text{C}_4\text{H}_{10}\text{O}$)

47. (d) Chair and boat form differ in energy by 44 kJ/mol.

 48. (b) $\text{CH}_3 - \text{O} - \text{CH}_2 - \text{CH}_3$ and $\text{CH}_3\text{CH}_2\text{CH}_2 - \text{OH}$ ethylmethyl ether and propylalcohol are functional isomers.

Propoxy ethane

Both are same compounds.

 50. (a) $\text{CH}_3 - \text{CO} - \text{CH}_3$ and $\text{CH}_3 - \text{CH}_2 - \text{CHO}$ are functional isomers.

51. (b) Three isomers are possible

 52. (d) Diastereoisomers - Optical isomers which are not mirror images of each other.
 e.g.

 53. (b) $\text{C}_7\text{H}_9\text{N}$ has 5 isomers

Number of enantiomers = 2^n (n = asymmetric Carbon atom) = $2^2 = 4$.

A carbon atom which is attached to four different atoms or groups is called a chiral or asymmetric carbon atom. such a carbon atom is often marked by an asterisk.

Secondary butyl amine is optically active.

92. (a) Enantiomers have same chemical properties but different physical properties.

93. (a) Meso isomer have two achiral carbon with opposite spin so it becomes optically inactive

95. (d)

96. (b) Due to formation of the plane of symmetry by the syn addition of hydrogen in the triple bond, the compound formed is optically inactive.

101. (b) Racemic mixture is combination of *d* and *l* isomers.

102. (c) $Cl_2C = CH - CH_2 - CH_2 - CH_2$. It can't show geometrical isomerism due to unsymmetrical alkene.

103. (b) Geometrical isomerism.

104. (b) $CH_3 - CH_2 - \underset{\substack{| \\ CH_3}}{CH} - CH_2 - Cl$

105. (a) Functional isomerism

109. (b) Non superimposable on its mirror image.

112. (d) $CH_3 - CH_2 - \underset{\substack{| \\ CH_3}}{CH} - \underset{\substack{| \\ CH_3}}{CH} - \underset{\substack{| \\ CH_3}}{CH} - CH_3$, it is a chiral compound.

114. (d) $CH_3 - \underset{\substack{| \\ C_2H_5}}{\overset{\substack{| \\ OH}}{C}} - H$

In this structure chiral carbon is present that is why it is optically active.

115. (b) 2-chloro butane will be optically active.

118. (b) Structures are mirror images of each other which are non super imposable so they are enantiomers.

120. (d) Both have one chiral carbon atom hence racemic mixture will be obtain

121. (b) Structure have 3-different atoms and group so it is unable to show geometrical isomerism

122. (c) Metamerism is shown by the different arrangement of alkyl group about functional group.

124. (b) $CH_3 - \underset{\substack{| \\ Br}}{\overset{\substack{| \\ H}}{C}} - Cl$, it is a chiral compound.

126. (c) $CH_3 - O - CH_3$ and C_2H_5OH are functional isomers.

127. (c) Both are enantiomer.

128. (d) $CH_3COOC_2H_5$ shows tautomeric isomerism.

129. (b)

130. (d) Gaseous density of both ethanol and dimethyl ether would be same under identical condition of temperature and pressure while the rest of these three properties vapour pressure, boiling point and heat of vaporization will differ as ethanol has hydrogen bonding where as ether does not.

132. (a)

Cis-trans isomerism shown by compound which have double or triple bond by which they restrict their rotation, since 2 butyne have no hydrogen on triple bonded carbon.

133. (d) Because it contain asymmetric carbon atom.

135. (b) $HC \equiv C - \underset{\substack{| \\ Cl}}{\overset{\substack{| \\ H}}{C}} - CH_3$ shows optical isomerism because of molecule is unsymmetrical. That is called chiral.

136. (c) Nitroalkanes exhibit tautomerism. In it, $\alpha - H -$ atom is labile and form nitrolic acid.

137. (b) $H - \underset{\substack{| \\ OH}}{\overset{\substack{| \\ CH_3}}{C}} - COOH$ shows optical isomerism due to presence of asymmetric carbon atom.

138. (a) 2-chloro butane has a chiral carbon atom, hence only it will show optical activity and will possess two enantiomers (one chiral carbon atom).

139. (b) C_4H_7Cl is a monochloro derivative of C_4H_8 which itself exists in three isomeric forms.

(i) $CH_3 - CH_2 - CH = CH_2$: Its possible mono-chloro derivatives are :

2 isomers : cis and trans forms

optically active (exists in two forms)

(ii) $\text{CH}_3 - \text{CH} = \text{CH} - \text{CH}_3$: Its possible monochloro derivatives are :

Exists in two geometrical forms

Exists in two geometrical forms

(iii) $\text{CH}_3 - \underset{\text{CH}_3}{\underset{|}{\text{C}}} = \text{CH}_2$: Its possible monochloro derivatives

are

Only one form

Only one form

Thus, the total acyclic isomers forms of $\text{C}_4\text{H}_7\text{Cl}$ are 12.

Its monochloro derivatives are as follows :

It will exist as enantiomeric pair (*d* and *l*-forms)

no asymmetric C atom

It will exist as enantiomeric pair (*d* and *l*-forms)

No asymmetric carbon atom

Hence, only two enantiomeric pairs will be obtained by the monochlorination of 2-methylbutane.

141. (d) When isomers have the structural formula but differ in the relative arrangement of atoms or groups in space with in the molecule, these are known as stereoisomers and the phenomenon as stereo isomerism. Stereoisomerism is of three

types (i) Geometrical isomerism (ii) Optical isomerism (iii) Conformational isomerism.

146. (d) *Trans* configuration is more stable than *cis* configuration because in *cis*-configuration the *H* groups are thrown closely enough together to cause crowding or repulsion. Again between 1,2-and 1,3-configurations, in 1-3, the *OH* groups are placed further apart to minimise the repulsion. Hence, more stable is 1,3-configuration.

147. (a) Chirality of carbon compound is because of its tetrahedral nature of carbon.

For highly substituted alkenes *E* and *Z* system of nomenclature is used, which is based on a priority system developed by Cahn, Ingold and Prelog.

C^* -chiral carbon as all the four valencies are attached with different substituents or groups.

All the four valencies of carbon are satisfied with different atoms/substituents.

151. (c) The configuration in which, *OH* group are on right side, *H* - atom are on left side, *CHO* group are on upper side & CH_2OH are on lower side found in fischer projection known as *D*-configuration.

Critical Thinking Questions

2. (d) Only four structural isomers are possible for diphenyl methane.

3. (c) S_N1 mechanism proceeds through carbocation intermediate.

4. (e) $CH_3 - \underset{\text{CH}_3}{\underset{|}{CH}} - \underset{\text{CH}_3}{\underset{|}{CH}} - CH_3 + Cl_2 \rightarrow$
2,3-dimethyl butane

Due to the presence of chiral carbon it shows the optical activity and its mirror image are non superimposable so it shows one enantiomer pair.

5. (a) $CH_3 - CH_2 - \underset{\text{OH}}{\underset{|}{C}}(CH_3) - CH_2 - CH_3 \xrightarrow{H^+}$

The more stable carbocation is generated thus more easily it will be dehydrated.

6. (b) This option is not characteristics of free radical chain reaction.
7. (c) Due to NO_2 group in benzene ring,

8. (d) Dissociation of proton from $CH_3 - \overset{+}{N}H_3Cl^-$ is very difficult due to $-I$ effect of Cl^- and N^+ while in C_6H_5OH due to resonance stabilization of phenoxide ion proton eliminate easily similarly due to H -bonding in $C_6H_5CH_2OH$ it can be eliminate and $CH_3C \equiv CH$ show acidic character by triple bond by which proton can be dissociate.

Electron withdrawing group increases acidic character due to $-I$ and $-R$ effect of NO_2 hence orthonitrophenol is most acidic.

10. (d) Halogenation on alkene occurs by electrophilic addition.

11. (c) The number of possible optical isomers $= 2^n$
(where ' n ' is the number of chiral c -atoms) $= 2^3 = 8$

12. (c) 2-bromo, 3-chloro-butane has 2 chiral carbon atoms, hence has $2^2 = 4$ optical isomers.

13. (a) $CH_3 - CH_2 - CH_2 - CH_3$, $CH_3 - \underset{\text{CH}_3}{\underset{|}{CH}} - CH_3$
n-Butane Iso-butane

14. (b) $C_2H_3Cl_2Br$ three isomers are possible

15. (c) $D(+)$ -tartaric acid has positive optical rotation and is derived from $D(+)$ glyceraldehyde.

16. (c) $I > II > III$

Methoxy group is electron releasing it increases electron density of benzene nucleus while $-NO_2$ decreases electron density of benzene.

17. (c) Due to resistance benzyl carbonium ion is most stable.

18. (d) $R - CH_2 - \overset{+}{N} \begin{matrix} \nearrow O \\ \searrow O^- \end{matrix} \rightleftharpoons R - CH = \overset{+}{N} \begin{matrix} \nearrow OH \\ \searrow O^- \end{matrix}$
(Nitro-form) (Aci-form)

19. (b) (cis) (Trans)

20. (d) Both 1, 2-dichloro benzene

Hence, identical compounds.

Hence, identical compounds.

(iiiia) and (iiib) are position isomers.

In this reaction inversion of configuration takes place this is called optical inversion. It is an example of SN^2 reaction (Bimolecular Nucleophilic Substitution).

23. (b) This option shows eclipsed form of ethane.

24. (c) 2° and 4° forms of ethane are staggered.

25. (b) $(CH_3)_3C^+$ 3° carbonium ion is most stable.

$Y = -COOH$ because it is meta directing group while $-NH_2$, $-OH$ and $-Cl$ are O and P directing groups.

28. (c) $C_4H_{10}O$ have 7 isomers out of which 4 are alcohols and 3 are ethers.

29. (a) According to Huckel rule for aromaticity the molecule must be planar, cyclic system having delocalised $(4n + 2)\pi$ electron where n is an integer equal to 0, 1, 2, 3, thus the aromatic comp. have delocalised electron cloud of

2, 6, 10 or 14π electron cyclopropenyl cation

the 2π electron ($n = 0$) so it is aromatic.

30. (d) $-COOH$ group is a deactivating group, hence benzoic acid is less reactive towards electrophilic substitution than phenol.

31. (c) In the triphenyl methyl carbonium ion the π electrons of all the three benzene rings are delocalised with the vacant p -orbital of central carbon atom. So, it is resonance stabilised. It is the most stable of all the carbonium ions given

32. (b)

Nitro-group is electron withdrawing therefore decreases stability.

Methoxy group is electron releasing.

Therefore increases stability by donating electron.

Chlorine is also electron withdrawing but its effect is less than $-NO_2$ group.

Hence, correct order of stability.

33. (b) 3° alcohols $Me-\overset{\overset{Me}{|}}{\underset{\oplus}{C}}-Me$ is most stable carbocation

34. (b) Due to the increasing no. of hyperconjugative structures free radical stabilise following as $3^\circ > 2^\circ > 1^\circ$.

35. (c) $3^\circ > 2^\circ > 1^\circ$

36. (b,c) $CH_3-\overset{\overset{H}{|}}{C^*}-CH_2-CH_3$ and $CH_3-CH_2-\overset{\overset{H}{|}}{C^*}-CH_3$
 Br Br

37. (b) $C_2H_5-S-C_2H_5$ and $CH_3-S-C_3H_7$
 Diethyl thioether Methyl propyl thioether

are metamers.

38. (b) $HCOO-\overset{\overset{OH}{|}}{CH}-\overset{\overset{OH}{|}}{CH}-COOH$
 (1) (2)

Two carbon atoms in the molecule are asymmetric.

39. (a,b,d) $CH_3\ddot{N}H_2$, $R-\ddot{O}-$, $CH_3-Mg-\ddot{Br}:$ are nucleophiles due to presence of lone pairs.

40. (c) CH_3^- has the highest nucleophilicity.

41. (c,d) $C_6H_5-\overset{\overset{O}{||}}{C}-CH_3$ and $C_6H_5-\overset{\overset{OH}{|}}{C}=CH_2$
 (Keto form) (enol form)

42. (a,c) 2-butene

1-phenyl propene

43. (c) CH_3CN behaves both as nucleophile and electrophile.

44. (c) 2^n , n = no. of asymmetric carbon atoms.

45. (b) 1. $CH_3-CH_2-CH_2-CH_2-CH_2-CH_3$
 n-hexane

46. (c) Stability of carbanions increase with increase in s -character of hybrid orbitals of carbon bearing charge, hence correct order is : $sp^3 < sp^2 < sp$.

47. (b) $C_2H_2 < C_2H_4 < C_6H_6 < C_2H_6$
 1.20 Å 1.34 Å 1.39 Å 1.54 Å

48. (d) $CH_3CHO + HCN \rightarrow CH_3-\overset{\overset{*}{|}}{CH}-CN$
 OH

(Both d and l forms are obtained) Hence, product will be a racemic mixture.

49. (d) Molecule 'A' is benzene because in benzene bond length is between single and double bond.

50. (a) Two isomers $CH_3-\overset{\overset{|}{Cl}}{CH}-CH_3$ and

$CH_3-CH_2-CH_2Cl$ are possible for C_3H_7Cl .

Assertion & Reason

1. (a) It is fact that aniline is better nucleophile than anilium ion. Anilium ion contain $+ve$ charge, which reduces the tendency to donate lone pair of electron $C_6H_5NH_3^+$.
 Aniliumion

Therefore, both assertion and reason are true.

2. (b) Neopentane is isomer of pentane and neopentane forms only one substitution product. Both assertion and reason are true but reason is not a correct explanation of assertion. Neopentane forms mono substituted product due to presence of four identical methyl groups present on carbon atom.
3. (c) The assertion that *trans*-2 butene reacts with Br_2 to product meso-2, 3-dibromobutane is correct but it does not involve *syn*-addition of Br_2 .
4. (d) Here both assertion and reason are incorrect because *cis*-1, 3-dihydroxy cyclohexane exist in chair conformation and in chair conformation hydrogen bonding is present.
5. (a) Hydroxy ketones are not directly used in Grignard reagent. Grignard reagents are very reactive. Therefore, they react with hydroxyl group. Here both are correct.
6. (a) The assertion that on keeping benzyl bromide in acetone water it produces benzyl alcohol is correct. Because $C_6H_5CH_2Br$ hydrolysed to produce $C_6H_5CH_2OH$. This conversion is of SN^2 mechanism.
7. (b) Catenation property of carbon is primarily due to its small size. Electronic configuration and unique strength of carbon-carbon bonds.
8. (e) Olefins are unsaturated hydrocarbons containing two hydrogen atoms less than the corresponding paraffin *i.e.* there is one double bond between two carbon atoms in their molecules and they have the general formula C_nH_{2n} .
9. (b) Less reactivity of saturated hydrocarbons are due to presence of single bonds between carbon atoms.
10. (b) Glucose is insoluble in ether.
11. (a) An alkyl group attached to the positively charged carbon of a carbonium ion tends to release electrons towards that carbon; thus the positive charges gets dispersed as the alkyl group becomes some what positively charged itself. More the number of alkyl groups, the greater is the dispersal of positive charge and therefore more easily it will be formed.
12. (b) Heterolytic fission occurs when the two atoms differ considerably in their electronegativities and shared pair of electrons is carried by more electronegative atom.
13. (d) The order of reactivity of carbonium ions is $1^\circ > 2^\circ > 3^\circ$.
Carbon atom in carbonium ion is in sp^2 state of hybridisation. The three hybridized orbitals lie in the same plane and are involved in the formation of three σ bonds with three atoms or groups while the unhybridised p -orbital remains vacant.
14. (b) Since free radicals contain odd electrons, so they are short lived and they readily try to pair up the odd electrons to form neutral molecules, that is why they are highly reactive.
15. (b) Each carbon atom in ethylene is attached to two hydrogen atoms by single covalent bonds and to another carbon atoms by a double bond. Since each carbon is attached to three other atoms, it uses sp^2 hybrid orbitals and an unhybridised p_z orbital to form its bond. Each $C-H$ bond is a σ bond resulting from the overlap of $1s$ orbital of hydrogen atom and sp^2 orbital of a carbon atom. One $C-C$ bond results from the linear overlap of sp^2 orbitals one from each carbon atom. One π bond results from the lateral overlap of two unhybridised p_z orbitals, one from each carbon atom.

16. (a) In cyclohexanone keto enol tautomerism is as follows

17. (e) The staggered form is more stable than the eclipsed form because the potential energy of staggered form in which the bond pairs of two carbons are far away from each other is minimum. Also the H -atoms are as far apart as possible and non bonded interaction between them is maximum. In occupied form, the H -atom are very close and so the increased overlap between them non-bonded orbitals is repulsive. That is why staggered form is more stable than eclipsed form.
18. (b) Trans isomer is more stable than cis isomer because in cis isomer, the bulky groups are on the same side of the double bond. The steric repulsion of the groups makes the cis isomer less stable than the trans isomer in which the bulky groups are far apart. (They are on the opposite side of the double bond).
19. (e) 1, 2-propadiene is not optically active because the terminal sp^2 -hybridised carbons have the same atoms *i.e.* H -atoms. As a result, it has a plane of symmetry passing through the three carbon atoms and hence the molecule is optically inactive.
20. (b) Lactic acid is a chiral molecule because it has a chiral carbon atom or asymmetric carbon atom and is therefore optically active.
21. (e) Resonance structures contain the same number of unpaired electrons.
22. (b) CO_3^{2-} shows resonance and thus all the three bonds are of identical bond length.

General Organic Chemistry

Self Evaluation Test -23

1. The most stable conformation of *n*-butane is [CBSE PMT 1997]
 (a) Skew boat (b) Eclipsed
 (c) Gauche (d) Staggered
2. Which of the following undergoes nucleophilic substitution by S_N^1 mechanism [CBSE PMT 2005]
 (a) Benzyl chloride (b) Ethyl chloride
 (c) Chlorobenzene (d) Isopropyl chloride
3. Which type of isomerism is shown by propanal and propanone [CPMT 2004]
 (a) Functional group (b) Metamerism
 (c) Tautomerism (d) Chain isomerism
4. Which of the following exhibits optical isomerism [BHU 1980; NCERT 1983; AIIMS 1992; MNR 1993; MP PMT 1990, 94]
 (a) Butanol-1 (b) Butanol-2
 (c) Butene-1 (d) Butene-2
5. In carbonium ion the carbon bearing the positive charge in the [Pb. PMT 1998; MH CET 2002]
 (a) sp^2 -hybridized state (b) sp^3d -hybridized state
 (c) sp -hybridized state (d) sp^3 -hybridized state
6. Which of the following is not an electrophile [CBSE PMT 2001]
 (a) Cl^+ (b) Na^+
 (c) H^+ (d) BF_3
7. Heterolytic bond dissociation energy of alkyl halides follows the sequence [AMU 2000]
 (a) $R-F > R-Cl > R-Br > R-I$
 (b) $R-I > R-Br > R-Cl > R-F$
 (c) $R-I > R-F > R-Br > R-Cl$
 (d) $R-Cl > R-Br > R-I > R-F$
8. The shape of carbonium ion is [AMU (Engg.) 1999]
 (a) Planar (b) Pyramidal
 (c) Linear (d) None of these
9. Which of the following compounds shows tautomerism [MP PET 2001]
 (a) $HCHO$ (b) CH_3CHO
 (c) CH_3COCH_3 (d) $HCOOH$
10. In which bond angle is the highest [CBSE PMT 1991]
 (a) sp^3 (b) sp^2
 (c) sp (d) sp^3d
11. How many primary amines are possible for the formula $C_4H_{11}N$ [MNR 1995]
 (a) 1 (b) 2
 (c) 3 (d) 4
12. On monochlorination of 2-methyl butane, the total number of chiral compounds is [IIT-JEE Screening 2004]
 (a) 2 (b) 4
 (c) 6 (d) 8
13. An isomer of ethanol is [DPMT 1982, 88; CPMT 1973, 75, 78, 84; IIT-JEE 1986; BHU 1984, 85; EAMCET 1993; MP PET 1995; RPET 1999; BHU 2000; AFMC 2002]
 (a) Methanol (b) Dimethyl ether
 (c) Diethyl ether (d) Ethylene glycol
14. Due to the presence of an unpaired electron, free radicals are
 (a) Chemically reactive (b) Chemically inactive
 (c) Anions (d) Cations
15. Tertiary alkyl halides are practically inert to substitution by S_N2 mechanism because of [AIEEE 2005]
 (a) Insolubility (b) Instability
 (c) Inductive effect (d) Steric hindrance
16. The decreasing order of nucleophilicity among the nucleophiles
 (i) $CH_3C(=O)O^-$ (ii) CH_3O^-
 (iii) CN^- (iv) $H_3C-C_6H_4-S(=O)_2O^-$
 is [AIEEE 2005]
 (a) (i), (ii), (iii), (iv) (b) (iv), (iii), (ii), (i)
 (c) (ii), (iii), (i), (iv) (d) (iii), (ii), (i), (iv)
17. Which of the following is optically active [BHU 2005]
 (a) Butane (b) 4-methylheptane
 (c) 3-methylheptane (d) 2-methylheptane
18. Correct configuration of the following is [AIIMS 2005]

$$\begin{array}{c} CH_3 \\ | \\ H - C - OH \\ | \\ CH_3 - C - OH \\ | \\ H \end{array}$$

 (a) 1S, 2S (b) 1S, 2R
 (c) 1R, 2S (d) 1R, 2R
19. Which types of isomerism is shown by 2, 3-dichlorobutane [AIEEE 2005]
 (a) Distereo (b) Optical
 (c) Geometric (d) Structural
20. Who synthesised the first organic compound urea in the laboratory [RPMT 2000]
 (a) Kolbe (b) Wohler
 (c) Fraizer (d) Berzilius

Answers and Solutions

(SET -23)

1. (d) Anti or completely staggered

Staggered form is most stable because of minimum repulsion between bulky methyl groups.

2. (a) Due to more stable carbocation.
3. (a) When two compounds have similar molecular formula but differ in the functional group then the isomerism is called functional group isomerism *i.e.* $\text{CH}_3\text{CH}_2\text{CHO}$ and

4. (b) $\text{CH}_3 - \overset{\text{H}}{\underset{\text{OH}}{\text{C}}}^* - \text{CH}_2 - \text{CH}_3$

Because it has chiral carbon atom.

5. (a) The central carbon atom in carbonium ion is sp^2 hybridised and it has three sp^2 hybrid orbitals for single bonding to three substituents.
6. (b) Na^+ is not an electrophile.
7. (b) $\text{R}-\text{I} > \text{R}-\text{Br} > \text{R}-\text{Cl} > \text{R}-\text{F}$
8. (a) Carbonium ion is planar species
9. (c) Ketones show tautomerism. They form keto and enol form

10. (c) Type Bond angle
 sp^3 109.5°
 sp^2 120°
 sp^3d 90° and 120°
 sp 180°

11. (d) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_2 - \text{NH}_2$
(1-aminobutane)

12. (b) The possible monochlorinated products of 2-methyl butane are

Therefore, a total of four chiral compounds are obtained.

13. (b) Dimethyl ether is an isomer of ethanol.
14. (a) Free radicals are very reactive due to the presence of free e.
15. (d) Due to steric hindrance
16. (c) (ii) > (iii) > (i) > (iv)

17. (c) $\text{CH}_3\text{CH}_2\overset{\text{CH}_3}{\underset{|}{\text{CH}}}\text{CH}_2\text{CH}_2\text{CH}_3$ has a chiral carbon atom and hence is optically active.

Following the H procedure outlined under 'Golden Rule' the absolute configuration is 1s, 2s.

19. (b)
-

20. (b) Wohler synthesised the first organic compound urea in the laboratory.

Chapter 24 Hydrocarbon

Aliphatic Hydrocarbon

Organic compounds composed of only carbon and hydrogen are called hydrocarbons. Hydrocarbons are two types

- (1) *Aliphatic Hydrocarbon (Alkanes, Alkenes and Alkynes).*
- (2) *Aromatic Hydrocarbon (Arenes)*
- (1) **Sources of aliphatic hydrocarbon**

Mineral oil or crude oil, petroleum [Petra → rock; oleum → oil] is the dark colour oily liquid with offensive odour found at various depths in many regions below the surface of the earth. It is generally found under the rocks of earth's crust and often floats over salted water.

(2) Composition

(i) **Alkanes** : found 30 to 70% contain upto 40 carbon atom. Alkanes are mostly straight chain but some are branched chain isomers.

(ii) **Cycloalkanes** : Found 16 to 64% cycloalkanes present in petroleum are; cyclohexane, methyl cyclopentane etc. cycloalkanes rich oil is called asphaltic oil.

(iii) **Aromatic hydrocarbon** : found 8 to 15% compound present in petroleum are; Benzene, Toluene, Xylene, Naphthalene etc.

(iv) **Sulphur, nitrogen and oxygen compound** : Sulphur compound present to the extent of 6% include mercaptans [R-SH] and sulphides [R-S-R]. The unpleasant smell of petroleum is due to sulphur compounds. Nitrogenous compounds are pyridines, quinolines and pyrroles. Oxygen compounds present in petroleum are. Alcohols, Phenols and resins. Compounds like chlorophyll, haemin are also present in it.

(v) **Natural gas** : It is a mixture of Methane (80%), Ethane (13%), Propane (3%), Butane (1%), Vapours of low boiling pentanes and hexanes

(0.5%) and Nitrogen (1.3%). L.P.G. Contain butanes and pentanes and used as cooking gas. It is highly inflammable. This contain, methane, nitrogen and ethane.

(vi) **C.N.G.** : When natural gas compressed at very high pressure is called compressed natural gas (CNG). Natural gas has octane rating of 130 it consists, mainly of methane and may contain, small amount of ethane and propane.

(3) **Theories of origin of petroleum** : Theories must explain the following characteristics associated with petroleum,

Its association with brine (sodium chloride solution). The presence of nitrogen and sulphur compounds in it. The presence of chlorophyll and haemin in it. Its optically active nature. Three important theories are as follows.

- (i) *Mendeleeff's carbide theory or inorganic theory*
- (ii) *Engler's theory or organic theory*
- (iii) *Modern theory*

(4) **Mining of petroleum** : Petroleum deposits occurs at varying depth at different places ranging from 500 to 15000 feet. This is brought to the surface by artificial drilling.

(5) **Petroleum refining** : Separation of useful fractions by fractional distillation is called petroleum refining.

Table : 24.1

Fraction	Boiling range (°C)	Approximate composition	Uses
Uncondensed gases	Upto room temperature	$C_1 - C_4$	Fuel gases; refrigerants; production of carbon black, hydrogen; synthesis of organic chemicals.

Crude naphtha on refractionation yields,	30 – 150	$C_1 - C_6$	
(i) Petroleum ether	30 – 70	$C_1 - C_4$	Solvent
(ii) Petrol or gasoline	70 – 120	$C_4 - C_6$	Motor fuel; drycleaning; petrol gas.
(iii) Benzene derivatives	120 – 150	$C_6 - C_8$	Solvent; drycleaning
Kerosene oil	150 – 250	$C_8 - C_{10}$	Fuel; illuminant; oil gas
Heavy oil	250 – 400	$C_{10} - C_{20}$	As fuel for diesel engines; converted to gasoline by cracking.
Refractionation gives,			
(i) Gas oil, (ii) Fuel oil, (iii) Diesel oil			
Residual oil on fractionation by vacuum distillation gives,	Above 400	$C_{20} - C_{30}$	
(i) Lubricating oil		$C_{20} - C_{30}$	Lubrication
(ii) Paraffin wax		$C_{30} - C_{40}$	Candles; boot polish; wax paper; etc
(iii) Vaseline		$C_{40} - C_{50}$	Toilets; ointments; lubrication.
(iv) Pitch		$C_{50} - C_{60}$	Paints, road surfacing
Petroleum coke (on redistilling tar)			As fuel.

(6) Purification

(i) **Treatment with concentrated sulphuric acid** : The gasoline or kerosene oil fraction is shaken with sulphuric acid to remove aromatic compounds like thiophene and other sulphur compound with impart offensive odour to gasoline and kerosene and also make them corrosive.

(ii) **Doctor sweetening process :**

(iii) **Treatment with adsorbents** : Various fractions are passed over adsorbents like alumina, silica or clay etc; when the undesirable compounds get adsorbed.

(7) Artificial method for manufacture of Petrol or gasoline

(i) Cracking, (ii) Synthesis

(i) **Cracking** : It is a process in which high boiling fractions consisting of higher hydrocarbons are heated strongly to decompose them into lower hydrocarbons with low boiling points. Cracking is carried out in two different ways.

(a) *Liquid phase cracking* : In this process, the heavy oil or residual oil is cracked at a high temperature (475 – 530°C) under high pressure (7 to 70 atmospheric pressure). The high pressure keeps the reaction product in liquid state. The conversion is approximately 70% and the resulting petrol has the octane number in the range 65 to 70.

The cracking can be done in presence of some catalysts like silica, zinc oxide, titanium oxide, ferric oxide and alumina. The yields of petrol are generally high when catalyst is used.

(b) *Vapour phase cracking* : In this process, kerosene oil or gas oil is cracked in vapour phase. The temperature is kept 600 – 800°C and the pressure is about 3.5 to 10.5 atmospheres. The cracking is facilitated by use of a suitable catalyst. The yields are about 70%.

(ii) **Synthesis** : Two methods are applicable for synthesis.

(a) *Bergius process* : This method was invented by Bergius in Germany during first world war.

(b) *Fischer- tropsh process* : The overall yield of this method is slightly higher than Bergius process.

The best catalyst for this process is a mixture of cobalt (100 parts), thorium, (5 parts), magnesia (8 parts) and kieselguhr (200 parts).

Characteristics of hydrocarbons

(i) **Knocking** : The metallic sound during working of an internal combustion engine is termed as knocking.

"The greater the compression greater will be efficiency of engine."
The fuel which has minimum knocking property is always preferred.

The tendency to knock falls off in the following order : Straight chain alkanes > branched chain alkanes > olefins > cyclo alkanes > aromatic hydrocarbons.

(2) **Octane number** : It is used for measuring the knocking character of fuel used in petrol engine. The octane number of a given sample may be defined as the percentage by volume of iso-octane present in a mixture of iso-octane and *n*-heptane which has the same knocking performance as the fuel itself.

2, 2, 4-Trimethyl pentane or Iso-octane.

For example : a given sample has the knocking performance equivalent to a mixture containing 60% iso-octane and 40% heptane. The octane number of the gasoline is, therefore, 60.

Presence of following types of compounds increases the octane number of gasoline.

(i) In case of straight chain hydrocarbons octane number decreases with increase in the length of the chain.

(ii) Branching of chain increases the value of octane number

(iii) Introduction of double bond or triple bond increases the value of octane number.

(iv) Cyclic alkanes have relatively higher value of octane number.

(v) The octane number of aromatic hydrocarbons are exceptionally high

(vi) By adding gasoline additives (eg TEL)

(3) **Antiknock compounds** : To reduce the knocking property or to improve the octane number of a fuel certain chemicals are added to it. These are called **antiknock compounds**. One such compound, which is extensively used, is tetraethyl lead (TEL). TEL is used in the form of following mixture,

TEL = 63%, Ethylene bromide = 26%, Ethylene chloride = 9% and a dye = 2%.

However, there is a disadvantage that the lead is deposited in the engine. To remove the free lead, the ethylene halides are added which combine with lead to form volatile lead halides.

However, use of TEL in petrol is facing a serious problem of Lead pollution, to avoid this a new compound cyclopenta dienyl manganese carbonyl (called as AK-33-X) is used in developed countries as antiknocking compound.

(4) **Other methods of improving octane number of hydrocarbon.**

(i) **Isomerisation** [Reforming] : By passing an alkane over AlCl_3 at 200°C .

(ii) **Alkylation** :

(iii) **Aromatisation** :

The octane no. of petrol can thus be improved.

• By increasing the proportion of branched chain or cyclic alkanes.

• By addition of aromatic hydrocarbons Benzene, Toluene and Xylene (BTX).

• By addition of methanol or ethanol.

• By addition of tetraethyl lead $(\text{C}_2\text{H}_5)_4\text{Pb}$

(5) **Cetane number** : It is used for grading the diesel oils.

α -Methyl naphthalene

The cetane number of a diesel oil is the percentage of cetane (hexadecane) by volume in a mixture of cetane and α -methyl naphthalene which has the same ignition property as the fuel oil under consideration.

(6) **Flash point** : The lowest temperature at which an oil gives sufficient vapours to form an explosive mixture with air is referred to as flash point of the oil.

The flash point in India is fixed at 44°C , in France it is fixed at 35°C , and in England at 22.8°C . The flash point of an oil is usually determined by means of "**Abel's apparatus**".

Chemists have prepared some hydrocarbons with octane number even less than zero (e.g., *n*-nonane has octane number - 45) as well as hydrocarbon with octane number greater than 100 (e.g., 2, 2, 3 trimethylbutane. has octane number of 124).

(7) **Petrochemicals** : All such chemicals which are derived from petroleum or natural gas called petrochemicals. Some chemicals which are obtained from petroleum are summarised in table :

Table : 24.2

Hydrocarbons	Compounds derived
Methane	Methyl chloride, chloroform, methanol, formaldehyde, formic acid, freon, hydrogen for synthesis of ammonia.
Ethane	Ethyl chloride, ethyl bromide, acetic acid, acetaldehyde, ethylene, ethyl acetate, nitroethane, acetic anhydride.
Ethylene	Ethanol, ethylene oxide, glycol, vinyl chloride, glyoxal, polyethylene, styrene, butadiene, acetic acid.
Propane	Propanol, propionic acid, isopropyl ether, acetone, nitromethane, nitroethane, nitropropane.
Propylene	Glycerol, allyl alcohol, isopropyl alcohol, acrolein, nitroglycerine, dodecylbenzene, cumene, bakelite.
Hexane	Benzene, DDT, gammexane.
Heptane	Toluene
Cycloalkanes	Benzene, toluene, xylenes, adipic acid.
Benzene	Ethyl benzene, styrene, phenol, BHC (insecticide), adipic acid, nylon, cyclohexane, ABS detergents.
Toluene	Benzoic acid, TNT benzaldehyde, saccharin, chloramine-T, benzyl chloride, benzal chloride.

Alkanes [Paraffines]

"Alkanes are saturated hydrocarbon containing only carbon-carbon single bond in their molecules."

Alkanes are less reactive so called paraffins; because under normal conditions alkanes do not react with acids, bases, oxidising agents and reducing agent.

General formula : $\text{C}_n\text{H}_{2n+2}$

Examples are CH_4 , C_2H_6 , C_3H_8 .

(i) General Methods of preparation

(i) **By catalytic hydrogenation of alkenes and alkynes** (Sabatie and sanderen's reaction)

□ Methane is not prepared by this method

(ii) **Birch reduction :**(iii) **From alkyl halide**

(b) **With hydrogen in presence of pt/pd :**

(c) **With HI in presence of Red phosphorus :**

(iv) **By Zn-Cu couple :**(v) **Wurtz reaction :**

□ $R-Br$ or RI preferred in this reaction. The net result in this reaction is the formation of even no. of carbon atoms in molecules.

(vi) **Frankland's reaction :**(vii) **Corey-house synthesis**

□ Reaction is suitable for odd number of Alkanes.

(viii) **From Grignard reagent**

(a) **By action of acidic 'H' :**

(b) **By reaction with alkyl halide :**

(ix) **From carboxylic acids**

(a) **Laboratory method** [Decarboxylation reaction or Duma reaction]

□ $NaOH$ and CaO is in the ratio of 3 : 1. (Sodalime)

(b) **Kolbe's synthesis :**

At anode [Oxidation] :

At cathode [Reduction] :

□ Both ionic and free radical mechanism are involved in this reaction.

(c) **Reduction of carboxylic acid :**

(x) **By reduction of alcohols, aldehyde, ketones or acid derivatives**

□ Aldehyde and ketones when reduced with amalgamated zinc and conc. HCl also yield alkanes.

Clemmenson reduction :

□ Aldehydes and ketones ($>C=O$) can be reduced to hydrocarbon in presence of excess of hydrazine and sodium alkoxide on heating.

Wolff-kishner reduction :

(xi) **Hydroboration of alkenes**

(a) **On treatment with acetic acid**

(b) **Coupling of alkyl boranes by means of silver nitrate**

□ Poison's catalyst such as $BaSO_4, CaCO_3$ are used to stop the reaction after the formation of alkene.

(ii) **From mono halides :**

□ If we use alc. $NaOH$ in place of KOH then trans product is formed in majority because of its stability. According to saytzeff rule.

(iii) **From dihalides**

(a) **From Gem dihalides**

□ If we take two different types of gemdihalides then we get three different types of alkenes .

□ Above reaction is used in the formation of symmetrical alkenes only.

(b) **From vicinal dihalides :**

□ Alkene is not formed from 1, 3 dihalides. Cycloalkanes are formed by dehalogenation of it.

(iv) **By action of NaI on vicinal dihalide :**

(v) **From alcohols** [Laboratory method] :

(vi) **Kolbe's reaction :**

(vii) **From esters** [Pyrolysis of ester] :

(viii) **Pyrolysis of quaternary ammonium compounds :**

(ix) **Action of copper alkyl on vinyl chloride :**

(x) **By Grignard reagents :**

(xi) **The wittig reaction :**

(xii) **From β bromo ether** [Boord synthesis]

(2) **Physical Properties**

(i) Alkenes are colourless and odourless.

(ii) These are insoluble in water and soluble in organic solvents.

(iii) Physical state

(iv) *B.P.* and *M.P.* decreases with increasing branches in alkene.

(v) The melting points of cis isomers are lower than trans isomers because cis isomer is less symmetrical than trans. Thus trans packs more tightly in the crystal lattice and hence has a higher melting point.

(vi) The boiling points of cis isomers are higher than trans isomers because cis-alkenes has greater polarity (Dipole moment) than trans one.

(vii) These are lighter than water.

(viii) **Dipole moment** : Alkenes are weakly polar. The, π -electron's of the double bond. Can be easily polarized. Therefore, their dipole moments are higher than those of alkanes.

(3) **Chemical properties**

(i) **Francis experiment** : According to Francis electrophile first attacks on olefinic bond.

(ii) **Reaction with hydrogen :**

(iii) **Reduction of alkene via hydroboration** : Alkene can be converted into alkane by protolysis

Hydroboration : Alkene give addition reaction with diborane which called hydroboration. In this reaction formed trialkylborane, Which is very important and used for synthesis of different organic compound

The overall result of the above reaction appears to be antimarkownikoff's addition of water to a double bond.

(iv) **By treatment with $AgNO_3$ + $NaOH$** : This reaction gives coupling

(v) **Birch reduction** : This reaction is believed to proceed via anionic free radical mechanism.

(vi) **Halogenation**

□ If NBS [N-bromo succinimide] is a reagent used for the specific purpose of brominating alkenes at the allylic position.

□ In presence of polar medium alkene form vicinal dihalide with halogen.

Reactivity of halogen is $F_2 > Cl_2 > Br_2 > I_2$

(vii) **Reaction with HX** [Hydrohalogenation]

According to markownikoff's rule and kharasch effect.

According to Anti Markownikoff rule

(Based on F.R.M.)

(viii) **Reaction with hypohalous acids** :

□ In case of unsymmetrical alkenes markownikoff rule is followed.

(ix) **Reaction with sulphuric acid** :

□ This reaction is used in the separation of alkene from a gaseous mixture of alkanes and alkenes.

(x) **Reaction with nitrosyl chloride**

reagent)

□ If hydrogen is attached to the carbon atom of product, the product changes to more stable oxime.

(xi) **Oxidation** : With alkaline $KMnO_4$ [Bayer's reagent] : This reaction is used as a test of unsaturation.

With acidic KMnO_4 :

(xii) **Hydroxylation**

(a) Using per oxy acid :

(b) Hydroxylation by OsO_4 :

□ If per benzoic acid or peroxy acetic acid is used then oxirane are formed.

They burn with luminous flame and form explosive mixture with air or oxygen.

(xiv) **Ozonolysis**

□ Application of ozonolysis : This process is quite useful to locate the position of double bond in an alkene molecule. The double bond is obtained by joining the carbon atoms of the two carbonyl compounds.

(xv) **Oxy-mercuration demercuration** : With mercuric acetate (in THF), followed by reduction with $\text{NaBH}_4 / \text{NaOH}$ is also an example of hydration of alkene according to markownikoff's rule.

(xvi) **Epoxidation**

(b) Epoxidation by performic acid or perbenzoic acid :

(xvii) **Hydroboration**

(xviii) **Hydroformylation** :

□ If $\text{CO} + \text{H}_2\text{O}$ is taken then respective acid is formed.

(xix) **Addition of formaldehyde**

(xx) **Polymerisation**

□ If in polymerisation $\text{Ziegler-Natta catalyst } [(\text{R})_3\text{Al} + \text{TiCl}_4]$ is used then polymerisation is known as Ziegler-Natta polymerisation.

(xxi) **Isomerisation** :

The mechanism proceeds via carbocation.

(xxii) **Addition of HNO_2 :**(xxiii) **Addition of Acetyl chloride :**(4) **Uses**

(i) For the manufacture of polythene – a plastic material; (ii) For artificial ripening of fruits; (iii) As a general anaesthetic; (iv) As a starting material for a large number of compounds such as glycol, ethyl halides, ethyl alcohol, ethylene oxide, etc; (v) For making poisonous mustard gas (War gas); (vi) For making ethylene-oxygen flame.

Alkynes

These are the acyclic hydrocarbons which contain carbon-carbon triple bond are called alkynes. General formula is $\text{C}_n\text{H}_{2n-2}$. Ex. Ethyne

(i) **General methods of preparation**

□ In reaction with vicinal dihalide, if the reactant is 2-butylene chloride then product is 2-butyne as major product.

Preparation of higher alkynes (by metal acetylide)

□ Acetylene gives salt with NaNH_2 or AgNO_3 (ammonical) which react with alkyl halide to give higher alkyne.

(2) **Physical properties**

(i) Acetylene is a colourless gas. It has a garlic odour. The odour is due to presence of impurities of phosphorous and hydrogen sulphide. However, pure acetylene has pleasant odour.

(ii) It is insoluble in water but highly soluble in acetone and alcohol.

Acetylene is transported under high pressure in acetone soaked on porous material packed in steel cylinders.

(iii) Its boiling point is -84°C .

(iv) It is lighter than air. It is somewhat poisonous in nature.

(v) It burns with luminous flame and forms explosive mixture with air.

(3) **Chemical reactivity of alkynes :** $\text{C} \equiv \text{C}$ is less reactive than the carbon-carbon double bond towards electrophilic addition reaction. This is because in alkyne carbon has more s-character so more strongly will be the attraction for π electrons. Alkyne also undergo nucleophilic addition with electron rich reagents. Ex. Addition of water, cyanide, carboxylic acid, alcohols. Nucleophilic addition can be explained on the basis that alkynes form vinylic carbanion which is more stable than alkyl carbanion formed by alkene

(i) **Acidity of alkynes :** Acetylene and other terminal alkynes (1-alkynes) are weakly acidic in character

The acetylenic hydrogen of alkynes can be replaced by copper (I) and silver (I) ions. They react with ammonical solutions of cuprous chloride and silver nitrate to form the corresponding copper and silver alkynides.

This reaction can be used to distinguish between 2-alkynes and 1-alkynes. 1-alkynes will give this test while 2-alkynes, will not give this test.

Explanation for the acidic character : It explained by sp hybridisation. We know that an electron in s-orbital is more tightly held than in a p-orbital. In sp hybridisation s-character is more (50%) as compared to sp^2 (33%) or sp^3 (25%), due to large s-character the carbon atom is quite electronegative.

(ii) **Reaction with formaldehyde**

(4) Chemical properties of acetylene

Oxidative-Hydroboration : Alkynes react with BH_3 (in THF) and finally converted into carbonyl compounds.

Thus it is useful for preparing aldehyde from terminal alkyne.

Reduction of Alkyne : Alkynes add on hydrogen in presence of suitable catalysts like finely divided Ni , Pd .

If the triple bond is not present at the end of the carbon chain of the molecule, the alkene formed may be cis and trans depending upon the choice of reducing agents.

With Na / NH_3 or Li / NH_3 in (liquid ammonia) trans alkene is almost an exclusive product while catalytic reduction at alkyne affords mainly cis alkenes.

Degree of unsaturation : The number of degree of unsaturation in a hydrocarbon is given by

$$\frac{2n_1 + 2 - n_2}{2}, \text{ Where } n_1 \text{ is the number of carbon atoms; } n_2 \text{ is the number of hydrogen atoms.}$$

For example in C_6H_{12} , the degree of unsaturation is

$$= \frac{2 \times 6 + 2 - 12}{2} = 1$$

Tests of unsaturation

(a) **Baeyer's reagent** : It is 1% $KMnO_4$ solution containing sodium carbonate. It has pink colour. An aqueous solution of the compound, a few drops of Baeyer's reagent are added, the pink colour of the solution disappears. The decolourisation of pink colour indicates the presence of unsaturation in the compound.

☐ Alkene without any hydrogen atom on the carbon forming

(b) **Bromine- carbon tetrachloride test** : The compound is dissolved in carbon tetrachloride or chloroform and then a few drops of 5% bromine solution in carbon tetrachloride are added to it, the colour of bromine disappears. It indicates the presence of unsaturation.

☐ This test also fails in the case of alkene of the

(5) Uses

- (i) Acetylene is used as an illuminant.
(ii) It is used for the production of oxy-acetylene flame. The

temperature of the flame is above 3000°C . Is employed for cutting and welding of metals.

- (iii) Acetylene is used for artificial ripening of fruits.
(iv) It is used as a general anaesthetic under the name naracylene.

(v) Acetylene has synthetic applications. It serves as a starting material for the manufacture of a large variety of substances.

(vi) On electrical decomposition acetylene produces finely divided carbon and hydrogen. Hydrogen is used in airships.

(6) Interconversion

(i) Conversion of ethane into ethene : (Alkane into alkene)

(ii) Ethene into ethane : (Alkene into alkane)

(iii) Ethane into ethyne (acetylene) : i.e., alkane into alkyne

(iv) Ethyne into ethane : (Alkyne into alkane)

(v) Ethene into propene : Ascending in alkene series

(vi) Propene into ethene : Descending an alkene series

(vii) Acetylene into propyne (methyl acetylene) : (Ascent)

(viii) Propyne into acetylene : (Descent)

(ix) 1-Butyne into 2-pentyne : (Ascent)

(x) 1-Butyne into 2-pentanone : (Not more than three steps)

Separation of alkane, alkene and alkyne

The gaseous mixture is passed through ammonical cuprous chloride solution. The alkyne (acetylene) reacts with Cu_2Cl_2 and forms a red precipitate. It is filtered. The alkyne or acetylene is recovered by decomposition of the precipitate with an acid.

The remaining gaseous mixture is passed through concentrated H_2SO_4 . Alkene is absorbed. The Hydrogen sulphate derivatives is heated at 170°C to regenerate ethene.

The methane or ethane is left behind unreacted.

Distinction between alkanes, Alkenes and Alkynes

Table : 24.3

Property	Alkane (Ethane)	Alkene (Ethene)	Alkyne (Ethyne)
Molecular formula	$\text{C}_n\text{H}_{2n+2} (\text{C}_2\text{H}_6)$	$\text{C}_n\text{H}_{2n} (\text{C}_2\text{H}_4)$	$\text{C}_n\text{H}_{2n-2} (\text{C}_2\text{H}_2)$
Nature	Saturated	Unsaturated	Unsaturated
	Single bond between carbon atoms. Each carbon atom is sp^3 -hybridized  Bond length $1.54 \text{ \AA}$	Double bond between two carbon atoms. Both carbon atoms are sp^2 -hybridized  $1.34 \text{ \AA}$	Triple bond between two carbon atoms both carbon atoms are sp -hybridized  $1.20 \text{ \AA}$

(iii) **Addition reaction**

(iv) *Oxidation*

Cycloalkene

Carbocyclic compounds with double bonds in the ring are called cycloalkenes. Some of the common cycloalkenes are

Cycloalkenes can be easily obtained by Diels-Alder reaction. These compounds undergo the electrophilic addition reactions which are characteristic of alkenes, while the ring remains intact. Cycloalkenes decolourise the purple colour of dilute cold $KMnO_4$ or red colour of bromine in carbon tetrachloride.

Dienes

These are hydrocarbon with two carbon-carbon double bonds. Dienes are of three types

(i) **Conjugated dienes** : Double bonds are separated by one single bond.

Ex : $CH_2 = CH - CH = CH_2$ (1, 3-butadiene)

(2) **Cumulative dienes** : Double bonds are adjacent to each other.

Ex : $CH_2 = C = CH_2$ Propadiene [allene]

(3) **Isolated or Non-conjugated** : Double bonds are separated by more than one single bond.

Ex : $CH_2 = CH - CH_2 - CH = CH_2$ (1, 4 pentadiene)

The general formula is C_nH_{2n-2} . The predominant member of this class is 1, 3-butadiene.

(1) Method of preparation

(i) **From acetylene :**

(ii) **From 1, 4-dichlorobutane :**

(iii) **From 1,4-butanediol :**

(iv) *From butane :*

(v) *From cyclohexene :*

(2) **Physical property** : 1,3-butadiene is a gas.

(3) **Chemical properties**

(i) **Addition of halogens :**

(ii) **Addition of halogen acids :**

(iii) **Addition of water :**

(iv) **Polymerisation :**

**Diels-alder reaction :**

Stability of conjugated dienes : It is explained on the basis of delocalisation of electron cloud between carbon atoms.

The four π electrons of 1, 3-butadiene are delocalised over all the four atoms. This delocalisation of the π electrons makes the molecule more stable.

**(v) Ozonolysis :****Aromatic Hydrocarbon****(1) Source of Arenes**

Source of arenes is coal. It contains benzene, xylene, naphthalene etc. Arenes are obtained by destructive distillation of coal.

(2) Distillation of coal

☐ Coal tar is a mixture of large numbers of arenes.

(3) **Distillation of coal tar :** Arenes are isolated by fractional distillation of coal tar,

Table : 24.4

Name of the fraction	Temperature range (K)	Main constituents
Light oil (or crude oil) fraction	Upto 443	Benzene, toluene, xylene
Middle oil fraction (Carbolic oil)	443-503	Phenol, naphthalene, pyridine
Heavy oil fraction (Creosote oil)	503-543	Naphthalene, naphthol and cresol
Green oil (Anthracene oil)	543-633	Anthracene, phenanthrene
Pitch (left as residue)	Non-volatile	Carbon

☐ The residue left after fractional distillation of coal-tar is called pitch.

(4) Isolation of benzene**General characteristics of arenes**

(1) All arenes have general formula $[\text{C}_n\text{H}_{2n-6y}]$. Where y is number of benzene rings and n is not less than 6.

(2) Arenes are cyclic and planar. They undergo substitution rather than addition reactions.

(3) **Aromaticity or aromatic character :** The characteristic behaviour of aromatic compounds is called aromaticity. Aromaticity is due to extensive delocalisation of π -electrons in planar ring system. Huckel (1931) explained aromaticity on the basis of following rule.

Huckel rule : For aromaticity the molecule must be planar, cyclic system having delocalised $(4n+2)\pi$ electrons where n is an integer equal to 0, 1, 2, 3, ...

Thus, the aromatic compounds have delocalised electron cloud of 2, 6, 10 or 14 π electrons.

Similarly cyclopentadienyl anion or tropylium ion are also aromatic because of containing 6π electrons ($n=1$).

Heterocyclic compounds also have 6π electrons ($n=1$). ($n=0$)

Molecules do not satisfy huckel rule are not aromatic.

Cyclopentadiene
4π electrons

Cyclopentadienyl cation
4π electrons

Cyclooctatetraene
8π electrons

Cyclopropenyl anion
4π electrons

(4) **Antiaromaticity** : Planar cyclic conjugated species, less stable than the corresponding acyclic unsaturated species are called antiaromatic. Molecular orbital calculations have shown that such compounds have $4n\pi$ electrons. In fact such cyclic compounds which have $4n\pi$ electrons are called antiaromatic compounds and this characteristic is called antiaromaticity.

Example : 1,3-Cyclobutadiene, It is extremely unstable antiaromatic compound because it has $4n\pi$ electrons ($n = 1$) and it is less stable than 1,3 butadiene by about 83.6 KJ mol.

$$4n = 4 ; n = \frac{4}{4} = 1$$

Thus, cyclobutadiene shows two equivalent contributing structures and it has $n = 1$.

Cyclopropenyl anion
4π electrons

Cyclopentadienyl
4π electrons

Cycloheptatrienyl anion
8π electrons

Cyclooctatetraene
8π electrons

Benzene (C_6H_6)

Benzene is the first member of arenes. It was first discovered by Faraday (1825) from whale oil. Mitscherlich (1833) obtained it by distilling benzoic acid with lime. Hofmann (1845) obtained it from coal tar, which is still a commercial source of benzene.

(i) **Structure of benzene** : Benzene has a special structure, which is although unsaturated even then it generally behave as a saturated compound.

(i) **Kekule's structure** : According to Kekule, in benzene 6-carbon atoms placed at corner of hexagon and bonded with hydrogen and double bond present at alternate position.

(a) *Evidence in favour of Kekule's structure*

- Benzene combines with 3 molecules of hydrogen or three molecules of chlorine. It also combines with 3 molecules of ozone to form triozonide. These reactions confirm the presence of three double bonds.

- Studies on magnetic rotation and molecular refraction show the presence of three double bonds and a conjugated system.

- The synthesis of benzene from three molecule of acetylene also favour's Kekule's structure.

- Benzene gives cyclohexane by reduction with hydrogen.

Cyclohexane

(b) *Objections against Kekule's formula*

- Unusual stability of benzene.

- According to Kekule, two ortho disubstituted products are possible. But in practice only one ortho disubstituted product is known.

- Heat of hydrogenation of benzene is 49.8 kcal/mole, whereas theoretical value of heat of hydrogenation of benzene is 85.8 kcal/mole. It means resonance energy is 36 kcal/mole.

- C - C bond length in benzene are equal, (although it contains 3 double bonds and 3 single bonds) and are 1.39 Å.

Kekule explained this objection by proposing that double bonds in benzene ring were continuously oscillating between two adjacent positions.

(2) **Methods of preparation of benzene**

(i) **Laboratory method** :

Sodium benzoate

Benzene

(ii) **From benzene derivatives**

(a) *From phenol* :

Phenol

Benzene

(b) *From chlorobenzene* :

Chlorobenzene

Benzene

(c) *By first preparing grignard reagent of chlorobenzene and then hydrolysed*

(d) *From benzene sulphonic acid* :

Benzene sulphonic acid

Benzene

(e) *From benzene diazonium chloride* :

Benzene

(f) From acetylene :

□ Three molecules of acetylene
Cyclic polymerisation takes place in this reaction.

(3) Properties of benzene

(i) Physical properties

- Benzenes is a colourless, mobile and volatile liquid. Its boiling point is 80°C and freezing point is 5.5°C. It has characteristic odour.
- It is highly inflammable and burns with sooty flame.
- It is lighter than water. Its specific gravity at 20°C is 0.8788.
- It is immiscible with water but miscible with organic solvents such as alcohol and ether.
- Benzenes itself is a good solvent. Fats, resins, rubber, etc. dissolve in it.
- It is a non-polar compound and its dipole moment is zero.
- It is an extremely poisonous substance. Inhalation of vapours or absorption through skin has a toxic effect.

(ii) **Chemical properties** : Due to the presence of π electron clouds above and below the plane benzene ring, the ring serves as a source of electrons and is easily attacked by electrophiles (Electron loving reagents). Hence electrophilic substitution reaction are the characteristic reactions of aromatic compounds.

Substitution reactions in benzene are preferred rather than addition are due to the fact that in the former reactions resonance stabilised benzene ring system is retained while the addition reactions lead to the destruction of benzene ring. Principal reactions of benzene can be studied under three heads,

- Addition reactions
- Substitution reactions
- Oxidation reactions

(a) **Addition reactions** : In which benzene behaves like unsaturated hydrocarbon.

Addition of hydrogen : Benzene reacts with hydrogen in the presence of nickel (or platinum) as catalyst at 150°C under pressure to form cyclohexane.

Addition of halogen :

Addition of ozone :

(b) **Substitution reactions** :

Nucleophilic substitution :

Unimolecular : Mostly uncommon in aromatic substitution, there is only one example which obtain in benzene diazonium dichloride.

• **Bimolecular** :

• **Elimination-addition mechanism (Benzyne mechanism)**

• **Electrophilic substitution reaction** : Benzene undergoes this reaction because it is an electron rich system due to delocalized π -electrons.

Electrophile ($E^{\oplus}$)	Name	Source	Name of substitution reaction
Cl^+	Chloronium	$Cl_2 + AlCl_3$ or $FeCl_3$	Chlorination
Br^+	Bromonium	$Br_2 + AlBr_3$ or $FeBr_3$	Bromination
NO_2^+	Nitronium	$HNO_3 + H_2SO_4$	Nitration
SO_3	Sulphur trioxide	<i>Conc. H_2SO_4, Fuming sulphuric acid</i>	Sulphonation
R^+	Alkyl carbonium	$RX + AlX_3$ ($X = Cl$ or Br), $ROH + H^+$	Friedel-Craft's (Alkylation)
$R-\overset{+}{C}=O$	Acyl carbonium	$RCOCl + AlCl_3$	Friedel-Craft's (Acylation)

• Free radical aromatic substitution : The aromatic substitution reactions which follow free radical mechanisms are very few and have limited synthetic value. But some typical example of these reactions are:

When vapours of benzene and air are passed over vanadium pentoxide at $450 - 500^\circ C$, maleic anhydride is obtained.

The mechanism of chlorination of benzene at high temperature is similar to that of the free radical aliphatic substitution.

$$\Delta H = 6530 \text{ kJ/mole}$$

☐ Strong oxidising agents convert benzene slowly into CO_2 and water on heating.

(d) Reduction :

(iii) **Uses :** (a) In dry cleaning (b) As a motor fuel when mixed with petrol. (c) As a solvent. (d) In the manufacture of gammexane (As insecticide). (e) In the preparation of nitrobenzene, chlorobenzene, benzene sulphonic acid, aniline, styrene, etc. Many of these are employed for making dyes, drugs, plastics, insecticides, etc.

Directive effect in substituted benzene derivatives

(i) **Directive effect in mono substituted benzene derivatives :** The substituent already present on the benzene ring directs the incoming substituent to occupy ortho (2 or 6), meta (3 or 5) or para (4) position. This direction depends on the nature of the first substituent and is called **directive or the orientation effect**.

The substituent already present can increase or decrease the rate of further substitution, i.e., it either activates or deactivates the benzene ring towards further substitution. These effects are called **activity effects**.

There are two types of substituents which produce directive effect are,

(i) Those which direct the incoming group to ortho- and para-positions simultaneously (Neglecting meta all together).

(ii) Those which direct the incoming group to meta-position only (Neglecting ortho- and para-positions all together).

Ortho-para directors	Meta directors
Strongly activating $-\ddot{\text{N}}\text{H}_2, -\ddot{\text{N}}\text{HR}, -\ddot{\text{N}}\text{R}_2, -\ddot{\text{O}}\text{H}, -\ddot{\text{O}}^-$	Moderately deactivating $-\text{C}\equiv\text{N}, -\text{SO}_3\text{H}, -\text{COOH}, -\text{COOR}, -\text{CHO}, \text{COR}$
Moderately activating $-\ddot{\text{N}}\text{HCOCH}_3, -\ddot{\text{N}}\text{HCOR}, -\ddot{\text{O}}\text{CH}_3, -\ddot{\text{O}}\text{R}$	Strongly deactivating $-\text{NO}_2, -\text{NR}_3^+, -\text{CF}_3, -\text{CCl}_3$
Weakly activating $-\text{CH}_3, -\text{C}_2\text{H}_5, -\text{R}, -\text{C}_6\text{H}_5$	
Weakly deactivating $-\text{F}, -\text{Cl}, -\text{Br}, -\text{I},$	

Theory of ortho – para directing group

The above mechanism is followed when S is $-\text{OH}, -\text{NH}_2, -\text{Cl}, -\text{Br}, -\text{I}, -\text{OR}, -\text{NR}_2, -\text{NHCOR}$ etc.

In methyl or alkyl group, the $+I$ effect of the methyl group or alkyl group initiates the resonance effect.

Thus, methyl or alkyl group directs all electrophiles to ortho and para positions.

Theory of meta directing group : The substituent, S withdraws electrons from ortho and para positions. Thus, m -position becomes a point of relatively high electron density and further substitution by electrophile occurs at meta position. For example, $-\text{NO}_2$ group is a meta directing (Electron withdrawing). Its mechanism can be explained as :

All meta-directing groups have either a partial positive charge or a full positive charge on the atom directly attached to the ring.

(2) Directive effect in disubstituted benzene

(i) If the directive effects of two substituents reinforce, then a single product is formed.

Example :

Thus, both $(\text{CH}_3, \text{NO}_2)$ direct further substitution to the same position (Ortho with respect to CH_3).

(ii) If the directing effect of two groups oppose each other strongly activating groups win over deactivating or weakly activating group. The sequence of directing power is

$-\text{NH}_2 > -\text{OH} > -\text{OCH}_3 > -\text{NHCOR} > -\text{C}_6\text{H}_5 > \text{CH}_3 > \text{meta directors}$

Example :

(iii) There is normally little substitution when the two groups are meta to each other. Aromatic rings with three adjacent substituents are generally prepared by some other routes.

~~Toluene, methyl benzene or phenyl methane~~

Toluene is the simplest homologue of benzene. It was first obtained by dry distillation of tolu balsam and hence named toluene. It is commercially known as toluol.

(1) **Methods of preparation**

(i) **From benzene** [Friedel-Craft's reaction] :

Alkyl halide employed may undergo an isomeric change

Catalysts can be used in place of anhydrous AlCl_3 are,

(ii) **Wurtz fitting reaction** :

(iii) **Decarboxylation** :

(iv) **From cresol** :

(v) **From toluene sulphonic acid** :

(vi) **From toluidine** :

(vii) **From Grignard reagent** :

(viii) **Commercial preparation**

From coal tar : The main source of commercial production of toluene is the light oil fraction of coal-tar. The light oil fraction is washed with conc. H_2SO_4 to remove the bases, then with NaOH to remove acidic substances and finally with water. It is subjected to fractional distillation. The vapours collected between $80-110^\circ\text{C}$ is 90% benzol which contains 70–80% benzene and 14–24% toluene. 90% benzol is again distilled and the portion distilling between $108-110^\circ\text{C}$ is collected as toluene.

(ix) **From n-heptane and methyl cyclohexane**

(2) **Physical properties**

(i) It is a colourless mobile liquid having characteristic aromatic odour.

(ii) It is lighter than water (*sp. gr.* 0.867 at 20°C).

(iii) It is insoluble in water but miscible with alcohol and ether in all proportions.

(iv) Its vapours are inflammable. It boils at 110°C and freezes at -96°C .

(v) It is a good solvent for many organic compounds.

(vi) It is a weak polar compound having dipole moment 0.4D.

(3) **Chemical properties** : Toluene shows the behaviour of both an aliphatic and an aromatic compound.

(i) **Electrophilic substitution reactions** : Aromatic character (More reactive than benzene) due to electron releasing nature of methyl group.

(ii) **Reactions of side chain**

(a) **Side chain halogenation** :

Benzyl chloride on hydrolysis with aqueous caustic soda forms benzyl alcohol.

Benzal chloride on hydrolysis forms benzaldehyde.

Benzo trichloride on hydrolysis forms benzoic acid.

(b) **Oxidation** :

• With hot acidic KMnO_4 :

- With acidic manganese or chromyl chloride (Etards reaction) :

□ All alkyl benzenes on oxidation with hot acidic KMnO_4 or $\text{Na}_2\text{Cr}_2\text{O}_7$ form benzoic acid. The length of the side chain does not matter.

- (c) *Hydrogenation* :

- (d) *Combustion* : $\text{C}_6\text{H}_5\text{CH}_3 + 9\text{O}_2 \longrightarrow 7\text{CO}_2 + 4\text{H}_2\text{O}$

- (e) *Ozonolysis* :

- (4) *Uses*

- In the manufacture of benzyl chloride, benzal chloride, benzyl alcohol, benzaldehyde, benzoic acid, saccharin, etc.
- In the manufacture of trinitrotoluene (TNT), a highly explosive substance.
- As an industrial solvent and in drycleaning.
- As a petrol substitute.
- In the manufacture of certain dyes and drugs.

T.N.T. (Tri-nitro toluene)

- Preparation* :

Properties : It is pale yellow crystalline solid (M.P. = 81°C).

Uses : • It is used as an explosive in shells, bombs and torpedoes under the name trotyl.

- When mixed with 80% ammonium nitrate it forms the explosive amatol.

- TNT is also used as a mixture of aluminium nitrate, alumina and charcoal under the name **ammonal**.

T.N.B. (Tri-nitro benzene)

- Preparation* :

Properties and uses. It is colourless solid (M.P. = 122°C). It is more explosive than T.N.T. and used for making explosive.

Xylenes (Dimethyl benzene) $\text{C}_6\text{H}_4(\text{CH}_3)_2$

The molecular formula, C_8H_{10} represents four isomers.

These are produced along with benzene, toluene and ethylbenzene when aromatisation of $\text{C}_6 - \text{C}_8$ fraction of petroleum naphtha is done. The xylenes are isolated from the resulting mixture (BTX) by fractional distillation.

These can be prepared by Wurtz – Fittig reaction. A mixture of bromotoluene and methylbromide is treated with sodium in dry ethereal solution to form the desired xylene.

- These can also be obtained by Friedel – Crafts's synthesis,

- m-Xylene can be obtained from mesitylene.

Xylenes are colourless liquids having characteristic odour. The boiling points of three isomers are,

o-Xylene= 144°C ; m-Xylene= 139°C ; p-Xylene= 138°C .

Xylenes undergo electrophilic substitution reactions in the same manner as toluene. Upon oxidation with $KMnO_4$ or $K_2Cr_2O_7$, Xylenes form corresponding dicarboxylic acids.

Xylenes are used in the manufacture of lacquers and as solvent for rubber. *o*-Xylene is used for the manufacture of phthalic anhydride.

Ethyl benzene ($C_6H_5C_2H_5$)

It can be prepared by the following reactions,

(1) By Wurtz-Fittig reaction :

(2) By Friedel-Craft's reaction :

(3) By catalytic reduction of styrene :

(4) By alkyl benzene synthesis :

It undergoes electrophilic substitution reactions in the same way as toluene. When oxidised with dil. HNO_3 or alkaline $KMnO_4$ or chromic acid it forms benzoic acid.

Styrene ($C_6H_5CH=CH_2$)

It is present in storax balsam and coal-tar in traces.

(i) Preparation

(i) Dehydrogenation of side chain of ethylbenzene :

(ii) **Decarboxylation of cinnamic acid** : This is the laboratory preparation and involves heating of cinnamic acid with a small amount of quinol.

(iii) **Dehydration of 1-phenyl ethanol with H_2SO_4** :

(iv) **Dehydration of 2-phenyl ethanol with $ZnCl_2$** :

(v) **Dehydrohalogenation of 1-phenyl-1-chloro ethane** : On heating with alcoholic potassium hydroxide, a molecule of hydrogen chloride is eliminated by the chloroderivative.

(2) **Properties** : It is a colourless liquid, boiling point $145^\circ C$. On keeping, it gradually changes into a solid polymer called **metastyrene**. The polymerisation is rapid in sunlight or when treated with sodium. It shows properties of benzene ring (Electrophilic substitution) and unsaturated side

chain (Electrophilic addition). However, the side chain double bond is more susceptible to electrophilic attack as compared to benzene ring.

At lower temperature and pressure, it reacts with hydrogen to produce ethylbenzene and at higher temperature and pressure, it is converted into ethyl cyclohexane.

With bromine, it gives the dibromide.

Halogen acids add to the side chain.

Preparation of ring substituted styrenes is not done by direct halogenation but through indirect route.

When oxidised under drastic conditions, the side chain is completely oxidised to a carboxyl group.

In presence of peroxides, styrene undergoes free radical polymerisation resulting in the formation of polystyrene – an industrially important plastic.

Co-polymers of styrene with butadiene and other substances are also important since many of them are industrially useful products such as **SBR** (A rubber substitute).

Bi-phenyl ($C_6H_5 - C_6H_5$)

It occurs in coal-tar. It is the simplest example of an aromatic hydrocarbon in which two benzene rings are directly linked to each other.

(1) **Methods of formation**

(i) **Fittig reaction** : It consists heating of an ethereal solution of bromobenzene with metallic sodium.

(ii) **Ullmann biaryl synthesis** : Iodobenzene, on heating with copper in a sealed tube, forms biphenyl. The reaction is facilitated if a strong electron withdrawing group is present in ortho or para position.

(iii) **Grignard reaction** : Phenyl magnesium bromide reacts with bromo benzene in presence of CoCl_2 .

(2) **Properties** : It is a colourless solid, melting point 71°C . It undergoes usual electrophilic substitution reactions. Since aryl groups are electron withdrawing, they should have deactivating and *m*-orientating effect. But, it has been experimentally shown that presence of one benzene ring activates the other for electrophilic substitution and directs the incoming group to *o*- and *p*- positions. It has been shown that monosubstitution in the bi-phenyl results in the formation of para isomer as the major product.

Another special feature of the biphenyl is the behaviour towards second substitution in a monosubstituted biphenyl. The second substituent invariably enters the unsubstituted ring in the ortho and para position no matter what is the nature of substituent already present.

Tips & Tricks

✍ Octane number may be less than zero (e.g., *n*-Nonane has an octane number -45) and higher than 100 (e.g., Triptane or 2, 3, 3-Trimethylbutane has an octane number of 124).

✍ To avoid lead pollution, a new compound cyclopentadienyl manganese carbonyl

(called as AK-33-X) is used as antiknock now a days in developed countries (unleaded petrol).

✍ Acetylene has a garlic odour when impure due to impurities of phosphine and hydrogen sulphide.

✍ Fluorination is a violent reaction and can be controlled by diluting fluorine with nitrogen.

✍ The relative acidic character of water, alcohols acetylene, ammonia, ethylene and ethane follows the order :

Obviously, the basic character of their conjugate bases follows the reverse order, i.e.,

✍ **Wilkinson's catalyst** : (Triphenylphosphine) rhodium, (PPh_3) RhCl is called wilkinson's catalyst. It reduces alkenes and alkynes while other

common functional groups such as $\text{C}=\text{O}$, NO_2 and $\text{C} \equiv \text{N}$ remain unaffected,

✍ The order of reactivity of primary (1), secondary (2) and tertiary (3) hydrogens in alkanes follows the sequence : $3^\circ > 2^\circ > 1^\circ$.

Ordinary Thinking

Objective Questions

Alkane

- Which represents an alkane [CPMT 1976]
 - C_5H_8
 - C_8H_6
 - C_9H_{10}
 - C_7H_{16}
- The decreasing order of boiling points is [BHU 1999]
 - n -Pentane > iso-Pentane > neo-Pentane
 - iso-Pentane > n -Pentane > neo-Pentane
 - neo-Pentane > iso-Pentane > n -Pentane
 - n -Pentane > neo-Pentane > iso-Pentane
- To prepare a pure sample of n -hexane using sodium metal as one reactant, the other reactant will be [BHU 1999]
 - n -propyl bromide
 - Ethyl bromide and n -butyl bromide
 - Ethyl chloride and n -butyl chloride
 - Methyl bromide and n -pentyl chloride
- In the preparation of Grignard reagent from haloalkane, the metal [RPET 1999]
 - Mg
 - Zn
 - Li
 - K
- Sodium acetate can be converted to ethane by [Pune CET 1998]
 - Heating with $LiAlH_4$
 - Electrolysing its aqueous solution
 - Heating with sodalime
 - Heating with calcium acetate
- Which of the following compounds is used in antiknock compositions to prevent the deposition of oxides of lead on spark plug, combustion chamber and exhaust pipe [KCET 1998]
 - Glycerol
 - Glycol
 - 1, 2-dibromoethane
 - Benzene
- Which of petroleum corresponds to kerosene oil [DCE 1999]
 - $C_{15} - C_{18}$
 - $C_{10} - C_{12}$
 - $C_5 - C_9$
 - $C_1 - C_9$
- In the reaction $CH_3 - Br + 2Na + Br - CH_3 \rightarrow$, the product called [Pb. CET 1999; CPMT 1983. 86; KCET 1992; MP PMT 1994; BHU 1998; MP PMT 2002; MP PET 1986]
 - Wurtz reaction
 - Aldol condensation
 - Perkin's reaction
 - Levit reaction
- Iodoethane reacts with sodium in the presence of dry ether. The product is [AFMC 1997; KCET 1998]
 - Pentane
 - Propane
 - Butene
 - Butane
- Which of the following is oxidised by $KMnO_4$
 - Methane
 - Pentane
 - Isobutane
 - Neopentane
- Which of the following has maximum stability [AIIMS 2001]
 - $\overset{+}{CH_3}$
 - $CH_3 - \overset{+}{C} - H$
 - $CH_3 - \overset{+}{C} - CH_3$
 - $CH_3 - \overset{+}{C} - CH_3$
- The most volatile compound is [DPMT 2000]
 - 2, 2-dimethyl propane
 - 2-methyl butane
 - Isobutane
 - n -pentane
- In Wurtz reaction, the reagent used is [EAMCET 1998]
 - Na
 - Na/liquid NH_3
 - Na/dry ether
 - Na/dry alcohol
- Which of the following has highest octane number [MP PMT 2000]
 - n -hexane
 - n -heptane
 - n -pentane
 - 2, 2, 4-trimethyl pentane
- What is freon-12 [RPET 1999]
 - Pesticide
 - Refrigerant
 - Solvent
 - Lubricant
- The petrol having octane number 80 has [MP PET 2000]
 - 20% normal heptane + 80% iso-octane
 - 80% normal heptane + 20% iso-octane
 - 20% normal heptane + 80% normal octane
 - 80% normal heptane + 20% normal octane
- Which of the following reactions will not give propane [DPMT 2005]
 - $CH_3CH_2CH_2Cl \xrightarrow[H_2O]{Mg/ether}$
 - $CH_3COCl \xrightarrow[H_2O]{CH_3MgX}$
 - $CH_3CH = CH_2 \xrightarrow[CH_3COOH]{B_2H_6}$
 - $CH_3CH - CH_3 \xrightarrow{P/HI}$
- The shape of methane molecule is [MP PET 1997, 2001]
 - Linear
 - Trigonal planar
 - Square planar
 - Tetrahedral
- Which of the following shows only one brominated compound [CPMT 1996]
 - Butene-2
 - 2, 2-dimethylpropane
 - Butyne-1
 - Butanol-3
- Kerosene is used as fuel because it is [CPMT 1996]
 - Less volatile
 - More volatile
 - Cheap
 - Abundantly available
- $CH_3 - CH_2 - CH_2 - CH_3 \xrightarrow[HBBr]{AlCl_3} \text{Product}$. Product in above reaction is [RPMT 2003]
 - $CH_3 - \overset{+}{CH} - CH_2 - CH_3$
 - $CH_3 - \overset{+}{CH} - CH_3$
 - $CH_2 - CH_2 - CH_2$
 - All of these
- Which of the following statements is not true for ethane [AIIMS 1996]

- (a) It can be chlorinated with chlorine
(b) It can be catalytically hydrogenated
(c) When oxidised produces CO_2 and H_2O
(d) It is a homologue of iso-butane
- 23.** Petroleum refining is [AIIMS 1996; KCET 2004]
(a) Distillation of petroleum to get different fractions
(b) Obtaining aromatic compounds from aliphatic compounds present in petroleum
(c) Cracking of petroleum to get gaseous hydrocarbons
(d) Purification of petroleum
- 24.** The chemical added to leaded petrol to prevent the deposition of lead in the combustion chamber is [Kerala (Med.) 2003]
(a) Iso-octane (b) Ethylene dibromide
(c) Tetraethyl lead (d) Mercaptan
(e) *n*-Heptane
- 25.** In the commercial gasolines, the type of hydrocarbons which are more desirable is [CBSE PMT 1997; AFMC 1997]
(a) Branched hydrocarbon
(b) Straight-chain hydrocarbon
(c) Linear unsaturated hydrocarbon
(d) Toluene
- 26.** Which of the following is not formed by the reaction of Cl_2 on CH_4 in sunlight [AIIMS 1987]
(a) CHCl_3 (b) CH_3Cl
(c) CH_3CH_3 (d) $\text{CH}_3\text{CH}_2\text{CH}_3$
- 27.** Which of the following has the highest boiling point [DPMT 1986]
(a) Neopentane (b) *n*-butane
(c) *n*-heptane (d) Isobutane
- 28.** Which gives CH_4 when treated with water [CPMT 1974, 79; NCERT 1976; IIT-JEE 1990]
(a) Silicon carbide (b) Calcium carbide
(c) Aluminium carbide (d) Iron carbide
- 29.** Which of the following does not react with PCl_5 [CPMT 1973]
(a) CH_3OH (b) CH_3COOH
(c) CH_3CHO (d) C_2H_6
- 30.** Which of the following compounds is insoluble even in hot concentrated H_2SO_4 [IIT-JEE 1983]
(a) Ethylene (b) Benzene
(c) Hexane (d) Aniline
- 31.** A reaction between methyl magnesium bromide and ethyl alcohol gives [CPMT 1979; MNR 1986; UPSEAT 1999]
(a) Methane (b) Ethane
(c) Propane (d) Butane
- 32.** Methane and ethane both can be obtained in single step from [CPMT 1974; MP PET 1995; AFMC 1998, 2000; BHU 2005]
(a) CH_3I (b) $\text{C}_2\text{H}_5\text{I}$
(c) CH_3OH (d) $\text{C}_2\text{H}_5\text{OH}$
- 33.** Paraffin wax is [MP PMT 1986; CPMT 1993]
(a) Ester
(b) Alcohol
(c) Unsaturated hydrocarbon
(d) Saturated hydrocarbon
- 34.** The number of possible enantiomeric pairs that can be produced during monochlorination of 2-methylbutane is [IIT-JEE 1997]
(a) 2 (b) 3
(c) 4 (d) 1
- 35.** Petroleum consists mainly of [CPMT 1985, 94; KCET 1991]
(a) Aliphatic hydrocarbons (b) Aromatic hydrocarbons
(c) Aliphatic alcohols (d) None of these
- 36.** Petroleum ether can be used as
(a) Solvent for fat, oil, varnish and rubber
(b) As a fuel
(c) Both (a) and (b)
(d) None of these
- 37.** Which of the following are produced from coal tar [MNR 1987; UPSEAT 2002]
(a) Synthetic dyes (b) Drugs
(c) Perfumes (d) All the three
- 38.** In alkanes, the bond angle is [MP PMT 1989; BHU 1996]
(a) 109.5° (b) 109°
(c) 120° (d) 180°
- 39.** In the preparation of alkanes; a concentrated aqueous solution of sodium or potassium salts of saturated carboxylic acid are subjected to [CPMT 1985; MP PET 1999]
(a) Hydrolysis (b) Oxidation
(c) Hydrogenation (d) Electrolysis
- 40.** Halogenation of alkanes is an example of [MP PET 1993; KCET 1998]
(a) Electrophilic substitution
(b) Nucleophilic substitution
(c) Free-radical substitution
(d) Oxidation
- 41.** Propionic acid is subjected to reduction with hydroiodic acid in the presence of a little *P*, the product formed is [JIPMER 1997]
(a) Ethane (b) Propane
(c) Butane (d) None of these
- 42.** When ethyl iodide and propyl iodide react with *Na* in the presence of ether, they form [BHU 1997]
(a) One alkane (b) Two alkanes
(c) Four alkanes (d) Three alkanes
- 43.** The alkane that yields two isomeric monobromo derivatives is
(a) Neopentane (b) Ethane
(c) Methane (d) Propane
- 44.** Kerosene is a mixture of [CPMT 1979; AFMC 1992]
(a) Alkanes (b) Aromatic compounds
(c) Alcohols (d) Aliphatic acids
- 45.** When petroleum is heated the vapours contain mainly [CPMT 1981]
(a) Kerosene (b) Petroleum ether
(c) Diesel (d) Machine oil
- 46.** Iso-octane is mixed to the petrol [NCERT 1972]
(a) To precipitate inorganic substances
(b) To prevent freezing of petrol
(c) To increase boiling point of petrol
(d) As an antiknock
- 47.** Tetraethyl lead is used as [NCERT 1976, 79; DPMT 1984; CPMT 1989, 91; BHU 1995]

- (a) Fire extinguisher (b) Pain reliever
(c) Petroleum additive (d) Mosquito repellent
48. Cyclohexane, a hydrocarbon floats on water because [NCERT 1976]
(a) It is immiscible with water
(b) Its density is low as compared to water
(c) It is non-polar substance
(d) It is immiscible and lighter than water
49. Natural gas contains mainly [MNR 1990; UPSEAT 1999, 2000, 01, 02; BCECE 2005]
(a) Methane (b) *n*-butane
(c) *n*-octane (d) Mixture of octane
50. Which compound is not inflammable [MP PET 2001]
(a) CCl_4 (b) C_2H_5OH
(c) CH_4 (d) C_6H_6
51. Propane is obtained from propene, by which of the following methods [CBSE PMT 2001; AFMC 2001]
(a) Wurtz reaction (b) Dehydrogenation
(c) Frankland reaction (d) Catalytic hydrogenation
52. The organic compound used as antiknock agent in petroleum is [DCE 1999; CPMT 2000; Pb. CET 2000; MP PET 2001]
(a) $(C_2H_5)_4Pb$ (b) TNT
(c) CH_3MgBr (d) $(C_2H_5)_2Hg$
53. In catalytic reduction of hydrocarbons which catalyst is mostly used [DCE 2001]
(a) Pt/Ni (b) Pd
(c) SiO_2 (d) Misch Metal
54. Ethylene reacts with bromine to form [MP PET 2001]
(a) $Br-CH_2-CH_3$ (b) CH_3-CBr_3
(c) $Br-CH_2-CH_2Br$ (d) $CHBr_3$
55. Gasoline is obtained from crude petroleum oil by its [MP PMT 1999]
(a) Fractional distillation (b) Vacuum distillation
(c) Steam distillation (d) Pyrolysis
56. Which of the following does not give alkane [MP PMT 1999]
(a) Reaction of CH_3I with Na in ether
(b) Reaction of sodium acetate with sodalime
(c) Electrolysis of concentrated sodium acetate solution
(d) Reaction of ethyl chloride with alco. KOH
57. LPG is a mixture of [MP PMT 1999; KCET 2005]
(a) $C_6H_{12} + C_6H_6$ (b) $C_4H_{10} + C_3H_8$
(c) $C_2H_4 + C_2H_2$ (d) $C_2H_4 + CH_4$
58. Carbon black, which is used in making printer's ink, is obtained by decomposition of [MP PET 1993]
(a) Acetylene (b) Benzene
(c) Carbon tetrachloride (d) Methane
59. The addition of tetraethyl lead to petrol [MP PET 1993]
(a) Lowers its octane number
(b) Raises its octane number
(c) May raise or lower the octane number
(d) Has no effect on octane number
60. Which of the following compound has maximum boiling point [IIT-JEE 1982; MP PMT 1986; MADT Bihar 1995; Pb. PMT 1999]
(a) *n*-hexane (b) *n*-pentane
(c) 2, 2-dimethyl propane (d) 2-methyl butane
61. Knocking sound occurs in engine when fuel [CPMT 1981]
(a) Ignites slowly
(b) Ignites rapidly
(c) Contains water
(d) Is mixed with machine oil
62. Petroleum is mainly a mixture of [CPMT 1984; Pb. PMT 1999]
(a) Alkanes (b) Cyclohexane
(c) Benzenoid hydrocarbons (d) Alkenes
63. Which of the following has maximum boiling point [IIT-JEE 1986; MP PMT 1986; CPMT 1989]
(a) *iso*-octane
(b) *n*-octane
(c) 2, 2, 3, 3-tetramethyl butane
(d) *n*-butane
64. Aqueous solution of the following compound on electrolysis gives ethane [NCERT 1983; MP PET 1985; CPMT 1975, 79]
(a) Acetic acid (b) Acetamide
(c) Potassium acetate (d) Ethyl acetate
65. Which of the following does not decolourise bromine solution in carbon disulphide [MP PET 1986]
(a) Acetylene (b) Propene
(c) Ethane (d) Propyne
66. Anhydrous sodium acetate on heating with sodalime gives [CPMT 1972, 84; Pb. CET 2001, 2003]
(a) Acetic acid (b) Methane
(c) Calcium acetate (d) Ethane
67. Water gas is [CPMT 1993, 2004; Pb. PMT 2004]
(a) $CO + CO_2$ (b) $CO + N_2$
(c) $CO + H_2$ (d) $CO + N_2 + H_2$
68. A sample of gasoline contains 81% *iso*-octane and 19% *n*-heptane. Its octane number will be [MP PMT 1995]
(a) 19 (b) 81
(c) 100 (d) 62
69. The natural petroleum contains [MP PMT 1995]
(a) Saturated hydrocarbons
(b) Cyclic saturated hydrocarbons
(c) Compounds of sulphur
(d) All of these
70. The preparation of ethane by electrolysis of aqueous solution of potassium acetate is called as [MP PMT 1995]
(a) Wurtz reaction
(b) Sabatier-Senderen's reaction
(c) Kolbe's synthesis
(d) Grignard reaction
71. Action of hydrogen chloride on $CH_3-C \equiv CH_2$ and on $CH_3-C \equiv CH$ will predominantly give the compounds, respectively

- (a) $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} = \text{CH}_2\text{Cl}$ and $\text{CH}_2\text{Cl} - \text{CH}_2\text{Cl}$
- (b) $\text{CH}_3 - \underset{\text{CH}_3}{\text{CCl}} = \text{CH}_3$ and $\text{CH}_3 - \text{CHCl}_2$
- (c) $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} = \text{CH}_2\text{Cl}$ and $\text{CH}_3 - \text{CHCl}_2$
- (d) $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} = \text{CH}_3$ and $\text{CH}_2\text{Cl} - \text{CH}_2\text{Cl}$
72. As the number of carbon atoms in a chain increases the boiling point of alkanes [AFMC 1989]
 (a) Increases
 (b) Decreases
 (c) Remains same
 (d) May increase or decrease
73. In the fractional distillation of crude petroleum [Roorkee 1989]
 (a) Petrol condenses at the bottom of the column
 (b) The gases condense at the top of the column
 (c) High boiling constituents condense at the bottom of the column
 (d) High boiling constituents condense at the top of the column
74. Which of the following is not an endothermic reaction [J & K 2005]
 (a) Dehydrogenation
 (b) Ethane to ethene
 (c) Combustion of propane
 (d) Change of chlorine molecule into chlorine atoms.
75. Gasoline is the name of [Roorkee 1989]
 (a) Crude oil
 (b) The gaseous constituents of petroleum
 (c) The mixture of uncondensed gases produced in the distillation of crude oil
 (d) The mixture of the residue and gas oil obtained in the distillation of crude oil
76. In the process of cracking [Roorkee 1989]
 (a) Organic compounds decompose into their constituent elements
 (b) Hydrocarbons decompose into carbon and hydrogen
 (c) High molecular weight organic compounds decompose to give low molecular weight organic compounds
 (d) Hydrocarbons yield alkyl radicals and hydrogen
77. Octane number has 0 value for [Roorkee 1989; MP PET 1999, 2002; MP PMT 2001; KCET 2002]
 (a) iso-octane (b) *n*-hexane
 (c) *n*-heptane (d) iso-heptane
78. Dry distillation of sodium propanoate with sodalime gives [CPMT 1996]
 (a) Propane (b) Propene
 (c) Ethane (d) Ethene
79. What is the chief product obtained when *n*-butane is treated with bromine in the presence of light at 130°C [IIT-JEE 1995]
 (a) $\text{CH}_3 - \text{CH}_2 - \underset{\text{CH}_3}{\text{CH}} - \text{Br}$
 (b) $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \text{Br}$
 (c) $\text{CH}_3 - \underset{\text{CH}_3}{\text{C}} - \text{Br}$
 (d) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_2 - \text{Br}$
80. A mixture of propene and methane is obtained by the cracking of
 (a) 1-butene (b) 2-butene
 (c) *n*-butane (d) Isobutane
81. Which of the following fractions of petroleum refining contains kerosene ? (Boiling ranges in $^\circ\text{C}$ are given below)
 (a) 40 - 80 (b) 80 - 200
 (c) 200 - 300 (d) Above 300
82. Which of the following statements is incorrect ? The members of the homologous series of alkanes [NCERT 1974]
 (a) Are all straight chain compounds
 (b) Have the general formula $\text{C}_n\text{H}_{2n+2}$
 (c) Have similar chemical properties
 (d) Show a regular gradation of physical properties
83. On mixing tetraethyl lead to gasoline available at petrol pumps [CPMT 1981]
 (a) Calorific value of the fuel increases
 (b) Odour diminishes
 (c) Less smoke is obtained on combustion
 (d) Antiknock property of fuel increases
84. A liquid hydrocarbon can be converted to gaseous hydrocarbon by [CPMT 1980; MP PMT 2001]
 (a) Cracking
 (b) Hydrolysis
 (c) Oxidation
 (d) Distillation under reduced pressure
85. The tetrahedral nature of carbon was first given by [MP PMT 1994]
 (a) Kekule (b) Le Bell and Van't Hoff
 (c) Pauling (d) Armstrong and Bayer
86. Formation of alkane by the action of Zn on alkyl halide is called [DPMT 1984; MHCET 2004]
 (a) Frankland's reaction (b) Wurtz reaction
 (c) Cannizzaro reaction (d) Kolbe's reaction
87. Which of the following compounds will form a hydrocarbon on reaction with Grignard reagent [CPMT 1988, 93]
 (a) $\text{CH}_3\text{CH}_2\text{OH}$ (b) CH_3CHO
 (c) CH_3COCH_3 (d) $\text{CH}_3\text{CO}_2\text{CH}_2$
88. Name the hydrocarbon that is a liquid at STP
 (a) Ethane (b) Propane
 (c) *n*-butane (d) *n*-pentane
89. Which statement is not true concerning alkanes [MP PET 2003]

- (a) Large number alkanes are soluble in water
 (b) All alkanes have a lower density than water
 (c) At room temperature some alkanes are liquids, some solids and some gases
 (d) All alkanes burn
90. Fischer Tropsch process is used for the manufacture of [DCE 1999; MP PET 2003]
 (a) Synthetic petrol (b) Thermosetting plastics
 (c) Ethanol (d) Benzene
91. Which one of the following compounds cannot be prepared by Wurtz reaction [Kurukshetra CEE 2002; MP PMT 2002; MP PET 2003]
 (a) CH_4 (b) C_2H_6
 (c) C_3H_8 (d) C_4H_{10}
92. A fuel contains 25 % *n*-heptane and 75 % iso-octane. Its octane number is [MP PMT 1993; MP PET 1994]
 (a) 50 (b) 75
 (c) 100 (d) 25
93. Sodium ethoxide is a specific reagent for [CPMT 1985]
 (a) Dehydration
 (b) Dehydrogenation
 (c) Dehydrohalogenation
 (d) Dehalogenation
94. Which of the following has highest percentage of hydrogen [CPMT 1975; 79]
 (a) CH_4 (b) C_2H_4
 (c) C_6H_6 (d) C_2H_2
95. What is the molecular formula of the alkane, the 5.6 litre of which weight 11 g at STP [MP PMT 2003]
 (a) C_6H_{14} (b) C_4H_{10}
 (c) C_3H_8 (d) C_2H_6
96. The reference compound 'iso-octane' which is used in determining the octane number of gasoline has the structure
 (a) $CH_3 - CH(CH_3) - CH(CH_3) - CH(CH_3) - CH_3$
 (b) $CH_3 - C(CH_3)_2 - CH_2 - CH(CH_3) - CH_3$
 (c) $CH_3 - C(CH_3)_2 - CH(CH_3) - CH_2 - CH_3$
 (d) $CH_3 - C(CH_3)_2 - C(CH_3)_2 - CH_3$
97. Sample of 2, 3-dibromo-3-methylpentane is heated with zinc dust. The resulting product is isolated and heated with HI in the presence of phosphorus. Indicate which is the structure that represent the final organic product formed in the reaction [CBSE PMT 1991]
 (a) $CH_3 - CH_2 - \underset{\substack{| \\ CH_3}}{CH} - CH_2 - CH_3$
 (b) $CH_2 = CH - \underset{\substack{| \\ CH_3}}{CH} - CH_2 - CH_3$
 (c) $CH_3 - CHI - \underset{\substack{| \\ CH_3}}{CH} - CH_2 - CH_3$
 (d) $CH_2 = CH - C(I) - CH_2 - CH_3$
 $\quad \quad \quad |$
 $\quad \quad \quad CH_3$
98. The order of appearance of the following with rising temperature during the refining of crude oil is [MNR 1993; UPSEAT 2002]
 (a) Kerosene oil, gasoline, diesel
 (b) Diesel, gasoline, kerosene oil
 (c) Gasoline, diesel, kerosene oil
 (d) Gasoline, kerosene oil, diesel
99. When sodium propionate is heated with soda lime, the main product is [AMU 2002]
 (a) Ethane (b) Methane
 (c) Propane (d) Butane
100. Gasoline is a mixture of alkanes with the number of carbon atoms [CPMT 1983, 84; BVP 2003]
 (a) $C_3 - C_5$ (b) $C_5 - C_6$
 (c) $C_6 - C_8$ (d) $C_7 - C_9$
101. The final product of complete oxidation of hydrocarbons is [CPMT 1981]
 (a) Acid (b) Aldehyde
 (c) $H_2O + CO_2$ (d) Dihydric alcohol
102. Which of the following will have least hindered rotation about carbon-carbon bond [IIT-JEE 1987; CPMT 1989, 94]
 (a) Ethane (b) Ethylene
 (c) Acetylene (d) Hexachloroethane
103. Which of the following represents the most oxidized form of hydrocarbon [MP PMT/PET 1988]
 (a) CO_2 (b) $RCHO$
 (c) $RCOOH$ (d) $RCOOOH$
104. Name the reaction
 $C_{10}H_{22} \xrightarrow{900 K} C_4H_8 + C_6H_{14}$ [MP PET 1995; MP PMT 1997]
 (a) Alkylation (b) Cracking
 (c) Pyrolysis (d) Fractionation
105. How many types of carbon atoms are present in 2, 2, 3-trimethylpentane
 (a) One (b) Two
 (c) Three (d) Four
106. Which one gives only one monosubstitution product on chlorination [AIEEE 2003]
 (a) *n*-pentane (b) Neopentane
 (c) Isopentane (d) *n*-butane
107. CH_4 is formed when [AFMC 1987]
 (a) Sodium acetate is heated with sodalime
 (b) Iodomethane is reduced
 (c) Aluminium carbide reacts with water
 (d) All of these
108. A mixture of methane, ethylene and acetylene gases is passed through a Wolf's bottle containing ammoniacal cuprous chloride. The gas coming out is [NCERT 1976]
 (a) Methane

- (b) Acetylene
(c) A mixture of methane and ethylene
(d) The original mixture
- 109.** At room temperature solid paraffin is [RPET/PMT 1999]
(a) C_3H_8 (b) C_8H_{18}
(c) C_4H_{10} (d) $C_{20}H_{42}$
- 110.** Which one of the following compounds does not give addition reactions [MADT Bihar 1981]
(a) Aldehydes (b) Alkanes
(c) Alkenes (d) Alkynes
(e) Ketones (f) All of these
- 111.** The most important method of preparation of hydrocarbons of lower carbon number is [CBSE PMT 1989]
(a) Pyrolysis of higher carbon number hydrocarbons
(b) Electrolysis of salts of fatty acids
(c) Sabatier and Senderen's reaction
(d) Direct synthesis
- 112.** The inorganic origin of petroleum is indicated by the fact that [Roorkee 1990]
(a) Its constituents can be separated by fractional distillation
(b) Carbon and hydrocarbon can combine by absorption of solar energy to give hydrocarbons
(c) Petroleum contains traces of chlorophyll
(d) Oil fields are located with the help of seismograph
- 113.** Which of the following is a gemdihalide [CPMT 1976, 88]
(a) $CH_3.CHBr.CHBr.CH_3$ (b) $CH_2Br.CH_2Br$
(c) $CHBr = CHBr$ (d) CH_3CHBr_2
- 114.** Which one of the following contain isopropyl group [BHU 2005]
(a) 2,2,3,3-tetramethylpentane
(b) 2-methylpentane
(c) 2,2,3-trimethylpentane
(d) 3,3-dimethylpentane
- 115.** Natural gas is a mixture of [MP PMT 1986]
(a) $CO + CO_2$ (b) $CO + N_2$
(c) $CO + H_2 + CH_4$ (d) $CH_4 + C_2H_6 + C_3H_8$
- 116.** By Wurtz reaction, a mixture of methyl iodide and ethyl iodide gives [BHU 2003]
(a) Butane
(b) Ethane
(c) Propane
(d) A mixture of the above three
- 117.** Product obtained by nitration of propane is [RPMT 2003]
(a) Nitropropane (b) Nitromethane
(c) Nitroethane (d) All of these
- 118.** Isomerism in saturated hydrocarbons is due to
(a) Change in the valence of carbon
(b) Change in the ratio of elements in compounds
(c) Formation of branches in the chain of C atoms
(d) Formation of double bond
- 119.** Photochemical chlorination of alkane is initiated by a process of [DPMT 1985; NCERT 1978]
(a) Pyrolysis (b) Substitution
(c) Homolysis (d) Peroxidation
- 120.** Which of the following is not linked with methane
(a) Marsh gas (b) Natural gas
(c) Producer gas (d) Coal gas
- 121.** Which of the following has highest octane number [MP PET 1996]
(a) *n*-hexane
(b) *n*-heptane
(c) *iso*-octane
(d) *n*-heptane and *iso*-octane mixed in ratio 50 : 50
- 122.** A mixture of ethyl iodide and *n*-propyl iodide is subjected to Wurtz reaction. The hydrocarbon that will not be formed is [IIT-JEE (Screening) 1990]
(a) *n*-butane (b) *n*-propane
(c) *n*-pentane (d) *n*-hexane
- 123.** Most of the hydrocarbons from petroleum are obtained by [CPMT 1974, 80]
(a) Fractional distillation (b) Fractional crystallization
(c) Vaporization (d) Polymerization
- 124.** Which is the best antiknock compound or Which one of the following substances is used as an antiknock compound [CPMT 1974, 81, 99, 2000; RPMT 2002; CBSE PMT 1996; KCET (Med.) 2000 MP PET 1985, 87, 97, 2001; MP PMT 1994, 96; AIIMS 2000]
(a) Lead tetrachloride (b) Lead acetate
(c) Zinc ethyl (d) Tetraethyl lead (TEL)
- 125.** In the dichlorination reaction of propane, mixture of products are obtained. How many isomers, the mixture contains [Orissa JEE 2003]
(a) 2 (b) 3
(c) 4 (d) 5
- 126.** Which of the following cycloalkane gives open chain compound, when reacts with bromine [Orissa JEE 2003]
(a) Cyclopropane (b) Cyclopentane
(c) Cyclohexane (d) Cyclo-octane
- 127.** Grignard reagent is not prepared in aqueous medium but prepared; in ether medium because the reagent [KCET 2002]
(a) Reacts with water
(b) Is insoluble in water
(c) Is highly reactive in ether
(d) Becomes inactive in water
- 128.** A sample of petrol is a mixture of 30% *n*-heptane and 70% *iso*-octane. The sample has octane number [MP PET 1985]
(a) 30 (b) 70
(c) 15 (d) 35
- 129.** For the reduction of ketones to hydrocarbon, the appropriate agent is [DPMT 2002]
(a) *HI* (b) *Zn - Hg / HCl*

- (c) Red phosphorous (d) H_2SO_4
130. Heating of alkanes with fuming sulphuric acid or oleum at high temperature, which forms sulphonic acid, is called [MH CET 1999]
(a) Nitration (b) Halogenation
(c) Sulphonation (d) Oxidation
131. Propane is obtained from propene by which method ? [CPMT 1997; CBSE PMT 2001; AFMC 2001; MH CET 2001]
(a) Catalyst hydrogenation (b) Wurtz reaction
(c) Dehydrogenation (d) Frankland reaction
132. B.P. of branched chain alkanes as compared to straight chain alkanes are [MP PMT 1987; AIIMS 1999]
(a) Lower
(b) Equal
(c) Higher
(d) Independent of the chain
133. Daily use candles (paraffin wax) contain [CPMT 1996]
(a) Higher saturated hydrocarbon
(b) Lower saturated hydrocarbon
(c) Higher unsaturated hydrocarbon
(d) Lower unsaturated hydrocarbon
134. The reaction $CH_4 + Cl_2 \xrightarrow{\text{uv light}} CH_3Cl + HCl$ is an example of [CBSE PMT 1999, 2002]
(a) Addition reactions (b) Substitution reaction
(c) Elimination reaction (d) Rearrangement reaction
135. Normal butane convert into isobutane by [RPMT 2002]
(a) $LiAlH_4$ (b) $AlCl_3$
(c) $NaBH_4$ (d) Zn/HCl
136. Alcoholic solution of KOH is used for [CPMT 1982, 86; IIT-JEE 1990]
(a) Dehydration (b) Dehydrogenation
(c) Dehydrohalogenation (d) Dehalogenation
137. Aluminium carbide on reacting with water gives [NCERT 1981; MP PET 1985]
(a) Methane (b) Ethane
(c) Ethene (d) Ethyne
138. Maximum carbon-carbon bond distance is found in [MP PMT 1987; IIT-JEE 1981; Bihar MEE 1995]
(a) Ethyne (b) Ethene
(c) Ethane (d) Benzene
139. Which of the following reaction is expected to readily give a hydrocarbon product in good yields [CBSE PMT 1997]
(a) $RCOOK \xrightarrow{\text{Oxidation Electrolysis}}$
(b) $RCOOAg \xrightarrow{I_2}$
(c) $CH_3 - CH_3 \xrightarrow[h\nu]{Cl_2}$
(d) $(CH_3)_2CCl \xrightarrow{C_2H_5OH}$
140. Out of the following fractions of petroleum, the one having the lowest boiling point is or Which of the following is obtained at lowest temperature by fractional distillation of petroleum [MP PMT 1993; MP PET 1996]
(a) Kerosene (b) Diesel oil
(c) Gasoline (d) Heavy oil
141. The marsh gas detector used by miners works on the principle of [AMU 1984]
(a) Difference in the rates of diffusion of gases
(b) Avogadro's hypothesis
(c) Gay-Lussac's law of gaseous volumes
(d) Berzelius hypothesis
142. Methane can be prepared by [DCE 2001]
(a) Wurtz's reaction (b) Decarboxylation
(c) Hydrogenation reaction (d) All of these
143. The most strained cycloalkane is [IIT-JEE 1981]
(a) Cyclopropane (b) Cyclobutane
(c) Cyclopentane (d) Cyclohexane
144. Which does not react with chlorine in dark [Pb. PMT 2000]
(a) C_2H_4 (b) C_2H_2
(c) CH_4 (d) CH_3CHO
145. Main constituent of marsh gas is [IIT-JEE 1980; MP PMT 1994; AFMC 1997]
(a) C_2H_2 (b) CH_4
(c) H_2S (d) CO
146. Which of the following method can be used for the preparation of methane
(a) Wurtz reaction (b) Kolbe's reaction
(c) Reduction of alkyl halide (d) Hydrogenation of alkene
147. Which hydrocarbon will be most stable [MP PET 2000, 03]
(a) Methane (b) Ethane
(c) Propane (d) Butane
148. C-H bond length is greatest in [IIT-JEE 1989; MNR 1990; AMU 2002]
(a) C_2H_2 (b) C_2H_4
(c) C_2H_6 (d) $C_2H_2Br_2$
149. Which one of the following compounds does not form an ozonide [EAMCET 1997]
(a) Ethene (b) Propyne
(c) Propene (d) Propane
150. Which type of hybridisation occurs in ethylene [CBSE PMT 1991; Bihar MEE 1996; JIPMER 1997]
(a) sp (b) sp^2
(c) sp^3 (d) sp^3d
151. Silver acetylide when heated with HCl gives
(a) C_2H_2 (b) H_2
(c) C_2H_4 (d) None of these
152. When sodium reacts with ethyl iodide, which of the following hydrocarbons is produced [NCERT 1984; BHU 1982]
(a) Methane (b) Ethane
(c) Butane (d) Ethene
153. Solid methane is [DPMT 1983; CBSE PMT 1989]
(a) Molecular solid (b) Ionic solid
(c) Covalent solid (d) Not possible
154. The shape of ethane is [Bihar CEE 1995]
(a) Triangular (b) Tetrahedral
(c) Linear (d) None of these

155. CH_3MgI will give methane with [Roorkee 1995]
 (a) C_2H_5OH (b) $CH_3 - CH_2 - NH_2$
 (c) $CH_3 - CO - CH_3$ (d) All of these
156. Propane-1-ol can be prepared from propene by its reaction with [MP PMT 2003]
 (a) CH_3COOH (b) H_3BO_3
 (c) $B_2H_6 / NaOH, H_2O_2$ (d) H_2SO_4 / H_2O
157. The process in which higher hydrocarbons are broken down into lower hydrocarbons by controlled pyrolysis, is called [MP PMT 2002]
 (a) Hydrolysis (b) Cracking
 (c) Oxidation (d) Reduction
158. Successive alkanes differ by [MP PMT 2002]
 (a) $>CH_2$ (b) $>CH$
 (c) $-CH_3$ (d) C_2H_4
159. General formula of alkane is [EAMCET 1979; Manipal MEE 1995]
 (a) C_nH_{2n+2} (b) C_nH_{2n-1}
 (c) C_nH_{2n} (d) C_nH_{2n+1}
160. Methane and ethane both can be prepared in one step by which of the following compound [BHU 2004]
 (a) C_2H_4 (b) CH_3O
 (c) CH_3Br (d) CH_3CH_2OH
161. Photochemical chlorination of alkane is initiated by a process of [Kerala PMT 2004]
 (a) Pyrolysis (b) Substitution
 (c) Cracking (d) Peroxidation
 (e) Homolysis
162. A petroleum fraction having boiling range $70-200^\circ C$ and containing 6-10 carbon atoms per molecule is called [UPSEAT 2004]
 (a) Natural gas (b) Gas oil
 (c) Gasoline (d) Kerosene
163. Producer gas is a mixture of [Pb. CET 2002; UPSEAT 2004]
 (a) CO and N_2 (b) CO_2 and H_2
 (c) N_2 and O_2 (d) CH_4 and N_2
164. The highest boiling point is expected for [DEC. 2003]
 (a) n -butane
 (b) iso-octane
 (c) n -octane
 (d) 2,2,3,3-tetramethyl butane
165. Which of the following is a good conductor of heat of electricity [Pb. CET 2003]
 (a) Diamond (b) Graphite
 (c) Anthracite (d) Charcoal
166. Which one of the following has the minimum boiling point [AIEEE 2004]
 (a) 1-Butene (b) 1-Butyne
 (c) n -Butane (d) Isobutane
167. Octane number can be changed by [AFMC 2004]
 (a) Isomerisation (b) Alkylation
 (c) Cyclisation (d) All of these
168. Gasoline has composition [AFMC 2004]
 (a) $C_8 - C_{12}$ (b) $C_2 - C_5$
 (c) $C_6 - C_{11}$ (d) None of these
169. The complete combustion of CH_4 gives [BHU 2004]
 (a) $CO + H_2$ (b) $CO + N_2$
 (c) $CO_2 + H_2O$ (d) $CO + N_2O$
170. Which of the following has highest knocking [UPSEAT 2004]
 (a) Olefins
 (b) Branched chain olefins
 (c) Straight chain olefins
 (d) Aromatic hydrocarbons
171. Which one of the following compounds gives methane on treatment with water [Kerala PMT 2004; MH CET 2004]
 (a) Al_4C_3 (b) CaC_2
 (c) VC (d) SiC
 (e) B_4C
172. Pick out the alkane which differs from the other members of the group. [KCET 2004]
 (a) 2,2-dimethyl propane
 (b) Pentane
 (c) 2-methyl butane
 (d) 2,2-dimethyl butane
173. 2-Methylbutane on reacting with bromine in the presence of sunlight gives mainly [AIEEE 2005]
 (a) 1-bromo-2-methylbutane
 (b) 2-bromo-2-methylbutane
 (c) 2-bromo-3-methylbutane
 (d) 1-bromo-3-methylbutane
174. Of the five isomeric hexanes, the isomer which can give two monochlorinated compounds is [AIEEE 2005]
 (a) n -hexane
 (b) 2, 3-dimethylbutane
 (c) 2, 2-dimethylbutane
 (d) 2-methylpentane
175. The product obtained on reaction of C_2H_5Cl with hydrogen over palladium carbon is [AFMC 2005]
 (a) C_3H_8 (b) C_4H_{10}
 (c) C_2H_6 (d) C_2H_4

Alkene

1. Addition of bromine to 1, 3-butadiene gives [CPMT 1987, 93]
 (a) 1, 2 addition product only
 (b) 1, 4 addition product only
 (c) Both 1, 2 and 1, 4 addition products
 (d) No reaction
2. When ethylene bromide is treated with Zn , we get [RPMT 1997]
 (a) Alkane (b) Alkene
 (c) Alkyne (d) All
3. Ethene when treated with Br_2 in the presence of CCl_4 which compound is formed [RPMT 1997; DCE 2001; KCET (Med.) 1999]
 (a) 1, 2-dibromoethane
 (b) 1-bromo-2-chloroethane
 (c) Both (a) and (b)

- (d) 1, 1, 1-tribromoethane
4. In a reaction
- $$CH_2 = CH_2 \xrightarrow[\text{acid}]{\text{Hypochlorous}} M \xrightarrow{R} \begin{array}{c} CH_2 - OH \\ | \\ CH_2 - OH \end{array}$$
- Where M = molecule; R = reagent M and R are
[CBSE PMT 1997; CPMT 2001]
- (a) CH_3CH_2Cl and $NaOH$
(b) $CH_2Cl - CH_2OH$ and aq. $NaHCO_3$
(c) CH_3CH_2OH and HCl
(d) $CH_2 = CH_2$ and heat
5. Alkenes usually show which type of reaction
[AIIMS 1999; MADT Bihar 1980]
- (a) Addition (b) Substitution
(c) Elimination (d) Superposition
6. The propene reacts with HBr to form
[AIIMS 1999; RPET 1999]
- (a) Ethane (b) Hexane
(c) 1-bromo-propane (d) 2-bromo propane
7. Ethylene may be obtained by dehydration of which of the following with concentrated H_2SO_4 at $160 - 170^\circ C$
[RPET 1999]
- (a) C_2H_5OH (b) CH_3OH
(c) $CH_3CH_2CH_2OH$ (d) $(CH_3)_2CHCH_2OH$
- 8.
- $$\begin{array}{c} H_3C \\ \diagdown \\ C = C \\ \diagup \\ H_3C \end{array} \begin{array}{c} CH_3 \\ \diagup \\ C \\ \diagdown \\ CH_3 \end{array} \xrightarrow[\text{KOH (heat)}]{X} \begin{array}{c} CH_3 \\ \diagdown \\ C = O \\ \diagup \\ CH_3 \end{array} + O = C \begin{array}{c} CH_3 \\ \diagup \\ C \\ \diagdown \\ CH_3 \end{array}$$
- X in the above reaction is
[CPMT 1985, 93]
- (a) HNO_3 (b) O_2
(c) O_3 (d) $KMnO_4$
9. The disappearance of the characteristic purple colour of $KMnO_4$ in its reaction with an alkene is the test for unsaturation. It is known as
[CPMT 1989, 94; CBSE PMT 1990]
- (a) Markownikoff's test (b) Baeyer's test
(c) Wurtz's test (d) Grignard test
10. A gas formed by the action of alcoholic KOH on ethyl iodide, decolourises alkaline $KMnO_4$. The gas is
[KCET 2003]
- (a) C_2H_6 (b) CH_4
(c) C_2H_2 (d) C_2H_4
11. $CH_3 - CH_2 - Cl \xrightarrow{\text{alc. KOH}} A$, the product is
[CPMT 2003]
- (a) CH_3CH_2OK (b) CH_3CHO
(c) $CH_3CH_2OCH_2CH_3$ (d) $CH_2 = CH_2$
12. The final product formed when ethyl bromide is treated with excess of alcoholic KOH is
[MP PET 1999]
- (a) Ethylene (b) Ethane
- (c) Ethyne (d) Vinyl bromide
13. Which of the following hydrocarbons cannot be obtained by Sabatier and Senderen's reaction
- (a) CH_4 (b) C_2H_6
(c) C_3H_8 (d) All
14. When 3, 3-dimethyl-2-butanol is heated with H_2SO_4 the major product obtained is
[CBSE PMT 1995]
- (a) *cis* and *trans* isomers of 2, 3-dimethyl-2-butene
(b) 3, 3-dimethyl-1-butene
(c) 2, 3-dimethyl-2-butene
(d) 2, 3-dimethyl-1-butene
15. The intermediate during the addition of HCl to propene in the presence of peroxide is
[IIT-JEE 1997]
- (a) $CH_3 \dot{C}HCH_2Cl$ (b) $CH_3 \overset{+}{C}HCH_3$
(c) $CH_3CH_2 \dot{C}H_2$ (d) $CH_3CH_2 \overset{+}{C}H_2$
16. $CH_2 = CH_2 \xrightarrow[\text{KOH} / H_2O]{KMnO_4} X$. Product ' X ' in above reaction is
[RPMT 2003]
- (a) Ethylene glycol (b) Glucose
(c) Ethanol (d) All of these
17. Which of the following compounds represents acrylonitrile
[JIPMER 1997]
- (a) Vinyl cyanide (b) Cyanoethene
(c) Prop-2-ene nitrile (d) All of them
18. When acetylene reacts with arsenic trichloride in the presence of anhydrous aluminium chloride, it produces
[AFMC 1999]
- (a) Lewisite
(b) β -chlorovinyl dichloroarsine
(c) Nitrobenzene
(d) Both (a) and (b)
19. Ozonolysis of which one of the following will give two molecules of acetaldehyde
[Bihar MEE 1997; MP PET 2000]
- (a) 1-butene (b) 2-butene
(c) 1-pentene (d) 2-pentene
(e) None of these
20. In which of the following, addition of HBr does not take place against Markownikoff's rule or Anti-Markownikoff addition of HBr is not observed for
[IIT-JEE 1985; CBSE PMT 1994; MADT Bihar 1995; MP PMT 1999; AMU 2002]
- (a) Propene (b) But-1-ene
(c) But-2-ene (d) Pent-2-ene
21. Which one of the following characteristics apply to both ethene and ethyne
[NCERT 1990]
- (a) Explode when mixed with chlorine
(b) Decolourise Baeyer's reagent giving brown precipitate
(c) Rapidly absorbed by cold conc. H_2SO_4
(d) Form white precipitate with silver nitrate solution
22. Which of the following has highest knocking property
- (a) Aromatic hydrocarbons
(b) Olefins
(c) Branched chain paraffins

- (d) Straight chain paraffins
23. Dilute aqueous $KMnO_4$, at room temperature reacts with $R-CH=CH-R$ to give [Roorkee 1992]
 (a) $R-CHO$ (b) $R-COOH$
 (c) $RCHOH-CHOHR$ (d) $CO_2 + H_2O$
24. Aqueous sulphuric acid reacts with 2-methyl-1-butene to give predominantly [Roorkee 1992]
 (a) Isobutyl hydrogen sulphate
 (b) 2-methyl-2-butanol
 (c) 2-methyl-1-butanol
 (d) Secondary butyl hydrogen sulphate
25. How can ethene be produced from ethanol [BHU 1996]
 (a) By dehydrohalogenation
 (b) By dehydrogenation
 (c) By dehydration with conc. H_2SO_4 at $170^\circ C$
 (d) By reduction with hydrogen iodide
26. Baeyer's reagent is used in the laboratory for [CBSE PMT 1991, 92; AIIMS 1998; AFMC 1999]
 (a) Detection of double bonds
 (b) Detection of glucose
 (c) Reduction
 (d) Oxidation
27. Isopropyl alcohol is obtained by reacting which of the following alkenes with conc. H_2SO_4 and H_2O [MP PMT 1999]
 (a) Ethylene (b) Propylene
 (c) 2-methyl propene (d) Isoprene
28. Which of the following compound is produced when $CH_2=CH-(CH_2)_2COOH$ reacts with HBr in presence of peroxides [AIIMS 2000]
 (a) $CH_3CH(CH_2)_5COOH$
 (b) $BrCH_2CH_2(CH_2)_5COOH$
 (c) $CH_3CH_2CH_2(CH_2)_5COOH$
 (d) $CH_3CH_2BrCH_2CH_2COOH$
29. One mole of each of the following alkenes is catalytically hydrogenated. The quantity of heat evolved will be the lowest in the case of [Roorkee 2000]
 (a) 1-butene (b) Trans-2-butene
 (c) Cis-2-butene (d) 1, 3-butadiene
30. Which of the following is not used to distinguish ethene from ethane [KCET (Med.) 2001; UPSEAT 2002; CBSE PMT 2002]
 (a) Iodine in CCl_4 (b) Bromine in CCl_4
 (c) Alkaline $KMnO_4$ (d) Ammonical Cu_2Cl_2
31. A hydrocarbon X adds on one mole of hydrogen to give another hydrocarbon and decolourised bromine water. X reacts with $KMnO_4$ in presence of acid to give two moles of the same carboxylic acid. The structure of X is [JIPMER 2001]
 (a) $CH_2=CH-CH_2CH_2CH_3$
 (b) $CH_3CH_2CH_2-CH=CHCH_3$
 (c) $CH_3CH_2CH=CHCH_2CH_3$
 (d) $CH_3CH=CHCH_2CH_2CH_3$
32. When 2-bromobutane reacts with alcoholic KOH , the reaction is called [KCET (Med.) 2001]
 (a) Halogenation (b) Hydrogenation
 (c) Chlorination (d) Dehydro-halogenation
33. 1, 3-butadiene reacts with ethylene to form [BHU 2001]
 (a) Benzene (b) Cyclohexane
 (c) Cyclohexene (d) 2, 3 dimethyl butane
34. Ethylene reacts with ozone gas to form the compound
 (a) $HCHO$ (b) C_2H_5OH
 (c) $O \begin{array}{c} \diagup C H_2 - O \\ | \\ C H_2 - O \end{array}$ (d) CH_3CHO
35. Oils are converted into fats by [Kerala (Med.) 2002]
 (a) Hydration (b) Decarboxylation
 (c) Hydrogenation (d) Dehydrogenation
 (e) Hydrogenolysis
36. Which process converts olefins into paraffins [MP PET 2002]
 (a) Halogenation (b) Dehydration
 (c) Hydrogenation (d) Hydrolysis
37. Of the following the formula which represents a saturated cyclic compound is [AMU 1983]
 (a) C_3H_6 (b) C_3H_8
 (c) C_8H_{10} (d) C_8H_{12}
38. In a reaction, if half of the double bond is broken and two new bonds are formed, this is a case of [AMU 1983; NCERT 1978; CPMT 1983]
 (a) Elimination (b) Addition
 (c) Displacement (d) Rearrangement
39. Which of the following are formed on addition reaction of DCI with 3-methyl-1-butene [Roorkee 2000]
 (a) $CH_2DCHClCH(CH_3)_2$ (b) $CH_2DCH_2CCl(CH_3)_2$
 (c) $CH_3CDClCH(CH_3)_2$ (d) $ClCH_2CHDCH(CH_3)_2$
40. Major product of the following reaction is

$$CH_3 - \overset{\overset{Br}{|}}{\underset{\underset{H}{|}}{C}} - CH_2 - CH_3 + \text{alca. KOH} \rightarrow$$
 [MP PMT 1986]
 (a) Butene-1 (b) Butene-2
 (c) Butane (d) Butyne-1
41. Cyclopentene on treatment with alkaline $KMnO_4$ gives [CPMT 1987]
 (a) Cyclopentanol
 (b) *trans* 1, 2-cyclopentanediol
 (c) *cis* 1, 2-cyclopentanediol
 (d) 1 : 1 mixture of *cis* and *trans* 1, 2-cyclopentanediol
42. Which of the following is the most stable alkene [AIIMS 1998; KCET (Med.) 2000; CPMT 2003]
 (a) $R_2C=CR_2$ (b) $RCH=CHR$
 (c) $RCH_2=CH_2R$ (d) $CH_2=CH_2$
43. Ethene gives with acidic $KMnO_4$ solution [MP PMT 1997]
 (a) Ethylene glycol (b) Ethylene oxide
 (c) Formaldehyde (d) Acetaldehyde
44. In paraffins, with the increasing molecular weight, it is found that
 (a) Freezing point decreases
 (b) Boiling point decreases
 (c) Boiling point increases
 (d) Vapour pressure decreases

45. When alcoholic solution of ethylene dibromide is heated with granulated zinc, the compound formed is [CPMT 1990]
(a) Ethylene (b) Ethyne
(c) Cyclobutane (d) Butane
46. A gas formed by the action of alcoholic KOH on ethyl iodide, decolorises alkaline $KMnO_4$ solution. The gas is [CPMT 1974, 91; MP PET 1985; IIT-JEE 1982]
(a) CH_4 (b) C_2H_6
(c) C_2H_4 (d) C_2H_2
47. Markownikoff's rule provides guidance of addition of HBr on [MNR 1994]
(a) $CH_2 = CH_2$ (b) $CH_3 - CH_2 - CH_3$
(c) $CH_3CH = CHCH_3$ (d) $CH_2 = CHBr$
48. Ethyl bromide gives ethylene when reacted with [CPMT 1982, 93; RPET 2000; Pb. PMT 2001]
(a) Ethyl alcohol (b) Dilute H_2SO_4
(c) Aqueous KOH (d) Alcoholic KOH
49. Ethylene is prepared by the dehydration of [CPMT 1974, 79; DPMT 1985; BHU 1989]
(a) Ethyl alcohol (b) Methyl alcohol
(c) Acetic acid (d) Oxalic acid
50. Which reactions are most common in alkenes [Pb. CET 1989]
(a) Electrophilic substitution reactions
(b) Nucleophilic substitution reactions
(c) Electrophilic addition reactions
(d) Nucleophilic addition reactions
51. A mixture of 1-chloropropane and 2-chloropropane when treated with alcoholic KOH gives [NCERT 1990]
(a) 1-propene (b) 2-propene
(c) Isopropylene (d) All the three
52. The compound formed by passing ethylene gas into cold alkaline solution of $KMnO_4$ is [NCERT 1974, 81; CPMT 1979, 86, 88; MP PET 1985, 95; AFMC 1998]
(a) Ethyl alcohol (b) Acetaldehyde
(c) Acetic acid (d) Ethylene glycol
53. A gas decolourised $KMnO_4$ solution but gives no precipitate with ammoniacal cuprous chloride is or Which of the following gases does not give a precipitate with ammoniacal solution of silver nitrate but decolourizes $KMnO_4$ (neutral or slightly alkaline) [NCERT 1974, 77; CPMT 1974, 77, 78; MP PMT 1996; MP PET 1996, 99]
(a) Ethane (b) Methane
(c) Ethene (d) Acetylene
54. A hydrocarbon reacts with hypochlorous acid to give 1-chloro-2-hydroxyethane. The hydrocarbon is [CBSE PMT 1989]
(a) Ethylene (b) Methane
(c) Ethane (d) Acetylene
55. When ethene is heated at $400^\circ C$ under high pressure, the product is/are
(a) Carbon and H_2 (b) Polyethylene
(c) Acetylene and H_2 (d) None of these
56. Which decolorize aqueous bromine and gives white fumes of HCl on reaction with PCl_5 [Pb. PMT 1999]
(a) $CH_3COCH_2CH = CH_2$
(b) $CH_3CH_2CH_2CH_2CH_3$
(c) $CH_3CH = CHCH_2CH_2OH$
(d) $CH_3OCH_2CH_2CH_2CH_2OH$
57. During debromination of meso-dibromobutane, the major compound formed is [IIT-JEE 1997]
(a) n-butane (b) 1-butene
(c) cis-2-butene (d) trans-2-butene
58. What product is formed when 1-chlorobutane react with alcoholic KOH [RPMT 2002]
(a) 1-butene (b) 2-butene
(c) 1-butanol (d) 2-butanol
59. The olefin which on ozonolysis gives CH_3CH_2CHO and CH_3CHO is [Roorkee 1992]
(a) 1-butene (b) 2-butene
(c) 1-pentene (d) 2-pentene
60. Bond length between carbon-carbon in ethylene molecule is [MP PET 1997]
(a) $1.54 \text{ \AA}$ (b) $1.35 \text{ \AA}$
(c) $1.19 \text{ \AA}$ (d) $2.4 \text{ \AA}$
61. The compound having both sp and sp^2 hybridised carbon atom is [IIT-JEE 1981]
(a) Propene (b) Propyne
(c) Propadiene (d) None of these
62. The halogen which is most reactive in the halogenation of alkenes under sunlight is [IIT-JEE 1981]
(a) Chlorine (b) Bromine
(c) Iodine (d) All equal
63. When ethene reacts with bromine, it forms [AFMC 2000; KCET 2001]
(a) Chloroethane (b) Ethylene dibromide
(c) 1 bromopropane (d) 1,2-dichloroethene
64. Paraffins are soluble in [NCERT 1978]
(a) Distilled water (b) Benzene
(c) Methanol (d) Sea water
65. Addition of HCl to propene in presence of peroxides gives [BHU 1981, 98]
(a) 1-Chloropropane (b) 2-Chloropropane
(c) 3-Chloropropane (d) Propene dichloride
66. The name of the product obtained by the addition of HI to propene in presence of peroxide catalyst is [KCET 2000]
(a) Isopropyl iodide (b) 2-Iodopropene
(c) 2-Iodopropane (d) 1-Iodopropane
67. In the reaction $C_2H_5CH = CH_2 + H - X \rightarrow$ Product. What is the product [BHU 2002]
(a) $C_2H_5 - CH_3$
(b) $C_2H_5CH_2 - CH_2X$

- (c) $C_2H_5 - CHX - CH_3$
(d) $CH_3 - CH_2X - CH = CH_2$
68. Alkene can be prepared from alkyl halide by the following reagent $R-X + Nu^- \rightarrow \text{Alkene} + NuH$ [RPET 2000]
(a) Alc. KOH + heat (b) Aq. KOH + cold water
(c) NaOH (d) LiOH
69. 2-chlorobutane is heated with alcoholic NaOH, the product formed in larger amount is [RPET 1999; AMU 2000]
(a) 1-Butene (b) 1-Butyne
(c) 2-Butene (d) All of these
70. Ethylene has high b.p. and high vapour pressure at $100^\circ C$ and does not dissolve in water. Hence ethylene is separated by this method [UPSEAT 1999]
(a) Simple distillation (b) Vacuum distillation
(c) Vapour distillation (d) Alkali treatment
71. Addition of bromine to 1, 3-butadiene gives [AMU 1999]
(a) 1, 4-addition product only
(b) 1, 2-addition product only
(c) Both 1, 2-and 1, 4 addition product
(d) None of these
72. In the presence of peroxide, hydrogen chloride and hydrogen iodide do not give anti-Markovnikoff's addition to alkenes because [IIT-JEE Screening 2001]
(a) Both are highly ionic
(b) One is oxidising and the other is reducing
(c) One of the steps is endothermic in both the cases
(d) All the steps are exothermic in both the cases
73. The compound most likely to decolourize a solution of potassium permanganate is [NCERT 1978]
(a) CH_3CH_3
(b) 
(c) $CH_3CH = CHCH_2CH_3$
(d) $CH_3 - \overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}} - CH_3$
74. Ethylene is converted to X on passing through a mixture of an acidified aqueous solution of palladium chloride and cupric chloride. Which of the following reagents readily take part in addition reaction with X [UPSEAT 2003]
(a) Br_2 (b) HBr
(c) HCl (d) HCN
75. Addition of HCl does not obey antimarkownikoff's rule because [UPSEAT 2003]
(a) It is a strong acid (b) It is a gas
(c) Its bond energy is high (d) Its bond energy is less
76. Correct statement about 1, 3-dibutene [UPSEAT 2003]
(a) Conjugated double bonds are present
(b) Reacts with HBr
(c) Forms polymer
(d) All of these
77. At low temperatures, the slow addition of molecular bromine to $CH_2 = CH - CH_2 - C \equiv CH$ gives [Roorkee Qualifying 1998]
(a) $CH_2 = CH - CH_2 - CBr = CHBr$
(b) $BrCH_2 - CHBr - CH_2 - C \equiv CH$
(c) $CH_2 = CH - CH_2 - CH_2 - CBr_3$
(d) $CH_3 - CBr_2 - CH_2 - C \equiv CH$
78. PCl_5 reacts with propanone, to give [Pb. PMT 2001]
(a) vic-dichloride (b) Propanal
(c) propane-chloride (d) gem-dichloride
79. The compounds that will give an isomer of 2; 2-dimethyl propane on catalytic hydrogenation are [AMU 1999]
(1) $CH_3CH = C - CH_3$ (2) $CH_3CH = CHCH_3$
 $\quad \quad \quad |$
 $\quad \quad \quad CH_3$
(3) $CH_3\overset{\overset{H}{|}}{C} = CHCH_2CH_3$ (4) $CH_3C = C - CH_3$
 $\quad \quad \quad | \quad \quad |$
 $\quad \quad \quad CH_3 \quad CH_3$
(a) 1 and 4 (b) 2 and 4
(c) 1 and 3 (d) 1 and 2
80. Alkene $R - C - H = CH_2$ reacts readily with B_2H_6 and the product on oxidation with alkaline hydrogen peroxides produces [CBSE PMT 1995]
(a) $R - CH_2 - CHO$ (b) $R - CH_2 - CH_2 - OH$
(c) $R - \overset{\overset{O}{||}}{C} - CH_3$ (d) $R - \overset{\overset{OH}{|}}{CH} - \overset{\overset{OH}{|}}{CH_3}$
81. Bayer's reagent is used for detection of [RPMT 2002]
(a) Amines (b) Glucose
(c) Unsaturated bond (d) Alcohol
82. Which of the following is(are) example(s) of nucleophilic addition reaction in case of acetylene
(a) Addition of water (b) Addition of HCN
(c) Addition of $AsCl_3$ (d) All
83. Structural formula for lewisite is
 $CHCl$ $CHCl_2$
(a) $\parallel$ (b) $|$
 $CHAsCl_3$ $CHAsCl_3$
 $CHCl$
(c) $\parallel$ (d) None of these
 $CHAsCl_2$
84. Propene when heated with chlorine at about $500^\circ C$ forms [MP PET 1997]
(a) $CH_2Cl.CH = CH_2$ (b) $CH_3.CHCl.CH_2Cl$
(c) $CH_2Cl.CHCl.CH_2Cl$ (d) All the three
85. PVC is obtained from vinyl chloride by a reaction called
(a) Addition (b) Isomerization
(c) Polymerization (d) Substitution
86. Reaction of Br_2 on ethylene in presence of $NaCl$ gives
(a) $BrCH_2 - CH_2Br$ (b) $ClCH_2 - CH_2Br$
(c) Both (a) and (b) (d) None of these
87. $CH_3 - CH = CH_2 + HBr \longrightarrow \dots\dots\dots$, the product formed is [AIIMS 1983; CPMT 1997; RPMT 1999, 2003]

- (a) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{Br}$ (b) $\text{CH}_3 - \text{CHBr} - \text{CH}_3$
 (c) $\text{BrCH}_2 - \text{CH} = \text{CH}_2$ (d) $\text{CH}_2 = \text{C} = \text{CH}_2$
88. The product of reaction between propene and HBr in the presence of a peroxide is
 (a) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2\text{Br}$ (b) $\text{CH}_3 - \text{CHBr} - \text{CH}_3$
 (c) $\text{CH}_3 - \text{CH}_2\text{Br}$ (d) $\text{CH}_3 - \text{CH} = \text{CHBr}$
89. Ozonolysis of 2-methyl butene-2 yields
 (a) Only aldehyde
 (b) Only ketone
 (c) Both aldehyde and ketone
 (d) None of these
90. The final product formed by the ozonolysis of compound $\text{RCH} = \text{CR}_2$ is [NCERT 1978]
 (a) RCHO (b) R_2CO
 (c) Both (a) and (b) (d) None of these
91. Which one is an unsaturated compound [BIT 1990]
 (a) C_6H_{14} (b) C_4H_8
 (c) $\text{C}_3\text{H}_7\text{OH}$ (d) CH_3OH
92. Ethyl alcohol on heating with conc. H_2SO_4 gives [EAMCET 1979; MP PMT 1996]
 (a) $\text{CH}_3\text{COOC}_2\text{H}_5$ (b) C_2H_6
 (c) C_2H_4 (d) C_2H_2
93. Monohalides on reacting with alcoholic KOH give [MP PET 1982, 86; DPMT 1981; CPMT 1979, 83]
 (a) Alkanes (b) Alkenes
 (c) Alkynes (d) Aromatic hydrocarbons
94. Ethylene is a member of..... series [BHU 1979]
 (a) Alkyne (b) Olefin
 (c) Paraffin (d) Amine
95. In a double bond between two carbon atoms of ethene, there are [NCERT 1981]
 (a) Two sigma bonds perpendicular to each other
 (b) One sigma and one pi bond
 (c) Two pi bonds perpendicular to each other
 (d) Two pi bonds at an angle of 60°
96. The formation of alkene from alkyl halide is an example of [CPMT 1983; AMU 1982; Pb. CET 1986]
 (a) Addition (b) Elimination
 (c) Substitution (d) (a) and (c)
97. In the following reaction

$$\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_3 \xrightarrow[475\text{ K}]{\text{H}_2\text{SO}_4}$$
 [AIIMS 1983]
 (a) $\text{CH}_3\text{CH} = \text{CHCH}_3$ predominates
 (b) $\text{CH}_2 = \text{CHCH}_2\text{CH}_3$ predominates
 (c) Both are formed in equal amounts
 (d) The amount of production depends on the nature of catalyst
98. The compound B formed in the following sequences of reactions is

$$\text{CH}_3\text{CH}_2\text{CH}_2\text{OH} \xrightarrow{\text{PCl}_3} \text{A} \xrightarrow{\text{Alca. KOH}} \text{B}$$
 [NCERT 1981]
 (a) Propyne (b) Propene
 (c) Propanol (d) Propane
99. n -propyl bromide on treatment with ethanolic potassium hydroxide produces [IIT-JEE 1987; MP PMT 1997]
 (a) Propane (b) Propene
 (c) Propyne (d) Propanol
100. The dehydrohalogenation of neopentyl bromide with alcoholic KOH mainly gives [IIT-JEE (Screening) 1990; MP PET 1993]
 (a) 2-methyl-1-butene (b) 2-methyl-2-butene
 (c) 2, 2-dimethyl-1-butene (d) 2-butene
101. Which is the most reactive hydrocarbon in the following [JIPMER 2002]
 (a) Ethane (b) Ethyne
 (c) Ethene (d) Methane
102. Shape of ethylene molecule is [MP PET 1993]
 (a) Tetrahedral (b) Pyramidal
 (c) Planar (d) Linear
103. Electrophilic addition on a carbon-carbon double bond involves the intermediate formation of a more stable carbocation. This statement is called
 (a) Saytzeff's rule (b) Baeyer's effect
 (c) Markownikoff's rule (d) None of these
104. $\text{CH}_2 = \text{CHCl}$ reacts with HCl to form [CPMT 1985, 93]
 (a) $\text{CH}_2\text{Cl} - \text{CH}_2\text{Cl}$ (b) $\text{CH}_3 - \text{CHCl}_2$
 (c) $\text{CH}_2 = \text{CHCl} \cdot \text{HCl}$ (d) None of these
105. Deviation from Markownikoff's rule occurs in presence of
 (a) Zinc (b) Peroxides
 (c) $\text{Hg} - \text{Zn} / \text{HCl}$ (d) All of these
106. Presence of peroxides affects the addition of [BHU 1987]
 (a) HBr (b) HCl
 (c) HI (d) All of these
107. Catalyst used in dimerisation of acetylene to prepare chloroprene is [BHU 1984]
 (a) $\text{HgSO}_4 + \text{H}_2\text{SO}_4$ (b) Cu_2Cl_2
 (c) $\text{Cu}_2\text{Cl}_2 + \text{NH}_4\text{Cl}$ (d) $\text{Cu}_2\text{Cl}_2 + \text{NH}_4\text{OH}$
108. Chloroprene is
 (a) 2-chloro-1, 3-butadiene
 (b) 3-chloro-2, 3-butadiene
 (c) 2, 3-dichlorobutadiene
 (d) None of these
109. Chloroprene is used in making [MP PET 1985]
 (a) Synthetic rubber (b) Plastic
 (c) Petrol (d) All of these
110. When isobutyl magnesium bromide in dry ether is treated with absolute ethyl alcohol, the products formed are [IIT-JEE 1995]
 (a) $\text{CH}_3 - \text{CH} - \text{CH}_2\text{OH}$ and $\text{CH}_3\text{CH}_2\text{MgBr}$

$$\begin{array}{c} | \\ \text{CH}_3 \end{array}$$

 (b) $\text{CH}_3 - \text{CH} - \text{CH}_2 - \text{CH}_2 - \text{CH}_3$ and Mg(OH)Br

$$\begin{array}{c} | \\ \text{CH}_3 \end{array}$$

111. The predominant product formed, when 3-methyl-2-pentene reacts with HOCl , is [IIT-JEE 1995]

112. Which of the following occurs easily in ethylene [MNR 1987; NCERT 1979]

- (a) Addition (b) Substitution
(c) Elimination (d) Rearrangement

113. How many gm of bromine will react with 21 gm C_3H_6 [MP PET 1985]

- (a) 80 (b) 160
(c) 240 (d) 320

114. Conjugate double bond is present in [MP PMT 1987]

- (a) Propylene (b) Butadiene
(c) Isobutylene (d) Butylene

115. On passing vapours of an organic liquid over finely divided Cu at 573K the product was an alkene. This reaction is

- (a) Catalytic oxidation of primary alcohol
(b) Catalytic dehydrogenation of secondary alcohol
(c) Catalytic dehydrogenation of tertiary alcohol
(d) Catalytic dehydration of tertiary alcohol

116. The total number of sigma (σ) and pi (π) bonds in an ethylene molecule are

- (a) $4\sigma, 2\pi$ (b) $4\sigma, 1\pi$
(c) $5\sigma, 2\pi$ (d) $5\sigma, 1\pi$

117. Cyclic hydrocarbon molecule A has all the carbon and hydrogens in a single plane. All the carbon-carbon bonds are of same length and less than $1.54 \text{ \AA}$ but more than $1.34 \text{ \AA}$. $\text{C}-\text{C}-\text{C}$ bond angle will be [CBSE PMT 1989]

- (a) 120° (b) 180°
(c) 100° (d) $109^\circ 28'$

118. General formula of alkenes is [CPMT 1975; MNR 1987; NCERT 1987; MP PMT 1994]

- (a) C_nH_{2n} (b) $\text{C}_n\text{H}_{2n-2}$

- (c) $\text{C}_n\text{H}_{2n+2}$ (d) $\text{C}_n\text{H}_{2n-1}$

119. The product of following reaction is

[MP PMT 1986; MP PET 1997]

120. Which one of the following organic compounds decolourizes an alkaline KMnO_4 solution [CPMT 1987, 93]

- (a) CS_2 (b) C_3H_6
(c) C_3H_8 (d) CH_3OH

121. Decolourization of alkaline KMnO_4 is used as a test for [AMU 1983]

- (a) Aromatic hydrocarbons
(b) Olefinic hydrocarbons
(c) Acetylenic hydrocarbons
(d) Cycloalkanes

122. The reaction

[MP PMT 1996; CBSE PMT 2001; MH CET 2001; BHU 2002]

- (a) Wurtz's reaction
(b) Kolbe's reaction
(c) Sabatier and Senderen's reaction
(d) Carbylamine reaction

123. The alkene which on ozonolysis yields acetone is [MP PMT 1986, 2000]

- (a) $\text{CH}_2 = \text{CH}_2$
(b) $\text{CH}_3 - \text{CH} = \text{CH}_2$
(c) $(\text{CH}_3)_2\text{C} = \text{C}(\text{CH}_3)_2$
(d) $\text{CH}_3 - \text{CH} = \text{CH} - \text{CH}_3$

124. $\text{CH}_3\text{CH} = \text{CHCHO}$ is oxidized to $\text{CH}_3\text{CH} = \text{CHCOOH}$ using [NCERT 1978]

- (a) Alkaline potassium permanganate
(b) Acidified potassium permanganate
(c) Selenium dioxide
(d) Osmium tetroxide

125. The order of increasing reactivity towards HCl of the following compounds will be

126. The reagent which is used to distinguish between propene and propyne is [MP PET 1994; IIT-JEE (Screening) 2000; AIIMS 2000; Pb. PMT 2002; BHU 2003]

127. Which one of the following reactions would be the best for the formation of 2-bromobutane [MP PET 1994]

128. If HCl is added over $CH_2 = C \begin{matrix} \swarrow CH_3 \\ \searrow CH_3 \end{matrix}$ then what is formed [CPMT 1996]

129. Position of double bond in an organic compound is determined by [DCE 2001; RPMT 2002]

130. A gas decolourises Bayer's reagent but does not react with Tollen's reagent, this gas is [MP PMT 2001]

131. Formation of 2-butene from 2-bromobutane is according to

132. An alkene on ozonolysis gave acetaldehyde the alkene is

133. Indicate the organic structure for the product expected when 2-methyl propene is heated with acetyl chloride in presence of anhydrous zinc chloride [CBSE PMT 1989]

134. The reaction

is the example of [AMU 1983]

135. Olefins can be hydrogenated by [AIIMS 1991]

136. Electrolysis of cold concentrated aqueous solution of potassium succinate yields [CPMT 1985; MP PMT 1986]

137. A hydrocarbon containing 2 carbon atoms gives Sabatier and Senderen's reaction but does not give precipitate with ammoniacal silver nitrate solution. The hydrocarbon in the question is [MADT Bihar 1983]

138. The reaction

[CBSE PMT 1996]

139. What is the product of the reaction of 1, 3-butadiene with Br_2 [Orissa JEE 2003]

140. An alkene given two moles of $HCHO$, one mole of CO_2 and one mole of CH_3COCHO on ozonolysis. What is its structure [Orissa JEE 2003]

- (d) $\text{CH}_2 = \text{C} = \overset{\text{CH}_3}{\underset{|}{\text{C}}} - \text{CH} = \text{CH}_2$
141. In the reaction

$$\text{CH}_3\text{CH} = \text{CH}_2 + \text{H}_2\text{O} + [\text{O}] \xrightarrow[\text{Acid}]{\text{KMnO}_4}$$

$$\text{CH}_3 - \underset{\text{OH}}{\text{CH}} - \underset{\text{OH}}{\text{CH}_2} \xrightarrow{[\text{O}]} \text{X} + \text{HCOOH}$$
X is [MP PMT 2002]
(a) $\text{CH}_3\text{CH}_2\text{COOH}$ (b) CH_3COOH
(c) $\text{CH}_3\text{CH}_2\text{CHO}$ (d) $\text{CH}_3\text{CH}_2\text{OH}$
142. Which of the following alkenes gives only acetic acid and on oxidation with potassium permanganate solution [MP PET 2003]
(a) Ethylene (b) 1-Butene
(c) Propene (d) 2-Butene
143. Butene-1 may be converted to butane by reaction with [AIIEE 2003]
(a) Zn-HCl (b) Sn-HCl
(c) Zn-Hg (d) Pd/H_2
144. The major product formed when propene reacts with HBr in presence of peroxides is [NCERT 1980; CBSE PMT 1989]
(a) *n*-propyl bromide (b) Isopropyl bromide
(c) *n*-propyl alcohol (d) 1, 3-dibromopropane
145. Ethyl hydrogen sulphate is obtained by the reaction of H_2SO_4 on [CPMT 1985]
(a) Ethylene (b) Ethane
(c) Ethyl chloride (d) Ethanol
146. Ethylene reacts with ozone to give [DPMT 1981]
(a) Formaldehyde (b) Ethyl alcohol
(c) Ozonide (d) Acetaldehyde
147. Which of the following aliphatic compounds will discharge red colour of bromine
(a) C_2H_4 (b) C_3H_6
(c) C_4H_8 (d) All of these
148. Chlorination can be done on
(a) $\text{CH}_3 - \text{CH} = \text{CH}_2$ (b) $\text{CH}_2 = \text{CH}_2$
(c) $\text{CH} \equiv \text{CH}$ (d) None of these
149. Addition of HI on the double bond of propene yields isopropyl iodide and not *n*-propyl iodide as the major product. This is because the addition proceeds through [CPMT 1988]
(a) A more stable carbonium ion
(b) A more stable carbanion
(c) A more stable free radical
(d) None of the above being a concerted reaction
150. When butene-1 is mixed with excess of bromine, the expected reaction product is [CPMT 1974; BHU 1980]
(a) 1, 2-dibromobutane (b) 1, 1-dibromobutane
(c) 2, 2-dibromobutane (d) Perbromobutane
151. A compound 'X' on ozonolysis forms two molecules of HCHO . Compound 'X' is [AIIMS 1987; CPMT 1993]
(a) C_2H_4 (b) C_2H_2
- (c) C_2H_6 (d) C_6H_6
152. For the reaction

$$\text{CH}_3 - \text{CH} = \text{CH}_2 + \text{HOCl} \rightarrow \text{A}$$
the product A is [Orissa JEE 2002]
(a) $\text{CH}_3 - \text{CHCl} - \text{CH}_2\text{OH}$
(b) $\text{CH}_3 - \underset{\text{OH}}{\text{CH}} - \text{CH}_2 - \text{Cl}$
(c) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{COCl}$
(d) $\text{CH}_3 - \underset{\text{OH}}{\overset{\text{Cl}}{\text{C}}} - \text{CH}_3$
153. $(\text{CH}_3)_2\text{C} = \underset{\text{CH}_3}{\text{CH}} \xrightarrow[\text{H}_2]{\text{Catalyst}}$ Optical isomers [BHU 2003]
(a) 2 (b) 4
(c) Zero (d) 3
154. Isobutene + $\text{HBr} \xrightarrow{\text{Peroxide}}$ product is [BHU 2003]
(a) Tertiary butyl bromide (b) Isobutyl bromide
(c) Tertiary butyl alcohol (d) Isobutyl alcohol
155. Which of the following represents the given mode of hybridisation sp^2 - sp^2 - sp - sp from left to right [IIT-JEE (Screening) 2003]
(a) $\text{H}_2\text{C} = \text{CH} - \text{C} \equiv \text{CH}$ (b) $\text{HC} \equiv \text{C} - \text{C} \equiv \text{CH}$
(c) $\text{H}_2\text{C} = \text{C} = \text{C} = \text{CH}_2$ (d) $\text{CH}_2 = \text{CH} = \text{CH} = \text{CH}_2$
156. "The negative part of addenda adds on to the carbon atom linked with least number of hydrogen atoms". This statement is called [DPMT 1982; AIIMS 1988; AFMC 2004]
(a) Thiele's principle (b) Bayer's strain theory
(c) Markownikoff's rule (d) Peroxide effect
157. The product obtained, heating ethanol with conc. H_2SO_4 at $165^\circ - 170^\circ$, is [MP PMT 2003]
(a) $(\text{C}_2\text{H}_5)_2\text{SO}_4$ (b) $\text{CH}_2 = \text{CH}_2$
(c) CH_3COOH (d) $\text{C}_2\text{H}_5\text{HSO}_4$
158. Which of the following is the most stable
(a) 1-butene (b) 2-butene
(c) 1-pentene (d) 2-pentene
159. Which doesn't follow Markownikoff's rule [JEE Orissa 2004; MP PMT 2004; BCECE 2005]
(a) $\text{CH}_3 - \text{CH} = \text{CH}_2$
(b) $\text{CH}_3\text{CH} = \text{CHCH}_3$
(c) $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} - \text{CH} = \text{CH}_2$
(d) $\text{CH}_3 - \text{CH}_2 - \text{CH} = \text{CH}_2$
160. The product of acid catalyzed hydration of 2-phenyl propene is [IIT JEE (Screening) 2004]
(a) 3-phenyl-2-propanol (b) 1-phenyl-2-propanol
(c) 2-phenyl-2-propanol (d) 2-phenyl-1-propanol
161. A reagent used to test for unsaturation of allkene is

[BHU 2004]

- (a) conc. H_2SO_4 (b) Ammonical Cu_2Cl_2
(c) Ammonical $AgNO_3$ (d) Solution of Br_2 in CCl_4

162. Propylene on hydrolysis with sulphuric acid forms

[MH CET-2003]

- (a) *n*-propyl alcohol (b) Isopropyl alcohol
(c) Ethyl alcohol (d) Butyl alcohol

163. An alkene, on ozonolysis gives formaldehyde and acetaldehyde. The alkene is :

- (a) Ethene (b) Propene
(c) Butene-1 (d) Butene-2

164. In the reaction, $H_2C = CH_2 \xrightarrow[\text{KMnO}_4]{\text{cold alkaline}} \text{A}$:

Product A is : [Pb. CET 2000]

- (a) Ethylene glycol (b) Acetic acid
(c) Ethane (d) Butyric acid

165. Using anhydrous $AlCl_3$ as catalyst, which one of the following reaction produces ethylbenzene (*PhEt*)

[CBSE PMT 2004]

- (a) $H_2C = CH_2 + C_6H_6$
(b) $H_3C - CH_3 + C_6H_6$
(c) $H_3C - CH_2OH + C_6H_6$
(d) $CH_3 - CH = CH_2 + C_6H_6$

166. Which of these does not follow Anti-Markownikoff's rule

[Orissa JEE 2005]

- (a) 2-butene (b) 1-butene
(c) 2-pentene (d) 2-hexene

167. Reaction of HBr with propene in the presence of peroxide gives

[CBSE PMT 2004]

- (a) Allyl bromide (b) *n*-propyl bromide
(c) Isopropyl bromide (d) 3-bromo propane

168. Which of the following react with $KMnO_4$ but does not react with $AgNO_3$?

[BCECE 2005]

- (a) C_2H_6 (b) CH_4
(c) C_2H_4 (d) C_2H_2

169. 3-Phenylpropene on reaction with HBr gives (as a major product)

[AIIMS 2005]

- (a) $C_6H_5CH_2CH(Br)CH_3$
(b) $C_6H_5CH(Br)CH_2CH_3$
(c) $C_6H_5CH_2CH_2CH_2Br$
(d) $C_6H_5CH(Br)CH = CH_2$

170. Reaction of one molecule of HBr with one molecule of 1,3-butadiene at $40^\circ C$ gives predominantly

- (a) 3-bromobutene under kinetically controlled conditions
(b) 1-bromo-2-butene under thermodynamically controlled conditions
(c) 3-bromobutene under thermodynamically controlled conditions
(d) 1-bromo-2-butene under kinetically controlled conditions

171. The only alcohol that can be prepared by the indirect hydration of alkene is

[AFMC 2005]

- (a) Ethyl alcohol (b) Propyl alcohol
(c) Isobutyl alcohol (d) Methyl alcohol

172. The reaction of HBr with $CH_3 - \overset{\overset{CH_3}{|}}{C} = CH_2$ in the presence of peroxide will give

[BHU 2005]

- (a) CH_3CBrCH_3 (b) $CH_3CH_2CH_2CH_2Br$

- (c) $CH_3\overset{\overset{CH_3}{|}}{CH}CH_2Br$ (d) $CH_3CH_2\overset{\overset{CH_3}{|}}{CH}CH_3$

173. A gas, decolourised by $KMnO_4$ solution but gives no precipitate with ammoniacal cuprous chloride is

[KCET 2005]

- (a) Ethane (b) Methane
(c) Ethene (d) Acetylene

174. Cyclohexene on reaction with OsO_4 followed by reaction with $NaHSO_3$ gives

[Orissa JEE 2005]

- (a) cis-diol (b) trans-diol
(c) epoxy (d) alcohol

Alkyne

1. Which of the following gases is used for welding

[CPMT 1996]

- (a) Methane (b) Ethane
(c) Acetylene (d) Ethene

2. A metallic carbide on treatment with water gives a colourless gas which burns readily in air and which gives a precipitate with ammoniacal silver nitrate solution. Gas evolved is

[NCERT 1975; CPMT 1977; MP PET 2002]

- (a) Methane (b) Ethane
(c) Acetylene (d) Ethylene

3. 1-butyne reacts with cold alkaline $KMnO_4$ to produce

[AIIMS 1997]

- (a) CH_3CH_2COOH
(b) $CH_3CH_2CH_2COOH$
(c) $CH_3CH_2COOH + CO_2$
(d) $CH_3CH_2COOH + HCOOH$

4. Identify the product D in the following series of reaction

[CBSE PMT 1998]

- (a) Methane (b) Alcohol
(c) Acetylene (d) Benzaldehyde

5. The correct order towards bond length is

[RPMT 1997]

- (a) $C - C < C = C < C \equiv C$ (b) $C \equiv C < C = C < C - C$
(c) $C = C < C \equiv C < C - C$ (d) $C = C < C - C < C \equiv C$

6. In the molecule $CH \equiv C - CH = CH_2$, the hybridisation of $C - C$ bond is

[Orissa JEE 2005]

- (a) $sp^2 - sp$ (b) $sp^3 - sp^3$
(c) $sp^2 - sp^2$ (d) $sp^3 - sp$
7. The product formed when acetylene is passed through red hot tube is [BHU 1989; RPMT 2003]
(a) Benzene (b) Cyclohexane
(c) Neoprene (d) Ethane
8. Acetylenic hydrogens are acidic because [CBSE PMT 1989; Pb. PMT 1999]
(a) Sigma electron density of $C-H$ bond in acetylene is nearer to carbon, which has 50% s -character
(b) Acetylene has only one hydrogen on each carbon
(c) Acetylene contains least number of hydrogens among the possible hydrocarbons having two carbons
(d) Acetylene belongs to the class of alkynes with molecular formula C_nH_{2n-2}
9. Which is the most suitable reagent among the following to distinguish compound (iii) from rest of the compounds
(i) $CH_3 - C \equiv C - CH_3$
(ii) $CH_3 - CH_2 - CH_2 - CH_3$
(iii) $CH_3 - CH_2 - C \equiv CH$
(iv) $CH_3 - CH = CH_2$ [CBSE PMT 1989]
(a) Bromine in carbon tetrachloride
(b) Bromine in acetic acid
(c) Alkaline $KMnO_4$
(d) Ammoniacal silver nitrate reagent
10. A hydrocarbon of formula C_6H_{10} absorbs only one molecule of H_2 upon catalytic hydrogenation. Upon ozonolysis, the hydrocarbon yields

$$O = \overset{\overset{H}{|}}{C} - CH_2 - CH_2 - CH_2 - CH_2 - \overset{\overset{H}{|}}{C} = O$$
The hydrocarbon is [MP PMT 1986]
(a) Cyclohexane (b) Benzene
(c) Cyclohexene (d) Cyclobutane
11. Poisonous gas 'Lewissite' is obtained by the reaction of [MP PMT 2003]
(a) $CH \equiv CH$ and $AsCl_3$
(b) $CH_2 = CH_2$ and $AsCl_3$
(c) $CH \equiv CH$ and S_2Cl_2
(d) $CH_2 = CH_2$ and $NOCl$
12. Products of the following reaction

$$CH_3C \equiv CCH_2CH_3 \xrightarrow[(2) \text{ Hydrolysis}]{(1) O_3} \dots\dots \text{are}$$
[CBSE PMT 2005]
(a) $CH_3CHO + CH_3CH_2CHO$
(b) $CH_3COOH + CH_3CH_2CHO$
(c) $CH_3COOH + HOOCCH_2CH_3$
(d) $CH_3COOH + CO_2$
13. By coaltar distillation, which is not obtained [SCRA 1990; MP PMT 1986]
(a) Light oil (b) Middle oil
(c) Heavy oil (d) Mobil oil
14. Hydrocarbon containing following bond is most reactive [AIIMS 1987]
(a) $C \equiv C$ (b) $C = C$
(c) $C - C$ (d) All of these
15. The shapes of methane, ethene and ethyne molecules are, respectively
(a) Tetrahedral, planar and linear
(b) Tetrahedral, linear and planar
(c) Pyramidal, planar and linear
(d) Tetrahedral, pyramidal and planar
16. To synthesize the unsymmetrical alkyne $CH_3 - C \equiv C - CH_2 - CH_3$ the reagents needed would be
(a) Ethene, iodoethane, iodomethane and potassium hydroxide
(b) Acetaldehyde, 1-bromopropane and conc. H_2SO_4
(c) 1, 2-dichloroethane, 1-propanol and alcoholic potassium hydroxide
(d) Ethyne, iodomethane, iodoethane and sodamide
17. When propyne is treated with dilute H_2SO_4 and $HgSO_4$, the major product is [Kurukshetra CEE 2002]
(a) Propanal
(b) Propanol
(c) Propyl hydrogen sulphate
(d) Propanone
18. Which of the following will be the final product when C_2H_2 reacts with HCl [DPMT 1984; AFMC 1982; Bihar MEE 1982]
(a) $\begin{array}{c} CH \\ || \\ CHCl \end{array}$ (b) $\begin{array}{c} CH_3 \\ | \\ CHCl_2 \end{array}$
(c) $\begin{array}{c} CHCl \\ || \\ CHCl \end{array}$ (d) None of these
19. What is the end product of the following sequences of operations $CaC_2 \xrightarrow{H_2O} A \xrightarrow[Hg^{++}]{dil. H_2SO_4} B \xrightarrow[H_2]{Ni} C$ [CPMT 1978; MP PMT 1996]
(a) Methyl alcohol (b) Acetaldehyde
(c) C_2H_5OH (d) C_2H_4
20. $R - CH_2 - CCl_2 - R \xrightarrow{\text{Reagent}} R - C \equiv C - R$
The reagent is [CBSE PMT 1989; MP PET 1995]
(a) Na (b) HCl and H_2O
(c) KOH in C_2H_5OH (d) Zn
21. Acetylene can be prepared from [CPMT 1988]
(a) Potassium fumarate (b) Calcium carbide
(c) Ethylene bromide (d) All of these
22. Acetylene is obtained by the electrolysis of [BHU 1986]
(a) Sodium succinate (b) Potassium fumarate
(c) Both (a) and (b) (d) None of these

23. The compound C_3H_4 has a triple bond, which is indicated by its reaction with [MP PMT 1999]
 (a) Bromine water (b) Bayer's reagent
 (c) Fehling solution (d) Ammonical silver nitrate
24. $CH \equiv CH \xrightarrow[H_2SO_4]{H_2O/Hg^{2+}} X \xrightarrow{LiAlH_4} Y \xrightarrow{P_4/Br_2} Z$ Here Z is [JIPMER 2002]
 (a) Ethylene bromide (b) Ethanol
 (c) Ethyl bromide (d) Ethylidene bromide
25. $CH \equiv CH \xrightarrow[Pressure]{Ni(CN)_2} X$. Here X in the reaction [JIPMER 2002]
 (a) Benzene (b) Ethane
 (c) Cyclooctatetraene (d) Cyclohexane
26. A salt producing hydrocarbon among these compounds is [KCET (Engg.) 2002]
 (a) Ethane (b) Methane
 (c) Ethene (d) Ethyne
27. An unknown compound A has a molecular formula C_4H_6 . When A is treated with an excess of Br_2 a new substance B with formula $C_4H_6Br_4$ is formed. A forms a white precipitate with ammoniacal silver nitrate solution. A may be [MP PET/PMT 1998]
 (a) Butyne-1 (b) Butyne-2
 (c) Butene-1 (d) Butene-2
28. Which of the following reacts with sodium with the elimination of hydrogen [BHU 1983]
 (a) CH_4 (b) C_2H_6
 (c) C_2H_4 (d) C_2H_2
29. Acetylene gives [CPMT 1985]
 (a) White precipitate with $AgNO_3$ and red precipitate with Cu_2Cl_2
 (b) White precipitate with Cu_2Cl_2 and red precipitate with $AgNO_3$
 (c) White precipitate with both the reagents
 (d) Red precipitate with both the reagents
30. The bond length between sp^3 hybridised carbon atom and other carbon atom is minimum in [CBSE PMT 1996; Pb. PMT 1999]
 (a) Propane (b) Butane
 (c) Propene (d) Propyne
31. The C - H bond length is minimum in the bond formed by
 (a) $sp-s$ overlapping (as in alkynes)
 (b) sp^2-s overlapping (as in alkenes)
 (c) sp^3-s overlapping (as in alkanes)
 (d) None of these
32. Which of the C - C bond is strongest
 (a) Formed by sp^3-sp^3 hybridised carbon atoms (as in alkanes)
 (b) Formed by sp^2-sp^2 hybridised carbon atoms (as in alkenes)
 (c) Formed by $sp-sp$ hybridised carbon atoms (as in alkynes)
 (d) All are equal
33. Which of the following pairs has the same bond angle
 (a) Ethane and ethylene (b) Ethylene and acetylene
 (c) Ethylene and benzene (d) Acetylene and benzene
34. The product(s) obtained via oxymercuration ($HgSO_4 + H_2SO_4$) of 1-butyne would be [IIT-JEE 1999]
 (a) $CH_3-CH_2-\overset{\overset{O}{\parallel}}{C}-CH_3$
 (b) $CH_3-CH_2-CH_2-CHO$
 (c) $CH_3-CH_2-CHO + HCHO$
 (d) $CH_3CH_2COOH + HCOOH$
35. A compound is treated with $NaNH_2$ to give sodium salt. Identify the compound [AFMC 1998]
 (a) C_2H_2 (b) C_6H_6
 (c) C_2H_6 (d) C_2H_4
36. A gas decolourises bromine in CCl_4 and forms a precipitate with ammoniacal silver nitrate. The gas is [EAMCET 1998]
 (a) C_2H_2 (b) C_2H_4
 (c) C_2H_6 (d) CH_4
37. Among the following compounds which have more than one type of hybridisation for carbon atom
 (i) $CH_3CH_2CH_2CH_3$
 (ii) $CH_3-CH=CH-CH_3$
 (iii) $CH_2=CH-C \equiv CH$
 (iv) $H-C \equiv C-H$ [EAMCET 1998]
 (a) (ii) and (iii) (b) (ii)
 (c) (iii) and (iv) (d) (iv)
38. The homologue of ethyne is [EAMCET 1998]
 (a) C_2H_4 (b) C_2H_6
 (c) C_3H_8 (d) C_3H_4
39. When acetylene reacts with HCl in the presence of $HgCl_2$, the product is [MNR 1985; MP PET 1996; UPSEAT 2000]
 (a) Methyl chloride (b) Dichloroethane
 (c) Vinyl chloride (d) Ethylidene chloride
40. When propyne reacts with aqueous H_2SO_4 in the presence of $HgSO_4$, the major product is [IIT-JEE 1983; AFMC 1991; KCET 1993]
 (a) Propanal (b) Propyl hydrogen sulphate
 (c) Acetone (d) Propanol
41. Propyne on polymerisation gives [CPMT 1999, 2002]
 (a) Mesitylene (b) Benzene
 (c) Ethyl benzene (d) Propyl benzene
42. When treated with ammoniacal cuprous chloride, which one among the following forms copper derivative [CBSE PMT 1989; MP PMT 1993]
 (a) C_2H_6 (b) C_2H_4

- (c) C_2H_2 (d) C_6H_6
43. Which of the following catalyst is used in the polymerisation of $CH \equiv CH$ to C_6H_6 [CPMT 1999]
 (a) $AlCl_3$ (b) $HgSO_4$
 (c) $NbCl_3$ (d) HCl
44. $KMnO_4$ will oxidise acetylene to [CPMT 1999]
 (a) Ethylene glycol (b) Ethyl alcohol
 (c) Oxalic acid (d) Acetic acid
45. Ethyne on reaction with dil. H_2SO_4 and $Hg(II)$ gives
 (a) Ethanol
 (b) Ethanal
 (c) Methoxymethane
 (d) Ethyl hydrogen sulphate
46. Which of the following is used to distinguish ethylene and acetylene [MP PET 2000; KCET 2000; JIPMER 2000; CPMT 1977; NCERT 1973]
 (a) Alkaline $KMnO_4$
 (b) Bromine water
 (c) Ammoniacal cuprous chloride
 (d) Conc. H_2SO_4
47. The distinguishing test for triple bond containing acidic hydrogen is [JIPMER 2000]
 (a) $Ag(NH_3)_2^+$ (b) Br_2 in CCl_4
 (c) Alkaline $KMnO_4$ (d) $AlCl_3$
48. If acetylene is passed through an electric arc in the atmosphere of nitrogen, the compound formed is [RPMT 1999]
 (a) HCN (b) Pyrrole
 (c) Pyrazole (d) Pyridine
49. Ozonolysis of acetylene gives [RPMT 1999]
 (a) Glycol (b) Glyoxal, formic acid
 (c) Formaldehyde (d) None
50. The bond length between the hybridised carbon atom and other carbon atom is minimum in [Pb. PMT 2000]
 (a) Butane (b) Propyne
 (c) Propene (d) Propane
51. The reaction of propene with $HOCl$ proceeds via the addition of [IIT-JEE (Screening) 2001]
 (a) H^+ in the first step
 (b) Cl^+ in the first step
 (c) OH^- in the first step
 (d) Cl^+ and OH^- in a single step
52. Acetylene reacts with ammonical $AgNO_3$ forming [MH CET 1999; CPMT 1984, 86; MP PMT 1997]
 (a) Silver acetylene (b) Silver acetate
 (c) Metal silver (d) Silver mirror
53. Ethylidene dichloride can be prepared by the reaction of HCl and
 (a) C_2H_4 (b) C_2H_2
 (c) C_2H_5 (d) All of these
54. Which of the following order of reagent is chosen to prepare 1, 3-butadiene from C_2H_2 [RPET 2000]
 (a) $CuCl / NH_4Cl$ and $H_2 / Pd(BaSO_4)$
 (b) $NH_4Cl / CuCl$ and $H_2 / Pd(BaSO_4)$
 (c) $H_2 / Pd(BaSO_4)$ and $CuCl / NH_4Cl$
 (d) $H_2 / Pd(BaSO_4)$ and $NH_4Cl / CuCl$
55. Benzene is the polymer of [RPET 1999; Bihar MEE 1999]
 (a) Methane (b) Ethane
 (c) Ethylene (d) Ethyne
56. $\begin{matrix} CH \\ || \\ CH \end{matrix}$ reacts with acetic acid in presence of Hg^{2+} to give [BHU 2005]
 (a) $\begin{matrix} CH_3 \\ | \\ CH(CH_3COO)_2 \end{matrix}$ (b) $\begin{matrix} CH(CH_3COO)_2 \\ | \\ CH(CH_3COO)_2 \end{matrix}$
 (c) $\begin{matrix} CH_3 \\ | \\ CH_2(CH_3COO) \end{matrix}$ (d) None of these
57. Acetylene is prepared industrially by passing electric discharge through graphite electrodes in the atmosphere of [CPMT 1985]
 (a) Air (b) N_2
 (c) H_2 (d) CO_2
58. When acetylene is passed into dilute sulphuric acid containing Hg^{2+} ions, the product formed is [DPMT 1996; Roorkee 1995; BHU 1998; KCET 1999; MP PET 1985, 86; DCE 1999; DPMT 1999, 2002; CPMT 1975, 82, 83, 90; MP PMT 1994, 97; CBSE PMT 1999; AIIMS 2002; CBSE PMT 1999; KCET (Med.) 1999; JIPMER 1999]
 (a) Acetone (b) Acetic acid
 (c) Acetaldehyde (d) Formaldehyde
59. Which of the following has acidic hydrogen [IIT-JEE 1985, 89; CPMT 1986; Bihar MEE 1997; RPET 1999; AFMC 1999]
 (a) Ethyne (b) Ethene
 (c) Ethane (d) Benzene
60. Xylenes on oxidation with acidic $KMnO_4$ gives [JIPMER 2000]
 (a) Terphthalic acid (b) Phthalic acid
 (c) Isophthalic acid (d) All of these
61. The structure of the product(Z) in the reactions given below $HC \equiv CH \xrightarrow[H^+]{NaNH_2, CH_3COCH_3} X \xrightarrow[H_2O]{Hg^{2+}, H_3O^+} Z$ is [Roorkee 2000]
 (a) $CH_3 - CH_2 - CH_2 - \overset{\overset{O}{||}}{C} - CH_2OH$

[MH CET 1999]

62. Carbon-carbon bond length is minimum in

[CBSE PMT 1988, 91; MNR 1984; CPMT 1989; RPMT 1997; Pb. PMT 2001]

- (a) Ethane (b) Ethene
(c) Ethyne (d) Benzene
(e) Ethanol

63. Triple bond of ethyne is made of or Cylindrical shape of an alkyne is due to

[EAMCET 1978; NCERT 1979; CBSE PMT 1997; Manipal MEE 1995; Bihar MEE 1996]

- (a) Three σ -bonds
(b) Three π -bonds
(c) Two σ and one π -bond
(d) Two π and one σ -bond

64. An organic compound has a triple bond and not double bond. It can be tested by

[MP PMT 2000, 03]

- (a) Bromine water
(b) Bayer's reagent
(c) Fehling solution
(d) Ammonical silver nitrate

65. Which of these will not react with acetylene

[AIEEE 2002; DCE 2002]

- (a) NaOH (b) Ammonical AgNO_3
(c) Na (d) HCl

66. What is the product when acetylene reacts with hypochlorous acid

[RPMT 2002; AIEEE 2002]

- (a) CH_3COCl (b) ClCH_2CHO
(c) Cl_2CHCHO (d) ClCHCOOH

67. The alkene C_6H_{10} producing $\text{OHC}-(\text{CH}_2)_4-\text{CHO}$ on ozonolysis is

[Roorkee 1999]

- (a) Hexene-1 (b) Hexene-3
(c) Cyclohexene (d) 1-methylcyclohexene-1

68. The number of moles of proton which can be easily given by butyne-1 (1 mole) is

[MP PMT 2000]

- (a) 1 (b) 2
(c) 3 (d) 6

69. Which will undergo reaction with ammoniacal AgNO_3

[DPMT 1996]

- (a) $\text{CH}_3 \begin{array}{c} \diagup \\ \diagdown \end{array} \text{CH} - \text{CH}_2 - \text{CH} = \text{CH} - \text{CH}_3$
(b) $\text{CH}_3 - \text{CH} = \text{CH} - \text{C} \equiv \text{CH}$

(e) None

70. Acetylene gas when passed through the 20% H_2SO_4 at 80°C gives acetaldehyde. The catalyst required for this conversion is

- (a) Anhydrous AlCl_3 (b) HgSO_4
(c) Pd (d) Pt

71. Which of the following reactions will yield 2, 2-dibromopropane [MNR 1993; UPSEAT 2001]

- (a) $\text{HC} \equiv \text{CH} + 2\text{HBr} \rightarrow$
(b) $\text{CH}_3\text{C} \equiv \text{CH} + 2\text{HBr} \rightarrow$
(c) $\text{CH}_3\text{CH} = \text{CH}_2 + \text{HBr} \rightarrow$
(d) $\text{CH}_3\text{CH} = \text{CHBr} + \text{HBr} \rightarrow$

72. Which of the following does not give white precipitate with ammoniacal AgNO_3

- (a) $\text{CH} \equiv \text{CH}$ (b) $\text{CH}_3 - \text{C} \equiv \text{CH}$
(c) $\text{CH}_3 - \text{C} \equiv \text{C} - \text{CH}_3$ (d) $\text{CH}_2 - \text{C} \equiv \text{CH}$
 $\quad \quad \quad |$
 $\quad \quad \quad \text{Cl}$

73. $\text{CH} \begin{array}{c} ||| \\ \text{CH} \end{array} \xrightarrow{\text{O}_3 / \text{NaOH}} \text{X} \xrightarrow{\text{Zn} / \text{CH}_3\text{COOH}} \text{Y}$ 'Y' is [AIIMS 1988]

- (a) $\text{CH}_2\text{OH} \begin{array}{c} | \\ \text{CH}_2\text{OH} \end{array}$ (b) $\text{CH}_3\text{CH}_2\text{OH}$
(c) CH_3COOH (d) CH_3OH

74. Which is represented by the formula $\text{C}_n\text{H}_{2n-2}$

[CPMT 1975, 76; EAMCET 1979; MP PET 2003]

- (a) Alkane (b) Alkyne
(c) Alkene (d) None of these

75. What is the major product of the following reaction

[Kerala (Med.) 2003]

76. A compound C_5H_8 which give white ppt. with ammonical AgNO_3 . A give $(\text{CH}_3)_2\text{CHCOOH}$ with hot alcoholic KOH then compound is

[RPMT 2002]

- (a) $\text{CH}_3\text{CH}_2 - \text{CH}_2 - \text{CH} = \text{CH}_2$

- (b) $CH_3 - CH_2 - C \equiv CH$
 (c) $(CH_3)_2CH - C \equiv CH$
 (d) $CH_2 = CH - CH_2 - CH = CH_2$
77. 1, 2-dibromoethane when heated with alcoholic potash gives [Kerala PMT 2004]
 (a) Ethane (b) Acetylene
 (c) Ethylene (d) Methane
 (e) None of these
78. Which of the following is not a member of homologous series [RPMT 2002]
 (a) Ethene (b) 1-butene
 (c) 2-butene (d) 2-butyne
79. The compound formed as a result of potassium permanganate oxidation of ethylbenzene is [MP PET/PMT 1998]
 (a) Benzoic acid (b) Benzyl alcohol
 (c) Benzophenone (d) Acetophenone
80. What is the product when 2-butyne is treated with liquid NH_3 in presence of lithium [Orissa JEE 2003]
 (a) *n*-butane (b) *cis*-2-butene
 (c) *trans*-2-butene (d) 1-butene
81. Distinction in pentene-1 and pentyne-1 is done by [CPMT 1996]
 (a) $[Ag(NH_3)_2]^+$ (b) Conc. H_2SO_4
 (c) HCl (d) Br_2
82. A mixture of ethane, ethene and ethyne is passed through ammoniacal $AgNO_3$ solution. The gases which remain unreacted are [CPMT 1990]
 (a) Ethane and ethene (b) Ethane and ethyne
 (c) Ethene and ethyne (d) Ethane only
83. In its reaction with silver nitrate acetylene shows [MP PET 1999]
 (a) Oxidising property (b) Reducing property
 (c) Basic property (d) Acidic property
84. Simplest alkyne is represented by [CPMT 1974]
 (a) CH (b) CH_2
 (c) C_2H_2 (d) C_2H_4
85. Which of the following bonds is most acidic
 (a) $=C-H$ (b) $-C-H$
 (c) $\equiv C-H$ (d) All are equally acidic
86. The hybridisation in methane, ethene and Ethyne respectively is [CPMT 2003]
 (a) sp^3 , sp^2 and sp (b) sp^3 , sp , sp^2
 (c) sp^2 , sp^3 and sp (d) sp^3 , sp^2 , sp
87. Number of acidic hydrogen atoms in butyne-1 are [MP PET 1986]
 (a) 2 (b) 3
 (c) 1 (d) 4
88. Which of the following shows linear structure [CPMT 2003]
 (a) Ethane (b) Ethene
 (c) Acetylene (d) CCl_4
89. Calcium carbide on reacting with water gives [CBSE PMT 1991; MP PMT 1993, 94; RPMT 2002; J & K 2005]
 (a) Methane (b) Ethane
 (c) Ethene (d) Acetylene
90. Addition of HCN to ethyne in presence of $Ba(CN)_2$ as catalyst gives [AFMC 1991]
 (a) 1, 1-dicyano ethane (b) Ethyl cyanide
 (c) Vinyl cyanide (d) Divinyl cyanide
91. Which compound will react with an aqueous solution of $Ag(NH_3)_2^+ OH^-$ [DPMT 2000]
 (a) $CH_2 = CH_2$ (b) $CH_3 - CH_3$
 (c) $CH_3CH_2C \equiv CH$ (d) $CH_3 - C \equiv C - CH_3$
92. Which of the following give H_2 gas with Na [RPMT 2002]
 (a) CH_4 (b) C_2H_6
 (c) C_2H_4 (d) C_2H_2
93. $CH_3 - C \equiv CH \xrightarrow[Zn/H_2O_2]{O_3}$ Product. Product in above reaction is [RPMT 2003]
 (a) CH_3COOH (b) $HCOOH$
 (c) Both (a) and (b) (d) $CH_3CHO + HCHO$
94. The number of π -bonds in the product formed by passing acetylene through dilute sulphuric acid containing mercuric sulphate is [EAMCET 1997]
 (a) Zero (b) One
 (c) Two (d) Three
95. Which of the following is weakly acidic
 (a) $CH_2 = CH_2$ (b) C_6H_6
 (c) $CH_3 - C \equiv CH$ (d) $CH_3 - C \equiv C - CH_3$
96. Which of the following reactions is shown by alkynes [AMU 1984; RPMT 2000]
 (a) Addition (b) Substitution
 (c) Polymerization (d) All of these
97. Shortest C-C bond length is present in [BVP 2004]
 (a) $CH_3 - CH_2 - CH_3$ (b) $CH_3CH_2CH_2CH_3$
 (c) $CH_2 = CH - CH = CH_2$ (d) $CH \equiv C - C \equiv CH$
98. Acetylene can be obtained by the reaction [MH CET 2004]
 (a) $HCOOK \xrightarrow{\text{electrolysis}}$
 (b) $CHI_3 + 6Ag + CHI_3 \xrightarrow{\Delta}$
 (c) $CH_3CH_2OH \xrightarrow[443^\circ C]{\text{Conc. } H_2SO_4}$
 (d) $Be_2C + H_2O \rightarrow$
99. Which of the following used for the conversion of 2-hexyne into *trans*-2-hexane [IIT JEE (Screening) 2004]
 (a) $H_2 / Pd / BaSO_4$ (b) H_2, PtO_2
 (c) $NaBH_4$ (d) $Li - NH_3 / C_2H_5OH$
100. In which of the following, the bond length between hybridized carbon atom and other carbon atom is minimum [MH CET 2003]
 (a) Propyne (b) Propene

- (c) Butane (d) Propane
101. What happens when a mixture of acetylene and hydrogen is passed over heated Lindlar's catalyst
[Kerala PMT 2004; AIIMS 1987]
- (a) Ethane and water are formed
(b) Ethylene is formed
(c) Acetylene and ethane are formed
(d) None of these
102. In acetylene molecule, the two carbon atoms are linked by
[KCET 2004]
- (a) One sigma bond and two pi bonds
(b) Two sigma bonds and one pi bond
(c) Three sigma bonds
(d) Three pi bonds
103. Which reacts with ammoniacal $AgNO_3$
[Orissa JEE 2005]
- (a) Propyne (b) 2-butyne
(c) 1,3-butadiene (d) Pentene
104. $CH \equiv CH \xrightarrow[H_2SO_4]{HgSO_4} \xrightarrow[H_2O]{CH_3MgBr} \xrightarrow{P/Br_2}$
[DPMT 2005]
- (a) $CH_3CH(Br)CH_3$ (b) $CH_3CH_2CH_2Br$
(c) $CH_2 = CH - Br$ (d) $BrCH = CH - CH_3$
105. Carbide, which reacts with water to give propyne is
[Kerala CET 2005]
- (a) CaC_2 (b) SiC
(c) Mg_2C_3 (d) Al_4C_3
(e) Be_2C
- (c) Elimination (d) Oxidation
5. Coal tar is main source of [DPMT 1984]
- (a) Aromatic compounds
(b) Aliphatic compounds
(c) Cycloalkanes
(d) Heterocyclic compounds
6. Which of the following is not formed by the ozonolysis of o-xylene
- (a) Glyoxal (b) Ethyl glyoxal
(c) Dimethyl glyoxal (d) Methyl glyoxal
7. The number of σ and π bonds in a molecule of benzene is
[MP PMT/PET 1988; BHU 1995; CPMT 1997]
- (a) 6σ and 9π (b) 9σ and 3π
(c) 12σ and 3π (d) 6σ and 6π
8. The ratio of σ and π bonds in benzene is
[CPMT 1991; BHU 1995]
- (a) 2 (b) 4
(c) 6 (d) 8
9. Carbon atoms in benzene molecule are inclined at an angle of
[BHU 1985]
- (a) 120° (b) 180°
(c) $109^\circ 28'$ (d) 60°
10. When benzene is treated with excess of Cl_2 in the presence of I_2 , the end product is
- (a) Monochlorobenzene (b) Trichlorobenzene
(c) Hexachlorobenzene (d) Benzene hexachloride
11. Chemical name of the insecticide gammexene is
[CPMT 1981; MP PET 1995; MP PMT 1996; CBSE PMT 1999; MP PET 1999]
- (a) DDT (b) Benzene hexachloride
(c) Chloral (d) Hexachloroethane
12. Gammexane is obtained from benzene when it reacts with
- (a) Br_2 in bright sunlight (in the absence of a catalyst)
(b) Cl_2 in bright sunlight (in the absence of a catalyst)
(c) CH_3Cl in the presence of anhydrous $AlCl_3$
(d) $COCl_2$ in the presence of anhydrous $AlCl_3$
13. Point out the wrong statement in relation to the structure of benzene
- (a) It forms only one monosubstitution product
(b) The C - C bond distance in benzene is uniformly $1.397 \text{ \AA}$
(c) It is a resonance hybrid of a number of canonical forms
(d) It has three delocalised π - molecular orbitals
14. Which equation represents an example of Friedel-Craft's reaction
[MNR 1993; CPMT 1996]
- (a) $C_6H_6 + C_2H_5Cl \xrightarrow{AlCl_3} C_6H_5C_2H_5 + HCl$
(b) $C_2H_5OH + HCl \xrightarrow{ZnCl_2} C_2H_5Cl + H_2O$
(c) $C_6H_5Cl + CH_3COCl \xrightarrow{AlCl_3} C_6H_5COCH_3 + Cl_2$
(d) $C_2H_5Br + Mg \xrightarrow{Ether} C_2H_5MgBr$
15. The most stable carbonium ion among the following is
[JIPMER 2002; AFMC 2002]
- (a) $C_6H_5^+CHC_6H_5$ (b) $C_6H_5^+CH_2$

Aromatic hydrocarbon

1. The function of anhydrous $AlCl_3$ in the Friedel-Craft's reaction is to
[MNR 1986, 1995; Roorkee 1999; BHU 2001; CPMT 2002; MPPET 2001]
- (a) Absorb water (b) Absorb HCl
(c) To produce electrophile (d) To produce nucleophile
2. Benzene reacts with CH_3COCl in the presence of $AlCl_3$ to give
[DPMT 1983; CBSE PMT 1991]
- (a) C_6H_5Cl (b) C_6H_5COCl
(c) $C_6H_5CH_3$ (d) $C_6H_5COCH_3$
3. Acylation process is preferred than direct alkylation because (by the Friedel-Craft's reaction)
- (a) In alkylation, a poisonous gas is evolved
(b) In alkylation, large amount of heat is evolved
(c) In alkylation, polyalkylated product is formed
(d) Alkylation is very costly
4. Benzene cannot undergo
- (a) Substitution (b) Addition

- (c) $\text{CH}_3\overset{+}{\text{C}}\text{H}_2$ (d) $\text{C}_6\text{H}_5\text{CH}_2\overset{+}{\text{C}}\text{H}_2$
16. The reaction of toluene with chlorine in presence of ferric chloride gives predominantly [IIT-JEE 1986; DCE 2000]
(a) Benzoyl chloride (b) *m*-chlorotoluene
(c) Benzyl chloride (d) *o*- and *p*-chlorotoluenes
17. The product formed when toluene is heated in light with Cl_2 and in absence of halogen carrier is
(a) Benzotrichloride (b) Gammexene
(c) Chlorobenzene (d) None of these
18. Attacking or reactive or electrophilic species in nitration of benzene is **or** In the nitration of benzene with concentrated HNO_3 and H_2SO_4 the attack on ring is made by
[CBSE PMT 1994; MP PET 1996, 2000; Pb. PMT 1998; BHU 2001; BVP 2004; DCE 2003]
(a) NO_2^- (b) NO_2^+
(c) NO_3^- (d) NO_2
19. Which of the following reactions takes place when a mixture of concentrated HNO_3 and H_2SO_4 reacts on benzene at 350K [CPMT 1985]
(a) Sulphonation (b) Nitration
(c) Hydrogenation (d) Dehydration
20. Nitration of benzene by nitric acid and sulphuric acid is [MNR 1989; CPMT 1990; BCECE 2005]
(a) Electrophilic substitution (b) Electrophilic addition
(c) Nucleophilic substitution (d) Free radical substitution
21. Necessary conditions for halogenation are [CPMT 1976]
(a) Cold and dark
(b) Presence of halogen carrier
(c) Both (a) and (b)
(d) None
22. $\text{C}_6\text{H}_6 + \text{CH}_3\text{Cl} \xrightarrow[\text{AlCl}_3]{\text{anhydrous}} \text{C}_6\text{H}_5\text{CH}_3 + \text{HCl}$
is an example of [NCERT 1979; CPMT 1974, 85, 90; Bihar CEE 1995; BHU 1979, 2001; MP PET 1995; MP PMT 1995; KCET 1993; EAMCET 1998; AIIMS 1998; CBSE PMT 2000; AFMC 2000; JIPMER 2000]
(a) Friedel-Craft's reaction (b) Kolbe's synthesis
(c) Wurtz reaction (d) Grignard reaction
23. The reaction of benzene with chlorine in the presence of iron gives [MP PET 1993]
(a) Benzene hexachloride (b) Chlorobenzene
(c) Benzyl chloride (d) Benzoyl chloride
24. Benzene was discovered by [NCERT 1981]
(a) Ramsay (b) Dalton
(c) Faraday (d) Priestley
25. The correct structure of benzene was proposed by [CPMT 1972]
(a) Faraday (b) Davy
(c) Kekule (d) Wohler
26. The centric structure of benzene was proposed by [CPMT 1982, 83, 89]
(a) Dewar (b) Ladenberg
(c) Kekule (d) Armstrong and Baeyer
27. The bond order of individual carbon-carbon bonds in benzene is [IIT-JEE 1981; MP PET 2000]
(a) One (b) Two
(c) Between one and two (d) One and two, alternately
28. Six carbon atoms of benzene are of
(a) One type (b) Two types
(c) Three types (d) Six types
29. On heating a mixture of sodium benzoate and sodalime, the following is obtained [CPMT 1990; AIIMS 1996; MP PET 1999; AFMC 1999]
(a) Toluene (b) Phenol
(c) Benzene (d) Benzoic acid
30. Benzene on treatment with a mixture of conc. HNO_3 and conc. H_2SO_4 at 100°C gives
(a) Nitrobenzene (b) *m*-dinitrobenzene
(c) *p*-dinitrobenzene (d) *o*-dinitrobenzene
31. What is the end product which is obtained on the nitration of toluene [MP PMT/PET 1988]
(a) *o*-nitrotoluene (b) *p*-nitrotoluene
(c) 2, 4-dinitrotoluene (d) 2, 4, 6-trinitrotoluene
32. Which of the following processes is reversible
(a) Halogenation (b) Sulphonation
(c) Nitration (d) None
33. The attacking (electrophilic) species in sulphonation of benzene is [RPMT 1997; CPMT 1999, 2002]
(a) SO_2 (b) SO_3
(c) SO_4^{2-} (d) HSO_3^-
34. Which xylene is most easily sulphonated
(a) Ortho (b) Para
(c) Meta (d) All at the same rate
35. Toluene on oxidation with dilute HNO_3 and alkaline KMnO_4 gives [DPMT 1981]
(a) Benzaldehyde (b) Phenol
(c) Nitrotoluene (d) Benzoic acid
36. Benzene vapour mixed with air when passed over V_2O_5 catalyst at 775K gives [AFMC 1991; CPMT 2001; MP PMT 2003]
(a) Glyoxal (b) Oxalic acid
(c) Maleic anhydride (d) Fumaric acid
37. Most common reactions of benzene (aromatic hydrocarbon) and its derivatives are [DPMT 1984; MP PMT 1989; AFMC 1997; BHU 1996, 98]
(a) Electrophilic addition reactions
(b) Electrophilic substitution reactions
(c) Nucleophilic addition reactions
(d) Nucleophilic substitution reactions
38. Which is most readily nitrated [Roorkee 1992]
(a) Benzene (b) Phenol
(c) Aniline (d) Nitrobenzene
39. *o*, *p*-directing groups are mostly
(a) Activating groups (b) Deactivating groups
(c) Neutral groups (d) None of these
40. Which among the following is the strongest *o*, *p*-directing group [CBSE PMT 1989]
(a) OH (b) Cl
(c) C_6H_5 (d) Br
41. The compound that is most reactive towards electrophilic nitration is [IIT-JEE 1985; AIIMS 1998; MP PET/PMT 1998]
(a) Toluene (b) Benzene
(c) Benzoic acid (d) Nitrobenzene

42. Amongst the following, the compound that can be most readily sulphonated is
[IIT-JEE 1982; MADT Bihar 1995; KCET 2005]
(a) Benzene (b) Nitrobenzene
(c) Toluene (d) Chlorobenzene
43. Which of the following would be least reactive towards bromine
[NCERT 1981]
(a) Nitrobenzene (b) Phenol
(c) Anisole (d) Chlorobenzene
44. Amongst the following, the compound that is nitrated with difficulty is
(a) Benzene (b) Nitrobenzene
(c) Toluene (d) Phenol
45. Select the true statement about benzene from amongst the following [CBSE PMT 1992]
(a) Because of unsaturation benzene easily undergoes addition reactions
(b) There are two types of C - C bonds in benzene molecule
(c) There is a cyclic delocalisation of π electrons in benzene
(d) Monosubstitution of benzene group gives three isomeric substances
46. Anhydrous $AlCl_3$ is used in the Friedel-Craft's reaction because it is [CBSE PMT 1991]
(a) Electron rich
(b) Soluble in ether
(c) Insoluble to chloride and aluminium ions
(d) Electron deficient
47. (i) Chlorobenzene and (ii) benzene hexachloride are obtained from benzene by the reaction of chlorine, in the presence of
(a) (i) Direct sunlight and (ii) anhydrous $AlCl_3$
(b) (i) Sodium hydroxide and (ii) sulphuric acid
(c) (i) Ultraviolet light and (ii) anhydrous $FeCl_3$
(d) (i) Anhydrous $AlCl_3$ and (ii) direct sunlight
48. In Friedel Craft's alkylation, besides $AlCl_3$ the other reactants are [AFMC 1997; CBSE PMT 1999]
(a) $C_6H_6 + CH_3Cl$ (b) $C_6H_6 + CH_4$
(c) $C_6H_6 + NH_3$ (d) $C_6H_6 + CH_3COCl$
49. Nitration of benzene is a [RPMT 1999]
(a) Electrophilic displacement
(b) Electrophilic addition
(c) Nucleophilic addition
(d) Nucleophilic displacement
50. Benzene shows [RPMT 1999]
(a) Substitution (b) Addition
(c) Oxidation (d) All of these
51. Benzene can be obtained in the reaction [RPET 2000; Bihar MEE 1997]
(a) Ethene + 1, 3-butadiene
(b) Trimerisation of ethyne
(c) Reduction of $PhCHO$
(d) All of these
52. Thiophene and benzene are separated by [RPET 2000]
(a) Sulphonation of thiophene
(b) Sulphonation of benzene
(c) Nitration of thiophene
(d) Nitration of benzene
53. Which of the following is a hydrocarbon [AFMC 1992]
(a) Urea (b) Benzene
(c) Ammonium cyanate (d) Phenol
54. Aromatic compounds burn with sooty flame because [BIT 1991]
(a) They have a ring structure of carbon atoms
(b) They have a relatively high percentage of hydrogen
(c) They have a relatively high percentage of carbon
(d) They resist reaction with oxygen of air
55. Among the following compound which one is planar in shape [MP PMT 2000]
(a) Methane (b) Acetylene
(c) Benzene (d) Isobutane
56. Among the following statements on the nitration of aromatic compounds, the false one is [IIT-JEE 1997]
(a) The rate of nitration of benzene is almost the same as that of hexadeuterobenzene
(b) The rate of nitration of toluene is greater than that of benzene
(c) The rate of nitration of benzene is greater than that of hexadeuterobenzene
(d) Nitration is an electrophilic substitution reaction
57. Methyl group attached to benzene can be oxidised to carboxyl group by reacting with [KCET 1993]
(a) Fe_2O_3 (b) $AgNO_3$
(c) $KMnO_4$ (d) Cr_2O_3
58. How is  is widely used [MP PET 2002]
(a) Insecticide (b) Drug
(c) Explosive (d) Dye
59. The compound 'A' when treated with HNO_3 (in presence of H_2SO_4) gives compound 'B' which is then reduced with Sn and HCl to aniline. The compound 'A' is [MP PET 2002]
(a) Toluene (b) Benzene
(c) Ethane (d) Acetamide
60. Which is formed when benzene is heated with chlorine in the presence of sunlight [CPMT 2000; KCET (Med.) 2000; MP PMT 1993; MP PET 2002 AIIMS 1999]
(a) $C_6H_5CCl_3$ (b) $C_6H_5CHCl_2$
(c) $C_6H_5CH_2Cl_2$ (d) $C_6H_6Cl_6$
61. The compound used as an explosive is [Kerala (Engg.) 2002; MP PET 2002; MP PMT 1993]
(a) 2,4, 6-tribromoaniline (b) 1,3, 5-trinitrobenzene
(c) 2,4, 6-trichlorotoluene (d) 1,3, 5-trichlorobenzene
(e) 2,4, 6-trinitrotoluene
62. Adding of Cl_2 to benzene in the presence of $AlCl_3$ is an example of [Bihar MEE 1996]
(a) Addition (b) Halogenation
(c) Substitution (d) Elimination

- (e) None of these
63. What happens when naphthalene balls are put inside kerosene [Kerala (Med.) 2002]
 (a) Precipitates (b) Dissolves upon heating
 (c) Dissolves easily (d) Does not dissolve
 (e) None of these
64. Three fused benzene rings are found in [Kerala (Engg.) 2002]
 (a) Naphthalene (b) Anthracene
 (c) Phenanthroline (d) Triphenyl methane
65. Product obtained after nitration of nitrobenzene is [RPMT 1997]
 (a) TNT (b) 1, 3-dinitrobenzene
 (c) Picric acid (d) 1, 4-dinitrobenzene
66. After ozonolysis of benzene (not hydrolysis), the product is [RPMT 1997; CPMT 1997]
 (a) Benzene triozone (b) Glyoxal
 (c) Ethanediol (d) All of them
67. Which acid will not form hydrocarbon [CPMT 1997]
 (a) Cinnamic acid (b) Isothallic acid
 (c) Salicylic acid (d) Picric acid
68. Catalytic dehydrogenation of *n*-heptane in presence of Cr_2O_3 / Al_2O_3 at 750 K gives [Roorkee 1999]
 (a) iso-heptane (b) 1-heptene
 (c) toluene (d) 2, 3-dimethylpentene-1
69. $C_6H_6 \xrightarrow[H_2SO_4]{HNO_3} X \xrightarrow[FeCl_3]{Cl_2} Y$. In the above sequence Y is [AIIMS 1999]
 (a) 1-nitrochloro benzene (b) 3-nitrochlorobenzene
 (c) 4-nitrochlorobenzene (d) 1,2-nitrochlorobenzene
70. Which of the following has lowest knocking property
 (a) Olefins (b) Straight chain paraffins
 (c) Aromatic hydrocarbons (d) Branched chain paraffins
71. In which of the following, the bond length between carbon and carbon atom is equal [CPMT 1997]
 (a) 2-butene (b) Benzene
 (c) 1-butene (d) 1-propyne
72. Benzene is prepared in laboratory from which one of the following compounds [MP PMT 1996]
 (a) $C_6N_5N_2Cl$ (b) C_6H_5OH
 (c) C_6H_5COONa (d) $C_6H_5SO_3H$
73. Which of the following is not used in Friedel-Crafts reaction [KCET 2000]
 (a) Phenyl acetanilide (b) Bromobenzene
 (c) Benzene (d) Chlorobenzene
74. In chlorination of benzene, the reactive species is [MP PET 2000]
 (a) Cl^+ (b) Cl^-
 (c) Cl_2 (d) Cl_2^-
75. Which of the following having delocalised electron [BCECE 2005]
 (a) Benzene (b) Cyclohexane
 (c) CH_4 (d) C_2H_6
76. Benzene molecule is [MP PET 2001; Pb. PMT 2004]
 (a) Tetrahedral (b) Planar
 (c) Pyramidal (d) Trigonal
77. Pyridine is less basic than triethylamine because
 (a) Pyridine has aromatic character
 (b) Nitrogen in pyridine is sp^2 hybridized
 (c) Pyridine is a cyclic system
 (d) In pyridine, lone pair of nitrogen is delocalized
78. Electrophile in the case of chlorination of benzene in the presence of $FeCl_3$ is [CBSE PMT 1996]
 (a) Cl^+ (b) Cl^-
 (c) Cl (d) $FeCl_3$
79. Which one of the following will undergo meta substitution on monochlorination [AIIMS 1991]
 (a) Ethoxy ethane (b) Chlorobenzene
 (c) Ethyl benzoate (d) Phenol
80. Nitration of toluene takes place at [NCERT 1990]
 (a) *o*-position (b) *m*-position
 (c) *p*-position (d) Both *o*- and *p*-positions
81. Which of the following is not *o*, *p*-directing group
 (a) $-NH_2$ (b) $-OH$
 (c) $-X$ (halogens) (d) $-CHO$
82. Benzene can react with [UPSEAT 2003]
 (a) Br_2 water (b) HNO_3
 (c) H_2O (d) CH_3OH
83. The compound 'A' having formula C_8H_{10} (aromatic) which gives 1 mononitro substitute and 3 nitrosubstitute compound is [DPMT 2002]
 (a) *m*-Xylene (b) *p*-Xylene
 (c) *o*-Xylene (d) Ethyl benzene
84. Catalytic hydrogenation of benzene gives [AIIMS 1996]
 (a) Xylene (b) Cyclohexane
 (c) Benzoic acid (d) Toluene
85. Benzene is obtained from [CPMT 1996]
 (a) Coal tar (b) Plant
 (c) Animal (d) Charcoal
86. The 'middle oil' fraction of coal tar distillation contains [MP PET 2001]
 (a) Benzene (b) Anthracene
 (c) Naphthalene (d) Xylene
87. Lindane can be obtained by reaction of benzene with [DCE 2000]
 (a) CH_3Cl / anhy. $AlCl_3$ (b) Cl_2 / sunlight
 (c) C_2H_5I / anhy. $AlCl_3$ (d) CH_3COCl / $AlCl_3$
88. Which of the following oil is obtained from benzene after fractional distillation of coal tar [BHU 2004]
 (a) Light oil (b) Heavy oil
 (c) Middle oil (d) Anthracene oil
89. Hydrocarbon C_6H_6 decolourise Br_2 water and gives ppt. with ammonical $AgNO_3$. Hydrocarbon can be [MP PET 2004]
 (a) 1, 3, 5 Cyclohexatriene (b) 1, 5 Hexadiyne
 (c) 2, 4 Hexadiyne (d) None
90. Decreasing order of C-C bond length is [JEE Orissa 2004]
 (a) C_2H_4 (b) C_2H_2
 (c) C_6H_6 (d) C_2H_6
 (a) $IV > III > I > II$ (b) $I > II > IV > III$
 (c) $II > I > IV > III$ (d) $IV > I > III > II$

91. Benzene can be obtained by heating either benzoic acid with X or phenol with Y . X and Y are respectively
[KCET 2004]

(a) Zinc dust and soda lime
(b) Soda lime and zinc dust
(c) Zinc dust and sodium hydroxide
(d) Soda lime and copper

92. Order of reactivity of C_2H_6 , C_2H_4 and C_2H_2 is
[MH CET 2004]

(a) $C_2H_6 > C_2H_4 > C_2H_2$ (b) $C_2H_2 > C_2H_6 > C_2H_4$
(c) $C_2H_2 > C_2H_4 > C_2H_6$ (d) All are equally reactive

93. Which of the following yield both alkane and alkene
[AFMC 2004]

(a) Kolbe's reaction (b) Williamson's synthesis
(c) Wurtz reaction (d) Sandmeyer reaction

94. Aromatisation of n -heptane by passing over $(Al_2O_3 + Cr_2O_3)$ catalyst at 773 K gives
[DCE 2004]

(a) Benzene (b) Toluene
(c) Mixture of both (d) Heptylene

95. Amongst the following the most basic compound is
[AIEEE 2005]

(a) Benzylamine (b) Aniline
(c) Acetanilide (d) p -nitroaniline

96. When toluene is treated with $KMnO_4$, what is produced
[AFMC 2005]

(a) Benzene (b) Chlorobenzene
(c) Benzaldehyde (d) Benzoic acid

97. In presence of light & heat toluene chlorinated & react with aqueous $NaOH$ to give
[Kerala CET 2005]

(a) o -Cresol
(b) p -Cresol
(c) Mixture of o -Cresol & p -Cresol
(d) Benzoic acid
(e) 1, 3, 5 trihydroxy toluene

	Primary	Secondary	Tertiary	Quaternary
(a)	6	2	2	1
(b)	2	6	3	0
(c)	2	4	3	2
(d)	2	2	4	3

3. The octane number of a sample of petrol is 40. It means that its knocking property is equal to the mixture of
[MP PMT 2003]

(a) 40% n -heptane + 60% iso -octane
(b) 40% petrol + 60% iso -octane
(c) 60% n -heptane + 40% iso -octane
(d) 60% petrol + 40% iso -octane

4. Formation of 2-butene as major product by dehydration of 2-butanol is according to
[MP PMT 1995]

(a) Markownikoff rule (b) Saytzeff rule
(c) Peroxide effect (d) Anti-Markownikoff rule

5. $CH_3C \equiv CCH_3 \xrightarrow[(ii) H_2O / Zn]{(i) X} CH_3 - \underset{\substack{| \\ O}}{C} - \underset{\substack{| \\ O}}{C} - CH_3$

X in the above reaction is [CPMT 1985; MP PET 1997; Roorkee Qualifying 1998; DPMT 2001]

(a) HNO_3 (b) O_2
(c) O_3 (d) $KMnO_4$

6. Which of the following is Friedel-Craft's reaction
[MP PET 1994]

(a) $C_6H_6 + FeCl_3 + Cl_2 \rightarrow C_6H_5Cl$
(b) $C_6H_5CHO + CH_3CHO + KOH \rightarrow C_6H_5CH = CH - CHO$

(c) $C_6H_6 + CH_3COCl + AlCl_3 \rightarrow C_6H_5 - \overset{\substack{O \\ ||}}{C} - CH_3$
(d) $C_6H_5OH + CHCl_3 + KOH \rightarrow \text{Salicylaldehyde}$

7. Condition for maximum yield of C_2H_5Cl is
[IIT-JEE 1986]

(a) C_2H_6 (excess) + $Cl_2 \xrightarrow{UV \text{ Light}}$
(b) $C_2H_6 + Cl_2 \xrightarrow[\text{Room temp.}]{\text{Dark}}$
(c) $C_2H_6 + Cl_2$ (excess) $\xrightarrow{UV \text{ Light}}$
(d) $C_2H_6 + Cl_2 \xrightarrow{UV \text{ Light}}$

8. When ethyl alcohol is heated with red phosphorus and HI , then which of the following is formed
[Kurukshetra CEE 1998]

(a) C_2H_6 (b) CH_4
(c) C_3H_8 (d) C_2H_4

9. In the Fischer-Tropsch synthesis of petrol..... and are used as the raw materials
[KCET 1998]

(a) H_2 ; CO (b) CH_4 ; H_2
(c) CH_4 ; CH_3OH (d) CH_3OH ; CO

10. Which one of the following reactions is most suitable for the preparation of n -propyl benzene [MP PET/PMT 1998]

(a) Friedel-Craft's reaction (b) Wurtz reaction
(c) Wurtz-Fittig reaction (d) Grignard reaction

11. Propane cannot be prepared from which reaction

Critical Thinking

Objective Questions

1. In the case homologous series of alkanes, which one of the following statements is incorrect [JIPMER 2000]

(a) The members of the series are isomers of each other
(b) The members of the series have similar chemical properties
(c) The members of the series have the general formula C_nH_{2n+2} , where n is an integer
(d) The difference between any two successive members of the series corresponds to 14 unit of relative atomic mass

2. How many primary, secondary, tertiary and quaternary carbons are present in the following hydrocarbon

[DCE 2003]

(d) None of these

12. The reaction

as [MP PMT 2002]

- (a) Wurtz reaction (b) Koch reaction
-
- (c) Clemmensen reduction (d) Kolbe's reaction

13. The compound $\text{CH}_3 - \underset{\text{CH}_3}{\text{C}} = \text{CH} - \text{CH}_3$ on reaction with NaIO_4 in the presence of KMnO_4 gives [CBSE PMT 2003]

- (a)
- $\text{CH}_3\text{CHO} + \text{CO}_2$
-
- (b)
- CH_3COCH_3
-
- (c)
- $\text{CH}_3\text{COCH}_3 + \text{CH}_3\text{COOH}$
-
- (d)
- $\text{CH}_3\text{COCH}_3 + \text{CH}_3\text{CHO}$

14. In the reaction :

'X' is

- (a)
- Ag_2C
- (b)
- Ag_2C_2
-
- (c)
- AgC
- (d)
- AgOH

15. Naphthalene is a/an [AFMC 2004]

- (a) Ionic solid (d) Covalent solid
-
- (c) Metallic solid (d) Molecular solid

16. Which of the following is not aromatic [Pb. CET 2000]

- (a) Benzene (b) Naphthalene
-
- (c) Pyridine (d) 1,3,5 heptatriene

17. Acetylene reacts with HCN in the presence of $\text{Ba}(\text{CN})_2$ to yield [UP SEAT 2004]

- (a) 1, 1-dicyanoethane (b) 1, 2-dicyanoethane
-
- (c) Vinyl cyanide (d) None of these

18. Write the products of the addition reaction [Kerala (Med.) 2002]

19. Formation of polyethylene from calcium carbide takes place as follows

The amount of polyethylene obtained from 64.1 kg CaC_2

is

[AIIMS 1997]

(a) 7 kg (b) 14 kg

(c) 21 kg (d) 28 kg

20. Nitrobenzene can be prepared from benzene by using a mixture of conc. HNO_3 and conc. H_2SO_4 . In the nitrating mixture, HNO_3 acts as a [IIT-JEE 1997]

- (a) Base (b) Acid
-
- (c) Reducing agent (d) Catalyst

21. A group which deactivates the benzene ring towards electrophilic substitution but which directs the incoming group principally to the *o*- and *p*-positions is [Pb. PMT 1998]

- (a)
- $-\text{NH}_2$
- (b)
- $-\text{Cl}$
-
- (c)
- $-\text{NO}_2$
- (d)
- $-\text{C}_2\text{H}_5$

22. Which order is correct for the decreasing reactivity to ring monobromination of the following compounds

I

II

III

IV

- (a)
- $I > II > III > IV$
- (b)
- $I > III > II > IV$
-
- (c)
- $II > III > IV > I$
- (d)
- $III > I > II > IV$

23. Benzene is obtained by [DPMT 2002]

- (a) Substitution of three acetylene molecules
-
- (b) Addition of three
- C_2H_2
- molecules
-
- (c) Polymerisation of three
- C_2H_2
- molecules
-
- (d) Condensation of three
- C_2H_2
- molecules

24. Toluene can be oxidised to benzoic acid by [AIIMS 1999]

- (a)
- KMnO_4
- (b)
- $\text{K}_2\text{Cr}_2\text{O}_7$
-
- (c)
- H_2SO_4
- (d) Both (a) and (b)

25. $\text{CaC}_2 + \text{H}_2\text{O} \rightarrow \text{A} \xrightarrow{\text{H}_2\text{SO}_4 / \text{HgSO}_4} \text{B}$. Identify A and B in the given reaction [CPMT 2000; BVP 2004]

- (a)
- C_2H_2
- and
- CH_3CHO
- (b)
- CH_4
- and
- HCOOH
-
- (c)
- C_2H_4
- and
- CH_3COOH
- (d)
- C_2H_2
- and
- CH_3COOH

26. The compound X on reaction with $\text{HgSO}_4 + \text{H}_2\text{SO}_4$ gives Y which on oxidation gives acetic acid. X is [MP PMT 1999]

- (a)
- C_2H_2
- (b)
- C_2H_4
-
- (c)
- C_3H_4
- (d)
- C_4H_6

27. What is formed when calcium carbide react with heavy water [CPMT 1999]

- (a)
- C_2D_2
- (b)
- CaD_2
-
- (c)
- CaD_2O
- (d)
- CD_2

28. The addition of HBr is easiest with [MP PMT 2000]

- (a)
- $\text{ClCH}_2 = \text{CHCl}$
- (b)
- $\text{ClCH} = \text{CHCl}$
-
- (c)
- $\text{CH}_3 - \text{CH} = \text{CH}_2$
- (d)
- $(\text{CH}_3)_2\text{C} = \text{CH}_2$

29. Identify the species X in the reaction :

- (a) Acetone (b) Acetaldehyde
-
- (c) Isopropanol (d) Acetic acid

30. In benzene 1, 3 position is called

- (a) Meta (b) Para
-
- (c) Ortho (d) Odd position

31. Which of the following is formed as a result of biological oxidation of benzene in the body of the dog [Manipal MEE 1995]

- (a) Acrylic acid (b) Cinnamic acid
(c) Maleic acid (d) Gluconic acid
32. When acetylene is reacted with HBr , we get [CPMT 1979; JIPMER 2002]
(a) Methyl bromide (b) Ethyl bromide
(c) Ethylene bromide (d) Ethylidene bromide
33. The only *o*, *p*-directing group which is deactivating in nature is
(a) $-NH_2$ (b) $-OH$
(c) $-X$ (halogens) (d) $-R$ (alkyl groups)
34. Which kind of isomerism will butene-2 show
(a) Geometrical (b) Optical
(c) Position (d) None of these
35. In presence of light toluene on reaction with chlorine gives [RPET 1999]
(a) Benzoyl chloride (b) Ortho chlorotoluene
(c) Para chloro toluene (d) Benzyl chloride
36. If ethylene, carbon monoxide and water is heated at high temperature, which of the following is formed [AIIMS 2000]
(a) $C_4H_8O_2$ (b) C_2H_5COOH
(c) CH_3COOH (d) $CH_2 = CH - COOH$
37. Compound C_6H_{12} is an [AMU 1983]
(a) Aliphatic saturated compound
(b) Alicyclic compound
(c) Aromatic compound
(d) Heterocyclic compound
38. Identify Z in the following series

$$CH_2 = CH_2 \xrightarrow{HBr} X \xrightarrow{\text{Hydrolysis}} Y \xrightarrow[I_2 \text{ excess}]{Na_2CO_3} Z$$
 [AIIMS 1983; RPMT 1999]
 (a) C_2H_5I (b) C_2H_5OH
 (c) CHI_3 (d) CH_3CHO
39. *n*-pentane and iso pentane can be distinguished by [BVP 2004]
(a) Br_2 (b) O_3
(c) conc. H_2SO_4 (d) $KMnO_4$
40. $CH \equiv CH + HBr \rightarrow X$, product X is [Pb. CET 2003]
(a) Ethylene bromide (b) Vinyl bromide
(c) Bromo ethane (d) Ethyldiene bromide

Assertion & Reason

For AIIMS Aspirants

1. Assertion : 1-Butene on reaction with HBr in the presence of a peroxide produces 1-bromo-butane.
Reason : It involves the free radical mechanism. [IIT-JEE (Screening) 2000]
2. Assertion : Addition of Br_2 to 1-butene gives two optical isomers.
Reason : The product contains one asymmetric carbon. [IIT 1998]
3. Assertion : Cyclobutane is less stable than cyclopentane
Reason : Presence of bent bonds causes "loss of orbital overlap". [AIIMS 1996]
4. Assertion : Pyrrole is an aromatic heterocyclic compound.
Reason : It has a cyclic, delocalised 6π electrons. [AIIMS 1995]
5. Assertion : CH_4 does not react with Cl_2 in dark.
Reason : Chlorination of CH_4 takes place in sunlight. [AIIMS 2001]
6. Assertion : Alkyl benzene is not prepared by Friedel-Crafts alkylation of benzene.
Reason : Alkyl halides are less reactive than acyl halides. [AIIMS 2003]
7. Assertion : 2-Bromobutane on reaction with sodium ethoxide in ethanol gives 1-butene as a major product. [AIIMS 2004]
Reason : 1-Butene is more stable than 2-butene.
8. Assertion : Styrene on reaction with HBr gives 2-bromo-2-phenyl-ethane.
Reason : Benzyl radical is more stable than alkyl radical. [AIIMS 2004]
9. Assertion : Melting point of *n*-butane is higher than propane.
Reason : It is called oscillation effect.
10. Assertion : Iodination of alkanes is reversible.
Reason : Iodination is carried out in presence of iodic acid.
11. Assertion : Isobutane on oxidation with $KMnO_4$ gives tert-butyl alcohol.
Reason : Oxidising agents have no effect on alkanes.
12. Assertion : Halogenation of alkanes is catalysed by tetraethyl lead.
Reason : Halogenation proceeds through free radical mechanism.
13. Assertion : Neopentane forms only one monosubstituted compound.
Reason : Neopentane has high bond energy.
14. Assertion : Freezing point of neopentane is more than *n*-pentane.
Reason : Increase in Van der Waals forces increases freezing point.
15. Assertion : Knocking lowers the efficiency of the engine.
Reason : Fuel with minimum knocking property is preferred.
16. Assertion : The presence of Ag^+ enhances the solubility of alkenes in water.
Reason : Alkenes are weakly polar in nature.
17. Assertion : 2-Butanol on heating with H_2SO_4 gives 1-butene and 2-butene.
Reason : Dehydration of 2-butanol follows saytzeff rule.

1. Assertion : 1-Butene on reaction with HBr in the presence of a peroxide produces 1-bromo-butane.
Reason : It involves the free radical mechanism. [IIT-JEE (Screening) 2000]
2. Assertion : Addition of Br_2 to 1-butene gives two optical isomers.

- 18.** Assertion : Ethene on treating with Br_2 in presence of $NaCl$ forms CH_2ClCH_2Br and CH_2Br-CH_2-Br .
Reason : This addition involves the formation of free radicals.
- 19.** Assertion : Straight chain alkanes have very low octane number.
Reason : Quality of gasoline is measured in terms of octane number.
- 20.** Assertion : Corey-House reaction can be used to prepare both symmetrical and unsymmetrical alkanes.
Reason : The reaction involves the interaction between lithium dialkyl copper with an alkyl halide both of which may contain even or odd number of carbon atoms.
- 21.** Assertion : All the hydrogen atoms in $CH_2 = C = CH_2$ lie in one plane.
Reason : All the carbon atoms in it are sp^2 hybridized.
- 22.** Assertion : Propene reacts with HBr in presence of benzoyl peroxide to yield 2-bromopropane.
Reason : In presence of peroxide, the addition of HBr to propene follows ionic mechanism.
- 23.** Assertion : Acetylene reacts with sodamide to evolve H_2 gas.
Reason : Acetylene is a weaker acid than ammonia.
- 24.** Assertion : Aryl halides are less reactive towards substitution of halogen atom.
Reason : Halogens are o, p – directing in nature.
- 25.** Assertion : Benzene is a solvent for the Friedel Craft's alkylation of bromobenzene.
Reason : Friedel Craft's reaction is used to introduced on alkyl or acyl group in benzene nucleus.
- 26.** Assertion : Benzene removes a butter stain from a table cloth.
Reason : Butter has an affinity towards benzene.
- 27.** Assertion : Nitration of toluene is easier than benzene.
Reason : The methyl group in toluene is electron-releasing.
- 28.** Assertion : Benzene forms benzene sulphonic acid with fuming H_2SO_4 at high temperature.
Reason : The attacking species is SO_3 .
- 29.** Assertion : Activating groups are electron donors.
Reason : Nitroso group is activating group.
- 30.** Assertion : Benzene reacts with CH_3COCl to give chlorobenzene.
Reason : Chlorination is an electrophilic substitution reaction.
- 31.** Assertion : Conjugated polyenes containing odd number of carbon atoms is known as annulenes.
Reason : General formula of annulenes is $(CH = CH)_n$ where $n = 2, 3, 4$ etc.

- 32.** Assertion : Tropylium cation is aromatic in nature

- Reason : The only property that determines its aromatic behaviour is its planar structure.
- 33.** Assertion : [10] Annulene is not aromatic though it contains Huckel number of π -electrons.
Reason : Steric interaction between internal hydrogens makes it non-planar.
- 34.** Assertion : Rates of nitration of benzene and hexadeuterobenzene are different.
Reason : $C-H$ bond is stronger than $C-D$ bond
- 35.** Assertion : Cyclopentadienyl anion is much more stable than allyl anion.
Reason : Cyclopentadienyl anion is aromatic in character.

Answers

Alkane

Answers and Solutions

Alkane

- 3.** (a) According to wurtz reaction.

5. (b) $2CH_3COONa + 2H_2O \xrightarrow{\text{Electrolysis}}$
Sodium acetate

6. (c) $Pb(C_2H_5)_4 \xrightarrow{\text{heat}} Pb + 4CH_3CH_2$
Ethylradical

9. (d) $C_2H_5I + 2Na + IC_2H_5 \xrightarrow[\text{Ether}]{\text{Dry}} C_2H_5 - C_2H_5 + 2NaI$
Butane

10. (c) $(CH_3)_3CH \xrightarrow{KMnO_4} (CH_3)_3C - OH$
tertiary butylalcohol

13. (c) $RCl + 2Na + RCl \xrightarrow[\text{Ether}]{\text{Dry}} 2NaCl + R - R$
Alkane

14. (d) *iso*-octane i.e. 2,2,4-trimethyl pentane has highest octane number.
17. (b) With calculated amount of Grignard reagent, acetyl chloride forms ketones.

18. (d) CH_4 is tetrahedral

sp^3 hybridization
(tetrahedral)

22. (b) Ethane is a saturated compound it can not be catalytically hydrogenated.
25. (a) Branched hydrocarbons are more desirable because they are more volatile.
26. (d) $\text{CH}_4 \xrightarrow{\text{Cl}_2} \text{CH}_3\text{Cl} \xrightarrow{\text{Cl}_2} \text{CH}_2\text{Cl}_2 \xrightarrow{\text{Cl}_2} \text{CHCl}_3 \xrightarrow{\text{Cl}_2} \text{CCl}_4$. Since this reaction takes place by free radical mechanism. Hence, there is a possibility of formation of ethane.

28. (c) $\text{Al}_4\text{C}_3 + 6\text{H}_2\text{O} \rightarrow 3\text{CH}_4 + 2\text{Al}_2\text{O}_3$
- Aluminium carbide Methane

31. (a) $\text{C}_2\text{H}_5\text{O} \begin{matrix} \text{H} \\ | \\ \text{H} \end{matrix} + \text{CH}_3 \begin{matrix} \text{H} \\ | \\ \text{H} \end{matrix} \xrightarrow{\text{Mg} - \text{Br}} \text{CH}_4 + \text{Mg} \begin{matrix} \text{Br} \\ \diagup \\ \text{OC}_2\text{H}_5 \end{matrix}$

32. (a) $\text{CH}_3\text{I} + 2\text{H} \xrightarrow{\text{Zn/HCl}} \text{CH}_4 + \text{HI}$
- $\text{CH}_3\text{I} + 2\text{Na} + \text{ICH}_3 \xrightarrow[\text{Ether}]{\text{Dry}} \text{CH}_3 - \text{CH}_3 + 2\text{NaI}$

36. (a) Solvent for fat, oil, varnish and rubber
37. (d) Synthetic dyes, drugs, perfumes all are made from coal tar.
38. (a) In alkanes, hybridization is sp^3 . Hence bond angle is $109^\circ.5'$.

39. (d) $2\text{CH}_3\text{COONa} + 2\text{H}_2\text{O} \xrightarrow{\text{Electrolysis}} \text{CH}_3 - \text{CH}_3 + 2\text{CO}_2 + 2\text{NaOH} + \text{H}_2$

41. (b) $\text{CH}_3 - \text{CH}_2 - \text{COOH} + 6\text{HI} \xrightarrow{\text{Red P}} \text{CH}_3 - \text{CH}_2 - \text{CH}_3 + 2\text{H}_2\text{O} + 3\text{I}_2$
- Propanoic acid Propane

42. (d) $\text{C}_2\text{H}_5\text{I} + 2\text{Na} + \text{C}_3\text{H}_7\text{I} \xrightarrow[\text{Ether}]{\text{Dry}} \text{C}_2\text{H}_5 - \text{C}_3\text{H}_7 + 2\text{NaI}$
- Pentane
- $\text{C}_2\text{H}_5\text{I} + 2\text{Na} + \text{C}_2\text{H}_5\text{I} \xrightarrow[\text{Ether}]{\text{Dry}} \text{C}_2\text{H}_5 - \text{C}_2\text{H}_5 + 2\text{NaI}$
- Butane
- $\text{C}_3\text{H}_7\text{I} + 2\text{Na} + \text{C}_3\text{H}_7\text{I} \xrightarrow[\text{Ether}]{\text{Dry}} \text{C}_3\text{H}_7 - \text{C}_3\text{H}_7 + 2\text{NaI}$
- Hexane

48. (d) Cyclohexane, is immiscible and lighter than water. Hence, floats on the surface of water.
49. (a) Methane is the main component of natural gas.
53. (a) *Pt/Ni* is used in catalytic reduction of hydrocarbon.

55. (a) Fractional distillation is used because the difference between the boiling point of different component is less.

56. (d) $\text{CH}_3 - \text{CH}_2 - \text{Cl} + \text{KOH} \xrightarrow{(\text{alc.})} \text{CH}_2 = \text{CH}_2 + \text{KCl} + \text{H}_2\text{O}$
- Ethene

In presence of alc. *KOH* dehydrohalogenation occur and alkene is formed.

57. (b) Liquefied petroleum gas is a mixture of ethane, propane and butane. The main component is butane.

58. (d) $\text{CH}_4 + \text{O}_2 \xrightarrow[\text{Limited supply of air}]{\Delta} \text{C} + 2\text{H}_2\text{O}$

It contains 98-99% carbon. It is used in making black ink, paints and shoe polishes.

59. (b) Tetraethyl lead is anti-knocking agent it increases the octane no. of the fuel.

60. (a) *n*-hexane because it is linear therefore strong Vander Waal force.

61. (b) Knocking - Sudden and irregular burning of the fuel mixture causing jerks against the piston and gives rise to violent sound. This is known as knocking.

63. (b) *n*-octane

- Boiling point depends on molecular mass. Greater the molecular mass higher will be the boiling point.
- Boiling point also depends on the structure. If two compounds have same molecular mass then straight chain or linear compound has higher boiling point.

64. (c) $2\text{CH}_3\text{COOK} + 2\text{H}_2\text{O} \xrightarrow{\text{Electrolysis}} \text{CH}_3 - \text{CH}_3 + 2\text{CO}_2 + 2\text{KOH} + \text{H}_2$
- Potassium acetate Anode Cathode

65. (c) Ethane does not decolourise bromine solution because it is a saturated compound.

66. (b) $\text{CH}_3\text{COONa} + \text{NaOH} \xrightarrow{\text{CaO}} \text{CH}_4 + \text{Na}_2\text{CO}_3$
- Sodium acetate Methane

68. (b) Octane number is related to the percentage of *iso*-octane since *iso*-octane is 81% hence octane number is 81%.

70. (c) $2\text{CH}_3\text{COOK} + 2\text{H}_2\text{O} \xrightarrow{\text{Electrolysis}} \underbrace{2\text{CO}_2 + \text{CH}_3 - \text{CH}_3}_{\text{Anode}} + \underbrace{2\text{KOH} + \text{H}_2}_{\text{Cathode}}$

71. (b) $\text{CH}_3 - \underset{\text{CH}_3}{\text{C}} = \text{CH}_2 + \text{HCl} \rightarrow \text{CH}_3 - \underset{\text{CH}_3}{\overset{\text{Cl}}{\text{C}}} - \text{CH}_3$
- $\text{CH} \equiv \text{CH} + \text{HCl} \rightarrow \text{CH}_2 = \text{CH} - \text{Cl} \xrightarrow{\text{HCl}} \text{CH}_3 - \text{CHCl}_2$

72. (a) Boiling point of alkanes increases with the number of carbon atoms because surface area increases which increases the Vander Waal forces.

74. (c) The enthalpy of combustion i.e., ΔH is always negative. It means combustion is an exothermic reaction.

78. (c) $\text{CH}_3\text{CH}_2\text{COONa} + \text{NaOH} \xrightarrow{\text{CaO}} \text{C}_2\text{H}_6 + \text{Na}_2\text{CO}_3$

79. (a) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_3 + \text{Br}_2 \xrightarrow[130^\circ\text{C}]{\text{Light}} \text{CH}_3 - \underset{\text{Br}}{\text{CH}} - \text{CH}_2 - \text{CH}_3 + \text{CH}_3 - \text{CH}_2 - \underset{\text{Br}}{\text{CH}} - \text{CH}_3$
- 2-Bromo butane (Main product) 1-Bromo butane (Minor)

2-Bromobutane is the main product because

2° carbonium ion is more stable than 1° .

80. (c) $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3 \xrightarrow{\text{Cracking}}$
 $n\text{-Butane}$
 $\text{CH}_4 + \text{CH}_3 - \text{CH} = \text{CH}_2$
83. (d) Anti-knocking properties of fuel increases.
84. (a) $\text{C}_6\text{H}_{14} \xrightarrow{\Delta} \text{C}_4\text{H}_{10} + \text{C}_2\text{H}_2$
 Hexane Butane Ethene
 Liquid Gas
87. (a) Compounds having active hydrogen ($\text{ROH}, \text{H}_2\text{O}, \text{R}-\text{NH}_2$) can form alkane when treated with Grignard's reagent
 $\text{CH}_3\text{CH}_2\text{OH} + \text{CH}_3\text{MgBr} \rightarrow \text{CH}_4 + \text{Mg} \begin{smallmatrix} \text{Br} \\ \text{OCH}_2\text{CH}_3 \end{smallmatrix}$
91. (a) It is not possible to prepare CH_4 by wurtz reaction.
92. (b) Octane number is the percentage by volume of iso-octane in the mixture of iso-octane and n -heptane which has the same antiknocking properties as the fuel under examination.
 Given fuel (25% n -heptane + 75% iso-octane) Hence, octane number = 75 (because iso octane is 75%)
93. (c) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{Br} \xrightarrow{\text{C}_2\text{H}_5\text{ONa}}$
 Dehydro halogenation
 $\text{CH}_3 - \text{CH} = \text{CH}_2 + \text{HBr}$
94. (a) % of hydrogen = $\frac{\text{Mass of hydrogen}}{\text{Mass of compound}} \times 100$
 $\text{CH}_4 = \frac{4}{16} \times 100 = 25\%$
95. (c) Molecular mass can be obtained by the victor mayer process
 Molecular mass = $\frac{\text{Weight}}{\text{Vml.}} \times 22400$
 $= \frac{11}{5600} \times 22400 = 44$
97. (a) $\text{CH}_3 - \underset{\text{Br}}{\text{CH}} - \underset{\text{Br}}{\text{C}} - \text{CH}_2 - \text{CH}_3 + \text{Zn} \rightarrow$
 2,3-dibromo -3-methyl pentane
 $\text{CH}_3 - \text{CH} = \text{C} - \text{CH}_2 - \text{CH}_3 + \text{ZnBr}_2$
 $\text{HI} + \downarrow \text{Red P (Reduction)}$
 $\text{CH}_3 - \text{CH}_2 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \text{CH}_3$
 3-Methylpentane
98. (d) Gasoline, kerosene oil, diesel
99. (a) $\text{CH}_3 - \text{CH}_2 - \text{COONa} \xrightarrow[\Delta]{\text{Soda lime}} \text{CH}_3 - \text{CH}_3$
100. (d) Gasoline or petrol composition $\text{C}_7 - \text{C}_{12}$.
101. (c) $\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}$
 Methane
 $\text{C}_2\text{H}_4 + 3\text{O}_2 \rightarrow 2\text{CO}_2 + 2\text{H}_2\text{O}$
 Ethene
 All hydrocarbons saturated or unsaturated on complete combustion always produce CO_2 and H_2O .
102. (a) Free rotation around carbon-carbon bond takes place easily in alkanes. Now ethane and hexachloroethane both are alkanes. But in hexachloroethane bulky chlorine atom hinders the rotation. Therefore least hindered rotation takes place in ethane.
103. (a) Hydrocarbons on complete oxidation produce CO_2 and water
 $\text{CH}_3 - \text{CH}_3 + 3\frac{1}{2}\text{O}_2 \rightarrow 2\text{CO}_2 + 3\text{H}_2\text{O}$
104. (b) $\text{C}_{10}\text{H}_{22} \xrightarrow[900\text{K}]{\text{Cracking}} \text{C}_4\text{H}_8 + \text{C}_6\text{H}_{14}$
 Decane Butane Hexane
106. (b) $\text{CH}_3 - \underset{\text{CH}_3}{\overset{\text{CH}_3}{\text{C}}} - \text{CH}_3$
 Replaceable hydrogen atoms are present only on 4 primary carbon atoms. Hence, it gives only are monochloro Substituted product.
107. (d) $\text{CH}_3\text{COONa} + \text{NaOH} \xrightarrow{\text{CaO}} \text{CH}_4 + \text{Na}_2\text{CO}_3$
 Sod. acetate
 $\text{CH}_3\text{I} + 2\text{H} \xrightarrow{\text{Reduction}} \text{CH}_4 + \text{HI}$
 Iodomethane
 $\text{Al}_4\text{C}_3 + 6\text{H}_2\text{O} \rightarrow 3\text{CH}_4 + 2\text{Al}_2\text{O}_3$
 Aluminiumcarbide
108. (c) Acetylene reacts with ammonical cuprous chloride to form red ppt. of copper acetylide while methane and ethylene do not react (since they do not have acidic hydrogen) They come out from the bottle
 $\text{CH} \equiv \text{CH} + 2[\text{Cu}(\text{NH}_3)_2]\text{OH} \rightarrow$
 $\text{Cu} - \text{C} \equiv \text{C} - \text{Cu} + 4\text{NH}_3 + 2\text{H}_2\text{O}$
 $\text{CH}_4 + \text{Ammonical } \text{Cu}_2\text{Cl}_2 \rightarrow \text{No reaction}$
 $\text{C}_2\text{H}_4 + \text{Ammonical } \text{Cu}_2\text{Cl}_2 \rightarrow \text{No reaction}$
110. (b) Alkanes do not give addition reactions because multiple bond is absent.
111. (a) $\text{C}_6\text{H}_{14} \xrightarrow[\Delta]{\text{Pyrolysis}} \text{C}_2\text{H}_4 + \text{C}_4\text{H}_{10}$
 Hexane Ethene Butane
113. (d) In gemdihalide both the halogen atoms are present on the same carbon atom while in vicdihalide both the halogen atoms are present on adjacent carbon atoms.
 $\text{CH}_3 - \underset{\text{Gemdihalide}}{\text{CHBr}_2} \quad \text{CH}_2 - \underset{\text{vic-dihalide}}{\text{CH}_2}$
 $\text{Br} \quad \text{Br} \quad \text{Br} \quad \text{Br}$
114. (b) $\text{H}_3\text{C} - \text{H}_2\text{C} - \underset{\text{2,3,3,3-tetramethylpentane}}{\overset{\text{CH}_3}{\text{C}}} - \underset{\text{CH}_3}{\text{C}} - \text{CH}_3$
 $\text{H}_3\text{C} - \text{H}_2\text{C} - \underset{\text{isopropyl group 2-methylpentane}}{\overset{\text{CH}_3}{\text{C}}} - \text{HC} - \text{CH}_3$
 $\text{H}_3\text{C} - \text{H}_2\text{C} - \underset{\text{2,2,3-trimethylpentane}}{\overset{\text{CH}_3}{\text{C}}} - \underset{\text{CH}_3}{\text{C}} - \text{CH}_3 \quad \text{H}_3\text{C} - \text{H}_2\text{C} - \underset{\text{3,3-dimethylpentane}}{\overset{\text{CH}_3}{\text{C}}} - \text{CH}_2 - \text{CH}_3$
116. (d) All-butane, Ethane and Propane are possible in this reaction.
118. (c) Formation of branches in the chain of C atoms
 $\text{C} - \text{C} - \text{C} - \text{C}$ straight chain
 $\text{C} - \text{C} - \text{C}$
 $\quad \quad \quad \text{C}$ Branched chain
119. (c) Chlorination of alkane in photochemical reaction which takes place by free radical mechanism. Free radicals are formed by homolytic bond fission or homolysis.

Alkene

5. (a) Alkenes are unsaturated hydrocarbon having double bond so generally gives addition reaction.

6. (d) According to markownikoff's rule.

13. (a) Methane can not be obtained by Sabatier and Sendern's reaction because in this the product obtained contain minimum two carbon atoms.

Anti-markownikoff's rule is not applicable to symmetrical alkenes.

22. (d) Octane number increases in the order
Straight chain alkanes < Branched chain alkanes < Olefins < Cyclo alkanes < Aromatic compounds
Since, straight chain alkane has minimum octane number. Hence, it produces maximum knocking.

The reaction is dehydrohalogenation.

- 35.** (c) Oil are unsaturated esters which are converted into fats by saturating it by catalytic hydrogenation.

Half of the double bond is broken. It means π bond is broken while sigma bond is retained also two new $C-Br$ bonds are formed.

42. (a) We know that greater the number of alkyl groups attached to double bonded carbon atoms, more stable is the alkene. Therefore most stable is $R_2C=CR_2$

44. (c) Paraffins are non-polar compounds. The intermolecular forces are weak Vander Waal's forces. As the molecular mass increases Vander Waal's forces increases. Hence boiling point increases.

50. (c) Electrophillic addition reactions are shown by alkenes or alkynes in these reactions attacking species is electrophiles

53. (c) Ethane and Methane does not decolourise $KMnO_4$ and does not react with ammonical cuprous chloride. Acetylene decolourise $KMnO_4$ solution and also gives red ppt. with ammonical cuprous chloride. On the other hand ethene decolourize $KMnO_4$ solution but does not react with ammonical cuprous chloride.

Propadiene has both sp and sp^2 -hybridized carbon atoms.

- 64.** (b) Paraffins or alkanes are non-polar compounds. Hence soluble in benzene.

Peroxide rule is applicable only to HBr .

- 73.** (c) $CH_3 - CH = CH - CH_2 - CH_3$ it decolourizes $KMnO_4$ solution because double bond is present.

Lewisite is more poisonous than mustard gas and was used in world war -II.

This reaction is called allylic halogenation reaction because halogenation occurs at the allylic position of an alkene

It is based on Saytzeff's rule. According to this more symmetrical or more alkylated alkene predominates.

In this reaction 1° carbonium ion is formed which rearranges to form 3° carbonium ion from which base abstract proton. Hence 2-methyl-2-butene is formed as a main product.

1° carbonium less stable

Ethylene sp^2 -hybridization; Shape = Planar.

According to Markownikoff's rule H atom of the reagent goes to that carbon atom which is more hydrogenated.

106. (a) Peroxide rule is applicable only to HBr and not for HCl , HF and HI .

Addition takes place according to Markownikoff's rule in which Cl^+ goes to that carbon atom which is more hydrogenated.

112. (a) In case of ethene double bond is present. Hence, addition reactions occur easily.

$\therefore 42 \text{ gms}$ of propene reacts with 160 gms of bromine.

$\therefore 21 \text{ gms}$ of propene $\frac{160}{42} \times 21 = 80 \text{ gms}$.

A single bond separated by two double bonds is known as conjugated double bond.

117. (a) Cyclic hydrocarbon in which all the carbon atoms are present in the same plane is benzene. In this $C - C$ bond length is $1.39 \text{ \AA}$ which is more than $1.34 \text{ \AA}$ but less than $1.54 \text{ \AA}$. Hence bond angle is 120° with sp^2 hybridization.

120. (b) C_3H_6 is an alkene therefore decolourizes alkaline $KMnO_4$ solution.

129. (a) Ozonolysis is useful in locating the position of a double bond in an alkene. The double bond is obtained by joining the carbon atoms of the two carbonyl compounds. For example Let the product of ozonolysis be two molecules of ethanal.

143. (d) Pd acts as catalyst.

In presence of peroxide addition takes place according to Anti Markownikoff's rule and hydrogen atom goes to that carbon atom which is less hydrogenated.

147. (d) C_2H_4 , C_3H_6 and C_4H_8 all an alkene. Therefore they discharge the red colour of bromine.

157. (b) Reaction is of dehydration

158. (d) $CH_3-CH=CH-CH_2-CH_3$ will be the most stable because greater the number of alkyl groups attached to double bonded carbon atoms, more stable is the alkene.

159. (b) Markownikoff's rule can not be applied for symmetrical alkene.

161. (d) Solution of bromine in carbon tetrachloride is used to test for unsaturation of alkene. Red colour of bromine disappears due to the formation of colourless dibromo ethane ($C_2H_4Br_2$).

Thus in this reaction isopropyl alcohol is formed.

163. (b) Propene gives formaldehyde and acetaldehyde on ozonolysis.

164. (a) When ethylene is treated with cold alkaline $KMnO_4$, ethylene glycol is formed.

166. (a) Markownikoff as well as anti-Markownikoff's rule is valid only for unsymmetrical alkenes.

167. (b) The formation of *n*-propyl bromide in presence of peroxide can be explained as follows.

Step-I: Peroxide undergo fission to give free radicals

$$R-O-O-R \rightarrow 2-R-\dot{O}$$

Step-2 : HBr combines with free radical to form bromine free radical $R-\dot{O} + HBr \rightarrow R-OH + Br\cdot$

Step-3 : $Br\cdot$ attacks the double bond of the alkene to form a more stable free radical

Step-4 : More stable free radical attacks the HBr

Step-5 : $Br\cdot + Br\cdot \rightarrow Br_2$

168. (c) $\text{CH}_2 = \text{CH}_2 \xrightarrow{\text{KMnO}_4} \begin{array}{c} \text{CH}_2 - \text{CH}_2 \\ | \quad | \\ \text{OH} \quad \text{OH} \end{array}$
 $\xrightarrow{\text{AgNO}_3}$ No reaction
169. (b) According to Markownikoff's rule, the negative part of the unsymmetrical reagent adds to less hydrogenated (more substituted) carbon atom of the double bond.
- $$\text{C}_6\text{H}_5\text{CH} = \text{CH} - \text{CH}_3 + \text{HBr} \rightarrow \text{C}_6\text{H}_5\overset{\text{Br}}{\underset{|}{\text{CH}}}\text{CH}_2\text{CH}_3$$
171. (a) $\begin{array}{c} \text{CH}_2 \\ || \\ \text{CH}_2 \end{array} + \text{H}_2\text{SO}_4 \rightarrow \begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_2\text{HSO}_4 \end{array} \xrightarrow{\text{H}_2\text{O}} \begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_2\text{OH} \end{array} + \text{H}_2\text{SO}_4$
 Except ethyl alcohol, no other primary alcohol can be prepared by this method as the addition of H_2SO_4 follows Markownikoff's rule. Generally secondary and tertiary alcohols are obtained.
172. (c) $\text{CH}_3 - \text{C} = \text{CH}_2 \xrightarrow[\text{anti-Markownikoff's addition}]{\text{HBr / peroxide}} \text{CH}_3 - \underset{\text{CH}_3}{\text{CH}}\text{CH}_2 - \text{Br}$
173. (c) Decolourisation of KMnO_4
- Ethene $\xrightarrow{\text{CuCl, NH}_4\text{OH}}$ no ppt.
- Acetylene $\xrightarrow{\text{CuCl, NH}_4\text{OH}}$ red ppt.
174. (a) $\begin{array}{c} | \\ -\text{C} \\ || \\ -\text{C} \\ | \end{array} + \text{OsO}_4 \xrightarrow{\text{pyridine}} \begin{array}{c} | \\ -\text{C}-\text{O} \\ | \\ -\text{C}-\text{O} \end{array} \begin{array}{c} p_y \\ \vdots \\ \text{Os}=\text{O} \\ \vdots \\ p_y \end{array}$
 $\xrightarrow[\text{NaHSO}_3]{\text{H}_2\text{O}} \begin{array}{c} -\text{C}-\text{OH} \\ | \\ -\text{C}-\text{OH} \\ | \\ \text{cis-diol} \end{array}$

Alkyne

1. (c) $2\text{CH} \equiv \text{CH} + 5\text{O}_2 \rightarrow 4\text{CO}_2 + 2\text{H}_2\text{O} \quad \Delta H = -1300 \text{ KJ}$
 The combustion of acetylene is highly exothermic and the heat produced during the combustion can be used for welding purposes in the form of oxy acetylene flame.
2. (c) $\text{CaC}_2 + 2\text{H}_2\text{O} \rightarrow \text{Ca}(\text{OH})_2 + \text{C}_2\text{H}_2$
 $\text{CH} \equiv \text{CH} + 2[\text{Ag}(\text{NH}_3)_2]\text{OH} \rightarrow \text{Ag}-\text{C} \equiv \text{C}-\text{Ag} + 4\text{NH}_3 + 2\text{H}_2\text{O}$
 White ppt.
3. (c) $\text{CH}_3 - \text{CH}_2 - \text{C} \equiv \text{CH} \xrightarrow[\text{alk. KMnO}_4]{\text{Cold}} \text{CH}_3\text{CH}_2\text{COOH} + \text{CO}_2$
4. (c) $\text{CH}_3 - \text{COOH} \xrightarrow{\text{LiAlH}_4} \text{CH}_3 - \text{CH}_2 - \text{OH} \xrightarrow[443\text{K}]{\text{H}^+}$
 $\text{CH}_2 = \text{CH}_2 \xrightarrow{\text{Br}_2} \begin{array}{c} \text{CH}_2 - \text{CH}_2 \\ | \quad | \\ \text{Br} \quad \text{Br} \end{array} \xrightarrow[\text{KOH}]{\text{alc.}} \text{CH} \equiv \text{CH} + 2\text{KBr} + 2\text{H}_2\text{O}$
 Acetylene
5. (b) $\text{C} \equiv \text{C} < \text{C} = \text{C} < \text{C} - \text{C}$
 $1.20\text{Å} \quad 1.34\text{Å} \quad 1.54\text{Å}$
6. (a) $\text{HC} \equiv \overset{sp}{\text{C}} - \overset{sp^2}{\text{CH}} = \text{CH}_2$
7. (a) $3\text{CH} \equiv \text{CH} \xrightarrow[\text{Fe tube}]{\text{Red hot}} \text{Benzene}$
10. (c) $\text{Cyclohexene} \xrightarrow{\text{H}_2} \text{Cyclohexane}$
 $\text{Cyclohexene} \xrightarrow[\text{Zn/HO}]{\text{O}_2} \begin{array}{c} \text{CH}_3 \quad \text{CHO} \\ | \quad | \\ \text{CH}_2 - \text{CH}_2 \\ | \quad | \\ \text{CH}_2 \quad \text{CHO} \end{array}$
11. (a) $\text{HC} \equiv \text{CH} + \text{AsCl}_3 \rightarrow \text{CH} \equiv \text{CH} \text{AsCl}_2$
 2-chlorovinyl dichloroarsine (Lewsite)
12. (c) $\text{CH}_3 - \text{C} \equiv \text{C} - \text{CH}_2 - \text{CH}_3 \xrightarrow{\text{O}_3}$
 $\begin{array}{c} \text{O} \quad \text{O} \\ | \quad | \\ \text{CH}_3 - \text{C} - \text{C} - \text{CH}_2 - \text{CH}_3 \\ | \quad | \\ \text{O} \quad \text{O} \end{array} \xrightarrow{\text{H}_2\text{O}} \text{CH}_3 - \text{COOH} + \text{CH}_3\text{CH}_2\text{COOH}$
14. (a) $-\text{C} \equiv \text{C}-$ is most reactive because sp -hybridization.
16. (d) $\text{CH} \equiv \text{CH} \xrightarrow{\text{NaNH}_2} \text{CH} \equiv \text{C}^- \text{Na}^+ \xrightarrow[\text{-NaI}]{\text{CH}_3\text{I}} \text{CH} \equiv \text{C} - \text{CH}_3$
 $\text{C}_2\text{H}_5 - \text{C} \equiv \text{C} - \text{CH}_3 \xleftarrow[\text{-NaI}]{\text{C}_2\text{H}_5\text{I}} \text{Na}^+ \text{C}^- \equiv \text{C} - \text{CH}_3$
 Pent-2-yne
17. (d) $\text{CH}_3 - \text{C} \equiv \text{CH} + \text{H}_2\text{O} \xrightarrow{\text{H}_2\text{SO}_4 / \text{HgSO}_4}$
 $\begin{array}{c} \text{CH}_3 - \text{C} - \text{CH}_3 \\ || \\ \text{O} \\ \text{Propanone} \end{array} \xleftarrow{\text{Tautomerism}} \left[\begin{array}{c} \text{OH} \\ | \\ \text{CH}_3 - \text{C} = \text{CH}_2 \end{array} \right]$
 Prop-1-ene 2-ol
18. (b) $\text{CH} \equiv \text{CH} + \text{HCl} \rightarrow \text{CH}_2 = \text{CH} - \text{Cl} \xrightarrow{\text{HCl}} \text{CH}_3 - \text{CH} \begin{array}{l} \text{Cl} \\ \text{Cl} \end{array}$
 1,1-dichloroethane
19. (c) $\text{CaC}_2 \xrightarrow{\text{H}_2\text{O}} \text{HC} \equiv \text{CH} \xrightarrow[\text{Acetylene}]{\text{Dil. H}_2\text{SO}_4, \text{Hg}^{+2}} \text{CH}_3\text{CHO}$
 Acetaldehyde
 $\xrightarrow[\text{H}_2]{\text{Ni}} \text{CH}_3\text{CH}_2 - \text{OH}$
 Ethylalcohol
20. (c) $\text{R} - \text{CH}_2 - \text{CCl}_2 - \text{R} \xrightarrow{\text{KOH} + \text{C}_2\text{H}_5\text{OH}} \text{R} - \text{C} \equiv \text{C} - \text{R} + 2\text{HCl}$
 This reaction is an example of dehydrohalogenation. Hence, alcoholic KOH is used as a reagent.
 $\text{CH} - \text{COOK}$
21. (d) $||| + 2\text{H}_2\text{O} \xrightarrow{\text{Electrolysis}} \text{CH} - \text{COOK}$

Since the molecule takes 2 moles of Br_2 . Therefore it is alkyne. Also it gives white ppt with Tollen's reagent therefore acidic H is present. Hence it is 1-Butyne.

57. (c) $2C + H_2 \xrightarrow{\text{Electric arc}} CH \equiv CH$
58. (c) $CH \equiv CH \xrightarrow[1\% HgSO_4]{40\% H_2SO_4} CH_2 = CH - OH$
 Vinylalcohol
 $\xrightarrow{\text{Rearrangement}} CH_3 - CHO$
 Acetaldehyde
59. (a) $2CH \equiv CH + 2Na \rightarrow 2CH \equiv C^- Na^+ + H_2$
 Reaction with sodium metal shows that hydrogen is acidic.
63. (d) In $CH \equiv CH$ triple bond consists of one σ and two π bonds.
65. (a) Nucleophiles and alkalis normally do not react with acetylene. Thus $NaOH$ does not react.
66. (c) $HC \equiv CH + 2HOCl \rightarrow [CHCl_2 - CH(OH)_2]$
 $\downarrow -H_2O$
 $CHCl_2 - CHO$
 Dichloroacetaldehyde
69. (b) $CH_3 - CH = CH - C \equiv C - H$. Acidic hydrogen (H atom attached to triple bond) is present therefore it gives reaction with ammoniacal $AgNO_3$.
70. (b) $CH \equiv CH + H_2O \xrightarrow[1\% HgSO_4]{40\% H_2SO_4} CH_2 = CHOH$
 $\downarrow$
 CH_3CHO
71. (b) $CH_3C \equiv CH + 2HBr \longrightarrow CH_3 - \underset{\substack{| \\ Br}}{\overset{Br}{C}} - CH_3$
72. (c) $CH_3 - C \equiv C - CH_3$, 2-butyne does not have acidic hydrogen. Hence, does not give white ppt. with ammoniacal $AgNO_3$ solution.
73. (a) $(CH \equiv CH) \xrightarrow[NaOH]{O_3} \begin{array}{c} O \\ \diagup \quad \diagdown \\ CH - CH \\ \diagdown \quad \diagup \\ O - O \end{array} \xrightarrow{\text{Hydrolysis}}$
 $\begin{array}{c} CHO - CHO \\ \text{Glyoxal} \end{array} \xrightarrow[CH_3COOH]{Zn} \begin{array}{c} CH_2 - OH \\ | \\ CH_2 - OH \end{array}$
77. (b) $\begin{array}{c} CH_2Br \\ | \\ CH_2Br \end{array} + 2KOH (\text{alcoholic}) \xrightarrow{\Delta} CH \equiv CH + 2KBr + 2H_2O$
78. (d) All are alkenes but 2-butyne is not.
80. (c) Reduction of alkynes with liquid NH_3 / Li gives trans alkenes.
82. (a) Ethyne reacts with ammoniacal $AgNO_3$ to give white ppt of silver acetylide while ethane and ethene do not react because acidic hydrogen is absent.
83. (d) Acidic property because H atoms are replaced by Silver metal atoms.
87. (c) The hydrogen atom which is attached to triple bond is acidic.
88. (c) In acetylene both carbons are sp -hybridised so it has linear structure.
89. (d) $CaC_2 + 2H_2O \rightarrow CH \equiv CH + Ca(OH)_2$
 Acetylene
90. (c) $CH \equiv CH + HCN \xrightarrow{Ba(CN)_2} CH_2 = CH - C \equiv N$
 Vinyl cyanide
91. (c) Because $CH_3CH_2 - C \equiv CH$ has one acidic hydrogen.
92. (d) $CH \equiv CH + 2Na \xrightarrow{Liq. NH_3} C.Na \equiv C.Na + H_2$
94. (b) $CH \equiv CH + H_2O \xrightarrow[HgSO_4]{dil. H_2SO_4} CH_2 = C - OH \rightarrow$
 $CH_3 - \underset{\substack{|| \\ O}}{C} - H$
95. (d) $CH_3 - C \equiv C - CH_3$ has not acidic character.
96. (d) Addition - $CH \equiv CH + 3H_2 \xrightarrow{Ni} CH_3 - CH_3$
 Substitution -
 $CH \equiv CH + Na \longrightarrow CH \equiv C^- Na^+ + \frac{1}{2} H_2$
 Polymerization -
 $3CH \equiv CH \xrightarrow[\text{Benzene}]{\text{hot Cu tube}} C_6H_6$
97. (d) Bond length decrease with increase in Bond order. Hence triple bonded carbon has minimum bond length.
 $C - C$ bond length = 1.54 Å
 $C = C$ bond length = 1.33 Å
 $C \equiv C$ bond length = 1.22 Å
98. (b) Acetylene can be obtained by the reaction of silver and chloroform (or iodo form)
 $2CHI_3 + 6Ag \xrightarrow{\Delta} C_2H_2 + 6AgI$
 acetylene
99. (d) The partial reduction of alkynes by active metal in liquid ammonia takes place through trans vinylic anion which ultimately produces trans alkene.
100. (a) We know that $C - C$ bond length = 1.54 Å, $C = C$ bond length = 1.34 Å and $C \equiv C$ bond length = 1.20 Å. Since propyne has triple bond; therefore it has minimum bond length.
101. (b) $CH \equiv CH + H_2 \xrightarrow[\text{Catalyst}]{\text{Lindlar}} CH_2 = CH_2$
 Acetylene pd. $BaSO_4$ Ethylene
102. (a) $HC \overset{\pi}{\sigma} \equiv \overset{\pi}{\pi} CH$ one sigma and two π bond
103. (a) Propyne reacts with ammoniacal $AgNO_3$ due to presence of acidic hydrogen atom.
 $CH_3C \equiv CH + AgNO_3 + NH_4OH \rightarrow$
 $CH_3C \equiv CAg + NH_4NO_3 + H_2O$
104. (a) $CH \equiv CH \xrightarrow[H_2SO_4]{HgSO_4} CH_3CHO \xrightarrow{CH_3MgBr}$
 $\begin{array}{c} OMgBr \\ | \\ CH_3 - C - CH_3 \\ | \\ H \end{array} \xrightarrow{H_2O} \begin{array}{c} OH \\ | \\ CH_3 - C - H \\ | \\ CH_3 \end{array} \xrightarrow{P / Br_2}$
 $\begin{array}{c} Br \\ | \\ CH_3 - C - H \\ | \\ CH_3 \end{array}$
105. (c) $Mg_2C_3 + 4H_2O \rightarrow CH_3C \equiv CH + 2Mg(OH)_2$

2. (d)  $\xrightarrow{\text{Anhydrous AlCl}_3}$ 
Benzene Acetophenone
5. (a) Coal tar is a main source of aromatic hydrocarbons like benzene, naphthalene, anthracene, phenol etc
7. (c)  $\left. \begin{array}{l} C-C\pi \text{ bonds} = 3 \\ C-C\sigma \text{ bonds} = 6 \\ C-H\sigma \text{ bonds} = 6 \end{array} \right\} 12$
Hence 12 σ and 3 π bonds
8. (b) $\text{Ratio} = \frac{\sigma \text{ bonds}}{\pi \text{ bonds}} = \frac{12}{3} = 4$
11. (b)  + $3\text{Cl}_2 \xrightarrow{\text{Sunlight}}$ 
Addition reaction (BHC)
12. (b)  + $3\text{Cl}_2 \xrightarrow{\text{Sunlight}}$ 
Benzene (BHC)
14. (a) $\text{C}_6\text{H}_6 + \text{C}_2\text{H}_5\text{Cl} \xrightarrow{\text{AlCl}_3} \text{C}_6\text{H}_5 - \text{C}_2\text{H}_5 + \text{HCl}$
15. (a) $\text{C}_6\text{H}_5\text{CH}^+$ is the most stable carbonium ion due to resonance.
16. (d)  + $\text{Cl}_2 \rightarrow$  +  + HCl
o- and *p*-chlorotoluene
17. (a)  $\xrightarrow[\text{Light \& heat}]{\text{Cl}_2}$  $\xrightarrow[\text{-HCl}]{\text{Cl}_2}$ 
Benzyl chloride Benzotrichloride
18. (b) $\text{HO} - \text{NO}_2 + \text{H}^+ \text{HSO}_4^- \rightarrow \text{H}_2\text{O} + \text{NO}_2^+ + \text{HSO}_4^-$
Nitronium ion (attacking species)
19. (b)  + $\text{HNO}_3 \xrightarrow[\text{Conc.}]{\text{Conc. H}_2\text{SO}_4}$ 
Nitration
22. (a) $\text{C}_6\text{H}_6 + \text{CH}_3\text{Cl} \xrightarrow[\text{AlCl}_3]{\text{anhyd.}}$ $\text{C}_6\text{H}_5\text{CH}_3 + \text{HCl}$, it is a Friedel-Craft's reaction.
23. (b)  $\xrightarrow[\text{Fe}]{\text{Cl}_2}$ 
Benzene Chlorobenzene
29. (c)  + $\text{NaOH} \xrightarrow{\text{CaO}}$  + Na_2CO_3
Sodium benzoate Benzene
30. (b)  + $\text{HNO}_3 \xrightarrow[\text{Conc.}]{\text{Conc. H}_2\text{SO}_4}$ 
Conc.
31. (d)  + $3\text{HNO}_3 \xrightarrow{\text{Conc. H}_2\text{SO}_4}$  + $3\text{H}_2\text{O}$
2,4,6-trinitrotoluene
32. (b)  + $\text{H}_2\text{SO}_4 \rightarrow$  + H_2O
34. (c)   
m-xylene *o*-xylene *p*-xylene
m-xylene is most easily sulphonated because *O* and *P* both positions are free with respect to methyl group.
35. (d)  $\xrightarrow[\text{Alk. KMnO}_4]{\text{dil. HNO}_3}$ 
Toluene Benzoic acid
36. (c)  + $\frac{9}{2}\text{O}_2 \xrightarrow[773\text{K}]{\text{V}_2\text{O}_5}$  $\xrightarrow{-\text{H}_2\text{O}}$ 
Maleic acid

38. (b) Phenol is most easily nitrated.

43. (a) Nitrobenzene is least reactive towards bromine because of presence of $-NO_2$ group decreases electron density at *o* and *p* positions and hence attack of electrophile on the benzene nucleus is difficult because +ve charge on *o* and *p* position repel the incoming electrophile.

46. (d) $AlCl_3$ is an electron deficient compound. It generates electrophile in the reaction

51. (b) Benzene can be obtained by polymerisation of acetylene.
53. (b) Benzene C_6H_6 is made up of hydrogen and carbon only.
54. (c) They have a relatively high percentage of carbon
55. (c) All 6 carbons of Benzene are sp^2 -hybridised so it is planar.

58. (c) 2,4,6-Trinitro toluene (TNT) is used as explosive.

61. (e) TNT is used as an explosive.

71. (b) In benzene due to resonance all the carbon-carbon bond lengths are equal $1.39\text{\AA}$ which is between $C-C(1.54\text{\AA})$ and $C=C(1.34\text{\AA})$

73. (a) Friedel-Craft's reaction involves the introduction of an alkyl or acyl group into benzene ring in the presence of a catalyst. The presence of an electron withdrawing group in the ring hinders the reaction. Therefore phenyl acetanilide is not used.

74. (a) Halogenation is initiated by free radical.

76. (b) In benzene all the six carbon atoms are present in the same plane. All the carbon atoms are sp^2 hybridized. Hence, it is a planar molecule.

77. (d) Basicity of amines is due to availability of an unshared pair (lone pair) of electrons on nitrogen. This lone pair of electrons is available for the formation of a new bond with a proton or Lewis acid. Pyridine is less basic than triethylamine because lone pair of nitrogen in pyridine is delocalised.

78. (a) In chlorination electrophile is Cl^+ (chloronium ions).

Presence of $-CHO$ decrease electron density at o to p positions. Hence, attack of an electrophile occurs at m -position. therefore it is meta directing group.

88. (a) Benzene on fractional distillation gives light oil [It is lighter than water and hence called as light oil]

89. (d) Because Ammonical $AgNO_3$ reduce $C \equiv CH$ bond of yne.

90. (a) Bond length $\propto \frac{1}{\text{Bond order}}$
Bond order = $\frac{\text{Bonding} - \text{antibonding electron}}{2}$

Bond order is highest for C_2H_6 so it has minimum bond strength.

92. (c) Unsaturated hydrocarbons are more reactive than saturated hydrocarbons. Among ethyne (C_2H_2) and ethene (C_2H_4) the later is more reactive as $C \equiv C$ triple bond is quite strong bond and therefore ethyne generally require catalysts (like Hg^{2+} etc) in its reactions.

93. (a) **Kolbe's methods** – Electrolysis of a concentrated aqueous solution of either sodium or potassium salts of saturated mono carboxylic acids yields higher alkanes at anode.

95. (a) $-NH_2$ group is not linked with benzene ring.

Critical Thinking Question

1. (a) The difference between any two successive members of the homologous series $-CH_2-$ i.e., the molecular weight of every two adjacent members differ by 14.
($CH_2 = 12 + 2 = 14$)

$1^\circ \Rightarrow \text{Primary}$ $2^\circ \Rightarrow \text{Secondary}$

$3^\circ \Rightarrow \text{Tertiary}$ $4^\circ \Rightarrow \text{Quaternary}$

3. (c) Octane number of fuel is the percentage of *iso*-octane in mixture.

$+H_2O$

According to this rule H atom goes from that β -carbon which is less hydrogenated.

6. (c) Friedel-craft's reaction

9. (a) Fischer-Tropsch process –

- ii. (a) Hydroboration of alkenes followed by hydrolysis in basic medium yield alcohols and not the alkanes.

- 12. (b) Koch reaction : (Carboxylation of Alkene)**

14. (b) $HC \equiv CH + 2AgNO_3 \xrightarrow{NH_4OH}$
 $Ag-C \equiv C-Ag + 2NH_4NO_3 + 2H_2O$

15. (d) Naphthalene is a molecular solid. If the crystals contains only individuals atoms; as in solid argon or krypton or if they are composed of non polar molecules as in naphthalene, the only attraction between the molecules are the London forces.

16. (d) A compound is said to be aromatic if it is planar and there is complete delocalization of π electrons, which is only possible if it is a conjugated cyclic system and number of electrons used in delocalization is $(4n + 2)$. 1, 3, 5 heptatriene is not an aromatic compound because complete delocalization of π electrons, is not possible in it.

17. (c) $\text{CH} \equiv \text{CH} + \text{HCN} \xrightarrow{\text{Ba(CN)}_2} \text{CH}_2 = \text{CHCN}$
Acetylene Vinylcyanide

- 18.** (a) Addition reaction means addition on double bond.

19. (d) $CaC_2 + 2H_2O \rightarrow Ca(OH)_2 + C_2H_2$
 $\quad\quad\quad 64\text{ g}$

64g of CaC_2 gives 28g of ethylene

$\therefore 64\text{kg}$ of CaC_2 will give 28kg of polyethylene

20. (a)  Nitro benzene

21. (b) Electron accepting groups which make the substitution difficult are known as deactivating groups. The group or substituent already present on the ring also decides the position of the incoming group.

ortho and para directing groups are as follow

$$-CH_3, C_2H_5(-R), -NH_2, -OH, \text{ halogens, } (Cl, Br, I)$$

22. (b) 

- ### 23. (c) Polymerisation

24. (b) 

- 25.** (a) Wohler reaction :

- 26.** (a) $\underset{\text{Ethyne}}{CH \equiv CH} + H_2O \xrightarrow[H_2SO_4]{HgSO_4} \underset{\text{Vinyl alcohol}}{CH_2 = CH - OH} \xrightarrow{KMnO_4}$

27. (a) $\text{CaC}_2 + 2\text{D}_2\text{O} \longrightarrow \text{C}_2\text{D}_2 + \text{Ca(OD)}_2$
 calciumcarbide heavy water

- 28.** (d) It is a unsymmetrical olefin. In such cases addition of $H-X$ is governed by 'Markownikoff's rule'

29. (d) $CH_3 - CH = CH_2 \xrightarrow[\text{Acidic } KMnO_4]{\text{Conc.}} CH_3COOH + HCOOH$

30. (a)  1, 2 or 1, 6 = *ortho*
1, 3 or 1, 5 = *meta*
1, 4 = *para*.

- 31.** (b) Biological oxidation of benzene gives cinnamic acid.

32. (d) $CH \equiv CH \xrightarrow{HBr} CH_2 = CH - Br \xrightarrow{HBr}$

- 33.** (c) Electron accepting groups which make the substitution difficult are known or deactivating groups.

o. p. directing groups are as follow :

$$-CH_3, C_2H_5(-R), -NH_2, -OH, \text{ halogens } (Cl, Br, I).$$

- 34.** (a) 2-butene shows geometrical isomerism.

- 35.** (d) Sidechain chlorination and bromination is favoured by high temperature, light and in absence of halogen carrier.

Assertion & Reason

1. (a) This reaction is followed by against of Markownikoff rule

In this reaction anti Markownikoff's addition is explained on the basis of the fact that in the presence of peroxide the addition takes place via a free radical mechanism rather than the ionic mechanism.

4. (a) Pyrrole is a heterocyclic compound having five membered ring. It has 6π electrons. As 4π electrons in the ring and 2π electrons donated by nitrogen atom present in the ring.

5. (b) The assertion that chlorination of CH_4 does not take place in dark is correct because it is a free radical reaction and free radicals are obtained in presence of sun light.

6. (b) The alkyl benzene is not prepared by Friedel Craft's alkylation of benzene because the monoalkyl product formed undergoes alkylation to produce polyalkylated benzene.

The reason that alkyl halides are less reactive than acyl halides is also correct but this is not the correct explanation of assertion.

7. (d) 2-bromobutane on reaction with sodium ethoxide in ethanol gives 2-butene as a major product.

This is according to Saytzeff's rule i.e. the predominant product is the most substituted alkene, i.e. are carrying the largest number of alkyl substituents of hydrogen is eliminated preferentially from the carbon atom joined to the least number of hydrogen atoms.

2-butene is more stable than 1-butene due to presence of large number of hyperconjugating structures in 2-butene.

8. (b) HBr adds to the double bond of the styrene forming 1-bromo-1-phenylethane.

This is an example of elimination-addition reaction.

Note: Here given assertion is wrong.

9. (b) Alkanes with odd carbon atoms have their end carbon atom on the same side of the molecule and in even carbon atom alkane, the end carbon atom on opposite side. Thus alkanes with even carbon atoms are packed closely in crystal lattice to permit greater intermolecular attractions and hence higher melting point.

10. (b) Iodination is reversible since formed HI is a strong reducing agent and reduces the alkyl iodide back to alkane.

11. (b) Normally oxidising agents have no effect on alkanes. However, alkanes containing a tertiary hydrogen atom can be oxidised by oxidising agents such as KMnO_4 to the corresponding alcohols. For example,

12. (e) Halogenation of alkanes is catalysed by radical initiators like benzoyl peroxide.

13. (c) Neopentane has four identical methyl groups attached on a 4° carbon atom and thus only one product is possible during monosubstitution.

14. (b) Neopentane is more symmetric than *n*-pentane and it is expected to show more stable crystal lattice than that of *n*-pentane and thus have high melting point.
15. (b) Knocking involves the production of metallic sound due to irregular burning of the fuel. This irregular burning lowers the efficiency of the engine.
16. (b) Ag^+ coordinates with the alkene by $p\pi - d\pi$ bonding giving an ion and the solubility increases.

17. (a) In the dehydration of secondary and tertiary alcohols. When there is a possibility of formation of two isomers. The hydrogen atom is preferentially eliminated from the adjacent carbon atom with the fewer number of hydrogen atoms. This is Saytzeff's rule.

18. (c) The addition of Br_2 follows ionic mechanism

19. (b) Straight chain alkanes have very low octane number because as the length of the chain increases, octane number further decreases.
21. (d) The two hydrogen atoms on first carbon and the two *H*-atoms on the third carbon atom lie in perpendicular planes. The central carbon atom is *sp*-hybridized while terminal carbon atoms are *sp*²-hybridized.
22. (d) Propene reacts with *HBr* in presence of benzoyl peroxide to give 1-bromopropane. In presence of peroxide, the addition of *HBr* to propane occurs by free radical mechanism.
24. (b) Arylhalide shows resonance stabilization and thus resistant to substitution reaction.
25. (e) During alkylation of bromobenzene, if benzene is used as solvent, alkylation of benzene will take place because benzene is more reactive for *S_E* reactions than bromo benzene, benzene is not used as a solvent for this reaction.

- 26.** (b) Benzene is a polar solvent. Butter is composed of organic compounds of low polarity. So it gets dissolved in benzene.

- 27. (a)**

In toluene , the $-CH_3$ group is electron

Pushing. It is an activating group. By its +I effect, $-CH_3$ group activates the benzene ring at ortho and para position relative to it. Due to increased activity towards electrophilic substitution toluene can be more easily nitrated than benzene.

- 28.** (e) With fuming H_2SO_4 or oleum (conc. $H_2SO_4 + SO_3$) at high temperature benzene forms *m*-benzene disulphonic acid.

29. (c) Like halogens, the nitroso group ($-N=O$) is also deactivating but *o*, *p*-directing. It is deactivating because *O* is more electronegative than *N* and hence NO group as whole withdraws electrons from the benzene ring.

31. (e) Completely conjugated polyenes containing even number of carbon atoms is known as annulenes.

- 32.** (c) $(4n + 2)\pi$ electrons and planar structure are the essential conditions for aromaticity.

- 33. (a)**

Due to severe non-bonded interactions between the internal hydrogen (as shown in figure), the ring assumes non-planar geometry.

Hydrocarbon

Self Evaluation Test -24

1. Which one of the following alkenes will react fastest with H_2 under catalytic hydro-genation condition

[IIT-JEE (Screening) 2000; CBSE PMT 2005]

2. On cracking petrol, we get

[CPMT 1980]

- (a) CH_4
 (b) C_3H_6
 (c) Both (a) and (b)
 (d) $CH_3 + CH_4 + C_2H_6$ + alcohols

3. Cetane is a compound which has very good ignition property. Chemically it is

[CPMT 2004]

- (a) $CH_3(CH_2)_{14}CH_3$
 (b) $(CH_3)_3C(CH_2)_{11}CH_3$
 (c) $C_{17}H_{34}$
 (d) None of these

4. Which one of these is not compatible with arenes

[CBSE PMT 1998]

- (a) Greater stability
 (b) Delocalisation of π - electrons
 (c) Electrophilic additions
 (d) Resonance

5. Which of the following is an electrophile

[BHU 1998]

- (a) H_2O (b) NH_3
 (c) $AlCl_3$ (d) $C_2H_5NH_2$

6. The reaction,

is called :

[Pb. CET 2001]

- (a) Hydration (b) Sublimation
 (c) Dehydration (d) Substitution

7. In reaction

Then C is

[MP PET 2004]

- (a) C_6H_6 (b) C_6H_5OH
 (c) C_6H_5COONa (d) C_6H_5ONa

8. Which one of the following is a free-radical substitution reaction

9. The most unlikely representation of resonance structures of *p*-nitrophenoxide ion is

[IIT-JEE 1999]

10. Which one of the following on ozonolysis followed by oxidation will give adipic acid

[AMU 2002]

11. Which of the following structures correspond to the product expected, when excess of C_6H_6 reacts with CH_2Cl_2 in presence of anhydrous $AlCl_3$

[CBSE PMT 1989]

12. Which of the following will be easily nitrated

[DCE 2001]

13. Chlorination of benzene is not possible in the following reaction

- (a) $C_6H_6 + Cl_2 \xrightarrow{FeCl_3}$
 (b) $C_6H_6 + HOCl \xrightarrow{H^+}$
 (c) $C_6H_6 + I-Cl \xrightarrow{ZnCl_2}$
 (d) $C_6H_6 + Cl_2 \xrightarrow{AlCl_3}$

14. $Ph-C \equiv C-CH_3 \xrightarrow{Hg^{2+}/H^+} A$. A is

[IIT-JEE Screening 2002]

- (a)  (b) 
 (c)  (d) 

15. In order to complete the reaction

1-Pentyne $\xrightarrow{a}$ 4-Octyne $\xrightarrow{b}$ cis-4-Octene a and b will be

- (1) $NaNH_2; \overset{a}{CH_3CH_2Br}$: H_2 , (one mole) Pd or Ni
 (2) $NaNH_2; CH_3CH_2CH_2Br$: H_2 (two moles) Pd or Ni
 (3) $NaNH_2; CH_3CH_2CH_2Br$: H_2 , (one mole) Pd or Ni
 (4) $NaNH_2; CH_3CH_2CH_2Br$: BH_3, H_2O_2, OH^-

[MP PET 1994]

- (a) 1 (b) 2
 (c) 3 (d) 4

16. The number of secondary hydrogens in 2, 2-dimethyl butane is

- (a) 8 (b) 6
 (c) 4 (d) 2

17. An alkane (UPSEAT 2004) weight 72) forms only one monochlorinated product. Its formula is [BHU 1981]

- (a) $(CH_3)_4C$
 (b) $CH_3(CH_2)_3CH_3$
 (c) $(CH_3)_2CHCH_2CH_3$

18. The poisonous gas that comes out with petrol burning in a car is

- (a) CH_4 (b) C_2H_6
 (c) CO_2 (d) CO

19. The reagent X in the reactions

[Roorkee 2000]

- (a) H_3O^+
 (b) $Hg(CH_3COO)_2$
 (c) OH^-
 (d) $HCOOH$

20. $CH_2=CH_2 \xrightarrow{Br_2/H_2O} A$,

In the above reaction the compound A is

[DPMT 2004]

- (a) Ethylene bromohydrin
 (b) 1, 2-dibromo ethane
 (c) Ethanol
 (d) None of these

[UPSEAT 2004]

AS Answers and Solutions

(SET -24)

1. (a) According to saytzeff rule order of stability is

2. (c) On cracking petrol gives smaller hydrocarbons like CH_4 , C_2H_6 .

3. (a) Cetane is chemically hexadecane i.e.,

4. (c) In arenes electrophilic substitution reaction takes place and it does not give electrophilic addition reactions. We also know that benzene is a resonance hybrid of two structures and greater stability of benzene is due to delocalization of π electron.

5. (c) $AlCl_3$ is an electron deficient compound. Hence, act as an electrophile.

6. (a) Alkenes react with water in the presence of acid and form alcohols. This reaction is called as hydration.

8. (b) Halogenation of alkyl group proceed via free radical mechanism.

9. (c) The structure  is most unlikely as N containing 5 valence electrons should not carry positive charge.

12. (a) The presence of an electron-releasing groups (+I group) e.g., $-CH_3$, $-OH$, $-NH_2$ etc makes the process of nitration easier.***
So $C_6H_5CH_3$ will be easily nitrated.

13. (b) Reaction is called Gattermann-Koch synthesis, which is carried by catalyst $AlCl_3$.

17. (a) The alkane forms only one mono substituted product, it must have only one type of hydrogen atoms. therefore the alkane is 2, 2-dimethyl propane.

18. (d) On petrol burning CO comes out which is so much poisonous gas.

19. (b) Oxymercuration-demercuration : with mercuric acetate (in THF) followed by reduction with $NaBH_4 / NaOH$ is an example of hydration of alkene according to markovnikoff's rule.

Hence compound A is Ethylene bromohydrin.

Ordinary Thinking

Objective Questions

Alkane

- Which represents an alkane [CPMT 1976]
 - C_5H_8
 - C_8H_6
 - C_9H_{10}
 - C_7H_{16}
- The decreasing order of boiling points is [BHU 1999]
 - n -Pentane > iso-Pentane > neo-Pentane
 - iso-Pentane > n -Pentane > neo-Pentane
 - neo-Pentane > iso-Pentane > n -Pentane
 - n -Pentane > neo-Pentane > iso-Pentane
- To prepare a pure sample of n -hexane using sodium metal as one reactant, the other reactant will be [BHU 1999]
 - n -propyl bromide
 - Ethyl bromide and n -butyl bromide
 - Ethyl chloride and n -butyl chloride
 - Methyl bromide and n -pentyl chloride
- In the preparation of Grignard reagent from haloalkane, the metal
 - Mg
 - Zn
 - Li
 - K
- Sodium acetate can be converted to ethane by [Pune CET 1998]
 - Heating with $LiAlH_4$
 - Electrolysing its aqueous solution
 - Heating with sodalime
 - Heating with calcium acetate
- Which of the following compounds is used in antiknock compositions to prevent the deposition of oxides of lead on spark plug, combustion chamber and exhaust pipe [KCET 1998]
 - Glycerol
 - Glycol
 - 1, 2-dibromoethane
 - Benzene
- Which of petroleum corresponds to kerosene oil [DCE 1999]
 - $C_{15} - C_{18}$
 - $C_{10} - C_{12}$
 - $C_5 - C_9$
 - $C_1 - C_9$
- In the reaction $CH_3 - Br + 2Na + Br - CH_3 \rightarrow$, the product called [Pb. CET 1999; CPMT 1983. 86; KCET 1992; MP PMT 1994; BHU 1998; MP PMT 2002; MP PET 1986]
 - Wurtz reaction
 - Aldol condensation
 - Perkin's reaction
 - Levit reaction
- Iodoethane reacts with sodium in the presence of dry ether. The product is [AFMC 1997; KCET 1998]
 - Pentane
 - Propane
 - Butene
 - Butane
- Which of the following is oxidised by $KMnO_4$
 - Methane
 - Pentane
 - Isobutane
 - Neopentane
- Which of the following has maximum stability [AIIMS 2001]
 - CH_3^+
 - $CH_3 - \overset{\overset{H}{|}}{\underset{+}{C}} - H$
- $CH_3 - \overset{\overset{H}{|}}{\underset{+}{C}} - CH_3$
 - $CH_3 - \overset{\overset{CH_3}{|}}{\underset{+}{C}} - CH_3$
- The most volatile compound is [DPMT 2000]
 - 2, 2-dimethyl propane
 - 2-methyl butane
 - Isobutane
 - n -pentane
- In Wurtz reaction, the reagent used is [EAMCET 1998]
 - Na
 - Na/liquid NH_3
 - Na/dry ether
 - Na/dry alcohol
- Which of the following has highest octane number [MP PMT 2000]
 - n -hexane
 - n -heptane
 - n -pentane
 - 2, 2, 4-trimethyl pentane
- What is freon-12 [RPET 1999]
 - Pesticide
 - Refrigerant
 - Solvent
 - Lubricant
- The petrol having octane number 80 has [MP PET 2000]
 - 20% normal heptane + 80% iso-octane
 - 80% normal heptane + 20% iso-octane
 - 20% normal heptane + 80% normal octane
 - 80% normal heptane + 20% normal octane
- Which of the following reactions will not give propane [DPMT 2005]
 - $CH_3CH_2CH_2Cl \xrightarrow[H_2O]{Mg/ether}$
 - $CH_3COCl \xrightarrow[H_2O]{CH_3MgX}$
 - $CH_3CH=CH_2 \xrightarrow[CH_3COOH]{B_2H_6}$
 - $CH_3CH(OH)CH_3 \xrightarrow{P/HI}$
- The shape of methane molecule is [MP PET 1997, 2001]
 - Linear
 - Trigonal planar
 - Square planar
 - Tetrahedral
- Which of the following shows only one brominated compound
 - Butene-2
 - 2, 2-dimethylpropane
 - Butyne-1
 - Butanol-3
- Kerosene is used as fuel because it is [CPMT 1996]
 - Less volatile
 - More volatile
 - Cheap
 - Abundantly available
- $CH_3 - CH_2 - CH_2 - CH_3 \xrightarrow[HBBr]{AlCl_3} \text{Product}$. Product in above reaction is [RPMT 2003]
 - $CH_3 - \overset{\overset{Br}{|}}{CH} - CH_2 - CH_3$
 - $CH_3 - \overset{\overset{CH_3}{|}}{CH} - CH_3$
 - $CH_2 - \overset{\overset{Br}{|}}{CH} - \overset{\overset{CH_3}{|}}{CH} - CH_3$
 - All of these
- Which of the following statements is not true for ethane [AIIMS 1996]
 - It can be chlorinated with chlorine
 - It can be catalytically hydrogenated
 - When oxidised produces CO_2 and H_2O
 - It is a homologue of iso-butane
- Petroleum refining is [AIIMS 1996; KCET 2004]
 - Distillation of petroleum to get different fractions
 - Obtaining aromatic compounds from aliphatic compounds present in petroleum
 - Cracking of petroleum to get gaseous hydrocarbons
 - Purification of petroleum

24. The chemical added to leaded petrol to prevent the deposition of lead in the combustion chamber is
[Kerala (Med.) 2003]
(a) Iso-octane (b) Ethylene dibromide
(c) Tetraethyl lead (d) Mercaptan
(e) *n*-Heptane
25. In the commercial gasolines, the type of hydrocarbons which are more desirable is
[CBSE PMT 1997; AFMC 1997]
(a) Branched hydrocarbon
(b) Straight-chain hydrocarbon
(c) Linear unsaturated hydrocarbon
(d) Toluene
26. Which of the following is not formed by the reaction of Cl_2 on CH_4 in sunlight
[AIIMS 1987]
(a) $CHCl_3$ (b) CH_3Cl
(c) CH_3CH_3 (d) $CH_3CH_2CH_3$
27. Which of the following has the highest boiling point
[DPMT 1986]
(a) Neopentane (b) *n*-butane
(c) *n*-heptane (d) Isobutane
28. Which gives CH_4 when treated with water
[CPMT 1974, 79; NCERT 1976; IIT-JEE 1990]
(a) Silicon carbide (b) Calcium carbide
(c) Aluminium carbide (d) Iron carbide
29. Which of the following does not react with PCl_5
[CPMT 1973]
(a) CH_3OH (b) CH_3COOH
(c) CH_3CHO (d) C_2H_6
30. Which of the following compounds is insoluble even in hot concentrated H_2SO_4
[IIT-JEE 1983]
(a) Ethylene (b) Benzene
(c) Hexane (d) Aniline
31. A reaction between methyl magnesium bromide and ethyl alcohol gives
[CPMT 1979; MNR 1986; UPSEAT 1999]
(a) Methane (b) Ethane
(c) Propane (d) Butane
32. Methane and ethane both can be obtained in single step from
[CPMT 1974; MP PET 1995; AFMC 1998, 2000; BHU 2005]
(a) CH_3I (b) C_2H_5I
(c) CH_3OH (d) C_2H_5OH
33. Paraffin wax is
[MP PMT 1986; CPMT 1993]
(a) Ester
(b) Alcohol
(c) Unsaturated hydrocarbon
(d) Saturated hydrocarbon
34. The number of possible enantiomeric pairs that can be produced during monochlorination of 2-methylbutane is
[IIT-JEE 1997]
(a) 2 (b) 3
(c) 4 (d) 1
35. Petroleum consists mainly of
[CPMT 1985, 94; KCET 1991]
(a) Aliphatic hydrocarbons (b) Aromatic hydrocarbons
(c) Aliphatic alcohols (d) None of these
36. Petroleum ether can be used as
(a) Solvent for fat, oil, varnish and rubber
(b) As a fuel
(c) Both (a) and (b)
(d) None of these
37. Which of the following are produced from coal tar
(a) Synthetic dyes (b) Drugs
(c) Perfumes (d) All the three
38. In alkanes, the bond angle is
[MP PMT 1989; BHU 1996]
(a) 109.5° (b) 109°
(c) 120° (d) 180°
39. In the preparation of alkanes; a concentrated aqueous solution of sodium or potassium salts of saturated carboxylic acid are subjected to
[CPMT 1985; MP PET 1999]
(a) Hydrolysis (b) Oxidation
(c) Hydrogenation (d) Electrolysis
40. Halogenation of alkanes is an example of
[MP PET 1993; KCET 1998]
(a) Electrophilic substitution
(b) Nucleophilic substitution
(c) Free-radical substitution
(d) Oxidation
41. Propionic acid is subjected to reduction with hydroiodic acid in the presence of a little *P*, the product formed is
[JIPMER 1997]
(a) Ethane (b) Propane
(c) Butane (d) None of these
42. When ethyl iodide and propyl iodide react with *Na* in the presence of ether, they form
[BHU 1997]
(a) One alkane (b) Two alkanes
(c) Four alkanes (d) Three alkanes
43. The alkane that yields two isomeric monobromo derivatives is
(a) Neopentane (b) Ethane
(c) Methane (d) Propane
44. Kerosene is a mixture of
[CPMT 1979; AFMC 1992]
(a) Alkanes (b) Aromatic compounds
(c) Alcohols (d) Aliphatic acids
45. When petroleum is heated the vapours contain mainly
[CPMT 1981]
(a) Kerosene (b) Petroleum ether
(c) Diesel (d) Machine oil
46. Iso-octane is mixed to the petrol
[NCERT 1972]
(a) To precipitate inorganic substances
(b) To prevent freezing of petrol
(c) To increase boiling point of petrol
(d) As an antiknock
47. Tetraethyl lead is used as
[NCERT 1976, 79; DPMT 1984; CPMT 1989, 91; BHU 1995]
(a) Fire extinguisher (b) Pain reliever
(c) Petroleum additive (d) Mosquito repellent
48. Cyclohexane, a hydrocarbon floats on water because
[NCERT 1976]
(a) It is immiscible with water
(b) Its density is low as compared to water
(c) It is non-polar substance
(d) It is immiscible and lighter than water
49. Natural gas contains mainly
[MNR 1990; UPSEAT 1999, 2000, 01, 02; BCECE 2005]
(a) Methane (b) *n*-butane
(c) *n*-octane (d) Mixture of octane
50. Which compound is not inflammable
[MP PET 2001]
(a) CCl_4 (b) C_2H_5OH
(c) CH_4 (d) C_6H_6
51. Propane is obtained from propene, by which of the following methods
[CBSE PMT 2001; AFMC 2001]
(a) Wurtz reaction (b) Dehydrogenation
(c) Frankland reaction (d) Catalytic hydrogenation

52. The organic compound used as antiknock agent in petroleum is [DCE 1999; CPMT 2000; Pb. CET 2000; MP PET 2001] (b) Propene
(c) Ethane (d) Propyne
- (a) $(C_2H_5)_4Pb$ (b) *TNT*
53. In catalytic reduction of hydrocarbons which catalyst is mostly used [CPMT 1972, 84; Pb. CET 2001, 2003] (b) Methane
(c) CH_3MgBr (d) $(C_2H_5)_2Hg$ (d) Ethane
- (a) *Pt/Ni* (b) *Pd*
54. Ethylene reacts with bromine to form [MP PET 2001] (c) $CO + CO_2$ (b) $CO + N_2$
(c) SiO_2 (d) Misch Metal (d) $CO + N_2 + H_2$
- (a) $Br-CH_2-CH_3$ (b) CH_3-CBr_3
55. Gasoline is obtained from crude petroleum oil by its [MP PMT 1999] (b) 81
(c) Steam distillation (d) Pyrolysis (c) 100 (d) 62
- (a) Fractional distillation (b) Vacuum distillation
56. Which of the following does not give alkane [MP PMT 1999] (a) Saturated hydrocarbons
(c) Compounds of sulphur (d) All of these
- (a) Reaction of CH_3I with *Na* in ether
57. *LPG* is a mixture of [MP PMT 1999; KCET 2005] (b) Sabatier-Senderen's reaction
(c) Kolbe's synthesis (d) Grignard reaction
- (a) $C_6H_{12} + C_6H_6$ (b) $C_4H_{10} + C_3H_8$
58. Carbon black, which is used in making printer's ink, is obtained by decomposition of [MP PET 1993] (c) $C_2H_4 + C_2H_2$ (d) $C_2H_4 + CH_4$
- (a) Acetylene (b) Benzene
59. The addition of tetraethyl lead to petrol [MP PET 1993] (c) $CH_3-CH=CH_2Cl$ and CH_2Cl-CH_2Cl
(d) $CH_3-CH=CH_3$ and CH_3-CHCl_2
- (a) Lowers its octane number
60. Which of the following compound has maximum boiling point [IIT-JEE 1982; MP PMT 1986; MADT Bihar 1995; Pb. PMT 1999] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) *n*-hexane (b) *n*-pentane
61. Knocking sound occurs in engine when fuel [CPMT 1981] (c) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
(d) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
- (a) Ignites slowly
62. Petroleum is mainly a mixture of [CPMT 1984; Pb. PMT 1999] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) Alkanes (b) Cyclohexane
63. Which of the following has maximum boiling point [IIT-JEE 1986; MP PMT 1986; CPMT 1989] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) *iso*-octane
64. Aqueous solution of the following compound on electrolysis gives ethane [NCERT 1983; MP PET 1985; CPMT 1975, 79] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) Acetic acid (b) Acetamide
65. Which of the following does not decolourise bromine solution in carbon disulphide [MP PET 1986] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) Potassium acetate (b) Ethyl acetate
66. Anhydrous sodium acetate on heating with sodalime gives [CPMT 1972, 84; Pb. CET 2001, 2003] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) Acetic acid (b) Methane
67. Water gas is [CPMT 1993, 2004; Pb. PMT 2004] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) $CO + CO_2$ (b) $CO + N_2$
68. A sample of gasoline contains 81% *iso*-octane and 19% *n*-heptane. Its octane number will be [MP PMT 1995] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) 19 (b) 81
69. The natural petroleum contains [MP PMT 1995] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) Saturated hydrocarbons
70. The preparation of ethane by electrolysis of aqueous solution of potassium acetate is called as [MP PMT 1995] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) Wurtz reaction
71. Action of hydrogen chloride on $CH_3-C \equiv CH_2$ and on $CH \equiv CH$ will predominantly give the compounds, respectively (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) $CH_3-CH=CH_2Cl$ and CH_2Cl-CH_2Cl
- (b) $CH_3-CCl=CH_3$ and CH_3-CHCl_2
- (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
- (d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
72. As the number of carbon atoms in a chain increases the boiling point of alkanes [AFMC 1989] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) Increases
73. In the fractional distillation of crude petroleum [Roorkee 1989] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) Petrol condenses at the bottom of the column
74. Which of the following is not an endothermic reaction [J & K 2005] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) Dehydrogenation
75. Gasoline is the name of [Roorkee 1989] (c) $CH_3-CH=CH_2Cl$ and CH_3-CHCl_2
(d) $CH_3-CH=CH_3$ and CH_2Cl-CH_2Cl
- (a) Crude oil

- (b) The gaseous constituents of petroleum
(c) The mixture of uncondensed gases produced in the distillation of crude oil
(d) The mixture of the residue and gas oil obtained in the distillation of crude oil
76. In the process of cracking [Roorkee 1989]
(a) Organic compounds decompose into their constituent elements
(b) Hydrocarbons decompose into carbon and hydrogen
(c) High molecular weight organic compounds decompose to give low molecular weight organic compounds
(d) Hydrocarbons yield alkyl radicals and hydrogen
77. Octane number has 0 value for [Roorkee 1989; MP PET 1999, 2002; MP PMT 2001; KCET 2002]
(a) iso-octane (b) *n*-hexane
(c) *n*-heptane (d) iso-heptane
78. Dry distillation of sodium propanoate with sodalime gives [CPMT 1996]
(a) Propane (b) Propene
(c) Ethane (d) Ethene
79. What is the chief product obtained when *n*-butane is treated with bromine in the presence of light at 130°C [IIT-JEE 1995]
(a) $\text{CH}_3 - \text{CH}_2 - \underset{\text{CH}_3}{\text{CH}} - \text{Br}$
(b) $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \text{Br}$
(c) $\text{CH}_3 - \underset{\text{CH}_3}{\text{C}} - \text{Br}$
(d) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_2 - \text{Br}$
80. A mixture of propene and methane is obtained by the cracking of
(a) 1-butene (b) 2-butene
(c) *n*-butane (d) Isobutane
81. Which of the following fractions of petroleum refining contains kerosene? (Boiling ranges in $^{\circ}\text{C}$ are given below)
(a) 40 - 80 (b) 80 - 200
(c) 200 - 300 (d) Above 300
82. Which of the following statements is incorrect? The members of the homologous series of alkanes [NCERT 1974]
(a) Are all straight chain compounds
(b) Have the general formula $\text{C}_n\text{H}_{2n+2}$
(c) Have similar chemical properties
(d) Show a regular gradation of physical properties
83. On mixing tetraethyl lead to gasoline available at petrol pumps
(a) Calorific value of the fuel increases
(b) Odour diminishes
(c) Less smoke is obtained on combustion
(d) Antiknock property of fuel increases
84. A liquid hydrocarbon can be converted to gaseous hydrocarbon by [CPMT 1980; MP PET 2001]
(a) Cracking
(b) Hydrolysis
(c) Oxidation
(d) Distillation under reduced pressure
85. The tetrahedral nature of carbon was first given by [MP PMT 1994]
(a) Kekule (b) Le Bell and Van't Hoff
(c) Pauling (d) Armstrong and Bayer
86. Formation of alkane by the action of *Zn* on alkyl halide is called [DPMT 1984; MP PET 1985]
(a) Frankland's reaction (b) Wurtz reaction
(c) Cannizzaro reaction (d) Kolbe's reaction
87. Which of the following compounds will form a hydrocarbon on reaction with Grignard reagent [CPMT 1988, 93]
(a) $\text{CH}_3\text{CH}_2\text{OH}$ (b) CH_3CHO
(c) CH_3COCH_3 (d) $\text{CH}_3\text{CO}_2\text{CH}_2$
88. Name the hydrocarbon that is a liquid at STP
(a) Ethane (b) Propane
(c) *n*-butane (d) *n*-pentane
89. Which statement is not true concerning alkanes [MP PET 2003]
(a) Large number alkanes are soluble in water
(b) All alkanes have a lower density than water
(c) At room temperature some alkanes are liquids, some solids and some gases
(d) All alkanes burn
90. Fischer Tropsch process is used for the manufacture of [DCE 1999; MP PET 2003]
(a) Synthetic petrol (b) Thermosetting plastics
(c) Ethanol (d) Benzene
91. Which one of the following compounds cannot be prepared by Wurtz reaction [Kurukshetra CEE 2002; MP PMT 2002; MP PET 2003]
(a) CH_4 (b) C_2H_6
(c) C_3H_8 (d) C_4H_{10}
92. A fuel contains 25 % *n*-heptane and 75 % iso-octane. Its octane number is [MP PMT 1993; MP PET 1994]
(a) 50 (b) 75
(c) 100 (d) 25
93. Sodium ethoxide is a specific reagent for [CPMT 1985]
(a) Dehydration
(b) Dehydrogenation
(c) Dehydrohalogenation
(d) Dehalogenation
94. Which of the following has highest percentage of hydrogen [CPMT 1975; 79]
(a) CH_4 (b) C_2H_4
(c) C_6H_6 (d) C_2H_2
95. What is the molecular formula of the alkane, the 5.6 litre of which weight 11 g at STP [MP PMT 2003]
(a) C_6H_{14} (b) C_4H_{10}
(c) C_3H_8 (d) C_2H_6
96. The reference compound 'iso-octane' which is used in determining the octane number of gasoline has the structure [CPMT 1981]
(a) $\text{CH}_3 - \text{CH}(\text{CH}_3) - \text{CH}(\text{CH}_3) - \text{CH}(\text{CH}_3) - \text{CH}_3$
(b) $\text{CH}_3 - \text{C}(\text{CH}_3)_2 - \text{CH}_2 - \text{CH}(\text{CH}_3) - \text{CH}_3$
(c) $\text{CH}_3 - \text{C}(\text{CH}_3)_2 - \text{CH}(\text{CH}_3) - \text{CH}_2 - \text{CH}_3$
(d) $\text{CH}_3 - \text{C}(\text{CH}_3)_2 - \text{C}(\text{CH}_3)_2 - \text{CH}_3$
97. Sample of 2, 3-dibromo-3-methylpentane is heated with zinc dust. The resulting product is isolated and heated with *H/I* in the presence of phosphorus. Indicate which is the structure that represent the final organic product formed in the reaction

- (a) $\text{CH}_3 - \text{CH}_2 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \text{CH}_3$
- (b) $\text{CH}_2 = \text{CH} - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \text{CH}_3$
- (c) $\text{CH}_3 - \text{CHI} - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \text{CH}_3$
- (d) $\text{CH}_2 = \text{CH} - \underset{\text{CH}_3}{\text{C(I)}} - \text{CH}_2 - \text{CH}_3$
98. The order of appearance of the following with rising temperature during the refining of crude oil is [MNR 1993; UPSEAT 2002]
- (a) Kerosene oil, gasoline, diesel
(b) Diesel, gasoline, kerosene oil
(c) Gasoline, diesel, kerosene oil
(d) Gasoline, kerosene oil, diesel
99. When sodium propionate is heated with soda lime, the main product is [AMU 2002]
- (a) Ethane (b) Methane
(c) Propane (d) Butane
100. Gasoline is a mixture of alkanes with the number of carbon atoms [CPMT 1983, 84; BVP 2003]
- (a) $\text{C}_3 - \text{C}_5$ (b) $\text{C}_5 - \text{C}_6$
(c) $\text{C}_6 - \text{C}_8$ (d) $\text{C}_7 - \text{C}_9$
101. The final product of complete oxidation of hydrocarbons is [CPMT 1981]
- (a) Acid (b) Aldehyde
(c) $\text{H}_2\text{O} + \text{CO}_2$ (d) Dihydric alcohol
102. Which of the following will have least hindered rotation about carbon-carbon bond [IIT-JEE 1987; CPMT 1989, 94]
- (a) Ethane (b) Ethylene
(c) Acetylene (d) Hexachloroethane
103. Which of the following represents the most oxidized form of hydrocarbon [MP PMT/PET 1988]
- (a) CO_2 (b) RCHO
(c) RCOOH (d) RCOOOH
104. Name the reaction
 $\text{C}_{10}\text{H}_{22} \xrightarrow{900\text{ K}} \text{C}_4\text{H}_8 + \text{C}_6\text{H}_{14}$ [MP PET 1995; MP PMT 1997]
- (a) Alkylation (b) Cracking
(c) Pyrolysis (d) Fractionation
105. How many types of carbon atoms are present in 2, 2, 3-trimethylpentane
- (a) One (b) Two
(c) Three (d) Four
106. Which one gives only one monosubstitution product on chlorination
- (a) *n*-pentane (b) Neopentane
(c) Isopentane (d) *n*-butane
107. CH_4 is formed when [AFMC 1987]
- (a) Sodium acetate is heated with sodalime
(b) Iodomethane is reduced
(c) Aluminium carbide reacts with water
(d) All of these
108. A mixture of methane, ethylene and acetylene gases is passed through a Wolf's bottle containing ammoniacal cuprous chloride. The gas coming out is [NCERT 1976]
- (a) Methane
(b) Acetylene
(c) A mixture of methane and ethylene
(d) The original mixture
109. At room temperature solid paraffin is [RPET/PMT 1999]
- (a) C_3H_8 (b) C_8H_{18}
(c) C_4H_{10} (d) $\text{C}_{20}\text{H}_{42}$
110. Which one of the following compounds does not give addition reactions [MADT Bihar 1981]
- (a) Aldehydes (b) Alkanes
(c) Alkenes (d) Alkynes
(e) Ketones (f) All of these
111. The most important method of preparation of hydrocarbons of lower carbon number is [CBSE PMT 1989]
- (a) Pyrolysis of higher carbon number hydrocarbons
(b) Electrolysis of salts of fatty acids
(c) Sabatier and Senderen's reaction
(d) Direct synthesis
112. The inorganic origin of petroleum is indicated by the fact that [CPMT 1983, 84; BVP 2003]
- (a) Its constituents can be separated by fractional distillation
(b) Carbon and hydrocarbon can combine by absorption of solar energy to give hydrocarbons
(c) Petroleum contains traces of chlorophyll
(d) Oil fields are located with the help of seismograph
113. Which of the following is a gemdihalide [CPMT 1976, 88]
- (a) $\text{CH}_3\cdot\text{CHBr}\cdot\text{CHBr}\cdot\text{CH}_3$ (b) $\text{CH}_2\text{Br}\cdot\text{CH}_2\text{Br}$
(c) $\text{CHBr} = \text{CHBr}$ (d) CH_3CHBr_2
114. Which one of the following contain isopropyl group [BHU 2005]
- (a) 2,2,3,3-tetramethylpentane
(b) 2-methylpentane
(c) 2,2,3-trimethylpentane
(d) 3,3-dimethylpentane
115. Natural gas is a mixture of [MP PMT 1986]
- (a) $\text{CO} + \text{CO}_2$ (b) $\text{CO} + \text{N}_2$
(c) $\text{CO} + \text{H}_2 + \text{CH}_4$ (d) $\text{CH}_4 + \text{C}_2\text{H}_6 + \text{C}_3\text{H}_8$
116. By Wurtz reaction, a mixture of methyl iodide and ethyl iodide gives
- (a) Butane
(b) Ethane
(c) Propane
(d) A mixture of the above three
117. Product obtained by nitration of propane is [RPMT 2003]
- (a) Nitropropane (b) Nitromethane
(c) Nitroethane (d) All of these
118. Isomerism in saturated hydrocarbons is due to
- (a) Change in the valence of carbon
(b) Change in the ratio of elements in compounds
(c) Formation of branches in the chain of C atoms
(d) Formation of double bond
119. Photochemical chlorination of alkane is initiated by a process of [DPMT 1985; NCERT 1973]
- (a) Pyrolysis (b) Substitution
(c) Homolysis (d) Peroxidation

120. Which of the following is not linked with methane
(a) Marsh gas (b) Natural gas
(c) Producer gas (d) Coal gas
121. Which of the following has highest octane number [MP PET 1996]
(a) *n*-hexane
(b) *n*-heptane
(c) *iso*-octane
(d) *n*-heptane and *iso*-octane mixed in ratio 50 : 50
122. A mixture of ethyl iodide and *n*-propyl iodide is subjected to Wurtz reaction. The hydrocarbon that will not be formed is [IIT-JEE (Screening) 1990]
(a) *n*-butane (b) *n*-propane
(c) *n*-pentane (d) *n*-hexane
123. Most of the hydrocarbons from petroleum are obtained by [CPMT 1974, 80]
(a) Fractional distillation (b) Fractional crystallization
(c) Vaporization (d) Polymerization
124. Which is the best antiknock compound or Which one of the following substances is used as an antiknock compound [CPMT 1974, 81, 99, 2000; RPMT 2002; CBSE PMT 1996; KCET (Med.) 2000 MP PET 1985, 87, 97, 2001; MP PMT 1994, 96; AIIMS 2000]
(a) Lead tetrachloride (b) Lead acetate
(c) Zinc ethyl (d) Tetraethyl lead (TEL)
125. In the dichlorination reaction of propane, mixture of products are obtained. How many isomers, the mixture contains
(a) 2 (b) 3
(c) 4 (d) 5
126. Which of the following cycloalkane gives open chain compound, when reacts with bromine [Orissa JEE 2003]
(a) Cyclopropane (b) Cyclopentane
(c) Cyclohexane (d) Cyclo-octane
127. Grignard reagent is not prepared in aqueous medium but prepared; in ether medium because the reagent [KCET 2002]
(a) Reacts with water
(b) Is insoluble in water
(c) Is highly reactive in ether
(d) Becomes inactive in water
128. A sample of petrol is a mixture of 30% *n*-heptane and 70% *iso*-octane. The sample has octane number [MP PET 1985]
(a) 30 (b) 70
(c) 15 (d) 35
129. For the reduction of ketones to hydrocarbon, the appropriate agent is [DPMT 2002]
(a) *HI* (b) *Zn - Hg / HCl*
(c) Red phosphorous (d) *H₂SO₄*
130. Heating of alkanes with fuming sulphuric acid or oleum at high temperature, which forms sulphonic acid, is called [MH CET 1999]
(a) Nitration (b) Halogenation
(c) Sulphonation (d) Oxidation
131. Propane is obtained from propene by which method ? [CPMT 1997; CBSE PMT 2001; AFMC 2001; MH CET 2001]
(a) Catalyst hydrogenation (b) Wurtz reaction
(c) Dehydrogenation (d) Frankland reaction
132. B.P. of branched chain alkanes as compared to straight chain alkanes are [MP PMT 1987; AIIMS 1999]
(a) Lower
(b) Equal
(c) Higher
(d) Independent of the chain
133. Daily use candles (paraffin wax) contain [CPMT 1996]
(a) Higher saturated hydrocarbon
(b) Lower saturated hydrocarbon
(c) Higher unsaturated hydrocarbon
(d) Lower unsaturated hydrocarbon
134. The reaction $CH_4 + Cl_2 \xrightarrow{uv \text{ light}} CH_3Cl + HCl$ is an example of [CBSE PMT 1999, 2002]
(a) Addition reactions (b) Substitution reaction
(c) Elimination reaction (d) Rearrangement reaction
135. Normal butane convert into isobutane by [RPMT 2002]
(a) *LiAlH₄* (b) *AlCl₃*
(c) *NaBH₄* (d) *Zn / HCl*
136. Alcoholic solution of *KOH* is used for [CPMT 1982, 86; IIT-JEE 1990]
(a) Dehydration (b) Dehydrogenation
(c) Dehydrohalogenation (d) Dehalogenation
137. Aluminium carbide on reacting with water gives [NCERT 1981; MP PET 1985]
(a) Methane (b) Ethane
(c) Ethene (d) Ethyne
138. Maximum carbon-carbon bond distance is found in [MP PMT 1987; IIT-JEE 1981; Bihar MEE 1995]
(a) Ethyne (b) Ethene
(c) Ethane (d) Benzene
139. Which of the following reaction is expected to readily give a hydrocarbon product in good yields [CBSE PMT 1997]
(a) $RCOOK \xrightarrow{\text{Oxidation Electrolysis}}$
(b) $RCOOAg \xrightarrow{I_2}$
(c) $CH_3 - CH_3 \xrightarrow[h\nu]{Cl_2}$
(d) $(CH_3)_2CCl \xrightarrow{C_2H_5OH}$
140. Out of the following fractions of petroleum, the one having the lowest boiling point is or Which of the following is obtained at lowest temperature by fractional distillation of petroleum [MP PMT 1993; MP PET 1993]
(a) Kerosene (b) Diesel oil
(c) Gasoline (d) Heavy oil
141. The marsh gas detector used by miners works on the principle of
(a) Difference in the rates of diffusion of gases
(b) Avogadro's hypothesis
(c) Gay-Lussac's law of gaseous volumes
(d) Berzelius hypothesis
142. Methane can be prepared by [DCE 2001]
(a) Wurtz's reaction (b) Decarboxylation
(c) Hydrogenation reaction (d) All of these
143. The most strained cycloalkane is [IIT-JEE 1981]
(a) Cyclopropane (b) Cyclobutane
(c) Cyclopentane (d) Cyclohexane
144. Which does not react with chlorine in dark [Pb. PMT 2000]
(a) *C₂H₄* (b) *C₂H₂*
(c) *CH₄* (d) *CH₃CHO*

145. Main constituent of *marsh gas* is [IIT-JEE 1980; MP PMT 1994; AFMC 1997]
 (a) C_2H_2 (b) CH_4
 (c) H_2S (d) CO
146. Which of the following method can be used for the preparation of methane
 (a) Wurtz reaction (b) Kolbe's reaction
 (c) Reduction of alkyl halide (d) Hydrogenation of alkene
147. Which hydrocarbon will be most stable [MP PET 2000, 03]
 (a) Methane (b) Ethane
 (c) Propane (d) Butane
148. C-H bond length is greatest in [IIT-JEE 1989; MNR 1990; AMU 2002]
 (a) C_2H_2 (b) C_2H_4
 (c) C_2H_6 (d) $C_2H_2Br_2$
149. Which one of the following compounds does not form an ozonide
 (a) Ethene (b) Propyne
 (c) Propene (d) Propane
150. Which type of hybridisation occurs in ethylene [CBSE PMT 1991; Bihar MEE 1996; JIPMER 1997]
 (a) sp (b) sp^2
 (c) sp^3 (d) sp^3d
151. Silver acetylide when heated with HCl gives
 (a) C_2H_2 (b) H_2
 (c) C_2H_4 (d) None of these
152. When sodium reacts with ethyl iodide, which of the following hydrocarbons is produced [NCERT 1984; BHU 1982]
 (a) Methane (b) Ethane
 (c) Butane (d) Ethene
153. Solid methane is [DPMT 1983; CBSE PMT 1989]
 (a) Molecular solid (b) Ionic solid
 (c) Covalent solid (d) Not possible
154. The shape of ethane is [Bihar CEE 1995]
 (a) Triangular (b) Tetrahedral
 (c) Linear (d) None of these
155. CH_3MgI will give methane with [Roorkee 1995]
 (a) C_2H_5OH (b) $CH_3 - CH_2 - NH_2$
 (c) $CH_3 - CO - CH_3$ (d) All of these
156. Propane-1-ol can be prepared from propene by its reaction with
 (a) CH_3COOH (b) H_3BO_3
 (c) $B_2H_6 / NaOH, H_2O_2$ (d) H_2SO_4 / H_2O
157. The process in which higher hydrocarbons are broken down into lower hydrocarbons by controlled pyrolysis, is called [MP PMT 2002]
 (a) Hydrolysis (b) Cracking
 (c) Oxidation (d) Reduction
158. Successive alkanes differ by [MP PMT 2002]
 (a) $\text{>}CH_2$ (b) $\text{>}CH$
 (c) $-CH_3$ (d) C_2H_4
159. General formula of alkane is [EAMCET 1979; Manipal MEE 1995]
 (a) C_nH_{2n+2} (b) C_nH_{2n-1}
 (c) C_nH_{2n} (d) C_nH_{2n+1}
160. Methane and ethane both can be prepared in one step by which of the following compound [BHU 2004]
 (a) C_2H_4 (b) CH_3O
 (c) CH_3Br (d) CH_3CH_2OH
161. Photochemical chlorination of alkane is initiated by a process of
 (a) Pyrolysis (b) Substitution
 (c) Cracking (d) Peroxidation
 (e) Homolysis
162. A petroleum fraction having boiling range $70-200^\circ C$ and containing 6-10 carbon atoms per molecule is called [UPSEAT 2004]
 (a) Natural gas (b) Gas oil
 (c) Gasoline (d) Kerosene
163. Producer gas is a mixture of [Pb. CET 2002; UPSEAT 2004]
 (a) CO and N_2 (b) CO_2 and H_2
 (c) N_2 and O_2 (d) CH_4 and N_2
164. The highest boiling point is expected for [DEC. 2003]
 (a) n -butane
 (b) iso-octane
 (c) n -octane
 (d) 2,2,3,3-tetramethyl butane
165. Which of the following is a good conductor of heat of electricity [EAMCET 1997]
 (a) Diamond (b) Graphite
 (c) Anthracite (d) Charcoal
166. Which one of the following has the minimum boiling point [AIEEE 2004]
 (a) 1-Butene (b) 1-Butyne
 (c) n -Butane (d) Isobutane
167. Octane number can be changed by [AFMC 2004]
 (a) Isomerisation (b) Alkylation
 (c) Cyclisation (d) All of these
168. Gasoline has composition [AFMC 2004]
 (a) $C_8 - C_{12}$ (b) $C_2 - C_5$
 (c) $C_6 - C_{11}$ (d) None of these
169. The complete combustion of CH_4 gives [BHU 2004]
 (a) $CO + H_2$ (b) $CO + N_2$
 (c) $CO_2 + H_2O$ (d) $CO + N_2O$
170. Which of the following has highest knocking [UPSEAT 2004]
 (a) Olefins
 (b) Branched chain olefins
 (c) Straight chain olefins
 (d) Aromatic hydrocarbons
171. Which one of the following compounds gives methane on treatment with water [MP PMT 2003] [Kerala PMT 2004; MH CET 2004]
 (a) Al_4C_3 (b) CaC_2
 (c) VC (d) SiC
 (e) B_4C
172. Pick out the alkane which differs from the other members of the group. [KCET 2004]
 (a) 2,2-dimethyl propane
 (b) Pentane
 (c) 2-methyl butane
 (d) 2,2-dimethyl butane
173. 2-Methylbutane on reacting with bromine in the presence of sunlight gives mainly [AIEEE 2005]
 (a) 1-bromo-2-methylbutane
 (b) 2-bromo-2-methylbutane
 (c) 2-bromo-3-methylbutane
 (d) 1-bromo-3-methylbutane
174. Of the five isomeric hexanes, the isomer which can give two monochlorinated compounds is [AIEEE 2005]
 (a) n -hexane
 (b) 2, 3-dimethylbutane

- (c) 2, 2-dimethylbutane
(d) 2-methylpentane
175. The product obtained on reaction of C_2H_5Cl with hydrogen over palladium carbon is [AFMC 2005]
- (a) C_3H_8 (b) C_4H_{10}
(c) C_2H_6 (d) C_2H_4

Alkene

1. Addition of bromine to 1, 3-butadiene gives [CPMT 1987, 93]
- (a) 1, 2 addition product only
(b) 1, 4 addition product only
(c) Both 1, 2 and 1, 4 addition products
(d) No reaction
2. When ethylene bromide is treated with Zn , we get [RPMT 1997]
- (a) Alkane (b) Alkene
(c) Alkyne (d) All
3. Ethene when treated with Br_2 in the presence of CCl_4 which compound is formed [RPMT 1997; DCE 2001; KCET (Med.) 1999]
- (a) 1, 2-dibromoethane
(b) 1-bromo-2-chloroethane
(c) Both (a) and (b)
(d) 1, 1, 1-tribromoethane
4. In a reaction

Where M = molecule; R = reagent M and R are

[CBSE PMT 1997; CPMT 2001]

- (a) CH_3CH_2Cl and $NaOH$
(b) $CH_2Cl - CH_2OH$ and aq. $NaHCO_3$
(c) CH_3CH_2OH and HCl
(d) $CH_2 = CH_2$ and heat
5. Alkenes usually show which type of reaction [AIIMS 1999; MADT Bihar 1980]
- (a) Addition (b) Substitution
(c) Elimination (d) Superposition
6. The propene reacts with HBr to form [AIIMS 1999; RPET 1999]
- (a) Ethane (b) Hexane
(c) 1-bromo-propane (d) 2-bromo propane
7. Ethylene may be obtained by dehydration of which of the following with concentrated H_2SO_4 at $160 - 170^\circ C$ [RPET 1999]
- (a) C_2H_5OH (b) CH_3OH
(c) $CH_3CH_2CH_2OH$ (d) $(CH_3)_2CHCH_2OH$

8.

X in the above reaction is

[CPMT 1985, 93]

- (a) HNO_3 (b) O_2
(c) O_3 (d) $KMnO_4$
9. The disappearance of the characteristic purple colour of $KMnO_4$ in its reaction with an alkene is the test for unsaturation. It is known as [CPMT 1989, 94; CBSE PMT 1990]
- (a) Markownikoff's test (b) Baeyer's test
(c) Wurtz's test (d) Grignard test
10. A gas formed by the action of alcoholic KOH on ethyl iodide, decolourises alkaline $KMnO_4$. The gas is [KCET 2003]
- (a) C_2H_6 (b) CH_4
(c) C_2H_2 (d) C_2H_4
11. $CH_3 - CH_2 - Cl \xrightarrow{\text{alc.KOH}} A$, the product is [CPMT 2003]
- (a) CH_3CH_2OK (b) CH_3CHO
(c) $CH_3CH_2OCH_2CH_3$ (d) $CH_2 = CH_2$
12. The final product formed when ethyl bromide is treated with excess of alcoholic KOH is [MP PET 1999]
- (a) Ethylene (b) Ethane
(c) Ethyne (d) Vinyl bromide
13. Which of the following hydrocarbons cannot be obtained by Sabatier and Senderen's reaction
- (a) CH_4 (b) C_2H_6
(c) C_3H_8 (d) All
14. When 3, 3-dimethyl-2-butanol is heated with H_2SO_4 the major product obtained is [CBSE PMT 1995]
- (a) *cis* and *trans* isomers of 2, 3-dimethyl-2-butene
(b) 3, 3-dimethyl-1-butene
(c) 2, 3-dimethyl-2-butene
(d) 2, 3-dimethyl-1-butene
15. The intermediate during the addition of HCl to propene in the presence of peroxide is [IIT-JEE 1997]
- (a) $CH_3 \dot{C}HCH_2Cl$ (b) $CH_3^+CHCH_3$
(c) $CH_3CH_2\dot{C}H_2$ (d) $CH_3CH_2CH_2^+$
16. $CH_2 = CH_2 \xrightarrow[\text{KOH / H}_2\text{O}]{KMnO_4} X$. Product ' X ' in above reaction is [RPMT 2003]
- (a) Ethylene glycol (b) Glucose
(c) Ethanol (d) All of these
17. Which of the following compounds represents acrylonitrile [JIPMER 1997]
- (a) Vinyl cyanide (b) Cyanoethene
(c) Prop-2-ene nitrile (d) All of them
18. When acetylene reacts with arsenic trichloride in the presence of anhydrous aluminium chloride, it produces [AFMC 1999]
- (a) Lewisite
(b) β -chlorovinyl dichloroarsine
(c) Nitrobenzene
(d) Both (a) and (b)
19. Ozonolysis of which one of the following will give two molecules of acetaldehyde

- [Bihar MEE 1997; MP PET 2000]
- (a) 1-butene (b) 2-butene
(c) 1-pentene (d) 2-pentene
(e) None of these
20. In which of the following, addition of HBr does not take place against Markownikoff's rule or Anti-Markownikoff addition of HBr is not observed for [IIT-JEE 1985; CBSE PMT 1994; MADT Bihar 1995; MP PMT 1999; AMU 2002]
- (a) Propene (b) But-1-ene
(c) But-2-ene (d) Pent-2-ene
21. Which one of the following characteristics apply to both ethene and ethyne [NCERT 1990]
- (a) Explode when mixed with chlorine
(b) Decolourise Baeyer's reagent giving brown precipitate
(c) Rapidly absorbed by cold conc. H_2SO_4
(d) Form white precipitate with silver nitrate solution
22. Which of the following has highest knocking property
- (a) Aromatic hydrocarbons
(b) Olefins
(c) Branched chain paraffins
(d) Straight chain paraffins
23. Dilute aqueous $KMnO_4$, at room temperature reacts with $R-CH=CH-R$ to give [Roorkee 1992]
- (a) $R-CHO$ (b) $R-COOH$
(c) $RCHO-CHOHR$ (d) $CO_2 + H_2O$
24. Aqueous sulphuric acid reacts with 2-methyl-1-butene to give predominantly [Roorkee 1992]
- (a) Isobutyl hydrogen sulphate
(b) 2-methyl-2-butanol
(c) 2-methyl-1-butanol
(d) Secondary butyl hydrogen sulphate
25. How can ethene be produced from ethanol [BHU 1996]
- (a) By dehydrohalogenation
(b) By dehydrogenation
(c) By dehydration with conc. H_2SO_4 at $170^\circ C$
(d) By reduction with hydrogen iodide
26. Baeyer's reagent is used in the laboratory for [CBSE PMT 1991, 92; AIIMS 1998; AFMC 1999]
- (a) Detection of double bonds
(b) Detection of glucose
(c) Reduction
(d) Oxidation
27. Isopropyl alcohol is obtained by reacting which of the following alkenes with conc. H_2SO_4 and H_2O [MP PMT 1999]
- (a) Ethylene (b) Propylene
(c) 2-methyl propene (d) Isoprene
28. Which of the following compound is produced when $CH_2=CH-(CH_2)_2COOH$ reacts with HBr in presence of peroxides [AIIMS 2000]
- (a) $CH_3CH(CH_2)_5COOH$
(b) $BrCH_2CH_2(CH_2)_5COOH$
(c) $CH_3CH_2CH_2(CH_2)_5COOH$
(d) $CH_3CH_2BrCH_2CH_2COOH$
29. One mole of each of the following alkenes is catalytically hydrogenated. The quantity of heat evolved will be the lowest in the case of [Roorkee 2000]
- (a) 1-butene (b) Trans-2-butene
(c) Cis-2-butene (d) 1, 3-butadiene
30. Which of the following is not used to distinguish ethene from ethane [KCET (Med.) 2001; UPSEAT 2002; CBSE PMT 2002]
- (a) Iodine in CCl_4 (b) Bromine in CCl_4
(c) Alkaline $KMnO_4$ (d) Ammonical Cu_2Cl_2
31. A hydrocarbon X adds on one mole of hydrogen to give another hydrocarbon and decolourised bromine water. X reacts with $KMnO_4$ in presence of acid to give two moles of the same carboxylic acid. The structure of X is [JIPMER 2001]
- (a) $CH_2=CH-CH_2CH_2CH_3$
(b) $CH_3CH_2CH_2-CH=CHCH_3$
(c) $CH_3CH_2CH=CHCH_2CH_3$
(d) $CH_3CH=CHCH_2CH_2CH_3$
32. When 2-bromobutane reacts with alcoholic KOH , the reaction is called [KCET (Med.) 2001]
- (a) Halogenation (b) Hydrogenation
(c) Chlorination (d) Dehydro-halogenation
33. 1, 3-butadiene reacts with ethylene to form [BHU 2001]
- (a) Benzene (b) Cyclohexane
(c) Cyclohexene (d) 2, 3 dimethyl butane
34. Ethylene reacts with ozone gas to form the compound
- (a) $HCHO$ (b) C_2H_5OH
(c) $O \begin{array}{c} \diagup CH_2-O \\ | \\ CH_2-O \end{array}$ (d) CH_3CHO
35. Oils are converted into fats by [Kerala (Med.) 2002]
- (a) Hydration (b) Decarboxylation
(c) Hydrogenation (d) Dehydrogenation
(e) Hydrogenolysis
36. Which process converts olefins into paraffins [MP PET 2002]
- (a) Halogenation (b) Dehydration
(c) Hydrogenation (d) Hydrolysis
37. Of the following the formula which represents a saturated cyclic compound is [AMU 1983]
- (a) C_3H_6 (b) C_3H_8
(c) C_8H_{10} (d) C_8H_{12}
38. In a reaction, if half of the double bond is broken and two new bonds are formed, this is a case of [AMU 1983; NCERT 1978; CPMT 1983]
- (a) Elimination (b) Addition
(c) Displacement (d) Rearrangement
39. Which of the following are formed on addition reaction of DCI with 3-methyl-1-butene [Roorkee 2000]
- (a) $CH_2DCHClCH(CH_3)_2$ (b) $CH_2DCH_2CCl(CH_3)_2$
(c) $CH_3CDCI CH(CH_3)_2$ (d) $ClCH_2CHDCH(CH_3)_2$
40. Major product of the following reaction is [MP PMT 1986]
- $$CH_3 - \overset{\overset{Br}{|}}{\underset{\underset{H}{|}}{C}} - CH_2 - CH_3 + alc. KOH \rightarrow$$
- (a) Butene-1 (b) Butene-2
(c) Butane (d) Butyne-1
41. Cyclopentene on treatment with alkaline $KMnO_4$ gives [CPMT 1987]
- (a) Cyclopentanol
(b) *trans* 1, 2-cyclopentanediol
(c) *cis* 1, 2-cyclopentanediol
(d) 1 : 1 mixture of *cis* and *trans* 1, 2-cyclopentanediol

42. Which of the following is the most stable alkene
[AIIMS 1998; KCET (Med.) 2000; CPMT 2003]
(a) $R_2C = CR_2$ (b) $RCH = CHR$
(c) $RCH_2 = CH_2R$ (d) $CH_2 = CH_2$
43. Ethene gives with acidic $KMnO_4$ solution [MP PMT 1997]
(a) Ethylene glycol (b) Ethylene oxide
(c) Formaldehyde (d) Acetaldehyde
44. In paraffins, with the increasing molecular weight, it is found that
(a) Freezing point decreases
(b) Boiling point decreases
(c) Boiling point increases
(d) Vapour pressure decreases
45. When alcoholic solution of ethylene dibromide is heated with granulated zinc, the compound formed is [CPMT 1990]
(a) Ethylene (b) Ethyne
(c) Cyclobutane (d) Butane
46. A gas formed by the action of alcoholic KOH on ethyl iodide, decolorises alkaline $KMnO_4$ solution. The gas is
[CPMT 1974, 91; MP PET 1985; IIT-JEE 1982]
(a) CH_4 (b) C_2H_6
(c) C_2H_4 (d) C_2H_2
47. Markownikoff's rule provides guidance of addition of HBr on [MNR 1994]
(a) $CH_2 = CH_2$ (b) $CH_3 - CH_2 - CH_3$
(c) $CH_3CH = CHCH_3$ (d) $CH_2 = CHBr$
48. Ethyl bromide gives ethylene when reacted with
[CPMT 1982, 93; RPET 2000; Pb. PMT 2001]
(a) Ethyl alcohol (b) Dilute H_2SO_4
(c) Aqueous KOH (d) Alcoholic KOH
49. Ethylene is prepared by the dehydration of
[CPMT 1974, 79; DPMT 1985; BHU 1989]
(a) Ethyl alcohol (b) Methyl alcohol
(c) Acetic acid (d) Oxalic acid
50. Which reactions are most common in alkenes [Pb. CET 1989]
(a) Electrophilic substitution reactions
(b) Nucleophilic substitution reactions
(c) Electrophilic addition reactions
(d) Nucleophilic addition reactions
51. A mixture of 1-chloropropane and 2-chloropropane when treated with alcoholic KOH gives [NCERT 1990]
(a) 1-propene (b) 2-propene
(c) Isopropylene (d) All the three
52. The compound formed by passing ethylene gas into cold alkaline solution of $KMnO_4$ is
[NCERT 1974, 81; CPMT 1979, 86, 88; MP PET 1985, 95; AFMC 1998]
(a) Ethyl alcohol (b) Acetaldehyde
(c) Acetic acid (d) Ethylene glycol
53. A gas decolourised $KMnO_4$ solution but gives no precipitate with ammoniacal cuprous chloride is or Which of the following gases does not give a precipitate with ammoniacal solution of silver nitrate but decolourizes $KMnO_4$ (neutral or slightly alkaline)
[NCERT 1974, 77; CPMT 1974, 77, 78; MP PET 1996; MP PET 1996, 99]
(a) Ethane (b) Methane
(c) Ethene (d) Acetylene
54. A hydrocarbon reacts with hypochlorous acid to give 1-chloro-2-hydroxyethane. The hydrocarbon is [CBSE PMT 1989]
(a) Ethylene (b) Methane
(c) Ethane (d) Acetylene
55. When ethene is heated at $400^\circ C$ under high pressure, the product is/are [CPMT 1974]
(a) Carbon and H_2 (b) Polyethylene
(c) Acetylene and H_2 (d) None of these
56. Which decolorize aqueous bromine and gives white fumes of HCl on reaction with PCl_5 [Pb. PMT 1999]
(a) $CH_3COCH_2CH = CH_2$
(b) $CH_3CH_2CH_2CH_2CH_3$
(c) $CH_3CH = CHCH_2CH_2OH$
(d) $CH_3OCH_2CH_2CH_2CH_2OH$
57. During debromination of meso-dibromobutane, the major compound formed is [IIT-JEE 1997]
(a) *n*-butane (b) 1-butene
(c) *cis*-2-butene (d) *trans*-2-butene
58. What product is formed when 1-chlorobutane react with alcoholic KOH [RPMT 2002]
(a) 1-butene (b) 2-butene
(c) 1-butanol (d) 2-butanol
59. The olefin which on ozonolysis gives CH_3CH_2CHO and CH_3CHO is [Roorkee 1992]
(a) 1-butene (b) 2-butene
(c) 1-pentene (d) 2-pentene
60. Bond length between carbon-carbon in ethylene molecule is [MP PET 1997]
(a) $1.54 \text{ \AA}$ (b) $1.35 \text{ \AA}$
(c) $1.19 \text{ \AA}$ (d) $2.4 \text{ \AA}$
61. The compound having both sp and sp^2 hybridised carbon atom is
(a) Propene (b) Propyne
(c) Propadiene (d) None of these
62. The halogen which is most reactive in the halogenation of alkenes under sunlight is [IIT-JEE 1981]
(a) Chlorine (b) Bromine
(c) Iodine (d) All equal
63. When ethene reacts with bromine, it forms [AFMC 2000; KCET 2001]
(a) Chloroethane (b) Ethylene dibromide
(c) 1 bromopropane (d) 1,2-dichloroethene
64. Paraffins are soluble in [NCERT 1978]
(a) Distilled water (b) Benzene
(c) Methanol (d) Sea water
65. Addition of HCl to propene in presence of peroxides gives [BHU 1981, 98]
(a) 1-Chloropropane (b) 2-Chloropropane
(c) 3-Chloropropane (d) Propene dichloride
66. The name of the product obtained by the addition of HI to propene in presence of peroxide catalyst is [KCET 2000]
(a) Isopropyl iodide (b) 2-Iodopropene
(c) 2-Iodopropane (d) 1-Iodopropane
67. In the reaction $C_2H_5CH = CH_2 + H - X \rightarrow$ Product. What is the product [BHU 2002]
(a) $C_2H_5 - CH_3$

- (b) $C_2H_5CH_2 - CH_2X$
 (c) $C_2H_5 - CHX - CH_3$
 (d) $CH_3 - CH_2X - CH = CH_2$
68. Alkene can be prepared from alkyl halide by the following reagent
 $R - X + Nu^- \rightarrow \text{Alkene} + NuH$ [RPET 2000]
 (a) Alc. KOH + heat (b) Aq. KOH + cold water
 (c) NaOH (d) LiOH
69. 2-chlorobutane is heated with alcoholic NaOH, the product formed in larger amount is [RPET 1999; AMU 2000]
 (a) 1-Butene (b) 1-Butyne
 (c) 2-Butene (d) All of these
70. Ethylene has high b.p. and high vapour pressure at $100^\circ C$ and does not dissolve in water. Hence ethylene is separated by this method [UPSEAT 1999]
 (a) Simple distillation (b) Vacuum distillation
 (c) Vapour distillation (d) Alkali treatment
71. Addition of bromine to 1, 3-butadiene gives [AMU 1999]
 (a) 1, 4-addition product only
 (b) 1, 2-addition product only
 (c) Both 1, 2-and 1, 4 addition product
 (d) None of these
72. In the presence of peroxide, hydrogen chloride and hydrogen iodide do not give anti-Markovnikoff's addition to alkenes because [IIT-JEE Screening 2001]
 (a) Both are highly ionic
 (b) One is oxidising and the other is reducing
 (c) One of the steps is endothermic in both the cases
 (d) All the steps are exothermic in both the cases
73. The compound most likely to decolourize a solution of potassium permanganate is [NCERT 1978]
 (a) CH_3CH_3
 (b) 
 (c) $CH_3CH = CHCH_2CH_3$
 (d) $CH_3 - \overset{\overset{CH_3}{|}}{C} - CH_3$
 $\quad \quad \quad |$
 $\quad \quad \quad CH_3$
74. Ethylene is converted to X on passing through a mixture of an acidified aqueous solution of palladium chloride and cupric chloride. Which of the following reagents readily take part in addition reaction with X [UPSEAT 2003]
 (a) Br_2 (b) HBr
 (c) HCl (d) HCN
75. Addition of HCl does not obey antimarkownikoff's rule because [UPSEAT 2003]
 (a) It is a strong acid (b) It is a gas
 (c) Its bond energy is high (d) Its bond energy is less
76. Correct statement about 1, 3-dibutene [UPSEAT 2003]
 (a) Conjugated double bonds are present
 (b) Reacts with HBr
 (c) Forms polymer
 (d) All of these
77. At low temperatures, the slow addition of molecular bromine to $CH_2 = CH - CH_2 - C \equiv CH$ gives [Roorkee Qualifying 1998]
 (a) $CH_2 = CH - CH_2 - CBr = CHBr$
 (b) $BrCH_2 - CHBr - CH_2 - C \equiv CH$
 (c) $CH_2 = CH - CH_2 - CH_2 - CBr_3$
 (d) $CH_3 - CBr_2 - CH_2 - C \equiv CH$
78. PCl_5 reacts with propanone, to give [Pb. PMT 2001]
 (a) vic-dichloride (b) Propanal
 (c) propane-chloride (d) gem-dichloride
79. The compounds that will give an isomer of 2, 2-dimethyl propane on catalytic hydrogenation are [AMU 1999]
 (1) $CH_3CH = C - CH_3$ (2) $CH_3CH = CHCH_3$
 $\quad \quad \quad |$
 $\quad \quad \quad CH_3$
 (3) $CH_3\overset{\overset{H}{|}}{C} = CHCH_2CH_3$ (4) $CH_3C = C - CH_3$
 $\quad \quad \quad | \quad \quad |$
 $\quad \quad \quad CH_3 \quad CH_3$
80. Alkene $R - C - H = CH_2$ reacts readily with B_2H_6 and the product on oxidation with alkaline hydrogen peroxides produces
 (a) $R - CH_2 - CHO$ (b) $R - CH_2 - CH_2 - OH$
 (c) $R - C - CH_3$ (d) $R - CH - CH_3$
 $\quad \quad \quad || \quad \quad \quad | \quad |$
 $\quad \quad \quad O \quad \quad \quad OH \quad OH$
81. Bayer's reagent is used for detection of [RPMT 2002]
 (a) Amines (b) Glucose
 (c) Unsaturated bond (d) Alcohol
82. Which of the following is(are) example(s) of nucleophilic addition reaction in case of acetylene
 (a) Addition of water (b) Addition of HCN
 (c) Addition of $AsCl_3$ (d) All
83. Structural formula for lewisite is
 $CHCl$ $CHCl_2$
 (a) $||$ (b) $|$
 $CHAsCl_3$ $CHAsCl_3$
 $CHCl$
 (c) $||$ (d) None of these
 $CHAsCl_2$
84. Propene when heated with chlorine at about $500^\circ C$ forms [MP PET 1997]
 (a) $CH_2Cl.CH = CH_2$ (b) $CH_3.CHCl.CH_2Cl$
 (c) $CH_2Cl.CHCl.CH_2Cl$ (d) All the three
85. PVC is obtained from vinyl chloride by a reaction called
 (a) Addition (b) Isomerization
 (c) Polymerization (d) Substitution
86. Reaction of Br_2 on ethylene in presence of NaCl gives
 (a) $BrCH_2 - CH_2Br$ (b) $ClCH_2 - CH_2Br$
 (c) Both (a) and (b) (d) None of these
87. $CH_3 - CH = CH_2 + HBr \longrightarrow \dots\dots\dots$, the product formed is [AIIMS 1983; CPMT 1997; RPMT 1999, 2003]
 (a) $CH_3 - CH_2 - CH_2 - Br$ (b) $CH_3 - CHBr - CH_3$
 (c) $BrCH_2 - CH = CH_2$ (d) $CH_2 = C = CH_2$
88. The product of reaction between propene and HBr in the presence of a peroxide is
 (a) $CH_3 - CH_2 - CH_2Br$ (b) $CH_3 - CHBr - CH_3$

- (c) $CH_3 - CH_2Br$ (d) $CH_3 - CH = CHBr$ [JIPMER 2002]
89. Ozonolysis of 2-methyl butene-2 yields
(a) Only aldehyde
(b) Only ketone
(c) Both aldehyde and ketone
(d) None of these
90. The final product formed by the ozonolysis of compound $RCH = CR_2$ is [NCERT 1978]
(a) $RCHO$ (b) R_2CO
(c) Both (a) and (b) (d) None of these
91. Which one is an unsaturated compound [BIT 1990]
(a) C_6H_{14} (b) C_4H_8
(c) C_3H_7OH (d) CH_3OH
92. Ethyl alcohol on heating with conc. H_2SO_4 gives [EAMCET 1979; MP PMT 1996]
(a) $CH_3COOC_2H_5$ (b) C_2H_6
(c) C_2H_4 (d) C_2H_2
93. Monohalides on reacting with alcoholic KOH give [MP PET 1982, 86; DPMT 1981; CPMT 1979, 83]
(a) Alkanes (b) Alkenes
(c) Alkynes (d) Aromatic hydrocarbons
94. Ethylene is a member of..... series [BHU 1979]
(a) Alkyne (b) Olefin
(c) Paraffin (d) Amine
95. In a double bond between two carbon atoms of ethene, there are
(a) Two sigma bonds perpendicular to each other
(b) One sigma and one pi bond
(c) Two pi bonds perpendicular to each other
(d) Two pi bonds at an angle of 60°
96. The formation of alkene from alkyl halide is an example of [CPMT 1983; AMU 1982; Pb. CET 1986]
(a) Addition (b) Elimination
(c) Substitution (d) (a) and (c)
97. In the following reaction
$$CH_3 - CH_2 - CH_2 - CH_3 \xrightarrow[475\text{ K}]{H_2SO_4}$$
 [AIIMS 1983]
(a) $CH_3CH = CHCH_3$ predominates
(b) $CH_2 = CHCH_2CH_3$ predominates
(c) Both are formed in equal amounts
(d) The amount of production depends on the nature of catalyst
98. The compound B formed in the following sequences of reactions is
$$CH_3CH_2CH_2OH \xrightarrow{PCl_3} A \xrightarrow{Alca. KOH} B$$
 [NCERT 1981]
(a) Propyne (b) Propene
(c) Propanol (d) Propane
99. n -propyl bromide on treatment with ethanolic potassium hydroxide produces [IIT-JEE 1987; MP PMT 1997]
(a) Propane (b) Propene
(c) Propyne (d) Propanol
100. The dehydrohalogenation of neopentyl bromide with alcoholic KOH mainly gives [IIT-JEE (Screening) 1990; MP PET 1993]
(a) 2-methyl-1-butene (b) 2-methyl-2-butene
(c) 2, 2-dimethyl-1-butene (d) 2-butene
101. Which is the most reactive hydrocarbon in the following
(a) Ethane (b) Ethyne
(c) Ethene (d) Methane [MP PET 1993]
102. Shape of ethylene molecule is
(a) Tetrahedral (b) Pyramidal
(c) Planar (d) Linear
103. Electrophilic addition on a carbon-carbon double bond involves the intermediate formation of a more stable carbocation. This statement is called
(a) Saytzeff's rule (b) Baeyer's effect
(c) Markownikoff's rule (d) None of these
104. $CH_2 = CHCl$ reacts with HCl to form [CPMT 1985, 93]
(a) $CH_2Cl - CH_2Cl$ (b) $CH_3 - CHCl_2$
(c) $CH_2 = CHCl.HCl$ (d) None of these
105. Deviation from Markownikoff's rule occurs in presence of
(a) Zinc (b) Peroxides
(c) $Hg - Zn / HCl$ (d) All of these
106. Presence of peroxides affects the addition of [BHU 1987]
(a) HBr (b) HCl
(c) HI (d) All of these
107. Catalyst used in dimerisation of acetylene to prepare chloroprene is
(a) $HgSO_4 + H_2SO_4$ (b) Cu_2Cl_2
(c) $Cu_2Cl_2 + NH_4Cl$ (d) $Cu_2Cl_2 + NH_4OH$
108. Chloroprene is
(a) 2-chloro-1, 3-butadiene
(b) 3-chloro-1, 3-butadiene [NCERT 1981]
(c) 2, 3-dichlorobutadiene
(d) None of these
109. Chloroprene is used in making [MP PET 1985]
(a) Synthetic rubber (b) Plastic
(c) Petrol (d) All of these
110. When isobutyl magnesium bromide in dry ether is treated with absolute ethyl alcohol, the products formed are [IIT-JEE 1995]
(a) $CH_3 - CH - CH_2OH$ and CH_3CH_2MgBr
$$\quad \quad \quad |$$

$$\quad \quad \quad CH_3$$

(b) $CH_3 - CH - CH_2 - CH_2 - CH_3$ and $Mg(OH)Br$
$$\quad \quad \quad |$$

$$\quad \quad \quad CH_3$$

(c) $CH_3 - CH - CH_3$ and $CH_3 - CH_2OMgBr$
$$\quad \quad \quad |$$

$$\quad \quad \quad CH_3$$

(d) $CH_3 - CH - CH_3, CH_2 = CH_2$ and $Mg(OH)Br$
$$\quad \quad \quad |$$

$$\quad \quad \quad CH_3$$
- III. The predominant product formed, when 3-methyl-2-pentene reacts with $HOCl$, is [IIT-JEE 1995]
(a) $CH_3 - CH_2 - \overset{\overset{Cl}{|}}{\underset{\underset{OH}{|}}{C}} - CH - CH_3$
$$\quad \quad \quad |$$

$$\quad \quad \quad CH_3$$

(b) $CH_3 - CH_2 - \overset{\overset{Cl}{|}}{\underset{\underset{Cl}{|}}{C}} - CH - CH_3$
$$\quad \quad \quad |$$

$$\quad \quad \quad CH_3$$

112. Which of the following occurs easily in ethylene
[MNR 1987; NCERT 1979]

- (a) Addition (b) Substitution
(c) Elimination (d) Rearrangement

113. How many gm of bromine will react with 21 gm C_3H_6
[MP PET 1985]

- (a) 80 (b) 160
(c) 240 (d) 320

114. Conjugate double bond is present in [MP PMT 1987]

- (a) Propylene (b) Butadiene
(c) Isobutylene (d) Butylene

115. On passing vapours of an organic liquid over finely divided Cu at 573K the product was an alkene. This reaction is

- (a) Catalytic oxidation of primary alcohol
(b) Catalytic dehydrogenation of secondary alcohol
(c) Catalytic dehydrogenation of tertiary alcohol
(d) Catalytic dehydration of tertiary alcohol

116. The total number of sigma (σ) and pi (π) bonds in an ethylene molecule are

- (a) $4\sigma, 2\pi$ (b) $4\sigma, 1\pi$
(c) $5\sigma, 2\pi$ (d) $5\sigma, 1\pi$

117. Cyclic hydrocarbon molecule A has all the carbon and hydrogens in a single plane. All the carbon-carbon bonds are of same length and less than $1.54 \text{ \AA}$ but more than $1.34 \text{ \AA}$. C-C-C bond angle will be [CBSE PMT 1989]

- (a) 120° (b) 180°
(c) 100° (d) $109^\circ 28'$

118. General formula of alkenes is

[CPMT 1975, MNR 1987; NCERT 1987; MP PMT 1994]

- (a) C_nH_{2n} (b) $\text{C}_n\text{H}_{2n-2}$
(c) $\text{C}_n\text{H}_{2n+2}$ (d) $\text{C}_n\text{H}_{2n-1}$

119. The product of following reaction is

[MP PMT 1986; MP PET 1997]

120. Which one of the following organic compounds decolourizes an alkaline KMnO_4 solution [CPMT 1987, 93]

- (a) CS_2 (b) C_3H_6
(c) C_3H_8 (d) CH_3OH

121. Decolourization of alkaline KMnO_4 is used as a test for [AMU 1983]

- (a) Aromatic hydrocarbons
(b) Olefinic hydrocarbons
(c) Acetylenic hydrocarbons
(d) Cycloalkanes

122. The reaction

[MP PMT 1996; CBSE PMT 2001; MH CET 2001; BHU 2002]

- (a) Wurtz's reaction
(b) Kolbe's reaction
(c) Sabatier and Senderen's reaction
(d) Carbylamine reaction

123. The alkene which on ozonolysis yields acetone is [MP PMT 1986, 2000]

- (a) $\text{CH}_2 = \text{CH}_2$
(b) $\text{CH}_3 - \text{CH} = \text{CH}_2$
(c) $(\text{CH}_3)_2\text{C} = \text{C}(\text{CH}_3)_2$
(d) $\text{CH}_3 - \text{CH} = \text{CH} - \text{CH}_3$

124. $\text{CH}_3\text{CH} = \text{CHCHO}$ is oxidized to $\text{CH}_3\text{CH} = \text{CHCOOH}$ using [NCERT 1978]

- (a) Alkaline potassium permanganate
(b) Acidified potassium permanganate
(c) Selenium dioxide
(d) Osmium tetroxide

125. The order of increasing reactivity towards HCl of the following compounds will be

- (1) $\text{CH}_2 = \text{CH}_2$
(2) $(\text{CH}_3)_2\text{C} = \text{CH}_2$
(3) $\text{CH}_3\text{CH} = \text{CHCH}_3$ [MP PET 1994]

- (a) $1 < 2 < 3$ (b) $1 < 3 < 2$
(c) $3 < 2 < 1$ (d) $2 < 1 < 3$

126. The reagent which is used to distinguish between propene and propyne is [MP PET 1994; IIT-JEE (Screening) 2000; AIIMS 2000; Pb. PMT 2002; BHU 2003]

- (a) Bromine (b) Alkaline KMnO_4
(c) Ammoniacal AgNO_3 (d) Ozone

127. Which one of the following reactions would be the best for the formation of 2-bromobutane [MP PET 1994]

- (1) $\text{CH}_3\text{CH} = \text{CHCH}_2\text{CH}_3 \xrightarrow{\text{HBr}}$
(2) $\text{CH}_3\text{CH}_2\text{CH} = \text{CH}_2 \xrightarrow{\text{HBr}}$

- (3) $\text{CH}_3\text{CH}=\text{CHCH}_3 \xrightarrow{\text{Br}_2}$
- (4) $\text{CH}_3\text{CH}_2\text{CH}=\text{CH}_2 \xrightarrow[\text{Peroxide}]{\text{HBr}}$
- (a) 1 (b) 2
(c) 3 (d) 4
128. If HCl is added over $\text{CH}_2=\text{C} \begin{array}{l} \nearrow \text{CH}_3 \\ \searrow \text{CH}_3 \end{array}$ then what is formed [CPMT 1996]
- (a) $\text{CH}_2=\text{CH} \begin{array}{l} \nearrow \text{CH}_3 \\ \searrow \text{CH}_3 \end{array}$
|
Cl
- (b) $\text{CH}_2-\text{CH} \begin{array}{l} \nearrow \text{Cl} \\ \searrow \text{CH}_3 \end{array}$
|
CH₃
- (c) $\text{CH}_2=\text{C} \begin{array}{l} \nearrow \text{CH}_3 \\ \searrow \text{CH}_2\text{Cl} \end{array}$
- (d) None of these
129. Position of double bond in an organic compound is determined by [DCE 2001; RPMT 2002]
- (a) Ozonolysis (b) Oxidation
(c) Reduction (d) Hydrogenation
130. A gas decolourises Bayer's reagent but does not react with Tollen's reagent, this gas is [MP PMT 2001]
- (a) Ethene (b) Ethyne
(c) Ethane (d) Methane
131. Formation of 2-butene from 2-bromobutane is according to
- (a) Markownikoff's (b) Bayer
(c) Saytzeff (d) Wurtz
132. An alkene on ozonolysis gave acetaldehyde the alkene is
- (a) Ethylene (b) Propene
(c) 1-butene (d) 2-butene
133. Indicate the organic structure for the product expected when 2-methyl propene is heated with acetyl chloride in presence of anhydrous zinc chloride [CBSE PMT 1989]
- (a) $\text{CH}_3-\text{C} \begin{array}{l} \nearrow \text{CH}_3 \\ \searrow \text{Cl} \end{array}-\text{CH}_2-\text{CO}-\text{CH}_3$
- (b) $\text{CH}_3-\text{C} \begin{array}{l} \nearrow \text{H} \\ \searrow \text{CH}_3 \end{array}-\text{CH}_2-\text{CO}-\text{CH}_3$
- (c) $\text{CH}_3-\text{C} \begin{array}{l} \nearrow \text{O} \\ \searrow \text{O}-\text{C} \begin{array}{l} \nearrow \text{Me} \\ \searrow \text{Me} \\ \searrow \text{Me} \end{array} \end{array}$
- (d) $\text{CH}_3-\text{C} \begin{array}{l} \nearrow \text{O} \\ \searrow \text{C}=\text{CH}_2 \end{array}$
134. The reaction
- $\text{CH}_3-\text{C} \begin{array}{l} \nearrow \text{CH}_3 \\ \searrow \text{OH} \end{array}-\text{CH}_3 \xrightarrow{\text{H}_2\text{SO}_4} \text{CH}_3-\text{C} \begin{array}{l} \nearrow \text{CH}_3 \\ \searrow \end{array}=\text{CH}_2$
- is the example of [AMU 1983]
- (a) Sulphonation (b) Dehydration
- (c) Alkylation (d) Decomposition
135. Olefins can be hydrogenated by [AIIMS 1991]
- (a) Zinc and HCl (b) Nascent hydrogen
(c) Raney Ni and H_2 (d) Lithium hydride in ether
136. Electrolysis of cold concentrated aqueous solution of potassium succinate yields [CPMT 1985; MP PMT 1986]
- (a) Ethane (b) Ethyne
(c) Ethene (d) Ethane-1, 2-diol
137. A hydrocarbon containing 2 carbon atoms gives Sabatier and Senderen's reaction but does not give precipitate with ammoniacal silver nitrate solution. The hydrocarbon in the question is [MADT Bihar 1983]
- (a) Ethane (b) Acetylene
(c) Ethylene (d) None of these
138. The reaction
- $\text{CH}_2=\text{CH}-\text{CH}_3 + \text{HBr} \rightarrow \text{CH}_3\text{CHBr}-\text{CH}_3$ is [CBSE PMT 1996]
- (a) Nucleophilic addition (b) Electrophilic addition
(c) Electrophilic substitution (d) Free radical addition
139. What is the product of the reaction of 1, 3-butadiene with Br_2
- (a) 1,4-dibromobutene (b) 1,2-dibromobutene
(c) 3,4-dibromobutene (d) 2,3-dibromo-2-butene
140. An alkene given two moles of HCHO , one mole of CO_2 and one mole of CH_3COCHO on ozonolysis. What is its structure
- (a) $\text{CH}_2=\text{C}=\text{CH}-\text{CH}_2-\text{CH}_3$
- (b) $\text{CH}_2=\text{CH}-\text{C} \begin{array}{l} \nearrow \text{CH}_3 \\ \searrow \end{array}-\text{CH}=\text{CH}_2$
- (c) $\text{CH}_2=\text{C}=\text{C} \begin{array}{l} \nearrow \text{CH}_3 \\ \searrow \end{array}-\text{CH}_3$
- (d) $\text{CH}_2=\text{C}=\text{C} \begin{array}{l} \nearrow \text{CH}_3 \\ \searrow \end{array}-\text{CH}=\text{CH}_2$
141. In the reaction
- $\text{CH}_3\text{CH}=\text{CH}_2 + \text{H}_2\text{O} + [\text{O}] \xrightarrow[\text{Acid}]{\text{KMnO}_4}$
- $\text{CH}_3-\text{CH} \begin{array}{l} \nearrow \text{OH} \\ \searrow \text{OH} \end{array}-\text{CH}_2 \xrightarrow{[\text{O}]} \text{X} + \text{HCOOH}$
- X is [MP PMT 2002]
- (a) $\text{CH}_3\text{CH}_2\text{COOH}$ (b) CH_3COOH
(c) $\text{CH}_3\text{CH}_2\text{CHO}$ (d) $\text{CH}_3\text{CH}_2\text{OH}$
142. Which of the following alkenes gives only acetic acid and on oxidation with potassium permanganate solution [MP PET 2003]
- (a) Ethylene (b) 1-Butene
(c) Propene (d) 2-Butene
143. Butene-1 may be converted to butane by reaction with [AIEEE 2003]
- (a) Zn-HCl (b) Sn-HCl
(c) Zn-Hg (d) Pd/H_2
144. The major product formed when propene reacts with HBr in presence of peroxides is [NCERT 1980; CBSE PMT 1989]
- (a) *n*-propyl bromide (b) Isopropyl bromide
(c) *n*-propyl alcohol (d) 1, 3-dibromopropane
145. Ethyl hydrogen sulphate is obtained by the reaction of H_2SO_4 on

- (a) Ethylene (b) Ethane
(c) Ethyl chloride (d) Ethanol
146. Ethylene reacts with ozone to give [DPMT 1981]
(a) Formaldehyde (b) Ethyl alcohol
(c) Ozonide (d) Acetaldehyde
147. Which of the following aliphatic compounds will discharge red colour of bromine
(a) C_2H_4 (b) C_3H_6
(c) C_4H_8 (d) All of these
148. Chlorination can be done on
(a) $CH_3 - CH = CH_2$ (b) $CH_2 = CH_2$
(c) $CH \equiv CH$ (d) None of these
149. Addition of HI on the double bond of propene yields isopropyl iodide and not n -propyl iodide as the major product. This is because the addition proceeds through [CPMT 1988]
(a) A more stable carbonium ion
(b) A more stable carbanion
(c) A more stable free radical
(d) None of the above being a concerted reaction
150. When butene-1 is mixed with excess of bromine, the expected reaction product is [CPMT 1974; BHU 1980]
(a) 1, 2-dibromobutane (b) 1, 1-dibromobutane
(c) 2, 2-dibromobutane (d) Perbromobutane
151. A compound 'X' on ozonolysis forms two molecules of $HCHO$. Compound 'X' is [AIIMS 1987; CPMT 1993]
(a) C_2H_4 (b) C_2H_2
(c) C_2H_6 (d) C_6H_6
152. For the reaction
 $CH_3 - CH = CH_2 + HOCl \rightarrow A$ the product A is [Orissa JEE 2002]
(a) $CH_3 - CHCl - CH_2OH$
(b) $CH_3 - \underset{\substack{| \\ OH}}{CH} - CH_2 - Cl$
(c) $CH_3 - CH_2 - CH_2 - COCl$
(d) $CH_3 - \underset{\substack{| \\ OH}}{\overset{\substack{| \\ Cl}}{C}} - CH_3$
153. $(CH_3)_2C = \underset{\substack{| \\ CH_3}}{CH} \xrightarrow[H_2]{Catalyst} \text{Optical isomers}$ [BHU 2003]
(a) 2 (b) 4
(c) Zero (d) 3
154. Isobutene + $HBr \xrightarrow{\text{Peroxide}}$ product is [BHU 2003]
(a) Tertiary butyl bromide (b) Isobutyl bromide
(c) Tertiary butyl alcohol (d) Isobutyl alcohol
155. Which of the following represents the given mode of hybridisation $sp\ sp\ sp$ from left to right [IIT-JEE (Screening) 2003]
(a) $H_2C = CH - C \equiv CH$ (b) $HC \equiv C - C \equiv CH$
(c) $H_2C = C = C = CH_2$ (d) $CH_2 = \text{CH} = \text{CH} = CH_2$
156. "The negative part of addenda adds on to the carbon atom linked with least number of hydrogen atoms". This statement is called [DPMT 1982; AIIMS 1983]
(a) Thiele's principle (b) Bayer's strain theory
(c) Markownikoff's rule (d) Peroxide effect
157. The product obtained, heating ethanol with conc. H_2SO_4 at $165^\circ - 170^\circ$, is [MP PMT 2003]
(a) $(C_2H_5)_2SO_4$ (b) $CH_2 = CH_2$
(c) CH_3COOH (d) $C_2H_5HSO_4$
158. Which of the following is the most stable
(a) 1-butene (b) 2-butene
(c) 1-pentene (d) 2-pentene
159. Which doesn't follow Markownikoff's rule [JEE Orissa 2004; MP PMT 2004; BCECE 2005]
(a) $CH_3 - CH = CH_2$
(b) $CH_3CH = CHCH_3$
(c) $CH_3 - \underset{\substack{| \\ CH_3}}{CH} - CH = CH_2$
(d) $CH_3 - CH_2 - CH = CH_2$
160. The product of acid catalyzed hydration of 2-phenyl propene is [IIT JEE (Screening) 2002]
(a) 3-phenyl-2-propanol (b) 1-phenyl-2-propanol
(c) 2-phenyl-2-propanol (d) 2-phenyl-1-propanol
161. A reagent used to test for unsaturation of alkene is [BHU 2004]
(a) conc. H_2SO_4 (b) Ammonical Cu_2Cl_2
(c) Ammonical $AgNO_3$ (d) Solution of Br_2 in CCl_4
162. Propylene on hydrolysis with sulphuric acid forms [MH CET-2003]
(a) n -propyl alcohol (b) Isopropyl alcohol
(c) Ethyl alcohol (d) Butyl alcohol
163. An alkene, on ozonolysis gives formaldehyde and acetaldehyde. The alkene is : [BVP 2004]
(a) Ethene (b) Propene
(c) Butene-1 (d) Butene-2
164. In the reaction, $H_2C = CH_2 \xrightarrow[\text{cold alkaline } KMnO_4]{\text{cold alkaline } KMnO_4} (A)$:
Product A is : [Pb. CET 2000]
(a) Ethylene glycol (b) Acetic acid
(c) Ethane (d) Butyric acid
165. Using anhydrous $AlCl_3$ as catalyst, which one of the following reaction produces ethylbenzene ($PhEt$) [CBSE PMT 2004]
(a) $H_2C = CH_2 + C_6H_6$
(b) $H_3C - CH_3 + C_6H_6$
(c) $H_3C - CH_2OH + C_6H_6$
(d) $CH_3 - CH = CH_2 + C_6H_6$
166. Which of these does not follow Anti-Markownikoff's rule [Orissa JEE 2005]
(a) 2-butene (b) 1-butene
(c) 2-pentene (d) 2-hexene
167. Reaction of HBr with propene in the presence of peroxide gives
(a) Allyl bromide (b) n -propyl bromide
(c) Isopropyl bromide (d) 3-bromo propane
168. Which of the following react with $KMnO_4$ but does not react with $AgNO_3$? [BCECE 2005]

- (a) C_2H_6 (b) CH_4
(c) C_2H_4 (d) C_2H_2
169. 3-Phenylpropene on reaction with HBr gives (as a major product) [AIIMS 2005]
(a) $C_6H_5CH_2CH(Br)CH_3$
(b) $C_6H_5CH(Br)CH_2CH_3$
(c) $C_6H_5CH_2CH_2CH_2Br$
(d) $C_6H_5CH(Br)CH=CH_2$
170. Reaction of one molecule of HBr with one molecule of 1,3-butadiene at $40^\circ C$ gives predominantly [AIEEE 2005]
(a) 3-bromobutene under kinetically controlled conditions
(b) 1-bromo-2-butene under thermodynamically controlled conditions
(c) 3-bromobutene under thermodynamically controlled conditions
(d) 1-bromo-2-butene under kinetically controlled conditions
171. The only alcohol that can be prepared by the indirect hydration of alkene is [AFMC 2005]
(a) Ethyl alcohol (b) Propyl alcohol
(c) Isobutyl alcohol (d) Methyl alcohol
172. The reaction of HBr with $CH_3 - \overset{\overset{CH_3}{|}}{C} = CH_2$ in the presence of peroxide will give [BHU 2005]
(a) CH_3CBrCH_3 (b) $CH_3CH_2CH_2CH_2Br$
(c) $CH_3\overset{\overset{CH_3}{|}}{CH}CH_2Br$ (d) $CH_3CH_2\overset{\overset{CH_3}{|}}{CH}CH_3$
173. A gas decolourised by $KMnO_4$ solution but gives no precipitate with ammoniacal cuprous chloride is [KCET 2005]
(a) Ethane (b) Methane
(c) Ethene (d) Acetylene
174. Cyclohexene on reaction with OsO_4 followed by reaction with $NaHSO_3$ gives [Orissa JEE 2005]
(a) cis-diol (b) trans-diol
(c) epoxy (d) alcohol
- Alkyne**
1. Which of the following gases is used for welding [CPMT 1996]
(a) Methane (b) Ethane
(c) Acetylene (d) Ethene
2. A metallic carbide on treatment with water gives a colourless gas which burns readily in air and which gives a precipitate with ammoniacal silver nitrate solution. Gas evolved is [NCERT 1975; CPMT 1977; MP PET 2002]
(a) Methane (b) Ethane
(c) Acetylene (d) Ethylene
3. 1-butyne reacts with cold alkaline $KMnO_4$ to produce [AIIMS 1997]
(a) CH_3CH_2COOH
(b) $CH_3CH_2CH_2COOH$
(c) $CH_3CH_2COOH + CO_2$
(d) $CH_3CH_2COOH + HCOOH$
4. Identify the product D in the following series of reaction
 $CH_3COOH \xrightarrow{LiAlH_4} A \xrightarrow[443\text{ K}]{H^+} B \xrightarrow{Br_2} C \xrightarrow[KOH]{alc.} D$ [CBSE PMT 1998]
(a) Methane (b) Alcohol
(c) Acetylene (d) Benzaldehyde
5. The correct order towards bond length is [RPMT 1997]
(a) $C-C < C=C < C \equiv C$ (b) $C \equiv C < C=C < C-C$
(c) $C=C < C \equiv C < C-C$ (d) $C=C < C-C < C \equiv C$
6. In the molecule $CH \equiv C - CH = CH_2$, the hybridisation of $C-C$ bond is [Orissa JEE 2005]
(a) $sp^2 - sp$ (b) $sp^3 - sp^3$
(c) $sp^2 - sp^2$ (d) $sp^3 - sp$
7. The product formed when acetylene is passed through red hot tube is [BHU 1989; RPMT 2003]
(a) Benzene (b) Cyclohexane
(c) Neoprene (d) Ethane
8. Acetylenic hydrogens are acidic because [CBSE PMT 1989; Pb. PMT 1999]
(a) Sigma electron density of $C-H$ bond in acetylene is nearer to carbon, which has 50% s -character
(b) Acetylene has only one hydrogen on each carbon
(c) Acetylene contains least number of hydrogens among the possible hydrocarbons having two carbons
(d) Acetylene belongs to the class of alkynes with molecular formula C_nH_{2n-2}
9. Which is the most suitable reagent among the following to distinguish compound (iii) from rest of the compounds
(i) $CH_3 - C \equiv C - CH_3$
(ii) $CH_3 - CH_2 - CH_2 - CH_3$
(iii) $CH_3 - CH_2 - C \equiv CH$
(iv) $CH_3 - CH = CH_2$ [CBSE PMT 1989]
(a) Bromine in carbon tetrachloride
(b) Bromine in acetic acid
(c) Alkaline $KMnO_4$
(d) Ammoniacal silver nitrate reagent
10. A hydrocarbon of formula C_6H_{10} absorbs only one molecule of H_2 upon catalytic hydrogenation. Upon ozonolysis, the hydrocarbon yields
$$O = \overset{\overset{H}{|}}{C} - CH_2 - CH_2 - CH_2 - CH_2 - \overset{\overset{H}{|}}{C} = O$$

The hydrocarbon is [MP PMT 1986]
(a) Cyclohexane (b) Benzene
(c) Cyclohexene (d) Cyclobutane
11. Poisonous gas 'Lewissite' is obtained by the reaction of [MP PMT 2003]
(a) $CH \equiv CH$ and $AsCl_3$

- (b) $CH_2 = CH_2$ and $AsCl_3$
 (c) $CH \equiv CH$ and S_2Cl_2
 (d) $CH_2 = CH_2$ and $NOCl$
12. Products of the following reaction
 $CH_3C \equiv CCH_2CH_3 \xrightarrow[(2) \text{Hydrolysis}]{(1) O_3} \dots\dots$ are
 [CBSE PMT 2005]
- (a) $CH_3CHO + CH_3CH_2CHO$
 (b) $CH_3COOH + CH_3CH_2CHO$
 (c) $CH_3COOH + HOOCCH_2CH_3$
 (d) $CH_3COOH + CO_2$
13. By coaltar distillation, which is not obtained
 [SCRA 1990; MP PMT 1986]
- (a) Light oil (b) Middle oil
 (c) Heavy oil (d) Mobil oil
14. Hydrocarbon containing following bond is most reactive
 [AIIMS 1987]
- (a) $C \equiv C$ (b) $C = C$
 (c) $C - C$ (d) All of these
15. The shapes of methane, ethene and ethyne molecules are, respectively
- (a) Tetrahedral, planar and linear
 (b) Tetrahedral, linear and planar
 (c) Pyramidal, planar and linear
 (d) Tetrahedral, pyramidal and planar
16. To synthesize the unsymmetrical alkyne
 $CH_3 - C \equiv C - CH_2 - CH_3$ the reagents needed would be
- (a) Ethene, iodoethane, iodomethane and potassium hydroxide
 (b) Acetaldehyde, 1-bromopropane and conc. H_2SO_4
 (c) 1, 2-dichloroethane, 1-propanol and alcoholic potassium hydroxide
 (d) Ethyne, iodomethane, iodoethane and sodamide
17. When propyne is treated with dilute H_2SO_4 and $HgSO_4$, the major product is
 [Kurukshetra CEE 2002]
- (a) Propanal
 (b) Propanol
 (c) Propyl hydrogen sulphate
 (d) Propanone
18. Which of the following will be the final product when C_2H_2 reacts with HCl
 [DPMT 1984; AFMC 1982; Bihar MEE 1982]
- (a) $\begin{array}{c} CH \\ || \\ CHCl \end{array}$ (b) $\begin{array}{c} CH_3 \\ | \\ CHCl_2 \end{array}$
 (c) $\begin{array}{c} CHCl \\ || \\ CHCl \end{array}$ (d) None of these
19. What is the end product of the following sequences of operations
 $CaC_2 \xrightarrow{H_2O} A \xrightarrow[Hg^{++}]{dil. H_2SO_4} B \xrightarrow[H_2]{Ni} C$
 [CPMT 1978; MP PMT 1996]
- (a) Methyl alcohol (b) Acetaldehyde
 (c) C_2H_5OH (d) C_2H_4
20. $R - CH_2 - CCl_2 - R \xrightarrow{\text{Reagent}} R - C \equiv C - R$
- The reagent is [CBSE PMT 1989; MP PET 1995]
- (a) Na (b) HCl and H_2O
 (c) KOH in C_2H_5OH (d) Zn
21. Acetylene can be prepared from [CPMT 1988]
- (a) Potassium fumarate (b) Calcium carbide
 (c) Ethylene bromide (d) All of these
22. Acetylene is obtained by the electrolysis of [BHU 1986]
- (a) Sodium succinate (b) Potassium fumarate
 (c) Both (a) and (b) (d) None of these
23. The compound C_3H_4 has a triple bond, which is indicated by its reaction with [MP PMT 1999]
- (a) Bromine water (b) Bayer's reagent
 (c) Fehling solution (d) Ammonical silver nitrate
24. $CH \equiv CH \xrightarrow[H_2SO_4]{H_2O / Hg^{2+}} X \xrightarrow{LiAlH_4} Y \xrightarrow{P_4 / Br_2} Z$ Here Z is
 [JIPMER 2002]
- (a) Ethylene bromide (b) Ethanol
 (c) Ethyl bromide (d) Ethylidene bromide
25. $CH \equiv CH \xrightarrow[\text{Pressure}]{Ni(CN)_2} X$. Here X in the reaction
 [JIPMER 2002]
- (a) Benzene (b) Ethane
 (c) Cyclooctatetraene (d) Cyclohexane
26. A salt producing hydrocarbon among these compounds is [KCET (Engg.) 2002]
- (a) Ethane (b) Methane
 (c) Ethene (d) Ethyne
27. An unknown compound A has a molecular formula C_4H_6 . When A is treated with an excess of Br_2 a new substance B with formula $C_4H_6Br_4$ is formed. A forms a white precipitate with ammoniacal silver nitrate solution. A may be [MP PET/PMT 1998]
- (a) Butyne-1 (b) Butyne-2
 (c) Butene-1 (d) Butene-2
28. Which of the following reacts with sodium with the elimination of hydrogen [BHU 1983]
- (a) CH_4 (b) C_2H_6
 (c) C_2H_4 (d) C_2H_2
29. Acetylene gives [CPMT 1985]
- (a) White precipitate with $AgNO_3$ and red precipitate with Cu_2Cl_2
 (b) White precipitate with Cu_2Cl_2 and red precipitate with $AgNO_3$
 (c) White precipitate with both the reagents
 (d) Red precipitate with both the reagents
30. The bond length between sp^3 hybridised carbon atom and other carbon atom is minimum in [CBSE PMT 1996; Pb. PMT 1999]
- (a) Propane (b) Butane
 (c) Propene (d) Propyne
31. The $C - H$ bond length is minimum in the bond formed by
- (a) $sp - s$ overlapping (as in alkynes)
 (b) $sp^2 - s$ overlapping (as in alkenes)
 (c) $sp^3 - s$ overlapping (as in alkanes)
 (d) None of these
32. Which of the $C - C$ bond is strongest

- (a) Formed by $sp^3 - sp^3$ hybridised carbon atoms (as in alkanes)
 (b) Formed by $sp^2 - sp^2$ hybridised carbon atoms (as in alkenes)
 (c) Formed by $sp - sp$ hybridised carbon atoms (as in alkynes)
 (d) All are equal
33. Which of the following pairs has the same bond angle
 (a) Ethane and ethylene (b) Ethylene and acetylene
 (c) Ethylene and benzene (d) Acetylene and benzene
34. The product(s) obtained via oxymercuration ($HgSO_4 + H_2SO_4$) of 1-butyne would be [IIT-JEE 1999]
- $$\begin{array}{c} O \\ || \\ CH_3 - CH_2 - C - CH_3 \end{array}$$
- (a) $CH_3 - CH_2 - C(=O) - CH_3$
 (b) $CH_3 - CH_2 - CH_2 - CHO$
 (c) $CH_3 - CH_2 - CHO + HCHO$
 (d) $CH_3CH_2COOH + HCOOH$
35. A compound is treated with $NaNH_2$ to give sodium salt. Identify the compound [AFMC 1998]
- (a) C_2H_2 (b) C_6H_6
 (c) C_2H_6 (d) C_2H_4
36. A gas decolourises bromine in CCl_4 and forms a precipitate with ammoniacal silver nitrate. The gas is [EAMCET 1998]
- (a) C_2H_2 (b) C_2H_4
 (c) C_2H_6 (d) CH_4
37. Among the following compounds which have more than one type of hybridisation for carbon atom
- (i) $CH_3CH_2CH_2CH_3$
 (ii) $CH_3 - CH = CH - CH_3$
 (iii) $CH_2 = CH - C \equiv CH$
 (iv) $H - C \equiv C - H$ [EAMCET 1998]
- (a) (ii) and (iii) (b) (ii)
 (c) (iii) and (iv) (d) (iv)
38. The homologue of ethyne is [EAMCET 1998]
- (a) C_2H_4 (b) C_2H_6
 (c) C_3H_8 (d) C_3H_4
39. When acetylene reacts with HCl in the presence of $HgCl_2$, the product is [MNR 1985; MP PET 1996; UPSEAT 2000]
- (a) Methyl chloride (b) Dichloroethane
 (c) Vinyl chloride (d) Ethylidene chloride
40. When propyne reacts with aqueous H_2SO_4 in the presence of $HgSO_4$, the major product is [IIT-JEE 1983; AFMC 1991; KCET 1993]
- (a) Propanal (b) Propyl hydrogen sulphate
 (c) Acetone (d) Propanol
41. Propyne on polymerisation gives [CPMT 1999, 2002]
- (a) Mesitylene (b) Benzene
 (c) Ethyl benzene (d) Propyl benzene
42. When treated with ammoniacal cuprous chloride, which one among the following forms copper derivative [CBSE PMT 1989; MP PMT 1993]
- (a) C_2H_6 (b) C_2H_4
 (c) C_2H_2 (d) C_6H_6
43. Which of the following catalyst is used in the polymerisation of $CH \equiv CH$ to C_6H_6 [CPMT 1999]
- (a) $AlCl_3$ (b) $HgSO_4$
 (c) $NbCl_3$ (d) HCl
44. $KMnO_4$ will oxidise acetylene to [CPMT 1999]
- (a) Ethylene glycol (b) Ethyl alcohol
 (c) Oxalic acid (d) Acetic acid
45. Ethyne on reaction with dil. H_2SO_4 and $Hg(II)$ gives
- (a) Ethanol
 (b) Ethanal
 (c) Methoxymethane
 (d) Ethyl hydrogen sulphate
46. Which of the following is used to distinguish ethylene and acetylene [MP PET 2000; CPMT 1977; NCERT 1973]
- (a) Alkaline $KMnO_4$
 (b) Bromine water
 (c) Ammoniacal cuprous chloride
 (d) Conc. H_2SO_4
47. The distinguishing test for triple bond containing acidic hydrogen is
- (a) $Ag(NH_3)_2^+$ (b) Br_2 in CCl_4
 (c) Alkaline $KMnO_4$ (d) $AlCl_3$
48. If acetylene is passed through an electric arc in the atmosphere of nitrogen, the compound formed is [RPMT 1999]
- (a) HCN (b) Pyrrole
 (c) Pyrazole (d) Pyridine
49. Ozonolysis of acetylene gives [RPMT 1999]
- (a) Glycol (b) Glyoxal, formic acid
 (c) Formaldehyde (d) None
50. The bond length between the hybridised carbon atom and other carbon atom is minimum in [Pb. PMT 2000]
- (a) Butane (b) Propyne
 (c) Propene (d) Propane
51. The reaction of propene with $HOCl$ proceeds via the addition of [IIT-JEE (S)]
- (a) H^+ in the first step
 (b) Cl^+ in the first step
 (c) OH^- in the first step
 (d) Cl^+ and OH^- in a single step
52. Acetylene reacts with ammonical $AgNO_3$ forming [MH CET 1999; CPMT 1984, 86; MP PMT 1997]
- (a) Silver acetylene (b) Silver acetate
 (c) Metal silver (d) Silver mirror
53. Ethylidene dichloride can be prepared by the reaction of HCl and
- (a) C_2H_4 (b) C_2H_2
 (c) C_2H_5 (d) All of these
54. Which of the following order of reagent is chosen to prepare 1, 3-butadiene from C_2H_2 [RPET 2000]
- (a) $CuCl / NH_4Cl$ and $H_2 / Pd(BaSO_4)$

- (b) $\text{NH}_4\text{Cl} / \text{CuCl}$ and $\text{H}_2 / \text{Pd}(\text{BaSO}_4)$
 (c) $\text{H}_2 / \text{Pd}(\text{BaSO}_4)$ and $\text{CuCl} / \text{NH}_4\text{Cl}$
 (d) $\text{H}_2 / \text{Pd}(\text{BaSO}_4)$ and $\text{NH}_4\text{Cl} / \text{CuCl}$
55. Benzene is the polymer of [RPET 1999; Bihar MEE 1999]
 (a) Methane (b) Ethane
 (c) Ethylene (d) Ethyne
56. $\begin{array}{c} \text{CH} \\ || \\ \text{CH} \end{array}$ reacts with acetic acid in presence of Hg to give [BHU 2005]
 (a) $\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}(\text{CH}_3\text{COO})_2 \end{array}$ (b) $\begin{array}{c} \text{CH}(\text{CH}_3\text{COO})_2 \\ | \\ \text{CH}(\text{CH}_3\text{COO})_2 \end{array}$
 (c) $\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_2(\text{CH}_3\text{COO}) \end{array}$ (d) None of these
57. Acetylene is prepared industrially by passing electric discharge through graphite electrodes in the atmosphere of [CPMT 1985]
 (a) Air (b) N_2
 (c) H_2 (d) CO_2
58. When acetylene is passed into dilute sulphuric acid containing Hg^{2+} ions, the product formed is [DPMT 1996; Roorkee 1995; BHU 1998; KCET 1999; MP PET 1985, 86; DCE 1999; DPMT 1999, 2002; CPMT 1975, 82, 83, 90; MP PMT 1994, 97; CBSE PMT 1999; AIIMS 2002; CBSE PMT 1999; KCET (Med.) 1999, JIPMER 1999]
 (a) Acetone (b) Acetic acid
 (c) Acetaldehyde (d) Formaldehyde
59. Which of the following has acidic hydrogen [IIT-JEE 1985, 89; CPMT 1986; Bihar MEE 1997; RPET 1999; AFMC 1999]
 (a) Ethyne (b) Ethene
 (c) Ethane (d) Benzene
60. Xylenes on oxidation with acidic KMnO_4 gives [JIPMER 2000]
 (a) Terephthalic acid (b) Phthalic acid
 (c) Isophthalic acid (d) All of these
61. The structure of the product (Z) in the reactions given below

$$\text{HC} \equiv \text{CH} \xrightarrow[\text{H}^+]{\text{NaNH}_2, \text{CH}_3\text{COCH}_3} \text{X} \xrightarrow[\text{H}_2\text{O}]{\text{Hg}^{2+}, \text{H}_3\text{O}^+} \text{Z}$$
 [Roorkee 2000]
 (a) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \overset{\text{O}}{\parallel} \text{C} - \text{CH}_2\text{OH}$
 (b) $\text{CH}_3 - \overset{\text{CH}_3}{\underset{\text{O}}{\parallel} \text{C}} - \text{CH} - \text{CH}_2\text{OH}$
 (c) $\text{CH}_3 - \overset{\text{CH}_3}{\underset{\text{O}}{\parallel} \text{C}} - \overset{\text{CH}_3}{\underset{\text{OH}}{\mid} \text{C}} - \text{CH}_3$
 (d) $\text{CH}_3 - \text{CHOH} - \overset{\text{CH}_3}{\mid} \text{CH} - \text{CHO}$
62. Carbon-carbon bond length is minimum in [CBSE PMT 1988, 91; MNR 1984; CPMT 1989;
 RPMT 1997; Pb. PMT 2001]
 (a) Ethane (b) Ethene
 (c) Ethyne (d) Benzene
 (e) Ethanol
63. Triple bond of ethyne is made of or Cylindrical shape of an alkyne is due to [EAMCET 1978; NCERT 1979; CBSE PMT 1997; Manipal MEE 1995; Bihar MEE 1996]
 (a) Three σ -bonds
 (b) Three π -bonds
 (c) Two σ and one π -bond
 (d) Two π and one σ -bond
64. An organic compound has a triple bond and not double bond. It can be tested by [MP PMT 2000, 03]
 (a) Bromine water
 (b) Bayer's reagent
 (c) Fehling solution
 (d) Ammonical silver nitrate
65. Which of these will not react with acetylene [AIIEE 2002; DCE 2002]
 (a) NaOH (b) Ammonical AgNO_3
 (c) Na (d) HCl
66. What is the product when acetylene reacts with hypochlorous acid [RPMT 2002;
 (a) CH_3COCl (b) ClCH_2CHO
 (c) Cl_2CHCHO (d) ClCHCOOH
67. The alkene C_6H_{10} producing $\text{OHC} - (\text{CH}_2)_4 - \text{CHO}$ on ozonolysis is [Roorkee 1999]
 (a) Hexene-1 (b) Hexene-3
 (c) Cyclohexene (d) 1-methylcyclohexene-1
68. The number of moles of proton which can be easily given by butyne-1 (1 mole) is [MP PMT 2000]
 (a) 1 (b) 2
 (c) 3 (d) 6
69. Which will undergo reaction with ammoniacal AgNO_3 [DPMT 1996]
 (a) $\begin{array}{c} \text{CH}_3 \\ \diagup \\ \text{CH}_3 \end{array} \text{CH} - \text{CH}_2 - \text{CH} = \text{CH} - \text{CH}_3$
 (b) $\text{CH}_3 - \text{CH} = \text{CH} - \text{C} \equiv \text{CH}$
 (c) $\text{CH}_3 - \text{CH}_2 - \text{CH} = \text{CH} - \text{CH}_2 - \text{CH}_3$
 (d) $\text{CH}_2 = \text{CH} - \text{CH}_2 - \text{CH}_3$
 (e) None
70. Acetylene gas when passed through the 20% H_2SO_4 at 80°C gives acetaldehyde. The catalyst required for this conversion is
 (a) Anhydrous AlCl_3 (b) HgSO_4
 (c) Pd (d) Pt
71. Which of the following reactions will yield 2, 2-dibromopropane [MNR 1993; UP
 (a) $\text{HC} \equiv \text{CH} + 2\text{HBr} \rightarrow$
 (b) $\text{CH}_3\text{C} \equiv \text{CH} + 2\text{HBr} \rightarrow$
 (c) $\text{CH}_3\text{CH} = \text{CH}_2 + \text{HBr} \rightarrow$
 (d) $\text{CH}_3\text{CH} = \text{CHBr} + \text{HBr} \rightarrow$
72. Which of the following does not give white precipitate with ammoniacal AgNO_3

- (a) $CH \equiv CH$ (b) $CH_3 - C \equiv CH$
 (c) $CH_3 - C \equiv C - CH_3$ (d) $\begin{array}{c} CH_2 - C \equiv CH \\ | \\ Cl \end{array}$

73. $\begin{array}{c} CH \\ ||| \\ CH \end{array} \xrightarrow{O_3 / NaOH} X \xrightarrow{Zn / CH_3COOH} Y$ 'Y' is [AIIMS 1988]
 (a) $\begin{array}{c} CH_2OH \\ | \\ CH_2OH \end{array}$ (b) CH_3CH_2OH
 (c) CH_3COOH (d) CH_3OH

74. Which is represented by the formula C_nH_{2n-2} [CPMT 1975, 76; EAMCET 1979; MP PET 2003]
 (a) Alkane (b) Alkyne
 (c) Alkene (d) None of these

75. What is the major product of the following reaction
 $CH_3C \equiv C - CH_2 - CH_3 \xrightarrow{1 \text{ mole of } Cl_2}$ [Kerala (Med.) 2003]
 (a) $\begin{array}{c} Cl \\ \diagup \\ C = C \\ \diagdown \\ CH_3 \end{array} \begin{array}{c} Cl \\ \diagdown \\ CH_2CH_3 \end{array}$
 (b) $\begin{array}{c} Cl \\ | \\ CH_3 - CH_2 - C - CH_2CH_3 \\ | \\ Cl \end{array}$
 (c) $\begin{array}{c} Cl \\ \diagup \\ C = C \\ \diagdown \\ CH_3 \end{array} \begin{array}{c} CH_2CH_3 \\ \diagdown \\ Cl \end{array}$
 (d) $\begin{array}{c} Cl \quad Cl \\ | \quad | \\ CH_3 - C - C - CH_2CH_3 \\ | \quad | \\ Cl \quad Cl \end{array}$

76. A compound C_5H_8 which give white ppt. with ammonical $AgNO_3$. A give $(CH_3)_2CHCOOH$ with hot alcoholic KOH then compound is [RPMT 2002]
 (a) $CH_3CH_2 - CH_2 - CH = CH_2$
 (b) $CH_3 - CH_2 - C \equiv CH$
 (c) $(CH_3)_2CH - C \equiv CH$
 (d) $CH_2 = CH - CH_2 - CH = CH_2$

77. 1, 2-dibromoethane when heated with alcoholic potash gives [Kerala PMT 2004]
 (a) Ethane (b) Acetylene
 (c) Ethylene (d) Methane
 (e) None of these

78. Which of the following is not a member of homologous series
 (a) Ethene (b) 1-butene
 (c) 2-butene (d) 2-butyne

79. The compound formed as a result of potassium permanganate oxidation of ethylbenzene is [MP PET/PMT 1998]
 (a) Benzoic acid (b) Benzyl alcohol
 (c) Benzophenone (d) Acetophenone

80. What is the product when 2-butyne is treated with liquid NH_3 in presence of lithium [Orissa JEE 2003]
 (a) *n*-butane (b) *cis*-2-butene
 (c) *trans*-2-butene (d) 1-butene

81. Distinction in pentene-1 and pentyne-1 is done by [CPMT 1996]
 (a) $[Ag(NH_3)_2]^+$ (b) Conc. H_2SO_4
 (c) HCl (d) Br_2

82. A mixture of ethane, ethene and ethyne is passed through ammoniacal $AgNO_3$ solution. The gases which remain unreacted are [CPMT 1990]
 (a) Ethane and ethene (b) Ethane and ethyne
 (c) Ethene and ethyne (d) Ethane only

83. In its reaction with silver nitrate acetylene shows [MP PET 1999]
 (a) Oxidising property (b) Reducing property
 (c) Basic property (d) Acidic property

84. Simplest alkyne is represented by [CPMT 1974]
 (a) CH (b) CH_2
 (c) C_2H_2 (d) C_2H_4

85. Which of the following bonds is most acidic
 (a) $=C-H$ (b) $-C-H$
 (c) $\equiv C-H$ (d) All are equally acidic

86. The hybridisation in methane, ethene and Ethyne respectively is
 (a) *sp*, *sp* and *sp* (b) *sp*, *sp*, *sp*
 (c) *sp*, *sp* and *sp* (d) *sp*, *sp*, *sp*

87. Number of acidic hydrogen atoms in butyne-1 are [MP PET 1986]
 (a) 2 (b) 3
 (c) 1 (d) 4

88. Which of the following shows linear structure [CPMT 2003]
 (a) Ethane (b) Ethene
 (c) Acetylene (d) CCl_4

89. Calcium carbide on reacting with water gives [CBSE PMT 1991; MP PMT 1993, 94; RPMT 2002; J & K 2005]
 (a) Methane (b) Ethane
 (c) Ethene (d) Acetylene

90. Addition of HCN to ethyne in presence of $Ba(CN)_2$ as catalyst gives [AFMC 1991]
 (a) 1, 1-dicyano ethane (b) Ethyl cyanide
 (c) Vinyl cyanide (d) Divinyl cyanide

91. Which compound will react with an aqueous solution of $Ag(NH_3)_2^+OH^-$ [DPMT 2000]
 (a) $CH_2 = CH_2$ (b) $CH_3 - CH_3$
 (c) $CH_3CH_2C \equiv CH$ (d) $CH_3 - C \equiv C - CH_3$

92. Which of the following give H_2 gas with Na [RPMT 2002]
 (a) CH_4 (b) C_2H_6
 (c) C_2H_4 (d) C_2H_2

93. $CH_3 - C \equiv CH \xrightarrow[Zn / H_2O_2]{O_3}$ Product. Product in above reaction is [RPMT 2003]
 (a) CH_3COOH (b) $HCOOH$
 (c) Both (a) and (b) (d) $CH_3CHO + HCHO$

94. The number of π -bonds in the product formed by passing acetylene through dilute sulphuric acid containing mercuric sulphate is [EAMCET 1997]
 (a) Zero (b) One
 (c) Two (d) Three

95. Which of the following is weakly acidic
 (a) $CH_2 = CH_2$ (b) C_6H_6
 (c) $CH_3 - C \equiv CH$ (d) $CH_3 - C \equiv C - CH_3$
96. Which of the following reactions is shown by alkynes
 [AMU 1984; RPMT 2000]
 (a) Addition (b) Substitution
 (c) Polymerization (d) All of these
97. Shortest C-C bond length is present in [BVP 2004]
 (a) $CH_3 - CH_2 - CH_3$ (b) $CH_3CH_2CH_2CH_3$
 (c) $CH_2 = CH - CH = CH_2$ (d) $CH \equiv C - C \equiv CH$
98. Acetylene can be obtained by the reaction [MH CET 2004]
 (a) $HCOOK \xrightarrow{\text{electrolysis}}$
 (b) $CHI_3 + 6Ag + CHI_3 \xrightarrow{\Delta}$
 (c) $CH_3CH_2OH \xrightarrow[443^\circ C]{\text{Conc. } H_2SO_4}$
 (d) $Be_2C + H_2O \rightarrow$
99. Which of the following used for the conversion of 2-hexyne into trans-2-hexene [IIT JEE (Screening) 2004]
 (a) $H_2 / Pd / BaSO_4$ (b) H_2, PtO_2
 (c) $NaBH_4$ (d) $Li - NH_3 / C_2H_5OH$
100. In which of the following, the bond length between hybridized carbon atom and other carbon atom is minimum [MH CET 2003]
 (a) Propyne (b) Propene
 (c) Butane (d) Propane
101. What happens when a mixture of acetylene and hydrogen is passed over heated Lindlar's catalyst [Kerala PMT 2004; AIIMS 1987]
 (a) Ethane and water are formed
 (b) Ethylene is formed
 (c) Acetylene and ethane are formed
 (d) None of these
102. In acetylene molecule, the two carbon atoms are linked by [KCET 2004]
 (a) One sigma bond and two pi bonds
 (b) Two sigma bonds and one pi bond
 (c) Three sigma bonds
 (d) Three pi bonds
103. Which reacts with ammoniacal $AgNO_3$ [Orissa JEE 2005]
 (a) Propyne (b) 2-butyne
 (c) 1,3-butadiene (d) Pentene
104. $CH \equiv CH \xrightarrow[H_2SO_4]{HgSO_4} \xrightarrow[H_2O]{CH_3MgBr} \xrightarrow{P/Br_2}$ [DPMT 2005]
 (a) $CH_3CH(Br)CH_3$ (b) $CH_3CH_2CH_2Br$
 (c) $CH_2 = CH - Br$ (d) $BrCH = CH - CH_3$
105. Carbide, which react with water to give propyne is [Kerala CET 2005]
 (a) CaC_2 (b) SiC
 (c) Mg_2C_3 (d) Al_4C_3

(e) Be_2C

Aromatic hydrocarbon

1. The function of anhydrous $AlCl_3$ in the Friedel-Craft's reaction is to [MNR 1986, 1995; Roorkee 1999; BHU 2001; CPMT 2002; MP PET 2001]
 (a) Absorb water (b) Absorb HCl
 (c) To produce electrophile (d) To produce nucleophile
2. Benzene reacts with CH_3COCl in the presence of $AlCl_3$ to give [DPMT 1984]
 (a) C_6H_5Cl (b) C_6H_5COCl
 (c) $C_6H_5CH_3$ (d) $C_6H_5COCH_3$
3. Acylation process is preferred than direct alkylation because (by the Friedel-Craft's reaction)
 (a) In alkylation, a poisonous gas is evolved
 (b) In alkylation, large amount of heat is evolved
 (c) In alkylation, polyalkylated product is formed
 (d) Alkylation is very costly
4. Benzene cannot undergo
 (a) Substitution (b) Addition
 (c) Elimination (d) Oxidation
5. Coal tar is main source of [DPMT 1984]
 (a) Aromatic compounds
 (b) Aliphatic compounds
 (c) Cycloalkanes
 (d) Heterocyclic compounds
6. Which of the following is not formed by the ozonolysis of o-xylene
 (a) Glyoxal (b) Ethyl glyoxal
 (c) Dimethyl glyoxal (d) Methyl glyoxal
7. The number of σ and π bonds in a molecule of benzene is [MP PMT/PET 1988; BHU 1995; CPMT 1997]
 (a) 6σ and 9π (b) 9σ and 3π
 (c) 12σ and 3π (d) 6σ and 6π
8. The ratio of σ and π bonds in benzene is [CPMT 1991; BHU 1995]
 (a) 2 (b) 4
 (c) 6 (d) 8
9. Carbon atoms in benzene molecule is inclined at an angle of [BHU 1985]
 (a) 120° (b) 180°
 (c) $109^\circ 28'$ (d) 60°
10. When benzene is treated with excess of Cl_2 in the presence of I_2 , the end product is
 (a) Monochlorobenzene (b) Trichlorobenzene
 (c) Hexachlorobenzene (d) Benzene hexachloride
11. Chemical name of the insecticide gammexene is [CPMT 1981; MP PET 1995; MP PMT 1996; CBSE PMT 1999; MP PET 1999]
 (a) DDT (b) Benzene hexachloride
 (c) Chloral (d) Hexachloroethane
12. Gammexane is obtained from benzene when it reacts with
 (a) Br_2 in bright sunlight (in the absence of a catalyst)
 (b) Cl_2 in bright sunlight (in the absence of a catalyst)
 (c) CH_3Cl in the presence of anhydrous $AlCl_3$
 (d) $COCl_2$ in the presence of anhydrous $AlCl_3$

13. Point out the wrong statement in relation to the structure of benzene
 (a) It forms only one monosubstitution product
 (b) The C - C bond distance in benzene is uniformly 1.397 Å
 (c) It is a resonance hybrid of a number of canonical forms
 (d) It has three delocalised π - molecular orbitals
14. Which equation represents an example of Friedel-Craft's reaction [MNR 1993; CPMT 1996]
 (a) $C_6H_6 + C_2H_5Cl \xrightarrow{AlCl_3} C_6H_5C_2H_5 + HCl$
 (b) $C_2H_5OH + HCl \xrightarrow{ZnCl_2} C_2H_5Cl + H_2O$
 (c) $C_6H_5Cl + CH_3COCl \xrightarrow{AlCl_3} C_6H_5COCH_3 + Cl_2$
 (d) $C_2H_5Br + Mg \xrightarrow{Ether} C_2H_5MgBr$
15. The most stable carbonium ion among the following is [JIPMER 2002; AFMC 2002]
 (a) $C_6H_5\overset{+}{C}HC_6H_5$ (b) $C_6H_5\overset{+}{C}H_2$
 (c) $CH_3\overset{+}{C}H_2$ (d) $C_6H_5CH_2\overset{+}{C}H_2$
16. The reaction of toluene with chlorine in presence of ferric chloride gives predominantly [IIT-JEE 1986; DCE 2000]
 (a) Benzoyl chloride (b) *m*-chlorotoluene
 (c) Benzyl chloride (d) *o*- and *p*-chlorotoluenes
17. The product formed when toluene is heated in light with Cl_2 and in absence of halogen carrier is
 (a) Benzotrichloride (b) Gammexene
 (c) Chlorobenzene (d) None of these
18. Attacking or reactive or electrophilic species in nitration of benzene is or In the nitration of benzene with concentrated HNO_3 and H_2SO_4 the attack on ring is made by [CBSE PMT 1994; MP PET 1996, 2000; Pb. PMT 1998; BHU 2001; BVP 2004; DCE 2003]
 (a) NO_2^- (b) NO_2^+
 (c) NO_3^- (d) NO_2
19. Which of the following reactions takes place when a mixture of concentrated HNO_3 and H_2SO_4 reacts on benzene at 350K
 (a) Sulphonation (b) Nitration
 (c) Hydrogenation (d) Dehydration
20. Nitration of benzene by nitric acid and sulphuric acid is [MNR 1989; CPMT 1990; BCECE 2005]
 (a) Electrophilic substitution (b) Electrophilic addition
 (c) Nucleophilic substitution (d) Free radical substitution
21. Necessary conditions for halogenation are [CPMT 1976]
 (a) Cold and dark
 (b) Presence of halogen carrier
 (c) Both (a) and (b)
 (d) None
22. $C_6H_6 + CH_3Cl \xrightarrow[AlCl_3]{anhydrous} C_6H_5CH_3 + HCl$
 is an example of [NCERT 1979; CPMT 1974, 85, 90; Bihar CEE 1995; BHU 1979, 2001; MP PET 1995; MP PMT 1995; KCET 1993; EAMCET 1998; AIIMS 1998; CBSE PMT 2000; AFMC 2000; JIPMER 2000]
 (a) Friedel-Craft's reaction (b) Kolbe's synthesis
 (c) Wurtz reaction (d) Grignard reaction
23. The reaction of benzene with chlorine in the presence of iron gives
 (a) Benzene hexachloride (b) Chlorobenzene
 (c) Benzyl chloride (d) Benzoyl chloride
24. Benzene was discovered by [NCERT 1981]
 (a) Ramsay (b) Dalton
 (c) Faraday (d) Priestley
25. The correct structure of benzene was proposed by [CPMT 1972]
 (a) Faraday (b) Davy
 (c) Kekule (d) Wohler
26. The centric structure of benzene was proposed by [CPMT 1982, 83, 89]
 (a) Dewar (b) Ladenberg
 (c) Kekule (d) Armstrong and Baeyer
27. The bond order of individual carbon-carbon bonds in benzene is [IIT-JEE 1981; MP PET 1996]
 (a) One (b) Two
 (c) Between one and two (d) One and two, alternately
28. Six carbon atoms of benzene are of
 (a) One type (b) Two types
 (c) Three types (d) Six types
29. On heating a mixture of sodium benzoate and sodalime, the following is obtained [CPMT 1990; AIIMS 1996; MP PET 1999; AFMC 1999]
 (a) Toluene (b) Phenol
 (c) Benzene (d) Benzoic acid
30. Benzene on treatment with a mixture of conc. HNO_3 and conc. H_2SO_4 at 100°C gives
 (a) Nitrobenzene (b) *m*-dinitrobenzene
 (c) *p*-dinitrobenzene (d) *o*-dinitrobenzene
31. What is the end product which is obtained on the nitration of toluene [MP PMT/PET 1988]
 (a) *o*-nitrotoluene (b) *p*-nitrotoluene
 (c) 2, 4-dinitrotoluene (d) 2, 4, 6-trinitrotoluene
32. Which of the following processes is reversible
 (a) Halogenation (b) Sulphonation
 (c) Nitration (d) None
33. The attacking (electrophilic) species in sulphonation of benzene is [RPMT 1997; CPMT 1996]
 (a) SO_2 (b) SO_3
 (c) SO_4^{2-} (d) HSO_3^-
34. Which xylene is most easily sulphonated
 (a) Ortho (b) Para
 (c) Meta (d) All at the same rate
35. Toluene on oxidation with dilute HNO_3 and alkaline $KMnO_4$ gives [CPMT 1985; DPMT 1981]
 (a) Benzaldehyde (b) Phenol
 (c) Nitrotoluene (d) Benzoic acid
36. Benzene vapour mixed with air when passed over V_2O_5 catalyst at 775K gives [AFMC 1991; CPMT 2001; MP PMT 2003]
 (a) Glyoxal (b) Oxalic acid
 (c) Maleic anhydride (d) Fumaric acid
37. Most common reactions of benzene (aromatic hydrocarbon) and its derivatives are [DPMT 1984; MP PMT 1989; AFMC 1997; BHU 1996, 98]
 (a) Electrophilic addition reactions
 (b) Electrophilic substitution reactions
 (c) Nucleophilic addition reactions
 (d) Nucleophilic substitution reactions
38. Which is most readily nitrated [Roorkee 1992]
 (a) Benzene (b) Phenol
 (c) Aniline (d) Nitrobenzene
39. *o*, *p*-directing groups are mostly [MP PET 1998]
 (a) Activating groups (b) Deactivating groups
 (c) Neutral groups (d) None of these
40. Which among the following is the strongest *o*, *p*-directing group
 (a) OH (b) Cl
 (c) C_6H_5 (d) Br
41. The compound that is most reactive towards electrophilic nitration is [IIT-JEE 1985; AIIMS 1998; MP PET/PMT 1998]

- (a) Toluene (b) Benzene
(c) Benzoic acid (d) Nitrobenzene
42. Amongst the following, the compound that can be most readily sulphonated is [IIT-JEE 1982; MADT Bihar 1995; KCET 2005]
(a) Benzene (b) Nitrobenzene
(c) Toluene (d) Chlorobenzene
43. Which of the following would be least reactive towards bromine
(a) Nitrobenzene (b) Phenol
(c) Anisole (d) Chlorobenzene
44. Amongst the following, the compound that is nitrated with difficulty is
(a) Benzene (b) Nitrobenzene
(c) Toluene (d) Phenol
45. Select the true statement about benzene from amongst the following
(a) Because of unsaturation benzene easily undergoes addition reactions
(b) There are two types of C - C bonds in benzene molecule
(c) There is a cyclic delocalisation of π electrons in benzene
(d) Monosubstitution of benzene group gives three isomeric substances
46. Anhydrous $AlCl_3$ is used in the Friedel-Craft's reaction because it is [CBSE PMT 1991]
(a) Electron rich
(b) Soluble in ether
(c) Insoluble to chloride and aluminium ions
(d) Electron deficient
47. (i) Chlorobenzene and (ii) benzene hexachloride are obtained from benzene by the reaction of chlorine, in the presence of
(a) (i) Direct sunlight and (ii) anhydrous $AlCl_3$
(b) (i) Sodium hydroxide and (ii) sulphuric acid
(c) (i) Ultraviolet light and (ii) anhydrous $FeCl_3$
(d) (i) Anhydrous $AlCl_3$ and (ii) direct sunlight
48. In Friedel Craft's alkylation, besides $AlCl_3$ the other reactants are [AFMC 1997; CBSE PMT 1999]
(a) $C_6H_6 + CH_3Cl$ (b) $C_6H_6 + CH_4$
(c) $C_6H_6 + NH_3$ (d) $C_6H_6 + CH_3COCl$
49. Nitration of benzene is a [RPMT 1999]
(a) Electrophilic displacement
(b) Electrophilic addition
(c) Nucleophilic addition
(d) Nucleophilic displacement
50. Benzene shows [RPMT 1999]
(a) Substitution (b) Addition
(c) Oxidation (d) All of these
51. Benzene can be obtained in the reaction [RPET 2000; Bihar MEE 1997]
(a) Ethene + 1, 3-butadiene
(b) Trimerisation of ethyne
(c) Reduction of $PhCHO$
(d) All of these
52. Thiophene and benzene are separated by [RPET 2000]
(a) Sulphonation of thiophene
(b) Sulphonation of benzene
(c) Nitration of thiophene
(d) Nitration of benzene
53. Which of the following is a hydrocarbon [AFMC 1992]
(a) Urea (b) Benzene
(c) Ammonium cyanate (d) Phenol
54. Aromatic compounds burn with sooty flame because
(a) They have a ring structure of carbon atoms
(b) They have a relatively high percentage of hydrogen
(c) They have a relatively high percentage of carbon
(d) They resist reaction with oxygen of air
55. Among the following compound which one is planar in shape [NCERT 1981]
(a) Methane (b) Acetylene
(c) Benzene (d) Isobutane
56. Among the following statements on the nitration of aromatic compounds, the false one is [IIT-JEE 1997]
(a) The rate of nitration of benzene is almost the same as that of hexadeuterobenzene
(b) The rate of nitration of toluene is greater than that of benzene
(c) The rate of nitration of benzene is greater than that of hexadeuterobenzene [CBSE PMT 1992]
(d) Nitration is an electrophilic substitution reaction
57. Methyl group attached to benzene can be oxidised to carboxyl group by reacting with [KCET 1993]
(a) Fe_2O_3 (b) $AgNO_3$
(c) $KMnO_4$ (d) Cr_2O_3
58. How is  is widely used [MP PET 2002]
(a) Insecticide (b) Drug
(c) Explosive (d) Dye
59. The compound 'A' when treated with HNO_3 (in presence of H_2SO_4) gives compound 'B' which is then reduced with Sn and HCl to aniline. The compound 'A' is [MP PET 2002]
(a) Toluene (b) Benzene
(c) Ethane (d) Acetamide
60. Which is formed when benzene is heated with chlorine in the presence of sunlight [CPMT 2000; KCET (Med.) 2000; MP PMT 1993; MP PET 2002 AIIMS 1999]
(a) $C_6H_5CCl_3$ (b) $C_6H_5CHCl_2$
(c) $C_6H_5CH_2Cl_2$ (d) $C_6H_6Cl_6$
61. The compound used as an explosive is [Kerala (Engg.) 2002; MP PET 2002; MP PMT 1993]
(a) 2,4, 6-tribromoaniline (b) 1,3, 5-trinitrobenzene
(c) 2,4, 6-trichlorotoluene (d) 1,3, 5-trichlorobenzene
(e) 2,4, 6-trinitrotoluene
62. Adding of Cl_2 to benzene in the presence of $AlCl_3$ is an example of [Bihar MEE 1996]
(a) Addition (b) Halogenation
(c) Substitution (d) Elimination
(e) None of these
63. What happens when naphthalene balls are put inside kerosene
(a) Precipitates (b) Dissolves upon heating
(c) Dissolves easily (d) Does not dissolve
(e) None of these
64. Three fused benzene rings are found in [Kerala (Engg.) 2002]
(a) Naphthalene (b) Anthracene
(c) Phenanthroline (d) Triphenyl methane
65. Product obtained after nitration of nitrobenzene is [RPMT 1997]
(a) TNT (b) 1, 3-dinitrobenzene

- (c) Picric acid (d) 1, 4-dinitrobenzene
 66. After ozonolysis of benzene (not hydrolysis), the product is [RPMT 1997; CPMT 1997]
 (a) Benzene triozonide (b) Glyoxal
 (c) Ethanediol (d) All of them
67. Which acid will not form hydrocarbon [CPMT 1997]
 (a) Cinnamic acid (b) Isothallic acid
 (c) Salicylic acid (d) Picric acid
68. Catalytic dehydrogenation of *n*-heptane in presence of Cr_2O_3 / Al_2O_3 at 750 K gives [Roorkee 1999]
 (a) iso-heptane (b) 1-heptene
 (c) toluene (d) 2, 3-dimethylpentene-1
69. $C_6H_6 \xrightarrow[H_2SO_4]{HNO_3} X \xrightarrow[FeCl_3]{Cl_2} Y$. In the above sequence Y is [AIIMS 1999]
 (a) 1-nitrochloro benzene (b) 3-nitrochlorobenzene
 (c) 4-nitrochlorobenzene (d) 1,2-nitrochlorobenzene
70. Which of the following has lowest knocking property
 (a) Olefins (b) Straight chain paraffins
 (c) Aromatic hydrocarbons (d) Branched chain paraffins
71. In which of the following, the bond length between carbon and carbon atom is equal [CPMT 1997]
 (a) 2-butene (b) Benzene
 (c) 1-butene (d) 1-propyne
72. Benzene is prepared in laboratory from which one of the following compounds [MP PMT 1996]
 (a) $C_6N_5N_2Cl$ (b) C_6H_5OH
 (c) C_6H_5COONa (d) $C_6H_5SO_3H$
73. Which of the following is not used in Friedel-Crafts reaction [KCET 2000]
 (a) Phenyl acetanilide (b) Bromobenzene
 (c) Benzene (d) Chlorobenzene
74. In chlorination of benzene, the reactive species is [MP PET 2000]
 (a) Cl^+ (b) Cl^-
 (c) Cl_2 (d) Cl_2^-
75. Which of following having delocalised electron [BCECE 2005]
 (a) Benzene (b) Cyclohexane
 (c) CH_4 (d) $\dot{C}H_4$
76. Benzene molecule is [MP PET 2001; Pb. PMT 2004]
 (a) Tetrahedral (b) Planar
 (c) Pyramidal (d) Trigonal
77. Pyridine is less basic than triethylamine because [AIIMS 2005]
 (a) Pyridine has aromatic character
 (b) Nitrogen in pyridine is sp^2 hybridized
 (c) Pyridine is a cyclic system
 (d) In pyridine, lone pair of nitrogen is delocalized
78. Electrophile in the case of chlorination of benzene in the presence of $FeCl_3$ is [CBSE PMT 1996]
 (a) Cl^+ (b) Cl^-
 (c) Cl (d) $FeCl_3$
79. Which one of the following will undergo meta substitution on monochlorination [AIIMS 1991]
 (a) Ethoxy ethane (b) Chlorobenzene
 (c) Ethyl benzoate (d) Phenol
80. Nitration of toluene takes place at [NCERT 1990]
 (a) *o*-position (b) *m*-position
 (c) *p*-position (d) Both *o*- and *p*-positions
81. Which of the following is not *o*, *p*-directing group
 (a) $-NH_2$ (b) $-OH$
 (c) $-X$ (halogens) (d) $-CHO$
82. Benzene can react with [UPSEAT 2003]
 (a) Br_2 water (b) HNO_3
 (c) H_2O (d) CH_3OH
83. The compound 'A' having formula C_8H_{10} (aromatic) which gives 1 mononitro substitute and 3 nitrosubstitute compound is
 (a) *m*-Xylene (b) *p*-Xylene
 (c) *o*-Xylene (d) Ethyl benzene
84. Catalytic hydrogenation of benzene gives [AIIMS 1996]
 (a) Xylene (b) Cyclohexane
 (c) Benzoic acid (d) Toluene
85. Benzene is obtained from [CPMT 1996]
 (a) Coaltar (b) Plant
 (c) Animal (d) Charcoal
86. The 'middle oil' fraction of coaltar distillation contains [MP PET 2001]
 (a) Benzene (b) Anthracene
 (c) Naphthalene (d) Xylene
87. Lindane can be obtained by reaction of benzene with [DCE 2000]
 (a) CH_3Cl / anhy. $AlCl_3$ (b) Cl_2 / sunlight
 (c) C_2H_5I / anhy. $AlCl_3$ (d) CH_3COCl / $AlCl_3$
88. Which of the following oil is obtained from benzene after fractional distillation of coal tar [BHU 2004]
 (a) Light oil (b) Heavy oil
 (c) Middle oil (d) Anthracene oil
89. Hydrocarbon C_6H_6 decolourise Br_2 water and gives ppt. with ammonical $AgNO_3$. Hydrocarbon can be [MP PET 2004]
 (a) 1, 3, 5 Cyclohexatriene (b) 1, 5 Hexadiyne
 (c) 2, 4 Hexadiyne (d) None
90. Decreasing order of C-C bond length is [JEE Orissa 2004]
 (a) C_2H_4 (b) C_2H_2
 (c) C_6H_6 (d) C_2H_6
 (a) $IV > III > I > II$ (b) $I > II > IV > III$
 (c) $II > I > IV > III$ (d) $IV > I > III > II$
91. Benzene can be obtained by heating either benzoic acid with X or phenol with Y. X and Y are respectively [KCET 2004]
 (a) Zinc dust and soda lime
 (b) Soda lime and zinc dust
 (c) Zinc dust and sodium hydroxide
 (d) Soda lime and copper
92. Order of reactivity of C_2H_6 , C_2H_4 and C_2H_2 is [MH CET 2004]
 (a) $C_2H_6 > C_2H_4 > C_2H_2$ (b) $C_2H_2 > C_2H_6 > C_2H_4$
 (c) $C_2H_2 > C_2H_4 > C_2H_6$ (d) All are equally reactive
93. Which of the following yield both alkane and alkene [AFMC 2004]
 (a) Kolbe's reaction (b) Williamson's synthesis
 (c) Wurtz reaction (d) Sandmeyer reaction
94. Aromatisation of *n*-heptane by passing over $(Al_2O_3 + Cr_2O_3)$ catalyst at 773 K gives [DCE 2004]
 (a) Benzene (b) Toluene
 (c) Mixture of both (d) Heptylene
95. Amongst the following the most basic compound is [AIEEE 2005]

- (a) Benzylamine (b) Aniline
(c) Acetanilide (d) *p*-nitroaniline
96. When toluene is treated with $KMnO_4$, what is produced [AFMC 2005]
(a) Benzene (b) Chlorobenzene
(c) Benzaldehyde (d) Benzoic acid
97. In presence of light & heat toluene chlorinated & react with aqueous $NaOH$ to give [Kerala CET 2005]
(a) *o*-Cresol
(b) *p*-Cresol
(c) Mixture of *o*-Cresol & *p*-Cresol
(d) Benzoic acid
(e) 1, 3, 5 trihydroxy toluene

Critical Thinking

Objective Questions

1. In the case homologous series of alkanes, which one of the following statements is incorrect [JIPMER 2000]
(a) The members of the series are isomers of each other
(b) The members of the series have similar chemical properties
(c) The members of the series have the general formula C_nH_{2n+2} , where n is an integer
(d) The difference between any two successive members of the series corresponds to 14 unit of relative atomic mass
2. How many primary, secondary, tertiary and quaternary carbons are present in the following hydrocarbon
 $CH_3 - CH(CH_3) - C(CH_3)_2 - CH_2 - CH(CH_3) - CH_2 - CH_3$
- | | Primary | Secondary | Tertiary | Quaternary |
|-----|---------|-----------|----------|------------|
| (a) | 6 | 2 | 2 | 1 |
| (b) | 2 | 6 | 3 | 0 |
| (c) | 2 | 4 | 3 | 2 |
| (d) | 2 | 2 | 4 | 3 |
3. The octane number of a sample of petrol is 40. It means that its knocking property is equal to the mixture of [MP PMT 2003]
(a) 40% *n*-heptane + 60% *iso*-octane
(b) 40% petrol + 60% *iso*-octane
(c) 60% *n*-heptane + 40% *iso*-octane
(d) 60% petrol + 40% *iso*-octane
4. Formation of 2-butene as major product by dehydration of 2-butanol is according to [MP PMT 1995]
(a) Markownikoff rule (b) Saytzeff rule
(c) Peroxide effect (d) Anti-Markownikoff rule
5. $CH_3C \equiv CCH_3 \xrightarrow[(ii) H_2O / Zn]{(i) X} CH_3 - \underset{\substack{| \\ O}}{C} - \underset{\substack{| \\ O}}{C} - CH_3$
 X in the above reaction is [CPMT 1985; MP PET 1997; Roorkee Qualifying 1998; DPMT 2001]
(a) HNO_3 (b) O_2
(c) O_3 (d) $KMnO_4$
6. Which of the following is Friedel-Craft's reaction [MP PET 1994]
(a) $C_6H_6 + FeCl_3 + Cl_2 \rightarrow C_6H_5Cl$

- (b) $C_6H_5CHO + CH_3CHO + KOH \rightarrow C_6H_5CH = CH - CHO$
(c) $C_6H_6 + CH_3COCl + AlCl_3 \rightarrow C_6H_5 - \overset{\substack{O \\ ||}}{C} - CH_3$
(d) $C_6H_5OH + CHCl_3 + KOH \longrightarrow$ Salicylaldehyde

7. Condition for maximum yield of C_2H_5Cl is [IIT-JEE 1986]
(a) C_2H_6 (excess) + $Cl_2 \xrightarrow{UV \text{ Light}}$
(b) $C_2H_6 + Cl_2 \xrightarrow[\text{Room temp.}]{\text{Dark}}$
(c) $C_2H_6 + Cl_2$ (excess) $\xrightarrow{UV \text{ Light}}$
(d) $C_2H_6 + Cl_2 \xrightarrow{UV \text{ Light}}$
8. When ethyl alcohol is heated with red phosphorus and HI , then which of the following is formed [Kurukshetra CEE 1998]
(a) C_2H_6 (b) CH_4
(c) C_3H_8 (d) C_2H_4
9. In the Fischer-Tropsch synthesis of petrol..... and are used as the raw materials [KCET 1998]
(a) H_2 ; CO (b) CH_4 ; H_2
(c) CH_4 ; CH_3OH (d) CH_3OH ; CO
10. Which one of the following reactions is most suitable for the preparation of *n*-propyl benzene [MP PET/PMT 1998]
(a) Friedel-Craft's reaction (b) Wurtz reaction
(c) Wurtz-Fittig reaction (d) Grignard reaction
11. Propane cannot be prepared from which reaction [DCE 2003]
(a) $CH_3 - CH = CH_2 \xrightarrow[OH^-]{B_2H_6}$
(b) $CH_3CH_2CH_2I \xrightarrow[p]{HI}$
(c) $CH_3CH_2CH_2Cl \xrightarrow{Na}$
(d) None of these
12. The reaction
 $CH_3CH = CH_2 \xrightarrow[H^+]{(CO + H_2)} CH_3 - \underset{\substack{| \\ COOH}}{CH} - CH_3$ is known as [MP PMT 2002]
(a) Wurtz reaction (b) Koch reaction
(c) Clemmensen reduction (d) Kolbe's reaction
13. The compound $CH_3 - \overset{\substack{CH_3 \\ |}}{C} = CH - CH_3$ on reaction with $NaIO_4$ in the presence of $KMnO_4$ gives [CBSE PMT 2003]
(a) $CH_3CHO + CO_2$
(b) CH_3COCH_3
(c) $CH_3COCH_3 + CH_3COOH$
(d) $CH_3COCH_3 + CH_3CHO$
14. In the reaction :
 $HC \equiv CH + 2AgNO_3 \xrightarrow{NH_4OH} X + 2NH_4NO_3 + 2H_2O$
'X' is
(a) Ag_2C (b) Ag_2C_2
(c) AgC (d) $AgOH$
15. Naphthalene is a/an [AFMC 2004]
(a) Ionic solid (d) Covalent solid
(c) Metallic solid (d) Molecular solid
16. Which of the following is not aromatic [Pb. CET 2000]

- (a) Benzene (b) Naphthalene
(c) Pyridine (d) 1,3,5 heptatriene
17. Acetylene reacts with HCN in the presence of $Ba(CN)_2$ to yield
(a) 1,1-dicyanoethane (b) 1,2-dicyanoethane
(c) Vinyl cyanide (d) None of these
18. Write the products of the addition reaction $C=C + XY \rightarrow$
(a)  (b) $X-C=C-Y$
(c) $\begin{array}{c} | \\ C=C- \\ | \\ Y \end{array}$ (d) $\begin{array}{c} | & | \\ X-C & -C-Y \\ | & | \end{array}$
(e) $\begin{array}{c} X \\ | \\ C=C \\ | \\ Y \end{array}$
19. Formation of polyethylene from calcium carbide takes place as follows
 $CaC_2 + 2H_2O \rightarrow Ca(OH)_2 + C_2H_2$
 $C_2H_2 + H_2 \rightarrow C_2H_4$
 $n(C_2H_4) \rightarrow (-CH_2-CH_2-)_n$
The amount of polyethylene obtained from 64.1 kg CaC_2 is [AIIMS 1997]
(a) 7 kg (b) 14 kg
(c) 21 kg (d) 28 kg
20. Nitrobenzene can be prepared from benzene by using a mixture of conc. HNO_3 and conc. H_2SO_4 . In the nitrating mixture, HNO_3 acts as a [IIT-JEE 1997]
(a) Base (b) Acid
(c) Reducing agent (d) Catalyst
21. A group which deactivates the benzene ring towards electrophilic substitution but which directs the incoming group principally to the *o*- and *p*-positions is [Pb. PMT 1998]
(a) $-NH_2$ (b) $-Cl$
(c) $-NO_2$ (d) $-C_2H_5$
22. Which order is correct for the decreasing reactivity to ring monobromination of the following compounds
 $C_6H_5CH_3$, C_6H_5COOH , C_6H_6 , $C_6H_5NO_2$
I II III IV
(a) $I > II > III > IV$ (b) $I > III > II > IV$
(c) $II > III > IV > I$ (d) $III > I > II > IV$
23. Benzene is obtained by [DPMT 2002]
(a) Substitution of three acetylene molecules
(b) Addition of three C_2H_2 molecules
(c) Polymerisation of three C_2H_2 molecules
(d) Condensation of three C_2H_2 molecules
24. Toluene can be oxidised to benzoic acid by [AIIMS 1999]
(a) $KMnO_4$ (b) $K_2Cr_2O_7$
(c) H_2SO_4 (d) Both (a) and (b)
25. $CaC_2 + H_2O \rightarrow A \xrightarrow{H_2SO_4/HgSO_4} B$. Identify *A* and *B* in the given reaction [CPMT 2000; BVP 2004]
(a) C_2H_2 and CH_3CHO (b) CH_4 and $HCOOH$
(c) C_2H_4 and CH_3COOH (d) C_2H_2 and CH_3COOH
26. The compound *X* on reaction with $HgSO_4 + H_2SO_4$ gives *Y* which on oxidation gives acetic acid. *X* is [MP PMT 1999]
(a) C_2H_2 (b) C_2H_4
(c) C_4H_6 (d) CH_3CHO
27. What is formed when calcium carbide react with heavy water [UP SEAT 2004]
(a) C_2D_2 (b) CaD_2
(c) CD_2O (d) CD_2
28. The addition of HBr is easiest with [MP PMT 2000]
(a) $ClCH_2=CHCl$ (b) $ClCH=CHCl$
(c) $CH_3-CH=CH_2$ (d) $(CH_3)_2C=CH_2$
29. Identify the species *X* in the reaction :
Propene + *O* (conc. acidic $KMnO_4$) $\rightarrow$ *X* + Formic acid
(a) Acetone (b) Acetaldehyde
(c) Isopropanol (d) Acetic acid
30. In benzene 1, 3 position is called
(a) Meta (b) Para
(c) Ortho (d) Odd position
31. Which of the following is formed as a result of biological oxidation of benzene in the body of the dog [Manipal MEE 1995]
(a) Acrylic acid (b) Cinnamic acid
(c) Maleic acid (d) Gluconic acid
32. When acetylene is reacted with HBr , we get [CPMT 1979; JIPMER 2002]
(a) Methyl bromide (b) Ethyl bromide
(c) Ethylene bromide (d) Ethylidene bromide
33. The only *o*, *p*-directing group which is deactivating in nature is
(a) $-NH_2$ (b) $-OH$
(c) $-X$ (halogens) (d) $-R$ (alkyl groups)
34. Which kind of isomerism will butene-2 show
(a) Geometrical (b) Optical
(c) Position (d) None of these
35. In presence of light toluene on reaction with chlorine gives [RPET 1999]
(a) Benzoyl chloride (b) Ortho chlorotoluene
(c) Para chloro toluene (d) Benzyl chloride
36. If ethylene, carbon monoxide and water is heated at high temperature, which of the following is formed [AIIMS 2000]
(a) $C_4H_8O_2$ (b) C_2H_5COOH
(c) CH_3COOH (d) $CH_2=CH-COOH$
37. Compound C_6H_{12} is an [AMU 1983]
(a) Aliphatic saturated compound
(b) Alicyclic compound
(c) Aromatic compound
(d) Heterocyclic compound
38. Identify *Z* in the following series
 $CH_2=CH_2 \xrightarrow{HBr} X \xrightarrow{\text{Hydrolysis}} Y \xrightarrow[I_2 \text{ excess}]{Na_2CO_3} Z$ [AIIMS 1983; RPMT 1999]
(a) C_2H_5I (b) C_2H_5OH
(c) CHI_3 (d) CH_3CHO
39. *n*-pentane and iso pentane can be distinguished by [BVP 2004]
(a) Br_2 (b) O_3
(c) conc. H_2SO_4 (d) $KMnO_4$
40. $CH \equiv CH + HBr \rightarrow X$, product *X* is [Pb. CET 2003]
(a) Ethylene bromide (b) Vinyl bromide

(c) Bromo ethane

(d) Ethyldine bromide

Assertion & Reason

For AIIMS Aspirants

1. Assertion : 1-Butene on reaction with HBr in the presence of a peroxide produces 1-bromo-butane.
Reason : It involves the free radical mechanism. [IIT-JEE (Screening) 2000]
2. Assertion : Addition of Br_2 to 1-butene gives two optical isomers.
Reason : The product contains one asymmetric carbon. [IIT 1998]
3. Assertion : Cyclobutane is less stable than cyclopentane
Reason : Presence of bent bonds causes "loss of orbital overlap". [AIIMS 1996]
4. Assertion : Pyrrole is an aromatic heterocyclic compound.
Reason : It has a cyclic, delocalised 6π electrons. [AIIMS 1995]
5. Assertion : CH_4 does not react with Cl_2 in dark.
Reason : Chlorination of CH_4 takes place in sunlight. [AIIMS 2003]
6. Assertion : Alkyl benzene is not prepared by Friedel-Crafts alkylation of benzene.
Reason : Alkyl halides are less reactive than acyl halides. [AIIMS 2003]
7. Assertion : 2-Bromobutane on reaction with sodium ethoxide in ethanol gives 1-butene as a major product. [AIIMS 2004]
Reason : 1-Butene is more stable than 2-butene.
8. Assertion : Styrene on reaction with HBr gives 2-bromo-2-phenyl-ethane.
Reason : Benzyl radical is more stable than alkyl radical. [AIIMS 2004]
9. Assertion : Melting point of n -butane is higher than propane.
Reason : It is called oscillation effect.
10. Assertion : Iodination of alkanes is reversible.
Reason : Iodination is carried out in presence of iodic acid.
11. Assertion : Isobutane on oxidation with $KMnO_4$ gives tert-butyl alcohol.
Reason : Oxidising agents have no effect on alkanes.
12. Assertion : Halogenation of alkanes is catalysed by tetraethyl lead.
Reason : Halogenation proceeds through free radical mechanism.
13. Assertion : Neopentane forms only one monosubstituted compound.
Reason : Neopentane has high bond energy.
14. Assertion : Freezing point of neopentane is more than n -pentane.
Reason : Increase in Van der Waals forces increases freezing point.
15. Assertion : Knocking lowers the efficiency of the engine.
Reason : Fuel with minimum knocking property is preferred.
16. Assertion : The presence of Ag^+ enhances the solubility of alkenes in water.
Reason : Alkenes are weakly polar in nature.
17. Assertion : 2-Butanol on heating with H_2SO_4 gives 1-butene and 2-butene.
Reason : Dehydration of 2-butanol follows saytzeff rule.
18. Assertion : Ethene on treating with Br_2 in presence of $NaCl$ forms CH_2ClCH_2Br and CH_2Br-CH_2-Br .
Reason : This addition involves the formation of free radicals.
19. Assertion : Straight chain alkanes have very low octane number.
Reason : Quality of gasoline is measured in terms of octane number.
20. Assertion : Corey-House reaction can be used to prepare both symmetrical and unsymmetrical alkanes.
Reason : The reaction involves the interaction between lithium dialkyl copper with an alkyl halide both of which may contain even or odd number of carbon atoms.
21. Assertion : All the hydrogen atoms in $CH_2 = C = CH_2$ lie in one plane.
Reason : All the carbon atoms in it are sp^2 hybridized.
22. Assertion : Propene reacts with HBr in presence of benzoyl peroxide to yield 2-bromopropane.
Reason : In presence of peroxide, the addition of HBr to propene follows ionic mechanism.
23. Assertion : Acetylene reacts with sodamide to evolve H_2 gas.
Reason : Acetylene is a weaker acid than ammonia.
24. Assertion : Aryl halides are less reactive towards substitution of halogen atom.
Reason : Halogens are o, p - directing in nature.
25. Assertion : Benzene is a solvent for the Friedel Craft's alkylation of bromobenzene.
Reason : Friedel Craft's reaction is used to introduced on alkyl or acyl group in benzene nucleus.
26. Assertion : Benzene removes a butter stain from a table cloth.
Reason : Butter has an affinity towards benzene.
27. Assertion : Nitration of toluene is easier than benzene.
Reason : The methyl group in toluene is electron-releasing.
28. Assertion : Benzene forms benzene sulphonic acid with fuming H_2SO_4 at high temperature.
Reason : The attacking species is SO_3 .
29. Assertion : Activating groups are electron donors.
Reason : Nitroso group is activating group.
30. Assertion : Benzene reacts with CH_3COCl to give chlorobenzene.
Reason : Chlorination is an electrophilic substitution reaction.
31. Assertion : Conjugated polyenes containing odd number of carbon atoms is known as annulenes.
Reason : General formula of annulenes is $(CH = CH)_n$ where $n = 2, 3, 4$ etc.
32. Assertion : Tropylium cation is aromatic in nature

Reason : The only property that determines its aromatic behaviour is its planar structure.
33. Assertion : [10] Annulene is not aromatic though it contains Huckel number of π -electrons.
Reason : Steric interaction between internal hydrogens makes it non-planar.

34. Assertion : Rates of nitration of benzene and hexadeutero benzene are different.

Reason : $C-H$ bond is stronger than $C-D$ bond

35. Assertion : Cyclopentadienyl anion is much more stable than allyl anion.

Reason : Cyclopentadienyl anion is aromatic in character.

AS Answers and Solutions

Alkane

- (d) C_7H_{16} (C_nH_{2n+2})
- (a) According to wurtz reaction.

$$2CH_3CH_2CH_2Br + 2Na \xrightarrow{\text{ether}} CH_3(CH_2)_4CH_3 + 2NaBr$$
- (b) $2CH_3COONa + 2H_2O \xrightarrow{\text{Electrolysis}}$
Sodium acetate

$$CH_3 - CH_3 + 2CO_2 + 2NaOH + H_2$$
- (c) $Pb(C_2H_5)_4 \xrightarrow{\text{heat}} Pb + 4CH_3CH_2$
Ethyl radical

$$CH_2 - CH_2 + Pb \longrightarrow CH_2 = CH_2 + PbBr_2$$

$\begin{array}{c} | \\ Br \end{array}$
 $\begin{array}{c} | \\ Br \end{array}$
Ethene
Lead bromide

As leaded gasoline burns, lead metal gets deposited in the engine which is removed by adding ethylene dibromide. The lead bromide is volatile and is carried off with the exhaust gases from the engine
- (d) $C_2H_5I + 2Na + IC_2H_5 \xrightarrow[\text{Ether}]{\text{Dry}} C_2H_5 - C_2H_5 + 2NaI$
Butane
- (c) $(CH_3)_3CH \xrightarrow{KMnO_4} (CH_3)_3C - OH$
tertiary butylalcohol
- (c) $RCl + 2Na + RCl \xrightarrow[\text{Ether}]{\text{Dry}} 2NaCl + R - R$
Alkane

(g) Reaction with silver salts of fatty acids :

(h) Reaction with sodium acetylide :

(i) Reaction with sodium or potassium sulphide :

Thioethers can also be obtained by

(j) Reaction with halides :

(ii) **Elimination reactions** : The positive charge on carbon is propagated to the neighbouring carbon atoms by inductive effect. When approached by a strongest base (B), it tends to lose a proton usually from the β -carbon atom. Such reactions are termed elimination reactions. They are also E_1 and E_2 reactions.

As the above reactions involve leaving of X^- , the reactivity of alkyl halides (Same alkyl group, different halogens) should be limited with $C-X$ bond strength.

Type of bond	C-I	C-Br	C-Cl
Bond strength (kcal/mol)	45.5	54	66.5
	Bond strength increases		

The breaking of the bond becomes more and more difficult and thus, the reactivity decrease.

The order of reactivity (Tertiary > Secondary > Primary) is due to +I effect of the alkyl groups which increases the polarity of $C-X$ bond.

The primary alkyl halides undergo reactions either by S_N2 or E_2 mechanisms which involve the formation of transition state. The bulky groups cause steric hinderance in the formation of transition state. Therefore, higher homologues are less reactive than lower homologues. $CH_3X > C_2H_5X > C_3H_7X$, etc.

Example of elimination reaction

(a) Dehydrohalogenation :

In this reactions, ether is a by-product as potassium ethoxide is always present in small quantity.

(b) Action of heat :

The decomposition follows the following order,

Iodide > Bromide > Chloride (When same alkyl group is present) and

Tertiary > Secondary > Primary (When same halogen is present).

(iii) **Miscellaneous reactions**

(a) **Reduction** : Alkyl halides are reduced with nascent hydrogen obtained by Zn/HCl or sodium and alcohol or Zn/Cu couple or $LiAlH_4$.

Reaction is used for the preparation of pure alkanes

(b) **Wurtz reaction** : An ether solution of an alkyl halide (Preferably bromide or iodide) gives an alkane when heated with metallic sodium.

(c) **Reaction with magnesium** : Alkyl halides form Grignard reagent when treated with dry magnesium powder in dry ether.

Grignard reagents are used for making a very large number of organic compounds.

(d) **Reaction with other metals** : Organometallic compounds are formed.

□ When heated with zinc powder in ether, alkyl halides form dialkyl zinc compounds. These are called Frankland reagents.

□ When heated with lead-sodium alloy, ethyl bromide gives tetra ethyl lead which is used as antiknock compound in petrol.

□ **Reaction with lithium** : Alkyl halides react with lithium in dry ether to form alkyl lithiums.

Alkyl lithiums are similar in properties with Grignard reagents. These are reactive reagents also.

(e) *Friedel-Craft's reaction* :

(f) Substitution (Halogenation) : Alkyl halides undergo further halogenation in presence of sunlight, heat energy or peroxide.

Preparations and properties of Dihalides

(1) **Methods of preparation of dihalides**

(i) **Methods of preparation of gemdihalide**

(a) *From alkyne (Hydrohalogenation)* :

(b) *From carbonyl compound* :

□ If ketone is taken internal dihalide formed.

(ii) **Methods of preparation of vicinal dihalide**

(a) *From alkene [By halogenation]* :

(b) *From vicinal glycol* :

(2) **Properties of dihalides**

(i) **Physical properties**

(a) Dihalide are colourless with pleasant smell liquid. Insoluble in water, soluble in organic solvent.

(b) *M.P* and *B.P* $\propto$ -molecular mass.

(c) Reactivity of vicinal dihalides > Gem dihalide.

(ii) **Chemical properties of dihalide**

(a) *Reaction with aqueous KOH* :

(b) *Reaction with alcoholic KOH* :

(c) *Reaction with Zn dust*

□ Gem halide (*di*) form higher symmetrical alkene.

□ Vicinal dihalide form respective alkene.

(d) *Reaction with KCN* :

(e) *Other substitution reaction*

Tri-halides (Chloroform and iodoform)

Chloroform or trichloromethane, $CHCl_3$

It is an important trihalogen derivative of methane. It was discovered by Liebig in 1831 and its name chloroform was proposed by Dumas as it gave formic acid on hydrolysis. In the past, it was extensively used as anaesthetic for surgery but now it is rarely used as it causes liver damage.

(1) **Preparation**

(i) Chloroform is prepared both in the laboratory and on large scale by distilling ethyl alcohol or acetone with bleaching powder and water. The yield is about 40%. The available chlorine of bleaching powder serves both as oxidising as well as chlorinating agent.

(a) *From alcohol*

[So Cl_2 acts both as an oxidising and chlorinating agent]

Chloral, thus, formed, is hydrolysed by calcium hydroxide.

(b) *From acetone*

(ii) **From carbon tetrachloride** : Now-a-days, chloroform is obtained on a large scale by the reduction of carbon tetrachloride with iron filings and water.

This chloroform is not pure and used mainly as a solvent.

(iii) Pure Chloroform is obtained by distilling chloral hydrate with concentrated sodium hydroxide solution.

□ Chloral hydrate is a stable compound inspite of the fact that two $-OH$ groups are linked to the same carbon atom. This is due to the fact that intramolecular hydrogen bonding exists in the molecule between chlorine and hydrogen atom of $-OH$ group.

(2) Physical properties

- (i) It is a sweet smelling colourless liquid.
- (ii) It is heavy liquid. Its density is 1.485. It boils at 61°C .
- (iii) It is practically insoluble in water but dissolves in organic solvents such as alcohol, ether, etc.
- (iv) It is non-inflammable but its vapours may burn with green flame.
- (v) It brings temporary unconsciousness when vapours are inhaled for sufficient time.

(3) Chemical properties

(i) **Oxidation :**

Phosgene is extremely poisonous gas. To use chloroform as an anaesthetic agent, it is necessary to prevent the above reaction. The following two precautions are taken when chloroform is stored.

- (a) It is stored in dark blue or brown coloured bottles, which are filled upto the brim.
- (b) 1% ethyl alcohol is added. This retards the oxidation and converts the phosgene formed into harmless ethyl carbonate.

(ii) **Reduction :**

(iii) **Chlorination :**

(iv) **Hydrolysis :**

- (v) **Nitration** : The hydrogen of the chloroform is replaced by nitro group when it is treated with concentrated nitric acid. The product formed is chloropicrin or trichloronitro methane or nitro chloroform. It is a liquid, poisonous and used as an insecticide and a war gas.

(vi) *Heating with silver powder :*

(vii) **Condensation with acetone** : Chloroform condenses with acetone on heating in presence of caustic alkalis. The product formed is a colourless crystalline solid called chloretone and is used as **hypnotic** in medicine.

(viii) **Reaction with sodium ethoxide :**

(ix) **Reimer-Tiemann reaction :**

(x) **Carbylamine reaction** (Isocyanide test) : This reaction is actually the test of primary amines. Chloroform, when heated with primary amine in presence of alcoholic potassium hydroxide forms a derivative called isocyanide which has a very offensive smell.

This reaction is also used for the test of chloroform.

(4) Uses

- (i) It is used as a solvent for fats, waxes, rubber, resins, iodine, etc.
- (ii) It is used for the preparation of chlorethone (a drug) and chloropicrin (Insecticide).
- (iii) It is used in laboratory for the test of primary amines, iodides and bromides.
- (iv) It can be used as **anaesthetic** but due to harmful effects it is not used these days for this purpose.
- (v) It may be used to prevent putrefaction of organic materials, *i.e.*, in the preservation of anatomical species.

(5) Tests of chloroform

- (i) It gives isocyanide test (Carbylamine test).
- (ii) It forms silver mirror with Tollen's reagent.
- (iii) Pure Chloroform does not give white precipitate with silver nitrate.

Iodoform or tri-iodomethane, CHI_3

Iodoform resembles chloroform in the methods of preparation and properties.

(1) Preparation

Sodium carbonate can be used in place of KOH or NaOH . These reactions are called iodoform reactions.

(ii) **Industrial preparation** : Iodoform is prepared on large scale by electrolysis of a solution containing ethanol, sodium carbonate and potassium iodide. The iodine set free, combine with ethanol in presence of alkali to form iodoform. The electrolysis carried out in presence of CO_2 and the temperature is maintained at $60-70^\circ\text{C}$.

KOH is neutralised by CO_2 :

(2) Physical properties

- (i) It is a yellow crystalline solid.
- (ii) It has a pungent characteristic odour.
- (iii) It is insoluble in water but soluble in organic solvents such as alcohol, ether, etc.

(iv) It has melting point 119°C . It is steam volatile.

(3) Chemical Reactions of iodoform

(4) **Uses** : Iodoform is extensively used as an **antiseptic** for dressing of wounds; but the antiseptic action is due to the liberation of free iodine and not due to iodoform itself. When it comes in contact with organic matter, iodine is liberated which is responsible for antiseptic properties.

(5) Tests of iodoform

(i) **With AgNO_3** : CHI_3 gives a yellow precipitate of AgI .

(ii) **Carbylamine reaction** : CHI_3 on heating with primary amine and alcoholic KOH solution, gives an offensive smell of isocyanide (Carbylamine).

(iii) **Iodoform reaction** : With I_2 and NaOH or I_2 and Na_2CO_3 , the iodoform test is mainly given by ethyl alcohol

$(\text{CH}_3\text{CH}_2\text{OH})$, acetaldehyde ($\text{CH}_3-\overset{\text{O}}{\parallel}\text{C}-\text{H}$), α -methyl ketone or 2-one ($-\overset{\text{O}}{\parallel}\text{C}-\text{CH}_3$), secondary alcohols or 2-ol ($-\text{CHOH}\cdot\text{CH}_3$) and secondary alkyl halide at $\text{C}_2(-\text{CHClCH}_3)$. Also lactic acid ($\text{CH}_3-\text{CHOH}-\text{COOH}$), Pyruvic acid ($\text{CH}_3-\overset{\text{O}}{\parallel}\text{C}-\text{COOH}$) and methyl phenyl ketone ($\text{C}_6\text{H}_5-\overset{\text{O}}{\parallel}\text{C}-\text{CH}_3$) give this test.

Tetra-halides (Carbon tetrachloride, CCl_4)

It is the most important tetrahalogen derivative of methane.

(1) Manufacture

(i) **From methane** : $\text{CH}_4 + 4\text{Cl}_2 \xrightarrow{400^\circ\text{C}} \text{CCl}_4 + 4\text{HCl}$

(ii) **From carbon disulphide** :

S_2Cl_2 further reacts with CS_2 to form more of carbon tetrachloride.

Carbon tetrachloride is separated out by fractional distillation. It is washed with sodium hydroxide and then distilled to get a pure sample.

(iii) **From propane** :

(2) Physical properties

- (i) It is a colourless liquid having characteristic smell.
- (ii) It is non-inflammable and poisonous. It has boiling point 77°C .
- (iii) It is insoluble in water but soluble in organic solvents.
- (iv) It is an excellent solvent for oils, fats, waxes and greases.

(3) **Chemical properties** : Carbon tetrachloride is less reactive and inert to most organic reagents. However, the following reactions are observed.

(i) **Reaction with steam** (Oxidation) :

(ii) **Reduction** :

(iii) **Hydrolysis** :

(iv) **Reaction with phenol** (Reimer-tiemann reaction) :

**(4) Uses**

(i) It is used as a fire extinguisher under the name **pyrene**. The dense vapours form a protective layer on the burning objects and prevent the oxygen or air to come in contact with the burning objects.

(ii) It is used as a solvent for fats, oils, waxes and greases, resins, iodine etc.

(iii) It finds use in medicine as **helmenthicide** for elimination of hook worms.

Unsaturated halides (Halo-alkene)**Vinyl chloride or chloroethene, $CH_2=CHCl$**

(1) **Synthesis** : Vinyl chloride can be synthesised by a number of methods described below:

(i) From ethylene chloride :**(ii) From ethylene :****(iii) From acetylene :**

(2) **Properties** : It is a colourless gas at room temperature. Its boiling point is $-13^\circ C$. The halogen atom in vinyl chloride is not reactive as in other alkyl halides. However, $C=C$ bond of vinyl chloride gives the usual addition reactions.

The non-reactivity of chlorine atom is due to resonance stabilization. The lone pair on chlorine can participate in delocalization (Resonance) to give two canonical structures.

The following two effects are observed due to resonance stabilization.

(i) Carbon-chlorine bond in vinyl chloride has some double bond character and is, therefore, stronger than a pure single bond.

(ii) Carbon atom is sp^2 hybridized and $C-Cl$ bond length is shorter ($1.69\text{\AA}$) and the bond is stronger than in alkyl halides ($1.80\text{\AA}$) due to sp^3 hybridization of the carbon atom.

Addition reactions

(3) **Uses** : The main use of vinyl chloride is in the manufacture of polyvinyl chloride (PVC) plastic which is employed these days for making synthetic leather goods, rain coats, pipes, floor tiles, gramophone records, packaging materials, etc.

Allyl iodide or 3-iodopropene-1, $ICH_2CH=CH_2$

(1) **Synthesis** : It is obtained,

Or

This is halogen-exchange reaction and is called **Finkelstein reaction**.

(2) **Properties** : It is a colourless liquid. It boils at $103.1^\circ C$. The halogen atom in allyl iodide is quite reactive. The p -orbital of the halogen atom does not interact with π -molecular orbital of the double bond because these are separated by a saturated sp^3 -hybridized carbon atom. Thus, the halogen atom in allyl halides can be easily replaced and the reactions of allyl halides are similar to the reaction of alkyl halides.

In terms of valence bond approach, the reactivity of halogen atom is due to ionisation to yield a carbonium ion which can stabilize by resonance as shown below,

Substitution reactions : Nucleophilic substitution reactions occur,

Addition reactions : Electrophilic addition reactions take place in accordance to Markownikoff's rule.

Allyl iodide is widely used in organic synthesis.

Halo-arenes

In these compounds the halogen is linked directly to the carbon of the benzene nucleus.

(1) **Nomenclature** : Common name is aryl halide *IUPAC* name is halo-arene.

Example :

(2) Methods of preparation

(i) By direct halogenation of benzene ring

(ii) From diazonium salts

(iii) Hunsdiecker reaction :

(iv) From Aryl thallium compound :

(3) Physical properties

(i) **Physical state** : Haloarenes are colourless liquid or crystalline solid.

(ii) **Solubility** : They are insoluble in water, but dissolve readily in organic solvents. Insolubility is due to inability to form hydrogen bonding in water. Para isomer is less soluble than ortho isomer.

(iii) Halo-arenes are heavier than water.

(iv) B.P. of halo-arenes follow the trend. Iodo arene > Bromo arene > Chloro arene.

(4) Chemical properties

Inert nature of chlorobenzene : Aryl halides are unreactive as compared to alkyl halides as the halogen atom in these compounds is firmly attached and cannot be replaced by nucleophiles. Such as OH^- , NH_2^- , CN^- etc.

Thus delocalization of electrons by resonance in aryl halides, brings extra stability and double bond character between $C-X$ bond. This makes the bond stronger and shorter than pure single bond. However under vigorous conditions the following nucleophilic substitution reactions are observed,

(i) Nucleophilic displacement :

(ii) Electrophilic aromatic substitution

(iii) Wurtz - fittig reaction :

(iv) Formation of grignard reagent :

(v) Ullmann reaction

Some more important halogen derivatives

(1) **Freons** : The chloro fluoro derivatives of methane and ethane are called freons. Some of the derivatives are: CHF_2Cl (monochlorodifluoromethane), CF_2Cl_2 (dichlorodifluoro-methane), HCF_2CHCl_2 (1,1-dichloro-2,2-difluoroethane). These derivatives are non-inflammable, colourless, non-toxic, low boiling liquids. These are stable upto $550^\circ C$. The most important and useful derivative is CF_2Cl_2 which is commonly known as **freon** and **freon-12**.

Freon or freon-12 (CF_2Cl_2) is prepared by treating carbon tetrachloride with antimony trifluoride in the presence of antimony pentachloride as a catalyst.

Or it can be obtained by reacting carbon tetrachloride with hydrofluoric acid in presence of antimony pentafluoride.

Under ordinary conditions freon is a gas. Its boiling point is $-29.8^\circ C$. It can easily be liquified. It is chemically inert. It is used in

air-conditioning and in domestic refrigerators for cooling purposes (As refrigerant). It causes depletion of ozone layer.

(2) **Teflon** : It is plastic like substance produced by the polymerisation of tetrafluoroethylene ($CF_2 = CF_2$).

Tetrafluoroethylene is formed when chloroform is treated with antimony trifluoride and hydrofluoric acid.

On polymerisation tetrafluoroethylene forms a plastic-like material which is called **teflon**.

Teflon is chemically inert substance. It is not affected by strong acids and even by boiling aqua-regia. It is stable at high temperatures. It is, thus, used for electrical insulation, preparation of gasket materials and non-sticking frying pans.

(3) **Acetylene tetrachloride (Westron), $CHCl_2 \cdot CHCl_2$** : Acetylene tetrachloride is also known as sym. tetrachloroethane. It is prepared by the action of chlorine on acetylene in presence of a catalyst such as ferric chloride, aluminium chloride, iron, quartz or kieselguhr.

In absence of catalyst, the reaction between chlorine and acetylene is highly explosive producing carbon and HCl . The reaction is less violent in presence of a catalyst.

It is a heavy, non-inflammable liquid. It boils at $146^\circ C$. It is highly toxic in nature. Its smell is similar to chloroform. It is insoluble in water but soluble in organic solvents.

On further chlorination, it forms penta and hexachloroethane. On heating with lime (Calcium hydroxide), it is converted to useful product **westrosol** ($CCl_2 = CHCl$).

Both westron and westrosol are used as solvents for oils, fats, waxes, resins, varnishes and paints, etc.

(4) **p-Dichlorobenzene** : It is prepared by chlorination of benzene.

It is a white, volatile solid having melting point of 325 K , which readily sublimates. It resembles chlorobenzene in their properties.

It is used as general insecticides, germicide, soil fumigant deodorant. It is used as a larvicide for cloth moth and peach tree borer.

(5) **DDT; 2,2-bis (p-Chlorophenyl) -1,1,1-trichloroethane** :

Properties and uses of D.D.T.

(i) D.D.T. is almost insoluble in water but it is moderately soluble in polar solvents.

(ii) D.D.T. is a powerful insecticide. It is widely used as an insecticide for killing mosquitoes and other insects.

Side Effects of D.D.T. : D.D.T. is not biodegradable. Its residues accumulate in environment and its long term effects could be highly dangerous. It has been proved to be toxic to living beings. Therefore, its use has been abandoned in many western countries. However, in spite of its dangerous side effects, D.D.T. is still being widely used in India due to non-availability of other cheaper insecticides.

(6) **BHC (Benzene hexachloride), $C_6H_6Cl_6$** :

Uses : It is an important agricultural pesticide mainly used for exterminating white ants, leaf hopper, termite, etc. It is also known by the common name **gammexene or lindane or 666**.

□ aaaaae conformation of $C_6H_6Cl_6$ is most powerful insecticide.

(7) **Perfluorocarbons (PFCs)** : Perfluorocarbons (C_nF_{2n+2}) are obtained by controlled fluorination of vapourized alkanes diluted with nitrogen gas in the presence of a catalyst.

These are colourless, odourless, non-toxic, non-corrosive, non-flammable, non-polar, extremely stable and unreactive gases, liquids and solids. These are stable to ultraviolet radiations and other ionising radiations and therefore, they do not deplete the ozone layer like freons.

These are good electrical insulators. These have many important uses such as :

(i) These are used as lubricants, surface coatings and dielectrics.

(ii) These are used as heat transfer media in high voltage electrical equipment.

(iii) These are used for vapour phase soldering, gross leak detection of sealed microchips etc. in electronic industry.

(iv) These are also used in health care and medicine such as skin care cosmetics, wound healing, liquid ventilation, carbon monoxide poisoning and many medical diagnosis.

Organometallic compounds

Organic compounds in which a metal atom is directly linked to carbon or organic compounds which contain at least one carbon-metal bond are called organometallic compounds.

Example : Methyl lithium (CH_3Li), Dialkyl zinc (R_2Zn), Alkyl magnesium halide ($R-Mg-X$)

(1) **Methyl lithium** :

□ High reactivity of CH_3Li over grignard reagent is due to greater polar character of $C-Li$ bond in comparison to $C-Mg$ bond.

Chemical properties

□ Unlike grignard reagents, alkyl lithium can add to an alkenic double bond.

(2) **Dialkyl zinc** : First organometallic compound discovered by Frankland in 1849.

Chemical properties

Preparation of quaternary hydrocarbon :

(3) **Grignard reagent** : Grignard reagent are prepared by the action of alkyl halide on dry burn magnesium in presence of alcohol free dry ether.

Dry ether dissolves the grignard reagent through solvation.

Grignard reagents are never isolated in free state on account of their explosive nature.

□ For given alkyl radical the ease of formation of a grignard reagent is, Iodide > Bromide > Chloride

Usually alkyl bromides are used.

□ For a given halogen, the ease of formation of grignard reagent is, $CH_3X > C_2H_5X > C_3H_7X$

□ Since tertiary alkyl iodides eliminate HI to form an alkene, tertiary alkyl chlorides are used in place of tertiary alkyl iodides.

□ Grignard reagent cannot be prepared from a compound which consists in addition to halogen, some reactive group such as $-OH$ because it will react rapidly with the grignard reagent.

The $C-Mg$ bond in grignard reagent is some what covalent but highly polar.

The alkyl group acts as carbanion. The majority of reaction of grignard reagent fall into two groups:

(i) *Double decomposition with compound containing active hydrogen atom or reactive halogen atom*

(ii) *Addition reaction with compounds containing*

Tips & Tricks

✍ Iodination of alkanes is a reversible process, therefore, formation of iodoalkanes is possible only in the presence of oxidising agents such as HIO_3 .

✍ Iodination with methane does not take place at all.

✍ Fluorination of alkanes takes place with rupture of $C-C$ bonds in higher alkanes. Therefore alkyl fluorides are generally prepared by halide exchange reactions.

✍ Phosphorous halides are generally used to prepare lower alkyl bromides in the laboratory.

✍ $SOBr_2$ is less stable and SOI_2 does not exist. Thus, $R-Br$ and $R-I$ cannot be prepared by Darzan's method.

✍ Hunsdiecker reaction proceeds through free radical mechanism. It is used to reduce the length of carbon chain.

✍ Reactivity of halides towards S_N1 mechanism is $3^\circ > 2^\circ > 1^\circ$.

✍ Reactivity of halides towards S_N2 mechanism is $1^\circ > 2^\circ > 3^\circ$.

- ✍ Polar solvents favour S_N^1 mechanism.
- ✍ Non polar solvents favour S_N^2 mechanism.
- ✍ High concentration of nucleophile favour S_N^2 mechanism while low concentration of nucleophile favour S_N^1 mechanism.
- ✍ S_N^1 reactions partial racemisation occurs with inverted product predominant in yield whereas in S_N^2 reactions, inverted product is formed.
- ✍ Order of nucleophilicity among halide ions decreases in the order $I^- > Br^- > Cl^- > F^-$.
- ✍ During elimination reactions, the H atom is lost from the carbon atom carrying minimum number of H atom.
- ✍ C_2H_5SH (Ethyl mercaptan) is added to LPG (household cooking gas) to detect leakage. The compound has a typical smell.
- ✍ In Sandmeyer reaction, Cl of $CuCl$ is attached to benzene ring.
- ✍ Nuclear halogenation takes place by electrophilic substitution mechanism whereas side chain halogenation takes place by free radical mechanism.
- ✍ Aryl halides and vinyl halides ($CH_2 = CH - X$) are less reactive than alkyl halides and are not easily hydrolysed. Thus alkyl halides on reaction with $NaOH$ give coloured precipitate but aryl and vinyl halide does not.
- ✍ Before using the sample of chloroform as an anaesthetic it is tested by treating with aqueous solution of $AgNO_3$. A pure sample does not give ppt. with aq. $AgNO_3$.
- ✍ Halothane, $CF_3-CHClBr$, is a general anaesthetic which replace diethyl ether.
- ✍ CCl_4 resist hydrolysis with boiling water due to non availability of d -orbital in C .
- ✍ C_2Cl_6 is a solid and is known as artificial camphor.
- ✍ Chlorobenzene commercially produced by Raschig process.

Chapter 25

Halogen Containing Compounds

Compounds derived from hydrocarbons by the replacement of one or more hydrogen atoms by the corresponding number of halogen atoms are termed as halogen derivatives. The halogen derivatives of the hydrocarbons are broadly classified into three classes:

Halogen derivatives of saturated hydrocarbons (Alkanes)- Halo-alkanes.

Halogen derivatives of unsaturated hydrocarbons (Alkenes and alkynes)-Halo-alkene or alkyne.

Halogen derivatives of aromatic hydrocarbons (Arenes)-Halo-arenes.

General methods of preparation of Alkyl Halides

(1) From alkanes

(i) By halogenation :

This reaction proceed through free radical mechanism.

□ Order of reactivity of X_2 for a given alkane is, $F_2 > Cl_2 > Br_2 > I_2$.

□ The reactivity of the alkanes follows the order : $3^\circ\text{alkane} > 2^\circ\text{alkane} > 1^\circ\text{alkane}$.

(ii) With sulphuryl chloride :

□ This reaction is a fast due to in presence of light and trace of an organic peroxide.

(2) From alkenes (Hydrohalogenation by Electrophilic addition)

□ Addition of HBr to alkene in the presence of organic peroxide take place due to peroxide effect or Kharasch's effect.

□ This addition take place by two mechanism, Peroxide initiates free radical mechanism.

Markownikoff's addition by electrophilic mechanism.

□ The order of reactivity of halogen acids is, $\text{HI} > \text{HBr} > \text{HCl}$.

(3) From alcohols

(i) By the action of halogen acids

Groove's process

□ The reactivity order of HX in the above reaction is : $\text{HI} > \text{HBr} > \text{HCl} > \text{HF}$.

□ Reactivity order of alcohols $3^\circ > 2^\circ > 1^\circ > \text{MeOH}$.

□ 2° and 3° alcohols undergo S_N1 ; where as 1° and MeOH undergo S_N2 mechanism.

□ Concentrated HCl + anhy. ZnCl_2 is known as lucas reagent.

(ii) Using PCl_5 and PCl_3 :

□ Bromine and iodine derivatives cannot be obtain from the above reaction, because PBr_5 or PI_5 are unstable.

□ This method gives good yield of primary alkyl halides but poor yields of secondary and tertiary alkyl halides.

(iii) By the action of thionyl chloride (Darzan's process) : Reaction takes place through SN^2 mechanism.

(4) From silver salt of carboxylic acids (Hunsdiecker reaction, Decarboxylation by Free radical mechanism)

- The reactivity of alkyl group is $1^\circ > 2^\circ > 3^\circ$
- Only bromide are obtained in good yield.
- Not suitable for chlorination because yield is poor.
- In this reaction iodine forms ester instead of alkyl halide and the reaction is called Birnbaum-Simonini reaction,

(5) By **Finkelstein reaction** (Halide exchange method) :

□ Alkyl fluorides can not be prepared by this method. They can be obtained from corresponding chlorides by the action of Hg_2F_2 or antimony trifluoride. (swart reaction)

(6) **Other method**

Properties of Alkyl Halides

(1) **Physical properties**

(i) CH_3F, CH_3Cl, CH_3Br and C_2H_5Cl are gases at room temperature. The alkyl halides upto C_{18} are colourless liquids while higher members are colourless solids.

(ii) Alkyl halides are insoluble in water but soluble in organic solvents.

(iii) They burn on copper wire with green edged flame (Beilstein test for halogens).

(iv) Alkyl bromides and iodides are heavier than water. Alkyl chlorides and fluorides are lighter than water.

(v) Alkyl iodides become violet or brown in colour on exposure as they decompose in light.

(vi) For a given alkyl group, the boiling points of alkyl halides are in the order $RI > RBr > RCl > RF$ and for a given halogen the boiling points of alkyl halides increase with the increase of the size of the alkyl group.

(vii) Alkyl halides are in general toxic compounds and bring unconsciousness when inhaled in large amounts.

(2) **Chemical properties** : The alkyl halides are highly reactive, the order of reactivity is,

Iodide > Bromide > Chloride (Nature of the halogen atom)

Tertiary > Secondary > Primary (Type of the halogen atom)

Amongst the primary alkyl halide, the order of reactivity is :

The high reactivity of alkyl halides can be explained in terms of the nature of $C-X$ bond which is highly polarised covalent bond due to large

difference in the electronegativities of carbon and halogen atoms. The halogen is far more electronegative than carbon and tends to pull the electrons away from carbon, i.e., halogen acquires a small negative charge and carbon a small positive charge.

This polarity is responsible for reactions,

(i) Nucleophilic substitution reactions (ii) Elimination reactions

(i) **Nucleophilic substitution (S_N) reactions** : The $C^{\delta+}$ site is susceptible to attack by nucleophiles (An electron rich species).

Examples of S_N reactions,

(a) **Hydrolysis** :

□ With the help of this reaction an alkene can be converted into alcohol. Alkene is first reacted with HBr to form alkyl bromide and then hydrolysis is done.

(b) **Reaction with alkoxides or dry silver oxide** :

(c) **Reaction with sodium or potassium hydrogen sulphide** :

(d) **Reaction with alcoholic potassium cyanide and silver cyanide** :

(e) **Reaction with potassium nitrite or silver nitrite** :

(f) **Reaction with ammonia** :

(g) **Reaction with silver salts of fatty acids** :

(h) **Reaction with sodium acetylide** :

(i) *Reaction with sodium or potassium sulphide* :

Thioethers can also be obtained by

(j) *Reaction with halides* :

(ii) **Elimination reactions** : The positive charge on carbon is propagated to the neighbouring carbon atoms by inductive effect. When approached by a strongest base (B^-), it tends to lose a proton usually from the β -carbon atom. Such reactions are termed elimination reactions. They are also E and E_2 reactions.

As the above reactions involve leaving of X^- , the reactivity of alkyl halides (Same alkyl group, different halogens) should be limited with $C-X$ bond strength.

Type of bond	$C-I$	$C-Br$	$C-Cl$
Bond strength (kcal/mol)	45.5	54	66.5
	Bond strength increases $\longrightarrow$		

The breaking of the bond becomes more and more difficult and thus, the reactivity decrease.

The order of reactivity (Tertiary > Secondary > Primary) is due to +I effect of the alkyl groups which increases the polarity of $C-X$ bond.

The primary alkyl halides undergo reactions either by S_N2 or E_2 mechanisms which involve the formation of transition state. The bulky groups cause steric hinderance in the formation of transition state. Therefore, higher homologues are less reactive than lower homologues. $CH_3X > C_2H_5X > C_3H_7X$, etc.

Example of elimination reaction

(a) *Dehydrohalogenation* :

In this reactions, ether is a by-product as potassium ethoxide is always present in small quantity.

(b) *Action of heat* :

The decomposition follows the following order,

Iodide > Bromide > Chloride (When same alkyl group is present) and

Tertiary > Secondary > Primary (When same halogen is present).

(iii) **Miscellaneous reactions**

(a) *Reduction* : Alkyl halides are reduced with nascent hydrogen obtained by Zn/HCl or sodium and alcohol or Zn/Cu couple or $LiAlH_4$.

Reaction is used for the preparation of pure alkanes

(b) *Wurtz reaction* : An ether solution of an alkyl halide (Preferably bromide or iodide) gives an alkane when heated with metallic sodium.

(c) *Reaction with magnesium* : Alkyl halides form Grignard reagent when treated with dry magnesium powder in dry ether.

Grignard reagents are used for making a very large number of organic compounds.

(d) *Reaction with other metals* : Organometallic compounds are formed.

□ When heated with zinc powder in ether, alkyl halides form dialkyl zinc compounds. These are called Frankland reagents.

□ When heated with lead-sodium alloy, ethyl bromide gives tetra ethyl lead which is used as antiknock compound in petrol.

□ Reaction with lithium : Alkyl halides react with lithium in dry ether to form alkyl lithiums.

Alkyl lithiums are similar in properties with Grignard reagents. These are reactive reagents also.

(e) *Friedel-Craft's reaction* :

(f) *Substitution (Halogenation)* : Alkyl halides undergo further halogenation in presence of sunlight, heat energy or peroxide.

Preparations and properties of Dihalides

(i) **Methods of preparation of dihalides**

(i) **Methods of preparation of gemdihalide**

(a) From alkyne (Hydrohalogenation) :

(b) From carbonyl compound :

□ If ketone is taken internal dihalide formed.

(ii) **Methods of preparation of vicinal dihalide**

(a) From alkene [By halogenation] :

(b) From vicinal glycol :

(2) **Properties of dihalides**(i) **Physical properties**

(a) Dihalide are colourless with pleasant smell liquid. Insoluble in water, soluble in organic solvent.

(b) $M.P$ and $B.P \propto$ -molecular mass.

(c) Reactivity of vicinal dihalides > Gem dihalide.

(ii) **Chemical properties of dihalide**(a) **Reaction with aqueous KOH :**(b) **Reaction with alcoholic KOH :**(c) **Reaction with Zn dust**□ Gem halide (dh) form higher symmetrical alkene.

□ Vicinal dihalide form respective alkene.

(d) **Reaction with KCN :**(e) **Other substitution reaction****Tri-halides (Chloroform and iodoform)****Chloroform or trichloromethane, $CHCl_3$**

It is an important trihalogen derivative of methane. It was discovered by Liebig in 1831 and its name chloroform was proposed by Dumas as it gave formic acid on hydrolysis. In the past, it was extensively used as anaesthetic for surgery but now it is rarely used as it causes liver damage.

(1) **Preparation**

(i) Chloroform is prepared both in the laboratory and on large scale by distilling ethyl alcohol or acetone with bleaching powder and water. The yield is about 40%. The available chlorine of bleaching powder serves both as oxidising as well as chlorinating agent.

(a) **From alcohol**[So Cl_2 acts both as an oxidising and chlorinating agent]

Chloral, thus, formed, is hydrolysed by calcium hydroxide.

(b) **From acetone**

(ii) **From carbon tetrachloride** : Now-a-days, chloroform is obtained on a large scale by the reduction of carbon tetrachloride with iron filings and water.

This chloroform is not pure and used mainly as a solvent.

(iii) Pure Chloroform is obtained by distilling chloral hydrate with concentrated sodium hydroxide solution.

□ Chloral hydrate is a stable compound inspite of the fact that two $-OH$ groups are linked to the same carbon atom. This is due to the fact that intramolecular hydrogen bonding exists in the molecule between chlorine and hydrogen atom of $-OH$ group.

(2) **Physical properties**

- (i) It is a sweet smelling colourless liquid.
- (ii) It is heavy liquid. Its density is 1.485. It boils at $61^\circ C$.
- (iii) It is practically insoluble in water but dissolves in organic solvents such as alcohol, ether, etc.
- (iv) It is non-inflammable but its vapours may burn with green flame.
- (v) It brings temporary unconsciousness when vapours are inhaled for sufficient time.

(3) **Chemical properties**(i) **Oxidation :**

Phosgene is extremely poisonous gas. To use chloroform as an anaesthetic agent, it is necessary to prevent the above reaction. The following two precautions are taken when chloroform is stored.

(a) It is stored in dark blue or brown coloured bottles, which are filled upto the brim.

(b) 1% ethyl alcohol is added. This retards the oxidation and converts the phosgene formed into harmless ethyl carbonate.

(ii) **Reduction** :

(iii) **Chlorination** :

(iv) **Hydrolysis** :

(v) **Nitration** : The hydrogen of the chloroform is replaced by nitro group when it is treated with concentrated nitric acid. The product formed is chloropicrin or trichloronitro methane or nitro chloroform. It is a liquid, poisonous and used as an insecticide and a war gas.

(vi) **Heating with silver powder** :

(vii) **Condensation with acetone** : Chloroform condenses with acetone on heating in presence of caustic alkalis. The product formed is a colourless crystalline solid called chloretone and is used as **hypnotic** in medicine.

(viii) **Reaction with sodium ethoxide** :

(ix) **Reimer-Tiemann reaction** :

(x) **Carbylamine reaction** (Isocyanide test) : This reaction is actually the test of primary amines. Chloroform, when heated with primary amine in presence of alcoholic potassium hydroxide forms a derivative called isocyanide which has a very offensive smell.

This reaction is also used for the test of chloroform.

(4) **Uses**

(i) It is used as a solvent for fats, waxes, rubber, resins, iodine, etc.

(ii) It is used for the preparation of chloretone (a drug) and chloropicrin (Insecticide).

(iii) It is used in laboratory for the test of primary amines, iodides and bromides.

(iv) It can be used as **anaesthetic** but due to harmful effects it is not used these days for this purpose.

(v) It may be used to prevent putrefaction of organic materials, *i.e.*, in the preservation of anatomical species.

(5) **Tests of chloroform**

(i) It gives isocyanide test (Carbylamine test).

(ii) It forms silver mirror with Tollen's reagent.

(iii) Pure Chloroform does not give white precipitate with silver nitrate.

Iodoform or tri-iodomethane, CHI₃

Iodoform resembles chloroform in the methods of preparation and properties.

(1) **Preparation**

(i) **Laboratory preparation** :

Sodium carbonate can be used in place of *KOH* or *NaOH*. These reactions are called iodoform reactions.

(ii) **Industrial preparation** : Iodoform is prepared on large scale by electrolysis of a solution containing ethanol, sodium carbonate and potassium iodide. The iodine set free, combine with ethanol in presence of alkali to form iodoform. The electrolysis carried out in presence of CO_2 and the temperature is maintained at $60\text{--}70^\circ\text{C}$.

KOH is neutralised by CO_2 :

**(2) Physical properties**

- (i) It is a yellow crystalline solid.
 (ii) It has a pungent characteristic odour.
 (iii) It is insoluble in water but soluble in organic solvents such as alcohol, ether, etc.

(iv) It has melting point $119^\circ C$. It is steam volatile.

(3) Chemical Reactions of iodoform

(4) **Uses** : Iodoform is extensively used as an antiseptic for dressing of wounds; but the antiseptic action is due to the liberation of free iodine and not due to iodoform itself. When it comes in contact with organic matter, iodine is liberated which is responsible for antiseptic properties.

(5) Tests of iodoform

- (i) **With $AgNO_3$** : CHI_3 gives a yellow precipitate of AgI .
 (ii) **Carbylamine reaction** : CHI_3 on heating with primary amine and alcoholic KOH solution, gives an offensive smell of isocyanide (Carbylamine).

(iii) **Iodoform reaction** : With I_2 and $NaOH$ or I_2 and Na_2CO_3 , the iodoform test is mainly given by ethyl alcohol

(CH_3CH_2OH) , acetaldehyde $(CH_3-\overset{O}{\parallel}C-H)$, α -methyl ketone or 2-one $(-\overset{O}{\parallel}C-CH_3)$, secondary alcohols or 2-ol $(-CHOH \cdot CH_3)$ and secondary alkyl halide at $C_2(-CHClCH_3)$. Also lactic acid

$(CH_3-CHOH-COOH)$, Pyruvic acid $(CH_3-\overset{O}{\parallel}C-COOH)$ and

methyl phenyl ketone $(C_6H_5-\overset{O}{\parallel}C-CH_3)$ give this test.

Tetra-halides (Carbon tetrachloride, CCl_4)

It is the most important tetrahalogen derivative of methane.

(1) Manufacture

(ii) **From carbon disulphide** :

S_2Cl_2 further reacts with CS_2 to form more of carbon tetrachloride.

Carbon tetrachloride is separated out by fractional distillation. It is washed with sodium hydroxide and then distilled to get a pure sample.

(iii) **From propane** :

**(2) Physical properties**

- (i) It is a colourless liquid having characteristic smell.
 (ii) It is non-inflammable and poisonous. It has boiling point $77^\circ C$.
 (iii) It is insoluble in water but soluble in organic solvents.
 (iv) It is an excellent solvent for oils, fats, waxes and greases.

(3) **Chemical properties** : Carbon tetrachloride is less reactive and inert to most organic reagents. However, the following reactions are observed.

(i) **Reaction with steam** (Oxidation) :

(ii) **Reduction** :

(iii) **Hydrolysis** :

(iv) **Reaction with phenol** (Reimer-Tiemann reaction) :

**(4) Uses**

- (i) It is used as a fire extinguisher under the name **pyrene**. The dense vapours form a protective layer on the burning objects and prevent the oxygen or air to come in contact with the burning objects.
 (ii) It is used as a solvent for fats, oils, waxes and greases, resins, iodine etc.
 (iii) It finds use in medicine as **helmenthicide** for elimination of hook worms.

Unsaturated halides (Halo-alkene)**Vinyl chloride or chloroethene, $CH_2=CHCl$**

(i) **Synthesis** : Vinyl chloride can be synthesised by a number of methods described below:

(i) **From ethylene chloride** :

(ii) **From ethylene** :

(iii) **From acetylene :**

(2) **Properties :** It is a colourless gas at room temperature. Its boiling point is -13°C . The halogen atom in vinyl chloride is not reactive as in other alkyl halides. However, $\text{C}=\text{C}$ bond of vinyl chloride gives the usual addition reactions.

The non-reactivity of chlorine atom is due to resonance stabilization. The lone pair on chlorine can participate in delocalization (Resonance) to give two canonical structures.

The following two effects are observed due to resonance stabilization.

(i) Carbon-chlorine bond in vinyl chloride has some double bond character and is, therefore, stronger than a pure single bond.

(ii) Carbon atom is sp^2 hybridized and $\text{C}-\text{Cl}$ bond length is shorter ($1.69\text{\AA}$) and the bond is stronger than in alkyl halides ($1.80\text{\AA}$) due to sp^3 hybridization of the carbon atom.

Addition reactions

(3) **Uses :** The main use of vinyl chloride is in the manufacture of polyvinyl chloride (PVC) plastic which is employed these days for making synthetic leather goods, rain coats, pipes, floor tiles, gramophone records, packaging materials, etc.

Allyl iodide or 3-iodopropene-1, $\text{ICH}_2\text{CH}=\text{CH}_2$

(1) **Synthesis :** It is obtained,

This is halogen-exchange reaction and is called **Finkelstein reaction**.

(2) **Properties :** It is a colourless liquid. It boils at 103.1°C . The halogen atom in allyl iodide is quite reactive. The p -orbital of the halogen atom does not interact with π -molecular orbital of the double bond because these are separated by a saturated sp^3 -hybridized carbon atom. Thus, the halogen atom in allyl halides can be easily replaced and the reactions of allyl halides are similar to the reaction of alkyl halides.

In terms of valence bond approach, the reactivity of halogen atom is due to ionisation to yield a carbonium ion which can stabilize by resonance as shown below,

Substitution reactions : Nucleophilic substitution reactions occur,

Addition reactions : Electrophilic addition reactions take place in accordance to Markownikoff's rule.

Allyl iodide is widely used in organic synthesis.

Halo-arenes

In these compounds the halogen is linked directly to the carbon of the benzene nucleus.

(1) **Nomenclature :** Common name is aryl halide *IUPAC* name is halo-arene.

Example :

(2) **Methods of preparation**

(i) **By direct halogenation of benzene ring**

(ii) **From diazonium salts**

(iii) **Hunsdiecker reaction** :(iv) **From Aryl thallium compound** :(3) **Physical properties**(i) **Physical state** : Haloarenes are colourless liquid or crystalline solid.(ii) **Solubility** : They are insoluble in water, but dissolve readily in organic solvents. Insolubility is due to inability to form hydrogen bonding in water. Para isomer is less soluble than ortho isomer.

(iii) Halo-arenes are heavier than water.

(iv) B.P. of halo-arenes follow the trend. Iodo arene > Bromo arene > Chloro arene.

(4) **Chemical properties**

Inert nature of chlorobenzene : Aryl halides are unreactive as compared to alkyl halides as the halogen atom in these compounds is firmly attached and cannot be replaced by nucleophiles. Such as OH^- , NH_2^- , CN^- etc.

Thus delocalization of electrons by resonance in aryl halides, brings extra stability and double bond character between $C-X$ bond. This makes the bond stronger and shorter than pure single bond. However under vigorous conditions the following nucleophilic substitution reactions are observed,

(i) **Nucleophilic displacement** :(ii) **Electrophilic aromatic substitution**(iii) **Wurtz - fittig reaction** :(iv) **Formation of grignard reagent** :(v) **Ullmann reaction**

Some more important halogen derivatives

(i) **Freons** : The chloro fluoro derivatives of methane and ethane are called freons. Some of the derivatives are: CHF_2Cl (monochlorodifluoromethane), CF_2Cl_2 (dichlorodifluoro-methane), HCF_2CHCl_2 (1,1-dichloro-2,2-difluoroethane). These derivatives are non-inflammable, colourless, non-toxic, low boiling liquids. These are stable upto $550^\circ C$. The most important and useful derivative is CF_2Cl_2 which is commonly known as **freon** and **freon-12**.

Freon or freon-12 (CF_2Cl_2) is prepared by treating carbon tetrachloride with antimony trifluoride in the presence of antimony pentachloride as a catalyst.

Or it can be obtained by reacting carbon tetrachloride with hydrofluoric acid in presence of antimony pentafluoride.

Under ordinary conditions freon is a gas. Its boiling point is $-29.8^\circ C$. It can easily be liquified. It is chemically inert. It is used in air-conditioning and in domestic refrigerators for cooling purposes (As refrigerant). It causes depletion of ozone layer.

(2) **Teflon** : It is plastic like substance produced by the polymerisation of tetrafluoroethylene ($CF_2 = CF_2$).

Tetrafluoroethylene is formed when chloroform is treated with antimony trifluoride and hydrofluoric acid.

On polymerisation tetrafluoroethylene forms a plastic-like material which is called **teflon**.

Teflon is chemically inert substance. It is not affected by strong acids and even by boiling aqua-regia. It is stable at high temperatures. It is, thus, used for electrical insulation, preparation of gasket materials and non-sticking frying pans.

(3) **Acetylene tetrachloride (Westron)**, $CHCl_2 \cdot CHCl_2$: Acetylene tetrachloride is also known as sym. tetrachloroethane. It is prepared by the action of chlorine on acetylene in presence of a catalyst such as ferric chloride, aluminium chloride, iron, quartz or kieselguhr.

In absence of catalyst, the reaction between chlorine and acetylene is highly explosive producing carbon and HCl . The reaction is less violent in presence of a catalyst.

It is a heavy, non-inflammable liquid. It boils at $146^\circ C$. It is highly toxic in nature. Its smell is similar to chloroform. It is insoluble in water but soluble in organic solvents.

On further chlorination, it forms penta and hexachloroethane. On heating with lime (Calcium hydroxide), it is converted to useful product **westrosol** ($CCl_2 = CHCl$).

Both westron and westrosol are used as solvents for oils, fats, waxes, resins, varnishes and paints, etc.

(4) ***p*-Dichlorobenzene** : It is prepared by chlorination of benzene.

It is a white, volatile solid having melting point of 325 K, which readily sublimes. It resembles chlorobenzene in their properties.

It is used as general insecticides, germicide, soil fumigant deodorant. It is used as a larvicide for cloth moth and peach tee borer.

(5) **DDT; 2, 2-bis (*p*-Chlorophenyl) -1,1,1-trichloroethane** :

Properties and uses of D.D.T.

(i) D.D.T. is almost insoluble in water but it is moderately soluble in polar solvents.

(ii) D.D.T. is a powerful insecticide. It is widely used as an insecticide for killing mosquitoes and other insects.

Side Effects of D.D.T. : D.D.T. is not biodegradable. Its residues accumulate in environment and its long term effects could be highly dangerous. It has been proved to be toxic to living beings. Therefore, its use has been abandoned in many western countries. However, inspite of its dangerous side effects, D.D.T. is still being widely used in India due to non-availability of other cheaper insecticides.

(6) **BHC (Benzene hexachloride), $\text{C}_6\text{H}_6\text{Cl}_6$** :

Uses : It is an important agricultural pesticide mainly used for exterminating white ants, leaf hopper, termite, etc. It is also known by the common name **gammaxene or lindane or 666**.

□ aaaaaa conformation of $\text{C}_6\text{H}_6\text{Cl}_6$ is most powerful insecticide.

(7) **Perfluorocarbons (PFCs)** : Perfluorocarbons ($\text{C}_n\text{F}_{2n+2}$) are obtained by controlled fluorination of vaporized alkanes diluted with nitrogen gas in the presence of a catalyst.

These are colourless, odourless, non-toxic, non-corrosive, non-flammable, non-polar, extremely stable and unreactive gases, liquids and solids. These are stable to ultraviolet radiations and other ionising radiations and therefore, they do not deplete the ozone layer like freons.

These are good electrical insulators. These have many important uses such as :

(i) These are used as lubricants, surface coatings and dielectrics.

(ii) These are used as heat transfer media in high voltage electrical equipment.

(iii) These are used for vapour phase soldering, gross leak detection of sealed microchips etc. in electronic industry.

(iv) These are also used in health care and medicine such as skin care cosmetics, wound healing, liquid ventilation, carbon monoxide poisoning and many medical diagnosis.

Organometallic compounds

Organic compounds in which a metal atom is directly linked to carbon or organic compounds which contain at least one carbon-metal bond are called organometallic compounds.

Example : Methyl lithium (CH_3Li), Dialkyl zinc (R_2Zn), Alkyl magnesium halide ($\text{R}-\text{Mg}-\text{X}$)

(1) **Methyl lithium** :

□ High reactivity of CH_3Li over grignard reagent is due to greater polar character of $\text{C}-\text{Li}$ bond in comparison to $\text{C}-\text{Mg}$ bond.

Chemical properties

□ Unlike grignard reagents, alkyl lithium can add to an alkenic double bond.

(2) **Dialkyl zinc** : First organometallic compound discovered by Frankland in 1849.

Chemical properties

Preparation of quaternary hydrocarbon :

(3) **Grignard reagent** : Grignard reagent are prepared by the action of alkyl halide on dry burn magnesium in presence of alcohol free dry ether.

Dry ether dissolves the grignard reagent through solvation.

Grignard reagents are never isolated in free state on account of their explosive nature.

□ For given alkyl radical the ease of formation of a grignard reagent is, Iodide > Bromide > Chloride

Usually alkyl bromides are used.

□ For a given halogen, the ease of formation of grignard reagent is, $\text{CH}_3\text{X} > \text{C}_2\text{H}_5\text{X} > \text{C}_3\text{H}_7\text{X} \dots\dots\dots$

□ Since tertiary alkyl iodides eliminate HI to form an alkene, tertiary alkyl chlorides are used in place of tertiary alkyl iodides.

□ Grignard reagent cannot be prepared from a compound which consists in addition to halogen, some reactive group such as $-\text{OH}$ because it will react rapidly with the grignard reagent.

The $\text{C}-\text{Mg}$ bond in grignard reagent is some what covalent but highly polar.

The alkyl group acts as carbanion. The majority of reaction of grignard reagent fall into two groups:

(i) Double decomposition with compound containing active hydrogen atom or reactive halogen atom

(ii) Addition reaction with compounds containing

✍ Iodination of alkanes is a reversible process, therefore, formation of iodoalkanes is possible only in the presence of oxidising agents such as HIO_3 .

✍ Iodination with methane does not take place at all.

✍ Fluorination of alkanes takes place with rupture of $\text{C}-\text{C}$ bonds in higher alkanes. Therefore alkyl fluorides are generally prepared by halide exchange reactions.

✍ Phosphorous halides are generally used to prepare lower alkyl bromides in the laboratory.

✍ SOBr_2 is less stable and SOI_2 does not exist. Thus, $\text{R}-\text{Br}$ and $\text{R}-\text{I}$ cannot be prepared by Darzan's method.

✍ Hunsdiecker reaction proceeds through free radical mechanism. It is used to reduce the length of carbon chain.

✍ Reactivity of halides towards S_N mechanism is $3^\circ > 2^\circ > 1^\circ$.

✍ Reactivity of halides towards S_N mechanism is $1^\circ > 2^\circ > 3^\circ$.

✍ Polar solvents favour S_N mechanism.

✍ Non polar solvents favour S_N mechanism.

✍ High concentration of nucleophile favour S_N mechanism while low concentration of nucleophile favour S_N mechanism.

✍ S_N reactions partial racemisation occurs with inverted product predominant in yield whereas in S_N reactions, inverted product is formed.

✍ Order of nucleophilicity among halide ions decreases in the order $\text{I} > \text{Br} > \text{Cl} > \text{F}$.

✍ During elimination reactions, the H atom is lost from the carbon atom carrying minimum number of H atom.

✍ CH_3SH (Ethyl mercaptan) is added to LPG (household cooking gas) to detect leakage. The compound has a typical smell.

✍ In Sandmeyer reaction, Cl of CuCl is attached to benzene ring.

✍ Nuclear halogenation takes place by electrophilic substitution mechanism whereas side chain halogenation takes place by free radical mechanism.

✍ Aryl halides and vinyl halides ($\text{CH}_2=\text{CH}-\text{X}$) are less reactive than alkyl halides and are not easily hydrolysed. Thus alkyl halides on reaction with NaOH give coloured precipitate but aryl and vinyl halide does not.

✍ Before using the sample of chloroform as an anaesthetic it is tested by treating with aqueous solution of AgNO_3 . A pure sample does not give ppt. with aq. AgNO_3 .

✍ Halothane, CF_3CHClBr , is a general anaesthetic which replace diethyl ether.

✍ CCl_4 resist hydrolysis with boiling water due to non availability of d-orbital in C.

✍ CCl_4 is a solid and is known as artificial camphor.

✍ Chlorobenzene commercially produced by Raschig process.

 - Benzene
- Benzene hexachloride is
 - 1, 2, 3, 4, 5, 6-hexachlorocyclohexane
 - 1, 1, 1, 6, 6, 6-hexachlorocyclohexane
 - 1, 6-phenyl-1, 6-chlorohexane
 - 1, 1-phenyl-6, 6-chlorohexane
- Number of π -bonds present in B.H.C. (Benzene hexachloride) are [RPMT 1999]
 - 6
 - Zero
 - 3
 - 12
- The general formula for alkyl halides is
 - $C_nH_{2n+1}X$
 - $C_nH_{2n+2}X$
 - $C_nH_{n+1}X$
 - $C_nH_{2n}X$
- Which of the following is a primary halide [DCE 2004]
 - Isopropyl iodide
 - Secondary butyl iodide
 - Tertiary butyl bromide
 - Neo hexyl chloride
- Full name of DDT is [KCET 1993]
 - 1, 1, 1-trichloro-2, 2-bis(*p*-chlorophenyl) ethane
 - 1, 1-dichloro-2, 2-diphenyl trimethylethane
 - 1, 1-dichloro-2, 2-diphenyl trichloroethane
 - None of these

- The compound which contains all the four $1^\circ, 2^\circ, 3^\circ$ and 4° carbon atoms is [J & K 2005]
 - 2, 3-dimethyl pentane
 - 3-chloro-2, 3-dimethylpentane
 - 2, 3, 4-trimethylpentane
 - 3, 3-dimethylpentane

Preparation of Halogen containing compounds

- The following reaction is known as

$$C_2H_5OH + SOCl_2 \xrightarrow{\text{Pyridine}} C_2H_5Cl + SO_2 + HCl$$
 [AIIMS 2002]
 - Kharasch effect
 - Darzen's procedure
 - Williamson's synthesis
 - Hunsdiecker synthesis reaction
- What is the main product of the reaction between 2-methyl propene with HBr [RPMT 2002]
 - 1-bromo butane
 - 1-bromo-2 methyl propane
 - 2-bromo butane
 - 2-bromo-2 methyl propane
- Halogenation of alkanes is [KCET 2002]
 - A reductive process
 - An oxidative process
 - An isothermal process
 - An endothermal process
- $$\begin{array}{c}
 + \\
 N \equiv NBF_4 \\
 | \\
 \text{C}_6\text{H}_5
 \end{array}
 \xrightarrow{\Delta} A$$
 In the above process product A is [Kerala (Engg.) 2002]
 - Fluorobenzene
 - Benzene
 - 1, 4-difluorobenzene
 - 1, 3-difluorobenzene
- Silver acetate + $Br_2 \xrightarrow{CS_2}$. The main product of this reaction is [Kurukshetra CET 2002]
 - $CH_3 - Br$
 - CH_3COI
 - CH_3COOH
 - None of these
- Diazonium salts + $Cu_2Cl_2 + HCl \rightarrow$ , the reaction is known as [Kerala (Med.) 2002]
 - Chlorination
 - Sandmeyer's reaction
 - Perkin reaction
 - Substitution reaction
- When ethyl alcohol (C_2H_5OH) reacts with thionyl chloride, in the presence of pyridine, the product obtained is [AIIMS; CBSE PMT 2001]
 - $CH_3CH_2Cl + HCl$
 - $C_2H_5Cl + HCl + SO_2$
 - $CH_3CH_2Cl + H_2O + SO_2$
 - $CH_3CH_2Cl + HCl + SO_2$

8. Preparation of alkyl halides in laboratory is least preferred by [DPMT 2000]
 - (a) Treatment of alcohols
 - (b) Addition of hydrogen halides to alkenes
 - (c) Halide exchange
 - (d) Direct halogenation of alkanes
 9. Which of the following organic compounds will give a mixture of 1-chlorobutane and 2-chlorobutane on chlorination [CPMT 2001]
 - (a) $\text{CH}_3 - \underset{\text{CH}_3}{\underset{|}{\text{CH}}} - \text{CH} = \text{CH}_2$
 - (b) $\text{HC} \equiv \text{C} - \underset{\text{H}}{\underset{|}{\text{C}}} = \text{CH}_2$
 - (c) $\text{CH}_2 = \text{CH} - \text{CH} = \text{CH}_2$
 - (d) $\text{CH}_2 = \text{CH} - \text{CH}_2 - \text{CH}_3$
 10. The chlorobenzene is generally obtained from a corresponding diazonium salt by reacting it with [MP PMT 2000]
 - (a) Cu_2Cl_2
 - (b) CuSO_4
 - (c) Cu
 - (d) $\text{Cu}(\text{NH}_3)_4^{2+}$
 11. Decreasing order of reactivity of HX in the reaction $\text{ROH} + \text{HX} \rightarrow \text{RX} + \text{H}_2\text{O}$ [RPET 2000; AIIMS 1983; MP PET 1996]
 - (a) $\text{HI} > \text{HBr} > \text{HCl} > \text{HF}$
 - (b) $\text{HBr} > \text{HCl} > \text{HI} > \text{HF}$
 - (c) $\text{HCl} > \text{HBr} > \text{HI} > \text{HF}$
 - (d) $\text{HF} > \text{HBr} > \text{HCl} > \text{HI}$
 12. The product of the following reaction : $\text{CH}_2 = \text{CH} - \text{CCl}_3 + \text{HBr}$ [RPET 2000]
 - (a) $\text{CH}_3 - \text{CH}(\text{Br}) - \text{CCl}_3$
 - (b) $\text{CH}_2(\text{Br}) - \text{CH}_2 - \text{CCl}_3$
 - (c) $\text{BrCH}_2 - \text{CHCl} - \text{CHCl}_2$
 - (d) $\text{CH}_3 - \text{CH}_2 - \text{CCl}_3$
 13. Chlorobenzene is prepared commercially by [JIPMER 2000; CPMT 1976; Pb. CET 2002]
 - (a) Raschig process
 - (b) Wurtz Fitting reaction
 - (c) Friedel-Craft's reaction
 - (d) Grignard reaction
 14. In methyl alcohol solution, bromine reacts with ethylene to yield $\text{BrCH}_2\text{CH}_2\text{OCH}_3$ in addition to 1, 2-dibromoethane because [Pb. PMT 1998]
 - (a) The ion formed initially may react with Br^- or CH_3OH
 - (b) The methyl alcohol solvates the bromine
 - (c) The reaction follows Markownikoff's rule
 - (d) This is a free-radical mechanism
 15. $\text{C}_3\text{H}_8 + \text{Cl}_2 \xrightarrow{\text{Light}} \text{C}_3\text{H}_7\text{Cl} + \text{HCl}$ is an example of which of the following types of reactions [AFMC 1997; CPMT 1999]
 - (a) Substitution
 - (b) Elimination
 - (c) Addition
 - (d) Rearrangement
 16. Which of the following would be produced when acetylene reacts with HCl [MH CET 1999]
 - (a) $\text{CH}_3\text{CH}_2\text{Cl}$
 - (b) CH_3CHCl_2
 - (c) $\text{CHCl} = \text{CHCl}$
 - (d) $\text{CH}_2 = \text{CHCl}$
 17. $\text{R} - \text{OH} + \text{HX} \rightarrow \text{R} - \text{X} + \text{H}_2\text{O}$
 - In the above reaction, the reactivity of different alcohols is [CPMT 1997]
 - (a) Tertiary > Secondary > Primary
 - (b) Tertiary < Secondary < Primary
 - (c) Tertiary < Secondary > Primary
 - (d) Secondary < Primary < Tertiary
 18. $\text{C}_6\text{H}_6 + \text{Cl}_2 \xrightarrow{\text{UV Light}}$ Product. In above reaction product is [CPMT 1997]
 - (a) CCl_3CHO
 - (b) $\text{C}_6\text{H}_6\text{Cl}_6$
 - (c) $\text{C}_6\text{H}_{12}\text{Cl}_6$
 - (d) $\text{C}_6\text{H}_9\text{Cl}_2$
 19. Benzene reacts with chlorine to form benzene hexachloride in presence of [MP PET 1999]
 - (a) Nickel
 - (b) AlCl_3
 - (c) Bright sunlight
 - (d) Zinc
 20. The final product obtained by distilling ethyl alcohol with the excess of chlorine and $\text{Ca}(\text{OH})_2$ is [MP PET 1996]
 - (a) CH_3CHO
 - (b) CCl_3CHO
 - (c) CHCl_3
 - (d) $(\text{CH}_3)_2\text{O}$
 21. When ethyl alcohol and KI reacted in presence of Na_2CO_3 , yellow crystals of..... are formed [AFMC 1989]
 - (a) CHI_3
 - (b) CH_3I
 - (c) CH_2I_2
 - (d) $\text{C}_2\text{H}_5\text{I}$
 22. In preparation of CHCl_3 from ethanol and bleaching powder, the latter provides [BHU 1986]
 - (a) $\text{Ca}(\text{OH})_2$
 - (b) Cl_2
 - (c) Both (a) and (b)
 - (d) None of these
 23. Which one of the following processes does not occur during formation of CHCl_3 from $\text{C}_2\text{H}_5\text{OH}$ and bleaching powder [DPMT 1984]
 - (a) Hydrolysis
 - (b) Oxidation
 - (c) Reduction
 - (d) Chlorination
 24. Which of the following is obtained when chloral is boiled with NaOH [CBSE PMT 1991; RPMT 1999]
 - (a) CH_3Cl
 - (b) CHCl_3
 - (c) CCl_4
 - (d) None of these
 25. Chloroform can be obtained from [MNR 1986]
 - (a) Methanol
 - (b) Methanal
 - (c) Propanol-1
 - (d) Propanol-2
 26. Chlorine reacts with ethanol to give [MP PMT 1989; CPMT 1997; KCET 1998; JIPMER 1999]
 - (a) Ethyl chloride
 - (b) Chloroform
 - (c) Acetaldehyde
 - (d) Chloral
 27. On heating diethyl ether with conc. HI , 2 moles of which of the following is formed [IIT-JEE 1983; MP PET 1990; EAMCET 1990; AFMC 1993; JIPMER 2001]
 - (a) Ethanol
 - (b) Iodoform
 - (c) Ethyl iodide
 - (d) Methyl iodide
 28. Lucas reagent is [MP PMT 1996; MP PET 1992, 95; CPMT 1986, 89; AIIMS 1980; Kurukshetra CEE 2002]
 - (a) Concentrated HCl + anhydrous ZnCl_2
 - (b) Dilute HCl + hydrated ZnCl_2
 - (c) Concentrated HNO_3 + anhydrous ZnCl_2
 - (d) Concentrated HCl + anhydrous MgCl_2
 29. Which compound does not form iodoform with alkali and iodine [IIT-JEE 1985]

- (a) Acetone (b) Ethanol
(c) Diethyl ketone (d) Isopropyl alcohol
30. Which compound gives yellow ppt. with iodine and alkali [IIT-JEE 1984]
(a) 2-hydroxy propane (b) Acetophenone
(c) Methyl acetone (d) Acetamide
31. Acetone reacts with I_2 in presence of $NaOH$ to form [MP PMT 1992]
(a) C_2H_5I (b) $C_2H_4I_2$
(c) CHI_3 (d) CH_3I
32. Ethanol is converted into ethyl chloride by reacting with [MP PET 1991; MP PMT 1990; BHU 1997]
(a) Cl_2 (b) $SOCl_2$
(c) HCl (d) $NaCl$
33. C_6H_5Cl prepared by aniline with [IIT-JEE 1984]
(a) HCl
(b) Cu_2Cl_2
(c) Cl_2 in presence of anhydrous $AlCl_3$
(d) HNO_2 and then heated with Cu_2Cl_2
34. The starting substance for the preparation of CH_3I is [CPMT 1975]
(a) CH_3OH (b) C_2H_5OH
(c) CH_3CHO (d) $(CH_3)_2CO$
35. A Grignard's reagent may be made by reacting magnesium with [CPMT 1973, 83, 84]
(a) Methyl amine (b) Diethyl ether
(c) Ethyl iodide (d) Ethyl alcohol
36. Which of the following is responsible for iodoform reaction [CPMT 1980; RPMT 1997]
(a) Formalin (b) Methanol
(c) Acetic acid (d) Ethanol
37. When a solution of sodium chloride containing ethyl alcohol is electrolysed, it forms
(a) Ethyl alcohol (b) Chloral
(c) Chloroform (d) Acetaldehyde
38. Which reagent cannot be used to prepare an alkyl halide from an alcohol [CPMT 1989, 94]
(a) $HCl + ZnCl_2$ (b) $NaCl$
(c) PCl_5 (d) $SOCl_3$
39. Ethyl benzoate reacts with PCl_5 to give [KCET 2003]
(a) $C_2H_5Cl + C_6H_5COCl + POCl_3 + HCl$
(b) $C_2H_5Cl + C_6H_5COCl + POCl_3$
(c) $CH_3COCl + C_6H_5COCl + POCl_3$
(d) $C_2H_5Cl + C_6H_5COOH + POCl_3$
40. On treatment with chlorine in presence of sunlight, toluene gives the product [Orissa JEE 2003; MH CET 1999, 2002]
(a) o-chloro toluene (b) 2, 5-dichloro toluene
(c) p-chloro toluene (d) Benzyl chloride
41. When chlorine is passed through warm benzene in presence of the sunlight, the product obtained is [KCET 2003]
(a) Benzotrichloride (b) Chlorobenzene
(c) Gammexane (d) DDT
42. Which of the following acids adds to propene in the presence of peroxide to give anti-Markownikoff's product [MP PET 2003]
(a) HF (b) HCl
(c) HBr (d) HI
43. Propene on treatment with HBr gives [CPMT 1986]
(a) Isopropyl bromide (b) Propyl bromide
(c) 1, 2-dibromoethane (d) None of the above
44. The catalyst used in Raschig's process is
(a) $LiAlH_4$ (b) Copper chloride
(c) Sunlight (d) Ethanol/ Na
45. The compound formed on heating chlorobenzene with chloral in the presence of concentrated sulphuric acid, is [AIEEE 2004]
(a) Freon (b) DDT
(c) Gammexene (d) Hexachloroethane
46. Acetone is mixed with bleaching powder to give [AFMC 2004]
(a) Chloroform (b) Acetaldehyde
(c) Ethanol (d) Phosgene
47. Which of the following compounds gives trichloromethane on distilling with bleaching powder [KCET 2004; EAMCET 1986]
(a) Methanal (b) Phenol
(c) Ethanol (d) Methanol
48. The product formed on reaction of ethyl alcohol with bleaching powder is [Orissa JEE 2004; DPMT 1978; AIIMS 1991]
(a) $CHCl_3$ (b) CCl_3CHO
(c) CH_3COCH_3 (d) CH_3CHO
49. Ethylene reacts with bromine to form [Pb. CET 2000]
(a) Chloroethane (b) Ethylene dibromide
(c) Cyclohexane (d) 1-bromo propane
50. Best method of preparing alkyl chloride is [MH CET 2004]
(a) $ROH + SOCl_2 \longrightarrow$
(b) $ROH + PCl_5 \longrightarrow$
(c) $ROH + PCl_3 \longrightarrow$
(d) $ROH + HCl \xrightarrow{\text{anhy. } ZnCl_2}$
51. DDT is prepared by reacting chlorobenzene with [BHU 1998, 2005]
(a) CCl_4 (b) $CCl_3 - CHO$
(c) $CHCl_3$ (d) Ethane
52. Which compound needs chloral in its synthesis [Pb. PET 2003]
(a) D. D. T. (b) Gammexane
(c) Chloroform (d) Michler's Ketone
53. To get DDT, chlorobenzene has to react with which of the following compounds in the presence of concentrated sulphuric acid [KCET (Engg./Med.) 2001]
(a) Trichloroethane (b) Dichloroacetone
(c) Dichloroacetaldehyde (d) Trichloroacetaldehyde
54. What will be the product in the following reaction [BHU 2005]

(a)

(b)

Properties of Halogen containing compounds

1. A. Compounds A is
[Orissa JEE 2005]

2. Ethyl bromide can be converted into ethyl alcohol by
[KCET 1989]
(a) Heating with dilute hydrochloric acid and zinc
(b) Boiling with an alcoholic solution of KOH
(c) The action of moist silver oxide
(d) Refluxing methanol
3. Reaction of ethyl chloride with sodium leads to
[NCERT 1984]
(a) Ethane (b) Propane
(c) *n*-butane (d) *n*-pentane
4. Treatment of ammonia with excess of ethyl chloride will yield
[AIIMS 1992]
(a) Diethyl amine
(b) Ethane
(c) Tetraethyl ammonium chloride
(d) Methyl amine
5. $2\text{CHCl}_3 + \text{O}_2 \xrightarrow{\text{X}} 2\text{COCl}_2 + 2\text{HCl}$
In the above reaction, X stands for
(a) An oxidant (b) A reductant
(c) Light and air (d) None of these
6. Phosgene is the common name for
[DPMT 1983; CPMT 1993; MP PMT 1994; Kurukshetra CEE 1998; RPMT 2000, 02]
(a) CO_2 and PH_3 (b) Phosphoryl chloride
(c) Carbonyl chloride (d) Carbon tetrachloride
7. When chloroform is treated with amine and KOH, we get
[CPMT 1979]
(a) Rose odour smell
(b) Sour almond like smell
(c) Offensive odour
(d) Sour oil of winter green like smell

8. A mixture of two organic chlorine compounds was treated with sodium metal in ether solution. Isobutane was obtained as a product. The two chlorine compounds are [KCET 1985]
(a) Methyl chloride and propyl chloride
(b) Methyl chloride and ethyl chloride
(c) Isopropyl chloride and methyl chloride
(d) Isopropyl chloride and ethyl chloride
9. Alkyl halides can be converted into Grignard reagents by
[KCET 1989]
(a) Boiling them with Mg ribbon in alcoholic solution
(b) Warming them with magnesium powder in dry ether
(c) Refluxing them with MgCl_2 solution
(d) Warming them with MgCl_2
10. Which is not present in Grignard reagent
[CBSE PMT 1991]
(a) Methyl group (b) Magnesium
(c) Halogen (d) $-\text{COOH}$ group
11. The reactivity of ethyl chloride is [KCET 1986]
(a) More or less equal to that of benzyl chloride
(b) More than that of benzyl chloride
(c) More or less equal to that of chlorobenzene
(d) Less than that of chlorobenzene
12. The reactivity of halogen atom is minimum in [KCET 1985]
(a) Propyl chloride (b) Propyl iodide
(c) Isopropyl chloride (d) Isopropyl bromide
13. Chlorobenzene is
(a) Less reactive than benzyl chloride
(b) More reactive than ethyl bromide
(c) Nearly as reactive as methyl chloride
(d) More reactive than isopropyl chloride
14. The reactivities of methyl chloride, propyl chloride and chlorobenzene are in the order [KCET 1988]
(a) Methyl chloride > propyl chloride > chlorobenzene
(b) Propyl chloride > methyl chloride > chlorobenzene
(c) Methyl chloride > chlorobenzene > propyl chloride
(d) Chlorobenzene > propyl chloride > methyl chloride
15. Which of the following compound will make precipitate most readily with AgNO_3 [CPMT 1992]
[CPMT 1985]
(a) CCl_3CHO (b) CHCl_3
(c) $\text{C}_6\text{H}_5\text{CH}_2\text{Cl}$ (d) CHI_3
16. Carbylamine is liberated when..... is heated with chloroform and alcoholic potash [KCET 1992]
(a) An aldehyde (b) A primary amine
(c) A secondary amine (d) A phenol
17. Salicylic acid can be prepared using Reimer-Tiemann's reaction by treating phenol with [KCET 1989]
(a) Methyl chloride in the presence of anhydrous aluminium chloride
(b) Carbon dioxide under pressure in sodium hydroxide solution
(c) Carbon tetrachloride and concentrated sodium hydroxide
(d) Sodium nitrite and a few drops of concentrated sulphuric acid

18. Grignard reagent is prepared by the reaction between
[CBSE PMT 1994; DPMT 1996; Pb. PMT 1999; MH CET 1999]
- Zinc and alkyl halide
 - Magnesium and alkyl halide
 - Magnesium and alkane
 - Magnesium and aromatic hydrocarbon
19. Reaction of *t*-butyl bromide with sodium methoxide produces
[CBSE PMT 1994]
- Isobutane
 - Isobutylene
 - Sodium *t*-butoxide
 - t*-butyl methyl ether
20. War gas is formed from
[BHU 1995]
- PH_3
 - C_2H_2
 - Zinc phosphate
 - Chloropicrin
21. What happens when CCl_4 is treated with $AgNO_3$
[EAMCET 1987; CBSE PMT 1988; MP PET 2000]
- NO_2 will be evolved
 - A white ppt. of $AgCl$ will be formed
 - CCl_4 will dissolve in $AgNO_3$
 - Nothing will happen
22. If we use pyrene (CCl_4) in the Riemer-Tiemann reaction in place of chloroform, the product formed is
[CBSE PMT 1989; MP PMT 1990; MH CET 1999]
- Salicylaldehyde
 - Phenolphthalein
 - Salicylic acid
 - Cyclohexanol
23. $C_6H_5CH_2Cl + KCN(aq.) \rightarrow X + Y$
Compounds X and Y are
[BHU 1979]
- $C_6H_6 + KCl$
 - $C_6H_5CH_2CN + KCl$
 - $C_6H_5CH_3 + KCl$
 - None of these
24. The bad smelling substance formed by the action of alcoholic caustic potash on chloroform and aniline is
[MP PMT 1971, 92, 2001; CPMT 1971, 86; AFMC 2002; RPMT 1999]
- Phenyl isocyanide
 - Nitrobenzene
 - Phenyl cyanide
 - Phenyl isocyanate
25. Ethylidene chloride on treatment with aqueous KOH gives
[MP PMT 1986]
- Ethylene glycol
 - Acetaldehyde
 - Formaldehyde
 - None
26. Reaction
 $C_2H_5I + C_5H_{11}I + 2Na \rightarrow C_2H_5 - C_5H_{11} + 2NaI$ is called
[MP PMT 1992]
- Hoffmann's reaction
 - Dow's reaction
 - Wurtz's reaction
 - Riemer-Tiemann's reaction
27. In presence of $AlCl_3$, benzene and *n*-propyl bromide react in Friedal-Craft's reaction to form
[MP PMT 1991]
- n*-propyl benzene
 - 1, 2-dinormal propyl benzene
 - 1, 4-dinormal propyl benzene
 - Isopropyl benzene
28. The dehydrobromination of 2-bromobutane gives $CH_3CH = CHCH_3$. The product is
- Hofmann product
 - Saytzeff product
 - Hoffmann-Saytzeff product
 - Markownikoff product
29. Ethylene difluoride on hydrolysis gives
- Glycol
 - Fluoroethanol
 - Difluoroethanol
 - Freon
30. Benzyl chloride when oxidised by $pb(NO_3)_2$ gives
[MP PMT 1989]
- Benzoic acid
 - Benzaldehyde
 - Benzene
 - None
31. Which of the following statements about chloroform is false
[Manipal MEE 1995]
- It is a colourless, sweet-smelling liquid
 - It is almost insoluble in water
 - It is highly inflammable
 - It can be used as an inhalational anaesthetic agent
32. CCl_4 cannot give precipitate with $AgNO_3$ due to
[CPMT 1979]
- Formation of complex with $AgNO_3$
 - Evolution of Cl_2 gas
 - Chloride ion is not formed
 - $AgNO_3$ does not give silver ion
33. On heating $CHCl_3$ with aq. $NaOH$, the product is
[CPMT 1971, 78; BHU 1997; EAMCET 1998; JIPMER (Med.) 2002]
- CH_3COONa
 - $HCOONa$
 - Sodium oxalate
 - CH_3OH
34. Ethyl bromide reacts with lead-sodium alloy to form
[MP PMT/PET 1988; MP PET 1997]
- Tetraethyl lead
 - Tetraethyl bromide
 - Both (a) and (b)
 - None of the above
35. Iodoform heated with Ag powder to form
[DPMT 1985]
- Acetylene
 - Ethylene
 - Methane
 - Ethane
36. Ethyl bromide reacts with silver nitrite to form
[DPMT 1985; IIT-JEE 1991]
- Nitroethane
 - Nitroethane and ethyl nitrite
 - Ethyl nitrite
 - Ethane
37. Which of the following reactions leads to the formation of chloritone
[RPMT 2003]
- $CHCl_3 + CH_3COCH_3$
 - $CCl_4 + \text{Acetone}$
 - $CHCl_3 + KOH$
 - $CHCl_3 + HNO_3$
38. $CH_3 - CH_2 - CH_2Br + KOH (alc.) \rightarrow \text{Product}$ Product in above reaction is
[RPMT 2003]
- $CH_3 - CH = CH_2$
 - $CH_3 - CH_2 - CH_3$
 - (a) and (b) both
 - None of these
39. $A + CCl_4 + KOH \rightarrow \text{Salicylic acid}$
'A' in above reaction is
[RPMT 2003]

40. Identify X and Y in the following sequence

[Orissa JEE 2005]

- (a) $X = KCN, Y = LiAlH_4$
 (b) $X = KCN, Y = H_3O^+$
 (c) $X = CH_3Cl, Y = AlCl_3 / HCl$
 (d) $X = CH_3NH_2, Y = HNO_2$
41. 1-chlorobutane reacts with alcoholic KOH to form
 [IIT-JEE 1991; AFMC 1998]
 (a) 1-butene (b) 2-butene
 (c) 1-butanol (d) 2-butanol
42. Which of the following reactions gives
 $H_2C = C = C = CH_2$ [Roorkee Qualifying 1998]
 (a) $CH_2Br - CBr = CH_2 \xrightarrow{Zn / CH_3OH}$
 (b) $HC \equiv C - CH_2 - COOH \xrightarrow[40^\circ C]{Aq. K_2CO_3}$
 (c) $CH_2Br - C \equiv C - CH_2Br \xrightarrow[Heat]{Zn}$
 (d) $2CH_2 = CH - CH_2I \longrightarrow$
43. When ethyl amine is heated with chloroform and alcoholic KOH , a compound with offensive smell is obtained. This compound is [CPMT 1983, 84; RPMT 2002]
 (a) A secondary amine (b) An isocyanide
 (c) A cyanide (d) An acid
44. Chlorobenzene on fusing with solid $NaOH$ gives
 [DPMT 1981; CPMT 1990]
 (a) Benzene (b) Benzoic acid
 (c) Phenol (d) Benzene chloride
45. DDT can be prepared by reacting chlorobenzene (in the presence of conc. H_2SO_4) with
 (a) Cl_2 in ultraviolet light (b) Chloroform
 (c) Trichloroacetone (d) Chloral hydrate
46. When phenol reacts with $CHCl_3$ and KOH , the product obtained would be [RPMT 1997]
 (a) Salicylaldehyde (b) p -hydroxy benzaldehyde
 (c) Both (a) and (b) (d) Chlorotone
47. Ethyl chloride on heating with silver cyanide forms a compound X . The functional isomer of X is [EAMCET 1997; KCET 2005]
 (a) C_2H_5NC (b) C_2H_5CN
 (c) $H_3C - NH - CH_3$ (d) $C_2H_5NH_2$
48. Which of the following statements is incorrect [CPMT 1977]
 (a) C_2H_5Br reacts with alcoh. KOH to form C_2H_5OH
 (b) C_2H_5Br when treated with metallic sodium gives ethane
 (c) C_2H_5Br when treated with sodium ethoxide forms diethyl ether

(d) C_2H_5Br with $AgCN$ forms ethyl isocyanide

49. When chloroform is exposed to air and sunlight, it gives
 [NCERT 1984; CPMT 1978, 87; CBSE PMT 1990; EAMCET 1993; MNR 1994; MP PET 1997, 2000; BHU 2001; AFMC 2002]
 (a) Carbon tetrachloride (b) Carbonyl chloride
 (c) Mustard gas (d) Lewsite
50. An organic halide is shaken with aqueous $NaOH$ followed by the addition of dil. HNO_3 and silver nitrate solution gave white ppt. The substance can be [JIPMER 1997]
 (a) $C_6H_4(CH_3)Br$ (b) $C_6H_5CH_2Cl$
 (c) C_6H_5Cl (d) None of these
51. A compound A has a molecular formula C_2Cl_3OH . It reduces Fehling solution and on oxidation gives a monocarboxylic acid (B). A is obtained by action of chlorine on ethyl alcohol. A is
 [CBSE PMT 1994; MP PET 1997; KCET 2005]
 (a) Chloral (b) $CHCl_3$
 (c) CH_3Cl (d) Chloroacetic acid
52. Following equation illustrates

[Bihar CEE 1995]

- (a) Dow's process (b) Kolbe's process
 (c) Carbylamine test (d) Haloform reaction
53. One of the following that cannot undergo dehydrohalogenation is [J & K 2005]
 (a) Iso-propyl bromide (b) Ethanol
 (c) Ethyl bromide (d) None of these
54. A compound X on reaction with chloroform and $NaOH$ gives a compound with a very unpleasant odour. X is [MP PMT 1999]
 (a) $C_6H_5CONH_2$ (b) $C_6H_5NH_2$
 (c) $C_6H_5CH_2NHCH_3$ (d) $C_6H_5NHCH_3$

In the above reaction product is

- (a) $C_6H_5OC_2H_5$ (b) $C_2H_5OC_2H_5$
 (c) $C_6H_5OC_6H_5$ (d) C_6H_5I
56. $C_2H_5Cl + KCN \longrightarrow X \xrightarrow{\text{Hydrolysis}} Y$. 'X' and 'Y' are [MP PET 1995]
 (a) C_2H_6 and C_2H_5CN
 (b) C_2H_5CN and C_2H_6
 (c) C_2H_5CN and $C_2H_5CH_2NH_2$
 (d) C_2H_5CN and C_2H_5COOH
57. Iodoform is formed on warming I_2 and $NaOH$ with
 [MP PET 1995; DCE 1999; RPET 1999; RPMT 2002]
 (a) C_2H_5OH (b) CH_3OH

- (c) HCOOH (d) C_6H_6
58. Which of the following reacts with phenol to give salicylaldehyde after hydrolysis [MP PMT 1995]
(a) Dichloromethane (b) Trichloromethane
(c) Methyl chloride (d) None of these
59. Dehydrohalogenation in monohaloalkanes produces
(a) A single bond (b) A double bond
(c) A triple bond (d) Fragmentation
60. When chloroform is treated with conc. HNO_3 it gives [CPMT 1986; MP PMT 1989; AFMC 1998, 99; EAMCET 1991; BHU 1999]
(a) CHCl_2NO_2 (b) CCl_3NO_2
(c) $\text{CHCl}_2\text{HNO}_3$ (d) None of these
61. A sample of chloroform being used as anaesthetic is tested by [AIIMS 1980; CPMT 1983]
(a) Fehling solution
(b) Ammoniacal Cu_2Cl_2
(c) AgNO_3 solution
(d) AgNO_3 solution after boiling with alcoholic KOH solution
62. Dehydrohalogenation of an alkyl halide is [MP PMT 1996]
(a) An addition reaction (b) A substitution reaction
(c) An elimination reaction (d) An oxidation reaction
63. Reaction of aqueous sodium hydroxide on (i) ethyl bromide and (ii) chlorobenzene gives
(a) (i) Ethene and (ii) *o*-chlorophenol
(b) (i) Ethyl alcohol and (ii) *o*-chlorophenol
(c) (i) Ethyl alcohol and (ii) phenol
(d) (i) Ethyl alcohol and (ii) no reaction
64. 2-bromopentane is heated with potassium ethoxide in ethanol. The major product obtained is [CBSE PMT 1998]
(a) Pentene-1 (b) *cis* pentene-2
(c) *trans* pentene-2 (d) 2-ethoxypentane
65. What is the product formed in the following reaction
 $\text{C}_6\text{H}_5\text{OH} + \text{CCl}_4 \xrightarrow[(2) \text{H}^+]{(1) \text{NaOH}}$ [KCET 1998]
(a) *p*-hydroxybenzoic acid (b) *o*-hydroxybenzoic acid
(c) Benzaldehyde (d) Salicylaldehyde
66. When chloroform is treated with excess oxygen it forms [MH CET 1999]
(a) $\text{COCl}_2 + \text{HCl}$
(b) $\text{COCl}_2 + \text{Cl}_2 + \text{H}_2$
(c) $\text{COCl}_2 + \text{Cl}_2 + \text{H}_2\text{O}$
(d) No product will be formed
67. Which isomer of cyclohexane hexachloride is a very strong insecticide [MP PET 2003]
(a) α (b) β
(c) γ (d) δ
68. Haloalkane in the presence of alcoholic KOH undergoes [KCET (Engg./Med.) 2002]
(a) Elimination (b) Polymerisation
(c) Dimerisation (d) Substitution
69. The set of compounds in which the reactivity of halogen atom in the ascending order is [KCET (Engg.) 2002]
(a) Vinyl chloride, chloroethane, chlorobenzene
(b) Vinyl chloride, chlorobenzene, chloroethane
(c) Chloroethane, chlorobenzene, vinyl chloride
(d) Chlorobenzene, vinyl chloride, chloroethane
70. Alkyl halides react with Mg in dry ether to form [DPMT 2000; MP PET 2001]
(a) Magnesium halide (b) Grignard's reagent
(c) Alkene (d) Alkyne
71. In the following sequence of reactions
 $\text{CH}_3\text{CH}_2\text{CH}_2\text{Br} \xrightarrow{\text{KOH(alc)}} \text{X(A)} \xrightarrow{\text{HBr}} \text{X(B)} \xrightarrow{\text{KOH(aq.)}} \text{X(C)}$,
The product (C) is [JIPMER 2001]
(a) Propan-2-ol (b) Propan-1-ol
(c) Propyne (d) Propene
72. Alkyl halide on heating with alc. NH_3 in a sealed tube results... [Orissa JEE 2002]
(a) 1° amine (b) 2° amine
(c) 3° amine (d) All of these
73. When $\text{CH}_3\text{CH}_2\text{CHCl}_2$ is treated with NaNH_2 , the product formed is [CBSE PMT 2002]
(a) $\text{CH}_3 - \text{CH} = \text{CH}_2$ (b) $\text{CH}_3 - \text{C} \equiv \text{CH}$
(c) $\text{CH}_3\text{CH}_2\text{CH}(\text{NH}_2)\text{Cl}$ (d) $\text{CH}_3\text{CH}_2\text{C}(\text{NH}_2)_2$
74. By heating a mixture of CHCl_3 with silver powder, the compound formed is [Kurukshetra CET 2002]
(a) Acetylene (b) Silver acetate
(c) Methanol (d) None of these
75. Chloropicrin is [Kurukshetra CET 2002]
(a) Trichloro acetaldehyde (b) Nitrochloroform
(c) 2,4,6-trinitro phenol (d) None of these
76. Which of the following are correct statements about $\text{C}_2\text{H}_5\text{Br}$ [Roorkee 1999]
(a) It reacts with metallic Na to give ethane
(b) It gives nitroethane on heating with aqueous ethanolic solution of AgNO_2
(c) It gives $\text{C}_2\text{H}_5\text{OH}$ on boiling with alcoholic potash
(d) It forms ethylacetate on heating with silver acetate
77. Aryl halide is less reactive than alkyl halide towards nucleophilic substitution because [RPMT 2002]
(a) Less stable carbonium ion
(b) Due to large $\text{C} - \text{Cl}$ bond energy
(c) Inductive effect
(d) Resonance stabilization and sp^2 - hybridisation of C attached to halide
78. Methyl chloride reacts with silver acetate to yield [BVP 2003]
(a) Acetaldehyde (b) Acetyl chloride
(c) Methyl acetate (d) Acetic acid
79. Chloroform for anesthetic purposes is tested for its purity with the reagent [DPMT 2001]
(a) Silver nitrate (b) Lead nitrate
(c) Ammoniacal Cu_2Cl_2 (d) Lead nitrate
80. 2, 6 - Dimethylheptane on monochlorination produces..... derivatives [DPMT 2001]
(a) 5 (b) 6
(c) 3 (d) 4
81. The less reactivity of chlorine atom in $\text{CH}_2 = \text{CH} - \text{Cl}$ is due to [DCE 2001]
(a) Inductive effect (b) Resonance stabilization
(c) Electromeric effect (d) Electronegativity

82. $CH_3-CH_2-Br \xrightarrow{\text{alc. KCN}} CH_3CH_2CN \xrightarrow{\text{HOH}} X$
In this reaction, product X is [MH CET 2002]
(a) Acetic acid (b) Propionic acid
(c) Butyric acid (d) Formic acid
83. In alkaline hydrolysis of a tertiary alkyl halide by aqueous alkali if concentration of alkali is doubled, then the reaction [MH CET 2002]
(a) Will be doubled (b) Will be halved
(c) Will remain constant (d) Can't say
84. $AgNO_3$ does not give precipitate with $CHCl_3$ because [MP PET 1999; CPMT 2002]
(a) $CHCl_3$ does not ionise in water
(b) $AgNO_3$ does not react with $CHCl_3$
(c) $CHCl_3$ is chemically inert
(d) None of these
85. The reaction between chlorobenzene and chloral in the presence of concentrated sulphuric acid produces [Pb. PMT 2001]
(a) Gammexane
(b) p,p -dichloro diphenyl trichloro ethane
(c) Chloropicrin
(d) Benzene hexachloride
86. False statement is [RPET 1999]
(a) Chloroform is heavier than water
(b) CCl_4 is non-inflammable
(c) Vinyl chloride is more reactive than allyl chloride
(d) Br^- is a good nucleophile as compared to I^-
87. Chloroform is slowly oxidised by air in presence of light to form [MH CET 1999; UPSEAT 2001, 02; RPMT 2003]
(a) Formyl chloride (b) Phosgene
(c) Trichloroacetic acid (d) Formic acid
88. Alcoholic potash is used to bring about [KCET (Engg.) 2001]
(a) Dehydrogenation (b) Dehydration
(c) Dehydrohalogenation (d) Dehalogenation
89. Vinyl chloride reacts with HCl to form [JIPMER 2000]
(a) 1, 1-dichloro ethane
(b) 1, 2-dichloro ethane
(c) Tetrachloro ethylene
(d) Mixture of 1, 2 and 1, 1-dichloro ethane
90. $R-X + NaOH \longrightarrow ROH + NaX$
The above reaction is classified as [BHU 1982; CBSE PMT 1991; RPET 2000]
(a) Nucleophilic substitution
(b) Electrophilic substitution
(c) Reduction
(d) Oxidation
91. Reduction of acetyl chloride with H_2 in presence of Pd gives [MP PMT 2001]
(a) CH_3COCH_3 (b) C_2H_5OH
(c) CH_3COOH (d) CH_3CHO
92. When methyl bromide is heated with Zn it gives [MP PMT 2001]
(a) CH_4 (b) C_2H_6
(c) C_2H_4 (d) CH_3OH
93. Phenol reacts with $CHCl_3$ and $NaOH$ (at 340K) to give [MP PMT 1997; CBSE PMT 2002]
(a) o -chlorophenol (b) Salicylaldehyde
(c) Benzaldehyde (d) Chlorobenzene
94. Iodoform on heating with KOH gives [MP PMT 2000]
(a) CH_3CHO (b) CH_3COOK
(c) $HCOOK$ (d) $HCHO$
95. Which reaction is correct in the conversion of chloroform to acetylene [Pb. PMT 2000]
(a) $CHCl_3 + AgNO_3$ (b) $CHCl_3 + O_2$
(c) $CHCl_3 + HNO_3$ (d) $CHCl_3 + Ag$
96. Which of the following gases are poisonous [Pb. PMT 2000]
(a) $CHCl_3$ (b) CO_2
(c) None of these (d) CO
97. Which of the following alkyl halide is used as a methylating agent [KCET (Med.) 2000; MP PET 1999]
(a) CH_3I (b) C_2H_5Br
(c) C_2H_5Cl (d) C_6H_5Cl
98. $C_6H_6Cl_6$, on treatment with alcoholic KOH , yields [AFMC 2000]
(a) C_6H_6 (b) $C_6H_3Cl_3$
(c) $(C_6H_5)OH$ (d) $C_6H_6Cl_4$
99. When ethyl iodide is heated with silver nitrate, the product obtained is [CPMT 2000]
(a) C_2H_5Ag (b) $Ag-O-NO_2$
(c) $C_2H_5O-NO_2$ (d) $C_2H_5I-NO_2$
100. $CHCl_3$ and HF lead to the formation of a compound of fluorine of molecular weight 70. The compound is [RPET 2000]
(a) Fluoroform (b) Fluorine monoxide
(c) Fluorine dioxide (d) Fluoromethanol
101. Chloroform with zinc dust in water gives [UPSEAT 2000]
(a) CH_4 (b) Chloropicrin
(c) CCl_4 (d) CH_2Cl_2
102. Which of the following is used as a catalyst for preparing Grignard reagent [KCET 1998]
(a) Iron powder (b) Iodine powder
(c) Activated charcoal (d) Manganese dioxide
103. For a given alkyl group the densities of the halides follow the order [MP PMT 1997]
(a) $RI < RBr < RCl$ (b) $RI < RCl < RBr$
(c) $RBr < RI < RCl$ (d) $RCl < RBr < RI$
104. Which halide will be least reactive in respect to hydrolysis [MP PET 2003]
(a) Vinyl chloride (b) Allyl chloride
(c) Ethyl chloride (d) t -Butyl chloride
105. In nucleophilic aliphatic substitution, the nucleophiles are generally
(a) Acids (b) Bases
(c) Salts (d) Neutral molecules
106. Which one of the following compounds does not react with bromine [DPMT 1983]

- (a) Ethylamine (b) Propene
(c) Phenol (d) Chloroform
- 107.** Allyl chloride on dehydro chlorination gives
[Kerala (Med.) 2003]
(a) Propadiene (b) Propylene
(c) Acetylchloride (d) Acetone
- 108.** Toluene reacts with excess of Cl_2 in presence of sunlight to give a product which on hydrolysis followed by reaction with $NaOH$ gives
[Orissa JEE 2004]
- (a)  (b) 
(c)  (d) None of these
- 109.** An alkyl bromide produces a single alkene when it reacts with sodium ethoxide and ethanol. This alkene undergoes hydrogenation and produces 2-methyl butane. What is the identity of the alkyl bromide
[Kerala PMT 2004]
(a) 1-bromo-2, 2-dimethylpropane
(b) 1-bromobutane
(c) 1-bromo-2-methylbutane
(d) 2-bromo-2-methylbutane
(e) 2-bromopentane
- 110.** On treating a mixture of two alkyl halides with sodium metal in dry ether, 2-methyl propane was obtained. The alkyl halides are
[KCET 2004]
(a) 2-chloropropane and chloromethane
(b) 2-chloropropane and chloroethane
(c) Chloromethane and chloroethane
(d) Chloromethane and 1-chloropropane
- 111.** In which case formation of butane nitrile is possible
[Orissa JEE 2004]
(a) $C_3H_7Br + KCN$ (b) $C_4H_9Br + KCN$
(c) $C_3H_7OH + KCN$ (d) $C_4H_9OH + KCN$
- 112.** The reaction of an aromatic halogen compound with an alkyl halides in presence of sodium and ether is called
[MP PMT 2004]
(a) Wurtz reaction
(b) Sandmeyer's reaction
(c) Wurtz-fittig reaction
(d) Kolbe reaction
- 113.** The compound added to prevent chloroform to form phosgene gas is
[MP PET 2004]
(a) C_2H_5OH (b) CH_3COOH
(c) CH_3COCH_3 (d) CH_3OH
- 114.** Among the following, the one which reacts most readily with ethanol is
[AIIMS 2004]
(a) *p*-nitrobenzyl bromide
(b) *p*-chlorobenzyl bromide
(c) *p*-methoxybenzyl bromide
(d) *p*-methylbenzyl bromide
- 115.** Chloropicrin is obtained by the reaction of
[CBSE PMT 2004]
(a) Chlorine on picric acid
(b) Nitric acid on chloroform
(c) Steam on carbon tetrachloride
(d) Nitric acid on chlorobenzene
- 116.** In Wurtz reaction alkyl halide react with
[MH CET 2004]
(a) Sodium in ether (b) Sodium in dry ether
(c) Sodium only (d) Alkyl halide in ether
- 117.** Chloroform, when kept open, is oxidised to
[CPMT 2004]
(a) CO_2 (b) $COCl_2$
(c) CO_2, Cl_2 (d) None of these
- 118.** Chloroform reacts with concentrated HNO_3 to give
[Pb. CET 2000]
(a) Water gas (b) Tear gas
(c) Laughing gas (d) Producer gas
- 119.** When ethyl chloride and alcoholic KOH are heated, the compound obtained is
[MH CET 2003]
(a) C_2H_4 (b) C_2H_2
(c) C_6H_6 (d) C_2H_6
- 120.** Chloroform, on warming with Ag powder, gives
[MH CET 2003]
(a) C_2H_6 (b) C_3H_8
(c) C_2H_4 (d) C_2H_2
- 121.** When alkyl halide is heated with dry Ag_2O , it produces
[CPMT 1997; BHU 2004]
(a) Ester (b) Ether
(c) Ketone (d) Alcohol
- 122.** Reaction of alkyl halides with aromatic compounds in presence of anhydrous $AlCl_3$ is known as
[UPSEAT 2004]
(a) Friedal-Craft reaction
(b) Hofmann degradation
(c) Kolbe's synthesis
(d) Beckmann rearrangement
- 123.** Two percent of ethanol is added during the oxidation of chloroform to stop the formation of carbonyl chloride. In this reaction ethanol acts as
[Pb. CET 2001]
(a) Auto catalyst (b) Negative catalyst
(c) Positive catalyst (d) None of these
- 124.** When benzene is heated with chlorine in the presence of sunlight, it forms
[Pb. CET 2000]
(a) B.H.C. (b) Cyclopropane
(c) *p*-dichlorobenzene (d) None of these
- 125.** Ethylene di bromide on heating with metallic sodium in ether solution yields
[Pb. CET 2004]
(a) Ethene (b) Ethyne
(c) 2-butene (d) 1-butene
- 126.** The reaction, $CH_3Br + Na \rightarrow$ Product, is called
[Pb. CET 2003]
(a) Perkin reaction (b) Levit reaction
(c) Wurtz reaction (d) Aldol condensation
- 127.** At normal temperature iodoform is
[MP PET 2004]
(a) Thick viscous liquid (b) Gas
(c) Volatile liquid (d) Solid
- 128.** Which of the following statements about benzyl chloride is incorrect
[KCET 2004]
(a) It is less reactive than alkyl halides
(b) It can be oxidised to benzaldehyde by boiling with copper nitrate solution
(c) It is a lachrymatory liquid and answers Beilstein's test
(d) It gives a white precipitate with alcoholic silver nitrate

- 129.** Ethylene dichloride and ethylidene chloride are isomeric compounds. The false statement about these isomers is that they [DCE 2003]
 (a) React with alcoholic potash and give the same product
 (b) Are position isomers
 (c) Contain the same percentage of chlorine
 (d) Are both hydrolysed to the same product
- 130.** An alkyl bromide (X) reacts with Na to form 4, 5-diethyloctane. Compound X is [Roorkee 1999]
 (a) $\text{CH}_3(\text{CH}_2)_3\text{Br}$
 (b) $\text{CH}_3(\text{CH}_2)_5\text{Br}$
 (c) $\text{CH}_3(\text{CH}_2)_3\text{CH}.\text{Br}.\text{CH}_3$
 (d) $\text{CH}_3(\text{CH}_2)_2\text{CH}.\text{Br}.\text{CH}_2\text{CH}_3$
- 131.** In the following reaction X is
 $\text{CH}_3\text{NH}_2 + \text{X} + \text{KOH} \rightarrow \text{CH}_3\text{NC}$ (highly offensive odour) [MP PET 1994]
 (a) CH_2Cl_2 (b) CHCl_3
 (c) CH_3Cl (d) CCl_4
- 132.** Which metal is used in Wurtz synthesis [CPMT 1986; DPMT 1979; MP PET 2002]
 (a) Ba (b) Al
 (c) Na (d) Fe
- 133.** Which of the following is boiled with ethyl chloride to form ethyl alcohol [MNR 1982]
 (a) Alcoholic KOH (b) Aqueous KOH
 (c) H_2O (d) H_2O_2
- 134.** Why is chloroform put into dark coloured bottles [MP PET 2002]
 (a) To prevent evaporation
 (b) To prevent from moisture
 (c) To prevent it from oxidation to form phosgene
 (d) To prevent its reaction with glass
- 135.** DDT is
 (a) A solid (b) A liquid
 (c) A gas (d) A solution
- 136.** Bottles containing $\text{C}_6\text{H}_5\text{I}$ and $\text{C}_6\text{H}_5\text{CH}_2\text{I}$ lost their original labels. They were labelled A and B for testing. A and B were separately taken in test tubes and boiled with NaOH solution. The end solution in each tube was made acidic with dilute HNO_3 and then some AgNO_3 solution was added. Substance B give a yellow precipitate. Which one of the following statements is true for this experiment [AIEEE 2003]
 (a) A was $\text{C}_6\text{H}_5\text{I}$
 (b) A was $\text{C}_6\text{H}_5\text{CH}_2\text{I}$
 (c) B was $\text{C}_6\text{H}_5\text{I}$
 (d) Addition of HNO_3 was unnecessary
- 137.** Which of the following statements is incorrect regarding benzyl chloride [KCET 2003]
 (a) It gives white precipitate with alcoholic AgNO_3
 (b) It is an aromatic compound with substitution in the side chain
 (c) It undergoes nucleophilic substitution reaction
 (d) It is less reactive than vinyl chloride
- 138.** Alkyl halide can be converted into alkene by
 (a) Nucleophilic substitution reaction
 (b) Elimination reaction
 (c) Both nucleophilic substitution and elimination reaction
 (d) Rearrangement
- 139.** The major product formed in the following reaction is [AIIMS 2005]

$$\text{CH}_3 - \overset{\text{CH}_3}{\underset{\text{H}}{\text{C}}} - \text{CH}_2\text{Br} \xrightarrow[\text{CH}_3\text{OH}]{\text{CH}_3\text{O}}$$

 (a) $\text{CH}_3 - \overset{\text{CH}_3}{\underset{\text{H}}{\text{C}}} - \text{CH}_2\text{OCH}_3$ (b) $\text{CH}_3 - \overset{\text{OCH}_3}{\underset{\text{H}}{\text{C}}} - \text{CH}_2\text{CH}_3$
 (c) $\text{CH}_3 - \overset{\text{CH}_3}{\text{C}} = \text{CH}_2$ (d) $\text{CH}_3 - \overset{\text{CH}_3}{\underset{\text{OCH}_3}{\text{C}}} - \text{CH}_3$
- 140.** The major product obtained on treatment of $\text{CH}_3\text{CH}_2\text{CH}(\text{F})\text{CH}_3$ with $\text{CH}_3\text{O}^- / \text{CH}_3\text{OH}$ is [AIIMS 2005]
 (a) $\text{CH}_3\text{CH}_2\text{CH}(\text{OCH}_3)\text{CH}_3$
 (b) $\text{CH}_3\text{CH} = \text{CHCH}_3$
 (c) $\text{CH}_3\text{CH}_2\text{CH} = \text{CH}_2$
 (d) $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{OCH}_3$
- 141.** When phenyl magnesium bromide reacts with *t*-butanol, the product would be [IIT 2005]
 (a) Benzene (b) Phenol
 (c) *t*-butyl benzene (d) *t*-butyl phenyl ether
- 142.** Alkyl halides react with dialkyl copper reagents to give [AIEEE 2005]
 (a) Alkenes (b) Alkyl copper halides
 (c) Alkanes (d) Alkenyl halides
- 143.** Which of the following is liquid at room temperature [AFMC 2005]
 (a) CH_3I (b) CH_3Br
 (c) $\text{C}_2\text{H}_5\text{Cl}$ (d) CH_3F
- 144.** Which of the following haloalkanes is most reactive [KCET 2005]
 (a) 1-chloropropane (b) 1-bromopropane
 (c) 2-chloropropane (d) 2-bromopropane
- 145.** Grignard reagent adds to [KCET 2005]
 (a) $>\text{C}=\text{O}$ (b) $-\text{C}\equiv\text{N}$
 (c) $>\text{C}=\text{S}$ (d) All of the above
- 146.** Analyse the following reaction and identify the nature of A and B [Kerala CET 2005]

$$\text{B} \xleftarrow[\text{hv}]{\text{HBr}} \text{C}_6\text{H}_5\text{CH}=\text{CH}_2 \xrightarrow{\text{HBr}} \text{A}$$

 (a) Both A and B are 
 (b) Both A and B are 

- (c) A is  & B is 
- (d) A is  & B is 
- (e) A is  & B is 

Uses of Halogen Containing Compounds

1. Which of these can be used as moth repellent [CPMT 1987]
 (a) Benzene hexachloride (b) Benzal chloride
 (c) Hexachloroethane (d) Tetrachloroethane
2. Which one of the following is the correct formula of dichlorodiphenyl trichloroethane [AIIMS 1982]

3. The compound $(CH_3)_2C(OH)CCl_3$ is
 (a) Chloretone (b) Chloroquin
 (c) Chloropicrin (d) Chloropropyl chloride
4. Depletion of ozone layer is caused by [RPMT 2002]
 (a) Freon (b) Alkane
 (c) Grignard reagent (d) All of these
5. Which of the following is Teflon [RPMT 2002]
 (a) $[-CF_2 - CF_2 -]_n$ (b) $CF_2 = CF_2$
 (c) $CF \equiv CF$ (d) None of these
6. Statement "Ozone in atmosphere is decreased by chloro-fluoro-carbon (Cl_2F_2C)" [RPET 1999]
 (a) Is true
 (b) Is false
 (c) Only in presence of CO_2

(d) Only in absence of CO_2

7. CF_xCl_y [where $x + y = 4$]. These compounds are not used because [RPET 2000]
 (a) These are fluoro carbons
 (b) These are difficult to synthesise
 (c) They deplete ozone layer
 (d) None of these
8. The molecular formula of DDT has [MP PMT 1997]
 (a) 5 chlorine atoms (b) 4 chlorine atoms
 (c) 3 chlorine atoms (d) 2 chlorine atoms
9. What is the reagent used for testing fluoride ion in water [EAMCET 2003]
 (a) Alizarin - S (b) Quinalizarin
 (c) Phenolphthalein (d) Benzene
10. Chloropicrin is used as [UPSEAT 2000]
 (a) Solvent (b) Anaesthetic
 (c) Perfume (d) Tear gas
11. Which is used in the manufacture of plastic
 (a) $CH_2 = CHCl$ (b) $CH \equiv CH$
 (c) $CH_2 = CH - CH_2I$ (d) CCl_4
12. Freon (dichlorodifluoro methane) is used [CPMT 1986; DPMT 1983; CBSE PMT 2001]
 (a) As local anaesthetic
 (b) For dissolving impurities in metallurgical process
 (c) In refrigerator
 (d) In printing industry
13. Which of the following is known as freon which is used as a refrigerant [DPMT 1982; CPMT 1979, 81, 89; AFMC 1995; Manipal MEE 1995; MP PET 1995, 2004]
 (a) CCl_2F_2 (b) $CHCl_3$
 (c) CH_2F_2 (d) CF_4
14. Benzene hexachloride (BHC) is used as [MP PMT 1994; KCET 1999]
 (a) Dye (b) Antimalarial drug
 (c) Antibiotic (d) Insecticide
15. Which plastic is obtained from $CHCl_3$ as follows

$$CHCl_3 \xrightarrow[SbF_3]{HF} X \xrightarrow{800^\circ C} Y \xrightarrow{\text{Polymerisation}} \text{Plastic}$$

 (a) Bakelite (b) Teflon
 (c) Polythene (d) Perspex
16.  . The above structural formula refers to [MP PET 1997]
 (a) BHC (b) DNA
 (c) DDT (d) RNA
17. The commercial uses of DDT and benzene hexachloride are
 (a) DDT is a herbicide, benzene hexachloride is a fungicide
 (b) Both are insecticides
 (c) Both are herbicides
 (d) DDT is a fungicide and benzene hexachloride is a herbicide
18. Which of the following is used in fire extinguishers [AFMC 1993]
 (a) CH_4 (b) $CHCl_3$

- (c) CH_2Cl_2 (d) CCl_4
19. Iodoform can be used as [NCERT 1981]
(a) Anaesthetic (b) Antiseptic
(c) Analgesic (d) Antifebrin
20. Which of the following is an anaesthetic [AFMC 1989]
(a) C_2H_4 (b) CHCl_3
(c) CH_3Cl (d) $\text{C}_2\text{H}_5\text{OH}$
21. An important insecticide is obtained by the action of chloral on chlorobenzene. It is [KCET 1989]
(a) BHC (b) Gammexene
(c) DDT (d) Lindane
22. In fire extinguisher, pyrene is [DPMT 1985]
(a) CO_2 (b) CCl_4
(c) CS_2 (d) CHCl_3
23. B.H.C. is used as [Pb. CET 2002]
(a) Insecticide (b) Pesticide
(c) Herbicide (d) Weedicide
24. The use of the product obtained as a result of reaction between acetone and chloroform is [RPMT 1999]
(a) Hypnotic (b) Antiseptic
(c) Germicidal (d) Anaesthetic
25. Use of chlorofluoro carbons is not encouraged because [KCET 2005]
(a) They are harmful to the eyes of people that use it
(b) They damage the refrigerators and air conditioners
(c) They eat away the ozone in the atmosphere
(d) They destroy the oxygen layer
- (b) NO_2 withdraws e^- from meta position
(c) denotes e^- at meta position
(d) NO_2 withdraws e^- from ortho/para positions
6. Among the following one with the highest percentage of chlorine is [MNR 1989; BHU 1998; MH CET 1999]
(a) Chloral (b) Pyrene
(c) PVC (d) Gammexene
7. In which alkyl halide, SN^2 mechanism is favoured maximum [RPMT 1997]
(a) CH_3Cl (b) $\text{CH}_3\text{CH}_2\text{Cl}$
(c) $(\text{CH}_3)_2\text{CHCl}$ (d) $(\text{CH}_3)_3\text{C}-\text{Cl}$
8. Which conformation of $\text{C}_6\text{H}_6\text{Cl}_6$ is most powerful insecticide
(a) aaeeee (b) aaaeee
(c) aaaaae (d) aaaaaa
9. The odd decomposition of carbon chlorine bond form [UPSEAT 1999]
(a) Two free ions (b) Two-carbanium ion
(c) Two carbanion (d) A cation and an anion
10. A new carbon-carbon bond formation is possible in [IIT-JEE 1998]
(a) Cannizzaro reaction (b) Friedel-Craft's alkylation
(c) Clemmensen reduction (d) Reimer-Tiemann reaction
11. An isomer of $\text{C}_3\text{H}_6\text{Cl}_2$ on boiling with aqueous KOH gives acetone. Hence, the isomer is [UPSEAT 2000]
(a) 2, 2-dichloropropane (b) 1, 2-dichloropropane
(c) 1, 1-dichloropropane (d) 1, 3-dichloropropane
12. Which of the following is the example of SN^2 reaction [CPMT 1999]
(a) $\text{CH}_3\text{Br} + \text{OH}^- \longrightarrow \text{CH}_3\text{OH} + \text{Br}^-$
(b) $\text{CH}_3\text{CH}(\text{Br})\text{CH}_3 + \text{OH}^- \longrightarrow \text{CH}_3\text{CH}(\text{OH})\text{CH}_3 + \text{Br}^-$
(c) $\text{CH}_3\text{CH}_2\text{OH} \xrightarrow{-\text{H}_2\text{O}} \text{CH}_2 = \text{CH}_2$
(d) $\text{CH}_3 - \underset{\text{Br}}{\underset{|}{\text{C}}} - \text{CH}_3 + \text{OH}^- \rightarrow \text{CH}_3 - \underset{\text{H}}{\underset{|}{\text{C}}} - \text{O} - \text{CH}_3 + \text{Br}^-$
13. Wurtz reaction of methyl iodide yields an organic compound X. Which one of the following reactions also yields X [EAMCET 2003]
(a) $\text{C}_2\text{H}_5\text{Cl} + \text{Mg} \xrightarrow{\text{dry ether}}$
(b) $\text{C}_2\text{H}_5\text{Cl} + \text{LiAlH}_4 \longrightarrow$
(c) $\text{C}_2\text{H}_5\text{Cl} + \text{C}_2\text{H}_5\text{ONa} \longrightarrow$
(d) $\text{CHCl}_3 \xrightarrow[\Delta]{\text{Ag powder}}$
14. Ethyl orthoformate is formed by heating with sodium ethoxide [EAMCET 2003]
(a) CHCl_3 (b) $\text{C}_2\text{H}_5\text{OH}$
(c) HCOOH (d) CH_3CHO
15. 1, 2 di-bromo cyclohexane on dehydro halogenation gives

Critical Thinking

Objective Questions

1. Among the following, the molecule with the highest dipole moment is [IIT-JEE (Screening) 2003]
(a) CH_3Cl (b) CH_2Cl_2
(c) CHCl_3 (d) CCl_4
2. When CHCl_3 is boiled with NaOH , It gives [Orissa JEE 2003]
(a) Formic acid (b) Trihydroxy methane
(c) Acetylene (d) Sodium formate
3. The hybridization state of carbon atoms in the product formed by the reaction of ethyl chloride with aqueous potassium hydroxide is [EAMCET 1997]
(a) sp (b) sp^2
(c) sp^3 (d) sp^3d
4. Which of the following compounds does not undergo nucleophilic substitution reactions [KCET 1998]
(a) Vinyl chloride (b) Ethyl bromide
(c) Benzyl chloride (d) Isopropyl chloride
5. Replacement of Cl of chlorobenzene to give phenol requires drastic conditions but chlorine of 2, 4-dinitrochlorobenzene is readily replaced because [CBSE PMT 1997]
(a) NO_2 make ring electron rich at ortho and para

[UPSEAT 2003]

(d) None of these

16. In which one of the following conversions phosphorus pentachloride is used as a reagent [EAMCET 1997]

17. When but -3-en -2- ol reacts with aq. HBr, the product formed is [DCE 2001]

(a) 3 - bromobut - 1- ene

(b) 1 - bromobut - 2- ene

(c) A mixture of both a and b

(d) 2 - bromobut - 2 - ene

18. Which of these do not form Grignard reagent

19. An organic compound $A(C_4H_6Cl)$ on reaction with Na/diethyl ether gives a hydrocarbon, which on monochlorination gives only one chloro derivative. A is [Kerala PMT 2004]

(a) *t*-butyl chloride(b) *s*-butyl chloride

(c) Isobutyl chloride

(d) *n*-butyl chloride

(e) None of these

20. Among the following the most reactive towards alcoholic KOH is [AIIMS 2004]

21. Which one of the following possess highest m.pt.

[Pb. CET 2004]

(a) Chlorobenzene

(b) *o*-dichlorobenzene(c) *m*-dichlorobenzene(d) *p*-dichlorobenzene

22. Which chlorine atom is more electronegative in the following [UPSEAT 2004]

23. What would be the product formed when 1-Bromo-3-chloro cyclobutane reacts with two equivalents of metallic sodium in ether [IIT-JEE (Screening) 2005]

Read the assertion and reason carefully to mark the correct option out of the options given below:

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : $CHCl_3$ is stored in transparent bottles.

Reason : $CHCl_3$ is oxidised in dark. [AIIMS 1996]

2. Assertion : Addition of bromine to trans-2-butene yields meso-2, 3-dibromobutane

Reason : Bromine addition to an alkene is an electrophilic addition.

[IIT-JEE (Screening) 2001]

3. Assertion : Alkyl halides are soluble in organic solvents.

Reason : *p*-dichlorobenzene possesses low melting point.

4. Assertion : CCl_4 is not a fire extinguisher.

Reason : CCl_4 is insoluble in water.

5. Assertion : Aqueous hydrohalogen acids are used to prepare alkyl halides from alkenes.

Reason : Hydrogen iodide readily reacts with alkenes to form alkyl halides.

6. Assertion : Alkyl halides form alkenes when heated above $300^\circ C$.

Reason : CH_3CH_2I react slowly with strong base when compared to CD_3CH_2I .

7. Assertion : Halogen acids react with alcohols to form haloalkanes.

Reason : Order of reactivity of halogen acids
 $HCl > HBr > HI$

8. Assertion : is less reactive than towards reactions.

Reason : Tertiary alkyl halides react predominantly by S_N1 mechanism.

9. Assertion : Electron withdrawing groups in aryl halides decrease the reactivity towards nucleophilic substitution.

Reason : 2, 4-Dinitrochlorobenzene is less reactive than chlorobenzene.

10. Assertion : Aryl halides undergo electrophilic substitutions more readily than benzene.

Reason : Aryl halide gives a mixture of *o*- and *p*-products.

11. Assertion : Addition of Br_2 to cis-but-2-ene is stereoselective.

Reason : S_N2 reactions are stereospecific as well as stereoselective.

12. Assertion : Optically active 2-iodobutane on treatment with NaI in acetone undergoes racemization.

Assertion & Reason

For AIIMS Aspirants

Reason : Repeated Walden inversions on the reactant and its product eventually gives a racemic mixture.

13. Assertion : Nucleophilic substitution reaction on an optically active alkyl halide gives a mixture of enantiomers.

Reason : The reaction occurs by SN^1 mechanism.

AS

 Answers and Solutions

Introduction of Halogen containing compounds

$$2. \quad (b) \quad \% \text{ of Br} = \frac{\text{Mass of Br}}{\text{Mass of organic compound}} \times 100$$

$$= \frac{80}{109} \times 100 = 73.39\% \text{ or approx. } 75\%$$

3. (b) Gem-dihalides are those in which two halogen atoms are attached on the same carbon atom.

6. (a) Isopropyl chloride $\text{CH}_3 - \overset{\overset{\text{CH}_3}{|}}{\underset{\underset{\text{Cl}}{|}}{\text{CH}}} - \text{CH}_3$ chlorine atom is

attached to 2° carbon atom.

7. (b) $\text{CH}_4 \xrightarrow[-3\text{H}]{+3\text{X}} \text{CHX}_3$ ($\text{X} = \text{Cl}, \text{Br}, \text{I}$)

11. (d) Neohexyl chloride is a primary halide as in it Cl-atom is attached to a primary carbon.

12. (a) CCl_3CH 

13. (b) $\overset{1^\circ}{\text{CH}_3} - \overset{3^\circ}{\underset{\underset{\text{Cl}}{|}}{\text{CH}}} - \overset{1^\circ}{\text{CH}_3} - \overset{4^\circ}{\underset{\underset{\text{Cl}}{|}}{\text{C}}} - \overset{2^\circ}{\text{CH}_2} - \overset{1^\circ}{\text{CH}_3}$
3-chloro-2,3-dimethylpentane

Preparation of Halogen containing compounds

2. (d) $\text{CH}_3 - \underset{\underset{\text{CH}_3}{|}}{\text{CH}} = \text{CH}_2 + \text{HBr} \rightarrow \text{CH}_3 - \overset{\overset{\text{Br}}{|}}{\underset{\underset{\text{CH}_3}{|}}{\text{C}}} - \text{CH}_3$
2-bromo, -2-methyl propane

5. (a) $\text{CH}_3\text{COOAg} + \text{Br}_2 \xrightarrow{\text{CS}_2} \text{CH}_3\text{Br} + \text{AgBr} + \text{CO}_2$

7. (d) $\text{C}_2\text{H}_5\text{OH} + \text{SOCl}_2 \xrightarrow{\text{Pyridine}} \text{C}_2\text{H}_5\text{Cl} + \text{SO}_2 + \text{HCl}$

14. (a) $\text{CH}_2 = \text{CH}_2 + \text{Br}_2 \xrightarrow{\text{CH}_3\text{OH}}$
 $\begin{array}{c} \text{CH}_2 - \text{CH}_2 + \text{Br} - \text{CH}_2 - \text{CH}_2 - \text{O} - \text{CH}_3 \\ | \quad \quad | \\ \text{Br} \quad \quad \text{Br} \end{array}$

15. (a) $\text{C}_3\text{H}_8 + \text{Cl}_2 \xrightarrow{\text{Light}} \text{C}_3\text{H}_7\text{Cl} + \text{HCl}$

This is an example of substitution reaction. Hydrogen atom of alkane is replaced by halogen atom.

16. (b) $\text{CH} \equiv \text{CH} + \text{HCl} \rightarrow \text{CH}_2 = \text{CHCl} \xrightarrow{+\text{HCl}} \text{CH}_3\text{CHCl}_2$

17. (a) $\text{R} - \text{OX} + \text{HX} \rightarrow \text{R} - \text{X} + \text{H}_2\text{O}$

Reactivity order of alcohols for this reaction

$$3^\circ > 2^\circ > 1^\circ$$

Reactivity order of halogen acids

$$\text{R} - \text{I} > \text{R} - \text{Br} > \text{R} - \text{Cl}$$

18. (b) $\text{C}_6\text{H}_6 + 3\text{Cl}_2 \xrightarrow{\text{U.V light}} \text{C}_6\text{H}_6\text{Cl}_6$
Benzene BHC

19. (c) 

21. (a) $\text{C}_2\text{H}_5\text{OH} \xrightarrow[\text{Na}_2\text{CO}_3]{\text{KI}} \text{CHI}_3$

22. (c) $\text{CaOCl}_2 + \text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2 + \text{Cl}_2$
Bleaching powder

23. (c) $\text{CaOCl}_2 + \text{H}_2\text{O} \xrightarrow{\text{Hydrolysis}} \text{Ca(OH)}_2 + \text{Cl}_2$

24. (b) $\text{CCl}_3\text{CHO} + \text{NaOH} \xrightarrow{\text{Boil}} \text{CHCl}_3 + \text{HCOONa}$
Chlorol Chloroform

25. (d) $\text{CaOCl}_2 + \text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2 + \text{Cl}_2$

yellow ppt.

Properties of Halogen containing compounds

If NH_3 is in excess, then 1° amine will be the main product, if $\text{C}_2\text{H}_5\text{Cl}$ is in excess then mixture of $1^\circ, 2^\circ, 3^\circ$ and quaternary amine is obtained.

In chlorobenzene the lone pairs present on Cl atom get involved in resonance with π electrons of benzene due to which $\text{C} - \text{Cl}$ bond acquires double bond character. Hence, reactivity decreases.

methoxide ion (CH_3O^-) is a strong base, therefore it abstracts proton from 3° alkyl halide and favours elimination reaction.

CCl_4 is a covalent compound. Therefore does not provide Cl^- ions.

$Ag-O-N=O$ is a covalent compound. Therefore, attack of nucleophile occurs through Nitrogen atom. Hence, nitroethane is formed.

$X = KCN, Y = LiAlH_4$

$+3KCl + 3H_2O$

The functional isomer of ethyl isocyanide is ethyl cyanide $C_2H_5-C \equiv N$.

White ppt of $AgCl$ are obtained.

It means $-CHO$ group is present.

It means only one $-CHO$ group is present.

There are two types of elimination reactions.

When alkyl halide reacts with alc. KOH then it favours elimination reaction (Dehydrohalogenation). Since, *trans* pentene-2 is more symmetrical than *cis* isomers. Hence, it is main product.

70. (b) Alkyl halide reacts with Mg in presence of dry ether to give alkyl magnesium halide which is also called as Grignard reagent. This reaction is also called as Grignard's reaction.

79. (a) If CHCl_3 sample contains phosgene (COCl_2) then it will give a white ppt. When treated with cold AgNO_3 .

80. (d) Because $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \text{CH}_2 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_3$ has four methyl groups on the corner so it can produce for derivatives.

CHCl_3 is a covalent compound. It does not ionize in water.

86. (c,d) Vinyl chloride is less reactive than allyl chloride due to resonance effect.

Order of nucleophilicity amongst the halide ion are as $\text{I}^- > \text{Br}^- > \text{Cl}^-$.

96. (d) CO is poisonous gas.

Thus Benzene hexahalides decomposes when heated with alc. KOH and yield trichloro benzene.

100. (a) We know that $\text{CHCl}_3 + \text{HF} \rightarrow \text{CHF}_3 + 3\text{HCl}$. Thus in this reaction the compound obtained is fluorocarbon (CHF_3). As we know molecular weight of $\text{CHF}_3 = 70$.

103. (d) Density of alkyl halide increases as the size of halogen atom increases.

104. (a) Due to resonance partial double bond character is created on vinyl chloride. So, chlorine atom is not replaced easily.

110. (a) It is Wurtz reaction in which hydrocarbon formed when alkyl halide react with Na metal in dry ether.

111. (a) $\text{C}_3\text{H}_7\text{Br} + \text{KCN} \rightarrow \text{C}_3\text{H}_7\text{CN} + \text{KBr}$

In IUPAC system the carbon of functional group also take in numbering. So $\text{C}_3\text{H}_7\text{CN}$ is butane nitrile.

112. (c) It is Wurtz fittig reaction

113. (a) Because it float over chloroform and prevent its oxidation.

114. (c) Due to the presence of electron rich methoxy group (+I) at *p*-position the polarity increase on C-X bond by which it becomes more reactive towards nucleophilic attack of ethanol, *p*-nitro and chloro are electron deficient group decrease the polarity of C-X bond. Hence by them it become difficult to react with ethanol due to less polarity. Methyl group is less electron rich than methoxy group.

115. (b) When chloroform is treated with concentrated nitric acid, its hydrogen is replaced by nitro group.

116. (a) Alkyl halides give alkane when react with sodium in ether. This is called Wurtz reaction.

117. (b) Chloroform is oxidised to a poisonous gas, phosgene (COCl_2) by atmospheric gas.

118. (b) When chloroform reacts with HNO_3 product formed are chloropicrin or tear gas and water.

119. (a) We know that

Thus in this reaction ethene (C_2H_4) is produced.

120. (d) We know that

Thus in this reaction acetylene ($\text{HC} \equiv \text{CH}$) is produced.

121. (b) Alkyl halide on reaction with dry silver oxide furnish ether.

122. (a) Acylation or alkylation of aromatic compound in presence of AlCl_3 is known as Friedal-craft reaction.

123. (b) Any substance which when added to a chemical reaction inhibit or decrease the rate of reaction is called negative catalyst. In CHCl_3 when two percent ethanol is added, it stops the formation of carbonyl chloride. So ethanol acts as negative catalyst.

124. (a) When benzene is heated with chlorine in the presence of sunlight, it form benzene hexachloride.

125. (c) $\text{CH}_3\text{CH} \begin{smallmatrix} \text{Br} \\ \diagup \\ \text{Br} \end{smallmatrix} + 4\text{Na} + \begin{smallmatrix} \text{Br} \\ \diagdown \\ \text{Br} \end{smallmatrix} \text{CH} - \text{CH}_3 \xrightarrow[\Delta]{\text{ether}}$
- $$\text{CH}_3 - \text{CH} = \text{CH} - \text{CH}_3 + 4\text{NaBr}$$
- 2-butene

126. (c) It is a common method to prepare alkanes. Methane cannot be prepared by Wurtz reaction.

127. (d) At room temperature iodoform is the yellow solid.

128. (a) Benzyl chloride are far more reactive than alkyl halide towards nucleophilic substitution reaction due to the reason that the carbocation formed after the removal of halide ion is stabilized by resonance.

129. (d) On hydrolysis, ethylene dichloride gives ethylene glycol. While ethylidene chloride give acetaldehyde.

131. (b) $\text{CH}_3\text{NH}_2 + \text{CHCl}_3 + 3\text{KOH} \rightarrow 3\text{KCl} + \text{CH}_3\text{NC} + 3\text{H}_2\text{O}$
- (X)

132. (c) $\text{CH}_3\text{Br} + 2\text{Na} + \text{Br} - \text{CH}_3 \xrightarrow[\text{Ether}]{\text{Dry}}$

138. (b) Alkyl halide is best converted to alkene by mean of elimination reaction in form of dehydrohalogenation.

Alkyl halide is 1°.

Keep in mind 1° halide give product by $S_N2 / E-2$ mechanism and 1° halide always gives substitution reaction except when strongly hindered base is used.

The reaction involves carbocation intermediate.

but as it is a primary carbocation it will rearrange to give a tertiary carbocation, which completes the reaction

Stability of carbocation : $3^\circ > 2^\circ > 1^\circ > CH_3^+$

It is because the stability of a charged system is increased by dispersal of the charge. The more stable the carbocation, the faster it is formed.

N.B. – Rearrangement can be done in two ways.

Therefore,

140. (b) According to Saytzeff's rule, the major product will be that one which contains more number of substituents around the double bond.

143. (a) CH_3F , CH_3Cl , CH_3Br and C_2H_5Cl are gases at room temperature. CH_3I is a liquid at room temperature and solidifies at $-66.5^\circ C$.

144. (d) The alkyl halides are highly reactive, the order of reactivity is iodide > bromide > chloride > (nature of the halogen atom).
Tertiary > secondary > primary.
Thus 2-bromopropane is the given option.

145. (d) Grignard reagent gives addition reactions with compounds containing $C=O$, $C \equiv N$ and $C=S$ groups

Formation of A is an electrophilic addition reaction

Formation of B is a free radical addition reaction

Uses of Halogen Containing Compounds

8. (a) DDT

12. (c) Freon (CCl_2F_2) is an odourless, non-corrosive, non toxic gas which is stable even at high temperatures and pressures. It has low b.Pt, low specific heat and can be easily liquified by applying pressure at room temperature. It is therefore, widely used in refrigerant (cooling agent) in refrigerators and air conditioners.

18. (d) Its vapours are non inflammable (i.e. do not catch fire). Hence used as fire extinguishers under the name pyren.

19. (b) Iodoform is used as an antiseptic for dressing wounds. When it comes in contact with skin (organic matter), Iodine is set free which responsible for antiseptic action.

20. (b) Inhalation of CHCl_3 vapours produces loss of consciousness and is therefore, used as a general anaesthetic agent in surgery.

22. (b) CCl_4 is stable to red heat. Its vapours are highly non-inflammable i.e. do not catch fire. It is because of this property CCl_4 is used as a fire extinguisher. But now a days its use as a fire extinguisher is restricted because with water vaporious. It forms highly poisonous phosgene gas

23. (a) Benzene hexachloride is an insecticide generally known as gammexane. It is obtained by the following reaction

25. (c) Chlorofluorocarbon is used in air-conditioning and in domestic refrigerators for cooling purposes. Its main drawback is this, it is responsible for ozone depletion.

Critical Thinking Questions

1. (a) CH_3Cl have one Cl atom which is more electronegative so it will have highest dipole moment.

4. (a) As a result of resonance, the carbon-chloride bond acquires some double bond character. Hence, vinyl chloride does not undergo nucleophilic substitution reactions.

$$\text{Chloral } (\text{CCl}_3\text{CHO}) = \frac{106.5}{147.5} \times 100 = 72.20$$

$$\text{Pyrene } (\text{CCl}_4) = \frac{142}{154} \times 100 = 92.20 \text{ Highest}$$

$$\text{Gammexene } (\text{C}_6\text{H}_6\text{Cl}_6) = \frac{213}{291} \times 100 = 73.19$$

7. (a) SN^2 Substitution nucleophilic bimolecular order of different alkyl halides. $1^\circ > 2^\circ > 3^\circ$

SN^1 Substitution nucleophilic unimolecular order of different alkyl halides, $3^\circ > 2^\circ > 1^\circ$.

8. (b) aaaa form is the most powerful insecticide form of $\text{C}_6\text{H}_6\text{Cl}_6$.

Cl is more electronegative than C by which it form anion and hydrocarbon form cation.

10. (b,d) New carbon-carbon bond formation take place in Friedel Craft's alkylation and Reimer-Tiemann reaction. In Friedel Craft's alkylation following mechanism involve

Here new $C-C$ bond formed between carbon of benzene ring and alkyl group.

Similarly in Reimer-Tiemann reaction.

Here new $C-C$ bond formed between carbon of benzene ring and $-CHO$ group.

12. (a) Only 1° alkyl halides, i.e. CH_3Br undergoes S_N2 reaction.

13. (b) Wurtz reaction gives ethane

Similarly C_2H_5Cl reduced by $LiAlH_4$ to give ethane

So, both reaction carried out by PCl_5

18. (a) The $C-F$ bond energy is maximum in CH_3F . Thus fluoride is the less reactive to form the grignard reagent with Mg .

20. (d) The polarity between $C-X$ bond increase by increasing the $+I$ effect which increase by increasing the alkyl group by which X of $C-X$ easily eliminate. In $CH_3CH_2CH_2Br$ the polarity is maximum due to 3 alkyl group while in rest polarity decrease due to the presence of double bond, presence of $-CO$ group ($-I$) and less no. of alkyl group.

21. (d) p -dichlorobenzene molecule has symmetrical structure. It can fit well in its crystal lattice. The intermolecular forces of attraction are strong. Hence, it possesses highest melting point.

22. (d) Due to $+I$ effect of 3 alkyl group in option (d), the chlorine atom occupy the maximum charge in it so it is more electronegative.

23. (d) It is the example of Wurtz reaction.

Assertion and Reason

- (d) $CHCl_3$ is stored in dark bottles of prevent oxidation of $CHCl_3$ in presence of sunlight.
- (c) Due to symmetrical nature and more closer packing p -dichlorobenzene has highest melting point.
- (e) CCl_4 is used as a fire extinguisher. The dense, non combustible vapours cover the burning substance and prevents the availability of oxygen round burning material.
- (e) Dry gaseous hydrohalogen acids are better electrophile. Also in aqueous solution, H_2O , acting as nucleophile may produce alcohol.
- (c) CH_3CH_2I reacts more rapidly with strong base in comparison to CD_3CH_2I . The elimination of HI (or DI) in presence of strong base shows E_2 elimination. The rate determining step involves the breaking up of $C-H$ (or $C-D$) bond. The $C-D$ bond being stronger than $C-H$ and thus elimination is faster in case of CH_3CH_2I .
- (c) For a given alcohol the order of reactivity of halogen acids follows the sequence $HI > HBr > HCl$. It is because of the fact

that I^- is a stronger nucleophile than Br^- which in turn is a stronger nucleophile than Cl^- .

8. (e)  is more reactive than  because the former is a tertiary alkyl halide and the latter is a secondary alkyl halide. Tertiary alkyl halides react predominantly by S_N1 mechanism.
9. (d) Halobenzenes become reactive to nucleophilic substitution reactions when electron withdrawing groups (nitro, cyano) are present at ortho/para position. This is evident from the milder conditions required for hydrolysis in 2, 4-dinitrochlorobenzene than chlorobenzene.

10. (e) Halogens are somewhat deactivating but are directing. As a result, aryl halides undergo the usual electrophilic substitution reactions less readily than benzene.
11. (b) A reaction is said to be stereo selective if a particular stereoisomer can give two or more stereoisomeric products but gives one of them in greater amount than the other or even to the exclusion of the other. So, addition of Br_2 to cis-but-2-ene is stereoselective since it gives only ($\pm$) 2, 3-dibromobutane.
13. (a) In S_N1 mechanism, racemization takes place, which is due to inverting nucleophilic displacement of halogen atom from the alkyl halide by the halide in solution.

Halogen Containing compounds

Self Evaluation Test -25

- Preparation of alkyl halides in laboratory is least preferred by
 - Halide exchange
 - Direct halogenation of alkanes
 - Treatment of alcohols
 - Addition of hydrogen halides to alkenes
- An alkyl halide may be converted into an alcohol by
[EAMCET 1980; CBSE PMT 1997; BHU 1999; AIIMS 2001]
 - Addition
 - Substitution
 - Dehydrohalogenation
 - Elimination
- The $C-Cl$ bond in chlorobenzene as compared with $C-Cl$ bond in methyl chloride is
[MP PMT 1995]
 - Longer and weaker
 - Shorter and weaker
 - Shorter and stronger
 - Longer and stronger
- A salt solution is treated with chloroform drops. Then it is shaken with chlorine water. Chloroform layer becomes violet. Solution contains
[CPMT 1982]
 - NO_2^- ion
 - NO_3^- ion
 - Br^- ion
 - I^- ion
- The following reaction belongs to

$$(CH_3)_3C-Br \xrightarrow{H_2O} (CH_3)_3C-OH$$
 [AIEEE 2002]
 - Elimination reaction
 - Substitution reaction
 - Free radical reaction
 - Displacement reaction
- The order of reactivities of methyl halides in the formation of Grignard reagent is
[KCET 2003]
 - $CH_3I > CH_3Br > CH_3Cl$
 - $CH_3Cl > CH_3Br > CH_3I$
 - $CH_3Br > CH_3Cl > CH_3I$
 - $CH_3Br > CH_3I > CH_3Cl$
- Identify Z in the following series

$$C_2H_5I \xrightarrow{Alco. KOH} X \xrightarrow{Br_2} Y \xrightarrow{KCN} Z$$
 [AIIMS 1983; AFMC 1998; MP PET 1997]
 - CH_3CH_2CN
 - $$\begin{array}{c} CH_2CN \\ | \\ CH_2CN \end{array}$$
 - $BrCH_2-CH_2CN$
 - $BrCH=CHCN$
- The total number of stereoisomeric forms of $C_6H_6Cl_6$ known is
 - 6
 - 7
 - 8
 - None of these
- The correct order of $C-X$ bond polarity is
[RPMT 2000]
 - $CH_3Br > CH_3Cl > CH_3I$
 - $CH_3I > CH_3Br > CH_3Cl$
 - $CH_3Cl > CH_3Br > CH_3I$
 - $CH_3Cl > CH_3I > CH_3Br$
- The order of reactivities of the following alkyl halides for a SN^2 reaction is
[IIT-JEE (Screening) 2000]
 - $RF > RCl > RBr > RI$
 - $RF > RBr > RCl > RI$
 - $RCl > RBr > RF > RI$
 - $RI > RBr > RCl > RF$
- Which of the following reactions doesn't give benzene
[RPMT 2003]
 - $C_6H_5N_2Cl \xrightarrow[H_2O]{\text{boiling}}$
 - $C_6H_5N_2Cl \xrightarrow[\Delta]{C_2H_5OH}$
 - $C_6H_5N_2Cl + H_3PO_2 + H_2O \longrightarrow$
 - All of these
- Benzene hexachloride is prepared from benzene and chlorine in sunlight by
 - Substitution reaction
 - Elimination reaction
 - Addition reaction
 - Rearrangement
- Carbon-halogen bond is strongest among the following
[MP PMT 1995]
 - CH_3Cl
 - CH_3Br
 - CH_3F
 - CH_3I
- Which of these do not undergo Wurtz reaction
 - C_2H_5F
 - C_2H_5Br
 - C_2H_5Cl
 - C_2H_5I
- When ethyl bromide reacts with sodium acetylide the main product is
[Pb. CET 2002]
 - 1-butane
 - 1-butene
 - 1-butyne
 - 2-butene
- C_2H_5I and Ag_2O reacts to produce
[Pb. PMT 2004]
 - C_2H_6
 - $C_2H_5-C_2H_5$
 - $C_2H_5-O-C_2H_5$
 - $C_2H_5-CH_3$

1. (b) Direct halogenation of alkenes is not preferred because in it a mixture of monohalogen, dihalogen, trihalogen and tetrahalogen substituted product is obtained which is difficult to separate.

2. (b)

3. (c) In chlorobenzene $C-Cl$ bond acquires partial double bond character because of resonance.
4. (d) $2\text{NaI} + \text{Cl}_2 \rightarrow 2\text{NaCl} + \text{I}_2$ (Dissolves in CHCl_3 to give violet colour)
Chlorine displaces iodine from salt. The iodine get dissolve in CHCl_3 or CCl_4 to produce violet colour.

Here Br substitute by $-\text{OH}$ group.

6. (a) Reactivity towards grignard reagent are as under
 $\text{CH}_3\text{I} > \text{CH}_3\text{Br} > \text{CH}_3\text{Cl}$

8. (c) $\text{C}_6\text{H}_6\text{Cl}_6$ has 8 stereoisomer.

9. (c) The $C-X$ bond polarity order are as under
 $\text{CH}_3\text{Cl} > \text{CH}_3\text{Br} > \text{CH}_3\text{I}$

10. (d) The order of reactivity of alkyl halides for SN^2 reaction is
 $R-\text{I} > R-\text{Br} > R-\text{Cl} > R-\text{F}$

12. (c)

13. (c) $\text{CH}_3\text{F} > \text{CH}_3\text{Cl} > \text{CH}_3\text{Br} > \text{CH}_3\text{I}$

14. (a) $\text{C}_2\text{H}_5\text{F} + 2\text{Na} + \text{FC}_2\text{H}_5 \xrightarrow[\text{ether}]{\text{Dry}}$ No reaction

15. (c) $\text{C}_2\text{H}_5\text{Br} + \text{NaC}\equiv\text{CH} \rightarrow \text{C}_2\text{H}_5\text{C}\equiv\text{CH} + \text{NaBr}$
Ethyl bromide sodium acetylide 1-butyne sodium bromide

Thus in this reaction 1-butyne is main product.

16. (c) $\text{C}_2\text{H}_5\text{I}$ and Ag_2O reacts as below

Thus, $\text{C}_2\text{H}_5-\text{O}-\text{C}_2\text{H}_5$ is produced.

Ordinary Thinking

Objective Questions

Introduction of Halogen containing compounds

- How many structural isomers are possible for a compound with molecular formula C_3H_7Cl [MH CET 2001]
 - 2
 - 5
 - 7
 - 9
- In CH_3CH_2Br , % of Br is [DPMT 1996]
 - 80
 - 75
 - 70
 - 7
- Gem- dibromide is [RPMT 2000]
 - $CH_3CH(Br)OH(Br)CH_3$
 - $CH_3CBr_2CH_3$
 - $CH_2(Br)CH_2CH_2$
 - CH_2BrCH_2Br
- Ethylidene dibromide is
 - $CH_3 - CH_2 - Br$
 - $Br - CH_2 - CH_2 - Br$
 - $CH_3 - CHBr_2$
 - $CH_2 = CBr_2$
- Benzylidene chloride is
 - $C_6H_5CH_2Cl$
 - $C_6H_5CHCl_2$
 - $C_6H_4ClCH_2Cl$
 - $C_6H_5CCl_3$
- Which of the following halide is 2°
 - Isopropyl chloride
 - Isobutyl chloride
 - n*-propyl chloride
 - n*-butyl chloride
- Haloforms are trihalogen derivatives of [CPMT 1985]
 - Ethane
 - Methane
 - Propane
 - Benzene
- Benzene hexachloride is
 - 1, 2, 3, 4, 5, 6-hexachlorocyclohexane
 - 1, 1, 1, 6, 6, 6-hexachlorocyclohexane
 - 1, 6-phenyl-1, 6-chlorohexane
 - 1, 1-phenyl-6, 6-chlorohexane
- Number of π -bonds present in B.H.C. (Benzene hexachloride) are [RPMT 1999]
 - 6
 - Zero
 - 3
 - 12
- The general formula for alkyl halides is
 - $C_nH_{2n+1}X$
 - $C_nH_{2n+2}X$
 - $C_nH_{n+1}X$
 - $C_nH_{2n}X$
- Which of the following is a primary halide [DCE 2004]
 - Isopropyl iodide
 - Secondary butyl iodide
 - Tertiary butyl bromide
 - Neo hexyl chloride
- Full name of DDT is [KCET 1993]
 - 1, 1, 1-trichloro-2, 2-bis(*p*-chlorophenyl) ethane
 - 1, 1-dichloro-2, 2-diphenyl trimethylethane
 - 1, 1-dichloro-2, 2-diphenyl trichloroethane
 - None of these
- The compound which contains all the four $1^\circ, 2^\circ, 3^\circ$ and 4° carbon atoms is [J & K 2005]
 - 2, 3-dimethyl pentane
 - 3-chloro-2, 3-dimethylpentane

- 2, 3, 4-trimethylpentane
- 3, 3-dimethylpentane

Preparation of Halogen containing compounds

- The following reaction is known as

$$C_2H_5OH + SOCl_2 \xrightarrow{\text{Pyridine}} C_2H_5Cl + SO_2 + HCl$$
 [AIIMS 2002]
 - Kharasch effect
 - Darzen's procedure
 - Williamson's synthesis
 - Hunsdiecker synthesis reaction
- What is the main product of the reaction between 2-methyl propene with HBr [RPMT 2002]
 - 1-bromo butane
 - 1-bromo-2 methyl propane
 - 2-bromo butane
 - 2-bromo-2 methyl propane
- Halogenation of alkanes is [KCET 2002]
 - A reductive process
 - An oxidative process
 - An isothermal process
 - An endothermic process
- 

In the above process product A is [Kerala (Engg.) 2002]

 - Fluorobenzene
 - Benzene
 - 1, 4-difluorobenzene
 - 1, 3-difluorobenzene
- Silver acetate + $Br_2 \xrightarrow{CS_2}$. The main product of this reaction is [Kurukshetra CET 2002]
 - $CH_3 - Br$
 - CH_3COI
 - CH_3COOH
 - None of these
- 

Diazonium salts + $Cu_2Cl_2 + HCl \rightarrow$ the reaction is known as [Kerala (Med.) 2002]

 - Chlorination
 - Sandmeyer's reaction
 - Perkin reaction
 - Substitution reaction
- When ethyl alcohol (C_2H_5OH) reacts with thionyl chloride, in the presence of pyridine, the product obtained is [AIIMS; CBSE PMT 2001]
 - $CH_3CH_2Cl + HCl$
 - $C_2H_5Cl + HCl + SO_2$
 - $CH_3CH_2Cl + H_2O + SO_2$
 - $CH_3CH_2Cl + HCl + SO_2$
- Preparation of alkyl halides in laboratory is least preferred by [DPMT 2000]
 - Treatment of alcohols
 - Addition of hydrogen halides to alkenes
 - Halide exchange
 - Direct halogenation of alkanes
- Which of the following organic compounds will give a mixture of 1-chlorobutane and 2-chlorobutane on chlorination [CPMT 2001]

- (a) $\text{CH}_3 - \underset{\text{CH}_3}{\underset{|}{\text{CH}}} - \text{CH} = \text{CH}_2$
(b) $\text{HC} \equiv \underset{\text{H}}{\underset{|}{\text{C}}} - \text{CH} = \text{CH}_2$
(c) $\text{CH}_2 = \text{CH} - \text{CH} = \text{CH}_2$
(d) $\text{CH}_2 = \text{CH} - \text{CH}_2 - \text{CH}_3$
10. The chlorobenzene is generally obtained from a corresponding diazonium salt by reacting it with [MP PMT 2000]
(a) Cu_2Cl_2 (b) CuSO_4
(c) Cu (d) $\text{Cu}(\text{NH}_3)_4^{2+}$
11. Decreasing order of reactivity of HX in the reaction $\text{ROH} + \text{HX} \rightarrow \text{RX} + \text{H}_2\text{O}$ [RPET 2000; AIIMS 1983; MP PET 1996]
(a) $\text{HI} > \text{HBr} > \text{HCl} > \text{HF}$ (b) $\text{HBr} > \text{HCl} > \text{HI} > \text{HF}$
(c) $\text{HCl} > \text{HBr} > \text{HI} > \text{HF}$ (d) $\text{HF} > \text{HBr} > \text{HCl} > \text{HI}$
12. The product of the following reaction : $\text{CH}_2 = \text{CH} - \text{CCl}_3 + \text{HBr}$ [RPET 2000]
(a) $\text{CH}_3 - \text{CH}(\text{Br}) - \text{CCl}_3$ (b) $\text{CH}_2(\text{Br}) - \text{CH}_2 - \text{CCl}_3$
(c) $\text{BrCH}_2 - \text{CHCl} - \text{CHCl}_2$ (d) $\text{CH}_3 - \text{CH}_2 - \text{CCl}_3$
13. Chlorobenzene is prepared commercially by [JIPMER 2000; CPMT 1976; Pb. CET 2002]
(a) Raschig process (b) Wurtz Fitting reaction
(c) Friedel-Craft's reaction (d) Grignard reaction
14. In methyl alcohol solution, bromine reacts with ethylene to yield $\text{BrCH}_2\text{CH}_2\text{OCH}_3$ in addition to 1, 2-dibromoethane because [Pb. PMT 1998]
(a) The ion formed initially may react with Br^- or CH_3OH
(b) The methyl alcohol solvates the bromine
(c) The reaction follows Markownikoff's rule
(d) This is a free-radical mechanism
15. $\text{C}_3\text{H}_8 + \text{Cl}_2 \xrightarrow{\text{Light}} \text{C}_3\text{H}_7\text{Cl} + \text{HCl}$ is an example of which of the following types of reactions [AFMC 1997; CPMT 1999]
(a) Substitution (b) Elimination
(c) Addition (d) Rearrangement
16. Which of the following would be produced when acetylene reacts with HCl [MH CET 1999]
(a) $\text{CH}_3\text{CH}_2\text{Cl}$ (b) CH_3CHCl_2
(c) $\text{CHCl} = \text{CHCl}$ (d) $\text{CH}_2 = \text{CHCl}$
17. $\text{R} - \text{OH} + \text{HX} \rightarrow \text{R} - \text{X} + \text{H}_2\text{O}$
In the above reaction, the reactivity of different alcohols is [CPMT 1997]
(a) Tertiary > Secondary > Primary
(b) Tertiary < Secondary < Primary
(c) Tertiary < Secondary > Primary
(d) Secondary < Primary < Tertiary
18. $\text{C}_6\text{H}_6 + \text{Cl}_2 \xrightarrow{\text{UV Light}}$ Product. In above reaction product is [CPMT 1997]
(a) CCl_3CHO (b) $\text{C}_6\text{H}_6\text{Cl}_6$
(c) $\text{C}_6\text{H}_{12}\text{Cl}_6$ (d) $\text{C}_6\text{H}_9\text{Cl}_2$
19. Benzene reacts with chlorine to form benzene hexachloride in presence of [MP PET 1999]
(a) Nickel (b) AlCl_3
- (c) Bright sunlight (d) Zinc
20. The final product obtained by distilling ethyl alcohol with the excess of chlorine and $\text{Ca}(\text{OH})_2$ is [MP PET 1996]
(a) CH_3CHO (b) CCl_3CHO
(c) CHCl_3 (d) $(\text{CH}_3)_2\text{O}$
21. When ethyl alcohol and KI reacted in presence of Na_2CO_3 , yellow crystals of..... are formed [AFMC 1989]
(a) CHI_3 (b) CH_3I
(c) CH_2I_2 (d) $\text{C}_2\text{H}_5\text{I}$
22. In preparation of CHCl_3 from ethanol and bleaching powder, the latter provides [BHU 1986]
(a) $\text{Ca}(\text{OH})_2$ (b) Cl_2
(c) Both (a) and (b) (d) None of these
23. Which one of the following processes does not occur during formation of CHCl_3 from $\text{C}_2\text{H}_5\text{OH}$ and bleaching powder [DPMT 1984]
(a) Hydrolysis (b) Oxidation
(c) Reduction (d) Chlorination
24. Which of the following is obtained when chloral is boiled with NaOH [CBSE PMT 1991; RPMT 1999]
(a) CH_3Cl (b) CHCl_3
(c) CCl_4 (d) None of these
25. Chloroform can be obtained from [MNR 1986]
(a) Methanol (b) Methanal
(c) Propanol-1 (d) Propanol-2
26. Chlorine reacts with ethanol to give [MP PMT 1989; CPMT 1997; KCET 1998; JIPMER 1999]
(a) Ethyl chloride (b) Chloroform
(c) Acetaldehyde (d) Chloral
27. On heating diethyl ether with conc. HI , 2 moles of which of the following is formed [IIT-JEE 1983; MP PET 1990; EAMCET 1990; AFMC 1993; JIPMER 2001]
(a) Ethanol (b) Iodoform
(c) Ethyl iodide (d) Methyl iodide
28. Lucas reagent is [MP PMT 1996; MP PET 1992, 95; CPMT 1986, 89; AIIMS 1980; Kurukshetra CEE 2002]
(a) Concentrated HCl + anhydrous ZnCl_2
(b) Dilute HCl + hydrated ZnCl_2
(c) Concentrated HNO_3 + anhydrous ZnCl_2
(d) Concentrated HCl + anhydrous MgCl_2
29. Which compound does not form iodoform with alkali and iodine [IIT-JEE 1985]
(a) Acetone (b) Ethanol
(c) Diethyl ketone (d) Isopropyl alcohol
30. Which compound gives yellow ppt. with iodine and alkali [IIT-JEE 1984]
(a) 2-hydroxy propane (b) Acetophenone
(c) Methyl acetone (d) Acetamide
31. Acetone reacts with I_2 in presence of NaOH to form [MP PMT 1992]
(a) $\text{C}_2\text{H}_5\text{I}$ (b) $\text{C}_2\text{H}_4\text{I}_2$
(c) CHI_3 (d) CH_3I
- Ethanol is converted into ethyl chloride by reacting with [MP PET 1991; MP PMT 1990; BHU 1997]
(a) Cl_2 (b) SOCl_2
(c) HCl (d) NaCl
33. $\text{C}_6\text{H}_5\text{Cl}$ prepared by aniline with [IIT-JEE 1984]
(a) HCl

- (b) Cu_2Cl_2
 (c) Cl_2 in presence of anhydrous AlCl_3
 (d) HNO_2 and then heated with Cu_2Cl_2
34. The starting substance for the preparation of CH_3I is [CPMT 1975]
 (a) CH_3OH (b) $\text{C}_2\text{H}_5\text{OH}$
 (c) CH_3CHO (d) $(\text{CH}_3)_2\text{CO}$
35. A Grignard's reagent may be made by reacting magnesium with [CPMT 1974, 83, 84]
 (a) Methyl amine (b) Diethyl ether
 (c) Ethyl iodide (d) Ethyl alcohol
36. Which of the following is responsible for iodoform reaction [CPMT 1980; RPMT 1997]
 (a) Formalin (b) Methanol
 (c) Acetic acid (d) Ethanol
37. When a solution of sodium chloride containing ethyl alcohol is electrolysed, it forms
 (a) Ethyl alcohol (b) Chloral
 (c) Chloroform (d) Acetaldehyde
38. Which reagent cannot be used to prepare an alkyl halide from an alcohol [CPMT 1989, 94]
 (a) $\text{HCl} + \text{ZnCl}_2$ (b) NaCl
 (c) PCl_5 (d) SOCl_2
39. Ethyl benzoate reacts with PCl_5 to give [KCET 2003]
 (a) $\text{C}_2\text{H}_5\text{Cl} + \text{C}_6\text{H}_5\text{COCl} + \text{POCl}_3 + \text{HCl}$
 (b) $\text{C}_2\text{H}_5\text{Cl} + \text{C}_6\text{H}_5\text{COCl} + \text{POCl}_3$
 (c) $\text{CH}_3\text{COCl} + \text{C}_6\text{H}_5\text{COCl} + \text{POCl}_3$
 (d) $\text{C}_2\text{H}_5\text{Cl} + \text{C}_6\text{H}_5\text{COOH} + \text{POCl}_3$
40. On treatment with chlorine in presence of sunlight, toluene gives the product [Orissa JEE 2003; MH CET 1999, 2002]
 (a) *o*-chloro toluene (b) 2, 5-dichloro toluene
 (c) *p*-chloro toluene (d) Benzyl chloride
41. When chlorine is passed through warm benzene in presence of the sunlight, the product obtained is [KCET 2003]
 (a) Benzotrichloride (b) Chlorobenzene
 (c) Gammexane (d) DDT
42. Which of the following acids adds to propene in the presence of peroxide to give anti-Markownikoff's product [MP PET 2003]
 (a) HF (b) HCl
 (c) HBr (d) HI
43. Propene on treatment with HBr gives [CPMT 1986]
 (a) Isopropyl bromide (b) Propyl bromide
 (c) 1, 2-dibromoethane (d) None of the above
44. The catalyst used in Raschig's process is
 (a) LiAlH_4 (b) Copper chloride
 (c) Sunlight (d) Ethanol/ Na
45. The compound formed on heating chlorobenzene with chloral in the presence of concentrated sulphuric acid, is [AIIEE 2004]
 (a) Freon (b) DDT
 (c) Gammexene (d) Hexachloroethane
46. Acetone is mixed with bleaching powder to give [AFMC 2004]
 (a) Chloroform (b) Acetaldehyde
 (c) Ethanol (d) Phosgene
47. Which of the following compounds gives trichloromethane on distilling with bleaching powder [KCET 2004; EAMCET 1986]
 (a) Methanal (b) Phenol
 (c) Ethanol (d) Methanol
48. The product formed on reaction of ethyl alcohol with bleaching powder is [Orissa JEE 2004; DPMT 1978; AIIMS 1991]
 (a) CHCl_3 (b) CCl_3CHO
 (c) CH_3COCH_3 (d) CH_3CHO
49. Ethylene reacts with bromine to form [Pb. CET 2000]
 (a) Chloroethane (b) Ethylene dibromide
 (c) Cyclohexane (d) 1-bromo propane
50. Best method of preparing alkyl chloride is [MH CET 2004]
 (a) $\text{ROH} + \text{SOCl}_2 \longrightarrow$
 (b) $\text{ROH} + \text{PCl}_5 \longrightarrow$
 (c) $\text{ROH} + \text{PCl}_3 \longrightarrow$
 (d) $\text{ROH} + \text{HCl} \xrightarrow{\text{anhy. ZnCl}_2}$
51. DDT is prepared by reacting chlorobenzene with [BHU 1998, 2005]
 (a) CCl_4 (b) $\text{CCl}_3 - \text{CHO}$
 (c) CHCl_3 (d) Ethane
52. Which compound needs chloral in its synthesis [Pb. PET 2003]
 (a) *D. D. T.* (b) Gammexane
 (c) Chloroform (d) Michler's Ketone
53. To get DDT, chlorobenzene has to react with which of the following compounds in the presence of concentrated sulphuric acid [KCET (Engg./Med.) 2003]
 (a) Trichloroethane (b) Dichloroacetone
 (c) Dichloroacetaldehyde (d) Trichloroacetaldehyde
54. What will be the product in the following reaction [BHU 2005]
-

Properties of Halogen containing compounds

1. [Orissa JEE 2005]
2. Ethyl bromide can be converted into ethyl alcohol by [KCET 1989]
 (a) Heating with dilute hydrochloric acid and zinc

- (b) Boiling with an alcoholic solution of KOH
 (c) The action of moist silver oxide
 (d) Refluxing methanol
3. Reaction of ethyl chloride with sodium leads to [NCERT 1984]
 (a) Ethane (b) Propane
 (c) n -butane (d) n -pentane
4. Treatment of ammonia with excess of ethyl chloride will yield [AIIMS 1992]
 (a) Diethyl amine
 (b) Ethane
 (c) Tetraethyl ammonium chloride
 (d) Methyl amine
5. $2CHCl_3 + O_2 \xrightarrow{X} 2COCl_2 + 2HCl$
 In the above reaction, X stands for [CPMT 1985]
 (a) An oxidant (b) A reductant
 (c) Light and air (d) None of these
6. Phosgene is the common name for [DPMT 1983; CPMT 1993; MP PMT 1994; Kurukshetra CEE 1998; RPMT 2000, 02]
 (a) CO_2 and PH_3 (b) Phosphoryl chloride
 (c) Carbonyl chloride (d) Carbon tetrachloride
7. When chloroform is treated with amine and KOH , we get [CPMT 1979]
 (a) Rose odour smell
 (b) Sour almond like smell
 (c) Offensive odour
 (d) Sour oil of winter green like smell
8. A mixture of two organic chlorine compounds was treated with sodium metal in ether solution. Isobutane was obtained as a product. The two chlorine compounds are [KCET 1988]
 (a) Methyl chloride and propyl chloride
 (b) Methyl chloride and ethyl chloride
 (c) Isopropyl chloride and methyl chloride
 (d) Isopropyl chloride and ethyl chloride
9. Alkyl halides can be converted into Grignard reagents by [KCET 1989]
 (a) Boiling them with Mg ribbon in alcoholic solution
 (b) Warming them with magnesium powder in dry ether
 (c) Refluxing them with $MgCl_2$ solution
 (d) Warming them with $MgCl_2$
10. Which is not present in Grignard reagent [CBSE PMT 1991]
 (a) Methyl group (b) Magnesium
 (c) Halogen (d) $-COOH$ group
11. The reactivity of ethyl chloride is [KCET 1986]
 (a) More or less equal to that of benzyl chloride
 (b) More than that of benzyl chloride
 (c) More or less equal to that of chlorobenzene
 (d) Less than that of chlorobenzene
12. The reactivity of halogen atom is minimum in [KCET 1985]
 (a) Propyl chloride (b) Propyl iodide
 (c) Isopropyl chloride (d) Isopropyl bromide
13. Chlorobenzene is
 (a) Less reactive than benzyl chloride
 (b) More reactive than ethyl bromide
 (c) Nearly as reactive as methyl chloride
 (d) More reactive than isopropyl chloride
14. The reactivities of methyl chloride, propyl chloride and chlorobenzene are in the order [KCET 1988]
 (a) Methyl chloride > propyl chloride > chlorobenzene
 (b) Propyl chloride > methyl chloride > chlorobenzene
 (c) Methyl chloride > chlorobenzene > propyl chloride
 (d) Chlorobenzene > propyl chloride > methyl chloride
15. Which of the following compound will make precipitate most readily with $AgNO_3$ [CPMT 1992]
 (a) CCl_3CHO (b) $CHCl_3$
 (c) $C_6H_5CH_2Cl$ (d) CHI_3
16. Carbylamine is liberated when..... is heated with chloroform and alcoholic potash [KCET 1992]
 (a) An aldehyde (b) A primary amine
 (c) A secondary amine (d) A phenol
17. Salicylic acid can be prepared using Reimer-Tiemann's reaction by treating phenol with [KCET 1989]
 (a) Methyl chloride in the presence of anhydrous aluminium chloride
 (b) Carbon dioxide under pressure in sodium hydroxide solution
 (c) Carbon tetrachloride and concentrated sodium hydroxide
 (d) Sodium nitrite and a few drops of concentrated sulphuric acid
18. Grignard reagent is prepared by the reaction between [CBSE PMT 1994; DPMT 1996; Pb. PMT 1999; MH CET 1999]
 (a) Zinc and alkyl halide
 (b) Magnesium and alkyl halide
 (c) Magnesium and alkane
 (d) Magnesium and aromatic hydrocarbon
19. Reaction of t -butyl bromide with sodium methoxide produces [CBSE PMT 1994]
 (a) Isobutane (b) Isobutylene
 (c) Sodium t -butoxide (d) t -butyl methyl ether
20. War gas is formed from [BHU 1995]
 (a) PH_3 (b) C_2H_2
 (c) Zinc phosphate (d) Chloropicrin
21. What happens when CCl_4 is treated with $AgNO_3$ [EAMCET 1987; CBSE PMT 1988; MP PET 2000]
 (a) NO_2 will be evolved
 (b) A white ppt. of $AgCl$ will be formed
 (c) CCl_4 will dissolve in $AgNO_3$
 (d) Nothing will happen
22. If we use pyrene (CCl_4) in the Reimer-Tiemann reaction in place of chloroform, the product formed is [CBSE PMT 1989; MP PMT 1990; MH CET 1999]
 (a) Salicylaldehyde (b) Phenolphthalein
 (c) Salicylic acid (d) Cyclohexanol
23. $C_6H_5CH_2Cl + KCN(aq.) \rightarrow X + Y$
 Compounds X and Y are [BHU 1979]
 (a) $C_6H_6 + KCl$ (b) $C_6H_5CH_2CN + KCl$
 (c) $C_6H_5CH_3 + KCl$ (d) None of these
24. The bad smelling substance formed by the action of alcoholic caustic potash on chloroform and aniline is [MP PMT 1971, 92, 2001; CPMT 1971, 86; AFMC 2002; RPMT 1999]
 (a) Phenyl isocyanide (b) Nitrobenzene
 (c) Phenyl cyanide (d) Phenyl isocyanate
25. Ethylidene chloride on treatment with aqueous KOH gives [MP PMT 1986]
 (a) Ethylene glycol (b) Acetaldehyde
 (c) Formaldehyde (d) None

26. Reaction $C_2H_5I + C_5H_{11}I + 2Na \rightarrow C_2H_5 - C_5H_{11} + 2NaI$ is called
[MP PMT 1992]
(a) Hoffmann's reaction
(b) Dow's reaction
(c) Wurtz's reaction
(d) Riemer-Tiemann's reaction
27. In presence of $AlCl_3$, benzene and *n*-propyl bromide react in Friedal-Craft's reaction to form
[MP PMT 1991]
(a) *n*-propyl benzene
(b) 1, 2-dinormal propyl benzene
(c) 1, 4-dinormal propyl benzene
(d) Isopropyl benzene
28. The dehydrobromination of 2-bromobutane gives $CH_3CH = CHCH_3$. The product is
(a) Hofmann product
(b) Saytzeff product
(c) Hoffmann-Saytzeff product
(d) Markownikoff product
29. Ethylene difluoride on hydrolysis gives
(a) Glycol (b) Fluoroethanol
(c) Difluoroethanol (d) Freon
30. Benzyl chloride when oxidised by $pb(NO_3)_2$ gives
[MP PMT 1989]
(a) Benzoic acid (b) Benzaldehyde
(c) Benzene (d) None
31. Which of the following statements about chloroform is false
[Manipal MEE 1995]
(a) It is a colourless, sweet-smelling liquid
(b) It is almost insoluble in water
(c) It is highly inflammable
(d) It can be used as an inhalational anaesthetic agent
32. CCl_4 cannot give precipitate with $AgNO_3$ due to
[CPMT 1979]
(a) Formation of complex with $AgNO_3$
(b) Evolution of Cl_2 gas
(c) Chloride ion is not formed
(d) $AgNO_3$ does not give silver ion
33. On heating $CHCl_3$ with aq. $NaOH$, the product is
[CPMT 1971, 78; BHU 1997; EAMCET 1998; JIPMER (Med.) 2002]
(a) CH_3COONa (b) $HCOONa$
(c) Sodium oxalate (d) CH_3OH
34. Ethyl bromide reacts with lead-sodium alloy to form
[MP PMT/PET 1988; MP PET 1997]
(a) Tetraethyl lead (b) Tetraethyl bromide
(c) Both (a) and (b) (d) None of the above
35. Iodoform heated with Ag powder to form
[DPMT 1985]
(a) Acetylene (b) Ethylene
(c) Methane (d) Ethane
36. Ethyl bromide reacts with silver nitrite to form
[DPMT 1985; IIT-JEE 1991]
(a) Nitroethane
(b) Nitroethane and ethyl nitrite
(c) Ethyl nitrite
(d) Ethane
37. Which of the following reactions leads to the formation of chloritone [RPMT 2003]
(a) $CHCl_3 + CH_3COCH_3$ (b) $CCl_4 + \text{Acetone}$
- (c) $CHCl_3 + KOH$ (d) $CHCl_3 + HNO_3$
38. $CH_3 - CH_2 - CH_2Br + KOH$ (alc.) $\rightarrow$ Product. Product in above reaction is
[RPMT 2003]
(a) $CH_3 - CH = CH_2$ (b) $CH_3 - CH_2 - CH_3$
(c) (a) and (b) both (d) None of these
39. $A + CCl_4 + KOH \rightarrow$ Salicylic acid
'A' in above reaction is
[RPMT 2003]
- (a)  (b) 
(c)  (d) 
40. Identify X and Y in the following sequence
 $C_2H_5Br \xrightarrow{X} \text{product} \xrightarrow{Y} C_3H_7NH_2$
[Orissa JEE 2005]
(a) $X = KCN, Y = LiAlH_4$
(b) $X = KCN, Y = H_3O^+$
(c) $X = CH_3Cl, Y = AlCl_3 / HCl$
(d) $X = CH_3NH_2, Y = HNO_2$
41. 1-chlorobutane reacts with alcoholic KOH to form
[IIT-JEE 1991; AFMC 1998]
(a) 1-butene (b) 2-butene
(c) 1-butanol (d) 2-butanol
42. Which of the following reactions gives $H_2C = C = C = CH_2$ [Roorkee Qualify]
(a) $CH_2Br - CBr = CH_2 \xrightarrow{Zn / CH_3OH}$
(b) $HC \equiv C - CH_2 - COOH \xrightarrow[40^\circ C]{Aq. K_2CO_3}$
(c) $CH_2Br - C \equiv C - CH_2Br \xrightarrow[Heat]{Zn}$
(d) $2CH_2 = CH - CH_2I \longrightarrow$
43. When ethyl amine is heated with chloroform and alcoholic KOH , a compound with offensive smell is obtained. This compound is [CPMT 1983, 84; IIT-JEE 1991]
(a) A secondary amine (b) An isocyanide
(c) A cyanide (d) An acid
44. Chlorobenzene on fusing with solid $NaOH$ gives
[DPMT 1981; CPMT 1990]
(a) Benzene (b) Benzoic acid
(c) Phenol (d) Benzene chloride
45. DDT can be prepared by reacting chlorobenzene (in the presence of conc. H_2SO_4) with
(a) Cl_2 in ultraviolet light (b) Chloroform
(c) Trichloroacetone (d) Chloral hydrate
46. When phenol reacts with $CHCl_3$ and KOH , the product obtained would be
[RPMT 1997]
(a) Salicylaldehyde (b) *p*-hydroxy benzaldehyde
(c) Both (a) and (b) (d) Chloretone
47. Ethyl chloride on heating with silver cyanide forms a compound X . The functional isomer of X is
[EAMCET 1997; KCET 2005]
(a) C_2H_5NC (b) C_2H_5CN

- (c) $H_3C - NH - CH_3$ (d) $C_2H_5NH_2$
48. Which of the following statements is incorrect [CPMT 1977]
 (a) C_2H_5Br reacts with alco. KOH to form C_2H_5OH
 (b) C_2H_5Br when treated with metallic sodium gives ethane
 (c) C_2H_5Br when treated with sodium ethoxide forms diethyl ether
 (d) C_2H_5Br with $AgCN$ forms ethyl isocyanide
49. When chloroform is exposed to air and sunlight, it gives [NCERT 1984; CPMT 1978, 87; CBSE PMT 1990; EAMCET 1993; MNR 1994; MP PET 1997, 2000; BHU 2001; AFMC 2002]
 (a) Carbon tetrachloride (b) Carbonyl chloride
 (c) Mustard gas (d) Lewisite
50. An organic halide is shaken with aqueous $NaOH$ followed by the addition of dil. HNO_3 and silver nitrate solution gave white ppt. The substance can be [JIPMER 1997]
 (a) $C_6H_4(CH_3)Br$ (b) $C_6H_5CH_2Cl$
 (c) C_6H_5Cl (d) None of these
51. A compound A has a molecular formula C_2Cl_3OH . It reduces Fehling solution and on oxidation gives a monocarboxylic acid (B). A is obtained by action of chlorine on ethyl alcohol. A is [CBSE PMT 1994; MP PET 1997; KCET 2005]
 (a) Chloral (b) $CHCl_3$
 (c) CH_3Cl (d) Chloroacetic acid
52. Following equation illustrates

$$C_6H_5Cl + 2NaOH \xrightarrow[200\text{ atm}]{200-250^\circ C} C_6H_5ONa + NaCl + H_2O$$
 [Bihar CEE 1995]
 (a) Dow's process (b) Kolbe's process
 (c) Carbylamine test (d) Haloform reaction
53. One of the following that cannot undergo dehydro-halogenation is [J & K 2005]
 (a) Iso-propyl bromide (b) Ethanol
 (c) Ethyl bromide (d) None of these
54. A compound X on reaction with chloroform and $NaOH$ gives a compound with a very unpleasant odour. X is [MP PMT 1999]
 (a) $C_6H_5CONH_2$ (b) $C_6H_5NH_2$
 (c) $C_6H_5CH_2NHCH_3$ (d) $C_6H_5NHCH_3$
55.  + $C_2H_5I \xrightarrow[\text{Anhydrous } (C_2H_5OH)]{O^-C_2H_5} \text{Product}$
 In the above reaction product is
 (a) $C_6H_5OC_2H_5$ (b) $C_2H_5OC_2H_5$
 (c) $C_6H_5OC_6H_5$ (d) C_6H_5I
56. $C_2H_5Cl + KCN \longrightarrow X \xrightarrow{\text{Hydrolysis}} Y$. ' X ' and ' Y ' are [MP PET 1995]
 (a) C_2H_6 and C_2H_5CN
 (b) C_2H_5CN and C_2H_6
 (c) C_2H_5CN and $C_2H_5CH_2NH_2$
 (d) C_2H_5CN and C_2H_5COOH
57. Iodoform is formed on warming I_2 and $NaOH$ with [MP PET 1995; DCE 1999; RPET 1999; RPMT 2002]
 (a) C_2H_5OH (b) CH_3OH
 (c) $HCOOH$ (d) C_6H_6
58. Which of the following reacts with phenol to give salicylaldehyde after hydrolysis [MP PMT 1995]
 (a) Dichloromethane (b) Trichloromethane
 (c) Methyl chloride (d) None of these
59. Dehydrohalogenation in monohaloalkanes produces
 (a) A single bond (b) A double bond
 (c) A triple bond (d) Fragmentation
60. When chloroform is treated with conc. HNO_3 it gives [CPMT 1986; MP PMT 1989; AFMC 1998, 99; EAMCET 1991; BHU 1999]
 (a) $CHCl_2NO_2$ (b) CCl_3NO_2
 (c) $CHCl_2HNO_3$ (d) None of these
61. A sample of chloroform being used as anaesthetic is tested by [AIIMS 1980; CPMT 1990]
 (a) Fehling solution
 (b) Ammoniacal Cu_2Cl_2
 (c) $AgNO_3$ solution
 (d) $AgNO_3$ solution after boiling with alcoholic KOH solution
62. Dehydrohalogenation of an alkyl halide is [MP PMT 1996]
 (a) An addition reaction (b) A substitution reaction
 (c) An elimination reaction (d) An oxidation reaction
63. Reaction of aqueous sodium hydroxide on (i) ethyl bromide and (ii) chlorobenzene gives
 (a) (i) Ethene and (ii) o -chlorophenol
 (b) (i) Ethyl alcohol and (ii) o -chlorophenol
 (c) (i) Ethyl alcohol and (ii) phenol
 (d) (i) Ethyl alcohol and (ii) no reaction
64. 2-bromopentane is heated with potassium ethoxide in ethanol. The major product obtained is [CBSE PMT 1998]
 (a) Pentene-1 (b) cis pentene-2
 (c) $trans$ pentene-2 (d) 2-ethoxypentane
65. What is the product formed in the following reaction [KCET 1998]

$$C_6H_5OH + CCl_4 \xrightarrow[(2) H^+]{(1) NaOH} \text{Product}$$

 (a) p -hydroxybenzoic acid (b) o -hydroxybenzoic acid
 (c) Benzaldehyde (d) Salicylaldehyde
66. When chloroform is treated with excess oxygen it forms [MH CET 1999]
 (a) $COCl_2 + HCl$
 (b) $COCl_2 + Cl_2 + H_2$
 (c) $COCl_2 + Cl_2 + H_2O$
 (d) No product will be formed
67. Which isomer of cyclohexane hexachloride is a very strong insecticide [MP PET 2003]
 (a) α (b) β
 (c) γ (d) δ
68. Haloalkane in the presence of alcoholic KOH undergoes [KCET (Engg./Med.) 2002]
 (a) Elimination (b) Polymerisation
 (c) Dimerisation (d) Substitution
69. The set of compounds in which the reactivity of halogen atom in the ascending order is [KCET (Engg.) 2002]
 (a) Vinyl chloride, chloroethane, chlorobenzene
 (b) Vinyl chloride, chlorobenzene, chloroethane
 (c) Chloroethane, chlorobenzene, vinyl chloride
 (d) Chlorobenzene, vinyl chloride, chloroethane
70. Alkyl halides react with Mg in dry ether to form [DPMT 2000; MP PET 2001]

- (a) Magnesium halide (b) Grignard's reagent
(c) Alkene (d) Alkyne
71. In the following sequence of reactions

$$CH_3CH_2CH_2Br \xrightarrow{KOH(alc)} (A) \xrightarrow{HBr} (B) \xrightarrow{KOH(aq.)} (C),$$
 The product (C) is [JIPMER 2001]
 (a) Propan-2-ol (b) Propan-1-ol
 (c) Propyne (d) Propene
72. Alkyl halide on heating with alc. NH_3 in a sealed tube results... [Orissa JEE 2002]
 (a) 1° amine (b) 2° amine
 (c) 3° amine (d) All of these
73. When $CH_3CH_2CHCl_2$ is treated with $NaNH_2$, the product formed is [CBSE PMT 2002]
 (a) $CH_3-CH=CH_2$ (b) $CH_3-C \equiv CH$
 (c) $CH_3CH_2CH(NH_2)(Cl)$ (d) $CH_3CH_2C(NH_2)_2$
74. By heating a mixture of $CHCl_3$ with silver powder, the compound formed is [Kurukshestra CET 2002]
 (a) Acetylene (b) Silver acetate
 (c) Methanol (d) None of these
75. Chloropicrin is [Kurukshestra CET 2002]
 (a) Trichloro acetaldehyde (b) Nitrochloroform
 (c) 2,4,6-trinitro phenol (d) None of these
76. Which of the following are correct statements about C_2H_5Br [Roorkee 1999]
 (a) It reacts with metallic Na to give ethane
 (b) It gives nitroethane on heating with aqueous ethanolic solution of $AgNO_2$
 (c) It gives C_2H_5OH on boiling with alcoholic potash
 (d) It forms ethylacetate on heating with silver acetate
77. Aryl halide is less reactive than alkyl halide towards nucleophilic substitution because [RPMT 2002]
 (a) Less stable carbonium ion
 (b) Due to large $C-Cl$ bond energy
 (c) Inductive effect
 (d) Resonance stabilization and sp^2 -hybridisation of C attached to halide
78. Methyl chloride reacts with silver acetate to yield [BVP 2003]
 (a) Acetaldehyde (b) Acetyl chloride
 (c) Methyl acetate (d) Acetic acid
79. Chloroform for anesthetic purposes is tested for its purity with the reagent [DPMT 2001]
 (a) Silver nitrate (b) Lead nitrate
 (c) Ammoniacal Cu_2Cl_2 (d) Lead nitrate
80. 2, 6 - Dimethylheptane on monochlorination produces..... derivatives [DPMT 2001]
 (a) 5 (b) 6
 (c) 3 (d) 4
81. The less reactivity of chlorine atom in $CH_2=CH-Cl$ is due to [DCE 2001]
 (a) Inductive effect (b) Resonance stabilization
 (c) Electromeric effect (d) Electronegativity
82. $CH_3-CH_2-Br \xrightarrow{alc.KCN} CH_3CH_2CN \xrightarrow{HOH} X$
 In this reaction, product X is [MH CET 2002]
 (a) Acetic acid (b) Propionic acid
 (c) Butyric acid (d) Formic acid
83. In alkaline hydrolysis of a tertiary alkyl halide by aqueous alkali if concentration of alkali is doubled, then the reaction [MH CET 2002]
 (a) Will be doubled (b) Will be halved
 (c) Will remain constant (d) Can't say
84. $AgNO_3$ does not give precipitate with $CHCl_3$ because [MP PET 1999; CPMT 2002]
 (a) $CHCl_3$ does not ionise in water
 (b) $AgNO_3$ does not reacts with $CHCl_3$
 (c) $CHCl_3$ is chemically inert
 (d) None of these
85. The reaction between chlorobenzene and chloral in the presence of concentrated sulphuric acid produces [Pb. PMT 2001]
 (a) Gammexane
 (b) *p,p*-dichloro diphenyl trichloro ethane
 (c) Chloropicrin
 (d) Benzene hexachloride
86. False statement is [RPET 1999]
 (a) Chloroform is heavier than water
 (b) CCl_4 is non-inflammable
 (c) Vinyl chloride is more reactive than allyl chloride
 (d) Br^- is a good nucleophile as compared to I^-
87. Chloroform is slowly oxidise by air in presence of light to form [MH CET 1999; U]
 (a) Formyl chloride (b) Phosgene
 (c) Trichloroacetic acid (d) Formic acid
88. Alcoholic potash is used to bring about [KCET (Engg.) 2001]
 (a) Dehydrogenation (b) Dehydration
 (c) Dehydrohalogenation (d) Dehalogenation
89. Vinyl chloride reacts with HCl to form [JIPMER 2000]
 (a) 1, 1- dichloro ethane
 (b) 1, 2- dichloro ethane
 (c) Tetrachloro ethylene
 (d) Mixture of 1, 2 and 1, 1 - dichloro ethane
90. $R-X + NaOH \longrightarrow ROH + NaX$
 The above reaction is classified as [BHU 1982; CBSE PMT 1991; RPET 2000]
 (a) Nucleophilic substitution
 (b) Electrophilic substitution
 (c) Reduction
 (d) Oxidation
91. Reduction of acetyl chloride with H_2 in presence of Pd gives [MP PMT 2001]
 (a) CH_3COCH_3 (b) C_2H_5OH
 (c) CH_3COOH (d) CH_3CHO
92. When methyl bromide is heated with Zn it gives [MP PMT 2001]
 (a) CH_4 (b) C_2H_6
 (c) C_2H_4 (d) CH_3OH
93. Phenol reacts with $CHCl_3$ and $NaOH$ (at 340K) to give [MP PMT 1997; CBSE PMT 2002]
 (a) *o*-chlorophenol (b) Salicylaldehyde
 (c) Benzaldehyde (d) Chlorobenzene
94. Iodoform on heating with KOH gives [MP PMT 2000]
 (a) CH_3CHO (b) CH_3COOK
 (c) $HCOOK$ (d) $HCHO$
95. Which reaction is correct in the conversion of chloroform to acetylene [Pb. PMT 2000]
 (a) $CHCl_3 + AgNO_3$ (b) $CHCl_3 + O_2$
 (c) $CHCl_3 + HNO_3$ (d) $CHCl_3 + Ag$
96. Which of the following gases are poisonous [Pb. PMT 2000]

- (a) CHCl_3 (b) CO_2
(c) None of these (d) CO
97. Which of the following alkyl halide is used as a methylating agent [KCET (Med.) 2000; MP PET 1999]
(a) CH_3I (b) $\text{C}_2\text{H}_5\text{Br}$
(c) $\text{C}_2\text{H}_5\text{Cl}$ (d) $\text{C}_6\text{H}_5\text{Cl}$
98. $\text{C}_6\text{H}_6\text{Cl}_6$, on treatment with alcoholic KOH , yields [AFMC 2000]
(a) C_6H_6 (b) $\text{C}_6\text{H}_3\text{Cl}_3$
(c) $(\text{C}_6\text{H}_5)_2\text{O}$ (d) $\text{C}_6\text{H}_5\text{Cl}$
99. When ethyl iodide is heated with silver nitrate, the product obtained is [CPMT 2000]
(a) $\text{C}_2\text{H}_5\text{Ag}$ (b) $\text{Ag}-\text{O}-\text{NO}_2$
(c) $\text{C}_2\text{H}_5\text{O}-\text{NO}_2$ (d) $\text{C}_2\text{H}_5\text{I}-\text{NO}_2$
100. CHCl_3 and HF lead to the formation of a compound of fluorine of molecular weight 70. The compound is [RPET 2000]
(a) Fluoroform (b) Fluorine monoxide
(c) Fluorine dioxide (d) Fluoromethanol
101. Chloroform with zinc dust in water gives [UPSEAT 2000]
(a) CH_4 (b) Chloropicrin
(c) CCl_4 (d) CH_2Cl_2
102. Which of the following is used as a catalyst for preparing Grignard reagent [KCET 1998]
(a) Iron powder (b) Iodine powder
(c) Activated charcoal (d) Manganese dioxide
103. For a given alkyl group the densities of the halides follow the order [MP PMT 1997]
(a) $\text{RI} < \text{RBr} < \text{RCl}$ (b) $\text{RI} < \text{RCl} < \text{RBr}$
(c) $\text{RBr} < \text{RI} < \text{RCl}$ (d) $\text{RCl} < \text{RBr} < \text{RI}$
104. Which halide will be least reactive in respect to hydrolysis [MP PET 2003]
(a) Vinyl chloride (b) Allyl chloride
(c) Ethyl chloride (d) *t*-Butyl chloride
105. In nucleophilic aliphatic substitution, the nucleophiles are generally
(a) Acids (b) Bases
(c) Salts (d) Neutral molecules
106. Which one of the following compounds does not react with bromine [DPMT 1983]
(a) Ethylamine (b) Propene
(c) Phenol (d) Chloroform
107. Allyl chloride on dehydro chlorination gives [Kerala (Med.) 2003]
(a) Propadiene (b) Propylene
(c) Acetylchloride (d) Acetone
108. Toluene reacts with excess of Cl_2 in presence of sunlight to give a product which on hydrolysis followed by reaction with NaOH gives [Orissa JEE 2004]
(a)  (b) 
(c)  (d) None of these
109. An alkyl bromide produces a single alkene when it reacts with sodium ethoxide and ethanol. This alkene undergoes hydrogenation and produces 2-methyl butane. What is the identity of the alkyl bromide [Kerala PMT 2004]
(a) 1-bromo-2, 2-dimethylpropane
(b) 1-bromobutane
(c) 1-bromo-2-methylbutane
(d) 2-bromo-2-methylbutane
(e) 2-bromopentane
110. On treating a mixture of two alkyl halides with sodium metal in dry ether, 2-methyl propane was obtained. The alkyl halides are [KCET 2004]
(a) 2-chloropropane and chloromethane
(b) 2-chloropropane and chloroethane
(c) Chloromethane and chloroethane
(d) Chloromethane and 1-chloropropane
111. In which case formation of butane nitrile is possible [Orissa JEE 2004]
(a) $\text{C}_3\text{H}_7\text{Br} + \text{KCN}$ (b) $\text{C}_4\text{H}_9\text{Br} + \text{KCN}$
(c) $\text{C}_3\text{H}_7\text{OH} + \text{KCN}$ (d) $\text{C}_4\text{H}_9\text{OH} + \text{KCN}$
112. The reaction of an aromatic halogen compound with an alkyl halides in presence of sodium and ether is called [MP PMT 2004]
(a) Wurtz reaction
(b) Sandmeyer's reaction
(c) Wurtz-fittig reaction
(d) Kolbe reaction
113. The compound added to prevent chloroform to form phosgene gas is [MP PET 2004]
(a) $\text{C}_2\text{H}_5\text{OH}$ (b) CH_3COOH
(c) CH_3COCH_3 (d) CH_3OH
114. Among the following, the one which reacts most readily with ethanol is [AIIMS 2004]
(a) *p*-nitrobenzyl bromide
(b) *p*-chlorobenzyl bromide
(c) *p*-methoxybenzyl bromide
(d) *p*-methylbenzyl bromide
115. Chloropicrin is obtained by the reaction of [CBSE PMT 2004]
(a) Chlorine on picric acid
(b) Nitric acid on chloroform
(c) Steam on carbon tetrachloride
(d) Nitric acid on chlorobenzene
116. In Wurtz reaction alkyl halide react with [MH CET 2004]
(a) Sodium in ether (b) Sodium in dry ether
(c) Sodium only (d) Alkyl halide in ether
117. Chloroform, when kept open, is oxidised to [CPMT 2004]
(a) CO_2 (b) COCl_2
(c) CO_2, Cl_2 (d) None of these
118. Chloroform reacts with concentrated HNO_3 to give [Pb. CET 2000]
(a) Water gas (b) Tear gas
(c) Laughing gas (d) Producer gas
119. When ethyl chloride and alcoholic KOH are heated, the compound obtained is [MH CET 2003]
(a) C_2H_4 (b) C_2H_2
(c) C_6H_6 (d) C_2H_6
120. Chloroform, on warming with Ag powder, gives [MH CET 2003]
(a) C_2H_6 (b) C_3H_8
(c) C_2H_4 (d) C_2H_2
121. When alkyl halide is heated with dry Ag_2O , it produces [CPMT 1997; BHU 2004]
(a) Ester (b) Ether
(c) Ketone (d) Alcohol
122. Reaction of alkyl halides with aromatic compounds in presence of anhydrous AlCl_3 is known as [UPSEAT 2004]

- (a) Friedal-Craft reaction
(b) Hofmann degradation
(c) Kolbe's synthesis
(d) Beckmann rearrangement
123. Two percent of ethanol is added during the oxidation of chloroform to stop the formation of carbonyl chloride. In this reaction ethanol acts as [Pb. CET 2001]
(a) Auto catalyst (b) Negative catalyst
(c) Positive catalyst (d) None of these
124. When benzene is heated with chlorine in the presence of sunlight, it forms [Pb. CET 2000]
(a) B.H.C. (b) Cyclopropane
(c) *p*-dichlorobenzene (d) None of these
125. Ethylene di bromide on heating with metallic sodium in ether solution yields [Pb. CET 2004]
(a) Ethene (b) Ethyne
(c) 2-butene (d) 1-butene
126. The reaction, $\text{CH}_3\text{Br} + \text{Na} \rightarrow \text{Product}$, is called [Pb. CET 2003]
(a) Perkin reaction (b) Levit reaction
(c) Wurtz reaction (d) Aldol condensation
127. At normal temperature iodoform is [MP PET 2004]
(a) Thick viscous liquid (b) Gas
(c) Volatile liquid (d) Solid
128. Which of the following statements about benzyl chloride is incorrect [KCET 2004]
(a) It is less reactive than alkyl halides
(b) It can be oxidised to benzaldehyde by boiling with copper nitrate solution
(c) It is a lachrymatory liquid and answers Beilstein's test
(d) It gives a white precipitate with alcoholic silver nitrate
129. Ethylene dichloride and ethylidene chloride are isomeric compounds. The false statement about these isomers is that they [DCE 2003]
(a) React with alcoholic potash and give the same product
(b) Are position isomers
(c) Contain the same percentage of chlorine
(d) Are both hydrolysed to the same product
130. An alkyl bromide (*X*) reacts with *Na* to form 4, 5-diethyloctane. Compound *X* is [Roorkee 1999]
(a) $\text{CH}_3(\text{CH}_2)_3\text{Br}$
(b) $\text{CH}_3(\text{CH}_2)_5\text{Br}$
(c) $\text{CH}_3(\text{CH}_2)_3\text{CH}.\text{Br}.\text{CH}_3$
(d) $\text{CH}_3(\text{CH}_2)_2\text{CH}.\text{Br}.\text{CH}_2\text{CH}_3$
131. In the following reaction *X* is
 $\text{CH}_3\text{NH}_2 + \text{X} + \text{KOH} \rightarrow \text{CH}_3\text{NC}$ (highly offensive odour) [MP PET 1994]
(a) CH_2Cl_2 (b) CHCl_3
(c) CH_3Cl (d) CCl_4
132. Which metal is used in Wurtz synthesis [CPMT 1986; DPMT 1979; MP PET 2002]
(a) *Ba* (b) *Al*
(c) *Na* (d) *Fe*
133. Which of the following is boiled with ethyl chloride to form ethyl alcohol [MNR 1982]
(a) Alcoholic *KOH* (b) Aqueous *KOH*
(c) H_2O (d) H_2O_2
134. Why is chloroform put into dark coloured bottles [MP PET 2002]
(a) To prevent evaporation
(b) To prevent from moisture
(c) To prevent it from oxidation to form phosgene
(d) To prevent its reaction with glass
135. DDT is
(a) A solid (b) A liquid
(c) A gas (d) A solution
136. Bottles containing $\text{C}_6\text{H}_5\text{I}$ and $\text{C}_6\text{H}_5\text{CH}_2\text{I}$ lost their original labels. They were labelled *A* and *B* for testing. *A* and *B* were separately taken in test tubes and boiled with *NaOH* solution. The end solution in each tube was made acidic with dilute HNO_3 and then some AgNO_3 solution was added. Substance *B* give a yellow precipitate. Which one of the following statements is true for this experiment [AIEEE 2003]
(a) *A* was $\text{C}_6\text{H}_5\text{I}$
(b) *A* was $\text{C}_6\text{H}_5\text{CH}_2\text{I}$
(c) *B* was $\text{C}_6\text{H}_5\text{I}$
(d) Addition of HNO_3 was unnecessary
137. Which of the following statements is incorrect regarding benzyl chloride [KCET 2003]
(a) It gives white precipitate with alcoholic AgNO_3
(b) It is an aromatic compound with substitution in the side chain
(c) It undergoes nucleophilic substitution reaction
(d) It is less reactive than vinyl chloride
- Alkyl halide can be converted into alkene by [BCECE 2005]
(a) Nucleophilic substitution reaction
(b) Elimination reaction
(c) Both nucleophilic substitution and elimination reaction
(d) Rearrangement
139. The major product formed in the following reaction is [AIIMS 2005]
$$\text{CH}_3 - \overset{\text{CH}_3}{\underset{\text{H}}{\text{C}}} - \text{CH}_2\text{Br} \xrightarrow[\text{CH}_3\text{OH}]{\text{CH}_3\text{O}}$$

(a) $\text{CH}_3 - \overset{\text{CH}_3}{\underset{\text{H}}{\text{C}}} - \text{CH}_2\text{OCH}_3$ (b) $\text{CH}_3 - \overset{\text{OCH}_3}{\underset{\text{H}}{\text{C}}} - \text{CH}_2\text{CH}_3$
(c) $\text{CH}_3 - \overset{\text{CH}_3}{\text{C}} = \text{CH}_2$ (d) $\text{CH}_3 - \overset{\text{CH}_3}{\underset{\text{OCH}_3}{\text{C}}} - \text{CH}_3$
140. The major product obtained on treatment of $\text{CH}_3\text{CH}_2\text{CH}(\text{F})\text{CH}_3$ with $\text{CH}_3\text{O}^- / \text{CH}_3\text{OH}$ is [AIIMS 2005]
(a) $\text{CH}_3\text{CH}_2\text{CH}(\text{OCH}_3)\text{CH}_3$
(b) $\text{CH}_3\text{CH} = \text{CHCH}_3$
(c) $\text{CH}_3\text{CH}_2\text{CH} = \text{CH}_2$
(d) $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{OCH}_3$
141. When phenyl magnesium bromide reacts with *t*-butanol, the product would be [IIT 2005]
(a) Benzene (b) Phenol
(c) *t*-butyl benzene (d) *t*-butyl phenyl ether
142. Alkyl halides react with dialkyl copper reagents to give [AIEEE 2005]
(a) Alkenes (b) Alkyl copper halides
(c) Alkanes (d) Alkenyl halides
143. Which of the following is liquid at room temperature [AFMC 2005]
(a) CH_3I (b) CH_3Br

- (c) C_2H_5Cl (d) CH_3F

144. Which of the following haloalkanes is most reactive

[KCET 2005]

- (a) 1-chloropropane (b) 1-bromopropane
(c) 2-chloropropane (d) 2-bromopropane

145. Grignard reagent adds to

[KCET 2005]

- (a) $>C=O$ (b) $-C \equiv N$
(c) $>C=S$ (d) All of the above

146. Analyse the following reaction and identify the nature of A and B
[Kerala CET 2005]

- (a) Both A and B are
- (b) Both A and B are
- (c) A is & B is
- (d) A is & B is
- (e) A is & B is

Uses of Halogen Containing Compounds

1. Which of these can be used as moth repellent

[CPMT 1987]

- (a) Benzene hexachloride (b) Benzal chloride
(c) Hexachloroethane (d) Tetrachloroethane

2. Which one of the following is the correct formula of dichlorodiphenyl trichloroethane
[AIIMS 1982]

- (a)
- (b)
- (c)
- (d)

3. The compound $(CH_3)_2C(OH)CCl_3$ is
(a) Chloretone (b) Chloroquin
(c) Chloropicrin (d) Chloropropyl chloride
4. Depletion of ozone layer is caused by
(a) Freon (b) Alkane
(c) Grignard reagent (d) All of these
5. Which of the following is Teflon
(a) $[-CF_2 - CF_2 -]_n$ (b) $CF_2 = CF_2$
(c) $CF \equiv CF$ (d) None of these
6. Statement "Ozone in atmosphere is decreased by chloro-fluoro-carbon (Cl_2F_2C)"
(a) Is true (b) Is false
(c) Only in presence of CO_2 (d) Only in absence of CO_2
7. CF_xCl_y [where $x + y = 4$]. These compounds are not used because
(a) These are fluoro carbons
(b) These are difficult to synthesise
(c) They deplete ozone layer
(d) None of the these
8. The molecular formula of DDT has
(a) 5 chlorine atoms (b) 4 chlorine atoms
(c) 3 chlorine atoms (d) 2 chlorine atoms
9. What is the reagent used for testing fluoride ion in water
(a) Alizarin - S (b) Quinalizarin
(c) Phenolphthalein (d) Benzene
10. Chloropicrin is used as
(a) Solvent (b) Anaesthetic
(c) Perfume (d) Tear gas
11. Which is used in the manufacture of plastic
(a) $CH_2 = CHCl$ (b) $CH \equiv CH$
(c) $CH_2 = CH - CH_2I$ (d) CCl_4
12. Freon (dichlorodifluoro methane) is used
(a) As local anaesthetic
(b) For dissolving impurities in metallurgical process
(c) In refrigerator
(d) In printing industry
13. Which of the following is known as freon which is used as a refrigerant
(a) CCl_2F_2 (b) $CHCl_3$
(c) CH_2F_2 (d) CF_4
14. Benzene hexachloride (BHC) is used as
(a) Dye (b) Antimalarial drug
(c) Antibiotic (d) Insecticide
15. Which plastic is obtained from $CHCl_3$ as follows
 $CHCl_3 \xrightarrow[SbF_5]{HF} X \xrightarrow{800^\circ C} Y \xrightarrow{\text{Polymerisation}} \text{Plastic}$
(a) Bakelite (b) Teflon
(c) Polythene (d) Perspex
16. The above structural formula refers to
(a) Dye (b) Antimalarial drug
(c) Antibiotic (d) Insecticide

[MP PET 1997]

- (a) BHC (b) DNA
(c) DDT (d) RNA
17. The commercial uses of DDT and benzene hexachloride are
(a) DDT is a herbicide, benzene hexachloride is a fungicide
(b) Both are insecticides
(c) Both are herbicides
(d) DDT is a fungicide and benzene hexachloride is a herbicide
18. Which of the following is used in fire extinguishers [AFMC 1993]
(a) CH_4 (b) $CHCl_3$
(c) CH_2Cl_2 (d) CCl_4
19. Iodoform can be used as [NCERT 1981]
(a) Anaesthetic (b) Antiseptic
(c) Analgesic (d) Antifebrin
20. Which of the following is an anaesthetic [AFMC 1989]
(a) C_2H_4 (b) $CHCl_3$
(c) CH_3Cl (d) C_2H_5OH
21. An important insecticide is obtained by the action of chloral on chlorobenzene. It is [KCET 1989]
(a) BHC (b) Gammexene
(c) DDT (d) Lindane
22. In fire extinguisher, pyrene is [DPMT 1985]
(a) CO_2 (b) CCl_4
(c) CS_2 (d) $CHCl_3$
23. B.H.C. is used as [Pb. CET 2002]
(a) Insecticide (b) Pesticide
(c) Herbicide (d) Weedicide
24. The use of the product obtained as a result of reaction between acetone and chloroform is [RPMT 1999]
(a) Hypnotic (b) Antiseptic
(c) Germicidal (d) Anaesthetic
25. Use of chlorofluoro carbons is not encouraged because [KCET 2005]
(a) They are harmful to the eyes of people that use it
(b) They damage the refrigerators and air conditioners
(c) They eat away the ozone in the atmosphere
(d) They destroy the oxygen layer
- (c) Benzyl chloride (d) Isopropyl chloride
5. Replacement of Cl of chlorobenzene to give phenol requires drastic conditions but chlorine of 2, 4-dinitrochlorobenzene is readily replaced because [CBSE PMT 1997]
(a) NO_2 make ring electron rich at ortho and para
(b) NO_2 withdraws e^- from meta position
(c) denotes e^- at meta position
(d) NO_2 withdraws e^- from ortho/para positions
6. Among the following one with the highest percentage of chlorine is [MNR 1989;
(a) Chloral (b) Pyrene
(c) PVC (d) Gammexene
7. In which alkyl halide, SN^2 mechanism is favoured maximum [RPMT 1997]
(a) CH_3Cl (b) CH_3CH_2Cl
(c) $(CH_3)_2CHCl$ (d) $(CH_3)_3C-Cl$
8. Which conformation of $C_6H_6Cl_6$ is most powerful insecticide
(a) $aaeccc$ (b) $aaeecc$
(c) $aaaaee$ (d) $aaaaaa$
9. The odd decomposition of carbon chlorine bond form [UPSEAT 1999]
(a) Two free ions (b) Two-carbanium ion
(c) Two carbanion (d) A cation and an anion
10. A new carbon-carbon bond formation is possible in [IIT-JEE 1998]
(a) Cannizzaro reaction (b) Friedel-Craft's alkylation
(c) Clemmensen reduction (d) Reimer-Tiemann reaction
11. An isomer of $C_3H_6Cl_2$ on boiling with aqueous KOH gives acetone. Hence, the isomer is [UPSEAT 2000]
(a) 2, 2-dichloropropane (b) 1, 2-dichloropropane
(c) 1, 1-dichloropropane (d) 1, 3-dichloropropane
12. Which of the following is the example of SN^2 reaction [CPMT 1999]
(a) $CH_3Br + OH^- \longrightarrow CH_3OH + Br^-$
(b) $CH_3CH(Br)CH_3 + OH^- \longrightarrow CH_3CH(OH)CH_3 + Br^-$
(c) $CH_3CH_2OH \xrightarrow{-H_2O} CH_2=CH_2$
(d) $CH_3-C(Br)(CH_3)-CH_3 + OH^- \longrightarrow CH_3-C(OH)(CH_3)-CH_3 + Br^-$

Critical Thinking

Objective Questions

1. Among the following, the molecule with the highest dipole moment is [IIT-JEE (Screening) 2003]
(a) CH_3Cl (b) CH_2Cl_2
(c) $CHCl_3$ (d) CCl_4
2. When $CHCl_3$ is boiled with $NaOH$, it gives [Orissa JEE 2003]
(a) Formic acid (b) Trihydroxy methane
(c) Acetylene (d) Sodium formate
3. The hybridization state of carbon atoms in the product formed by the reaction of ethyl chloride with aqueous potassium hydroxide is [EAMCET 1997]
(a) sp (b) sp^2
(c) sp^3 (d) sp^3d
4. Which of the following compounds does not undergo nucleophilic substitution reactions [KCET 1998]
(a) Vinyl chloride (b) Ethyl bromide
- (a) Benzyl chloride (b) Isopropyl chloride
5. Replacement of Cl of chlorobenzene to give phenol requires drastic conditions but chlorine of 2, 4-dinitrochlorobenzene is readily replaced because [CBSE PMT 1997]
(a) NO_2 make ring electron rich at ortho and para
(b) NO_2 withdraws e^- from meta position
(c) denotes e^- at meta position
(d) NO_2 withdraws e^- from ortho/para positions
6. Among the following one with the highest percentage of chlorine is [MNR 1989;
(a) Chloral (b) Pyrene
(c) PVC (d) Gammexene
7. In which alkyl halide, SN^2 mechanism is favoured maximum [RPMT 1997]
(a) CH_3Cl (b) CH_3CH_2Cl
(c) $(CH_3)_2CHCl$ (d) $(CH_3)_3C-Cl$
8. Which conformation of $C_6H_6Cl_6$ is most powerful insecticide
(a) $aaeccc$ (b) $aaeecc$
(c) $aaaaee$ (d) $aaaaaa$
9. The odd decomposition of carbon chlorine bond form [UPSEAT 1999]
(a) Two free ions (b) Two-carbanium ion
(c) Two carbanion (d) A cation and an anion
10. A new carbon-carbon bond formation is possible in [IIT-JEE 1998]
(a) Cannizzaro reaction (b) Friedel-Craft's alkylation
(c) Clemmensen reduction (d) Reimer-Tiemann reaction
11. An isomer of $C_3H_6Cl_2$ on boiling with aqueous KOH gives acetone. Hence, the isomer is [UPSEAT 2000]
(a) 2, 2-dichloropropane (b) 1, 2-dichloropropane
(c) 1, 1-dichloropropane (d) 1, 3-dichloropropane
12. Which of the following is the example of SN^2 reaction [CPMT 1999]
(a) $CH_3Br + OH^- \longrightarrow CH_3OH + Br^-$
(b) $CH_3CH(Br)CH_3 + OH^- \longrightarrow CH_3CH(OH)CH_3 + Br^-$
(c) $CH_3CH_2OH \xrightarrow{-H_2O} CH_2=CH_2$
(d) $CH_3-C(Br)(CH_3)-CH_3 + OH^- \longrightarrow CH_3-C(OH)(CH_3)-CH_3 + Br^-$
13. Wurtz reaction of methyl iodide yields an organic compound X . Which one of the following reactions also yields X [EAMCET 2003]
(a) $C_2H_5Cl + Mg \xrightarrow{\text{dry ether}}$
(b) $C_2H_5Cl + LiAlH_4 \longrightarrow$
(c) $C_2H_5Cl + C_2H_5ONa \longrightarrow$

(a) $CHCl_3$ (b) C_2H_5OH
(c) $HCOOH$ (d) CH_3CHO
15. 1, 2 di-bromo cyclohexane on dehydro halogenation gives [UPSEAT 2003]
(a)  (b) 

- (c)  (d) None of these
16. In which one of the following conversions phosphorus pentachloride is used as a reagent [EAMCET 1997]
 (a) $H_2C = CH_2 \rightarrow CH_3CH_2Cl$
 (b) $H_3C - O - CH_3 \rightarrow CH_3Cl$
 (c) $CH_3CH_2OH \rightarrow CH_3CH_2Cl$
 (d) $HC \equiv CH \rightarrow CH_2 = CHCl$
17. When but -3-en-2-ol reacts with aq. HBr, the product formed is [DCE 2001]
 (a) 3-bromobut-1-ene
 (b) 1-bromobut-2-ene
 (c) A mixture of both a and b
 (d) 2-bromobut-2-ene
18. Which of these do not form Grignard reagent
 (a) CH_3F (b) CH_3Cl
 (c) CH_3Br (d) CH_3I
19. An organic compound $A(C_4H_6Cl)$ on reaction with Na/diethyl ether gives a hydrocarbon, which on monochlorination gives only one chloro derivative. A is [Kerala PMT 2004]
 (a) *t*-butyl chloride (b) *s*-butyl chloride
 (c) Isobutyl chloride (d) *n*-butyl chloride
 (e) None of these
20. Among the following the most reactive towards alcoholic KOH is [AIIMS 2004]
 (a) $CH_2 = CHBr$ (b) $CH_3COCH_2CH_2Br$
 (c) CH_3CH_2Br (d) $CH_3CH_2CH_2Br$
21. Which one of the following possess highest m.pt. [Pb. CET 2004]
 (a) Chlorobenzene (b) *o*-dichlorobenzene
 (c) *m*-dichlorobenzene (d) *p*-dichlorobenzene
22. Which chlorine atom is more electronegative in the following [UPSEAT 2004]
 (a) $CH_3 - Cl$ (b) $CH_3 - CH_2 - Cl$
 (c) $H - \overset{\overset{CH_3}{|}}{C} - Cl$ (d) $CH_3 - CH_2 - \overset{\overset{CH_3}{|}}{C} - Cl$
23. What would be the product formed when 1-Bromo-3-chloro cyclobutane reacts with two equivalents of metallic sodium in ether [IIT-JEE (Screening) 2005]
 (a)  (b) 
 (c)  (d) 
1. Assertion : $CHCl_3$ is stored in transparent bottles.
 Reason : $CHCl_3$ is oxidised in dark. [AIIMS 1996]
2. Assertion : Addition of bromine to trans-2-butene yields meso-2,3-dibromobutane
 Reason : Bromine addition to an alkene is an electrophilic addition. [IIT-JEE (Screening) 2001]
3. Assertion : Alkyl halides are soluble in organic solvents.
 Reason : *p*-dichlorobenzene possesses low melting point.
4. Assertion : CCl_4 is not a fire extinguisher.
 Reason : CCl_4 is insoluble in water.
5. Assertion : Aqueous hydrohalogen acids are used to prepare alkyl halides from alkenes.
 Reason : Hydrogen iodide readily reacts with alkenes to form alkyl halides.
6. Assertion : Alkyl halides form alkenes when heated above $300^\circ C$.
 Reason : CH_3CH_2I react slowly with strong base when compared to CD_3CH_2I .
7. Assertion : Halogen acids react with alcohols to form haloalkanes.
 Reason : Order of reactivity of halogen acids $HCl > HBr > HI$
8. Assertion :  is less reactive than  towards reactions.
 Reason : Tertiary alkyl halides react predominantly by S_N1 mechanism.
9. Assertion : Electron withdrawing groups in aryl halides decrease the reactivity towards nucleophilic substitution.
 Reason : 2,4-Dinitrochlorobenzene is less reactive than chlorobenzene.
10. Assertion : Aryl halides undergo electrophilic substitutions more readily than benzene.
 Reason : Aryl halide gives a mixture of *o*- and *p*- products.
11. Assertion : Addition of Br_2 to cis-but-2-ene is stereoselective.
 Reason : S_N2 reactions are stereospecific as well as stereoselective.
12. Assertion : Optically active 2-iodobutane on treatment with NaI in acetone undergoes racemization.
 Reason : Repeated Walden inversions on the reactant and its product eventually gives a racemic mixture.
13. Assertion : Nucleophilic substitution reaction on an optically active alkyl halide gives a mixture of enantiomers.
 Reason : The reaction occurs by S_N1 mechanism.

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

Uses of Halogen containing compounds

Chapter 26 Alcohol, Phenol and Ether

Hydroxy compounds

Hydroxy compounds are those compounds in which the hydroxy group, $-OH$ is directly linked with the aliphatic or aromatic carbon.

Monohydric alcohols

These are compound containing one hydroxyl group. Their general formula is $C_nH_{2n+2}O$

(i) Preparation : (i) From alkyl halide

- 1° alkyl halide gives good yield of alcohols.
- 2° alkyl halide gives mixture of alcohol and alkene.
- 3° alkyl halide gives alkenes due to dehydrohalogenation.

(ii) From alkenes : (a) Hydration

Indirect process :

In case of unsymmetrical alkenes

(b) Oxymercuration-demercuration

This reaction is very fast and produces the alcohol in high yield. The alcohol obtained corresponds to Markownikoff's addition of water to alkene.

(c) Hydroboration oxidation (HBO) : (Antimarkownikoff's orientation)

Diborane is an electron deficient molecule. It acts as an electrophile reacting with alkenes to form alkyl boranes R_3B .

□ Carbocation are not the intermediate in HBO hence no rearrangement take place.

(iii) By reduction of carbonyl compounds

Density $\propto$ Molecular masses.

(vii) **In toxicating effects** : Methanol is poisonous and is not good for drinking purposes. It may cause blindness and even death. Ethanol is used for drinking purposes.

(3) **Chemical properties** : Characteristic reaction of alcohol are the reaction of the $-OH$ group. The reactions of the hydroxyl group consists of either cleavage of $C-O$ bond or the cleavage of $O-H$ bond.

$C-O$ bond is weaker in the case of tertiary alcohols due to $+I$ effect of alkyl groups while $-OH$ bond is weaker in primary alcohols as electron density increase between $O-H$ bond and hydrogen tends to separates as a proton.

Thus primary alcohols give the most of reaction by cleavage of $O-H$ bond while tertiary alcohols are most reactive because of cleavage of $C-O$ bond. Hence $-O-H$ cleavage reactivity order : Primary > Secondary > Tertiary and $C-O$ cleavage reactivity order : Tertiary > Secondary > Primary alcohol

(i) **Reaction involving cleavage of $-OH$ with removal of ' H ' as proton**

Alcohols are stronger acids than terminal acetylene but are not acidic enough to react with aqueous $NaOH$ or KOH . Acidic nature is in the order $HOH > ROH > CH \equiv CH > NH_3 > RH$.

Acidic nature of alcohol decrease with increase of alkyl groups on $-OH$ bonded carbon due to $+I$ (inductive) effect of alkyl group.

(a) **Reaction with Na : (Active metals)**

Evolution of H_2 shows the presence of $-OH$ and reaction show that alcohols are acidic in nature. Alcohols acts as Bronsted acids because they donate a proton to a strong base (B^-).

Example :

On reaction of alkoxide with water, starting alcohol is obtained.

This is the analytical test for alcohols.

(b) **Reaction with carboxylic acid [Esterification] :**

When HCl gas is used as catalyst, the reaction is called fischer-speier esterification.

Presence of bulky group in alcohol or in acid decreases the rate of esterification. This is due to steric hindrance of bulky group. Reactivity of alcohol in this reaction is $1^\circ > 2^\circ > 3^\circ$.

(c) **Reaction with acid derivatives : (Analytical test of alcohol)**

(d) **Reaction with grignard reagents :**

(e) **Reaction with ketene :**

(f) **Reaction with isocyanic acid :**

(g) **Reaction with ethylene oxide :**

(h) **Reaction with diazomethane :**

(ii) **Alkylation : $ROH + R'SO_4 \rightarrow ROR' + R'HSO_4$**

(iii) **Reaction involving cleavage of $-C-OH$ with removal or substitution of $-OH$ group**

(a) **Reaction with hydrogen halides** : Alcohols give alkyl halide. The reactivity of HX is in the order of $HI > HBr > HCl$ and the reactivity of ROH is in the order of benzyl > allyl > $3^\circ > 2^\circ > 1^\circ$. The reaction follows a nucleophilic substitution mechanism.

If alcohols react with HI and red phosphorus, alkane will be formed.

Primary alcohols follow S_N2 mechanism.

In secondary and tertiary alcohols, the S_N1 mechanism operates

(Analytical test for alcohols)

(g) *Reaction with H_2SO_4* [Dehydration of alcohol]: The elimination of water from a compound is known as dehydration. The order of ease of dehydration is Tertiary > Secondary > primary alcohol. The products of dehydration of alcohols depend upon the nature of dehydrating agents and temperature.

Alcohol leading to conjugated alkene are dehydrated to a greater extent than those of alcohols leading to nonconjugated alkene. Thus dehydration is in order

3° alcohols are resistant to oxidation, but on taking stronger oxidising agent they form ketone.

Important reagents used for oxidation of alcohols

• PCC [Pyridinium chloro chromate ($C_5H_5NH^+ClCrO_3^-$)] to oxidise 1° alcohols to aldehydes and 2° alcohols to ketones.

• PDC [Pyridinium di chromate ($C_5H_5NH^+Cr_2O_7^{2-}$)] to oxidise 1° alcohols to aldehyde and 2° alcohol to ketones.

• H_2CrO_4 (chromic acid) to oxidise 1° alcohol to carboxylic acid.

• $CrO_3 \cdot H_2SO_4$ / Acetone to oxidise 2° alcohol to ketones.

• Jones reagents (chromic acid in aqueous acetone solution) oxidise 1° alcohol to aldehyde and 2° alcohol to ketone without affecting ($C=C$) double bond.

• MnO_2 selectively oxidises the $-OH$ group of allylic and benzylic 1° and 2° alcohols to give aldehyde and ketone respectively.

• N_2O_4 in $CHCl_3$ oxidises primary and secondary benzylic alcohol.

(d) **Self condensation : Guerbet's reaction**

(e) **Reaction with ceric ammonium nitrate :**

Ceric ammonium nitrate + $ROH \rightarrow$ Red colour solution of complex.
Yellow colour

This is analytical test for alcohols.

(f) **Iodoform test :** When a few drops of alcohol are warmed with iodine and $NaOH$ yellow precipitate of iodoform with characteristic smell is obtained. Any alcohol consists CH_3CHOH group give iodoform test.

Since reaction takes place with alkali solution as one of the reagents hence alkyl halide like CH_3-CH_2Cl and $CH_3-\underset{\substack{| \\ Cl}}{CH}-R$ will also give

this test.

(4) **Uses of monohydric alcohol :**

(i) **Uses of ethanol :** It is used

(a) In alcoholic beverages, (b) As a solvent in paints, varnishes, oils, perfumes etc., (c) In the preparation of chemical like chloroform, ether etc., (d) As a fuel in spirit lamps, (e) As an antifreeze for automobile radiators, (f) In the scientific apparatus like spirit levels, (g) As power alcohol.

(ii) **Uses of methanol :**

(a) Methanol is an important industrial starting material for preparing formaldehyde, acetic acid and other chemicals.

(b) As a fuel (a petrol substitute). A 20% mixture of methyl alcohol and gasoline is a good motor fuel.

(c) As an antifreeze or automobile radiators.

(d) To denature ethyl alcohol. The mixture is called methylated spirit.

(e) In the preparation of dyes, medicines and perfumes. Methyl salicylate and methyl anthra anilate are used in perfumery.

Table : 26.1 Difference between methanol and ethanol

Methanol	Ethanol
(i) When CH_3OH is heated on Cu coil it gives formalin like smell.	(i) It does not give formalin like smell.
(ii) When CH_3OH is heated with salicylic acid in H_2SO_4 (conc.) then methyl salicylate is formed which has odour like	(ii) No such odour is given.

Distinguish between primary, secondary and tertiary monohydric alcohols

(i) **Lucas test :** A mixture of anhydrous $ZnCl_2$ + conc. HCl is called as Lucas reagent.

Primary	$R-CH_2-OH \xrightarrow[-H_2O]{\text{conc. } HCl / ZnCl_2 \text{ anhy.}} R-CH_2-Cl \rightarrow$ ppt. appears after heating
Secondary	$R_2CH-OH \xrightarrow[-H_2O]{\text{conc. } HCl / ZnCl_2 \text{ anhy.}} R_2-CH-Cl \rightarrow$ ppt. appears with in 5 minutes
Tertiary	$R_3C-OH \xrightarrow{ZnCl_2 / HCl} R_3C-Cl \rightarrow$ ppt. appears immediately

winter green oil.

(iii) It does not give haloform or iodoform test.

(iii) It gives haloform test

Interconversion of monohydric alcohols

(i) **Primary alcohol into secondary alcohols**

(ii) **Secondary alcohol into tertiary alcohol**

(iii) **Primary alcohol into tertiary alcohol**

(iv) **Lower alcohol into higher alcohol** (ascent of series)

(v) **Higher alcohol into lower alcohol** [Descent series]

(ii) **Victor mayer test** : Also known as RBW test. RBW → Red, Blue, White test.

Primary	$C_2H_5OH \xrightarrow{P+I_2} C_2H_5I \xrightarrow{AgNO_2} C_2H_5NO_2 \xrightarrow{HONO} CH_3 - \underset{\substack{ \\ NOH}}{C} - NO_2 \xrightarrow{NaOH} CH_3 - \underset{\substack{ \\ NONa}}{C} - NO_2$ Nitrolic acid Sod. salt of nitrolic acid (Red colour)
Secondary	$(CH_3)_2CHOH \xrightarrow{P+I_2} (CH_3)_2CHI \xrightarrow{AgNO_2} (CH_3)_2 - \underset{H}{C}NO_2 \xrightarrow{HONO} (CH_3)_2 - \underset{NO}{C}NO_2 \xrightarrow{NaOH} \text{No reaction (Blue colour)}$
Tertiary	$(CH_3)_3COH \xrightarrow{P+I_2} (CH_3)_3CI \xrightarrow{AgNO_2} (CH_3)_3CNO_2 \xrightarrow{HONO} \text{No reaction (colourless)}$

Dihydric alcohols

These are compound containing two hydroxyl groups. These are dihydroxy derivatives of alkanes. Their general formula is $C_nH_{2n+2}O_2$. The simplest and most important dihydric alcohol is ethylene glycol. They are classified as α , β , γ glycols, according to the relative position of two hydroxyl groups. α is 1, 2 glycol, β is 1, 3 glycol.

(i) Preparation

(i) **From ethylene** : (a) Through cold dilute alkaline solution of Bayer's reagent

(b) With O_2 in presence of Ag :

(c) With $HOCl$ followed by hydrolysis : (Industrial method)

(ii) From 1, 2 dibromo ethane [Lab method]:

(2) Physical properties

- It is a colourless, syrupy liquid and sweet in taste. Its boiling point is $197^\circ C$.
- It is miscible in water and ethanol in all proportions but is insoluble in ether.
- It is toxic as methanol when taken orally.
- It is widely used as a solvent and as an antifreeze agent.

(3) Chemical properties

Dioxalane formation provides a path of protecting a carbonyl group in reaction studied in basic medium in which acetals are not affected. The carbonyl compound may be regenerated by the addition of periodic acid to aqueous solution of the dioxalane or by acidic hydrolysis.

Aldehyde is more reactive than ketone in dioxalane formation.

(4) Uses

- Used as an antifreeze in car radiators.
- Used in the manufacture of dacron, dioxane etc.
- As a solvent and as a preservatives.
- As a cooling agent in aeroplanes.
- As an explosives in the form of dinitrate.

Trihydric alcohols

The only important trihydric alcohol is glycerol (propane-1, 2, 3-triol). It occurs as glycosides in almost all animal and vegetable oils and fats.

(1) Preparation

(i) From oils and fats

(ii) By fermentation of sugar

(iii) From propene [Modern method]

(iv) From propenal:

(2) Physical properties

- It is a colourless, odourless, viscous and hygroscopic liquid.
- It has high boiling point i.e., 290°C. The high viscosity and high boiling point of glycerol are due to association through hydrogen bonding.
- It is soluble in water and ethyl alcohol but insoluble in ether.
- It is sweet in taste and non toxic in nature.

(3) Chemical properties

(i) Reaction with sodium

(ii) Reaction with PCl₅, PBr₃ and PI₃

(iii) Reaction with HCl or HBr

(iv) Reaction with HI

(v) Reaction with oxalic acid

- At 110°C Glycerol is formed

(b) At 260°C , allyl alcohol is formed

(vi) **Dehydration**

(vii) **Oxidation**

(viii) **Reaction with nitric acid**

Dynamite is prepared from T.N.G.

Dynamite : A mixture of T.N.G. and glyceryl dinitrate absorbed in kieselguhr is called dynamite. It was discovered by Alfred. Nobel in 1867. It releases large volume of gases and occupy 10,900 times the volume of nitroglycerine.

Blasting gelatin : A mixture of glyceryl trinitrate and cellulose nitrate (gun cotton).

Cordite : It is obtained by mixing glyceryl trinitrate with gun cotton and vaseline it is smokeless explosive.

(4) **Uses**

(a) As antifreeze in automobile radiator.

(b) In the preparation of good quality of soap-hand lotions shaving creams and tooth pastes.

(c) As a lubricant in watches.

(d) As a preservatives.

(e) As a sweetening agent in confectionary, beverages and medicines being non toxic in nature.

(f) In manufacture of explosives such as dynamite.

(5) **Analytical tests of glycerol**

(i) **Acrolein test** : When glycerol is heated with KHSO_4 a very offensive smell is produced due to formation of acrolein. Its aqueous solution restores the colour of schiff's reagent and reduces Fehling solution and Tollen's reagent.

(ii) **Dunstan's test** : A drop of phenolphthalein is added approximately 5 ml of borax solution. The pink colour appears on adding 2-3 drops of glycerol, pink colour disappears. The pink colour appears on heating and disappears on cooling again.

Unsaturated alcohols (Allyl alcohol)

(1) **Preparation**

(i) **From allyl halide**

(ii) **By heating glycerol with oxalic acid** :

(2) **Physical properties**

(a) It is colourless, pungent smelling liquid.

(b) It is soluble in water, alcohol and ether in all proportion.

(3) **Chemical properties**

(iii) *From Grignard reagent*

(iv) *From salicylic acid :*

Salicylic acid (V) **Middle oil of coal tar distillation**: ^{phenol} Middle oil of coal-tar distillation has naphthalene and phenolic compounds. Phenolic compounds are isolated in following steps.

Step 1 : Middle oil is washed with H_2SO_4 . It dissolves basic impurities like pyridine (base).

Step II: Excessive cooling separates naphthalene (a low melting solid)

Step III : Filtrate of step II is treated with aqueous *NaOH* when phenols dissolve as phenoxides. Carbon dioxide is then blown through the solution to liberate phenols.

Step IV : Crude phenol (of step III) is subjected to fractional distillation.

(vi) *Raschig's process*

(vii) *Dow process*

sodium phenoxide on treatment with mineral acid yields phenol.

(viii) ***Oxidation of benzene***

(ix) ***Oxidation of isopropyl benzene*** [Cumene]

Phenol (Carbolic acid), C_6H_5OH or Hydroxy benzene

It was discovered by Runge in the middle oil fraction of coal-tar distillation and named it 'carbolic acid' (carbo = coal, oleum = oil) or phenol containing 5% water is liquid at room temperature and is termed as carbolic acid. It is also present in traces in human urine.

(1) Preparation

(i) *From benzene sulphonic acid*

This is one of the laboratory methods for the preparation of phenol. Similarly methyl phenols (cresols) can be prepared.

(ii) ***From benzene diazonium chloride***

❑ *Diazonium salts are obtained from aniline and its derivatives by a process called **diazotisation**.*

(2) Physical properties

(i) Phenol is a colourless crystalline, deliquescent solid. It attains pink colour on exposure to air and light.

(ii) They are capable of forming intermolecular *H*-bonding among themselves and with water. Thus, they have high boiling points and they are soluble in water.

(crossed intermolecular *H*-bonding between water and phenol molecules)

Due to intermolecular *H*-bonding and high dipole moment, melting points and boiling points of phenol are much higher than that of hydrocarbon of comparable molecular weights.

(iii) It has a peculiar characteristic smell and a strong corrosive action on skin.

(iv) It is sparingly soluble in water but readily soluble in organic solvents such as alcohol, benzene and ether.

(v) It is poisonous in nature but acts as antiseptic and disinfectant.

(3) Chemical properties

(i) **Acidic nature** : Phenol is a weak acid. The acidic nature of phenol is due to the formation of stable phenoxide ion in solution.

The phenoxide ion is stable due to resonance.

The negative charge is spread throughout the benzene ring. This charge delocalisation is a stabilising factor in the phenoxide ion and increase acidity of phenol. [No resonance is possible in alkoxide ions (*RO*) derived from alcohols. The negative charge is localised on oxygen atom. Thus alcohols are not acidic].

☐ Phenols are much more acidic than alcohols but less so than carboxylic acids or even carbonic acid. This is indicated by the values of ionisation constants. The relative acidity follows the following order

Effects of substituents on the acidity of phenols : Presence of electron attracting group, (e.g., $-NO_2$, $-X$, $-NR_3^+$, $-CN$, $-CHO$, $-COOH$) on the benzene ring increases the acidity of phenol as it enables the

ring to draw more electrons from the phenoxy oxygen and thus releasing easily the proton. Further, the particular effect is more when the substituent is present on *o*- or *p*-position than in *m*-position to the phenolic group.

The relative strengths of some phenols (as acids) are as follows :

p-Nitrophenol > *o*-Nitrophenol > *m*-Nitrophenol > Phenol

Presence of electron releasing group, (e.g., $-CH_3$, $-C_2H_5$, $-OCH_3$, $-NR_2$) on the benzene ring decreases the acidity of phenol as it strengthens the negative charge on phenoxy oxygen and thus proton release becomes difficult. Thus, cresols are less acidic than phenol.

However, *m*-methoxy and *m*-aminophenols are stronger acids than phenol because of $-I$ effect and absence of $+R$ effect.

m-methoxy phenol > *m*-amino phenol > phenol > *o*-methoxy phenol > *p*-methoxy phenol

Chloro phenols : *o* > *m* > *p*-

Cresols : *m* > *p* > *o*-

Dihydric phenol : *m* > *p* > *o*-

The acidic nature of phenol is observed in the following :

(a) Phenol changes blue litmus to red.

(b) Highly electropositive metals react with phenol.

$$2C_6H_5OH + 2Na \rightarrow 2C_6H_5ONa + H_2$$

(c) Phenol reacts with strong alkalis to form phenoxides.

$$C_6H_5OH + NaOH \rightarrow C_6H_5ONa + H_2O$$

However, phenol does not decompose sodium carbonate or sodium bicarbonate, i.e., CO_2 is not evolved because phenol is weaker than carbonic acid.

(ii) Reactions of $-OH$ group

(a) **Reaction with $FeCl_3$** : Phenol gives violet colouration with ferric chloride solution (neutral) due to the formation of a coloured iron complex, which is a characteristic to the existence of keto-enol tautomerism in phenols (predominantly enolic form).

This is the test of phenol.

(b) **Ether formation** : Phenol reacts with alkyl halides in alkali solution to form phenyl ethers (Williamson's synthesis). The phenoxide ion is a nucleophile and will replace halogenation of alkyl halide.

Ethers are also formed when vapours of phenol and an alcohol are heated over thoria (ThO_2) or Al_2O_3 .

(c) **Ester formation** : Phenol reacts with acid chlorides (or acid anhydrides) in alkali solution to form phenylesters (Acylation). This reaction (Benzoylation) is called **Schotten-Baumann** reaction.

The phenyl esters on treatment with anhydrous $AlCl_3$ undergoes **Fries rearrangement** to give *o*- and *p*-hydroxy ketones.

(d) **Reaction with PCl_5** : Phenol reacts with PCl_5 to form chlorobenzene. The yield of chlorobenzene is poor and mainly triphenyl phosphate is formed.

(e) **Reaction with zinc dust** : When phenol is distilled with zinc dust, benzene is obtained.

(f) **Reaction with ammonia** : Phenol reacts with ammonia in presence of anhydrous zinc chloride at $300^\circ C$ or $(NH_4)_2SO_3 / NH_3$ at $150^\circ C$ to form aniline. This conversion of phenol into aniline is called **Bucherer reaction**.

(g) **Action of PS_5** : By heating phenol with phosphorus penta sulphide, thiophenols are formed.

(iii) **Reactions of benzene nucleus** : The $-OH$ group is *ortho* and *para* directing. It activates the benzene nucleus.

(a) **Halogenation** : Phenol reacts with bromine in carbon disulphide (or $CHCl_3$) at low temperature to form mixture of *ortho* and *para* bromophenol.

Phenol forms a white precipitate with excess of bromine water yielding 2, 4, 6-tribromophenol.

(b) **Sulphonation** : Phenol reacts with conc. H_2SO_4 readily to form mixture of *ortho* and *para* hydroxy benzene sulphonic acids.

At low temperature ($25^\circ C$), the *ortho*-isomer is the major product, whereas at $100^\circ C$, it gives mainly the *para*-isomer.

(c) **Nitration** : Phenol reacts with dilute nitric acid at $5-10^\circ C$ to form *ortho* and *para* nitro phenols, but the yield is poor due to oxidation of phenolic group. The $-OH$ group is activating group, hence nitration is possible with dilute nitric acid.

It is believed that the mechanism of the above reaction involves the formation of *o*- and *p*-nitroso phenol with nitrous acid, HNO_2 ($NaNO_2 + HCl$) at $0-5^\circ C$, which gets oxidised to *o*- and *p*-nitrophenol with dilute nitric acid.

However, when phenol is treated with concentrated HNO_3 in presence of concentrated H_2SO_4 , 2,4,6-trinitrophenol (Picric acid) is formed.

To get better yield of picric acid, first sulphonation of phenol is made and then nitrated. Presence of $-SO_3H$ group prevents oxidation of phenol.

(d) **Friedel-Craft's reaction** : Phenol when treated with methyl chloride in presence of anhydrous aluminium chloride, *p*-cresol is the main product. A very small amount of *o*-cresol is also formed.

RX and AlCl_3 give poor yields because AlCl_3 coordinates with O . So Ring alkylation takes place as follows,

Thus to carry out successful Friedel-Craft's reaction with phenol it is necessary to use a large amount of AlCl_3 . The **Ring alkylation** takes place as follows :

(e) **Kolbe-Schmidt reaction** (Carbonation) : hydroxy acetophenone

(f) **Reimer-Tiemann reaction** : Phenol, reacting with chloroform and sodium hydroxide (aq.) followed by acid hydrolysis yields salicylaldehyde (Oil of winter green).

(*o*-hydroxy benzaldehyde) and a very small amount of *p*-hydroxy benzaldehyde. However, when carbon tetrachloride is used, salicylic acid (predominating product) is formed.

(g) **Gattermann's reaction** : Phenol, when treated with liquid hydrogen cyanide and hydrochloric acid gas in presence of anhydrous aluminium chloride yields mainly *p*-hydroxy benzaldehyde (Formylation).

(h) **Mercuration**

(i) **Hydrogenation**

(iv) **Miscellaneous reactions**

(a) **Coupling reactions** : Phenol couples with benzene diazonium chloride in presence of an alkaline solution to form a red dye (*p*-hydroxy azobenzene).

Phenol couples with phthalic anhydride in presence of concentrated H_2SO_4 to form a dye, (phenolphthalein) used as an indicator.

(b) **Condensation with formaldehyde** Phenol condenses with formaldehyde (excess) in presence of sodium hydroxide or acid (H^+) for about a week to form a polymer known as bakelite (a resin).

(c) **Liebermann's nitroso reaction** When phenol is reacted with $NaNO_2$ and concentrated H_2SO_4 , it gives a deep green or blue colour which changes to red on dilution with water. When made alkaline with $NaOH$ original green or blue colour is restored. This reaction is known as Liebermann's nitroso reaction and is used as a test of phenol.

(d) **Oxidation** : Phenol turns pink or red or brown on exposure to air and light due to slow oxidation. The colour is probably due to the formation of quinone and phenoquinone.

But on oxidation with potassium persulphate in alkaline solution, phenol forms 1, 4-dihydroxy benzene (Quinol). This is known as Elbs persulphate oxidation.

(4) **Uses** : Phenol is extensively used in industry. The important applications of phenol are

- As an antiseptic in soaps, lotions and ointments. A powerful antiseptic is "Dettol" which is a phenol derivative (2, 4-dichloro-3, 5-dimethyl phenol).
- In the manufacture of azo dyes, phenolphthalein, etc.
- In the preparation of picric acid used as an explosive and for dyeing silk and wool.
- In the manufacture of cyclohexanol required for the production of nylon and used as a solvent for rubber and lacquers.
- As a preservative for ink.
- In the manufacture of phenol-formaldehyde plastics such as bakelite.
- In the manufacture of drugs like aspirin, salol, phenacetin, etc.
- For cauterising wounds caused by the bite of mad dogs.
- As a starting material for the manufacture of nylon and artificial tannins.
- In the preparation of disinfectants, fungicides and bactericides.

(5) Tests of phenol

- Aqueous solution of phenol gives a violet colouration with a drop of ferric chloride.
- Aqueous solution of phenol gives a white precipitate of 2, 4, 6-tribromophenol with bromine water.
- Phenol gives **Liebermann's nitroso reaction**.

(iv) Phenol combines with phthalic anhydride in presence of conc. H_2SO_4 to form phenolphthalein which gives pink colour with alkali, and used as an indicator.

(v) With ammonia and sodium hypochlorite, phenol gives blue colour.

Table : 26.2 Difference between phenol and alcohol

Property	Phenol (C_6H_5OH)	Alcohol (C_2H_5OH)
Odour	Typical phenolic odour	Pleasant alcoholic odour
Nature, reaction with alkali	Acidic, dissolves in sodium hydroxide forming sodium phenoxide.	Neutral, no reaction with alkalis.
Reaction with neutral $FeCl_3$	Gives violet colouration due to formation of complex compound.	No reaction.
Reaction with halogen acids	No reaction with halogen acids.	Forms ethyl halides.
Oxidation	Pink or brown colour due to formation of quinone and phenoquinone.	Undergoes oxidation to give acetaldehyde and acetic acid.
Reaction with $HCHO$	Forms polymer (bakelite).	No reaction.
Liebermann's nitroso reaction	Positive.	Does not show.
Coupling with benzene diazonium chloride	Forms azo dye.	Does not form any dye.
Reaction with PCl_5	Mainly forms triphenyl phosphate.	Forms ethyl chloride
Iodoform test	Does not show.	Positive.

Derivatives of phenol

NITROPHENOLS

(i) Preparation

(2) **Properties** : *o*-Nitrophenol is a yellow coloured crystalline compound, while *m*- and *p*-isomers are colourless crystalline compounds.

Isomer	<i>ortho</i>	<i>meta</i>	<i>para</i>
mpt. ($^\circ C$)	45	97	114

The lowest melting point of *o*-isomer is due to **intramolecular hydrogen bonding** whereas *meta* and *para* isomers possess **intermolecular hydrogen bonding** and thus, they have higher melting points.

They are stronger acids than phenol. The order is :

p-isomer > *o*-isomer > *m*-isomer > phenol

When reduced, they form corresponding aminophenols. *o*- and *p*-Nitrophenols react with bromine water to form 2, 4, 6-tribromophenol by replacement of nitro group.

Picric acid (2, 4, 6-trinitrophenol)

(i) **Preparation** : It is obtained when phenol is treated with conc. HNO_3 . However, the yield is very poor. It is prepared on an industrial scale :

(i) From chlorobenzene

(ii) From phenol through disulphonic acid

(2) **Properties** : It is a yellow crystalline solid, melting points 122°C . It is insoluble in cold water but soluble in hot water and in ether. It is bitter in taste. Due to the presence of three electronegative nitro groups, it is a stronger acid than phenol and its properties are comparable to the carboxylic acid. It neutralises alkalis and decomposes carbonates with evolution of carbon dioxide.

Dry picric acid as well as its potassium or ammonium salts explode violently when detonated. It reacts with PCl_5 to form picryl chloride which on shaking with NH_3 yields picramide.

When distilled with a paste of bleaching powder, it gets decomposed and yields chloropicrin, CCl_3NO_2 , as one of the products and is thus employed for the manufacture of tear gas.

It forms yellow, orange or red coloured molecular compounds called picrates with aromatic hydrocarbons, amines and phenols which are used for characterisation of these compounds.

❑ *Picrates are explosive in nature and explode violently when heated. These are prepared carefully.*

(3) **Uses** : It is used as a yellow dye for silk and wool, as an explosive and as an antiseptic in treatment of burns.

Catechol (1, 2-Dihydroxy benzene)

(i) Preparation

(2) **Properties** : It is a colourless crystalline solid, melting points 105°C . It is soluble in water. It is affected on exposure to air and light. It acts as a reducing agent as it reduces Tollen's reagent in cold and Fehling's solution on heating. With silver oxide it is oxidised to α -benzoquinone.

It forms insoluble lead salt (white ppt.) when treated with lead acetate solution and gives green colour with FeCl_3 which changes to red on adding Na_2CO_3 solution. It forms alizarin dye stuff when condensed with phthalic anhydride in the presence of sulphuric acid.

(3) **Uses** : It finds use as photographic developer, in the manufacture of alizarin and adrenaline hormone and as an antioxidant (inhibitor in auto oxidation) for preserving gasoline.

Resorcinol (1, 3-Dihydroxy benzene)

(1) **Preparation** : It is prepared by alkali fusion of 1,3, benzene disulphonic acid (Industrial method).

(2) **Properties** : It is a colourless crystalline solid, melting points 110°C . It is affected on exposure by air and light. It is soluble in water, alcohol and ether. It shows tautomerism. Its aqueous solution gives violet colour with FeCl_3 . It reduces Fehling's solution and Tollen's reagent on warming.

With bromine water, it gives a crystalline precipitate, 2, 4, 6-tribromoresorcinol.

On nitration, it forms 2, 4, 6-trinitro-1, 3-dihydroxybenzene.

It condenses with phthalic anhydride and forms fluorescein.

With nitrous acid, it forms 2, 4-dinitrosoresorcinol

Resorcinol behaves as a tautomeric compound. This is shown by the fact that it forms a dioxime and a bisulphite derivative.

- It is used as an antiseptic and for making dyes.
- It is also used in the treatment of eczema. 2, 4, 6-trinitrosoresorcinol is used as an explosive.

Hydroquinone or quinol (1, 4-Dihydroxy benzene)

(1) **Preparation** : It is formed by reduction of *p*-benzoquinone with sulphurous acid ($H_2SO_3 = H_2O + SO_2$).

(2) **Properties** : It is a colourless crystalline solid, melting points $170^\circ C$. it is soluble in water. It also shows tautomerism. It gives blue colour with $FeCl_3$ solution.

It acts as a powerful reducing agent as it is easily oxidised to *p*-benzoquinone. It reduces Tollen's reagent and Fehling's solution.

Due to this property, it is used as photographic developer.

(3) **Uses** : It is used as an antiseptic, developer in photography, in the preparation of quinhydrone electrode and as an antioxidant.

Trihydric Phenols : Three trihydroxy isomeric derivatives of benzene are **Pyrogallol** (1, 2, 3), hydroxy quinol (1, 2, 4) and phloroglucinol (1, 3, 5).

Pyrogallol is obtained by heating aqueous solution of gallic acid at $220^\circ C$.

Phloroglucinol is obtained from trinitrotoluene (TNT) by following sequence of reactions.

Hydroxyquinol is prepared by the alkaline fusion of hydroquinone in air.

The three isomers are colourless crystalline compounds. All are soluble in water and their aqueous solutions give characteristic colour with $FeCl_3$ (Red, brown or bluish violet). Alkaline solutions absorb oxygen rapidly from air.

Uses of pyrogallol

- As a developer in photography.
- As a hair dye.
- In treatment of skin diseases like eczema.
- For absorbing unreacted oxygen in gas analysis.

Ether

Ethers are anhydride of alcohols, they may be obtained by elimination of a water molecule from two alcohol molecules.

General formula is $C_n H_{2n+2} O$

General methods of preparation of ethers

(1) **From alkyl halides**

(i) **Williamson's synthesis**

It is a nucleophilic substitution reaction and proceed through S_N2 mechanism.

(a) Order of reactivity of primary halide is $\text{CH}_3\text{X} > \text{CH}_3\text{CH}_2\text{X} > \text{CH}_3\text{CH}_2\text{CH}_2\text{X}$.

(b) Tendency of alkyl halide to undergo elimination is $3^\circ > 2^\circ > 1^\circ$.

(c) For better yield alkyl halide should be primary and alkoxide should be secondary or tertiary.

(d) Secondary and tertiary alkyl halides readily undergo E_2 elimination in the presence of a strong base to form alkenes.

□ Aryl halide and sodium alkoxide cannot be used for preparing phenolic ethers because aryl halide are less reactive toward nucleophilic substitution reaction than alkyl halides.

(ii) By heating alkyl halide with dry silver oxide

(2) From alcohols

(i) By dehydration of alcohols

(a) With conc. H_2SO_4 at 140°C

□ In this reaction alcohol must be present in excess.

□ This reaction is mainly applicable for the dehydration of primary alcohols. Secondary and tertiary alcohols form alkenes mainly.

□ When this reaction is carried out between different alcohols then there is a mixture of different ethers is obtained.

(b) With Al_2O_3 at 250°C :

(ii) By the action of diazomethane on alcohols: This reaction is in presence of catalyst, boron trifluoride or HBF_4 .

(a) This method is very useful for preparing mixed ethers.

(b) In higher cases, there can be 1, 2-hydride or 1, 2-methyl shift to form more stable carbonium ion.

(3) Alkoxy mercuriation-demercuration

□ This is the best method for the preparation of t-ethers.

(4) Reaction of lower halogenated ether with grignard reagent

(i) Higher members can be prepared by the action of grignard reagent on lower halogenated ethers.

(ii) Ether form soluble coordinated complexes with grignard reagent.

Physical properties

(1) **Physical state**: Methoxy methane and methoxy ethane are gases while other members are volatile liquid with pleasant smell.

(2) **Dipole moment (D.M.)**: Bond angle of ether is due to sp^3 hybridisation of oxygen atom. Since $\text{C}-\text{O}$ bond is a polar bond, hence ether possess a net dipole moment, even if they are symmetrical. Dipole moment of dimethyl ether is 1.3 D and dipole moment of diethyl ether is 1.18 D.

□ The larger bond angle may be because of greater repulsive interaction between bulkier alkyl groups as compared to smaller H-atoms in water.

(3) **Boiling points**: Boiling points of ethers are much lower than those of isomeric alcohols, but closer to alkanes having comparable mass. This is due to the absence of hydrogen bonding in ethers.

(4) **Solubility**: Solubilities of ethers in water are comparable with those of alcohols.

Example: Diethyl ether and n-butyl alcohol have approximately the same solubility in water. This is because, ether form hydrogen bond with water much in the same way as alcohol do with water.

□ Solubility of ether in water decreases with the size of alkyl groups.

(5) **Hydrogen bonding**: There is no hydrogen directly attached (bonded) to oxygen in ethers, so ethers do not show any intermolecular hydrogen bonding.

(6) **Density**: Ethers are lighter than water.

Chemical properties: Ethers are quite stable compounds. These are not easily attacked by alkalis, dilute mineral acids, active metals, reducing agents or oxidising agents under ordinary conditions.

(1) Reaction due to alkyl group

(i) **Halogenation**:

(ii) **Burning**: Ethers are highly inflammable. They burn like alkanes.

(2) Reaction due to ethereal oxygen

(i) **Peroxide formation**:

(a) The boiling point of peroxide is higher than that of ether. It is left as residue in the distillation of ether and may cause explosion. Therefore ether may never be evaporated to dryness.

(b) Absolute ether can be prepared by distillation of ordinary ether from conc. H_2SO_4 and subsequent storing over metallic sodium.

❑ Formation of peroxide can be prevented by adding small amount of Cu_2O to ether.

❑ With strong oxidising agent like acid, dichromate ethers are oxidised to aldehydes.

❑ The presence of peroxide can be indicated by the formation of blood red colour complex in the following reaction.

(ii) Oxidation with $K_2Cr_2O_7/H^+$

(a) Oxidation of ether can only be possible if any one of the alkyl groups of ether has hydrogen on α -carbon.

(b) α -carbon having two hydrogens converts in carboxylic group and α -carbon having only one hydrogen converts into keto group.

(iii) **Salt formation** : Due to lone pair of electrons on oxygen atom. Ether behaves as Lewis base and form stable oxonium salt with strong inorganic acids at low temperature.

The oxonium salts are soluble in acid solution and ethers can be recovered from the oxonium salts by treatment with water.

❑ The formation of oxonium salt is similar to the formation of ammonium salts from ammonia and acids.

❑ Ether is removed from alkyl halides by shaking with conc. H_2SO_4 .

❑ Ethers can be distinguished from alkanes with the help of this reaction.

(iv) **Reaction with Lewis acids** : Being Lewis bases, ethers form complexes with Lewis acids such as BF_3 , $AlCl_3$, $FeCl_3$, etc. These complexes are called **etherates**.

Similarly, diethyl ether reacts with Grignard reagent forming Grignard reagent etherate.

Due to the formation of the etherate, Grignard reagents dissolve in ether. That is why Grignard reagents are usually prepared in ethers. However, they cannot be prepared in benzene, because benzene has no lone pair of electrons and therefore, cannot form complexes with them.

(3) Reaction involving cleavage of carbon-oxygen bond

(i) Hydrolysis

(a) With dil. H_2SO_4 : $ROR + H_2O \xrightarrow{H_2SO_4} 2ROH$

(b) With conc. H_2SO_4 :

(ii) Action of hydroiodic acid

(a) With cold HI

(b) With hot HI

(iii) **Zeisel method** : $RI + AgNO_3(\text{alc.}) \rightarrow AgI \downarrow + RNO_3$

❑ The silver iodide thus form can be detected and estimated. This is the basis of Zeisel method for the detection and estimation of alkoxy group in a compound.

(iv) Action of PCl_5

$R-O-R + PCl_5 \xrightarrow{\text{heat}} 2RCl + POCl_3$. There is no reaction in cold.

(v) Reaction with acetyl chloride

(vi) Reaction with acid anhydride

(vii) **Dehydration**(viii) **Reaction with carbon mono oxide**(ix) **Action of bases**

(4) **Ring substitution in aromatic ethers** : Alkoxy group is *ortho* and *para* directing and it directs the incoming groups to *ortho* and *para* position. It activates the aromatic ring towards electrophilic substitution reaction.

III, IV and V show high electron density at *ortho* and *para* position.

(i) **Halogenation** : Phenyl alkyl ethers undergo usual halogenation in benzene ring.

For example, Bromination of anisole gives *ortho* and *para* bromo derivative even in the absence of iron (III) bromide catalyst.

(ii) **Friedel craft reaction**(iii) **Nitration**

☐ Ethers are relatively less reactive than phenol towards electrophilic substitution reaction.

Tips & Tricks

✍ Methyl alcohol (CH_3OH) is called wood spirit. It is obtained by destructive distillation of wood. Drinking of methanol causes blindness.

✍ Ethyl alcohol ($\text{C}_2\text{H}_5\text{OH}$) is called grain alcohol. It is used in preparation of various beverages by using different percentages.

✍ An alcohol-water mixture containing 57.1% alcohol by volume or 49.3% by weight is called proof spirit.

✍ Ethyl alcohol containing 5 to 10% methyl alcohol is called methylated spirit. It is unfit for drinking purpose. Widespread deaths due to liquor poisoning occur mainly due to the presence of methyl alcohol. It is also called denatured spirit. Denaturing can also be done by adding 0.5% pyridine, petroleum naphtha, rubber distillate (caoutchoucine) or CuSO_4 .

✍ Pyrolygneous acid contains acetic acid (10%), methyl alcohol (2.5%) and acetone (0.5%).

✍ Fusel oil is a mixture of *n*-propyl alcohol, *n*-butyl alcohol, *n*-amyl alcohol and isoamyl alcohol.

✍ Tincture of iodine is 2-3% alcoholic solution of iodine.

✍ In the esterification reaction, the water formed is removed by Dean and stark apparatus. It should be noted that bulkier the acid or alcohol, slower is the rate (due to steric hinderance). Decreasing order of rate of reaction of different alcohols and acids is $\text{CH}_3\text{OH} > \text{C}_2\text{H}_5\text{OH} > (\text{CH}_3)_2\text{CHOH} > (\text{CH}_3)_3\text{COH}$

$\text{HCOOH} > \text{CH}_3\text{COOH} > (\text{CH}_3)_2\text{CHCOOH} > (\text{CH}_3)_3\text{CCOOH}$.

✍ **Pinacol-pinacolone rearrangement** : The reaction involves dehydration of diols through the formation of carbocation intermediate which rearranges to more stable compound.

✍ In general, acid strength increases as Cresols $\ll$ Phenol $\ll$ *p*-chlorophenol $\ll$ *m*-Nitrophenol $\ll$ *o*-Nitrophenol $<$ *p*-Nitrophenol $\ll$ Picric acid.

✍ Glyceryl trinitrate is an inorganic ester.

✍ Glyceryl trinitrate is colourless, oily liquid insoluble in water and is called Nobel's oil. Nobel's oil is also used in the treatment of angina pectoris and asthma.

✍ Ether peroxide formation is prevented by adding a little Cu_2O to it.

✍ Di-isopropyl ether is used in the petrol as an antiknock compound.

✍ The mixture of alcohol and ether is used as a substitute for petrol under the trade name natelite.

✍ Ethers form soluble co-ordination complexes with Grignard's reagent i.e., why Grignard reagent is usually prepared in ether.

✍ Thio alcohols are known as mercaptans.

Ordinary Thinking

Objective Questions

General introduction of alcohol, Phenol & Ethers

- Butane-2-ol is [CPMT 1977, 89]
 - Primary alcohol
 - Secondary alcohol
 - Tertiary alcohol
 - Aldehyde
- Picric acid is [CPMT 1971, 80, 81; DPMT 1983; MP PMT 1990; BHU 1996]
 - Trinitroaniline
 - Trinitrotoluene
 - A volatile liquid
 - 2, 4, 6 trinitrophenol
- 3-pentanol is a [RPET 2002]
 - Primary alcohol
 - Secondary alcohol
 - Tertiary alcohol
 - None of these
- Glycerol is a [DPMT 1984, 2000; MP PET 2001; J & K 2005]
 - Primary alcohol
 - Monohydric alcohol
 - Secondary alcohol
 - Trihydric alcohol
- Cresols are
 - Hydroxy toluenes
 - Dihydric phenols
 - Trihydric phenols
 - Trihydric alcohols
- Carbon percentage is maximum in [BHU 1998]
 - Pyrene
 - Gammexane
 - Ethylene glycol
 - PVC
- Ortho-dihydroxy benzene is
 - Carvacrol
 - Resorcinol
 - Catechol
 - Orcinol
- Glycerine has [MP PMT/PET 1988; MP PMT 1989, 91; AIIMS 1997]
 - One primary and two secondary $-OH$ groups
 - One secondary and two primary $-OH$ groups
 - Three primary $-OH$ groups
 - Three secondary $-OH$ groups
- Which of the following is tertiary alcohol [DPMT 2000]
 - $$\begin{array}{c} CH_2 - OH \\ | \\ CH - OH \\ | \\ CH_2 - OH \end{array}$$
 - $$\begin{array}{c} CH_2 \\ | \\ CH_3 - CH_2 - CH_2OH \\ | \\ CH_2 \\ | \\ CH_3 \end{array}$$
 - $$\begin{array}{c} CH_3 \\ | \\ CH_3 - C - OH \\ | \\ CH_3 \end{array}$$
 - $$CH_3 - CH_2 - OH$$
- Which is primary alcohol [CPMT 1980]
 - Butane-2-ol
 - Butane-1-ol
 - Propane-2-ol
 - Isopropyl alcohol
- Carbinol is [RPMT 2000]
 - C_2H_5OH
 - CH_3OH
 - $(CH_3)_2CHOH$
 - $CH_3CH_2CH(OH)CH_3$
- General formula of primary alcohol [CPMT 1975]
 - $>CHOH$
 - $\geq C - OH$

- Which of following is phenolic [J & K 2005]
 - Phthalic acid
 - Phosphoric acid
 - Picric acid
 - Phenylacetic acid
- 1, 2, 3-trihydroxybenzene is also known as
 - Pyrogallol
 - Phloroglucinol
 - Resorcinol
 - Quinol
- Butanal is an example of [MP PET 1991]
 - Primary alcohol
 - Secondary alcohol
 - Aliphatic aldehyde
 - Aliphatic ketone
- Cyclohexanol is a
 - Primary alcohol
 - Secondary alcohol
 - Tertiary alcohol
 - Phenol
- The characteristic grouping of secondary alcohols is [DPMT 1984]
 - $-CH_2OH$
 - $>CHOH$
 - $\begin{array}{c} | \\ -C-OH \\ | \end{array}$
 - $\begin{array}{c} OH \\ >C \\ \searrow \\ OH \end{array}$
- Which of the following are isomers [AFMC 2005; BCECE 2005]
 - Methyl alcohol and dimethyl ether
 - Ethyl alcohol and dimethyl ether
 - Acetone and acetaldehyde
 - Propionic acid and propanone
- The compound $HOCH_2 - CH_2OH$ is
 - Ethane glycol
 - Ethylene glycol
 - Ethylidene alcohol
 - Dimethyl alcohol
- Methylated spirit is
 - Methanol
 - Methanol + ethanol
 - Methanoic acid
 - Methanamide
- The structural formula of cyclohexanol is [Bihar CEE 1995]
 - 
 - 
 - 
 - 
- Molecular formula of amyl alcohol is
 - $C_7H_{14}O$
 - $C_6H_{13}O$
 - $C_5H_{12}O$
 - $C_5H_{10}O$
- Carbolic acid is [MP PET/PMT 1998; RPET 1999; KCET (Engg./Med.) 1999; BHU 2000; MP PET 2003]
 - Phenol
 - Phenyl benzoate
 - Phenyl acetate
 - Salol
- Absolute alcohol is [RPMT 1997]
 - 100% pure ethanol
 - 95% alcohol + 5% H_2O
 - Ethanol + water + phenol

- (d) 95% ethanol + 5% methanol
25. Which of the following is dihydric alcohol [DCE 2004]
(a) Glycerol (b) Ethylene glycol
(c) Catechol (d) Resorcinol
26. Wood spirit is known as [AFMC 2004]
(a) Methanol (b) Ethanol
(c) Acetone (d) Benzene
27. Oxygen atom in ether is [MP PMT/PET 1988]
(a) Very active (b) Replaceable
(c) Comparatively inert (d) Active
28. Which of the following is a simple ether [AFMC 1997]
(a) CH_3OCH_3 (b) $C_2H_5OCH_3$
(c) $C_6H_5OCH_3$ (d) $C_6H_5OC_2H_5$
29. An example of a compound with the functional group '-O-' is [CPMT 1983]
(a) Acetic acid (b) Methyl alcohol
(c) Diethyl ether (d) Acetone
30. Which of the following do not contain an acyl group
(a) Acid chloride (b) Amide
(c) Ester (d) Ether
31. Name of $(CH_3)_2HC-O-CH_2-CH_2-CH_3$ is [MP PMT 1992]
(a) Isopropyl propyl ether (b) Dipropyl ether
(c) Di-isopropyl ether (d) Isopropyl propyl ketone
32. Acetals are [BVP 2003]
(a) Ketones (b) Diethers
(c) Aldehyde (d) Hydroxy aldehydes
33. In ethers, the C-O-C bond angle is
(a) 180° (b) 90°
(c) 110° (d) 160°
34. According to Lewis concept of acids and bases, ether is [CPMT 1994]
(a) Acidic (b) Basic
(c) Neutral (d) Amphoteric
35. The compound which is not isomeric with diethyl ether is [IIT 1981; CPMT 1989; Bihar MEE 1995; MP PET 2001]
(a) *n*-propylmethyl ether (b) Butan-1-ol
(c) 2-methylpropan-2-ol (d) Butanone
36. Structure of diethyl ether is confirmed by [DPMT 1985]
(a) Kolbe's synthesis (b) Frankland's synthesis
(c) Wurtz's synthesis (d) Williamson's synthesis
37. Fermentation is an [CPMT 1977; RPMT 1999]
(a) Endothermic reaction (b) Exothermic reaction
(c) Reversible reaction (d) None of these
38. Nitroglycerine is
(a) An ester (b) An alcohol
(c) A nitro compound (d) An acid
39. Which of the following are known as mercaptans [Pb. PMT 2002]
(a) Thio-alcohols (b) Thio-ethers
(c) Thio-acids (d) Thio-aldehydes
- (a) Permanganate oxidation
(b) Catalytic reduction
(c) Absorbing in H_2SO_4 followed by hydrolysis
(d) Fermentation
3. Propene, $CH_3-CH=CH_2$ can be converted to 1-propanol by oxidation. Which set of reagents among the following is ideal to effect the conversion [CBSE PMT 1991]
(a) Alkaline $KMnO_4$
(b) B_2H_6 and alkaline H_2O_2
(c) O_3 / Zn dust
(d) $OsO_4 / CH_4, Cl_2$
4. Which one of the following will produce a primary alcohol by reacting with CH_3MgI [MP PET 1991]
(a) Acetone (b) Methyl cyanide
(c) Ethylene oxide (d) Ethyl acetate
5. The fermentation of starch to give alcohol occurs mainly with the help of [CPMT 1971; MH CET 1999; RPMT 2000]
(a) O_2 (b) Air
(c) CO_2 (d) Enzymes
6. Coconut oil upon alkaline hydrolysis gives [MP PET 1991; AFMC 2000; KCET 2001; BCECE 2005]
(a) Glycol (b) Alcohol
(c) Glycerol (d) Ethylene oxide
7. Which enzyme converts glucose and fructose both into ethanol [MP PMT 1989, 90, 96; CPMT 1983, 84, 86, 94; KCET 1989; MNR 1978; MP PET 1994, 99]
(a) Diastase (b) Invertase
(c) Zymase (d) Maltase
8. Chlorination of toluene in the presence of light and heat followed by treatment with aqueous $NaOH$ gives [IIT-JEE 1990]
(a) *o*-cresol (b) *p*-cresol
(c) 2, 4-dihydroxy toluene (d) Benzyl alcohol
9. In the commercial manufacture of ethyl alcohol from starchy substances by fermentation method, which enzymes stepwise complete the fermentation reaction [BIT 1992]
(a) Diastase, maltase and zymase
(b) Maltase, zymase and invertase
(c) Diastase, zymase and lactase
(d) Diastase, invertase and zymase
10. Primary alcohols can be obtained from the reaction of the $RMgX$ with [Pb. PMT 2001]
(a) CO_2 (b) $HCHO$
(c) CH_3CHO (d) H_2O
11. On heating aqueous solution of benzene diazonium chloride, which is formed [CPMT 1988; BHU 1980]
(a) Benzene (b) Chlorobenzene
(c) Phenol (d) Aniline
12. $LiAlH_4$ converts acetic acid into [CPMT 1977; MP PMT 1990, 92]
(a) Acetaldehyde (b) Methane
(c) Ethyl alcohol (d) Methyl alcohol
13. Formaldehyde gives an additive product with methyl magnesium iodide which on aqueous hydrolysis gives [MP PMT/PET 1988]
(a) Isopropyl alcohol (b) Ethyl alcohol
(c) Methyl alcohol (d) Propyl alcohol
14. Benzyl alcohol is obtained from benzaldehyde by [CPMT 1983; MNR 1993]
(a) Fittig's reaction (b) Cannizaro's reaction
(c) Kolbe's reaction (d) Wurtz's reaction

Preparation of alcohol, Phenol and Ethers

1. Ethanol is prepared industrially by [MP PMT 1989]
(a) Hydration of ethylene (b) Fermentation of sugars
(c) Both the above (d) None of these
2. Ethyl alcohol is industrially prepared from ethylene by [CPMT 1985]

15. Benzene diazonium chloride on boiling with dilute sulphuric acid gives [MP PMT 1983]
 (a) Toluene (b) Benzoic acid
 (c) Benzene (d) Phenol
16. The reaction given below is known as

$$C_2H_5ONa + IC_2H_5 \longrightarrow C_2H_5OC_2H_5 + NaI$$
 [CPMT 1990; KCET 1990; MH CET 2003; Pb. CET 2002]
 (a) Kolbe's synthesis (b) Wurtz's synthesis
 (c) Williamson's synthesis (d) Grignard's synthesis
17. Salicylaldehyde can be prepared from [CPMT 1983]
 (a) Phenol and chloroform
 (b) Phenol, chloroform and sodium hydroxide
 (c) Phenol, carbon tetrachloride and NaOH
 (d) None of these
18. If formaldehyde and potassium hydroxide are heated, then we get [CPMT 1989, 90; KCET 2000]
 (a) Acetylene (b) Methane
 (c) Methyl alcohol (d) Ethyl formate
19. An organic compound dissolved in dry benzene evolved hydrogen on treatment with sodium. It is [NCERT 1981; SCRA 1990]
 (a) A ketone (b) An aldehyde
 (c) A tertiary amine (d) An alcohol
20. $A \xrightarrow[\text{dil. } H_2SO_4]{K_2Cr_2O_7} B \xrightarrow[H_2O]{CH_3MgI} CH_3 - \overset{\overset{CH_3}{|}}{\underset{\underset{OH}{|}}{C}} - CH_3$. The reactant A is [MH CET 2002, 03; AFMC 2004; MP PMT/PET 1988; EAMCET 1989; CPMT 1988; MP PET 2000]
 (a) $CH_3CHOHCH_3$ (b) CH_3COCH_3
 (c) C_2H_5OH (d) CH_3COOH
21. The reaction, water gas ($CO + H_2$) + H_2 673K, 300 atmosphere in presence of the catalyst Cr_2O_3 / ZnO is used for the manufacture of [MP PMT 1989]
 (a) $HCHO$ (b) $HCOOH$
 (c) CH_3OH (d) CH_3COOH
22. $CH_2 = CH_2 + B_2H_6 \xrightarrow[H_2SO_4]{NaOH}$ Product.
 Product in above reaction is [RPMT 2003]
 (a) CH_3CH_2CHO (b) CH_3CH_2OH
 (c) CH_3CHO (d) None of these
23. Phenolphthalein is obtained by heating phthalic anhydride with conc. H_2SO_4 and [BHU 1996]
 (a) Benzyl alcohol (b) Benzene
 (c) Phenol (d) Benzoic acid
24. Maltose on hydrolysis gives [BHU 1996; CPMT 2001]
 (a) Mannose + glucose (b) Galactose + glucose
 (c) Glucose (d) Mannose + fructose
25. Absolute alcohol can be obtained from rectified spirit [KCET 1985]
 (a) By removing the water in it using concentrated sulphuric acid
 (b) By removing the water using phosphorus pentoxide
 (c) By distilling with the appropriate amount of benzene
 (d) By distilling over plenty of quick lime
26. Grignard reagent reacts with compounds containing which of the following groups [MNR 1987]
 (a) $>C=O$ (b) $-C \equiv N$
 (c) $>C=S$ (d) All of these
27. $Oil + NaOH(aq) \xrightarrow{\Delta}$ Glycerol + Soap
 Above reaction is called [UPSEAT 2001]
 (a) Saponification (b) Esterification
 (c) Hydrogenation (d) None of these
28. Acetone on treatment with $CH_3 - Mg - I$ and on further hydrolysis gives [UPSEAT 2000]
 (a) Isopropyl alcohol (b) Primary alcohol
 (c) Acetic acid (d) 2-methyl 2-propanol
29. In the following reaction 'A' is

$$C_2H_5MgBr + H_2C - \underset{\underset{O}{|}}{CH_2} \xrightarrow{H_2O} A$$
 [MP PET 1994; CBSE PMT 1998]
 (a) $C_2H_5CH_2CHO$ (b) $C_2H_5CH_2CH_2OH$
 (c) $C_2H_5CH_2OH$ (d) C_2H_5CHO
30. Sodium benzene sulphonate reacts with NaOH and then on acidic hydrolysis, it gives [Roorkee 1995; KCET 1998]
 (a) Phenol (b) Benzoic acid
 (c) Benzene (d) Disodium benzaldehyde
31. Phenol is obtained by heating aqueous solution of [MP PMT 1995]
 (a) Aniline
 (b) Benzene diazonium chloride
 (c) Benzoic acid
 (d) None of these
32. C_2H_5MgI reacts with $HCHO$ to form last product [MP PMT 1991]
 (a) CH_3CHO (b) C_3H_7OH
 (c) CH_3COCH_3 (d) CH_3COOCH_3
33. Which one is not synthesized by Grignard reagent [MP PET 1991]
 (a) Primary alcohol (b) Secondary alcohol
 (c) A ketone (d) An ester
34. Reaction of aqueous sodium hydroxide on (i) ethyl bromide and (ii) chlorobenzene gives
 (a) (i) Ethene and (ii) o-chlorophenol
 (b) (i) Ethyl alcohol and (ii) o-chlorophenol
 (c) (i) Ethyl alcohol and (ii) phenol
 (d) (i) Ethyl alcohol and (ii) no reaction
35. $RMgBr$ on reaction with an excess of oxygen followed by hydrolysis gives [Roorkee Qualifying 1998]
 (a) RH (b) $ROOR$
 (c) $ROOH$ (d) ROH
36. The reaction between an ester and excess of Grignard reagent shall finally result in a [UPSEAT 2000]
 (a) Primary alcohol (b) Secondary alcohol
 (c) Tertiary alcohol (d) Ketone
37. The compound that will react most readily with NaOH to form methanol is [IIT-JEE (Screening) 2001]
 (a) $(CH_3)_4N^+I^-$ (b) CH_3OCH_3
 (c) $(CH_3)_3S^+I^-$ (d) $(CH_3)_3Cl$
38. When 2-ethylanthraquinol dissolved in a mixture of benzene and cyclohexanol is oxidised, the product is [JIPMER 1999]
 (a) Ethanol (b) Hydrogen peroxide
 (c) Anthracene (d) None of these
39. Which gas is eliminated in fermentation [RPMT 1997]
 (a) O_2 (b) CO_2
 (c) N_2 (d) H_2
40. Action of nitrous acid with ethylamine produces [BHU 2000]
 (a) Ethane (b) Ammonia
 (c) Ethyl alcohol (d) Nitroethane
41. The product of reduction of benzaldehyde is
 (a) Benzoic acid (b) Benzyl alcohol
 (c) Benzene (d) Catechol
42. Commercially methanol is prepared by [IIT 1984; MP PMT 1990; KCET 1992]
 (a) Reduction of CO in presence of $ZnO.Cr_2O_3$

- (b) Methane reacts with water vapours at 900°C in presence of Ni catalyst
 (c) Reduction of HCHO by LiAlH_4
 (d) Reduction of HCHO by aqueous NaOH
43. Action of water in the presence of sulphuric acid with the following alkenes
- (i) $\text{CH}_3 - \text{CH} = \text{C} \begin{smallmatrix} \text{CH}_3 \\ \text{CH}_3 \end{smallmatrix}$ and (ii) $\text{CH}_3 - \text{CH} = \text{CH}_2$ gives
- (a) $\text{CH}_3 - \text{CH}_2 - \text{C} \begin{smallmatrix} \text{CH}_3 \\ \text{OH} \end{smallmatrix}$ and (ii) $\text{CH}_3 - \text{CH} - \text{CH}_3$
 OH OH
- (b) (i) $\text{CH}_3 - \text{CH} = \text{CH} \begin{smallmatrix} \text{CH}_3 \\ \text{OH} \end{smallmatrix}$ and (ii) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2\text{OH}$
- (c) (i) $\text{CH}_3 - \text{CH} - \text{CH} \begin{smallmatrix} \text{CH}_3 \\ \text{OH} \end{smallmatrix}$ and (ii) $\text{CH}_3 - \text{CH} - \text{CH}_3$
 OH OH
- (d) (i) $\text{CH}_3 - \text{CH}_2 - \text{C} \begin{smallmatrix} \text{CH}_3 \\ \text{OH} \end{smallmatrix}$ and (ii) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2\text{OH}$
44. From Williamson's synthesis preparation of which of following is possible
 (a) Only symmetrical ethers (b) Only symmetrical ethers
 (c) Both types (d) None of these
45. In the reaction $\text{Ar}-\text{OH} + \text{Rx} \xrightarrow{\text{alkali}} \text{A}$, A is [MP PET 1994]
 (a) An aldehyde (b) An aryl chloride
 (c) An ether (d) A ketone
46. Williamson's synthesis is used to prepare [DPMT 1976, 81, 82, 83, 84; CPMT 1976, 82]
 (a) Acetone (b) Diethyl ether
 (c) P.V.C. (d) Bakelite
47. When an alkyl halide is allowed to react with a sodium alkoxide the product most likely is [MP PMT 1996; EAMCET 1998]
 (a) An aldehyde (b) A ketone
 (c) An ether (d) A carboxylic acid
48. In Williamson's synthesis, ethoxyethane is prepared by [MP PMT 1995; BHU 2005]
 (a) Passing ethanol over heated alumina
 (b) Sodium ethoxide with ethyl bromide
 (c) Ethyl alcohol with sulphuric acid
 (d) Ethyl iodide and dry silver oxide
49. Formation of diethyl ether from ethanol is based on a [BVP 2003]
 (a) Dehydration reaction
 (b) Dehydrogenation reaction
 (c) Hydrogenation reaction
 (d) Heterolytic fission reaction
50. The compound formed when ethyl bromide is heated with dry silver oxide is [MP PET/PMT 1988]
 (a) Dimethyl ether (b) Diethyl ether
 (c) Methyl alcohol (d) Ethyl alcohol
51. The reagent used for the preparation of higher ether from halogenated ethers is [Tamil Nadu CET 2001]
 (a) conc. H_2SO_4 (b) Sodium alkoxide
 (c) Dry silver oxide (d) Grignard reagent
52. Acetyl bromide reacts with excess of CH_3MgI followed by treatment with a saturated solution of NH_4Cl gives [AIEEE 2004]
 (a) 2-methyl-2-propanol (b) Acetamide
 (c) Acetone (d) Acetyl iodide
53. What is obtained when chlorine is passed in boiling toluene and product is hydrolysed [DCE 2004]
 (a) *o*-Cresol (b) *p*-Cresol
 (c) 2, 4-Dihydroxytoluene (d) Benzyl alcohol
54. Which of the following is formed when benzaldehyde reacts with sodium hydroxide [Pb. CET 2002]
 (a) Benzyl alcohol (b) Benzoic acid
 (c) Glucose (d) Acetic acid
55. When ethanal reacts with CH_3MgBr and $\text{C}_2\text{H}_5\text{OH}$ /dry HCl the product formed are [DCE 2003]
 (a) Ethyl alcohol and 2-propanol
 (b) Ethane and hemi-acetal
 (c) 2-propanol and acetal
 (d) Propane and methyl acetate
56. Which of the following is industrially prepared by passing ethylene into hypochlorous acid [BHU 2004]
 (a) Ethylene glycol (b) Ethylene oxide
 (c) Ethylene dinitrate (d) Ethane
57. In which case methyl-*t*-butyl ether is formed [Orissa JEE 2004]
 (a) $(\text{C}_2\text{H}_5)_3\text{CONa} + \text{CH}_3\text{Cl}$
 (b) $(\text{CH}_3)_3\text{CONa} + \text{CH}_3\text{Cl}$
 (c) $(\text{CH}_3)_3\text{CONa} + \text{C}_2\text{H}_5\text{Cl}$
 (d) $(\text{CH}_3)_3\text{CONa} + \text{CH}_3\text{Cl}$
58. Which of the following combinations can be used to synthesize ethanol [KCET 2004]
 (a) CH_3MgI and CH_3COCH_3
 (b) CH_3MgI and $\text{C}_2\text{H}_5\text{OH}$
 (c) CH_3MgI and $\text{CH}_3\text{COOC}_2\text{H}_5$
 (d) CH_3MgI and HCOOC_2H_5
59. $\text{C}_6\text{H}_5 - \text{CH} = \text{CHCHO} \xrightarrow{\text{X}} \text{C}_6\text{H}_5\text{CH} = \text{CHCH}_2\text{OH}$. In the above sequence X can be [DCE 2004]
 (a) H_2 / Ni (b) NaBH_4
 (c) $\text{K}_2\text{Cr}_2\text{O}_7 / \text{H}^+$ (d) Both (a) and (b)
60. Alkenes convert into alcohols by [MP PET 1991]
 (a) Hydrolysis by dil. H_2SO_4
 (b) Hydration of alkene by alkaline KMnO_4
 (c) Hydrolysis by water vapours and conc. H_2SO_4
 (d) Hydration of alkene by aqueous KOH
61. Acetic acid and CH_3OH are obtained on large scale by destructive distillation of
 (a) Wood (b) Coal
 (c) Turpentine (d) Crude oil
62. Which is formed when benzaldehyde reacts with nitrous acid [KCET (Med.) 2001]
 (a) $\text{C}_6\text{H}_5\text{OH}$ (b) $\text{C}_6\text{H}_5\text{ON}$

- (c) $C_2H_5N_2OH$ (d) $C_6H_5CH_2OH$
63. Acid catalyzed hydration of alkenes except ethene leads to the formation of [AIEEE 2005]
 (a) Primary alcohol
 (b) Secondary or tertiary alcohol
 (c) Mixture of primary and secondary alcohols
 (d) Mixture of secondary and tertiary alcohols
64. Methylphenyl ether can be obtained by reacting [J & K 2005]
 (a) Phenolate ions and methyl iodide
 (b) Methoxide ions and bromobenzene
 (c) Methanol and phenol
 (d) Bromo benzene and methyl bromide

Properties of alcohol, Phenol and Ethers

1. Which compound is formed when CH_3OH reacts with $CH_3 - Mg - X$ [CPMT 1977, 89]
 (a) Acetone (b) Alcohol
 (c) Methane (d) Ethane
2. A compound X of formula C_3H_8O yields a compound C_3H_6O , on oxidation. To which of the following classes of compounds could X be [Pb. PMT 2000]
 (a) Secondary alcohol (b) Alkene
 (c) Aldehyde (d) Tertiary alcohol
3. The boiling point of alcohol are than corresponding thiols [Pb. PMT 2000]
 (a) More (b) Same
 (c) Either of these (d) Less
4. Methyl alcohol can be distinguished from ethyl alcohol using [KCET 1984; BHU 2000]
 (a) Fehling solution
 (b) Schiff's reagent
 (c) Sodium hydroxide and iodine
 (d) Phthalein fusion test
5. A compound X with molecular formula C_3H_8O can be oxidised to a compound Y with the molecular formula $C_3H_6O_2$. X is most likely to be [MP PMT 1991]
 (a) Primary alcohol (b) Secondary alcohol
 (c) Aldehyde (d) Ketone
6. An alcohol on oxidation is found to give CH_3COOH and CH_3CH_2COOH . The structure of the alcohol is [BIT 1990]
 (a) $CH_3CH_2CH_2OH$
 (b) $(CH_3)_2C(OH)CH_2CH_3$
 (c) $CH_3CH_2CHOHCH_3$
 (d) $CH_3CH(OH)CH_2CH_2CH_3$
7. An organic liquid A containing C, H and O has a pleasant odour with a boiling point of $78^\circ C$. On boiling A with conc. H_2SO_4 a colourless gas is produced which decolourises bromine water and alkaline $KMnO_4$. One mole of this gas also takes one mole of H_2 . The organic liquid A is [KCET 1993]
 (a) C_2H_5Cl (b) C_2H_5CHO
- (c) C_2H_6 (d) C_2H_5OH
8. An aromatic amine (A) was treated with alcoholic potash and another compound (Y) when foul smelling gas was formed with formula C_6H_5NC . Y was formed by reacting a compound (Z) with Cl_2 in the presence of slaked lime. The compound (Z) is [CBSE PMT 1990]
 (a) $C_6H_5NH_2$ (b) C_2H_5OH
 (c) CH_3OCH_3 (d) $CHCl_3$
9. Rectified spirit obtained by fermentation contains 4.5% of water. So in order to remove it, rectified spirit is mixed with suitable quantity of benzene and heated. Benzene helps because [KCET 1987]
 (a) It is dehydrating agent and so removes water
 (b) It forms the lower layer which retains all the water so that alcohol can be distilled off
 (c) It forms an azeotropic mixture having high boiling point and thus allows the alcohol to distill over
 (d) It forms low boiling azeotropic mixtures which distill over, leaving behind pure alcohol which can then be distilled
10. $C_6H_5OH + ClCOCH_3 \xrightarrow{aq. NaOH} C_6H_5OCOCH_3$ is an example of [BHU 1984]
 (a) Dow's reaction
 (b) Reimer-Tiemann reaction
 (c) Schotten-Baumann reaction
 (d) Kolbe's reaction
11. Ortho-nitrophenol is steam volatile whereas para-nitrophenol is not. This is due to [CBSE PMT 1989]
 (a) Intramolecular hydrogen bonding present in ortho-nitrophenol
 (b) Intermolecular hydrogen bonding
 (c) Intramolecular hydrogen bonding present in para-nitrophenol
 (d) None of these
12. Reaction of phenol with dil. HNO_3 gives [KCET 1993; RPMT 1997]
 (a) p and m -nitrophenols (b) o - and p -nitrophenols
 (c) Picric acid (d) o - and m -nitrophenols
13. Phenol is less acidic than [IIT-JEE 1986; UPSEAT 2003; Orissa JEE 2004]
 (a) Acetic acid (b) p -nitrophenol
 (c) Both (a) and (b) (d) None of these
14. The strongest acid among the following aromatic compounds is [NCERT 1978]
 (a) ortho-nitrophenol (b) para-chlorophenol
 (c) para-nitrophenol (d) meta-nitrophenol
15. Diazo-coupling is useful to prepare some [CBSE PMT 1994]
 (a) Pesticides (b) Proteins
 (c) Dyes (d) Vitamins
16. Glycerol reacts with $P_4 + I_2$ to form [CBSE PMT 1991]
 (a) Aldehyde (b) Allyl iodide
 (c) Allyl alcohol (d) Acetylene
17. When glycerine is added to a litre of water which of the following behaviour is observed [NCERT 1977; BHU 1979]
 (a) Water evaporates more easily
 (b) The temperature of water is increased
 (c) The freezing point of water is lowered
 (d) The viscosity of water is lowered
18. Final product formed on reduction of glycerol by hydroiodic acid is [CPMT 1987]
 (a) Propane (b) Propanoic acid
 (c) Propene (d) Propyne
19. Glycerol was distilled with oxalic acid crystals and the products were led into Fehling solution and warmed. Cuprous oxide was precipitated. It is due to [KCET 1987]
 (a) CO (b) $HCHO$
 (c) CH_3CHO (d) $HCOOH$
20. Kolbe-Schmidt reaction is used for [CBSE PMT 1991]
 (a) Salicylic acid (b) Salicylaldehyde
 (c) Phenol (d) Hydrocarbon
21. Which of the following explains the viscous nature of glycerol [JIPMER 1997]

- (a) Covalent bonds (b) Hydrogen bonds
(c) Vander Wall's forces (d) Ionic forces
22. On heating glycerol with conc. H_2SO_4 , a compound is obtained which has a bad odour. The compound is [CPMT 1974; CBSE PMT 1994]
(a) Glycerol sulphate (b) Acrolein
(c) Formic acid (d) Allyl alcohol
23. Isopropyl alcohol on oxidation forms [CPMT 1971, 81, 94; RPMT 2002]
(a) Acetone (b) Ether
(c) Ethylene (d) Acetaldehyde
24. Benzenediazonium chloride on reaction with phenol in weakly basic medium gives [IIT-JEE 1998]
(a) Diphenyl ether (b) *p*-hydroxyazobenzene
(c) Chlorobenzene (d) Benzene
25. The alcohol that produces turbidity immediately with $ZnCl_2$ + conc. HCl at room temperature [EAMCET 1997; MP PMT 1989, 99; IIT JEE 1981, 86; CBSE PMT 1989; CPMT 1989; MP PET 1997; JIPMER 1999]
(a) 1-hydroxybutane
(b) 2-hydroxybutane
(c) 2-hydroxy-2-methylpropane
(d) 1-hydroxy-2-methylpropane
26. The reagent which easily reacts with ethanol and propanol is [MP PET 1989]
(a) Fehling solution (b) Grignard reagent
(c) Schiff's reagent (d) Tollen's reagent
27. Propene is the product obtained by dehydrogenation of [KCET (Engg.) 2001]
(a) 2-propanol (b) 1-propanol
(c) Propanal (d) *n*-propyl alcohol
28. Which of the following statements is correct [BHU 1997]
(a) Phenol is less acidic than ethyl alcohol
(b) Phenol is more acidic than ethyl alcohol
(c) Phenol is more acidic than carboxylic acid
(d) Phenol is more acidic than carbonic acid
29. Boiling point of alcohol is comparatively higher than that corresponding alkane due to [MH CET 2002]
(a) Intermolecular hydrogen bonding
(b) Intramolecular hydrogen bonding
(c) Volatile nature
(d) None of these
30. When Phenol is heated with phthalic anhydride in concentrated sulphuric acid and the hot reaction mixture is poured into a dilute solution of sodium hydroxide, the product formed is [MP PET 1997, 2003; RPMT 1999; KCET (Med.) 2000; CPMT 1981; CBSE PMT 1988]
(a) Alizarin (b) Methyl orange
(c) Fluorescein (d) Phenolphthalein
31. $CH_3 - CH = CH - CH(OH) - CH_3 \xrightarrow[\text{reagent}]{\text{Jon's}} X$
Product X is [RPET 2000]
(a) $CH_3CH_2CH_2CH(OH)CH_3$
(b) $CH_3CH = CHCOCH_3$
(c) Both (a) and (b) are correct
(d) $CH_3CH_2CH_2COCH_3$
32. Reaction : $CH_3OH + O_2 \xrightarrow[Ag]{600^\circ C}$ product
The product is [RPET 2000]
(a) $CH_2 = C = O$ (b) $H_2C = O$
(c) C_2H_4 (d) C_2H_2
33. Ethylene glycol, on oxidation with per-iodic acid, gives [NCERT 1983; CPMT 1983]
(a) Oxalic acid (b) Glycol
(c) Formaldehyde (d) Glycollic acid
34. An unknown compound ' D ', first oxidised to aldehyde and then acetic acid by a dilute solution of $K_2Cr_2O_7$ and H_2SO_4 . The unknown compound ' D ' is [BHU 2000]
(a) CH_3CHO (b) CH_2CH_3OH
(c) CH_3CH_2OH (d) $CH_3CH_2CH_3$
35. The reaction of ethylene glycol with PI_3 gives [MP PMT 2000]
(a) ICH_2CH_2I (b) $CH_2 = CH_2$
(c) $CH_2 = CHI$ (d) $ICH = CHI$
36. The compound ' A ' when treated with ceric ammonium nitrate solution gives yellow ppt. The compound ' A ' is [MP PET 2002]
(a) Alcohol (b) Aldehyde
(c) Acid (d) Alkane
37. Which of the following product is formed, when ether is exposed to air [AIIMS 2000; RPMT 2002]
(a) Oxide (b) Alkanes
(c) Alkenes (d) Peroxide of diethyl ether
38. During dehydration of alcohols to alkenes by heating with conc. H_2SO_4 the initiation step is [AIEEE 2003]
(a) Protonation of alcohol molecule
(b) Formation of carbocation
(c) Elimination of water
(d) Formation of an ester
39. Phenol is less acidic than [MNR 1995]
(a) Ethanol (b) Methanol
(c) *o*-nitrophenol (d) *p*-methylphenol
40. The compound which gives the most stable carbonium on dehydration is [MNR 1995]
(a) $CH_3 - \underset{\substack{| \\ CH_3}}{CH} - CH_2OH$
 CH_3
 CH_3
 $|$
 $CH_3 - C - OH$
 $|$
 CH_3
(b) $CH_3 - CH_2 - CH_2 - CH_2OH$
(c) $CH_3 - CH - CH_2 - CH_3$
 $|$
 OH
(d) $CH_3 - CH - CH_2 - CH_3$
 $|$
 OH
41. At higher temperature, iodoform reaction is given by [AIIMS 2003]
(a) $CH_3CO_2CH_3$ (b) $CH_3CO_2C_2H_5$
(c) $C_6H_5CO_2CH_3$ (d) $CH_3CO_2C_6H_5$
42. Cresol has [CPMT 2003]
(a) Alcoholic - OH (b) Phenolic - OH
(c) - $COOH$ (d) - CHO
43. In $CH_3CH_2OH \xrightarrow[350^\circ C]{X} CH_2 = CH_2 + H_2O$; ' X ' is
(a) $NaCl$ (b) $CaCl_2$
(c) P_2O_5 (d) Al_2O_3

44. Sodium phenoxide reacts with CO_2 at 400K and $4-7\text{ atm}$ pressure to give [MP PET 1996]
 (a) Sodium salicylate (b) Salicylaldehyde
 (c) Catechol (d) Benzoic acid
45. The reaction of $\text{C}_2\text{H}_5\text{OH}$ with H_2SO_4 does not give [MP PET 1996]
 (a) Ethylene (b) Diethyl ether
 (c) Acetylene (d) Ethyl hydrogen sulphate
46. The order of stability of carbonium ions is [MP PET 1996]
 (a) Methyl > ethyl > iso-propyl > tert-butyl
 (b) Tert-butyl > iso-propyl > ethyl > methyl
 (c) Iso-propyl > tert-butyl > ethyl > methyl
 (d) Tert-butyl > ethyl > iso-propyl > methyl
47. Which statement is not correct about alcohol [AFMC 1997]
 (a) Alcohol is lighter than water
 (b) Alcohol evaporates quickly
 (c) Alcohol of less no. of carbon atoms is less soluble in water than alcohol of high no. of carbon atoms
 (d) All of these
48. An organic compound A reacts with sodium metal and forms B . On heating with conc. H_2SO_4 , A gives diethyl ether. A and B are [AFMC 1998]
 (a) $\text{C}_2\text{H}_5\text{OH}$ and $\text{C}_2\text{H}_5\text{ONa}$
 (b) $\text{C}_3\text{H}_7\text{OH}$ and CH_3ONa
 (c) CH_3OH and CH_3ONa
 (d) $\text{C}_4\text{H}_9\text{OH}$ and $\text{C}_4\text{H}_9\text{ONa}$
49. In the Liebermann's nitroso reaction, sequential changes in the colour of phenol occurs as [AFMC 1998; BHU 1999]
 (a) Brown or red $\rightarrow$ green $\rightarrow$ red $\rightarrow$ deep blue
 (b) Red $\rightarrow$ deep blue $\rightarrow$ green
 (c) Red $\rightarrow$ green $\rightarrow$ white
 (d) White $\rightarrow$ red $\rightarrow$ green
50. Which one of the following reactions does not yield an alkyl halide [EAMCET 1998]
 (a) Diethyl ether + Cl_2
 (b) Diethyl ether + HI
 (c) Diethyl ether and PCl_5
 (d) Diethyl ether $\xrightarrow{\text{Reduction}} \text{X} \xrightarrow{\text{SO}_2\text{Cl}_2}$
51. Compound A reacts with PCl_5 to give B which on treatment with KCN followed by hydrolysis gave propionic acid. What is A and B respectively [EAMCET 1998]
 (a) C_3H_8 and $\text{C}_3\text{H}_7\text{Cl}$
 (b) C_2H_6 and $\text{C}_2\text{H}_5\text{Cl}$
 (c) $\text{C}_2\text{H}_5\text{Cl}$ and $\text{C}_2\text{H}_5\text{Cl}$
 (d) $\text{C}_2\text{H}_5\text{OH}$ and $\text{C}_2\text{H}_5\text{Cl}$
52. The increasing order of acidity among phenol, p -methylphenol, m -nitrophenol and p -nitrophenol is [CBSE PMT 1995; RPMT 2002]
 (a) m -nitrophenol, p -nitrophenol, phenol, p -methylphenol
 (b) p -methylphenol, m -nitrophenol, phenol, p -nitrophenol
 (c) p -methylphenol, phenol, m -nitrophenol, p -nitrophenol
 (d) Phenol, p -methylphenol, p -nitrophenol, m -nitrophenol
53. Which of the following is not characteristic of alcohols [AFMC 1992]
 (a) Lower alcohols are stronger and have bitter taste
 (b) Higher alcohols are stronger and have bitter taste
 (c) The boiling points of alcohols increase with increasing molecular mass
 (d) The lower alcohols are soluble in water
54. In reaction of alcohols with alkali metal, acid etc. which of the following alcohol will react fastest [BHU 1984]
 (a) Secondary (b) Tertiary
 (c) Primary (d) All equal
55. Order of reactivity of alcohols towards sodium metal is [Pb. CET 1985]
 (a) $\text{Pri} > \text{Sec} > \text{Ter}$ (b) $\text{Pri} > \text{Sec} < \text{Ter}$
 (c) $\text{Pri} < \text{Sec} > \text{Ter}$ (d) $\text{Pri} < \text{Sec} < \text{Ter}$
56. 23 g of Na will react with methyl alcohol to give [NCERT 1972]
 (a) One mole of oxygen (b) One mole of H_2
 (c) $\frac{1}{2}$ mole of H_2 (d) None of these
57. Which reagent is useful in converting 1-butanol to 1-bromobutane [EAMCET 1989]
 (a) CHBr_3 (b) Br_2
 (c) CH_3Br (d) PBr_3
58. The $-\text{OH}$ group of methyl alcohol cannot be replaced by chlorine by the action of [KCET 1989]
 (a) Chlorine
 (b) Hydrogen chloride
 (c) Phosphorus trichloride
 (d) Phosphorus pentachloride
59. Which of the following gives ketone on oxidation [EAMCET 1987; BIT 1992]
 (a) $(\text{CH}_3)_3\text{COH}$ (b) $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$
 (c) $(\text{CH}_3)_2\text{CHCH}_2\text{OH}$ (d) $\text{CH}_3\text{CHOHCH}_3$
60. Phenol is treated with bromine water and shaken well. The white precipitate formed during the process is [KCET (Med.) 2001; BIT 1992; AIIMS 1996; KCET 2001]
 (a) m -bromophenol
 (b) 2, 4-dibromophenol
 (c) 2, 4, 6-tribromophenol
 (d) A mixture of o - and p -bromophenols
61. Which compound has the highest boiling point [MP PET 2003]
 (a) Acetone (b) Diethyl ether
 (c) Methanol (d) Ethanol
62. When vapour of ethanol are passed over platinised asbestos in excess of air, the compound formed is [CPMT 1983]
 (a) CH_3CHO (b) CH_3COCH_3
 (c) C_2H_2 (d) CH_3COOH
63. Dehydration of ethanol gives [CPMT 1985; BHU 1989]
 (a) Acetic acid (b) Ethane
 (c) Ethylene (d) Acetylene
64. Which of the following compound will give positive iodoform test [MP PMT 1986, 1987]
 (a) CH_3OH (b) $\text{CH}_3 - \overset{\text{H}}{\underset{\text{CH}_3}{\text{C}}} - \text{OH}$
 (c) $\text{CH}_3 - \overset{\text{CH}_3}{\underset{\text{CH}_3}{\text{C}}} - \text{OH}$ (d) $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$
65. Absolute ethanol cannot be obtained by simple fraction of a solution of ethanol and water because [KCET 1984; MP PMT 1987]
 (a) Their B.P.'s are very nearer
 (b) Ethanol remains dissolved in water
 (c) They form a constant boiling mixture

- (d) Ethanol molecules are solvated
66. The alcohol which easily reacts with conc. HCl is [MP PMT 1985]
- (a) $CH_3 - CHOH - CH_2 - CH_3$
 (b) $(CH_3)_3 - C - OH$
 (c) $CH_3 - CH_2 - CH_2 - CH_2 - OH$
 (d) $(CH_3)_3 - CH - CH_2OH$
67. In the following series of chemical reactions, identify Z
- $$C_3H_7OH \xrightarrow[160-180^\circ C]{Conc. H_2SO_4} X \xrightarrow{Br_2} Y \xrightarrow[Alc.KOH]{Excess of} Z$$
- [Manipal MEE 1995]
- (a) $CH_3 - \underset{\substack{| \\ NH_2}}{CH} - \underset{\substack{| \\ NH_2}}{CH_2}$ (b) $CH_3 - \underset{\substack{| \\ OH}}{CH} - \underset{\substack{| \\ OH}}{CH_2}$
 (c) $CH_3 - \underset{\substack{| \\ OH}}{C} = CH_2$ (d) $CH_3C \equiv CH$
68. Alcohols of low molecular weight are [CPMT 1976, 89; Pb. PMT 2000]
- (a) Soluble in water
 (b) Soluble in all solvents
 (c) Insoluble in all solvents
 (d) Soluble in water on heating
69. Which of the following compounds is oxidised to prepare methyl ethyl ketone [DCE 2001]
- (a) 2-propanol (b) 1-butanol
 (c) 2-butanol (d) Tert-butyl alcohol
70. Which of the following is acidic [CBSE PMT 2001; MH CET 2001]
- (a) CH_3OH (b) C_6H_5OH
 (c) $(CH_3)_2CHOH$ (d) CH_3CH_2OH
71. With excess bromine, phenol reacts of form [BHU 2001]
- (a)  (b) 
 (c)  (d) Mixture of (a) and (b)
72. Which is obtained on treating phenol, with dilute HNO_3 [BVP 2003]
- (a)  (b) 
 (c)  (d) None of these
73. Primary alcohols on dehydration give [NCERT 1986]
- (a) Alkenes (b) Alkanes
 (c) Both (a) and (b) (d) None of these
74. Primary and secondary alcohols on action of reduced copper give [CPMT 1982; MP PMT 1983; EAMCET 1987, 93; MP PET 1995]
- (a) Aldehydes and ketones respectively
 (b) Ketones and aldehydes respectively
 (c) Only aldehydes
 (d) Only ketones
75. Methyl alcohol on oxidation with acidified $K_2Cr_2O_7$ gives [MNR 1987]
- (a) CH_3COCH_3 (b) CH_3CHO
 (c) $HCOOH$ (d) CH_3COOH
76. Ethyl alcohol on oxidation with $K_2Cr_2O_7$ gives [MNR 1987; Bihar CEE 1995; UPSEAT 2000]
- (a) Acetic acid (b) Acetaldehyde
 (c) Formaldehyde (d) Formic acid
77. Lucas test is used for [CBSE PMT 1990; AIIMS 2002; AFMC 2005]
- (a) Alcohols (b) Amines
 (c) Diethyl ether (d) Glacial acetic acid
78. When phenol reacts with ammonia in presence of $ZnCl_2$ at $300^\circ C$, it gives [AFMC 2001]
- (a) Primary amine (b) Secondary amine
 (c) Tertiary amine (d) Both (b) and (c)
79. Azo-dyes are prepared from [CPMT 2001]
- (a) Aniline (b) Benzaldehyde
 (c) Benzoic acid (d) Phenol
80. A compound that easily undergoes bromination is [KCET (Engg.) 2002]
- (a) Phenol (b) Toluene
 (c) Benzene (d) Benzoic acid
81. Which of the following has lowest boiling point [MH CET 1999]
- (a) *p*-nitrophenol (b) *m*-nitrophenol
 (c) *o*-nitrophenol (d) phenol
82. In esterification, the reactivity of alcohols is [DPMT 2000]
- (a) $1^\circ > 2^\circ > 3^\circ$ (b) $3^\circ > 2^\circ > 1^\circ$
 (c) Same in all cases (d) None of these
83. The role of conc. H_2SO_4 in the esterification process is [RPMT 1999]
- (a) Catalyst
 (b) Dehydrating agent
 (c) Hydrolysing agent
 (d) Dehydrating agent and catalyst
84. Methanol and ethanol are distinguished by the [MP PET 1999]
- (a) Action of HCl (b) Iodoform test
 (c) Solubility in water (d) Sodium
85. For phenol, which of the following statements is correct [MP PMT 1995]
- (a) It is insoluble in water
 (b) It has lower melting point compared to aromatic hydrocarbons of comparable molecular weight
 (c) It has higher boiling point than toluene
 (d) It does not show acidic property
86. The reaction of Lucas reagent is fast with [MP PMT 2000]
- (a) $(CH_3)_3COH$ (b) $(CH_3)_2CHOH$
 (c) $CH_3(CH_2)_2OH$ (d) CH_3CH_2OH
87. Which of the following reagents convert the propene to 1-propanol [CBSE PMT 1995]
- (a) H_2O, H_2SO_4
 (b) Aqueous KOH

- (c) $MgSO_4, NaBH_4 / H_2O$
(d) B_2H_6, H_2O_2, OH^-
88. Compound 'A' reacts with PCl_5 to give 'B' which on treatment with KCN followed by hydrolysis gave propanoic acid as the product. What is 'A' [CBSE PMT 2002]
(a) Ethane (b) Propane
(c) Ethyl chloride (d) Ethyl alcohol
89. Which reagent can convert acetic acid into ethanol [BVP 2003]
(a) Na + alcohol (b) $LiAlH_4$ + ether
(c) H_2 + Pt (d) Sn + HCl
90. Which of the following would undergo dehydration most readily [UPSEAT 2000]
(a) 1-phenyl-1-butanol (b) 2-phenyl-2-butanol
(c) 1-phenyl-2-butanol (d) 2-phenyl-1-butanol
91. Phenol and benzoic acid is distinguished by [BHU 2003]
(a) $NaOH$ (b) $NaHCO_3$
(c) Na_2CO_3 (d) H_2SO_4
92. Electrophilic substitution reaction in phenol take place at [RPMT 2002]
(a) p - position (b) m - position
(c) o - position (d) o - and p - position
93. Liebermann's test is answered by [KCET 1998]
(a) Aniline (b) Methylamine
(c) Ethyl benzoate (d) Phenol
94. In the sequence of the following reactions [MP PMT 2002]

$$CH_3CH_2OH \xrightarrow[\text{Chromic Acid}]{[O]} X \xrightarrow[\text{Chromic Acid}]{[O]} CH_3COOH$$
 X is
(a) CH_3COCH_3 (b) CH_3CHO
(c) CH_3OCH_3 (d) CH_3CH_2COOH
95. The boiling point of glycerol is more than propanol because of [CPMT 1997, 2002]
(a) Hydrogen bonding (b) Hybridisation
(c) Resonance (d) All the above
96. Which of the following produces violet colour with $FeCl_3$ solution
(a) Enols (b) Ethanol
(c) Ethanal (d) Alkyl halides
97. When heated with NH_3 under pressure alone or in presence of zinc chloride phenols are converted into [RPMT 1997]
(a) Aminophenols (b) Aniline
(c) Nitrobenzene (d) Phenyl hydroxylamine
98. Because of resonance the oxygen atom of $-OH$ group of phenol
(a) Acquires positive charge (b) Acquires negative charge
(c) Remains unaffected (d) Liberates
99. When glycerol is heated with $KHSO_4$ it gives [CPMT 1974, 85; MP PMT 1988, 90, 91, 92, 94; MP PET 1988, 92]
(a) $CH_2 = CH - CH_3$ (b) $CH_2 = CH - CH_2OH$
(c) $CH_2 = CH - CHO$ (d) $CH_2 = C = CH_2$
100. An organic compound X on treatment with acidified $K_2Cr_2O_7$ gives a compound Y which reacts with I_2 and sodium carbonate to form tri-iodomethane. The compound X is [KCET 1996]
(a) CH_3OH (b) $CH_3 - CO - CH_3$
(c) CH_3CHO (d) $CH_3CH(OH)CH_3$
101. The reaction of conc. HNO_3 and phenol forms [MP PMT/PET 1988; BHU 1988; MP PMT 1999; Pb. PMT 2000]
(a) Benzoic acid (b) Salicylic acid
(c) o - and p -nitrophenol (d) Picric acid
102. Phenol is [MP PMT 1990; UPSEAT 1999]
(a) A weaker base than NH_3
(b) Stronger than carbonic acid
(c) Weaker than carbonic acid
(d) A neutral compound
103. Phenol at $25^\circ C$ is
(a) A white crystalline solid (b) A transparent liquid
(c) A gas (d) Yellow solution
104. At low temperature phenol reacts with Br_2 in CS_2 to form [MP PET 1991; CPMT 1981; MP PMT 1990; IIT 1982; RPMT 2000]
(a) m -bromophenol (b) o - and p -bromophenol
(c) p -bromophenol (d) 2, 4, 6-tribromophenol
105. Oxidation of ethanol by chromic acid forms [MP PET 1992]
(a) Ethanol (b) Methanol
(c) 2-propanone (d) Ethanoic acid
106. Which of the following not gives effervescence with $NaHCO_3$ [MP PET 1992]
(a) Phenol (b) Benzoic acid
(c) 2, 4-dinitrophenol (d) 2, 4, 6-trinitrophenol
107. Conc. H_2SO_4 reacts with C_2H_5OH at $170^\circ C$ to form [MP PMT 1991; MP PET 1991; IIT-JEE 1981; EAMCET 1979; KCET 2001]
(a) CH_3COCH_3 (b) CH_3COOH
(c) CH_3CHO (d) C_2H_4
108. Which compound has hydrogen bonding [MP PMT 1992; MP PET 1991]
(a) Toluene (b) Phenol
(c) Chlorobenzene (d) Nitrobenzene
109. Which statement is true [MP PMT 1991]
(a) C_6H_5OH is more acidic than C_2H_5OH
(b) C_6H_5OH is less acidic than C_2H_5OH
(c) C_6H_5OH react with $NaHCO_3$
(d) C_6H_5OH gives oxime with NH_2OH and HCl
110. Read the following statements carefully :
(A) A secondary alcohol on oxidation gives a ketone
(B) Ethanol reacts with conc. H_2SO_4 at $180^\circ C$ to yield ethylene
(C) Methanol reacts with iodine and sodium hydroxide to give a yellow precipitate of iodoform
(D) Hydrogen gas is liberated when sodium is added to alcohol.
Select the correct statements from the above set:
(a) A, B (b) C, D
(c) A, B, D (d) A, C, D

iii. The following reaction :

is known as

- (a) Perkin reaction
(b) Gattermann reaction
(c) Kolbe reaction
(d) Gattermann-Koch reaction

112. Carbylamine test is done by heating alcoholic KOH with
[IIT-JEE 1984; BIT 1992; CBSE PMT 1992]
(a) Chloroform and silver powder
(b) Trihalogen methane and primary amine
(c) Alkyl halide and primary amine
(d) Alkyl cyanide and primary amine

113. Isopropyl alcohol heated at $300^{\circ}C$ with copper catalyst to form [AFMC 1990; MP PMT 1996, 99; JPMER 2000]
(a) Acetone (b) Dimethyl ether
(c) Acetaldehyde (d) Ethane

114. Dehydrogenation of $CH_3 - \underset{\substack{| \\ OH}}{CH} - CH_3$ gives
[MP PMT 2002]
(a) Acetone (b) Acetaldehyde
(c) Acetic acid (d) Acetylene

115. In the sequence of the following reactions
 $CH_3OH \xrightarrow{HI} CH_3I \xrightarrow{KCN}$
 $CH_3CN \xrightarrow{\text{reduction}} X \xrightarrow{HNO_3} Y$
 X and Y are respectively [MP PMT 2002]
(a) $CH_3CH_2NH_2$ and CH_3CH_2OH
(b) $CH_3CH_2NH_2$ and CH_3COOH
(c) CH_3CH_2OH and CH_3CHO
(d) CH_3OCH_3 and CH_3CHO

116. Alcohols (i) $CH_3CH_2CH_2OH$, (ii) $CH_3 - CHOH - CH_3$ and (iii) $CH_3 - C(CH_3)(OH) - CH_3$ were treated with Lucas reagent (Conc. $HCl + ZnCl_2$). What results do you expect at room temperature
(a) (ii) and (iii) react immediately and (i) in about 5 minutes
(b) (iii) reacts immediately, (ii) reacts in about 5 minutes and (i) not at all
(c) (i) reacts immediately, (ii) reacts in about 5 minutes and (iii) not at all
(d) (i) reacts in about 5 minutes, (ii) reacts in about 15 minutes and (iii) not at all

117. Ethylene may be obtained by dehydration of which of the following with concentrated H_2SO_4 at $160 - 170^{\circ}C$
[DPMT 2000; MP PET 2001]
(a) C_2H_5OH (b) CH_3OH
(c) $CH_3CH_2CH_2OH$ (d) $(CH_3)_2CHCH_2OH$

118. The final product of the oxidation of ethyl alcohol is [KCET (Med.) 1999]
(a) Ethane (b) Acetone
(c) Acetaldehyde (d) Acetic acid

119. The compound obtained by heating salicylic acid with phenol in the presence of phosphorus oxychloride is [KCET (Med.) 1999]
(i) o - and p -bromophenol
(b) (i) m -bromophenol and (ii) 2, 3, 4-tribromophenol
(c) (i) o - and p -bromophenol and (ii) 2, 4, 6-tribromophenol
(d) (i) o - and m -bromophenol and (ii) 2, 3, 4-tribromophenol

121. Which of the following is not true in case of reaction with heated copper at $300^{\circ}C$ [CPMT 1999]
(a) Phenol $\rightarrow$ Benzyl alcohol
(b) $CH_3CHO \rightarrow$ Benzaldehyde
(c) Secondary alcohol $\rightarrow$ Ketone
(d) Tertiary alcohol $\rightarrow$ Olefin

122. Which of the following is the most suitable method for removing the traces of water from ethanol [CPMT 1999]
(a) Heating with Na metal
(b) Passing dry HCl through it
(c) Distilling it
(d) Reacting with Mg

123. With oxalic acid, glycerol at $260^{\circ}C$ gives [BHU 1996]
(a) Allyl alcohol (b) Glyceryl mono-oxalate
(c) Formic acid (d) Glyceraldehyde

124. Absolute alcohol cannot be prepared by fractional distillation of rectified spirit since
(a) It forms azeotropic mixture
(b) It is used as power alcohol
(c) It is used in wines
(d) None of the above

125. The reagent used for the dehydration of an alcohol is [MP PET/PMT 1998]
(a) Phosphorus pentachloride
(b) Calcium chloride
(c) Aluminium oxide
(d) Sodium chloride

126. Which one of the following compounds gives a positive iodoform test [MP PMT 1997]
(a) Pentanal (b) 1-phenyl ethanol
(c) 2-phenyl ethanol (d) 3-pentanol

127. What amount of bromine will be required to convert 2 g of phenol into 2, 4, 6-tribromophenol [MP PET/PMT 1998]
(a) 4.00 (b) 6.00
(c) 10.22 (d) 20.44

128. Ethyl alcohol exhibits acidic character on reacting with [MP PMT 1995]
(a) Acetic acid
(b) Sodium metal
(c) Hydrogen iodide
(d) Acidic potassium dichromate

129. The mixture of ethanol and water cannot be separated by distillation because [KCET 1984]
(a) They form a constant boiling mixture
(b) Alcohol molecules are solvated

- (c) Their boiling points are very near
(d) Alcohol remains dissolved in water
130. The reaction between an alcohol and an acid with the elimination of water molecule is called [MH CET 1999]
(a) Esterification (b) Saponification
(c) Etherification (d) Elimination
131. The compound with the highest boiling point is [MNR 1985]
(a) CH_4 (b) CH_3OH
(c) CH_3Cl (d) CH_3Br
132. The boiling point of ethyl alcohol should be less than that of [Pb. CET 1985]
(a) Propane (b) Formic acid
(c) Dimethyl ether (d) None of these
133. Which of the following is not characteristic of alcohols [AIIMS 1980]
(a) They are lighter than water
(b) Their boiling points rise fairly uniformly with increasing molecular weight
(c) Lower members are insoluble in water and organic solvents but solubility regularly increases with molecular weight
(d) Lower members have pleasant smell and burning taste, while higher members are odourless and tasteless
134. At room temperature the alcohol that do not reacts with Lucas reagent is
(a) Primary alcohol (b) Secondary alcohol
(c) Tertiary alcohol (d) All these three
135. By means of calcium chloride which of following can be dried
(a) Methanol (b) Ethanol
(c) Both (a) and (b) (d) None of these
136. Lucas test is used to distinguish between [MP PET 1994]
(a) 1° , 2° and 3° alcohols (b) 1° , 2° and 3° amines
(c) Aldehydes and ketones (d) Alkenes and alkynes
137. Among the following, the compound that undergoes nitration readily is [NCERT 1984]
(a) Benzoic acid (b) Toluene
(c) Phenol (d) Nitrobenzene
138. Phenol $\xrightarrow{Zn}$ A $\xrightarrow[\text{Conc. } HNO_3]{\text{Conc. } H_2SO_4}$ B $\xrightarrow[NaOH]{Zn}$ C
Distillation
In the above reaction A, B and C are the following compounds
(a) C_6H_6 , $C_6H_5NO_2$ and aniline
(b) C_6H_6 , dinitrobenzene and metanitroaniline
(c) Toluene, metanitrobenzene and metatoluedine
(d) C_6H_6 , $C_6H_5NO_2$ and hydrazobenzene
139. $CH_3-O-C_3H_7$ and $C_2H_5-O-C_2H_5$ exhibit which type of isomerism [MP PMT 1989]
(a) Metamerism (b) Position
(c) Chain (d) Functional
140. Phenol reacts with CCl_4 in presence of aqueous alkali and forms a product which on hydrolysis gives [MP PMT 1990]
(a) Salicylaldehyde (b) Salicylic acid
(c) Benzaldehyde (d) Benzoic acid
141. In fermentation by zymase, alcohol and CO_2 are obtained from the following sugar [MP PMT/PET 1988]
(a) Glucose (b) Invert sugar
(c) Fructose (d) All of these
142. The order of melting point of *ortho*, *para*, *meta*-nitrophenol is [Orissa JEE 2003]
(a) $o > m > p$ (b) $p > m > o$
(c) $m > p > o$ (d) $p > o > m$
143. The alcohol which does not give a stable compound on dehydration is [MP PET 1997]
(a) Ethyl alcohol (b) Methyl alcohol
(c) *n*-propyl alcohol (d) *n*-butyl alcohol
144. When ethyl alcohol (C_2H_5OH) is mixed with ammonia and passed over heated alumina, the compound formed is [DPMT 1981; CBSE PMT 1989]
(a) $C_2H_5NH_2$ (b) C_2H_4
(c) $C_2H_5OC_2H_5$ (d) CH_3OCH_3
145. A mixture of methanol vapours and air is passed over heated copper. The products are [KCET 1988]
(a) Carbon monoxide and hydrogen
(b) Formaldehyde and water vapour
(c) Formic acid and water vapour
(d) Carbon monoxide and water vapour
146. In the esterification reaction of alcohols [Bihar CEE 1995]
(a) OH^- is replaced by CH_3COO group
(b) OH^- is replaced by chlorine
(c) H^- is replaced by sodium metal
(d) OH^- is replaced by C_2H_5OH
147. A compound A on oxidation gave acetaldehyde, then again on oxidation gave acid. After first oxidation it was reacted with ammoniacal $AgNO_3$ then silver mirror was produced. A is likely to be [DPMT 1996]
(a) Primary alcohol (b) Tertiary alcohol
(c) Acetaldehyde (d) Acetone
148. Phenol $\xrightarrow[H^+]{CHCl_3/NaOH}$ Salicyldehyde
The above reaction is known as [Pb. PMT 2002]
(a) Riemer Tiemann reaction
(b) Bucherer reaction
(c) Gattermann synthesis
(d) Perkin reaction
149. Alcohol which gives red colour with Victor Meyer test is [MP PMT/PET 1988] [RPMT 2003]
(a) C_2H_5OH (b) $CH_3-CH(OH)-CH_3$
(c) $C(CH_3)_3OH$ (d) None of these
150. Conc. H_2SO_4 heated with excess of C_2H_5OH at $140^\circ C$ to form [MP PMT 1990; RPMT 2000; AFMC 2002]
(a) $CH_3CH_2-O-CH_3$
(b) $CH_3CH_2-O-CH_2CH_3$
(c) $CH_3-O-CH_2-CH_2-CH_3$
(d) $CH_2=CH_2$
151. Rate of substitution reaction in phenol is [MP PMT 1989]
(a) Slower than the rate of benzene
(b) Faster than the rate of benzene
(c) Equal to the rate of benzene
(d) None of these
152. Phenol reacts with dilute HNO_3 at normal temperature to form [MP PMT 1989]

(a)

(b)

(c)

(d)

153. One mole of phenol reacts with bromine to form tribromophenol. How much bromine is used

[MP PMT 1989]

- (a) 1.5 mol (b) 3 mol
(c) 4.5 mol (d) 6 mol

154. In presence of NaOH , phenol react with CHCl_3 to form *o*-hydroxy benzaldehyde. This reaction is called

[BIT 1992; MP PMT 1990, 2002; AIIMS 1992; MP PET 1994; JIPMER 1999]

- (a) Reimer-Tiemann's reaction
(b) Sandmeyer's reaction
(c) Hoffmann's degradation reaction
(d) Gattermann's aldehyde synthesis

155. Which of the following vapours passed over heated copper to form acetone

[BIT 1992]

156. Methyl alcohol (methanol), ethyl alcohol (ethanol) and acetone (propanone) were treated with iodine and sodium hydroxide solutions. Which substances will give iodoform test

- (a) Only ethyl alcohol
(b) Only methyl alcohol and ethyl alcohol
(c) Only ethyl alcohol and acetone
(d) Only acetone

157. TNT has the structure

[UPSEAT 2000]

158. The vapour pressure of aqueous solution of methanal is

[UPSEAT 2000]

- (a) Equal to water (b) Equal to methanal
(c) More than water (d) Less than water

159. Glycerol reacts with conc. HNO_3 and conc. H_2SO_4 to form

[MP PMT 1995]

- (a) Glycerol mononitrate (b) Glycerol dinitrate
(c) Glycerol trinitrate (d) Acrolein

160. Glycerol heated with oxalic acid at 110°C to form

[CPMT 1986, 90, 91, 97; JIPMER 1997]

- (a) Formic acid (b) Oxalic acid
(c) Allyl alcohol (d) Glycerol trioxalate

161. Dimethyl ether and ethyl alcohol are

[CPMT 1986; Manipal MEE 1995]

- (a) Branched isomer (b) Position isomer
(c) Functional isomer (d) Tautomer

162. The process of manufacture of absolute alcohol from rectified spirit is

[CPMT 1986, 87; Kurukshetra CEE 2002]

- (a) Fractional distillation (b) Steam distillation
(c) Azeotropic distillation (d) Vacuum distillation

163. When ethyl alcohol reacts with acetic acid, the products formed are

[CPMT 1989]

- (a) Sodium ethoxide + hydrogen
(b) Ethyl acetate + water
(c) Ethyl acetate + soap
(d) Ethyl alcohol + water

164. Picric acid is (at 25°C)

- (a) A white solid (b) A colourless liquid
(c) A gas (d) A bright yellow solid

165. Phenol on distillation with zinc dust gives

[MP PET 1991; CPMT 1997; MP PMT 1999, 2001; Pb. PMT 2000]

- (a) C_6H_6 (b) C_6H_{12}
(c) $\text{C}_6\text{H}_5\text{OC}_6\text{H}_5$ (d) $\text{C}_6\text{H}_5-\text{C}_6\text{H}_5$

166. Methanol and ethanol are miscible in water due to

[MP PET/PMT 1988; CPMT 1989; CBSE PMT 1991]

- (a) Covalent character
(b) Hydrogen bonding character
(c) Oxygen bonding character
(d) None of these

167. By distilling glycol with fuming sulphuric acid, which of following is obtained

- (a) Glycerol (b) Pinacol
(c) Dioxan (d) Ethylene oxide

168. The compound which gives the most stable carbonium ion on dehydration is

[DCE 2000]

169. In $\text{CH}_3\text{CH}_2\text{OH}$ which bond dissociates heterolytically

[IIT-JEE 1988; CPMT 1996]

- (a) $\text{C}-\text{C}$ (b) $\text{C}-\text{O}$
(c) $\text{C}-\text{H}$ (d) $\text{O}-\text{H}$

170. Which compound is soluble in water

[IIT-JEE 1980; CPMT 1993; RPET 1999]

- (a) CS_2 (b) $\text{C}_2\text{H}_5\text{OH}$
(c) CCl_4 (d) CHCl_3

171. Which of the following is most soluble in water

[MP PMT 1995]

- (a) Normal butyl alcohol (b) Isobutyl alcohol
(c) Tertiary butyl alcohol (d) Secondary butyl alcohol

172. Which of the following gives negative iodoform test

- (a) $\text{CH}_3\text{CH}_2\text{OH}$ (b) $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$

- (c) $C_6H_5-\underset{\substack{| \\ OH}}{CH}-CH_3$ (d) $CH_3-\underset{\substack{| \\ OH}}{CH}-CH_3$
173. If ethanol dissolves in water, then which of the following would be done [MP PET 1989]
 (a) Absorption of heat and contraction in volume
 (b) Emission of heat and contraction in volume
 (c) Absorption of heat and increase in volume
 (d) Emission of heat and increase in volume
174. A migration of hydrogen with a pair of electrons is called
 (a) Alkyl shift (b) Hydride shift
 (c) Hydrogen ion formation (d) Dehydrogenation
175. When rectified spirit and benzene are distilled together, the first fraction obtained is
 (a) A ternary azeotrope (b) Absolute alcohol
 (c) A binary azeotrope (d) Denatured spirit
176. Alcohols react with Grignard reagent to form [DPMT 1986]
 (a) Alkanes (b) Alkenes
 (c) Alkynes (d) All of these
177. Action of diazomethane on phenol liberates
 (a) O_2 (b) H_2
 (c) N_2 (d) CO_2
178. The ring deuteration of phenol
 (a) Lowers the acidity
 (b) Increases the acidity
 (c) Imparts no effect
 (d) Causes amphoteric nature
179. In esterification of an acid, the other reagent is [CPMT 1988]
 (a) Aldehyde (b) Alcohol
 (c) Amine (d) Water
180. Maximum solubility of alcohol in water is due to [MP PMT / PET 1988; MP PMT 1989]
 (a) Covalent bond (b) Ionic bond
 (c) H-bond with H_2O (d) None of the above
181. Alcohols can be distinguished from alkenes by
 (a) Dissolving in cold concentrated H_2SO_4
 (b) Decolourizing with bromine in CCl_4
 (c) Oxidizing with neutral permanganate solution
 (d) None of the above
182. At $25^\circ C$ Ethylene glycol is a
 (a) Solid compound (b) Liquid
 (c) Gas (d) Brown solid
183. When primary alcohol is oxidised with chlorine, it produces [AFMC 1999]
 (a) $HCHO$ (b) CH_3CHO
 (c) CCl_3CHO (d) C_3H_7CHO
184. Alcohols combine with acetylene in the presence of mercury compounds as catalyst to form
 (a) Acetals (b) Xanthates
 (c) Vinyl ethers (d) None of the above
185. The compound which will give negative iodoform test is [CPMT 1993, 99]
 (a) CH_3CHO (b) CH_3CH_2OH
 (c) Isopropyl alcohol (d) Benzyl alcohol
186. Which of the following is most acidic [CPMT 1999]
 (a) Phenol (b) Benzyl alcohol
 (c) *m*-chlorophenol (d) Cyclohexanol
187. Number of metamers represented by molecular formula $C_4H_{10}O$ is [Tamil Nadu CET 2001]
 (a) 4 (b) 3
 (c) 2 (d) 1
188. When ether is exposed in air for sometime an explosive substance produced is [RPMT 2002]
 (a) Peroxide (b) TNT
 (c) Oxide (d) Superoxide
189. Ether which is liquid at room temperature is [BVP 2002]
 (a) $C_2H_5OCH_3$ (b) CH_3OCH_3
 (c) $C_2H_5OC_2H_5$ (d) None of these
190. In the following reaction

$$C_2H_5OC_2H_5 + 4[H] \xrightarrow{\text{Red P + HI}} 2X + H_2O, X \text{ is}$$
 (a) Ethane (b) Ethylene
 (c) Butane (d) Propane
191. Diethyl ether absorbs oxygen to form [DPMT 1984]
 (a) Red coloured sweet smelling compound
 (b) Acetic acid
 (c) Ether suboxide
 (d) Ether peroxide
192. Diethyl ether can be decomposed by heating with [CPMT 1980, 81, 89]
 (a) HI (b) $NaOH$
 (c) Water (d) $KMnO_4$
193. On boiling with concentrated hydrobromic acid, phenyl ethyl ether will yield [AIIMS 1992]
 (a) Phenol and ethyl bromide
 (b) Phenol and ethane
 (c) Bromobenzene and ethanol
 (d) Bromobenzene and ethane
194. Ether is formed when ethyl alcohol is heated with conc. H_2SO_4 . The conditions are [KCET 1984]
 (a) Excess of H_2SO_4 and $170^\circ C$
 (b) Excess of C_2H_5OH and $140^\circ C$
 (c) Excess of C_2H_5OH and $180^\circ C$
 (d) Excess of conc. H_2SO_4 and $100^\circ C$
195. The ether  when treated with HI produces [IIT-JEE 1999]
 (a)  (b) 
 (c)  (d) 
196. Addition of alcohols to aldehydes in presence of anhydrous acids yield [CET Pune 1998]
 (a) Carboxylic acids (b) Ethers
 (c) Cyclic ethers (d) Acetals
197. In which of the following reaction, phenol or sodium phenoxide is not formed [CPMT 1996]

- (a) $C_6H_5N_2Cl + aq. KOH \rightarrow$
 (b) $C_6H_5OCl + NaOH \rightarrow$
 (c) $C_6H_5N_2Cl + aq. NaOH \rightarrow$
 (d) $C_6H_5NNCl \xrightarrow[\Delta]{H_2O}$
198. Dimethyl ether when heated with excess HI gives [CPMT 1996]
 (a) CH_3I and CH_3OH
 (b) CH_3I and H_2O
 (c) $C_2H_6 + CH_3I$ and CH_3OH
 (d) CH_3I and $HCHO$
199. The ether that undergoes electrophilic substitution reactions is [JIPMER 2001]
 (a) $CH_3OC_2H_5$ (b) $C_6H_5OCH_3$
 (c) CH_3OCH_3 (d) $C_2H_5OC_2H_5$
200. Acetyl chloride does not react with [MNR 1995]
 (a) Diethyl ether (b) Aniline
 (c) Phenol (d) Ethanol
201. The products formed in the following reaction
 $C_6H_5-O-CH_3 + HI \xrightarrow{\text{heat}}$ are [IIT 1995]
 (a) C_6H_5-I and CH_3-OH
 (b) C_6H_5-OH and CH_3-I
 (c) $C_6H_5-CH_3$ and HOI
 (d) C_6H_6 and CH_3OI
202. Etherates are
 (a) Ethers
 (b) Solution in ether
 (c) Complexes of ethers with Lewis acid
 (d) Complexes of ethers with Lewis base
203. An ether is more volatile than an alcohol having the same molecular formula. This is due to [AIEEE 2003]
 (a) Dipolar character of ethers
 (b) Alcohols having resonance structures
 (c) Inter-molecular hydrogen bonding in ethers
 (d) Inter-molecular hydrogen bonding in alcohols
204. When ether is reacted with O_2 , it undergoes explosion due to [CPMT 1996]²¹²
 (a) Peroxide (b) Acid
 (c) Ketone (d) TNT
205. The compound which does not react with sodium is [CBSE PMT 1994]
 (a) C_2H_5OH (b) CH_3-O-CH_3
 (c) CH_3COOH (d) $CH_3-CHOH-CH_3$
206. Methyl-terbutyl ether on heating with HI of one molar concentration gives [MP PET 1997]
 (a) $CH_3I + (CH_3)_3COH$ (b) $CH_3OH + (CH_3)_3Cl$
 (c) $CH_3I + (CH_3)_3Cl$ (d) None of the above
207. A substance $C_4H_{10}O$ yields on oxidation a compound C_4H_8O which gives an oxime and a positive iodoform test. The original substance on treatment with conc. H_2SO_4 gives C_4H_8 . The structure of the compound is [SCRA 2000]
 (a) $CH_3CH_2CH_2CH_2OH$
 (b) $CH_3CH(OH)CH_2CH_3$
 (c) $(CH_3)_3COH$
 (d) $CH_3CH_2CH_2CH_2OH$
208. Ethylene glycol reacts with excess of PCl_5 to give [Kerala PMT 2004]
 (a) 1, 1-dichloroethane
 (b) 1, 2-dichloroethane
 (c) 1, 1, 1-trichloroethane
 (d) 1, 1, 2, 2-tetrachloroethane
 (e) 2, 2-dichloroethane
209. Which of the following will not react with $NaOH$ [CPMT 2004]
 (a)  (b) C_2H_5OH
 (c) CH_3CONH_2 (d) $CH(CN)_3$
210. The boiling point of methanol is greater than that of methyl thiol because [Kerala PMT 2004]
 (a) There is intramolecular hydrogen bonding in methanol and intermolecular hydrogen bonding in methyl thiol
 (b) There is intermolecular hydrogen bonding in methanol and no hydrogen bonding in methyl thiol
 (c) There is no hydrogen bonding in methanol and intermolecular hydrogen bonding in methyl thiol
 (d) There is intramolecular hydrogen bonding in methanol and no hydrogen bonding in methyl thiol
 (e) There is no hydrogen bonding in methanol and intramolecular hydrogen bonding in methyl thiol
211. In the reaction $\begin{matrix} CH_2OH \\ | \\ CHO \\ | \\ CH_2OH \end{matrix} + \begin{matrix} COOH \\ | \\ COOH \end{matrix} \xrightarrow{110^\circ C} (A)$ product (A) will be [Pb . CET 2001]
 (a) Glycerol monoformate
 (b) Allyl alcohol
 (c) Formaldehyde
 (d) Acetic acid
212. Which of the following will not form a yellow precipitate on heating with an alkaline solution of iodine [CBSE PMT 2004]
 (a) CH_3OH
 (b) CH_3CH_2OH
 (c) $CH_3CH(OH)CH_3$
 (d) $CH_3CH_2CH(OH)CH_3$
213. In Friedel-Crafts acylation, besides $AlCl_3$, the other reactants are [DPMT 2004]
 (a)  + CH_3Cl (b)  + CH_3COCl
 (c)  + HN_3 (d)  + CH_3Cl
214. Which of the following reagents will produce salicylaldehyde on reaction with phenol [DPMT 2004]
 (a) $CHCl_3 / NaOH$ (b) $CCl_4 / NaOH$

- (c) $\text{CH}_2\text{Cl}_2 / \text{NaOH}$ (d) $\text{CH}_3\text{Cl} / \text{NaOH}$
215. At 530 K, glycerol reacts with oxalic acid to produce [Pb. CET 2002]
(a) Allyl alcohol (b) Formic acid
(c) Glyceraldehyde (d) Glycerol monooxalate
216. With anhydrous zinc chloride, ethylene glycol gives [MP PMT 2004]
(a) Formaldehyde (b) Acetylene
(c) Acetaldehyde (d) Acetone
217. Which of the following compound give yellow precipitate with I_2 and NaOH [Pb. CET 2003]
(a) CH_3OH (b) $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$
(c) $\text{C}_2\text{H}_5\text{OC}_2\text{H}_5$ (d) $\text{CH}_3\text{CH}_2\text{OH}$
218. Amongst the following, HBr reacts fastest with [IIT-JEE 1986; JIPMER 2000; DCE 2003]
(a) Propane-1-ol (b) Propane-2-ol
(c) 2-methyl propane-1-ol (d) 2-methyl propane-2-ol
219. Which of the following react with benzoic acid to form ethyl benzoate [Pb. CET 2001]
(a) Ethyl alcohol (b) Cinnamic acid
(c) Sodium ethoxide (d) Ethyl chloride
220. When phenyl magnesium bromide reacts with t -butanol, the product would be
(a) Benzene (b) Phenol
(c) t -butyl benzene (d) t -butyl ether
221. Which of the following is used as catalyst for preparing Grignard reagent [Pb. CET 2002]
(a) Iron powder (b) Dry ether
(c) Activated charcoal (d) MnO_2
222. Ethyl alcohol is heated with conc. H_2SO_4 . The product formed is [DCE 2004]
(a) $\text{CH}_3 - \overset{\text{O}}{\parallel} \text{C} - \text{OC}_2\text{H}_5$ (b) C_2H_6
(c) C_2H_4 (d) C_2H_2
223. Dehydration of 2-butanol yield [Pb. CET 2004]
(a) 1-butene (b) 2-butene
(c) 2-butyne (d) Both (a) and (b)
224. Fats, on alkaline hydrolysis, gives [MH CET 2003]
(a) Oils (b) Soaps
(c) Detergents (d) Glycol + acid
225. When vapours of an alcohol are passed over hot reduced copper, alcohol is converted into alkene quickly, the alcohol is [CPMT 1985]
(a) Primary (b) Secondary
(c) Tertiary (d) None of these
226. The adduct of the compound 'A' obtained by the reaction with excess of isopropyl magnesium iodide, upon hydrolysis gives a tertiary alcohol. The compound 'A' is [MP PET 1985]
(a) An ester (b) A secondary alcohol
(c) A primary alcohol (d) An aldehyde
227. If there be a compound of the formula $\text{CH}_3\text{C}(\text{OH})_3$ which one of the following compounds would be obtained from it without reaction with any reagent [CPMT 1983]
(a) CH_3OH (b) $\text{C}_2\text{H}_5\text{OH}$
(c) CH_3COOH (d) HCHO
228. Which of the following can work as a dehydrating agent for alcohols [BHU 1980]
(a) H_2SO_4 (b) Al_2O_3
(c) H_3PO_4 (d) All of these
229. What is formed when glycerol reacts with HI [DCE 2002]
(a) $\begin{array}{c} \text{CH}_2\text{OH} \\ | \\ \text{CHI} \\ | \\ \text{CH}_2\text{OH} \end{array}$ (b) $\begin{array}{c} \text{CH}_2 \\ || \\ \text{CH} \\ | \\ \text{CH}_2\text{I} \end{array}$
(c) $\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_2 \\ | \\ \text{CH}_3 \end{array}$ (d) $\begin{array}{c} \text{CH}_2\text{OH} \\ | \\ \text{C} = \text{O} \\ | \\ \text{CH}_3 \end{array}$
230. The dehydration of 2-methyl butanol with conc. H_2SO_4 gives [UPSEAT 2004]
(a) 2-methyl butene as major product
(b) Pentene
(c) 2-methyl but-2-ene as major product
(d) 2-methyl pent-2-ene
231. Which alcohol reacts with fatty acids to form fats [MP PMT/PET 1988; MP PET 1991]
(a) Ethanol (b) Glycerol
(c) Methanol (d) Isopropanol
232. Which will dehydrate easily [Roorkee 1995]
(a) 3-methyl-2-butanol (b) Ethyl alcohol
(c) 2-methyl propane-2-ol (d) 2-methyl butanol-2
233. $A \xleftarrow[\Delta]{\text{Cu}} \text{CH}_3\text{CH}_2\text{OH} \xrightarrow[\Delta]{\text{Al}_2\text{O}_3} B$. A and B respectively are [RPMT/PET 2000]
(a) Alkene, alkanal (b) Alkyne, alkanal
(c) Alkanal, alkene (d) Alkene, alkyne
234. Which one of the following reactions would produce secondary alcohol [MP PET 1994]
(a) $\text{C}_6\text{H}_5\overset{\text{O}}{\parallel}\text{CCH}_3 \xrightarrow[2.\text{H}^+]{1.\text{CH}_3\text{MgBr}}$
(b) $\text{C}_6\text{H}_5\overset{\text{O}}{\parallel}\text{CCH}_3 \xrightarrow[2.\text{H}^+]{1.\text{LiAlH}_4}$
(c) $\text{CH}_3\text{CHO} \xrightarrow[2.\text{H}^+]{1.\text{LiAlH}_4}$
(d) $\text{CH}_3\overset{\text{O}}{\parallel}\text{CCH}_3 \xrightarrow[2.\text{Br}_2]{1.\text{OH}^-}$
235. On reaction with hot conc. H_2SO_4 , which one of the following compounds loses a molecule of water [CPMT 1989]
(a) CH_3COCH_3 (b) CH_3COOH
(c) CH_3OCH_3 (d) $\text{CH}_3\text{CH}_2\text{OH}$
236. The best method to prepare cyclohexene from cyclohexanol is by using [IIT 2005]
(a) Conc. $\text{HCl} + \text{ZnCl}_2$ (b) Conc. HPO_3
(c) HBr (d) Conc. HCl
237. Which of the following compound is most acidic [BCECE 2005]
(a) CH_4 (b) C_2H_6
(c) $\text{CH} \equiv \text{CH}$ (d) $\text{C}_2\text{H}_5\text{OH}$
238. $\text{C}_2\text{H}_5\text{OH}$ can be differentiated from CH_3OH by

- (a) Reaction with HCl (b) Reaction with NH_3
(c) By iodoform test (d) By solubility in water
239. A compound does not react with 2,4 di-nitrophenyl hydrazine and Na , compound is [UPSEAT 2003]
(a) Acetone (b) Acetaldehyde
(c) CH_3OH (d) $CH_2 = CHOCH_3$
240. Which of the following reaction is correctly represented [Orissa JEE 2005]
- (a)  (b) 
(c)  (d) 
241. Tertiary butyl alcohol gives tertiary butyl chloride on treatment with [Orissa JEE 2005]
(a) Conc. HCl / anhydrous $ZnCl_2$
(b) KCN
(c) $NaOCl$
(d) Cl_2
242.  [DPMT 2005]
(a) 
(b) 
(c) 
(d) 
243. In which of the following reactions carbon carbon bond formation takes place [DPMT 2005]
(a) Cannizzaro (b) Reimer-Tiemann
(c) HVZ reaction (d) Schmidt reaction
244. Reaction of phenol with chloroform/sodium hydroxide to give *o*-hydroxy benzaldehyde involves the formation of [J & K 2005]
(a) Dichloro carbene (b) Trichloro carbene
(c) Chlorine atoms (d) Chlorine molecules
245. Which is not correct [J & K 2005]
(a) Phenol is more acidic than acetic acid
(b) Ethanol is less acidic than phenol
(c) Ethanol has lower boiling point than ethane
(d) Ethyne is a non-linear molecule
2. Glycerol as a triester present in [MP PMT 1990]
(a) Petroleum (b) Kerosene
(c) Vegetable oil and fat (d) Naphtha
3. In presence of air, fermentation of ethyl alcohol by azotobacter bacteria forms [MP PMT 1989]
(a) $CH_2 = CH_2$ (b) C_2H_6
(c) CH_3CHO (d) CH_3COOH
4. Aspirin is also known as [CPMT 1989, 94; MP PET 1995]
(a) Methyl salicylic acid (b) Acetyl salicylic acid
(c) Acetyl salicylate (d) Methyl salicylate
5. Substances used in bringing down the temperature in high fevers are called [DPMT 1983]
(a) Pyretics (b) Antipyretics
(c) Antibiotics (d) Antiseptics
6. When glycol is heated with dicarboxylic acid, the products are
(a) Polyesters (b) Polyethers
(c) Polyethylene (d) No reaction at all
7. Cresol is [BHU 1996]
(a) A mixture of three cresols with little phenol
(b) Used as dye for wood
(c) A soapy solution of cresols
(d) Having an aldehyde group
8. Phenol is used in the manufacture of [AIIMS 1996]
(a) Bakelite (b) Polystyrene
(c) Nylon (d) PVC
9. In cold countries ethylene glycol is added to water in the radiators to [CPMT 1971; NCERT 1971; MP PMT 1993]
(a) Bring down the specific heat of water
(b) Lower the viscosity
(c) Reduce the viscosity
(d) Make water a better lubricant
10. Power alcohol is [KCET 1990]
(a) An alcohol of 95% purity
(b) A mixture of petrol hydrocarbons and ethanol
(c) Rectified spirit
(d) A mixture of methanol and ethanol
11. 4-chloro-3, 5-dimethyl phenol is called [KCET 2003]
(a) Chloramphenicol (b) Paracetamol
(c) Barbital (d) Dettol
12. Alcoholic fermentation is brought about by the action of [CPMT 1977, 79, 88; DPMT 1983]
(a) CO_2 (b) O_2
(c) Invertase (d) Yeast
13. Rectified spirit is a mixture of [DPMT 1982; MP PMT 1976, 77, 96; CPMT 1976, 77, 90; KCET 1990]
(a) 95% ethyl alcohol + 5% water
(b) 94% ethyl alcohol + 4.53% water
(c) 94.4% ethyl alcohol + 5.43 % water
(d) 95.57% ethyl alcohol + 4.43% water
14. Methyl alcohol is toxic. The reason assigned is [RPET 2000]
(a) It stops respiratory track
(b) It reacts with nitrogen and forms CN^- in the lungs
(c) It increases CO_2 content in the blood
(d) It is a reduction product of formaldehyde
15. Glycerol is used [Kurukshetra CET 2002]
(a) As a sweetening agent
(b) In the manufacture of good quality soap
(c) In the manufacture of nitro glycerine
(d) In all of these
16. Glycerol is not used in which of following cases
(a) Explosive making (b) Shaving soap making
(c) As an antifreeze for water (d) As an antiseptic agent

Uses of alcohol, Phenol and Ethers

1. Glycerol is used in the manufacture of [SCRA 1991]
(a) Dynamite (b) Varnish
(c) Paints (d) Soft drinks

17. Liquor poisoning is due to [CPMT 1971]
 (a) Presence of bad compound in liquor
 (b) Presence of methyl alcohol
 (c) Presence of ethyl alcohol
 (d) Presence of carbonic acid
18. In order to make alcohol undrinkable pyridine and methanol are added to it. The resulting alcohol is called
 (a) Power alcohol (b) Proof spirit
 (c) Denatured spirit (d) Poison alcohol
19. Denatured spirit is mainly used as a [MNR 1995; MP PET 2002]
 (a) Good fuel
 (b) Drug
 (c) Solvent in preparing varnishes
 (d) Material in the preparation of oil
20. Main constituent of dynamite is [MP PET 1992; BHU 1979]
 (a) Nitrobenzene (b) Nitroglycerine
 (c) Picric acid (d) TNT
21. Wine (alcoholic beverages) contains [CPMT 1972, 77; BHU 1996; AFMC 2001]
 (a) CH_3OH (b) Glycerol
 (c) C_2H_5OH (d) 2-propanol
22. Tonics in general contain [MNR 1995]
 (a) Ether (b) Methanol
 (c) Ethanol (d) Rectified spirit
23. Widespread deaths due to liquor poisoning occurs due to [DPMT 2001]
 (a) Presence of carbonic acid in liquor
 (b) Presence of ethyl alcohol in liquor
 (c) Presence of methyl alcohol in liquor
 (d) Presence of lead compounds in liquor
24. Diethyl ether finds use in medicine as [KCET 1989]
 (a) A pain killer (b) A hypnotic
 (c) An antiseptic (d) An anaesthetic
25. Washing soap can be prepared by saponification with alkali of the oil [CPMT 1986]
 (a) Rose oil (b) Paraffin oil
 (c) Groundnut oil (d) Kerosene
26. Ether can be used [CPMT 1982]
 (a) As a general anaesthetic (b) As a refrigerant
 (c) In perfumery (d) All of these
27. The Bouveault-Blanc reduction involves [MP PET 1991]
 (a) C_2H_5OH / Na (b) $LiAlH_4$
 (c) $C_2H_5MgX^-$ (d) Zn / HCl
28. Which is used as an antifreeze [AFMC 1992]
 (a) Glycol (b) Ethyl alcohol
 (c) Water (d) Methanol
- (c) 2 and 4 (d) 1 and 2
2. The product 'A' in the following reaction is [MP PMT 2003]

$$\begin{array}{c} H_2C - CH_2 \\ \diagdown \quad \diagup \\ O \end{array} \xrightarrow{RMgI} A$$

 (a) $RCHOHR$ (b) $RCHOH \cdot CH_3$
 (c) $R-CH_2-CH_2-OH$ (d) $R > CHCH_2OH$
3. Glycerol boils at $290^\circ C$ with slight decomposition. Impure glycerine can be purified by [CPMT 1983, 94]
 (a) Steam distillation (b) Simple distillation
 (c) Vacuum distillation (d) Extraction with a solvent
4. Phenol $\xrightarrow{NaNO_2 / H_2SO_4} B \xrightarrow{H_2O} C \xrightarrow{NaOH} D$
 Name of the above reaction is [KCET 2003]
 (a) Liebermann's reaction
 (b) Phthalein fusion test
 (c) Reimer-Tiemann reaction
 (d) Schottenf-Baumann reaction
5. The correct order of boiling point for primary (1°), secondary (2°) and tertiary (3°) alcohols is [CPMT 1999; RPMT 2002]
 (a) $1^\circ > 2^\circ > 3^\circ$ (b) $3^\circ > 2^\circ > 1^\circ$
 (c) $2^\circ > 1^\circ > 3^\circ$ (d) $2^\circ > 3^\circ > 1^\circ$
6. What will be the products of reaction if methoxybenzene reacts with HI
 (a) Methyl alcohol (methanol) + iodobenzene
 (b) Methyl iodide (iodomethane) + benzene
 (c) Methyl iodide + phenol
 (d) Methyl iodide + iodobenzene
7. Ethylene reacts with Baeyer's reagent to give [CPMT 1988]
 (a) Ethane (b) Ethyl alcohol
 (c) Ethylene glycol (d) None of these
8. Which of the following statements is correct regarding case of dehydration in alcohols [CPMT 1980, 85; MP PMT 2001; BHU 2002]
 (a) Primary > Secondary (b) Secondary > Tertiary
 (c) Tertiary > Primary (d) None of these
9. Oxiran is
 (a) Ethylene oxide (b) Diethyl ether
 (c) Ethyl glycolate (d) Glycolic ester
10. Propan-1-ol can be prepared from propene by alcohol [AIIMS 2003]
 (a) H_2O / H_2SO_4
 (b) $Hg(OAc)_2 / H_2O$ followed by $NaBH_4$
 (c) B_2H_6 followed by H_2O_2
 (d) CH_3CO_2H / H_2SO_4
11. Distinction between primary, secondary and tertiary alcohol is done by [MP PMT/PET 1988; RPMT 2000]
 (a) Oxidation method
 (b) Lucas test
 (c) Victor Meyer method
 (d) All of these
12. Oxidation of which of the following by air in presence of vanadium pentoxide gives phenol
 (a) Toluene (b) Benzene
 (c) Benzaldehyde (d) Phenyl acetic acid
13. The most suitable method of the separation of a 1 : 1 mixture of *ortho* and *para* nitrophenols is [CBSE PMT 1994, 99; CPMT 1997]
 (a) Distillation (b) Sublimation
 (c) Crystallization (d) Chromatography
14. Which of the following does not form phenol or phenoxide [AFMC 2000]

Critical Thinking

Objective Questions

1. Which will undergo a Friedel-Craft's alkylation reaction [Pb. PMT 1998]

 (a) 1, 2 and 4 (b) 1 and 3

11. Distinction between primary, secondary and tertiary alcohol is done by [MP PMT/PET 1988; RPMT 2000]
 (a) Oxidation method
 (b) Lucas test
 (c) Victor Meyer method
 (d) All of these
12. Oxidation of which of the following by air in presence of vanadium pentoxide gives phenol
 (a) Toluene (b) Benzene
 (c) Benzaldehyde (d) Phenyl acetic acid
13. The most suitable method of the separation of a 1 : 1 mixture of *ortho* and *para* nitrophenols is [CBSE PMT 1994, 99; CPMT 1997]
 (a) Distillation (b) Sublimation
 (c) Crystallization (d) Chromatography
14. Which of the following does not form phenol or phenoxide [AFMC 2000]

- (a) C_6H_5Cl (b) C_6H_5COOH
(c) $C_6H_5N_2Cl$ (d) $C_6H_5SO_3Na$
15. Which of the following will be obtained by keeping ether in contact with air for a long time [RPMT 2003]
(a) $C_2H_5 - O - CH(CH_3) - O - OH$
(b) $C_2H_5 - OCH_2 - OH$
(c) $C_2H_5 - O - C_2H_5OH$
(d) $CH_3 - OCH(CH_3) - O - OH$
16. When a mixture of ethanol and methanol is heated in the presence of concentrated H_2SO_4 the resulting organic product or products is/are [Manipal MEE 1995]
(a) $CH_3OC_2H_5$
(b) CH_3OCH_3 and $C_2H_5OC_2H_5$
(c) $CH_3OC_2H_5$ and CH_3OCH_3
(d) $CH_3OC_2H_5$, CH_3OCH_3 and $C_2H_5OC_2H_5$
17. In the following groups
 $-OAc$ $-OMe$ $-OSO_2Me$ $-OSO_2CF_3$
 I II III IV
 The order of leaving group ability is [IIT 1997]
 (a) $I > II > III > IV$
 (b) $IV > III > I > II$
 (c) $III > II > I > IV$
 (d) $II > III > IV > I$
18. Epoxides are
(a) Cyclic ethers
(b) Not ethers
(c) Aryl-alkyl ethers
(d) Ethers with another functional group
19. The reaction of $CH_3CH=CH-$  with HBr gives [IIT-JEE 1998]
 (a) $CH_3CHBrCH_2-$ 
 (b) CH_3CH_2CHBr- 
 (c) $CH_3CHBrCH_2-$ 
 (d) CH_3CH_2CHBr- 
20. Which of the following compounds on boiling with $KMnO_4$ (alk.) and subsequent acidification will not give benzoic acid [KCET 2001]
(a) Benzyl alcohol (b) Acetophenone
(c) Anisole (d) Toluene
21. The best reagent to convert pent-3-en-2-ol into pent-3-in-2-one is [AIEEE 2005]
(a) Acidic permanganate
(b) Acidic dichromate
(c) Chromic anhydride in glacial acetic acid
(d) Pyridinium chloro-chromate
22. When alcohol reacts with concentrated H_2SO_4 intermediate compound formed is [AFMC 2005]
(a) Carbonium ion (b) Alkoxy ion
(c) Alkyl hydrogen sulphate (d) None of these

Read the assertion and reason carefully to mark the correct option out of the options given below:

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : A triester of glycerol and palmitic acid on boiling with aqueous $NaOH$ gives a solid cake having soapy touch
Reason : Free glycerol is liberated which is a greasy solid [AIIMS 1996]
2. Assertion : Phenol is a weak acid than ethanol
Reason : Groups with + M effect and - I effect decrease acidity at p-position [AIIMS 2002]
3. Assertion : Phenol is more reactive than benzene towards electrophilic substitution reaction
Reason : In the case of phenol, the intermediate carbocation is more resonance stabilized [IIT-JEE (Screening) 2000]
4. Assertion : Phenol undergo Kolbe reaction, ethanol does not.
Reason : Phenoxide ion is more basic than ethoxide ion. [AIIMS 1994]
5. Assertion : Lucas reagent is a mixture of anhydrous $ZnCl_2$ and concentrate HCl
Reason : Primary alcohol produce ppt. with Lucas reagents. [AIIMS 1995]
6. Assertion : Resorcinol turns $FeCl_2$ solution purple.
Reason : Resorcinol have phenolic group. [AIIMS 2000]
7. Assertion : Glycerol is purified by distillation under reduced pressure.
Reason : Glycerol is a trihydric alcohol.
8. Assertion : Alcohol and phenol can be distinguished by sodium hydroxide.
Reason : Phenol is acidic while alcohol is neutral.
9. Assertion : Alcohols are dehydrated to hydrocarbons in the presence of acidic zeolites.
Reason : Zeolites are porous catalysts.
10. Assertion : The major products formed by heating $C_6H_5CH_2OCH_3$ with HI are $C_6H_5CH_3$, I and CH_3OH .
Reason : Benzyl cation is more stable than methyl cation. [AIIMS 2004]
11. Assertion : The pK_a of acetic acid is lower than that of phenol.
Reason : Phenoxide ion is more resonance stabilized. [AIIMS 2004]
12. Assertion : Alcoholic fermentation involves conversion of sugar into ethyl alcohol by yeast.
Reason : Fermentation involves the slow decomposition of complex organic
13. Assertion : The water solubility of the alcohols follow the order t -butyl > s -butyl alcohol > n -butyl alcohol.
Reason : Alcohols form H-bonding with water to show soluble nature.
- Assertion : Absolute ethanol can be obtained by simple fractional distillation of a mixture of alcohol and water.
Reason : The absolute alcohol boils at $78.3^\circ C$.
15. Assertion : Acid catalysed dehydration of t -butanol is slower than n -butanol.
Reason : Dehydration involves formation of the protonated alcohol, ROH_2^+ .
16. Assertion : Tertiary alcohols give turbidity immediately with Lucas reagent.
Reason : A mixture of conc. HCl + anhydrous $ZnCl_2$ is called Lucas reagent.

Assertion & Reason

For AIIMS Aspirants

17. Assertion : 4-nitrophenol is more acidic than 2, 4, 6-trinitrophenol.
Reason : Phenol is a weaker acid than carbonic acid.
18. Assertion : Phenols cannot be converted into esters by direct reaction with carboxylic acids.
Reason : Electron withdrawing groups increase the acidity of phenols.
19. Assertion : *tert*-butyl alcohol undergoes acid catalysed dehydration readily than propanol.
Reason : 3° alcohols do not give Victor-Meyer's test.
20. Assertion : The ease of dehydration of alcohols follows the order. Primary > Secondary > Tertiary.
Reason : Dehydration proceeds through the formation of oxonium ions.
21. Assertion : Phenol reacts with acyl halides in presence of pyridine to form phenyl acetate.
Reason : Benzoylation of phenol is carried out in the presence of NH_4OH .
22. Assertion : Alcohols are easily protonated than phenols.
Reason : Alcohols undergo intermolecular hydrogen bonding due to the presence of highly electronegative oxygen.
23. Assertion : Phenol is less acidic than *p*-nitrophenol.
Reason : Phenolate ion is more stable than *p*-nitrophenolate ion.
24. Assertion : Treatment of phenol with nitrous acid yields *p*-benzoquinone monoxime.
Reason : *p*-nitrosophenol and *p*-benzoquinone monoxime are tautomers.
25. Assertion : Reimer-Tiemann reaction of phenol with CCl_4 in $NaOH$ at 340 K gives salicylic acid as the major product.
Reason : The reaction occurs through intermediate formation of dichlorocarbene.
26. Assertion : Primary and secondary alcohols can be distinguished by Victor-Meyer's test.
Reason : Primary alcohols form nitrolic acid which dissolve in $NaOH$ to form blood red colouration but secondary alcohols form pseudonitrotes which give blue colouration with $NaOH$.
27. Assertion : HIO_4 cleaves 1, 2-glycols but not 1, 3- or higher glycols.
Reason : Only 1, 2- glycols form cyclic esters which subsequently undergo cleavage to form carbonyl compounds.
28. Assertion : Dehydration of glycerol with $KHSO_4$ gives acrolein.
Reason : Acrolein is an α, β -unsaturated aldehyde.
29. Assertion : Both symmetrical and unsymmetrical ethers can be prepared by Williamson's synthesis.
Reason : Williamson's synthesis is an example of nucleophilic substitution reaction.
30. Assertion : Etherates are coordination complexes of ethers with Lewis acids.
Reason : Ethers are easily cleaved by mineral acids such as HCl and H_2SO_4 at 373 K.
31. Assertion : $(CH_3)_3Br$ and CH_3CH_2ONa react to form $(CH_3)_3C-O-CH_2CH_3$.
Reason : Good yields of ethers are obtained when *tert*-alkyl halides are treated with alkoxides.
32. Assertion : A rate of hydrolysis of methyl chloride to methanol is higher in DMF than in water.
Reason : Hydrolysis of methyl chloride follows second order kinetics. [AIIMS 2005]
33. Assertion : *t*-Butyl methyl ether is not prepared by the reaction of *t*-butyl bromide with sodium methoxide.
Reason : Sodium methoxide is a strong nucleophile. [AIIMS 2005]

AS Answers and Solutions

General introduction of alcohol, Phenol & Ethers

2. (d) 
- 2, 4, 6-trinitrophenol or picric acid
4. (d) $\text{CH}_2 - \text{CH} - \text{CH}_2$ Glycerol is trihydric alcohols.

5. (a) 
- Hydroxy
6. (c) % of C = $\frac{\text{Mass of C}}{\text{Mass of substance}} \times 100$
- $$\text{CCl}_4 = \frac{12}{154} \times 100 = 7.79\%$$
- $$\text{C}_6\text{H}_6\text{Cl}_6 = \frac{72}{291} \times 100 = 24.74\%$$
- $$\text{CH}_2\text{OH} - \text{CH}_2\text{OH} = \frac{24}{62} \times 100 = 38.70\%$$
7. (c)  o-dihydroxy benzene or catechol.
8. (b) 
- one secondary and two primary alcoholic groups.
11. (b) Carbinol is CH_3OH (Methanol).
12. (c) -OH group is attached to primary carbon.
13. (c) 
- (Picric acid) or 2, 4, 6-trinitrophenol
 Picric acid is phenolic while others are non phenolic.
15. (c) Butanal $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CHO}$, an aliphatic aldehyde.
16. (b) 
- Cyclohexanol is a secondary alcohol because -OH group is linked to 2° carbon.

18. (b) $\text{C}_2\text{H}_5\text{OH}$ and $\text{CH}_3 - \text{O} - \text{CH}_3$ are isomers.
20. (b) 5-10 % methyl and remaining ethanol is called methylated spirit. It is also known as denatured alcohol because it is unfit for drinking.

- cyclohexanol
23. (a) 5% aqueous solution of phenol at room temperature is called as carbolic acid.
25. (b) Glycols are dihydric alcohols (having two hydroxyl groups). Ethylene glycol is the first member of this series.
- 
- (Ethylene glycol)
26. (a) Methanol is also referred as wood alcohol or wood spirit or wood naphtha as the earliest method for its preparation was by destructive distillation of wood.
34. (b) Ether is basic because lone pairs of electrons are present on oxygen atom, $\text{R} - \ddot{\text{O}} - \text{R}$.
39. (a) Thio alcohol is known as mercaptans.

Preparation of alcohol, Phenol and Ethers

1. (c) Hydration of alkenes
- $$\text{CH}_2 = \text{CH}_2 + \text{HHSO}_4 \rightarrow \text{CH}_3 - \text{CH}_2 - \text{HSO}_4$$
- $$\text{CH}_3 - \text{CH}_2\text{HSO}_4 \xrightarrow[\text{Boil}]{\text{H}_2\text{O}} \text{CH}_3 - \text{CH}_2 - \text{OH} + \text{H}_2\text{SO}_4$$
- Fermentation of sugars:
- $$\text{C}_{12}\text{H}_{22}\text{O}_{11} + \text{H}_2\text{O} \xrightarrow{\text{Invertase}} \text{C}_6\text{H}_{12}\text{O}_6 + \text{C}_6\text{H}_{12}\text{O}_6$$
- Glucose Fructose
- $$\text{C}_6\text{H}_{12}\text{O}_6 \xrightarrow[\text{Glucose or Fructose}]{\text{Zymase}} 2\text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2$$
2. (c) $\text{CH}_2 = \text{CH}_2 \xrightarrow{\text{H}_2\text{SO}_4} \text{CH}_3 - \text{CH}_2 - \text{HSO}_4 \xrightarrow{\text{Hydrolysis}} \text{CH}_3\text{CH}_2 - \text{OH} + \text{H}_2\text{SO}_4$
3. (b) Hydroboration oxidation (Industrial preparation of alcohol)
- $$3\text{CH}_3\text{CH} = \text{CH}_2 + \frac{1}{2} \text{B}_2\text{H}_6 \xrightarrow[\text{ether}]{\text{Dry}} (\text{CH}_3\text{CH}_2\text{CH}_3)_3\text{B}$$
- $$(\text{CH}_3\text{CH}_2\text{CH}_3)_3\text{B} \xrightarrow{\text{H}_2\text{O}_2} 3\text{CH}_3\text{CH}_2\text{CH}_2 - \text{OH}$$
4. (c) 
- $$\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{OH} + \text{Mg} \begin{matrix} \nearrow \text{I} \\ \searrow \text{OH} \end{matrix}$$
- Propyl alcohol
5. (d) Starch $\xrightarrow{\text{Enzymes}}$ Alcohol
6. (c) Coconut oil + Alkali $\rightarrow$ Soap + Glycerol
 It is a saponification reaction.
7. (c) $\text{C}_6\text{H}_{12}\text{O}_6 \xrightarrow{\text{Zymase}} 2\text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2$
 Glucose or Fructose Ethyl alcohol

8. (d)  Benzylchloride
9. (a) $2(C_6H_{10}O_5)_n + nH_2O \xrightarrow[\text{(from germinated barley)}]{\text{Diastase}} n(C_{12}H_{22}O_{11})$
 $C_{12}H_{22}O_{11} + H_2O \xrightarrow[\text{(from yeast)}]{\text{Maltase}} 2C_6H_{12}O_6$
 $C_6H_{12}O_6 \xrightarrow[\text{(from yeast)}]{\text{Zymase}} 2C_2H_5OH + 2CO_2$
10. (b) 
11. (c) 
12. (c) $CH_3COOH + 4H \xrightarrow{LiAlH_4} CH_3CH_2OH + H_2O$
13. (b) $\begin{matrix} H \\ \diagup \\ C=O \\ \diagdown \\ H \end{matrix} \xrightarrow{CH_3MgI} \begin{matrix} CH_2-O-MgI \\ | \\ CH_3 \end{matrix} \xrightarrow{\text{Hydrolysis}} CH_3-CH_2-OH + Mg \begin{matrix} I \\ \diagup \\ OH \end{matrix}$
14. (b) 
15. (d) 
16. (c) $C_2H_5ONa + IC_2H_5 \rightarrow C_2H_5OC_2H_5 + NaI$
17. (b) 
18. (c) $HCHO + HCHO \xrightarrow{\text{Conc. KOH}} \begin{matrix} CH_3OH \\ \text{Methyl alcohol} \end{matrix} + \begin{matrix} HCOOK \\ \text{Potassium formate} \end{matrix}$
 It is cannizzaro's reaction.
19. (d) Alcohol + Benzene $\xrightarrow{\text{(dry)}}$ Soluble
 (Alcohol) $R-OH + Na \rightarrow R-ONa + H_2$
21. (c) $\underbrace{CO + H_2}_{\text{water gas}} + H_2 \xrightarrow[672 \text{ K, 200 atm}]{Cr_2O_2 / ZnO} CH_3OH$
23. (c) 

24. (c) $C_{12}H_{22}O_{11} + H_2O \xrightarrow[\text{(from yeast)}]{\text{Maltase}} 2C_6H_{12}O_6$
 Maltose Glucose
26. (d) Grignard reagent reacts with compounds containing multiple bonds like
 $>C=O$, $>C=S$, $>C \equiv N$.
28. (d) Acetone reacts with Grignard's reagent to give tertiary alcohol.
 $(CH_3)_2C=O + CH_3MgBr \xrightarrow{H_2O} (CH_3)_3C-OH$
 ter-butyl alcohol
29. (b) $C_2H_5MgBr + H_2C \begin{matrix} \diagup \\ O \\ \diagdown \end{matrix} CH_2 \xrightarrow{H_2O} C_2H_5CH_2CH_2OH + MgBr(OH)$
 (A)
 n-butyl alcohol
30. (a)  Phenol
31. (b)  Phenol
32. (b) $\begin{matrix} H \\ \diagup \\ C=O \\ \diagdown \\ H \end{matrix} + C_2H_5MgI \rightarrow \begin{matrix} CH_2-O-MgI \\ | \\ C_2H_5 \end{matrix} \xrightarrow{\text{Hydrolysis}} C_2H_5-CH_2-OH \text{ or } C_3H_7OH + Mg \begin{matrix} I \\ \diagup \\ OH \end{matrix}$
35. (d) $RMgBr + O_2 \rightarrow R-OMgBr \xrightarrow{\text{hydrolysis}} R-OH + Mg \begin{matrix} Br \\ \diagup \\ OH \end{matrix}$
 Grignard reagent Alcohol
39. (b) $C_6H_{12}O_6 \xrightarrow{\text{Zymase}} 2C_2H_5OH + 2CO_2$
 Glucose
 During fermentation CO_2 gas is eliminated.
40. (c) $C_2H_5-NH_2 + HNO_2 \rightarrow C_2H_5OH + N_2 + H_2O$
41. (b)  Benzylaldehyde Benzyl alcohol
42. (a) $CO + H_2 \xrightarrow[573 \text{ K, 200 atm}]{CuO-ZnO-Cr_2O_3} CH_3OH$
 Methanol
43. (a) $CH_3-CH=C \begin{matrix} \diagup \\ CH_3 \\ \diagdown \end{matrix} + H_2O \xrightarrow{H_2SO_4} \begin{matrix} CH_3-CH_2-CH_2-CH_3 \\ | \\ CH_3 \end{matrix}$
 2 methyl 2butene Markownikoff rule

It is a Williamson's synthesis reaction.

If we take moist Ag_2O then alcohol is formed

53. (d) When chlorine is passed in boiling toluene, substitution inside chain takes place and benzyl chloride is obtained which on hydrolysis give benzyl alcohol.

55. (c) Ethanal with CH_3MgBr gives propanol-2 (after hydrolysis) and with $\text{C}_2\text{H}_5\text{OH}$, it gives acetal.

59. (b) NaBH_4 and LiAlH_4 attacks only carbonyl group and reduce it into alcohol group. They do not attack on double bond.

Since on oxidation same no. of carbon atoms are obtained in as therefore alcohol is primary

21. (b) Glycerol undergoes extensive hydrogen bonding due to the presence of 3 -OH groups. As a result the glycerol molecules are highly associated and thus it has high viscosity.

39. (c)

47. (c) Alcohols having less number of carbon atoms are more soluble in water.

53. (b) Higher alcohols are stronger and have bitter taste.

54. (c) Order of reactivity with alkali metal (e.g., -Sodium) follows the order $1^\circ > 2^\circ > 3^\circ$.

61. (d) Due to hydrogen bonding.

66. (b) Tertiary alcohol readily reacts with halogen acid

Presence of 3 alkyl group increases electron density on 3° carbon atom. Hence $-\text{OH}$ group is easily removed. After the removal of $-\text{OH}$ group 3° carbonium ion is formed which is most stable

68. (b) Lower alcohols are soluble in all solvents.

70. (b) Due to the resonance stabilisation of phenoxide ion.

77. (a) Lucas test is used for the distinction of primary secondary and tertiary alcohols.

78. (a) $+ NH_3 \xrightarrow[300^\circ C]{ZnCl_2} + H_2O$
80. (a) A compound that undergoes bromination easily is phenol. Due to presence of $-OH$ group the ring becomes much more active in substitution reactions. The bromination occurs due to availability of electrons on ortho and para position.
81. (c) *o*-Nitrophenol has intramolecular *H*-bonding.
84. (b) C_2H_5OH gives iodoform test having α -hydrogen atom while CH_3OH does not give due to the absence of α -hydrogen atom.
85. (c) Phenol has higher boiling point than toluene because of hydrogen bonding.
87. (b) $CH_3-CH=CH_2 + aq. KOH \rightarrow CH_3-CH_2-CH_2OH$
Propene-1 Propanol-1
88. (d) $C_2H_5OH + PCl_5 \rightarrow C_2H_5Cl \xrightarrow{KCN} C_2H_5CN$
 $\downarrow HCl/H_2O$
 C_6H_5COOH

89. (b) $LiAlH_4$ + ether, is reducing agent.

102. (c) Phenol is weaker acid than carbonic acid

$$C_6H_5OH \quad H_2CO_3 \quad CH_3COOH$$

$$K_a = 10^{-8} - 10^{-10}, \quad K_a = 10^{-7}, \quad K_a = 10^{-5}$$

In presence of non-polar solvent (CS_2) the ionization of phenol is suppressed. The ring is slightly activated and hence mono substitution occurs.

On the other hand with Br_2 water phenol forms 2,4,6-tribromo phenol.

In aqueous solution phenol ionizes to give phenoxide ion. Due to the presence of negative charge on oxygen the benzene ring is highly activated and hence trisubstituted product is obtained.

112. (b) Carbylamine reaction

113. (a) Secondary alcohol on dehydrogenation gives acetone

In aq. solution phenol ionize to give phenoxide in which highly activates benzene ring and give trisubstituted product while in presence of CS₂ an inert solvent phenol is unable to ionize due to which benzene ring is slightly activated. Hence, monosubstituted product is obtained.

122. (d) Traces of water from ethanol is removed by reacting with Mg metal.

Iodoform test is given by compounds in which CH₃-CH(OH)- or CH₃-C(=O)- group is present.

1 mole 3 moles 1 mole
94 grams of phenol reacts with 480 gms. of Br₂.

$$2 \text{ gm. of phenol} - \frac{480}{94} \times 2 = 10.22 \text{ gms.}$$

131. (b) CH₃OH has highest boiling point because of hydrogen bonding.

Formic acid forms dimer due to which strength of H-bond increases. Hence, boiling point increases.

133. (c) Lower members are soluble in water and solubility decreases with increasing molecular mass because hydrophobic character increases.

135. (d) Alcohols can not be dried using anhydrous CaCl₂ because it forms an addition compound CaCl₂·4CH₃OH.

137. (b)

Presence of methyl group increases electron density at o- and p- positions. Hence, it undergoes nitration readily.

1246 Alcohol, Phenol and Ethers

group increases electron density at *o*- and *p*-positions.

155. (b) Secondary alcohol on dehydrogenation gives acetone

157. (d) 2,4,6 Trinitro toluene (TNT)

168. (b) Tertiary carbonium ion is the most stable and it will be given by dehydration of tertiary alcohol.

170. (b) $\text{C}_2\text{H}_5\text{OH}$ is soluble in water due to *H*-bonding.

173. (b) When ethanol dissolves in water then emission of heat and contraction in volume.

175. (a) Azeotropic distillation method –
 Rectified spirit + Benzene + water
 ↓ Fractional distillation

First fraction at 331.8 K is ternary azeotrope

(H_2O 7.4% + Benzene 74% + alcohol 18.5%)

Second fraction 341.2 K is a binary azeotrope

(Benzene 67.7% + Alcohol 32.2%)

Last fraction at 351K is absolute alcohol.

180. (c) Alcohol is soluble in water due to *H*-bonding

Oxidation will occur with chlorination of methyl group.

186. (c) Benzyl alcohol and cyclohexanol are not acidic while phenol and *m*-chlorophenol are acidic due to presence of electron withdrawing groups like $-\text{NO}_2$, $-\text{Cl}$, $-\text{CN}$ increases the acidic character of phenols. Hence, *m*-chlorophenol is more acidic than phenol.

187. (b) Three, these are

$\text{CH}_3\text{CH}_2\text{OCH}_2\text{CH}_3$ (I), $\text{CH}_3\text{OCH}_2\text{CH}_2\text{CH}_3$ (II)
 and $\text{CH}_3\text{OCH}(\text{CH}_3)_2$ (III). Here I and II, I and III are pairs of metamers.

189. (c) CH_3OCH_3 and $\text{C}_2\text{H}_5\text{OCH}_3$ are gases while $\text{C}_2\text{H}_5\text{OC}_2\text{H}_5$ (b.p. 308 K) is low boiling liquid.

190. (a) $\text{C}_2\text{H}_5\text{OC}_2\text{H}_5 \xrightarrow[\text{Cleavage of ethers}]{\text{Red P / HI}} 2\text{C}_2\text{H}_5\text{I} \xrightarrow[\text{Reduction}]{\text{Red P / HI}} 2\text{C}_2\text{H}_6$
Ethane

191. (d) $\text{C}_2\text{H}_5\text{OC}_2\text{H}_5 + \text{O}_2 \rightarrow \text{CH}_3 - \underset{\substack{| \\ \text{O} - \text{OH} \\ \text{Ether peroxide}}}{\text{CH}} - \text{O} - \text{C}_2\text{H}_5$

192. (a) $\text{C}_2\text{H}_5\text{OC}_2\text{H}_5 + \text{HI} \rightarrow \text{C}_2\text{H}_5\text{OH} + \text{C}_2\text{H}_5\text{I}$

193. (a) 

196. (d) $\text{R}-\underset{\substack{| \\ \text{H}}}{\text{C}}=\text{O} + \text{R}'\text{OH} \xrightarrow{\text{Dry HCl}} \text{R}-\underset{\substack{| \\ \text{H}}}{\text{C}}(\text{OH})(\text{OR}')$
 $\xrightarrow[\text{Acetal}]{\text{Dry HCl, R'OH}} \text{R}-\underset{\substack{| \\ \text{H}}}{\text{C}}(\text{OR}')_2$

198. (b) $\text{CH}_3 - \text{O} - \text{CH}_3 + 2\text{HI} \rightarrow 2\text{CH}_3\text{I} + \text{H}_2\text{O}$

199. (b) Only alkyl aryl ethers e.g., $\text{C}_6\text{H}_5\text{OCH}_3$ undergoes electrophilic substitution reactions.

200. (a) $\text{CH}_3\text{COCl} + \text{C}_2\text{H}_5\text{O} - \text{C}_2\text{H}_5 \rightarrow \text{No reaction}$

201. (b) 

202. (c) $\text{R}-\text{O}-\text{R} \xrightarrow{\text{BF}_3} \text{R}-\underset{\substack{| \\ \text{R}}}{\text{O}}: \rightarrow \text{BF}_3$
Etherate

203. (d) Due to inter-molecular hydrogen bonding in alcohols boiling point of alcohols is much higher than ether.

205. (b) $\text{CH}_3 - \text{OCH}_3$ does not have replaceable H-atom.

206. (a) $\text{CH}_3 - \underset{\substack{| \\ \text{CH}_3}}{\text{C}}(\text{CH}_3) - \text{O} - \text{CH}_3 + \text{H}_2 \rightarrow \text{CH}_3\text{I} + (\text{CH}_3)_3\text{COH}$

207. (b) $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}_3 \xrightarrow{\text{Conc. H}_2\text{SO}_4} \text{CH}_3\text{CH}=\text{CHCH}_3$
(C_4H_8)

$\text{CH}_3\text{CHOHCH}_2\text{CH}_3 \xrightarrow{[\text{O}]} \text{CH}_3\text{COCH}_2\text{CH}_3$
2-Butanol Butanone

Butanone gives both an oxime and positive iodoform test, therefore, the original compound is 2-butanol.

208. (b) $\text{CH}_2\text{OH} + 2\text{PCl}_5 \rightarrow \text{CH}_2\text{Cl} + 2\text{POCl}_3 + 2\text{HCl}$
Ethylene glycol 1, 2 dichloroethane

209. (b) $\text{C}_2\text{H}_5\text{OH}$ (ethanol) is a very weak acid hence it does not react with NaOH . However it reacts with metallic sodium.

210. (b) Methanol has high boiling point than methyl thiol because there is intermolecular hydrogen bonding in methanol and no hydrogen bonding in methyl thiol.

211. (a) $\text{CH}_2\text{OH} + \text{COOH} \xrightarrow{110^\circ\text{C}} \text{CH}_2\text{O}-\text{C}(=\text{O})-\text{OH}$
Glycerol oxalic acid Glycerol acid oxalate
 $\xrightarrow{-\text{CO}_2} \text{CH}_2\text{O}-\text{C}(=\text{O})-\text{H}$
Glycerol monoformate

212. (a) Formation of a yellow precipitate on heating a compound with an alkaline solution of iodine is known as iodoform reaction. Methyl alcohol does not respond to this test. Iodoform test is exhibited by ethyl alcohol, acetaldehyde, acetone, methyl ketone and those alcohols which possess $\text{CH}_3\text{CH}(\text{OH})-$ group.

213. (b) In Friedel-Crafts acylation, aromatic compounds such as benzene, phenol etc. undergo acylation with CH_3COCl in the presence of anhydrous AlCl_3 and gives ortho and para derivatives. Intermediate is $\text{CH}_3\text{C}^+ = \text{O}$ (acylium ion) of this reaction.

In fact denotes Friedel-Crafts alkylation.

214. (a) This reaction is known as Reimer-Tiemann reaction.

215. (a) $\text{COOH} + \text{CH}_2\text{OH} \xrightarrow{380^\circ\text{K}} \text{HCOOH} + \text{CO}_2 \uparrow$
oxalic acid Glycerol Formic acid

$\text{COOH} + \text{CH}_2\text{OH} \rightarrow \text{CH}_2\text{OCO} + \text{CHO} \xrightarrow{-2\text{CO}_2} \text{CH}_2$
oxalic acid Glycerol Dioxalin Allyl alcohol

Thus at 530 K allyl alcohol is formed.

216. (c) $\text{CH}_2\text{OH} \xrightarrow[\text{-H}_2\text{O}]{\text{anh. ZnCl}_2} \text{CH}_3\text{CHO}$
Acetaldehyde

217. (d) Ethyl alcohol gives positive iodoform test (i.e. yellow ppt. with I_2 and NaOH)

1248 Alcohol, Phenol and Ethers

218. (d) Tertiary alcohols react fastest with hydrogen halides
2 methyl propan-2-ol is a tertiary alcohol.

219. (a) When benzoic acid reacts with ethyl alcohol in the presence of sulphuric acid ethyl benzoate is formed. This is known as esterification.

222. (a) Ethyl alcohol on dehydration with conc. H_2SO_4 at $170^\circ C$ gives ethylene.

224. (b) Fats are esters of higher fatty acids with glycerol, hence on alkaline hydrolysis they give back glycerol and sodium or potassium salt of acid (this is called soap).

If two or more $-OH$ groups are present on carbon atom then it immediately loses water molecule and forms acid or aldehyde.

Two $-OH$ groups on the same carbon aldehyde is formed

Three $-OH$ groups on the same carbon acid is formed.

228. (d) H_2SO_4 , Al_2O_3 and H_3PO_4 all can act as dehydrating agent.

Because conc. H_3PO_4 acts as a dehydrating agent.

239. (d) It is not acetaldehyde or acetone as does not react with hydrazine. It is not CH_3OH as does not react with Na .

240. (a) The ether molecule gets protonated by the hydrogen of the acid to form protonated ether or oxonium salt.

Protonated ether

The protonated ether undergoes nucleophilic attack by halide ion (X^-) and forms alkyl alcohol and alkyl halide

11. (d) Distinction between primary, secondary and tertiary alcohol is done by all three methods : oxidation, Victor Meyer and Lucas test.

13. (a) *o*- and *p*-nitrophenols are separated by steam distillation because *o*-nitrophenol is steam volatile while *p*-isomer is not.

14. (b) Benzoic acid.

15. (a) $R-O-R' \xrightarrow{O_2 / \text{light}}$

16. (d) $CH_3OH + CH_3OH \xrightarrow{H_2SO_4 (Conc)} CH_3OCH_3$

17. (b) IV > III > I > II.

18. (a) Cyclic ethers are called epoxides. 

19. (b) $CH_3-CH=CH-\text{C}_6\text{H}_4-OH \xrightarrow{HBr}$
 $CH_3-CH_2-CH(\text{Br})-\text{C}_6\text{H}_4-OH$

20. (c)  on $KMnO_4$ oxidation does not give benzoic acid.

21. (c) Chromic anhydride in glacial acetic acid is the best reagent to convert pen-3-en-2-ol into pent-3-in-2-one.

Protonated alcohol

carbonium ion

In all cases intermediate is carbonium ion, and there may be 1, 2-hydride or 1, 2-methyl shift to form more stable carbonium ion.

Assertion & Reason

3. (a) It is correct that phenol is more reactive than benzene.
4. (c) It is correct that sodium phenoxide (sodium salt of phenol) and CO_2 on heating from sodium salicylate. This is known as Kolbe's reaction. Ethanol does not respond to this reaction. Therefore, assertion is true. But the reason that phenoxide ion is more basic than ethoxide ion is not correct.

5. (c) Lucas reagent is a mixture of anhydrous $ZnCl_2$ and conc. HCl is used for the distinction of monohydric alcohol. Tertiary alcohols on addition produce a precipitate immediately while secondary alcohols produce ppt. after 5 minutes. Primary alcohols do not produce any precipitate. Therefore, assertion is true but reason is false.

6. (a) Phenols on treatment with neutral $FeCl_3$ solution produce purple colour, resorcinol contains phenolic group hence in treatment with $FeCl_3$ solution it gives purple colour. Here both assertion and reason are correct and reason is a correct explanation of assertion.

7. (b) Glycerol is purified by distillation under reduced pressure because it decomposes on heating below its melting point. It is a trihydric alcohol. Here, both assertion and reason are true but reason is not a correct explanation of assertion.

8. (a) Alcohols and phenols can be distinguished by treating with $NaOH$. Phenols react with $NaOH$ to produce sodium phenoxide because phenols are acidic and alcohols are neutral. Both assertion and reason are true and reason is correct explanation.

9. (b) Zeolites are shape-selective porous solid acid catalysts, their catalytic activity originates from the presence of highly acidic $Al-O(H)-Si$ hydroxyl in the framework.

10. (a) $C_6H_5CH_2OCH_3 \xrightarrow{H^+} C_6H_5CH_2^+ + CH_3OH$

This can be explained on the basis of S_N1 mechanism. The carbonium ion produced being benzylium ion. Since this type is more stable than alkylm ion.

11. (c) Lower the value of pK_a , more acidic will be the compound. Acetic acid is more acidic than phenol. This indicates that carboxylate ion should be more stable than the phenoxide ion and it is clear that carboxylate ion has more equivalent resonating structures than the phenoxide ion.

12. (a) The conversion of sugar into ethyl alcohol by yeast is called alcoholic fermentation.

13. (b) The tendency to show *H*-bonding decreases with increasing hydrophobic character of carbon chain. The hydrophobic character of carbon chain increases with the length of carbon chain.

14. (e) Ethyl alcohol forms azeotropic mixture with water which distils with unchanged composition (about 75% ethanol) and thus absolute alcohol cannot be obtained by simple distillation.

15. (e) The dehydration of *t*-butanol involves the formation of 3° carbocation which is more stable than 1° carbocation in *n*-butanol. Thus, tendency to lose water becomes more in *t*-butanol.

16. (c) A mixture of conc. HCl + anhyd. $ZnCl_2$ is called Lucas reagent.

17. (e) Electron withdrawing groups such as $-\text{NO}_2$, $-\text{CN}$, $-\text{X}$, increase the acidity. Greater the number of electron withdrawing groups more is the acidic character i.e. 2, 4, 6-trinitrophenol is more acidic than 4-nitrophenol.
18. (b) Phenols cannot be converted into esters by direct reaction with carboxylic acids since phenols are less nucleophilic than alcohols.
19. (b) Alcohol which forms the more stable carbocation undergoes dehydration more readily. Since tert-butyl alcohol forms more stable tert-butyl cation, therefore, it undergoes dehydration most readily than propanol.
20. (e) The ease of dehydration of alcohols can be explained on the basis of stability of the intermediate carbocation. Greater the stability of the carbocation formed, greater will be the rate of reaction. The order of stability of carbocation formed is

This is due to the electron releasing (+I) effect of the alkyl group. Therefore the ease of dehydration of alcohols follows the order.

Tertiary > secondary > primary alcohol.

21. (c) Benzoylation in phenols is usually carried out in the presence of aqueous NaOH because benzoyl chloride is not readily hydrolysed by alkalies.
22. (b) In phenols, the lone pairs of electrons on the oxygen atom are delocalised over the benzene ring due to resonance and hence are not easily available for protonation. On the other hand, in alcohols, the lone pairs of electrons on oxygen atom are localized due to the absence of resonance and hence are easily available for protonation.

23. (c) *p*-Nitrophenolate ion is more stable than phenolate ion.
24. (b) Nitrous acid gives nitrosamine ion (NO^+) which attacks phenol at less hindered *p*-position of form *p*-nitrosophenol which is a tautomer of *p*-benzoquinone monoxide.

25. (c) Nucleophilic attack of phenolate ion through the ortho-carbon atom occurs on CCl_4 to form an intermediate which on hydrolysis gives salicylic acid.
26. (a) Victor-Meyer's test is used to distinguish primary, secondary and tertiary alcohols.

28. (b) Removal of two molecules of water gives a product which tautomerises to yield acrolein-an α , β -unsaturated aldehyde.
29. (b) Depending upon whether the alkyl halide and the alkoxide ion carry the same or different alkyl groups both symmetrical and unsymmetrical ethers can be prepared by Williamson's synthesis.
30. (c) Ethers being Lewis bases form etherates with Lewis acids.
31. (d) $(\text{CH}_3)_3\text{CONa}$ and $\text{CH}_3\text{CH}_2\text{Br}$ react to form $(\text{CH}_3)_3\text{C}-\text{O}-\text{CH}_2\text{CH}_3$. Good yields of ethers are obtained when primary alkyl halides are treated with alkoxides derived from any alcohol. 1°, 2° or 3°.

Alcohol, Phenol and Ether

Self Evaluation Test -26

2. Phenol is more acidic than [Pb. CET 2003]

3. In the reaction, $\text{C}_6\text{H}_5\text{CHO} + (\text{CH}_3\text{CO})_2\text{O} \xrightarrow{\text{CH}_3\text{COONa}} \text{A}$ product (A) is [Pb. CET 2000]

4. The correct order of ease of dehydration of following is [CPMT 2004]

5. PCl_5 reacts with a compound containing [Pb. CET 2002]

6. Cumene process is the most important commercial method for the manufacture of phenol. Cumene is [KCET 2004]

7. The compound X in the reaction [Roorkee 1999]

is

8. Reaction

is called

[MP PET 2003]

9. When phenol is reacted with CHCl_3 and NaOH followed by acidification, salicylaldehyde is obtained. Which of the following species are involved in the above mentioned reaction as intermediate [DCE 2000]

10. The order of solubility of alkanols in water is

11. In the following compounds

The order of acidity is

[IIT-JEE 1996]

12. Butanal with dilute NaOH gives

[UPSEAT 2000]

13. The correct order of the solubility of the different alcohols in water is [Pune CET 1998]

- (a) *n*-propyl alcohol > ethyl alcohol > *n*-butyl alcohol
 (b) Ethyl alcohol > *n*-butyl alcohol > *n*-propyl alcohol
 (c) *n*-butyl alcohol > *n*-propyl alcohol > ethyl alcohol
 (d) Ethanol > *n*-propanol > *n*-butyl alcohol

14. Which one of the following will most readily be dehydrated in acidic condition [IIT-JEE (Screening) 2000]

15. Which of the following compounds will be most easily attacked by an electrophile [CBSE PMT 1998, 99]

- (c) (d)

16. Fittig's reaction produces

- (a) Alkane (b) Alcohol
 (c) Diphenyl (d) Diethyl ether

17. *p*-cresol reacts with chloroform in alkaline medium to give the compound A which adds hydrogen cyanide to form, the compound B. The latter on acidic hydrolysis gives chiral carboxylic acid. The structure of the carboxylic acid is

[AIEEE 2005]

AS Answers and Solutions

(SET -26)

1. (c) The reaction sequence is as follows

2. (d) Methoxy group due to +I effect increase electron density on OH-group, thus making it less acidic. Thus *o*-methoxy phenol and acetylene are less acidic than phenol, *p*-nitrophenol is more acidic than phenol
3. (b) Perkin reaction is the condensation reaction in which an aromatic aldehyde is heated with an aromatic aldehyde is heated with an anhydride of an aliphatic acid in presence of sodium salt of same acid to form α, β unsaturated acid.

4. (b) The correct order of stability of carbocation is as follows

5. (b) PCl_5 is used in organic chemistry to replace the $-\text{OH}$ group by $-\text{Cl}$ and carbonyl oxygen by $(-\text{Cl}_2)$.

8. (a) It is Lederer Manasse reaction.

10. (b) Propanol > Butanol > Pentanol
The solubility of alcohols in water decreases as the molecular mass increases. As the size of alkyl group increases, hydrophobic character increases, Hence solubility decreases.
11. (d) IV > III > I > II.
 $-\text{NO}_2$ group is electron withdrawing group while $-\text{CH}_3$ group is electron releasing group.
12. (d) $2\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CHO} + \text{dil. NaOH} \rightarrow$

13. (d) Ethanol > *n*-propanol > *n*-butyl alcohol
Solubility of alcohols in water decreases as the size of alkyl group increases because tendency to form hydrogen bonding decreases.
14. (a) Aldols (β -hydroxy aldehydes or β -hydroxy ketones) readily undergo dehydration to form α, β -unsaturated aldehydes or ketones.

15. (c) Phenol is most easily attacked by an electrophile because presence of $-\text{OH}$ group increases electron density at *o*- and *p*-positions.

AS Answers and Solutions

General introduction of alcohol, Phenol & Ethers

2. (d) 
- 2, 4, 6-trinitrophenol or picric acid
4. (d)  Glycerol is trihydric alcohols.
5. (a) 
- Hydroxy toluene
6. (c) $\% \text{ of C} = \frac{\text{Mass of C}}{\text{Mass of substance}} \times 100$
- $$\text{CCl}_4 = \frac{12}{154} \times 100 = 7.79\%$$
- $$\text{C}_6\text{H}_6\text{Cl}_6 = \frac{72}{291} \times 100 = 24.74\%$$
- $$\text{CH}_2\text{OH} - \text{CH}_2\text{OH} = \frac{24}{62} \times 100 = 38.70\%$$
7. (c)  o-dihydroxy benzene or catechol.
8. (b) 
- one secondary and two primary alcoholic groups.
11. (b) Carbinol is CH_3OH (Methanol).
12. (c) -OH group is attached to primary carbon.
13. (c) 
- (Picric acid is phenolic while others are non phenolic.)
15. (c) Butanal $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CHO}$, an aliphatic aldehyde.
16. (b) 
- Cyclohexanol is a secondary alcohol because -OH group is linked to 2° carbon.
18. (b) $\text{C}_2\text{H}_5\text{OH}$ and $\text{CH}_3 - \text{O} - \text{CH}_3$ are isomers.

20. (b) 5-10 % methyl and remaining ethanol is called methylated spirit. It is also known as denatured alcohol because it is unfit for drinking.

23. (a) 5% aqueous solution of phenol at room temperature is called as carbolic acid.
25. (b) Glycols are dihydric alcohols (having two hydroxyl groups). Ethylene glycol is the first member of this series.

26. (a) Methanol is also referred as wood alcohol or wood spirit or wood naphtha as the earliest method for its preparation was by destructive distillation of wood.

34. (b) Ether is basic because lone pairs of electrons are present on oxygen atom, $\text{R} - \ddot{\text{O}} - \text{R}$.

39. (a) Thio alcohol is known as mercaptans.

Preparation of alcohol, Phenol and Ethers

1. (c) Hydration of alkenes
- $$\text{CH}_2 = \text{CH}_2 + \text{HHSO}_4 \rightarrow \text{CH}_3 - \text{CH}_2 - \text{HSO}_4$$
- $$\text{CH}_3 - \text{CH}_2\text{HSO}_4 \xrightarrow[\text{Boil}]{\text{H}_2\text{O}} \text{CH}_3 - \text{CH}_2 - \text{OH} + \text{H}_2\text{SO}_4$$
- Fermentation of sugars:
- $$\text{C}_{12}\text{H}_{22}\text{O}_{11} + \text{H}_2\text{O} \xrightarrow{\text{Invertase}} \text{C}_6\text{H}_{12}\text{O}_6 + \text{C}_6\text{H}_{12}\text{O}_6$$
- Glucose Fructose
- $$\text{C}_6\text{H}_{12}\text{O}_6 \xrightarrow[\text{Glucose or Fructose}]{\text{Zymase}} 2\text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2$$
2. (c) $\text{CH}_2 = \text{CH}_2 \xrightarrow{\text{H}_2\text{SO}_4} \text{CH}_3 - \text{CH}_2 - \text{HSO}_4 \xrightarrow{\text{Hydrolysis}} \text{CH}_3\text{CH}_2 - \text{OH} + \text{H}_2\text{SO}_4$
3. (b) Hydroboration oxidation (Industrial preparation of alcohol)
- $$3\text{CH}_3\text{CH} = \text{CH}_2 + \frac{1}{2} \text{B}_2\text{H}_6 \xrightarrow[\text{ether}]{\text{Dry}} (\text{CH}_3\text{CH}_2\text{CH}_3)_3\text{B}$$
- $$(\text{CH}_3\text{CH}_2\text{CH}_3)_3\text{B} \xrightarrow{\text{H}_2\text{O}_2} 3\text{CH}_3\text{CH}_2\text{CH}_2 - \text{OH}$$
4. (c) 
- $$\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{OH} + \text{Mg} \begin{matrix} \text{I} \\ \diagup \\ \text{OH} \end{matrix}$$
- Propyl alcohol
5. (d) Starch $\xrightarrow{\text{Enzymes}}$ Alcohol
6. (c) Coconut oil + Alkali $\rightarrow$ Soap + Glycerol
It is a saponification reaction.
7. (c) $\text{C}_6\text{H}_{12}\text{O}_6 \xrightarrow[\text{Glucose or Fructose}]{\text{Zymase}} 2\text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2$
Ethylalcohol
8. (d) 
- Benzylchloride

It is cannizzaro's reaction.

During fermentation CO_2 gas is eliminated.

It is a Williamson's synthesis reaction.

49. (a) Dehydration of alcohols gives ethers.

If we take moist Ag_2O then alcohol is formed

53. (d) When chlorine is passed in boiling toluene, substitution inside chain takes place and benzyl chloride is obtained which on hydrolysis give benzyl alcohol.

55. (c) Ethanal with CH_3MgBr gives propanol-2 (after hydrolysis) and with $\text{C}_2\text{H}_5\text{OH}$, it gives acetal.

59. (b) NaBH_4 and LiAlH_4 attacks only carbonyl group and reduce it into alcohol group. They do not attack on double bond.

Properties of alcohol, Phenol and Ethers

Since on oxidation same no. of carbon atoms are obtained in as therefore alcohol is primary

45. (c)

47. (c) Alcohols having less number of carbon atoms are more soluble in water.

53. (b) Higher alcohols are stronger and have bitter taste.

54. (c) Order of reactivity with alkali metal (e.g. Sodium) follows the order $1^\circ > 2^\circ > 3^\circ$.

61. (d) Due to hydrogen bonding.

66. (b) Tertiary alcohol readily reacts with halogen acid

Presence of 3 alkyl group increases electron density on 3° carbon atom. Hence $-\text{OH}$ group is easily removed. After the removal of $-\text{OH}$ group 3° carbonium ion is formed which is most stable

68. (b) Lower alcohols are soluble in all solvents.

70. (b) Due to the resonance stabilisation of phenoxide ion.

77. (a) Lucas test is used for the distinction of primary secondary and tertiary alcohols.

80. (a) A compound that undergoes bromination easily is phenol. Due to presence of $-\text{OH}$ group the ring becomes much more active in substitution reactions. The bromination occurs due to availability of electrons on ortho and para position.81. (c) *o*-Nitrophenol has intramolecular *H*-bonding.84. (b) $\text{C}_2\text{H}_5\text{OH}$ gives iodoform test having α -hydrogen atom while CH_3OH does not give due to the absence of α -hydrogen atom.

85. (c) Phenol has higher boiling point than toluene because of hydrogen bonding.

89. (b) LiAlH_4 + ether, is reducing agent.

In presence of non-polar solvent (CS_2) the ionization of phenol is suppressed. The ring is slightly activated and hence mono substitution occurs.

On the other hand with Br_2 water phenol forms 2,4,6-tribromo phenol.

In aqueous solution phenol ionizes to give phenoxide ion. Due to the presence of negative charge on oxygen the benzene ring is highly activated and hence trisubstituted product is obtained.

112. (b) Carbylamine reaction

113. (a) Secondary alcohol on dehydrogenation gives acetone

In aq. solution phenol ionize to give phenoxide in which highly activates benzene ring and give trisubstituted product while in presence of CS_2 an inert solvent phenol is unable to ionize

due to which benzene ring is slightly activated. Hence, monosubstituted product is obtained.

122. (d) Traces of water from ethanol is removed by reacting with Mg metal.

Iodoform test is given by compounds in which $\text{CH}_3 - \text{CH} - \text{OH}$ group is present.

1 mole 3 moles 1 mole
94 grams of phenol reacts with 480 gms. of Br_2 .

$$2 \text{ gm. of phenol} \longrightarrow \frac{480}{94} \times 2 = 10.22 \text{ gms.}$$

131. (b) CH_3OH has highest boiling point because of hydrogen bonding.

Formic acid forms dimer due to which strength of H -bond increases. Hence, boiling point increases.

133. (c) Lower members are soluble in water and solubility decreases with increasing molecular mass because hydrophobic character increases.

135. (d) Alcohols can not be dried using anhydrous CaCl_2 because it forms an addition compound $\text{CaCl}_2 \cdot 4\text{CH}_3\text{OH}$.

159. (c)
$$\begin{array}{c} \text{CH}_2 - \text{OH} \\ | \\ \text{CH} - \text{OH} \\ | \\ \text{CH}_2 - \text{OH} \end{array} + 3\text{HNO}_3 \xrightarrow[\text{H}_2\text{SO}_4]{\text{Conc. H}_2\text{SO}_4} \begin{array}{c} \text{CH}_2 - \text{ONO}_2 \\ | \\ \text{CH} - \text{ONO}_2 \\ | \\ \text{CH}_2 - \text{ONO}_2 \end{array} + 3\text{H}_2\text{O}$$

Glycerol trinitrate
160. (a)
$$\begin{array}{c} \text{CH}_2 - \text{OH} \\ | \\ \text{CH} - \text{OH} \\ | \\ \text{CH}_2 - \text{OH} \end{array} + \begin{array}{c} \text{COOH} \\ | \\ \text{COOH} \end{array} \xrightarrow[-\text{H}_2\text{O}]{110^\circ\text{C}} \begin{array}{c} \text{CH}_2 - \text{O} - \text{CO} - \text{COOH} \\ | \\ \text{CH} - \text{OH} \\ | \\ \text{CH}_2 - \text{OH} \end{array} \xrightarrow{-\text{CO}_2} \begin{array}{c} \text{CH}_2 - \text{O} - \text{CO} - \text{H} \\ | \\ \text{CH} - \text{OH} \\ | \\ \text{CH}_2 - \text{OH} \end{array}$$

Glycerol mono-oxalate
Hydrolysis
Glycerol mono-formate
+ HCOOH
Formic acid
163. (b)
$$\text{C}_2\text{H}_5\text{OH} + \text{CH}_3\text{COOH} \xrightarrow[\text{Esterification}]{\text{H}_2\text{SO}_4} \text{CH}_3\text{COOC}_2\text{H}_5 + \text{H}_2\text{O}$$

Ethylacetate
165. (a) 
166. (b) Hydrogen bonding:
$$\begin{array}{c} \delta^- \quad \delta^+ \quad \delta^- \quad \delta^+ \quad \delta^- \quad \delta^+ \\ \text{O} - \text{H} \cdots \text{O} - \text{H} \cdots \text{O} - \text{H} \\ | \quad \quad | \quad \quad | \\ \text{R} \quad \quad \text{H} \quad \quad \text{R} \\ \text{Alcohol} \quad \text{Water} \quad \text{Alcohol} \end{array}$$
167. (c)
$$\begin{array}{c} \text{HO} \quad \text{CH}_2 - \text{CH}_2 \quad \text{OH} \\ | \quad \quad | \\ \text{HO} \quad \text{CH}_2 - \text{CH}_2 \quad \text{OH} \end{array} + \begin{array}{c} \text{OH} \\ | \\ \text{OH} \end{array} \xrightarrow[\text{H}_2\text{SO}_4]{\text{Fuming}} \begin{array}{c} \text{CH}_2 - \text{CH}_2 \\ | \quad \quad | \\ \text{O} \quad \quad \text{O} \end{array} + 2\text{H}_2\text{O}$$

Ethylene glycol
168. (b) Tertiary carbonium ion is the most stable and it will be given by dehydration of tertiary alcohol.
169. (d)
$$\text{CH}_3\text{CH}_2\text{OH} \xrightarrow[\text{bond fission}]{\text{Heterolytic}} \text{CH}_3\text{CH}_2\text{O}^- + \text{H}^+$$
170. (b) $\text{C}_2\text{H}_5\text{OH}$ is soluble in water due to H -bonding.
173. (b) When ethanol dissolves in water then emission of heat and contraction in volume.
175. (a) Azeotropic distillation method –
Rectified spirit + Benzene + water
↓ Fractional distillation
First fraction at 331.8 K is ternary azeotrope
(H_2O 7.4% + Benzene 74% + alcohol 18.5%)
Second fraction 341.2 K is a binary azeotrope
(Benzene 67.7% + Alcohol 32.2%)
Last fraction at 351K is absolute alcohol.
176. (a)
$$\text{CH}_3 - \text{O} - \text{H} + \text{C}_2\text{H}_5\text{MgBr} \rightarrow \text{C}_2\text{H}_6 + \text{Mg} \begin{array}{c} \text{Br} \\ | \\ \text{OCH}_3 \end{array}$$

Methyl alcohol Ethylmagnesium bromide Ethane
- 

180. (c) Alcohol is soluble in water due to H -bonding

183. (c)
$$\text{CH}_3\text{CH}_2 - \text{OH} + 2\text{Cl}_2 \rightarrow \text{CCl}_3 - \text{CHO}$$

Oxidation will occur with chlorination of methyl group.

185. (d)
$$\begin{array}{l} \text{CH}_3\text{CHO} \xrightarrow{\text{NaOH/I}_2} \text{CHI}_3 \\ \text{CH}_3\text{CH}_2\text{OH} \xrightarrow{\text{NaOH/I}_2} \text{CHI}_3 \\ \text{CH}_3 - \underset{\text{OH}}{\text{CH}} - \text{CH}_3 \xrightarrow{\text{NaOH/I}_2} \text{CHI}_3 \end{array} \left. \vphantom{\begin{array}{l} \text{CH}_3\text{CHO} \\ \text{CH}_3\text{CH}_2\text{OH} \\ \text{CH}_3 - \text{CH} - \text{CH}_3 \end{array}} \right\} \text{Yellow ppt.}$$
- $$\text{C}_6\text{H}_5 - \text{CH}_2 - \text{OH} \xrightarrow{\text{NaOH/I}_2} \text{No yellow ppt.}$$

186. (c) Benzyl alcohol and cyclohexanol are not acidic while phenol and m -chlorophenol are acidic due to presence of electron withdrawing groups like $-\text{NO}_2$, $-\text{Cl}$, $-\text{CN}$ increases the acidic character of phenols. Hence, m -chlorophenol is more acidic than phenol.

187. (b) Three, these are
 $\text{CH}_3\text{CH}_2\text{OCH}_2\text{CH}_3$ (I), $\text{CH}_3\text{OCH}_2\text{CH}_2\text{CH}_3$ (II)
and $\text{CH}_3\text{OCH}(\text{CH}_3)_2$ (III). Here I and II, I and III
are pairs of metamers.

189. (c) CH_3OCH_3 and $\text{C}_2\text{H}_5\text{OCH}_3$ are gases while $\text{C}_2\text{H}_5\text{OC}_2\text{H}_5$ (b.p. 308 K) is low boiling liquid.

190. (a)
$$\text{C}_2\text{H}_5\text{OC}_2\text{H}_5 \xrightarrow[\text{Cleavage of ethers}]{\text{Red P / HI}} 2\text{C}_2\text{H}_5\text{I} \xrightarrow[\text{Reduction}]{\text{Red P / HI}} 2\text{C}_2\text{H}_6$$

Ethane

191. (d)
$$\text{C}_2\text{H}_5\text{OC}_2\text{H}_5 + \text{O}_2 \rightarrow \text{CH}_3 - \underset{\text{O} - \text{OH}}{\text{CH}} - \text{O} - \text{C}_2\text{H}_5$$

Ether peroxide

192. (a)
$$\text{C}_2\text{H}_5\text{OC}_2\text{H}_5 + \text{HI} \rightarrow \text{C}_2\text{H}_5\text{OH} + \text{C}_2\text{H}_5\text{I}$$

193. (a) 

196. (d)
$$\begin{array}{c} \text{R} - \text{C} = \text{O} + \text{R}'\text{OH} \xrightarrow{\text{Dry HCl}} \begin{array}{c} \text{R} \quad \text{OH} \\ \diagdown \quad \diagup \\ \text{C} \\ \diagup \quad \diagdown \\ \text{H} \quad \text{OR}' \end{array} \xrightarrow[\text{Dry HCl}]{\text{R}'\text{OH}} \begin{array}{c} \text{R} \quad \text{OR}' \\ \diagdown \quad \diagup \\ \text{C} \\ \diagup \quad \diagdown \\ \text{H} \quad \text{OR}' \end{array} \end{array}$$

Acetal

198. (b)
$$\text{CH}_3 - \text{O} - \text{CH}_3 + 2\text{HI} \rightarrow 2\text{CH}_3\text{I} + \text{H}_2\text{O}$$

199. (b) Only alkyl aryl ethers *e.g.*, $\text{C}_6\text{H}_5\text{OCH}_3$ undergoes electrophilic substitution reactions.

200. (a)
$$\text{CH}_3\text{COCl} + \text{C}_2\text{H}_5\text{O} - \text{C}_2\text{H}_5 \rightarrow \text{No reaction}$$

201. (b) 

202. (c)
$$\text{R} - \text{O} - \text{R} \xrightarrow{\text{BF}_3} \begin{array}{c} \text{R} \quad \text{R} \\ \diagdown \quad \diagup \\ \text{O} \\ \diagup \quad \diagdown \\ \text{R} \quad \text{R} \end{array} \rightarrow \text{BF}_3$$

Etherate

203. (d) Due to inter-molecular hydrogen bonding in alcohols boiling point of alcohols is much higher than ether.

205. (b) $\text{CH}_3 - \text{OCH}_3$ does not have replaceable H -atom.

Butanone gives both an oxime and positive iodoform test, therefore, the original compound is 2-butanol.

209. (b) $\text{C}_2\text{H}_5\text{OH}$ (ethanol) is a very weak acid hence it does not react with NaOH . However it reacts with metallic sodium.

210. (b) Methanol has high boiling point than methyl thiol because there is intermolecular hydrogen bonding in methanol and no hydrogen bonding in methyl thiol.

212. (a) Formation of a yellow precipitate on heating a compound with an alkaline solution of iodine is known as iodoform reaction. Methyl alcohol does not respond to this test. Iodoform test is exhibited by ethyl alcohol, acetaldehyde, acetone, methyl ketone and those alcohols which possess $\text{CH}_3\text{CH}(\text{OH})-$ group.

213. (b) In Friedel-Crafts acylation, aromatic compounds such as benzene, phenol etc. undergo acylation with CH_3COCl in the presence of anhydrous AlCl_3 and gives ortho and para derivatives. Intermediate is $\text{CH}_3\text{C}^+ = \text{O}$ (acylium ion) of this reaction.

214. (a) This reaction is known as Reimer-Tiemann reaction.

Thus at 530°K allyl alcohol is formed.

217. (d) Ethyl alcohol gives positive iodoform test (i.e. yellow ppt. with I_2 and NaOH)

218. (d) Tertiary alcohols react fastest with hydrogen halides. 2-methylpropan-2-ol is a tertiary alcohol.

219. (a) When benzoic acid reacts with ethyl alcohol in the presence of sulphuric acid ethyl benzoate is formed. This is known as esterification.

222. (a) Ethyl alcohol on dehydration with conc. H_2SO_4 at 170°C gives ethylene.

224. (b) Fats are esters of higher fatty acids with glycerol, hence on alkaline hydrolysis they give back glycerol and sodium or potassium salt of acid (this is called soap).

If two or more $-\text{OH}$ groups are present on carbon atom then it immediately loses water molecule and forms acid or aldehyde.

Two $-\text{OH}$ groups on the same carbon aldehyde is formed

Three $-\text{OH}$ groups on the same carbon acid is formed.

Because conc. H_3PO_4 acts as a dehydrating agent.

The protonated ether undergoes nucleophilic attack by halide ion (X^-) and forms alkyl alcohol and alkyl halide

This is an example of coupling reaction

Uses of alcohol, Phenol and Ethers

6. (a) $n(\text{HOOC} - \text{C}_6\text{H}_4 - \text{COOH}) + n \begin{pmatrix} \text{CH}_2 - \text{OH} \\ | \\ \text{CH}_2 - \text{OH} \end{pmatrix}$
Terephthalic acid Ethyleneglycol
 $\downarrow$
 $\left(-\text{C}(=\text{O}) - \text{C}_6\text{H}_4 - \text{C}(=\text{O}) - \text{O} - \text{CH}_2 - \text{CH}_2 - \text{O} - \right)_n$
Polyester
9. (a) Ethylene glycol is added to lowering down the freezing point of water so that it does not freeze.
10. (b) Power alcohol 80% petrol and 20% ethyl alcohol
12. (d) Glucose $\xrightarrow[\text{(From yeast)}]{\text{Zymase}} 2\text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2$
16. (d) Glycerol is not used as an antiseptic agent.
18. (c) Denaturing can also be done by adding 0.5% pyridine, petroleum naphtha, CuSO_4 etc.
20. (b) A mixture of glyceryl trinitrate and glyceryl dinitrate when absorbed on kieselgurh is called dynamite.
22. (c) Tonics have generally contains ethyl alcohol.
23. (c) Due to presence of methyl alcohol in liquor.
24. (d) An anaesthetic.
25. (c) Groundnut oil.
27. (a) $\text{C}_3\text{H}_7\text{COOC}_2\text{H}_5 \xrightarrow{\text{Na} / \text{C}_2\text{H}_5\text{OH}} \text{C}_3\text{H}_7\text{CH}_2\text{OH}$
Ethylbutyrate Butylalcohol
28. (a) Glycol is used as an antifreeze for automobile radiators because it lowers down the melting point of water.

Critical Thinking Questions

1. (c)  or  will undergoes a Friedel Craft's alkylation on ortho or para position because of more electron density.
2. (c) $\text{CH}_2 = \text{CH}_2 + \text{RMgI} \rightarrow \text{CH}_2 - \text{CH}_2 - \text{R} \xrightarrow{\text{HOH}} \text{OMgI}$
 $\text{Mg}(\text{OH}) + \text{R} - \text{CH}_2 - \text{CH}_2 - \text{OH}$
3. (c) The liquids which decompose at its boiling point can be purified by vacuum distillation. Glycerol which decomposes at its boiling point (-563K) can be distilled without decomposition at 453K under 12mm Hg pressure.
4. (a) Liebermann's reaction.
5. (a) $1^\circ \text{ alcohol} > 2^\circ \text{ alcohol} > 3^\circ \text{ alcohol}$
Boiling point of alcohols decreases as the number of branches increases.
6. (c)  + $\text{HI} \rightarrow$  + CH_3I
7. (c) $3\text{CH}_2 = \text{CH}_2 + 2\text{KMnO}_4 + 4\text{H}_2\text{O} \rightarrow$
 $3 \begin{pmatrix} \text{CH}_2 - \text{OH} \\ | \\ \text{CH}_2 - \text{OH} \end{pmatrix} + 2\text{KMnO}_2 + 2\text{KOH}$
Glycol

8. (c) Correct order of dehydration in alcohols $3^\circ > 2^\circ > 1^\circ$.
9. (a) Oxiran is ethylene oxide, 
10. (c) $6\text{CH}_3 - \text{CH} = \text{CH}_2 + \text{B}_2\text{H}_6 \xrightarrow{\text{H}_2\text{O}_2} \text{CH}_3 - \text{CH}_2 - \text{CH}_2\text{OH}$
11. (d) Distinction between primary, secondary and tertiary alcohol is done by all three methods : oxidation, Victor Meyer and Lucas test.
12. (b)  $\xrightarrow[\text{V}_2\text{O}_5]{\text{O}_2, \text{air}}$ 
13. (a) *o*- and *p*-nitrophenols are separated by steam distillation because *o*-nitrophenol is steam volatile while *p*-isomer is not.
14. (b) Benzoic acid.
15. (a) $\text{R} - \text{O} - \text{R}' \xrightarrow{\text{O}_2 / \text{light}}$
 $\text{C}_2\text{H}_5 - \text{O} - \text{CH}(\text{CH}_3) - \text{O} - \text{OH}$
16. (d) $\text{CH}_3\text{OH} + \text{CH}_3\text{OH} \xrightarrow{\text{H}_2\text{SO}_4 (\text{Conc})} \text{CH}_3\text{OCH}_3$
 $\text{CH}_3\text{OH} + \text{C}_2\text{H}_5\text{OH} \xrightarrow{\text{H}_2\text{SO}_4 (\text{Conc})} \text{CH}_3\text{OC}_2\text{H}_5$
 $\text{C}_2\text{H}_5\text{OH} + \text{C}_2\text{H}_5\text{OH} \xrightarrow{\text{H}_2\text{SO}_4 (\text{Conc})} \text{C}_2\text{H}_5\text{OC}_2\text{H}_5$
17. (b) $\text{IV} > \text{III} > \text{I} > \text{II}$.
18. (a) Cyclic ethers are called epoxides. 
19. (b) $\text{CH}_3 - \text{CH} = \text{CH} - \text{C}_6\text{H}_4 - \text{OH} \xrightarrow{\text{HBr}}$
 $\text{CH}_3 - \text{CH}_2 - \text{CH}(\text{Br}) - \text{C}_6\text{H}_4 - \text{OH}$

20. (c)  on KMnO_4 oxidation does not give benzoic acid.
21. (c) Chromic anhydride in glacial acetic acid is the best reagent to convert pen-3-en-2-ol into pent-3-in-2-one.
22. (a) $\begin{matrix} | & | \\ -\text{C} & - & \text{C}- \\ | & | \\ \text{H} & \text{OH} \end{matrix} \xrightleftharpoons{\text{H}^+} \begin{matrix} | & | \\ -\text{C} & - & \text{C}- \\ | & | \\ \text{H} & +\text{OH}_2 \end{matrix} \xrightleftharpoons{-\text{H}_2\text{O}}$
Protonated alcohol
 $\begin{matrix} | & | \\ -\text{C} & - & \text{C}- \\ | & | \\ \text{H} & \end{matrix} \xrightleftharpoons{-\text{H}^+} \begin{matrix} | & | \\ -\text{C} & = & \text{C}- \end{matrix}$
carbonium ion
In all cases intermediate is carbonium ion, and there may be 1, 2-hydride or 1, 2-methyl shift to form more stable carbonium ion.

Assertion & Reason

3. (a) It is correct that phenol is more reactive than benzene.
4. (c) It is correct that sodium phenoxide (sodium salt of phenol) and CO_2 on heating from sodium salicylate. This is known as Kolbe's reaction. Ethanol does not respond to this reaction. Therefore, assertion is true. But the reason that phenoxide ion is more basic than ethoxide ion is not correct.

5. (c) Lucas reagent is a mixture of anhydrous $ZnCl_2$ and conc. HCl is used for the distinction of monohydric alcohol. Tertiary alcohols on addition produce a precipitate immediately while secondary alcohols produce ppt. after 5 minutes. Primary alcohols do not produce any precipitate. Therefore, assertion is true but reason is false.
6. (a) Phenols on treatment with neutral $FeCl_3$ solution produce purple colour, resorcinol contains phenolic group hence in treatment with $FeCl_3$ solution it gives purple colour. Here both assertion and reason are correct and reason is a correct explanation of assertion.
7. (b) Glycerol is purified by distillation under reduced pressure because it decomposes on heating below its melting point. It is a trihydric alcohol. Here, both assertion and reason are true but reason is not a correct explanation of assertion.
8. (a) Alcohols and phenols can be distinguished by treating with $NaOH$. Phenols react with $NaOH$ to produce sodium phenoxide because phenols are acidic and alcohols are neutral. Both assertion and reason are true and reason is correct explanation.
9. (b) Zeolites are shape-selective porous solid acid catalysts, their catalytic activity originates from the presence of highly acidic $Al-O(H)-Si$ hydroxyl in the framework.

This can be explained on the basis of S_N1 mechanism. The carbonium ion produced being benzylum ion. Since this type is more stable than alkylum ion.

11. (c) Lower the value of pK_a , more acidic will be the compound. Acetic acid is more acidic than phenol. This indicates that carboxylate ion should be more stable than the phenoxide ion and it is clear that carboxylate ion has more equivalent resonating structures than the phenoxide ion.
12. (a) The conversion of sugar into ethyl alcohol by yeast is called alcoholic fermentation.
- $$C_{12}H_{22}O_{11} + H_2O \xrightarrow{\text{Invertase}} C_6H_{12}O_6 + C_6H_{12}O_6$$
- Glucose Fructose
- $$C_6H_{12}O_6 \xrightarrow{\text{Zymase}} 2C_2H_5OH + 2CO_2$$
- Ethylalcohol
13. (b) The tendency to show H -bonding decreases with increasing hydrophobic character of carbon chain. The hydrophobic character of carbon chain increases with the length of carbon chain.
14. (e) Ethyl alcohol forms azeotropic mixture with water which distills with unchanged composition (about 75% ethanol) and thus absolute alcohol cannot be obtained by simple distillation.
15. (e) The dehydration of t -butanol involves the formation of 3° carbocation which is more stable than 1° carbocation in n -butanol. Thus, tendency to lose water becomes more in t -butanol.
16. (c) A mixture of conc. HCl + anhyd. $ZnCl_2$ is called Lucas reagent.
17. (e) Electron withdrawing groups such as $-NO_2$, $-CN$, $-X$, increase the acidity. Greater the number of electron withdrawing groups more is the acidic character i.e. 2, 4, 6-trinitrophenol is more acidic than 4-nitrophenol.
18. (b) Phenols cannot be converted into esters by direct reaction with carboxylic acids since phenols are less nucleophilic than alcohols.
19. (b) Alcohol which forms the more stable carbocation undergoes dehydration more readily. Since $tert$ -butyl alcohol forms more

stable $tert$ -butyl cation, therefore, it undergoes dehydration more readily than propanol.

20. (e) The ease of dehydration of alcohols can be explained on the basis of stability of the intermediate carbocation. Greater the stability of the carbocation formed, greater will be the rate of reaction. The order of stability of carbocation formed is

This is due to the electron releasing (+I) effect of the alkyl group. Therefore the ease of dehydration of alcohols follows the order.

Tertiary > secondary > primary alcohol.

21. (c) Benzoylation in phenols is usually carried out in the presence of aqueous $NaOH$ because benzoyl chloride is not readily hydrolysed by alkalis.
22. (b) In phenols, the lone pairs of electrons on the oxygen atom are delocalised over the benzene ring due to resonance and hence are not easily available for protonation. On the other hand, in alcohols, the lone pairs of electrons on oxygen atom are localized due to the absence of resonance and hence are easily available for protonation.

23. (c) p -Nitrophenolate ion is more stable than phenolate ion.
24. (b) Nitrous acid gives nitrosamine ion (NO^+) which attacks phenol at less hindered p -position of form p -nitrosophenol which is a tautomer of p -benzoquinone monoxide.

25. (c) Nucleophilic attack of phenolate ion through the ortho-carbon atom occurs on CCl_4 to form an intermediate which on hydrolysis gives salicylic acid.
26. (a) Victor-Meyer's test is used to distinguish primary, secondary and tertiary alcohols.

28. (b) Removal of two molecules of water gives a product which tautomerises to yield acrolein-an α, β -unsaturated aldehyde.
29. (b) Depending upon whether the alkyl halide and the alkoxide ion carry the same or different alkyl groups both symmetrical and unsymmetrical ethers can be prepared by Williamsons synthesis.
30. (c) Ethers being Lewis bases form etherates with Lewis acids.
31. (d) $(CH_3)_3CONa$ and CH_3CH_2Br react to form $(CH_3)_3C-O-CH_2CH_3$. Good yields of ethers are obtained when primary alkyl halides are treated with alkoxides derived from any alcohol. 1°, 2° or 3°.

Chapter 27 Aldehydes and Ketones

Introduction

Carbonyl compounds are of two types, aldehydes and ketones. Both have a carbon-oxygen double bond often called as carbonyl group.

Both aldehyde and ketones possess the same general formula $C_nH_{2n}O$.

Structure : Carbonyl carbon atom is joined to three atoms by sigma bonds. Since these bonds utilise sp^2 -orbitals, they lie in the same plane and are 120° apart. The carbon-oxygen double bond is different than carbon-carbon double bond. Since, oxygen is more electronegative, the electrons of the bond are attracted towards oxygen. Consequently, oxygen attains a partial negative charge and carbon a partial positive charge making the bond polar. The high values of dipole moment, $\begin{array}{c} \delta^+ \quad \delta^- \\ \text{C} = \text{O} \end{array}$

(2.3 – 2.8D) cannot be explained only on the basis of inductive effect and thus, it is proposed that carbonyl group is a resonance hybrid of the following two structures.

Preparation of carbonyl compounds

- (i) From alcohols (i) By oxidation.

Mild oxidising agents are

- (a) X_2 (Halogen) (b) Fenton reagent ($\text{FeSO}_4 + \text{H}_2\text{O}_2$)
(c) $\text{K}_2\text{Cr}_2\text{O}_7 / \text{H}^+$ (d) Jones reagent
(e) Sarret reagent (f) MnO_2
(g) Aluminium tertiary butoxide [$\text{Al}(\text{O} - \text{C}(\text{CH}_3)_3)_3$]

□ When the secondary alcohols can be oxidised to ketones by aluminium tert-butoxide, $[(\text{CH}_3)_3\text{CO}]_3\text{Al}$ the reaction is known as oppenauer oxidation. Unsaturated secondary alcohols can also be oxidised to unsaturated ketones (without affecting double bond) by this reagent.

□ The yield of aldehydes is usually low by this methods. The allylic alcohols can be converted to aldehydes by treating with oxidising agent pyridinium chloro-chromate ($\text{C}_5\text{H}_5\text{NH}^+\text{CrO}_3\text{Cl}^-$). It is abbreviated as PCC and is called **Collin's reagent**. This reagent is used in non-aqueous solvents like CH_2Cl_2 (dichloro methane). It is prepared by mixing pyridine, CrO_3 and HCl in dichloromethane. This is a very good reagent because it checks the further oxidation of aldehydes to carboxylic acids and is suitable method for preparing α,β -unsaturated aldehydes.

- (ii) Dehydrogenation of 1° and 2° alcohols by $\text{Cu}/300^\circ$ or $\text{Ag}/300^\circ\text{C}$

- (2) From carboxylic acids

- (i) Distillation of Ca, Ba, Sr or Th salts of monobasic acids

Thus in the product, one alkyl group comes from one carboxylic acid and other alkyl group from other carboxylic acid.

Calcium salts of dibasic acid (1, 4 and higher) on distillation give cyclic ketones.

(ii) **Decarboxylation or Dehydration of acids by $\text{MnO}/300^\circ\text{C}$.**

(a) This reaction takes place between two molecules of carboxylic acids. Both may be the same or different.

(b) If one of the carboxylic acids is HCOOH then this acid undergoes decarboxylation because this acid is the only monobasic acid which undergoes decarboxylation even in the absence of catalyst.

Case I : When both molecules are HCOOH

Case II : When only one molecule is formic acid.

Case III : When none of the molecule is formic acid.

(3) **From gem dihalides :** Gem dihalides on hydrolysis give carbonyl compounds

❑ This method is not used much since aldehydes are affected by alkali and dihalides are usually prepared from the carbonyl compounds.

(4) **From alkenes**

(i) **Ozonolysis :** Alkenes on reductive ozonolysis give carbonyl compounds

❑ This method is used only for aliphatic carbonyl compounds.

(ii) **Oxo process**

❑ Oxo process is used only for the preparation of aldehydes.

(iii) **Wacker process**(5) **From alkynes**(6) **From Grignard reagents**(7) **From acid chloride**

(i) Acid chlorides give nucleophilic substitution reaction with dialkyl cadmium and dialkyl lithium cuprate to give ketones. This is one of the most important method for the preparation of ketones from acid chlorides.

(Only used for the preparation of ketones)

In this method product is always ketone because $\text{R} \neq \text{H}$ and also $\text{R}' \neq \text{H}$.

(ii) **Rosenmunds reduction :** This reduction takes place in the presence of Lindlars catalyst.

(Only used for aldehydes)

(8) **From cyanides**

(i) **Stephen aldehyde synthesis** : Conversion of cyanides into aldehydes by partial reduction with $\text{SnCl}_2 / \text{HCl}$, followed by hydrolysis, is known as Stephens aldehyde synthesis.

(9) **From vic diols**

□ $\text{Pb}(\text{OCOCH}_3)_4$ also gives similar oxidation products.

(10) **From Alkyl halides and benzyl halides**

(ii) **From nitro alkanes** : Nitro alkanes having at least one α -hydrogen atom give carbonyl compounds on treatment with conc NaOH followed by 70% H_2SO_4 . The reaction is known as **Nef** carbonyl synthesis.

(12) **Reaction with excess of alkyl lithium** : Carboxylic acids react with excess of organo lithium compound to give lithium salt of gem diols which on hydrolysis give ketones.

Preparation of only aromatic carbonyl compounds

(1) **From methyl arenes**

(2) **From chloro methyl**

(3) **Gattermann - Koch formylation** : This reaction is mainly given by aromatic hydrocarbons and halobenzenes.

(4) **Gattermann formylation** : This reaction is mainly given by alkyl benzenes, phenols and phenolic ethers.

(5) **Houben - Hoesch reaction** : This reaction is given by and polyhydric benzenes.

(6) **Reimer – Tiemann reaction** : Phenol gives *o*- and *p*- hydroxy benzaldehyde in this reaction.

Physical properties of carbonyl compounds

(1) **Physical state** : Methanal is a pungent smell gas. Ethanal is a volatile liquid, boiling points 294 K. Other aldehydes and ketones containing up to eleven carbon atoms are *colourless liquids* while higher members are solids.

(2) **Smell** : With the exception of lower aldehydes which have unpleasant odours, aldehydes and ketones have generally pleasant smell. As the size of the molecule increases, the odour becomes less pungent and more fragrant. In fact, many naturally occurring aldehydes and ketones have been used in blending of perfumes and flavouring agents.

(3) **Solubility** : Aldehydes and ketones upto four carbon atoms are miscible with water. This is due to the presence of hydrogen bonding between the polar carbonyl group and water molecules as shown below :

With the increase in the size of alkyl group, the solubility decreases and the compounds with more than four carbon atom are practically insoluble in water. All aldehydes and ketones are, however, soluble in organic solvents such as ether, alcohol, etc. The ketones are good solvents themselves.

(4) **Boiling points** : The boiling points of aldehydes and ketones are higher than those of non polar compounds (hydrocarbons) or weakly polar compounds (such as ethers) of comparable molecular masses. However, their boiling points are lower than those of corresponding alcohols or carboxylic acids. This is because aldehydes and ketones are polar compounds having sufficient intermolecular dipole-dipole interactions between the opposite ends of $C=O$ dipoles.

However, these dipole-dipole interactions are weaker than the intermolecular hydrogen bonding in alcohols and carboxylic acids. Therefore, boiling points of aldehydes and ketones are relatively lower than the alcohols and carboxylic acids of comparable molecular masses.

Among the carbonyl compounds, ketones have slightly higher boiling points than the isomeric aldehydes. This is due to the presence of two electrons releasing groups around the carbonyl carbon, which makes them more polar.

(5) **Density** : Density of aldehydes and ketones is less than that of water.

Chemical properties of carbonyl compounds

Carbonyl compounds give chemical reactions due to carbonyl group and α -hydrogens.

Chemical reactions of carbonyl compounds can be classified into following categories.

- (1) Nucleophilic addition reactions
- (2) Addition followed by elimination reactions
- (3) Oxidation
- (4) Reduction
- (5) Reactions due to α -hydrogen
- (6) Condensation reactions and
- (7) Miscellaneous reactions

(1) Nucleophilic addition reactions

(i) Carbonyl compounds give nucleophilic addition reaction with those reagents which on dissociation give electrophile as well as nucleophile.

(ii) If nucleophile is weak then addition reaction is carried out in the presence of acid as catalyst.

(iii) Product of addition reactions can be written as follows,

In addition reactions nucleophile adds on carbonyl carbon and electrophile on carbonyl oxygen to give adduct.

(iv) **Relative reactivity of aldehydes and ketones** : Aldehydes and ketones readily undergo nucleophilic addition reactions. However, *ketones are less reactive than aldehydes*. This is due to electronic and steric effects as explained below:

(a) **Inductive effect** : The relative reactivities of aldehydes and ketones in nucleophilic addition reactions may be attributed to the amount of positive charge on the carbon. A greater positive charge means a higher reactivity. If the positive charge is dispersed throughout the molecule, the carbonyl compound becomes more stable and its reactivity decreases. Now, alkyl group is an electron releasing group (+I inductive effect). Therefore, electron releasing power of two alkyl groups in ketones is more than that of one alkyl group in aldehyde. As a result, the electron deficiency of carbon atom in the carbonyl group is satisfied more in ketones than in aldehydes. Therefore, the reduced positive charge on carbon in case of ketones discourages the attack of nucleophiles. Hence ketones are less reactive than aldehydes. Formaldehyde with no alkyl groups is the most reactive of the aldehydes and ketones. Thus, the order of reactivity is:

(b) **Steric effect** : The size of the alkyl group is more than that of hydrogen. In aldehydes, there is one alkyl group but in ketones, there are two alkyl groups attached to the carbonyl group. The alkyl groups are larger than a hydrogen atom and these cause hindrance to the attacking group. This is called **steric hindrance**. As the number and size of the alkyl groups increase, the hindrance to the attack of nucleophile also increases and the reactivity of a carbonyl decreases. The lack of hindrance in nucleophilic attack is another reason for the greater reactivity of formaldehyde. Thus, the reactivity follows the order:

In general, **aromatic aldehydes and ketones are less reactive than the corresponding aliphatic analogues**. For example, *benzaldehyde is less reactive than aliphatic aldehydes*. This can be easily understood from the resonating structures of benzaldehyde as shown below:

It is clear from the resonating structures that due to electron releasing resonance effect of the benzene ring, the magnitude of the positive charge on the carbonyl group decreases and consequently it becomes less susceptible to the nucleophilic attack. Thus, aromatic aldehydes and ketones are less reactive than the corresponding aliphatic aldehyde and ketones. The order of reactivity of aromatic aldehydes and ketones is,

Some important examples of nucleophilic addition reactions

Addition of HCN

❑ Because HCN is a toxic gas, the best way to carry out this reaction is to generate hydrogen cyanide during the reaction by adding HCl to a mixture of the carbonyl compound and excess of NaCN.

☐ *Benzophenone does not react with HCN.*

❑ Except formaldehyde, all other aldehydes gives optically active cyanohydrin (racemic mixture).

❑ This reaction is synthetically useful reaction for the preparation of α -hydroxy acids, β -amino alcohols and α -hydroxy aldehydes.

Addition of sodium bisulphite

All types of aldehydes give addition reaction with this reagent.

Only aliphatic methyl ketones give addition reaction with sodium bisulphite.

❑ This reagent can be used for differentiation between aromatic and aliphatic methyl ketones, e.g.

❑ This reagent can be used for the separation of aldehydes and aliphatic methyl ketones from the mixture, e.g.

These two compounds can be separated from their mixture by the use of NaHSO_3 . Higher aliphatic ketones and aromatic ketones do not react with NaHSO_3 .

Addition of alcohols : Carbonyl compounds give addition reaction with alcohols. This reaction is catalysed by acid and base. Nature of product depends on the catalyst.

Case 1 : Addition catalysed by base : In the presence of a base one equivalent of an alcohol reacts with only one equivalent of the carbonyl compound. The product obtained is called hemiacetal (in case of aldehyde) and hemiketal (in case of ketone). The reaction is reversible. There is always equilibrium between reactants and product.

Hemiacetals and hemiketals are **α -alkoxy alcohols**.

Case II : Addition catalysed by acid : In the presence of an acid one equivalent of carbonyl compound reacts with two equivalents of alcohol. Product of the reaction is acetal (in case of aldehyde) or ketal (in case of ketone).

(i) Formation of acetals and ketals can be shown as follows:

(ii) Acetals and ketals are gem dialkoxy compounds.

(iii) High yield of acetals or ketals are obtained if the water eliminated from the reaction is removed as it formed because the reaction is reversible.

(iv) Acetals and ketals can be transformed back to corresponding aldehyde or ketone in the presence of excess of water.

This reaction is very useful reaction for the protection of carbonyl group which can be deprotected by hydrolysis. Glycol is used for this purpose. Suppose we want to carry out the given conversion by $LiAlH_4$.

This can be achieved by protection of >C=O group and then by deprotection

Addition of Grignard reagents : Grignard reagents react with carbonyl compounds to give alcohols. Nature of alcohol depends on the nature of carbonyl compound.

Addition of water : Carbonyl compounds react with water to give gem diols. This reaction is catalysed by acid. The reaction is reversible reaction.

Gem diols are highly unstable compounds hence equilibrium favours the backward direction. The extent to which an aldehyde or ketone is hydrated depends on the stability of gem diol.

Stability of gem diols depend on the following factors:

(i) Steric hindrance by +I group around α -carbon decreases the stability of gem diols. +I group decreases stability of gem diol and hence decreases extent of hydration.

(ii) Stability of gem diols mainly depends on the presence of -I group on α -carbon. More is the -I power of the group more will be stability of gem diols.

(iii) Intramolecular hydrogen bonding increases stability of gem diols. -I groups present on carbon having gem diol group increases strength of hydrogen bond.

More is the strength of hydrogen bond more will be the stability of gem diol.

Addition of terminal alkynes : This reaction is known as **ethinylation**.

(2) **Addition followed by elimination reactions :** This reaction is given by ammonia derivatives ($NH_2 - Z$).

(i) In nucleophilic addition reactions poor nucleophile such as ammonia and ammonia derivatives requires acid as catalyst.

(ii) If the attacking atom of the nucleophile has a lone pair of electrons in the addition product, water will be eliminated from the addition product. This is called a nucleophilic addition elimination.

Primary amines and derivatives of ammonia react with carbonyl compounds to give adduct.

In adduct nucleophilic group has lone pair of electrons. It undergoes elimination to give product known as imine. An imine is a compound with a carbon-nitrogen double bond.

The overall reaction can be shown as follows

Different Imine formation with $NH_2 - Z$ is given below

Benedict's solution and Fehling solutions are used as a reagent for the test of sugar (glucose) in blood sample.

(c) **Tollens reagent** : Tollens reagent is ammoniacal silver nitrate solution. Its reacting species is $Ag^{\oplus}$.

It oxidises aliphatic as well as aromatic aldehydes.

This reagent has no effect on carbon-carbon multiple bond.

In this reaction the oxidation no. of Ag varies from +1 to 0.

Glucose, fructose give positive test with Tollen's reagents and Fehling solution.

Fructose contain >C=O (keto) group yet give positive test with Fehling solution due to presence of α -hydroxyl keto group. Tollens reagent also gives positive test with terminal alkynes and $HCOOH$.

(d) **Reaction with mercuric chloride solution** :

(e) **Schiff's reagent** : Magenta solution $\xrightarrow{SO_2}$ colourless solution
 $\xrightarrow{CH_3CHO}$ pink colour restored (In cold).

(ii) **Oxidation by strong oxidising agents** : Main strong oxidising agents are $KMnO_4 / OH^{\ominus} / \Delta$, $K_2MnO_4 / H^{\oplus} / \Delta$, $K_2Cr_2O_7 / H^{\oplus} / \Delta$ and conc HNO_3 / Δ . These agents oxidise aldehydes as well as ketones.

(a) **Oxidation of aldehydes** : Aldehydes are oxidised into corresponding acids.

(b) **Oxidation of ketones** : Ketones undergo oxidation only in drastic conditions. During the oxidation of ketones there is breaking of carbon-carbon bond between α -carbon and carbonyl carbon. In this process both carbons convert into carboxylic groups. This leads to the formation of two moles of monocarboxylic acids.

Case I : Oxidation of symmetrical ketones

Thus number of carbons in any product is less than the number of carbons in ketone.

Case II : Oxidation of unsymmetrical ketones : In case of unsymmetrical ketones α -carbon whose bond breaks always belongs to the

Beckmann rearrangement : Ketoxime when treated with acid at $0^\circ C$ it undergoes rearrangement known as **Beckmann rearrangement**.

Thus acid catalysed conversion of ketoximes to *N*-substituted amides is called Beckmann rearrangement. Acid catalyst used are proton acids (H_2SO_4 , HCl , H_3PO_4) and Lewis acids (PCl_5 , $SOCl_2$, $PhSO_2Cl$, $RCOCl$, SO_3 , BF_3 etc.)

In short product of the rearrangement can be obtained as follows:

(3) Oxidation of carbonyl compounds

(i) **Oxidation by mild oxidising agents** : Mild oxidising agents oxidise only aldehydes into carboxylic acids. They do not oxidise ketones. Main oxidising agents are:

(a) **Fehling solution** : It is a mixture of two Fehling solution: Fehling solution No. 1 : It contains $CuSO_4$ solution and $NaOH$.

Fehling solution No. 2 : It contains sodium potassium tartrate. (Rochelle salt).

(b) **Benedict's solution** : This solution contains $CuSO_4$, $NaOH$ and sodium or potassium citrate.

Reacting species of both solutions is Cu^{++} oxidation no. of Cu varies from 2 to 1.

These two oxidising agents oxidise only aliphatic aldehydes and have no effect on any other functional groups

alkyl group which has more number of carbons. This rule is known as **Popoff's rule**.

Case III : Oxidation of cyclic ketones : Formation of dibasic acid takes place from cyclic ketones. In this case the number of carbons in ketone and dibasic carboxylic acid is always same.

□ **α -carbons are not identical then bond breaking takes place between carbonyl carbon and the α -carbon which has maximum number of hydrogens.**

(iii) **Miscellaneous oxidation**

(a) **Haloform Reaction**

(b) **Oxidation at α -CH₂ or CH₃ by SeO₂ :** SeO₂ oxidises α -CH₂-group into keto group and α -CH₃-group into aldehydic group.

In this oxidation reactivity of CH₂ is more than the CH₃ group and Oxidation is regio selective in nature.

(c) **Oxidation by organic peracids :** Organic peracids oxidise aldehydes into carboxylic acids and ketones into esters. This oxidation is known as **Baeyer – Villiger oxidation**.

In case of aldehyde there is insertion of atomic oxygen (obtained from peracid) between carbonyl carbon and hydrogen of carbonyl carbon.

In case of ketone, insertion of oxygen takes place between carbonyl carbon and α -carbon. Thus the product is ester. This is one of the most important reaction for the conversion of ketones into esters.

□ Vic dicarbonyl compound also undergo oxidation and product is anhydride.

□ **Popoff's rule :** Oxidation of unsymmetrical ketones largely take place in such a way that the smaller alkyl group remains attached to the CO group during the formation of two molecules of acids. This is known as **Popoff's rule**

Example :

(d) **Baeyer- villiger oxidation :**

□ Reaction will be held if the oxidising agent is performic acid.

(4) **Reduction of carbonyl compounds**

(i) **Reduction of $\text{C}=\text{O}$ group into CH_2 -group :** Following three reagents reduce carbonyl group into CH_2 -groups: (a) **HI/P/Δ** (b)

Zn/Hg/Conc. HCl and (c) **NH₂-NH₂/OH**.

(ii) **Reduction of carbonyl compounds into hydroxy compounds :** Carbonyl group converts into CHOH -group by **LiAlH₄**, **NaBH₄**, **Na/C₂H₅OH** and aluminium isopropoxide.

NaBH₄ is regioselective reducing agent because it reduced only **CHO** in the presence of other reducible group.

Example :

Hydride ion of **NaBH₄** attack on carbonyl carbon during reduction.

(iii) **Reductive amination :** In this reduction CO -group converts into $\text{CH} - \text{NH}_2$ group

(iv) **Reduction of ketones by Mg or Mg/Hg** : In this case ketones undergo reduction via coupling reaction and product is vic *cis* diol.

When this reaction is carried out in the presence of Mg / Hg / TiCl₄, the product is vic *trans* diol.

(v) **Reduction of benzaldehyde by Na/C₂H₅OH** : Benzaldehyde undergoes reduction via coupling reaction and product is vic diol.

□ Aldehydes are reduced to 1° alcohols whereas ketones to 2° alcohols. If carbon – carbon double bond is also present in the carbonyl compound, it is also reduced alongwith. However, the use of the reagent 9-BBN (9-borabicyclo (3, 3, 1) nonane) prevents this and thus only the carbonyl group is reduced

Example :

□ If reducing agent is NaH, reaction is called Darzen's reaction, we can also use LiAlH₄ in this reaction.

□ If reducing agent is aluminium iso propoxide (CH₃ – CH – O)₃Al. Product will be alcohol. This reaction is called

Meerwein – pondorff verley reduction (MPV reduction).

□ The percentage yield of alkanes can be increased by using diethylene glycol in Wolf Kishner reduction. Then reaction is called Huang – Millan conversion.

(vi) Hydrazones when treated with base like alkoxide give hydrocarbon (Wolf – Kishner reduction).

(vii) Schiff's base on reduction gives secondary amines.

(5) Reactions due to α-hydrogen

(i) **Acidity of α-hydrogens** :

(a) α-hydrogen of carbonyl compounds are acidic in character due to the presence of the electron withdrawing –CO– group.

(b) Thus carbonyl compounds having α-hydrogen convert into carbanions in the presence of base. This carbanion is stabilised by delocalisation of negative charge.

(c) The acidity of α-hydrogen is more than ethyne. pKa value of aldehydes and ketones are generally 19 – 20 where as pKa value of ethyne is 25.

(d) Compounds having active methylene or methyne group are even more acidic than simple aldehydes and ketones.

(ii) **Halogenation** : Carbonyl compounds having α-hydrogens undergo halogenation reactions. This reaction is catalysed by acid as well as base.

(a) **Acid catalysed halogenation** : This gives only monohalo derivative.

(b) **Base catalysed halogenation** : In the presence of base all α-hydrogens of the same carbon is replaced by halogens.

(iii) **Deuterium exchange reaction** : Deuterium exchange reaction is catalysed by acid (D⁺) as well as base (OD⁻). In both the cases all the hydrogens on only one α-carbon is replaced by D.

(iv) **Racemisation** : Ketones whose α -carbon is chiral undergo Racemisation in the presence of acid as well as base.

(v) **Alkylation** : Carbonyl compounds having α -hydrogens undergo alkylation reaction with RX in the presence of base. This reaction is S_N2 reaction. The best result is obtained with $CH_3 - X$. Other halides undergo elimination in the presence of strong base.

(vi) **Wittig reaction** : Aldehyde and ketones undergo the wittig reaction to form alkenes.

(6) **Condensation reaction of carbonyl compounds** : Nucleophilic addition reaction of compounds having carbonyl group with those compounds which have at least one acidic hydrogen at α -carbon is known as condensation reaction. In this addition reaction :

Substrate is always an organic compound having a carbonyl group,

e.g.

Addition always takes place on the carbonyl group.

Reagents of the condensation reaction are also organic compounds having at least one hydrogen on α -carbon and α -carbon should have $-I$ group, *e.g.*

☐ If substrate and reagent both are carbonyl compounds then one should have at least one α -hydrogen and other may or may not have α -hydrogen.

Condensation reaction always takes place in the presence of acid or base as catalyst. Best result is obtained with base at lower temp.

Condensation is carried out at lower temperature ($\leq 20^{\circ}\text{C}$) because product of the reaction is alcohol which has strong $-I$ group at β -carbon.

Such type of alcohols are highly reactive for dehydration. They undergo dehydration in the presence of acid as well as base even at 25°C . They also undergo elimination even on strong heating.

(i) ***Aldol condensation***

(a) This reaction takes place between two molecules of carbonyl compounds; one molecule should have at least two α -hydrogen atoms. In this reaction best result is obtained when

Both molecule are the same or

One should have no α -hydrogen atom and other should have at least two α -hydrogens.

(b) These reactions are practical when base is $NaOH$ and reaction temperature is high ($\geq 100^\circ$).

(c) The reaction is two step reaction. First step is aldol formation and second step is dehydration of aldol.

Due to hyper-conjugation in crotonaldehyde further condensation give conjugated alkene carbonyl compound.

Step III :

In aldol condensation, dehydration occurs readily because the double bond that forms is conjugated, both with the carbonyl group and with the benzene ring. The conjugation system is thereby extended.

Crossed aldol condensation : Aldol condensation between two different aldehydes or two different ketones or one aldehyde and another ketone provided at least one of the components have α -hydrogen atom gives different possible product

However crossed aldol condensation is important when only it the components has α -hydrogen atom.

Intra molecular aldol condensation : One molecule Intramolecular condensation give aldol compounds

Example :

(ii) **Claisen – Schmidt reaction :** Crossed aldol condensation between aromatic aldehyde and aliphatic ketone or mixed ketone is known as Claisen – Schmidt reaction. Claisen – Schmidt reactions are useful when bases such as sodium hydroxide are used because under these conditions ketones do not undergo self condensation. Some examples of this reaction are :

Test of aldehydes and Ketones (Distinction)

Table : 27.1

Test	Aldehydes	Ketones
With Schiff's reagent	Give pink colour.	No colour.
With Fehling's solution	Give red precipitate.	No precipitate is formed.
With Tollen's reagent	Black precipitate or silver mirror is formed.	No black precipitate or silver mirror is formed.
With saturated sodium bisulphite solution in water	Crystalline compound (colourless) is formed.	Crystalline compound (colourless) is formed.
With 2, 4-dinitrophenyl hydrazine	Orange-yellow or red well defined crystals with melting points characteristic of individual aldehydes.	Orange-yellow or red well defined crystals with melting points characteristic of individual ketones.
With sodium hydroxide	Give brown resinous mass (formaldehyde does not give this test).	No reaction.
With sodium nitroprusside and few drops of sodium hydroxide	A deep red colour (formaldehyde does not respond to this test).	Red colour which changes to orange.

Some commercially important aliphatic carbonyl compounds

Formaldehyde : Formaldehyde is the first member of the aldehyde series. It is present in green leaves of plants where its presence is supposed to be due to the reaction of CO_2 with water in presence of sunlight and chlorophyll.

(1) Preparation

(2) Physical properties

- It is a colourless, pungent smelling gas.
- It is extremely soluble in water. Its solubility in water may be due to hydrogen bonding between water molecules and its hydrate.
- It can easily be condensed into liquid. The liquid formaldehyde boils at -21°C .
- It causes irritation to skin, eyes, nose and throat.
- Its solution acts as antiseptic and disinfectant.

(3) Uses

(i) The 40% solution of formaldehyde (formalin) is used as disinfectant, germicide and antiseptic. It is used for the preservation of biological specimens.

(ii) It is used in the preparation of hexamethylene tetramine (urotropine) which is used as an antiseptic and germicide.

(iii) It is used in silvering of mirror.

(iv) It is employed in manufacture of synthetic dyes such as pararosaniline, indigo, etc.

(v) It is used in the manufacture of formamint (by mixing formaldehyde with lactose) – a throat lozenges.

(vi) It is used for making synthetic plastics like bakelite, urea-formaldehyde resin, etc.

(vii) *Rongalite* – a product obtained by reducing formaldehyde sodium bisulphite derivative with zinc dust and ammonia and is used as a reducing agent in vat dyeing.

Acetaldehyde

Acetaldehyde is the second member of the aldehyde series. It occurs in certain fruits. It was first prepared by Scheele in 1774 by oxidation of ethyl alcohol.

(1) **Preparation** : It may be prepared by any of the general methods. The summary of the methods is given below

(i) By oxidation of ethyl alcohol with acidified potassium dichromate or with air in presence of a catalyst like silver at 300°C.

(ii) By dehydrogenation of ethyl alcohol. The vapours of ethyl alcohol are passed over copper at 300°C.

(iii) By heating the mixture of calcium acetate and calcium formate.

(iv) By heating ethylidene chloride with caustic soda or caustic potash solution.

(v) By the reduction of acetyl chloride with hydrogen in presence of a catalyst palladium suspended in barium sulphate (Rosenmund's reaction).

(vi) By the reduction of CH_3CN with stannous chloride and HCl in ether and hydrolysis (Stephen's method).

(vii) By hydration of acetylene with dil. H_2SO_4 and $HgSO_4$ at 60°C.

(viii) By ozonolysis of butene-2 and subsequent breaking of ozonide.

(ix) **Laboratory preparation** : Acetaldehyde is prepared in the laboratory by oxidation of ethyl alcohol with acidified potassium dichromate or acidified sodium dichromate.

To recover acetaldehyde, the distillate is treated with dry ammonia when crystallised product, acetaldehyde ammonia, is formed. It is filtered and washed with dry ether. The dried crystals are then distilled with dilute sulphuric acid when pure acetaldehyde is collected.

(x) **Manufacture** : Acetaldehyde can be manufactured by one of the following methods:

(a) *By air oxidation of ethyl alcohol*

(b) *By dehydrogenation of alcohol*

(c) *By hydration of acetylene*

(d) *From ethylene (Wacker process)*

(2) **Physical properties**

(i) Acetaldehyde is a colourless volatile liquid. It boils at 21°C.

(ii) It has a characteristic pungent smell.

(iii) It is soluble in water, chloroform, ethyl alcohol and ether. Its aqueous solution has a pleasant odour. In water, it is hydrated to a considerable extent to form ethylidene diol.

(3) **Uses** : Acetaldehyde is used :

(i) In the preparation of acetic acid, acetic anhydride, ethyl acetate, chloral, 1,3-butadiene (used in rubbers), dyes and drugs.

(ii) As an antiseptic inhalant in nose troubles.

(iii) In the preparation of paraldehyde (hypnotic and sporofic) and metaldehyde (solid fuel).

(iv) In the preparation of acetaldehyde ammonia (a rubber accelerator).

Table : 27.2 Comparative study of formaldehyde and acetaldehyde

S.No.	Reaction	Formaldehyde $HCHO$	Acetaldehyde CH_3CHO
Similarities			
I.	Addition of hydrogen (a) H_2 in presence of catalyst, Ni , Pd or Pt (b) $LiAlH_4$ (ether) (c) Amalgamated zinc + conc. HCl (Clemmenson reduction)	Forms methyl alcohol $HCHO + H_2 \longrightarrow CH_3OH$ Forms methyl alcohol Forms methane $HCHO + 4H \longrightarrow CH_4 + H_2O$	Forms ethyl alcohol $CH_3CHO + H_2 \longrightarrow CH_3CH_2OH$ Forms ethyl alcohol Forms ethane $CH_3CHO + 4H \longrightarrow C_2H_6 + H_2O$

2.	Addition of NaHSO_3 solution	Forms bisulphite addition product $\text{HCHO} + \text{NaHSO}_3 \longrightarrow \text{CH}_2(\text{OH})\text{SO}_3\text{Na}$	Forms bisulphite addition product $\text{CH}_3\text{CHO} + \text{NaHSO}_3 \longrightarrow$ $\text{CH}_3\text{CH}(\text{OH})\text{SO}_3\text{Na}$
3.	Addition of HCN	Forms formaldehyde cyanohydrin $\text{HCHO} + \text{HCN} \longrightarrow \text{CH}_2(\text{OH})\text{CN}$	Forms acetaldehyde cyanohydrin $\text{CH}_3\text{CHO} + \text{HCN} \longrightarrow$ $\text{CH}_3\text{CH}(\text{OH})\text{CN}$
4.	Addition of Grignard reagent followed by hydrolysis	Forms ethyl alcohol $\text{HCHO} + \text{CH}_3\text{MgI} \longrightarrow \text{CH}_2 \begin{matrix} \swarrow \text{OMgI} \\ \searrow \text{CH}_3 \end{matrix}$ $\xrightarrow[\text{-Mg(OH)I}]{\text{H}_2\text{O}} \text{CH}_3\text{CH}_2\text{OH}$	Forms isopropyl alcohol $\text{CH}_3\text{CHO} + \text{CH}_3\text{MgI} \longrightarrow$ $\text{CH}_3 - \underset{\text{CH}_3}{\underset{ }{\text{C}}} \text{HOMgI} \xrightarrow[\text{-Mg(OH)I}]{\text{H}_2\text{O}}$ $\text{CH}_3 - \underset{\text{CH}_3}{\underset{ }{\text{CH}}} - \text{OH}$
5.	With hydroxylamine NH_2OH	Forms formaldoxime $\text{CH}_2 = \text{O} + \text{H}_2\text{NOH} \xrightarrow{-\text{H}_2\text{O}}$ $\text{CH}_2 = \text{NOH}$	Forms acetaldoxime $\text{CH}_3\text{CH} = \text{O} + \text{H}_2\text{NOH} \xrightarrow{-\text{H}_2\text{O}}$ $\text{CH}_3\text{CH} = \text{NOH}$
6.	With hydrazine (NH_2NH_2)	Forms formaldehyde hydrazone $\text{CH}_2\text{O} + \text{H}_2\text{N NH}_2 \xrightarrow{-\text{H}_2\text{O}}$ $\text{CH}_2 = \text{NNH}_2$	Forms acetaldehyde hydrazone $\text{CH}_3\text{CH} = \text{O} + \text{H}_2\text{NNH}_2 \xrightarrow{-\text{H}_2\text{O}}$ $\text{CH}_3\text{CH} = \text{NNH}_2$
7.	With phenyl hydrazine $(\text{C}_6\text{H}_5\text{NNH}_2)$	Forms formaldehyde phenyl hydrazone $\text{CH}_2 = \text{O} + \text{H}_2\text{NNHC}_6\text{H}_5 \xrightarrow{-\text{H}_2\text{O}}$ $\text{CH}_2 = \text{NNHC}_6\text{H}_5$	Forms acetaldehyde phenyl hydrazone $\text{CH}_3\text{CH} = \text{O} + \text{H}_2\text{NNHC}_6\text{H}_5 \xrightarrow{-\text{H}_2\text{O}}$ $\text{CH}_3\text{CH} = \text{NNHC}_6\text{H}_5$
8.	With semicarbazide $(\text{H}_2\text{NNHCONH}_2)$	Forms formaldehyde semicarbazone $\text{CH}_2 = \text{O} + \text{H}_2\text{NNHCONH}_2 \xrightarrow{-\text{H}_2\text{O}}$ $\text{CH}_2 = \text{NNHCONH}_2$	Forms acetaldehyde semicarbazone $\text{CH}_3\text{CH} = \text{O} + \text{H}_2\text{NNHCONH}_2 \xrightarrow{-\text{H}_2\text{O}}$ $\text{CH}_3\text{CH} = \text{NNHCONH}_2$
9.	With alcohol $(\text{C}_2\text{H}_5\text{OH})$ in presence of acid	Forms ethylal $\text{H}_2\text{C} = \text{O} + 2\text{C}_2\text{H}_5\text{OH} \xrightarrow{\text{HCl}}$ $\text{CH}_2 \begin{matrix} \swarrow \text{OC}_2\text{H}_5 \\ \searrow \text{OC}_2\text{H}_5 \end{matrix}$	Forms acetaldehyde diethyl acetal $\text{CH}_3\text{CHO} + 2\text{C}_2\text{H}_5\text{OH} \xrightarrow{\text{HCl}}$ $\text{CH}_3\text{CH} \begin{matrix} \swarrow \text{OC}_2\text{H}_5 \\ \searrow \text{OC}_2\text{H}_5 \end{matrix}$
10.	With thioalcohols $(\text{C}_2\text{H}_5\text{SH})$ in presence of acid	Forms thio ethylal $\text{H}_2\text{C} = \text{O} + 2\text{C}_2\text{H}_5\text{SH} \longrightarrow$ $\text{CH}_2 \begin{matrix} \swarrow \text{SC}_2\text{H}_5 \\ \searrow \text{SC}_2\text{H}_5 \end{matrix}$	Forms acetaldehyde diethyl thioacetal $\text{CH}_3\text{CH} = \text{O} + 2\text{C}_2\text{H}_5\text{SH} \longrightarrow$ $\text{CH}_3\text{CH} \begin{matrix} \swarrow \text{SC}_2\text{H}_5 \\ \searrow \text{SC}_2\text{H}_5 \end{matrix}$
11.	Oxidation with acidified $\text{K}_2\text{Cr}_2\text{O}_7$	Forms formic acid $\text{HCHO} + \text{O} \longrightarrow \text{HCOOH}$	Forms acetic acid $\text{CH}_3\text{CHO} + \text{O} \longrightarrow \text{CH}_3\text{COOH}$
12.	With Schiff's reagent	Restores pink colour of Schiff's reagent	Restores pink colour of Schiff's reagent
13.	With Tollen's reagent	Gives black precipitate of Ag or silver mirror $\text{Ag}_2\text{O} + \text{HCHO} \longrightarrow 2\text{Ag} + \text{HCOOH}$	Gives black precipitate of Ag or silver mirror $\text{Ag}_2\text{O} + \text{CH}_3\text{CHO} \longrightarrow$ $2\text{Ag} + \text{CH}_3\text{COOH}$

14.	With Fehling's solution or Benedict's solution	Gives red precipitate of cuprous oxide $2CuO + HCHO \longrightarrow Cu_2O + HCOOH$	Gives red precipitate of cuprous oxide $2CuO + CH_3CHO \longrightarrow$ $Cu_2O + CH_3COOH$
15.	Polymerisation	Undergoes polymerisation $nHCHO \xrightleftharpoons{\text{Evaporation}} (HCHO)_n$ Paraformaldehyde $3HCHO \xrightleftharpoons[\text{heat}]{\text{Room temp.}} (HCHO)_3$ Metaformaldehyde	Undergoes polymerisation $3CH_3CHO \xrightleftharpoons[\text{dil. } H_2SO_4, \text{ distill}]{H_2SO_4 \text{ Conc.}} (CH_3CHO)_3$ Paraldehyde $4CH_3CHO \xrightleftharpoons[\text{dil. } H_2SO_4, \text{ distill}]{H_2SO_4 \text{ Conc.}} (CH_3CHO)_4$ Metaldehyde
Dissimilarities			
16.	With PCl_5	No reaction	Forms ethylidene chloride $CH_3CHO + PCl_5 \longrightarrow CH_3CH \begin{matrix} \swarrow Cl \\ \searrow Cl \end{matrix} + POCl_3$
17.	With chlorine	No reaction	Forms chloral $CH_3CHO + 3Cl_2 \longrightarrow CCl_3CHO + 3HCl$
18.	With SeO_2	No reaction	Forms glyoxal $CH_3CHO + SeO_2 \longrightarrow CHO \cdot CHO + Se + H_2O$
19.	Iodoform reaction ($I_2/NaOH$)	No reaction	Forms iodoform $CH_3CHO + 3I_2 + 4NaOH \longrightarrow CHI_3 + HCOONa + 3NaI + 3H_2O$
20.	With dil. alkali (Aldol condensation)	No reaction	Forms aldol $CH_3CHO + HCH_2CHO \longrightarrow CH_3CH(OH)CH_2CHO$
21.	With conc. $NaOH$ (Cannizzaro's reaction)	Forms sodium formate and methyl alcohol $2HCHO + NaOH \longrightarrow HCOONa + CH_3OH$	Forms a brown resinous mass
22.	With ammonia	Forms hexamethylene tetramine (urotropine) $6HCHO + 4NH_3 \longrightarrow (CH_2)_6N_4 + 6H_2O$	Forms addition product, acetaldehyde ammonia $CH_3CHO + NH_3 \longrightarrow$ $CH_3CH \begin{matrix} \swarrow OH \\ \searrow NH_2 \end{matrix}$
23.	With phenol	Forms bakelite plastic	No reaction
24.	With urea	Forms urea-formaldehyde plastic	No reaction
25.	Condensation in presence of $Ca(OH)_2$	Form formose (a mixture of sugars)	No reaction

Inter conversion of formaldehyde and acetaldehyde

(i) **Ascent of series** : Conversion of formaldehyde into acetaldehyde

(2) **Descent of series** : Conversion of acetaldehyde into formaldehyde

Acetone

It is a symmetrical (simple) ketone and is the first member of the homologous series of ketones. In traces, it is present in blood and urine.

(1) **Preparation** :

(vii) **From pyroligneous acid** : Pyroligneous acid containing acetic acid, acetone and methyl alcohol is distilled in copper vessel and the vapours are passed through hot milk of lime. Acetic acid combines to form nonvolatile calcium acetate. The unabsorbed vapours of methanol and acetone are condensed and fractionally distilled. Acetone distills at 56°C .

The acetone thus obtained is purified with the help of sodium bisulphite.

(2) **Physical properties** : (i) It is a colourless liquid with characteristic pleasant odour.

(ii) It is inflammable liquid. It boils at 56°C .

(iii) It is highly miscible with water, alcohol and ether.

(3) **Chemical properties**

If acetone would be in excess in ketal condensation or catalyst (ZnCl_2 / dry HCl) is used then three moles of acetone undergoes condensation polymerisation and form a compound called 'Phorone'.

Molecular mass of phorone = 3 mole of acetone – 2 mole of H_2O

Reformatsky reaction: This reaction involves the treatment of aldehyde and ketone with a bromo acid ester in presence of metallic zinc to form β -hydroxy ester, which can be easily dehydrated into α, β -unsaturated ester.

(b) Addition to carbonyl group

(4) Uses

(i) As a solvent for cellulose acetate, cellulose nitrate, celluloid, lacquers, resins, etc.

(ii) For storing acetylene.

(iii) In the manufacture of cordite – a smoke less powder explosive.

(iv) In the preparation of chloroform, iodoform, sulphonal and chloretone.

(v) As a nailpolish remover.

(vi) In the preparation of an artificial scent (ionone), plexiglass (unbreakable glass) and synthetic rubber.

(5) Tests

(i) **Legal's test** : When a few drops of freshly prepared sodium nitroprusside and sodium hydroxide solution are added to an aqueous solution of acetone, a wine colour is obtained which changes to yellow on standing.

(ii) **Indigo test** : A small amount of orthonitrobenzaldehyde is added to about 2 ml. of acetone and it is diluted with KOH solution and stirred. A blue colour of indigotin is produced.

(iii) **Iodoform test** : Acetone gives iodoform test with iodine and sodium hydroxide or iodine and ammonium hydroxide.

Table : 27.3 Comparison between Acetaldehyde and Acetone

Reaction	Acetaldehyde	Acetone
Similarities		
1. Reduction with H_2 and Ni or $LiAlH_4$	Forms ethyl alcohol $CH_3CHO + H_2 \xrightarrow{Ni} CH_3CH_2OH$	Forms isopropyl alcohol $CH_3COCH_3 + H_2 \longrightarrow CH_3CHOHCH_3$
2. Clemmensen's reduction (Zn/Hg and conc. HCl)	Forms ethane (an alkane) $CH_3CHO + 4H \longrightarrow CH_3CH_3 + H_2O$	Forms propane (an alkane) $CH_3COCH_3 + 4H \longrightarrow CH_3CH_2CH_3 + H_2O$
3. Addition of HCN	Forms acetaldehyde cyanohydrin $CH_3CHO + HCN \longrightarrow CH_3CH \begin{array}{c} \diagup OH \\ \diagdown CN \end{array}$	Forms acetone cyanohydrin $(CH_3)_2CO + HCN \longrightarrow (CH_3)_2C \begin{array}{c} \diagup OH \\ \diagdown CN \end{array}$
4. Addition of $NaHSO_3$	White crystalline derivative $CH_3CHO + NaHSO_3 \longrightarrow CH_3CH \begin{array}{c} \diagup OH \\ \diagdown SO_3Na \end{array}$	White crystalline derivative $(CH_3)_2CO + NaHSO_3 \longrightarrow (CH_3)_2C \begin{array}{c} \diagup OH \\ \diagdown SO_3Na \end{array}$
5. Grignard reagent followed by hydrolysis	Forms isopropyl alcohol $CH_3CHO + CH_3MgI \longrightarrow (CH_3)_2CH - OMgI$ $\xrightarrow{H_2O} CH_3CHOHCH_3$	Forms tertiary butyl alcohol $(CH_3)_2CO + CH_3MgI \longrightarrow (CH_3)_3COMgI$ $\xrightarrow{H_2O} (CH_3)_3COH$
6. With hydroxylamine (NH_2OH)	Forms acetaldoxime (an oxime) $CH_3CHO + H_2NOH \longrightarrow CH_3CH = NOH$	Forms acetoxime (an oxime) $(CH_3)_2CO + H_2NOH \longrightarrow (CH_3)_2C = NOH$
7. With hydrazine (NH_2NH_2)	Forms acetaldehyde hydrazone $CH_3CHO + H_2NNH_2 \longrightarrow CH_3CH = NNH_2$	Forms acetone hydrazone $(CH_3)_2CO + H_2NNH_2 \longrightarrow (CH_3)_2C = NNH_2$
8. With phenyl hydrazine ($C_6H_5NHNH_2$)	Forms acetaldehyde phenylhydrazone $CH_3CHO + H_2NNHC_6H_5 \longrightarrow$	Forms acetone phenyl hydrazone $(CH_3)_2CO + H_2NNHC_6H_5 \longrightarrow$

	$CH_3CH = NNHC_6H_5$	$(CH_3)_2C = NNHC_6H_5$
9. With semicarbazide ($H_2NNHCONH_2$)	Forms acetaldehyde semicarbazone $CH_3CHO + H_2NNHCONH_2 \longrightarrow$ $CH_3CH = NNHCONH_2$	Forms acetone semicarbazone $(CH_3)_2CO + H_2NNHCONH_2 \longrightarrow$ $(CH_3)_2C = NNHCONH_2$
10. With PCl_5	Forms ethylidene chloride (Gem dihalide) $CH_3CHO + PCl_5 \longrightarrow CH_3CH \begin{matrix} Cl \\ \diagdown \\ Cl \end{matrix}$	Forms isopropylidene chloride (Gem dihalide) $(CH_3)_2CO + PCl_5 \longrightarrow (CH_3)_2C \begin{matrix} Cl \\ \diagdown \\ Cl \end{matrix}$
11. With chlorine	Forms chloral (Gem trihalide) $CH_3CHO + Cl_2 \longrightarrow CCl_3CHO$	Forms trichloro acetone (Gem trihalide) $CH_3COCH_3 + Cl_2 \longrightarrow CCl_3COCH_3$
12. With alcohols	Forms acetal (a diether) $CH_3CHO + 2C_2H_5OH \longrightarrow CH_3CH \begin{matrix} OC_2H_5 \\ \diagdown \\ OC_2H_5 \end{matrix}$	Forms ketal (a diether) $(CH_3)_2CO + 2C_2H_5OH \longrightarrow (CH_3)_2C \begin{matrix} OC_2H_5 \\ \diagdown \\ OC_2H_5 \end{matrix}$
13. With SeO_2	Forms glyoxal $CH_3CHO + SeO_2 \longrightarrow CHOCHO + Se + H_2O$	Forms methyl glyoxal $(CH_3)_2CO + SeO_2 \longrightarrow CH_3COCHO + Se + H_2O$
14. Iodoform reaction ($I_2 + NaOH$)	Forms iodoform	Forms iodoform
15. Bleaching powder	Forms chloroform	Forms chloroform
16. Aldol condensation with mild alkali	Forms aldol $2CH_3CHO \longrightarrow CH_3CHOHCH_2CHO$	Forms diacetone alcohol $2CH_3COCH_3 \longrightarrow (CH_3)_2C(OH)CH_2COCH_3$
17. Polymerisation	Undergoes polymerisation	Does not undergo polymerisation but gives condensation reaction
18. With NH_3	Forms acetaldehyde ammonia $CH_3CHO + NH_3 \longrightarrow CH_3CH \begin{matrix} OH \\ \diagdown \\ NH_2 \end{matrix}$	Forms diacetone ammonia $(CH_3)_2CO + NH_3 + OC(CH_3)_2 \longrightarrow$ $(CH_3)_2C(NH_2)CH_2COCH_3$
19. With conc. $NaOH$	Forms brownish resinous mass	No reaction
20. With HNO_2	No reaction	Forms oximino acetone $CH_3COCH_3 + HNO_2 \longrightarrow CH_3COCH = NOH$
21. With chloroform	No reaction	Forms chloretone $(CH_3)_2CO + CHCl_3 \longrightarrow (CH_3)_2C \begin{matrix} OH \\ \diagdown \\ CCl_3 \end{matrix}$
22. With alk. sodium nitroprusside	Deep red colour	Red colour changes to yellow on standing
23. With sodium nitroprusside + Pyridine	Blue colour	No effect
24. Boiling point	$21^\circ C$	$56^\circ C$
Dissimilarities		
25. With Schiff's reagent	Pink colour	Does not give pink colour
26. With Fehling's solution	Gives red precipitate	No reaction
27. With Tollen's reagent	Gives silver mirror	No reaction
28. Oxidation with acidified $K_2Cr_2O_7$	Easily oxidised to acetic acid $CH_3CHO + O \longrightarrow CH_3COOH$	Oxidation occurs with difficulty to form acetic acid $CH_3COCH_3 + O \longrightarrow CH_3COOH + CO_2 + H_2O$

Aromatic Carbonyl Compounds

Aromatic aldehydes are of two types :

The compounds in which $-CHO$ group is attached directly to an aromatic ring, e.g., benzaldehyde, C_6H_5CHO .

Those in which aldehyde ($-CHO$) group is attached to side chain, e.g., phenyl acetaldehyde, $C_6H_5CH_2CHO$. They closely resemble with aliphatic aldehydes.

Aromatic ketones are compounds in which a carbonyl group ($>C=O$) is attached to either two aryl groups or one aryl group and one alkyl group. Examples are :

Benzaldehyde is the simplest aromatic aldehyde. It occurs in bitter almonds in the form of its glucoside, **amygdalin** ($C_{20}H_{27}O_{11}N$). When amygdalin is boiled with dilute acids, it hydrolyses into benzaldehyde, glucose and HCN

Benzaldehyde is also known as *oil of bitter almonds*.

(i) Method of preparation

(i) **Laboratory method** : It is conveniently prepared by boiling benzyl chloride with copper nitrate or lead nitrate solution in a current of carbon dioxide.

(ii) Rosenmund reaction :

(iii) **By dry distillation of a mixture of calcium benzoate and calcium formate**

(iv) **By oxidation of benzyl alcohol** : This involves the treatment of benzyl alcohol with dil. HNO_3 or acidic potassium dichromate or chromic anhydride in acetic anhydride or with copper catalyst at $350^\circ C$.

This method is used for commercial production of benzaldehyde.

(v) **By hydrolysis of benzal chloride** :

This is also an industrial method.

(vi) **By oxidation of Toluene**

Commercially the oxidation of toluene is done with air and diluted with nitrogen (to prevent complete oxidation) at $500^\circ C$ in the presence of oxides of Mn, Mo or Zr as catalyst.

Partial oxidation of toluene with manganese dioxide and dilute sulphuric acid at $35^\circ C$, also forms benzaldehyde.

(vii) **Etard's reaction** : $C_6H_5CH_3 + 2CrO_2Cl_2 \longrightarrow$

(viii) **Gattermann-koch aldehyde synthesis** : Benzene is converted into benzaldehyde by passing a mixture of carbon monoxide and HCl gas under high pressure into the ether solution of benzene in presence of anhydrous aluminium chloride and cuprous chloride.

(ix) **Gattermann reaction**

(x) **Stephen's reaction** : Benzaldehyde is obtained by partial reduction of phenyl cyanide with stannous chloride and passing dry HCl gas in ether solution followed by hydrolysis of the aldimine stannic chloride with water.

(xi) **By ozonolysis of styrene**(xii) **Grignard reaction**

Other reagents like carbon monoxide or HCN can also be used in place of ethyl formate.

(xiii) **From Diazonium salt**(2) **Physical properties**

(i) Benzaldehyde is a colourless oily liquid. Its boiling point is 179°C.

(ii) It has smell of bitter almonds.

(iii) It is sparingly soluble in water but highly soluble in organic solvents.

(iv) It is steam volatile.

(v) It is heavier than water (sp. gr. 1.0504 at 15°C).

(vi) It is poisonous in nature.

(3) **Chemical properties**

(i) **Addition reaction:** The carbonyl group is polar as oxygen is more electronegative than carbon,

Thus, The positive part of the polar reagent always goes to the carbonyl oxygen and negative part goes to carbonyl carbon.

However on reduction with sodium amalgam and water, it gives hydrobenzoin,

(ii) **Reactions involving replacement of carbonyl oxygen**

(iii) **Oxidation** : Benzaldehyde is readily oxidised to benzoic acid even on exposure to air.

Acidified $K_2Cr_2O_7$, alkaline $KMnO_4$ and dilute HNO_3 can be used as oxidising agents for oxidation.

(iv) **Reducing properties** : Benzaldehyde is a weak reducing agent. It reduces ammoniacal silver nitrate solution (Tollen's reagent) to give silver mirror but does not reduce Fehling's solution.

(v) **Clemmensen's reduction** : With amalgamated zinc and conc. HCl , benzaldehyde is reduced to toluene.

(vi) **Schiff's reaction** : It restores pink colour to Schiff's reagent (aqueous solution of *p*-rosaniline hydrochloride decolourised by passing sulphur dioxide).

(vii) **Tischenko reaction** : On heating benzaldehyde with aluminium alkoxide (ethoxide) and a little of anhydrous $AlCl_3$ or $ZnCl_2$, it undergoes an intermolecular oxidation and reduction (like aliphatic aldehydes) to form acid and alcohol respectively as such and react to produce benzyl benzoate (an ester).

(viii) **Reactions in which benzaldehyde differs from aliphatic aldehydes**

(a) **With fehling's solution** : No reaction

(b) **Action of chlorine** : Benzoyl chloride is formed when chlorine is passed through benzaldehyde at its boiling point in absence of halogen carrier. This is because in benzaldehyde there is no α -hydrogen atom present which could be replaced by chlorine.

(c) **Cannizzaro's reaction** : $2C_6H_5CHO \xrightarrow{KOH}$

The possible Mechanism is

First step is the reversible addition of hydroxide ion to carbonyl group.

Second step is the transfer of hydride ion directly to the another aldehyde molecule, the latter is thus reduced to alkoxide ion and the former (ion I) is oxidised to an acid.

Third Step is exchange of protons to give most stable pair alcohol and acid anion.

So one molecule of aldehyde acts as hydride donor and the other acts as hydride acceptor. In other words, Cannizzaro's reaction is an example of self reduction and oxidation.

□ Two different aldehydes each having no α -hydrogen atom, exhibit crossed Cannizzaro's reaction when heated in alkaline solution.

Aldehyde which do not have α -hydrogen ($C_6H_5 - CHO, CCl_3CHO, (CH_3)_3C - CHO, CH_2O$ etc.) undergoes Cannizzaro's reaction.

Intramolecular cannizzaro reaction

(d) Benzoin Condensation

Benzoin can also be reduced to a number of product i.e.,

Benzoin can be readily oxidised to a diketone, i.e. benzil.

(e) Perkin's reaction

(f) Claisen condensation [Claisen-schmidt reaction]

(g) Knoevenagel reaction

(h) Reaction with aniline : Benzaldehyde reacts with aniline and forms Schiff's base

Reaction with Dimethylaniline

(i) **Reaction with Ammonia** : Benzaldehyde reacts with ammonia to form hydrobenzamide aldehyde other than CH_2O give aldehyde ammonia while CH_2O forms urotropine.

(j) **Reformatsky reaction**

(k) **Reaction of benzene ring**

(4) **Uses** : Benzaldehyde is used,

- In perfumery
- In manufacture of dyes
- In manufacture of benzoic acid, cinnamic acid, cinnamaldehyde, Schiff's base, etc.

(5) **Tests** : (i) Benzaldehyde forms a white precipitate with NaHSO_3 solution.

(ii) Benzaldehyde forms a yellow precipitate with 2 : 4 dinitrophenyl hydrazine.

(iii) Benzaldehyde gives pink colour with Schiff's reagent.

(iv) Benzaldehyde forms black precipitate or silver mirror with Tollen's reagent.

(v) Benzaldehyde on treatment with alkaline KMnO_4 and subsequent acidification gives a white precipitate of benzoic acid on cooling.

Acetophenone, $\text{C}_6\text{H}_5\text{COCH}_3$, Acetyl Benzene

(1) **Method of preparation**

(i) **Friedel-Craft's reaction** : Acetyl chloride reacts with benzene in presence of anhydrous aluminium chloride to form acetophenone.

(ii) By distillation of a mixture of calcium benzoate and calcium acetate.

(iii) By methylation of benzaldehyde with diazomethane.

(iv) By treating benzoyl chloride with dimethyl cadmium.

(v) **By Grignard reagent**

(vi) **Commercial preparation** : Ethylbenzene is oxidised with air at 126°C under pressure in presence of a catalyst manganese acetate.

(2) **Physical properties** : It is a colourless crystalline solid with melting point 20°C and boiling point 202°C . It has characteristic pleasant odour. It is slightly soluble in water. Chemically, It is similar to acetone.

(3) **Chemical properties** :

(4) **Uses** : It is used in perfumery and as a sleep producing drug.

Benzophenone, $C_6H_5COC_6H_5$

(1) **Method of preparation**

(i) **From alkyl benzenes**

(2) **Physical properties** : It is a colourless, pleasant smelling solid.

(3) **Chemical properties** : It shows the characteristic properties of keto group but does not give bisulphite compounds.

(i) **Reduction** :

(ii) **Clemmenson reduction** :

(iii) **Fusion with KOH** :

Tips & Tricks

✍ Acidified $KCrO_4$ i.e., chromic acid sulphuric acid mixture is known as Jones's reagent. When used as an oxidising agent unlike acidified $KMnO_4$ it does not diffect a double bond.

✍ Vilsmeier reaction : this reaction involves the conversion of aromatic compounds to aldehydes in the presence of a 2° amino and formic acid.

✍ Benzaldehyde although reduces Tollen's reagent. It does not reduce Fehling or Benedict solution.

Ordinary Thinking

Objective Questions

Introduction

- Reaction of acetaldehyde with HCN followed by hydrolysis gives a compound which shows [MP PET 1997]
 - Optical isomerism
 - Geometrical isomerism
 - Metamerism
 - Tautomerism
- In aldehydes and ketones, carbon of carbonyl group is [MP PMT 1995; RPET 1999, 2000]
 - sp^3 hybridised
 - sp^2 hybridised
 - sp hybridised
 - Unhybridised
- The IUPAC name of the following structure is [MP PMT 1995]

$$\begin{array}{c} \text{CH}_3 \quad \text{O} \\ | \quad || \\ \text{CH}_3 - \text{CH} - \text{C} - \text{CH}_2 - \text{CH}_2\text{OH} \end{array}$$
 - 1-hydroxy 4-methyl 3-pentanone
 - 2-methyl 5-hydroxy 3-pentanone
 - 4-methyl 3-oxo 1-pentanol
 - Hexanol-1, one-3
- Glyoxal is [BVP 2003]
 - $\text{CH}_2\text{O} - \text{CH}_2\text{O}$
 - $\begin{array}{c} \text{CH}_2\text{OH} \\ | \\ \text{CH}_2\text{OH} \end{array}$
 - $\begin{array}{c} \text{CHO} \\ | \\ \text{CHO} \end{array}$
 - $\begin{array}{c} \text{CH}_2\text{OH} \\ | \\ \text{CHO} \end{array}$
- Aldehydes are isomeric with
 - Ketones
 - Ethers
 - Alcohols
 - Fatty acids
- Which of the following compounds does not contain an $-\text{OH}$ group [CPMT 1982]
 - Phenol
 - Carboxylic acid
 - Aldehydes
 - Alcohols
- IUPAC name of CH_3COCH_3 is [MP PET 1991]
 - Acetone
 - 2-propanone
 - Dimethyl ketone
 - Propanal
- What is the compound called if remaining two valencies of a carbonyl group are satisfied by two alkyl groups [CPMT 1990]
 - Aldehyde
 - Ketone
 - Acid
 - Acid chloride
- $\begin{array}{c} \text{OH} \\ | \\ \text{CH}_3 - \text{C} - \text{CN} \\ | \\ \text{H} \end{array}$ is
 - Acetaldehyde cyanohydrin
 - Acetone cyanohydrin
 - Cyanoethanol
 - Ethanol nitrile
- Ethanedial has which functional group(s)
 - One ketonic
 - Two aldehydic
 - One double bond
 - Two double bond
- In the group $\begin{array}{c} \text{R}' \\ \diagup \\ \text{R} \end{array} \text{C} = \text{O}$ the carbonyl carbon is joined to other atoms by
 - Two sigma and one pi bonds
 - Three sigma and one pi bonds

- One sigma and two pi bonds
 - Two sigma and two pi bonds
- Which of the following types of isomerism is shown by pentanone
 - Chain isomerism
 - Position isomerism
 - Functional isomerism
 - All of these
 - IUPAC name of CCl_3CHO is [MP PMT/PET 1988]
 - Chloral
 - Trichloro acetaldehyde
 - 1, 1, 1-trichloroethanal
 - 2, 2, 2-trichloroethanal
 - Which of the following is a mixed ketone [AFMC 1997]
 - Pentanone
 - Acetophenone
 - Benzophenone
 - Butanone
 - Chloral is [CPMT 1976, 84]
 - CCl_3CHO
 - $\text{CCl}_3\text{COCH}_3$
 - $\text{CCl}_3\text{COCCH}_3$
 - $\text{CCl}_3\text{CH}_2\text{OH}$
 - Carbonyl compounds are usually
 - Ethers, aldehydes, ketones and carboxylic acids
 - Aldehydes, ketones and carboxylic acids
 - Aldehydes and ketones
 - Carboxylic acids
 - Acetone and acetaldehyde are [KCET 1998]
 - Position isomers
 - Functional isomers
 - Not isomers
 - Chain isomers
 - Which of the aldehyde is most reactive? [DCE 2004]
 - $\text{C}_6\text{H}_5 - \text{CHO}$
 - CH_3CHO
 - HCHO
 - All the equally reactive

Preparation

- The end product in the following sequence of reaction is [Bihar CEE 2002]

$$\text{HC} \equiv \text{CH} \xrightarrow[20\% \text{H}_2\text{SO}_4]{1\% \text{HgSO}_4} \text{A} \xrightarrow{\text{CH}_3\text{MgX}} \text{B} \xrightarrow{[\text{O}]} \text{C}$$
 - Acetic acid
 - Isopropyl alcohol
 - Acetone
 - Ethanol
- In the following reaction, product P is $\text{R} - \overset{\text{O}}{\underset{\text{||}}{\text{C}}} - \text{Cl} \xrightarrow[\text{Pd} - \text{BaSO}_4]{\text{H}_2} \text{P}$ [CBSE PMT 1992; IIT 1992; AIIMS 1997; AFMC 1998]
 - RCH_2OH
 - RCOOH
 - RCHO
 - RCH_3
- Acetophenone is prepared from [CPMT 2003]
 - Rosenmund reaction
 - Sandmeyer reaction
 - Wurtz reaction
 - Friedel craft reaction
- Compound which gives acetone on ozonolysis [UPSEAT 2003]
 - $\text{CH}_3 - \text{CH} = \text{CH} - \text{CH}_3$
 - $(\text{CH}_3)_2\text{C} = \text{C}(\text{CH}_3)_2$
 - $\text{C}_6\text{H}_5\text{CH} = \text{CH}_2$
 - $\text{CH}_3\text{CH} = \text{CH}_2$
- $\text{CH}_3 - \overset{\text{O}}{\underset{\text{||}}{\text{C}}} - \text{CH}_2 - \text{COOC}_2\text{H}_5 \xrightarrow[\text{H}_2\text{O}]{\text{NaOH}} \text{A}$, product 'A' in the reaction is [RPMT 2003]
 - CH_3COOH
 - $\text{C}_2\text{H}_5\text{OH}$
 - CH_3COCH_3
 - $\text{C}_2\text{H}_5\text{CHO}$

6. Which one of the following compounds is prepared in the laboratory from benzene by a substitution reaction

[EAMCET 2003]

- (a) Glyoxal (b) Cyclohexane
(c) Acetophenone (d) Hexabromo cyclohexane

7. Ketones ($R-C(=O)-R_1$) where $R = R_1 =$ alkyl group. It can be obtained in one step by

[CBSE PMT 1997]

- (a) Hydrolysis of esters
(b) Oxidation of primary alcohol
(c) Oxidation of secondary alcohol
(d) Reaction of acid halide with alcohols

8. Predict the product 'B' in the sequence of reaction

[CBSE PMT 2001]

- (a) CH_3COONa (b) CH_3COOH
(c) CH_3CHO (d) $CH_3-CH(OH)-CH_2CHO$

9. $CH_3COCl \xrightarrow[Pd/BaSO_4]{2H} CH_3CHO + HCl$;

The above reaction is called

[JIPMER 1997]

- (a) Reimer-Tiemann reaction (b) Cannizzaro reaction
(c) Rosenmund reaction (d) Reformatsky reaction

10. The oxidation of toluene to benzaldehyde by chromyl chloride is called

[CBSE PMT 1996; AFMC 1998, 99; AIIMS 2000; JIPMER 2001; AFMC 2001; DCE 2004]

- (a) Cannizzaro reaction (b) Wurtz reaction
(c) Etard reaction (d) Reimer-Tiemann reaction

11. From which of the following tertiary butyl alcohol is obtained by the action of methyl magnesium iodide

[MP CET 2000]

- (a) $HCHO$ (b) CH_3CHO
(c) CH_3COCH_3 (d) CO_2

12. Catalyst used in Rosenmund reduction is

[Bihar MEE 1997]

- (a) $Pd/BaSO_4$ (b) $Zn-Hg$ couple
(c) $LiAlH_4$ (d) Ni/H_2

13. $CH_3-CH_2-C \equiv CH \xrightarrow[H_2O]{R} \text{Butanone}$, R is

[BHU 2003]

- (a) Hg^{++} (b) $KMnO_4$
(c) $KClO_3$ (d) $K_2Cr_2O_7$

14. Dry heating of calcium acetate gives

[DPMT 1979, 81, 96; NCERT 1981; KCET 1993; Bihar CEE 1995; MNR 1986; MP PMT 1997; MP PET 1993, 95; JIPMER 2002; AIIMS 1996; CPMT 1982, 86, 96, 2003; RPMT 2002]

- (a) Acetaldehyde (b) Ethane
(c) Acetic acid (d) Acetone

15. Identify the product C in the series

[MP PET 1999]

- (a) CH_3COOH (b) CH_3CH_2NHOH
(c) CH_3CONH_2 (d) CH_3CHO

16. Acetophenone is prepared by the reaction of which of the following in the presence of $AlCl_3$ catalyst [AIIMS 1996]

- (a) Phenol and acetic acid
(b) Benzene and acetone
(c) Benzene and acetyl chloride
(d) Phenol and acetone

17. Isopropyl alcohol on oxidation gives

[RPMT 1997; BHU 1997]

- (a) Acetone (b) Acetaldehyde
(c) Ether (d) Ethylene

18. On heating calcium acetate and calcium formate, the product formed is

[DPMT 1984; EAMCET 1985; MP PMT 1996, 92; KCET 1990; CPMT 1979, 82, 84; BIT 1992; RPET 2000]

- (a) CH_3COCH_3 (b) CH_3CHO
(c) $HCHO + CaCO_3$ (d) $CH_3CHO + CaCO_3$

19. Which of the following compound gives a ketone with Grignard reagent

[CPMT 1988; MP PET 1997]

- (a) Formaldehyde (b) Ethyl alcohol
(c) Methyl cyanide (d) Methyl iodide

20. In the Rosenmund's reduction, $BaSO_4$ taken with catalyst Pd acts as

- (a) Promotor (b) Catalytic poison
(c) Cooperator (d) Absorber

21. The Clemmenson reduction of acetone yields

- (a) Ethanol (b) Ethanal
(c) Propane (d) Propanol

22. Catalyst $SnCl_2/HCl$ is used in

[BHU 1995]

- (a) Stephen's reduction
(b) Cannizzaro reaction
(c) Clemmensen's reduction
(d) Rosenmund's reduction

23. Methyl ethyl ketone is prepared by the oxidation of

[IIT-JEE 1987; MP PMT 1992]

- (a) 2-propanol (b) 1-butanol
(c) 2-butanol (d) *t*-butyl alcohol

24. Benzaldehyde can be prepared by oxidation of toluene by

[BHU 1986]

- (a) Acidic $KMnO_4$ (b) $K_2Cr_2O_7$
(c) CrO_2Cl_2 (d) All of these

25. $C_6H_6 + CO + HCl \xrightarrow{\text{Anhy } AlCl_3} X + HCl$

Compound X is

[DPMT 1979, 83]

- (a) $C_6H_5CH_3$ (b) $C_6H_5CH_2Cl$
(c) C_6H_5CHO (d) C_6H_5COOH

26. Which of the following gases when passed through warm dilute solution of H_2SO_4 in presence of $HgSO_4$ gives acetaldehyde

- (a) CH_4 (b) C_2H_6
(c) C_2H_4 (d) C_2H_2

27. CH_3COCH_3 can be obtained by

[CBSE PMT 1992]

- (a) Heating acetaldehyde with methanol
(b) Oxidation of propyl alcohol
(c) Oxidation of isopropyl alcohol
(d) Reduction of propionic acid

28. Propyne on hydrolysis in presence of HCl and $HgSO_4$ gives

- (a) Acetaldehyde (b) Acetone
(c) Formaldehyde (d) None of these

29. Which of the following on reaction with NH_3 gives urinary antiseptic compound [MP PMT 1999]
 (a) $HCHO$ (b) CH_3CHO
 (c) C_6H_5CHO (d) $C_6H_5CH_2CHO$
30. The oxidation product of 2-propanol with hot conc. HNO_3 is
 (a) Ethanoic acid (b) Propanone
 (c) Propanal (d) None of these
31. Hydrolysis of ozonide of 1-butene gives [Kerala PMT 2003]
 (a) Ethylene only
 (b) Acetaldehyde and Formaldehyde
 (c) Propionaldehyde and Formaldehyde
 (d) Acetaldehyde only
 (e) Acetaldehyde and Oxalic acid
32. Ketones are prepared by
 (a) Clemmensen's reduction (b) Cannizzaro reaction
 (c) Rosenmund's reduction (d) Oppenauer's oxidation
33. O_3 reacts with $CH_2=CH_2$ to form ozonide. On hydrolysis it forms [MP PET 1986, 90]
 (a) Ethylene oxide (b) $HCHO$
 (c) Ethylene glycol (d) Ethyl alcohol
34. Ethyne on reaction with water in the presence of $HgSO_4$ and H_2SO_4 gives [UPSEAT 1999; BVP 2003]
 (a) Acetone (b) Acetaldehyde
 (c) Acetic acid (d) Ethyl alcohol
35. $CH_3-CH_2-C \equiv CH \xrightarrow[H_2SO_4]{HgSO_4} A$, the compound A is [Orissa JEE 2004]
 (a) $CH_3-CH_2-\overset{\overset{O}{\parallel}}{C}-CH_3$
 (b) $CH_3-CH_2-CH_2-CHO$
 (c) $CH_3-CH_2-CH_2-COOH$
 (d) None of these
36. When a mixture of methane and oxygen is passed through heated molybdenum oxide, the main product formed is [KCET 2004]
 (a) Methanoic acid (b) Ethanal
 (c) Methanol (d) Methanal
37. Benzoin is [KCET 2004]
 (a) Compound containing an aldehyde and a ketonic group
 (b) α, β -unsaturated acid
 (c) α -hydroxy aldehyde
 (d) α -hydroxy ketone
38. The oxidation of benzyl chloride with lead nitrate gives [MP PMT 2004]
 (a) Benzyl alcohol (b) Benzoic acid
 (c) Benzaldehyde (d) *p*-chlorobenzaldehyde
39. $R-CH=CH_2 + CO + H_2 \xrightarrow[\text{High Pressure}]{\text{High Temp}} RCH_2CH_2CHO$. [DPMT 2004]
 The above reaction is
 (a) Mendius reaction (b) Oxo process
 (c) Sandorn's reaction (d) Stephen's reaction
40. Glycerol reacts with potassium bisulphate to produce [Pb. CET 2003]
 (a) Allyl iodide (b) Allyl sulphate
 (c) Acryl aldehyde (d) Glycerol trisulphate
41. The reagent used in Gatterman Koch aldehyde synthesis is [CPMT 2004]

- (a) $Pb/BaSO_4$ (b) alkaline $KMnO_4$
 (c) acidic $KMnO_4$ (d) $CO + HCl$

42.  On reductive ozonolysis yields [Orissa JEE 2005]
 (a) 6-oxoheptanal (b) 6-oxoheptanoic acid
 (c) 6-hydroxyheptanal (d) 3-hydroxypentanal
43. An alkene of molecular formula C_9H_{18} on ozonolysis gives 2,2-dimethyl propanal & 2-butanone, then the alkene is [Kerala CET 2005]
 (a) 2, 2, 4-trimethyl -3-hexene
 (b) 2, 2, 6-trimethyl-3-hexene
 (c) 2, 3, 4-trimethyl-2-hexene
 (d) 2, 2, 4-trimethyl-2-hexene
 (e) 2, 2dimethyl-2-heptene

Properties

1. Identify the reactant X and the product Y
 $CH_3-CO-CH_3 + X \rightarrow (CH_3)_3C-OMg-Cl$
 $\downarrow$ Hydrolysis
 $Y + Mg(OH)Cl$ [Kerala PMT 2003]
 (a) $X = MgCl_2$; $Y = CH_3CH=CH_2$
 (b) $X = CH_3MgCl$; $Y = C_2H_5COCH_3$
 (c) $X = CH_3MgCl$; $Y = (CH_3)_3C-OH$
 (d) $X = C_2H_5MgCl$; $Y = (CH_3)_3C-OH$
2. When *m*-chlorobenzaldehyde is treated with 50% KOH solution, the product (s) obtained is (are) [CBSE PMT 2003]
 (a) 
 (b) 
 (c) 
 (d) 
3. A and B in the following reactions are
 $R-\overset{\overset{Cl}{\mid}}{C}-R' \xrightarrow[KCN]{HCN} A \xrightarrow{B} R-\overset{\overset{Cl}{\mid}}{C}-\overset{\overset{OH}{\mid}}{C}-R'$ [CBSE PMT 2003]

- (a) $A = RR'C \begin{smallmatrix} \text{CN} \\ \diagup \\ \text{OH} \end{smallmatrix}, B = LiAlH_4$
- (b) $A = RR'C \begin{smallmatrix} \text{OH} \\ \diagup \\ \text{COOH} \end{smallmatrix}, B = NH_3$
- (c) $A = RR'C \begin{smallmatrix} \text{CN} \\ \diagup \\ \text{OH} \end{smallmatrix}, B = H_3O^+$
- (d) $A = RR'CH_2CN, B = NaOH$
4. Reduction of Aldehydes and Ketones to hydrocarbon take place in the presence of [CPMT 2003]
- (a) Zn amalgam and HCl/acid
- (b) Pd/BaSO₄
- (c) Anhydrous AlCl₃
- (d) Ni/Pt
5. Reduction of $>C=O$ to CH_2 can be carried out with [DCE 2000]
- (a) Catalytic reduction
- (b) Na/C₂H₅OH
- (c) Wolf-Kischner reduction
- (d) LiAlH₄
6. For C₆H₅CHO which of the following is incorrect [CPMT 1985]
- (a) On oxidation it yields benzoic acid
- (b) It is used in perfumery
- (c) It is an aromatic aldehyde
- (d) On reduction yields phenol
7. Grignard reagent on reaction with acetone forms [BHU 1995; RPMT 2002; Roorkee 1990]
- (a) Tertiary alcohol
- (b) Secondary alcohol
- (c) Acetic acid
- (d) Acetaldehyde
8. Which of the following is incorrect [CBSE PMT 2001]
- (a) FeCl₃ is used in the detection of phenols
- (b) Fehling solution is used in the detection of glucose
- (c) Tollen's reagent is used in detection of unsaturation
- (d) NaHSO₃ is used in the detection of carbonyl compounds
9. Consider the following statement Acetophenone can be prepared by
- (1) Oxidation of 1-phenylethanol
- (2) Reaction of benzalcohol with methyl magnesium bromide
- (3) Friedel craft's reaction of benzene with acetyl chloride
- (4) Distillation of calcium benzoate [SCRA 2001]
- (a) 1 and 2
- (b) 1 and 4
- (c) 1 and 3
- (d) 3 and 4
10. Which one of the following pairs is not correctly matched [SCRA 2001]
- (a) $>C=O \xrightarrow{\text{Clemenson's reduction}} >CH_2$
- (b) $>C=O \xrightarrow{\text{Wolf-Kishner reduction}} >CHOH$
- (c) $-COCl \xrightarrow{\text{Rosenmund's reduction}} CHO$
- (d) $-C \equiv N \xrightarrow{\text{Stephen reduction}} CHO$
11. Which of the following gives aldol condensation reaction [CPMT 2001]
- (a) C₆H₅OH
- (b) $C_6H_5 - \overset{\overset{O}{\parallel}}{C} - C_6H_5$
- (c) $CH_3CH_2 - \overset{\overset{O}{\parallel}}{C} - CH_3$
- (d) $(CH_3)_3C - \overset{\overset{O}{\parallel}}{C} - CH_3$
12. Which of the following products is formed when benzaldehyde is treated with CH₃MgBr and the addition product so obtained is subjected to acid hydrolysis [Haryana CEET 2000]
- (a) Secondary alcohol
- (b) A primary alcohol
- (c) Phenol
- (d) Tert-Butyl alcohol
13. Aldol condensation will not be observed in [GATE 2001]
- (a) Chloral
- (b) Phenyl acetaldehyde
- (c) Hexanal
- (d) Ethanol
14. Which of the following compounds containing carbonyl group will give coloured crystalline compound with
- 
- [Kerala (Med.) 2001]
- (a) CH₃COCl
- (b) CH₃COCH₃
- (c) CH₃CO(OC₂H₅)
- (d) CH₃CONH₂
- (e) HO(C₆H₄)COOH
15. Which of the following organic compounds exhibits positive Fehling test as well as iodoform test [MP PET 1994; KCET 2001]
- (a) Methanal
- (b) Ethanol
- (c) Propanone
- (d) Ethanal
16. Which of the following compound will undergo self aldol condensation in the presence of cold dilute alkali [CBSE PMT 1994]
- (a) C₆H₅CHO
- (b) CH₃CH₂CHO
- (c) CH₂=CH-CHO
- (d) CH₂=CH-CHO
17. Acetaldehyde when treated with dilute NaOH gives [EAMCET 1998]
- (a) CH₃CH₂OH
- (b) CH₃COOH
- (c) $CH_3 - \underset{\underset{OH}{\mid}}{CH} - CH_2 - CHO$
- (d) CH₃-CH₃
18. C₂H₅CHO and (CH₃)₂CO can be distinguished by testing with [EAMCET 1998; CPMT 1994, 97; MP PET 1995; MP PMT 1996; RPMT 1997, 99]
- (a) Phenyl hydrazine
- (b) Hydroxylamine
- (c) Fehling solution
- (d) Sodium bisulphite
19. Which of the following will undergo aldol condensation [IIT 1998]
- (a) Acetaldehyde
- (b) Propanaldehyde
- (c) Benzaldehyde
- (d) Trideuteroacetaldehyde
20. Which of the following oxidation reactions can be carried out with chromic acid in aqueous acetone at 5–10°C [Roorkee Qualifying 1998]
- (a) $CH_3(CH_2)_3C \equiv C - \underset{\underset{OH}{\mid}}{CH} - CH_3 \rightarrow$
- $CH_3(CH_2)_3C \equiv C - \overset{\overset{O}{\parallel}}{C} - CH_3$
- (b) $CH_3(CH_2)_3CH = CH - CH_2OH \rightarrow$
- $CH_3(CH_2)_3CH = CH - CHO$

- (c) $C_6H_5CH_3 \rightarrow C_6H_5COOH$
 (d) $CH_3(CH_2)_3CH_2OH \rightarrow CH_3(CH_2)_3CHO$
21. Acetaldehyde cannot show [AIIMS 1997]
 (a) Iodoform test (b) Lucas test
 (c) Benedict's test (d) Tollen's test
22. Benzaldehyde + $NaOH \rightarrow$ [CPMT 1997, 2001; CBSE PMT 1999; Pb. PMT 1999]
 (a) Benzyl alcohol (b) Benzoic alcohol
 (c) Hydrobenzamide (d) Cinnamic acid
23. The following reagent converts C_6H_5COCHO to $C_6H_5CHOHCOONa$ [Roorkee Qualifying 1998]
 (a) Aq. $NaOH$ (b) Acidic $Na_2S_2O_3$
 (c) Na_2CrO_4 / H_2SO_4 (d) $NaNO_2 / HCl$
24. Benzyl alcohol and sodium benzoate is obtained by the action of sodium hydroxide on benzaldehyde. This reaction is known as
 (a) Perkin's reaction (b) Cannizzaro's reaction
 (c) Sandmeyer's reaction (d) Claisen condensation
25. To distinguish between formaldehyde and acetaldehyde, we require
 (a) Tollen's reagent (b) Fehling's solution
 (c) Schiff's reagent (d) Caustic soda solution
26. Which of the following does not give iodoform test [AIIMS 1992; MP PMT 1990, 96; CET Pune 1998; DPMT 1981; CPMT 1976]
 (a) CH_3CH_2OH (b) CH_3OH
 (c) CH_3CHO (d) $PhCOCH_3$
27. Which of the following will not give iodoform test [Kurukshetra CEE 1991; Bihar CEE 1995; CBSE PMT 1998; MP PMT 2004]
 (a) Ethanal (b) Ethanol
 (c) 2-propanone (d) 3-pentanone
28. Which of the following will not give the iodoform test [MNR 1994]
 (a) Acetophenone (b) Ethanal
 (c) Benzophenone (d) Ethanol
29. Haloform test is given by the following substance [EAMCET 1988]
 (a) $HCHO$ (b) $(CH_3)_2CO$
 (c) CH_3OCH_3 (d) CH_3CH_2Cl
30. Dimethyl ketones are usually characterised through [MNR 1992]
 (a) Tollen's reagent (b) Iodoform test
 (c) Schiff's test (d) Benedict's reagent
31. The light yellow compound produced when acetone reacts with iodine and alkali, is [MP PMT 1992; EAMCET 1993]
 (a) $CH_3.CO.CH_2I$ (b) CH_3I
 (c) CHI_3 (d) None of these
32. If formaldehyde and KOH are heated, then we get [MP PET 1999; KCET 2000]
 (a) Acetylene (b) Methane
 (c) Methyl alcohol (d) Ethyl formate
33. Which of the following reagent reacts differently with $HCHO, CH_3CHO$ and CH_3COCH_3 [MP PET 1999]
 (a) HCN (b) NH_2NH_2
 (c) NH_2OH (d) NH_3
34. Acetaldehyde reacts with C_2H_5MgCl the final product is
 (a) An aldehyde (b) A ketone
 (c) A primary alcohol (d) A secondary alcohol
35. Treatment of propionaldehyde with dilute $NaOH$ solution gives
 (a) $CH_3CH_2COOCH_2CH_2CH_3$
 (b) $CH_3CH_2CHOHCH(CH_3)CHO$
 (c) $CH_3CH_2CHOHCH_2CH_2CHO$
 (d) $CH_3CH_2COCH_2CH_2CHO$
36. Aldol condensation of acetaldehyde involves the formation of which of the following intermediate [Pb. CET 1986]
 (a) Acetate ion (b) A carbanion
 (c) A carbonium ion (d) A free radical
37. $3CH_3COCH_3 \xrightarrow{HCl} (CH_3)_2C = CH - CO - CH = C(CH_3)_2$
 This polymer (B) is obtained when acetone is saturated with hydrogen chloride gas, B can be [CBSE PMT 1989]
 (a) Phorone (b) Formose
 (c) Diacetone alcohol (d) Mesityl oxide [KCET 2005]
38. Aromatic aldehydes undergo disproportionation in presence of sodium or potassium hydroxide to give corresponding alcohol and acid. The reaction is known as [MNR 1987]
 (a) Wurtz-Fittig reaction (b) Cannizzaro reaction
 (c) Friedel-Craft's reaction (d) Claisen reaction [Orissa PMT 1987]
39. m -chlorobenzaldehyde on reaction with conc. KOH at room temperature gives [IIT-JEE 1991]
 (a) Potassium m -chlorobenzoate and m -hydroxy benzaldehyde
 (b) m -hydroxy benzaldehyde and m -chlorobenzyl alcohol
 (c) m -chlorobenzyl alcohol and m -hydroxy benzyl alcohol
 (d) Potassium m -chlorobenzoate and m -chlorobenzyl alcohol
40. Which of the following does not give yellow precipitate with $NaOH + KI$ [MP PMT 1997]
 (a) Acetone (b) Acetaldehyde
 (c) Benzaldehyde (d) Acetophenone
41. The alkaline $CuSO_4$ containing sodium potassium tartrate does not react with [MP PMT 1997]
 (a) CH_3CHO (b) C_2H_5CHO
 (c) $C_6H_5CH_2CHO$ (d) C_6H_5CHO
42. Correct order of reactivity of $CH_3CHO, C_2H_5COCH_3$ and CH_3COCH_3 is [MP PMT 1991]
 (a) $CH_3CHO > CH_3COCH_3 > CH_3COC_2H_5$
 (b) $C_2H_5COCH_3 > CH_3COCH_3 > CH_3CHO$
 (c) $CH_3COCH_3 > CH_3CHO > C_2H_5COCH_3$
 (d) $CH_3COCH_3 > C_2H_5COCH_3 > CH_3CHO$
43. One mole of an organic compound requires 0.5 mole of oxygen to produce an acid. The compound may be [NCERT 1981]
 (a) Alcohol (b) Ether
 (c) Ketone (d) Aldehyde
44. Aldehydes can be oxidised by [NCERT 1983]
 (a) Tollen's reagent (b) Fehling solution
 (c) Benedict solution (d) All of these
45. Silver mirror is a test for [DPMT 1983; CBSE PMT 1988]
 (a) Aldehydes (b) Thio alcohols
 (c) Amines (d) Ethers
46. $CH_3CH = CHCHO$ is oxidised to $CH_3CH = CHCOOH$ using [NCERT 1978]
 (a) Alkaline $KMnO_4$ (b) Selenium dioxide
 (c) Ammoniacal $AgNO_3$ (d) All of these

47. Which of the following does not turn Schiff's reagent to pink
[DPMT 1981; CPMT 1989]
- (a) Formaldehyde (b) Benzaldehyde
(c) Acetone (d) Acetaldehyde
48. Fehling's test is positive for [KCET 1993]
- (a) Acetaldehyde (b) Benzaldehyde
(c) Ether (d) Alcohol
49. Acetaldehyde and acetone differ in their reaction with [KCET 1989]
- (a) Sodium bisulphite
(b) Ammonia
(c) Phosphorus pentachloride
(d) Phenyl hydrazine
50. The final product formed when acetaldehyde is reduced with sodium and alcohol is [BHU 1976]
- (a) Ethylene (b) Ethyl alcohol
(c) Ethene (d) All of these
51. The compound obtained by the reduction of propionaldehyde by amalgamated zinc and concentrated HCl is
- (a) Propanol (b) Propane
(c) Propene (d) All of these
52. Formaldehyde when treated with KOH gives methanol and potassium formate. The reaction is known as [MP PET 1997]
- (a) Perkin reaction (b) Claisen reaction
(c) Cannizzaro reaction (d) Knoevenagel reaction
53. Aldehydes and ketones give addition reaction with [KCET 1992]
- (a) Hydrazine (b) Phenyl hydrazine
(c) Semicarbazide (d) Hydrogen cyanide
(e) All of these
54. Acetaldehyde reacts with [CBSE PMT 1991]
- (a) Electrophiles only
(b) Nucleophiles only
(c) Free radicals only
(d) Both electrophiles and nucleophiles
55. The typical reactions of aldehyde is [Pb. CET 1986]
- (a) Electrophilic addition (b) Nucleophilic substitution
(c) Nucleophilic addition (d) Nucleophilic elimination
56. Which will not give acetamide on reaction with ammonia [CPMT 1985]
- (a) Acetic acid (b) Acetyl chloride
(c) Acetic anhydride (d) Methyl formate
57. The addition of HCN to carbonyl compounds is an example of [Haryana CEET 2000]
- (a) Nucleophilic substitution
(b) Electrophilic addition
(c) Nucleophilic addition
(d) Electrophilic substitution
58. Which of the following reagents is used to distinguish acetone and acetophenone [RPMT 2002; KCET 1998]
- (a) $NaHSO_3$ (b) Grignard reagent
(c) Na_2SO_4 (d) NH_4Cl
59. The product formed by the reaction of chlorine with benzaldehyde in the absence of a catalyst is [Tamil Nadu CET 2002]
- (a) Chlorobenzene (b) Benzyl chloride
(c) Benzoyl Chloride (d) o -Chlorobenzaldehyde
60. Which of the following compound is resistant to nucleophilic attack by hydroxyl ions [CBSE PMT 1998; KCET (Med.) 2001; AFMC 2001]
- (a) Methyl acetate (b) Acetonitrile
(c) Dimethyl ether (d) Acetamide
61. Glucose molecule reacts with X number of molecules of phenylhydrazine to yield osazone. The value of X is [CBSE PMT 1998]
- (a) One (b) Two
(c) Three (d) Four
62. In which of the following reactions aromatic aldehyde is treated with acid anhydride in presence of corresponding salt of the acid to give unsaturated aromatic acid [BHU 1998, KCET (Med.) 2001]
- (a) Friedel-Craft's reaction (b) Perkin reaction
(c) Wurtz reaction (d) None of these
63. $2CH_3 - \underset{\text{O}}{\underset{\parallel}{C}} - CH_3 \xrightarrow[H^+]{Mg/Hg}$ Product, product in the reaction is [RPMT 2003]
- (a) $H_3C - \underset{\text{OH}}{\underset{\parallel}{C}} - \underset{\text{OH}}{\underset{\parallel}{C}} - CH_3$ (b) $CH_3 - \underset{\text{O}}{\underset{\parallel}{C}} - O - \underset{\text{O}}{\underset{\parallel}{C}} - CH_3$
(c) $CH_3 - \underset{\text{OH}}{\underset{\parallel}{C}} = \underset{\text{OH}}{\underset{\parallel}{C}} - CH_3$ (d) None of these [MP PMT 1983]
64. Cinnamic acid is formed when $C_6H_5 - CHO$ condenses with $(CH_3CO)_2O$ in presence of [Orissa JEE 2003]
- (a) Conc. H_2SO_4 (b) Sodium acetate
(c) Sodium metal (d) Anhydrous $ZnCl_2$
65. A mixture of benzaldehyde and formaldehyde on heating with aqueous $NaOH$ solution gives [IIT-JEE (Screening) 2001]
- (a) Benzyl alcohol and sodium formate
(b) Sodium benzoate and methyl alcohol
(c) Sodium benzoate and sodium formate
(d) Benzyl alcohol and methyl alcohol
66. The reaction,
- $$CH_3 - \underset{\text{O}}{\underset{\parallel}{C}} - OCH_3 + C_2H_5OH \xrightarrow{H^+ \text{ or } OH^-}$$
- $$CH_3 - \underset{\text{O}}{\underset{\parallel}{C}} - OC_2H_5 + CH_3OH$$
- is called [MP PMT 2003]
- (a) Perkin's reaction (b) Claisen Schmidt reaction
(c) Esterification (d) Trans-esterification
67. Formaldehyde reacts with ammonia to give urotropine. The formula of urotropine is [MP PMT 1989, 96, 2003; AIIMS 1982; NCERT 1987; MP PET 1990, 91, 2000; CPMT 1978, 82, 86, 97; KCET 2003]
- (a) $(CH_2)_6 N_4$ (b) $(CH_2)_4 N_3$
(c) $(CH_2)_6 N_6$ (d) $(CH_2)_3 N_3$
68. Aldol condensation will not take place in [CBSE PMT 1996, 99; RPMT 1999; CPMT 1988, 04]
- (a) $HCHO$ (b) CH_3CH_2CHO
(c) CH_3CHO (d) CH_3COCH_3
69. Contents of three bottles were found to react
- (i) Neither with Fehling's solution nor with Tollen's reagent
(ii) Only with Tollen's reagent but not with Fehling's solution
(iii) With both Tollen's reagent and Fehling's solution.
- If they contained either ethanal (acetaldehyde) or propanone (acetone) or benzal (benzaldehyde), which bottle contained which
- (a) In (i) benzal, in (ii) ethanal and in (iii) propanone
(b) In (i) benzal, in (ii) propanone and in (iii) ethanal
(c) In (i) propanone, in (ii) benzal and in (iii) ethanal
(d) In (i) propanone, in (ii) ethanal and in (iii) benzal

70. Action of hydrazine on aldehydes and ketones gives compound of the general structure
 (a) $>C=N-NH_2$
 (b) $>C=N-OH$
 (c) $>C=N-NH-CONH_2$
 (d) $>C=N-NH-C_6H_5$
71. The reaction in which sodium cyanide is used [MP PET/PMT 1998]
 (a) Perkin reaction (b) Reimer-Tiemann reaction
 (c) Benzoin condensation (d) Rosenmund reaction
72. Which one of the following reactions is a method for the conversion of a ketone into a hydrocarbon [MP PET/PMT 1998; CBSE PMT 1989]
 (a) Aldol condensation (b) Reimer-Tiemann reaction
 (c) Cannizzaro reaction (d) Wolf-Kishner reduction
73. Bakelite is a polymer of [DPMT 1996; MP PET 2002]
 (a) $HCHO$ + phenol
 (b) $HCHO$ + aldehyde (acetaldehyde)
 (c) Phenol + H_2SO_4
 (d) $HCHO$ + acetone
74. Clemmenson reduction involves $>C=O$ to $>CH_2$ in presence of [DPMT 1996]
 (a) Zn/Hg (b) Alcohol
 (c) Zn dust (d) Zn / alcohol
75. Aldol condensation involving $CH_3CHO + CH_3CHO$ gives the product [DPMT 1996]
 (a) $CH_3CHOHCH_2CHO$ (b) $CH_3COCH_2CH_3$
 (c) $CH_3CH=CH_2$ (d) None of these
76. Enol content is highest in [Orissa JEE 2005]
 (a) Acetone (b) Acetophenone
 (c) Acetic acid (d) Acetyl acetone
77. Which one of the following reacts with HCN and Tollen's reagent, but is not oxidised by Fehling's solution
 (a) Methanal (b) Ethanal
 (c) Benzaldehyde (d) Acetone
78. During reaction of benzaldehyde with alkali one of the product is
 (a) Phenol (b) Benzyl alcohol
 (c) Benzene (d) Benzophenone
79. Cannizzaro reaction is given by [DPMT 1996]
 (a) $HCHO$ (b) CH_3COCH_3
 (c) CH_3CHO (d) CH_3CH_2OH
80. The reaction $C_6H_5CHO + CH_3CHO \rightarrow C_6H_5CH=CH-CHO$ is known as [BHU 1996]
 (a) Perkin's reaction (b) Claisen condensation
 (c) Benzoin condensation (d) Cannizzaro's reaction
81. When two molecules of acetaldehyde condense in the presence of dilute alkali, it forms [Bihar MEE 1996]
 (a) Acetal (b) Sodium formate
 (c) Aldol (d) Mesitylene
 (e) None of these
82. Acetaldehyde on treatment with dil. $NaOH$ followed by heating gives
 (a) $CH_3CH_2CH_2CH_2OH$
 (b) $CH_3CH_2CH_2CHO$
 (c) $CH_3-CH=CHCHO$
 (d) $CH_3-CH=CHCH_2OH$
83. Reaction $\begin{matrix} R \\ \diagup \\ C=O \\ \diagdown \\ R \end{matrix} + HCN \rightarrow R-\begin{matrix} R \\ | \\ C \\ | \\ CN \end{matrix}-OH$ is [Kurukshetra CEE 1998; IIT 1990]
 (a) Electrophilic substitution
 (b) Electrophilic addition
 (c) Nucleophilic addition
 (d) Nucleophilic substitution
84. Benzaldehyde on reaction with acetophenone in the presence of sodium hydroxide solution gives [BVP 2003]
 (a) $C_6H_5CH=CHCOC_6H_5$
 (b) $C_6H_5COCH_2C_6H_5$
 (c) $C_6H_5CH=CHC_6H_5$
 (d) $C_6H_5CH(OH)COC_6H_5$
85. Aldehydes and ketones can be reduced to hydrocarbon by using
 (a) $LiAlH_4$ (b) $H_2/Pd-BaSO_4$
 (c) $Na-Hg/HCl$ (d) NH_2-NH_2/C_2H_5ONa
86. An important reaction of acetone is autocondensation in presence of concentrated sulphuric acid to give the aromatic compound [KCET 2003; MP PET 1986, 89; MP PMT 1992, 2000]
 (a) Mesitylene (b) Mesityl oxide
 (c) Trioxan (d) Phorone
87. Identify the organic compound which, on heating with strong solution of $NaOH$, partly converted into an acid salt and partly into alcohol [KCET 2003]
 (a) Benzyl alcohol (b) Acetaldehyde
 (c) Acetone (d) Benzaldehyde
88. Which of the following does not give brick red precipitate with Fehling solution [AIIMS 1996]
 (a) Acetone (b) Acetaldehyde
 (c) Formalin (d) D -glucose
89. Acetaldehyde and acetone can be distinguished by [AIIMS 1996; DCE 1999; Pb. CET 2000]
 (a) Molisch test (b) Bromoform test
 (c) Solubility in water (d) Tollen's test
90. Which compound is soluble in H_2O [RPMT 1997]
 (a) $HCHO$ (b) CH_3CHO
 (c) CH_3COCH_3 (d) All
91. $CH_3CHO + CH_3MgBr \rightarrow$ Product $\xrightarrow{H_2O} A$
 What is A? [RPMT 1997]
 (a) Primary alcohol (b) Secondary alcohol
 (c) Tertiary alcohol (d) Ketone
92. Which gives lactic acid on hydrolysis after reacting with HCN [UPSEAT 2003; MP PET 1998]
 (a) $HCHO$ (b) CH_3CHO
 (c) C_6H_5CHO (d) CH_3COCH_3
93. CH_3CHO react with aqueous $NaOH$ solution to form [MP PMT 1992]
 (a) 3-hydroxy butanal (b) 2-hydroxy butanal
 (c) 4-hydroxy butanal (d) 3-hydroxy butanol
94. Fehling solution react with $HCHO$ to form precipitate of [MP PMT 1992]
 (a) White colour [BVP 1998] (b) Yellow colour
 (c) Red colour (d) Blue colour
95. Product in following reaction is [RPMT 2003; BHU 1998, 2005; DCE 1999]
 $CH_3MgI + HCHO \rightarrow$ Product
 (a) CH_3CHO (b) CH_3OH

- (c) C_2H_5OH (d) CH_3-O-CH_3
96. $A \xrightarrow[800^\circ C]{\Delta} CH_2 = C = O$, Reactant 'A' in the reaction is [RPMT 2003]
- (a) CH_3CH_2CHO (b) CH_3CHO
(c) $CH_3 - \underset{\text{O}}{\underset{\parallel}{C}} - CH_3$ (d) C_2H_5OH
97. Only an aldehyde having..... can undergo the aldol condensation
(a) At least one beta H atom
(b) At least one alpha H atom
(c) An aromatic ring
(d) No alpha H atom
98. Clemenson's reduction of ketones is carried out in [BHU 2000]
- (a) H_2 with Pd catalyst (b) Glycol with KOH
(c) $LiAlH_4$ in water (d) $Zn-Hg$ with HCl
99. Reaction

$$\begin{array}{c} R \\ \diagup \\ C=O \\ \diagdown \\ R \end{array} \xrightarrow[\text{KOH / glycol}]{H_2NNH_2} \begin{array}{c} R \\ \diagup \\ C \\ \diagdown \\ R \end{array} \begin{array}{c} H \\ \\ H \end{array} + N_2 + H_2$$
 is called [MP PET 2003]
- (a) Wolff-Kishner reaction (b) Tischenko reaction
(c) Reformatsky reaction (d) Gattermann reaction
100. Propanal on treatment with dilute sodium hydroxide forms [Kerala CET 2000]
- (a) $CH_3CH_2CH_2CH_2CH_2CHO$
(b) $CH_3CH_2CH(OH)CH_2CH_2CHO$
(c) $CH_3CH_2CH(OH)CH(CH_3)CHO$
(d) CH_3CH_2COONa
101. Identify the product Y in the sequence
 $CH_3CHO + CH_3MgI \xrightarrow{\text{Ether}} X \xrightarrow{H_2O / H^+} Y$ [Kerala (Med.) 2001]
- (a) CH_3OH (b) CH_3CH_2OH
(c) $(CH_3)_2CHOH$ (d) $(CH_3)_3COH$
102. What is the name of reaction when benzaldehyde changes into benzyl alcohol [CPMT 1996; RPET 1999]
- (a) Friedel-Craft's reaction (b) Kolbe's reaction
(c) Wurtz reaction (d) Cannizzaro reaction
103. The reagent that gives an orange coloured precipitate with acetaldehyde [EAMCET 1997; Pb. PMT 2004; AIIMS 1987]
- (a) NH_2OH (b) $NaHSO_3$
(c) Iodine (d) 2, 4-DNP
104. Which one is used in the manufacture of mirror [MP PET 1992]
- (a) Red lead (litharge)
(b) Ammoniacal $AgNO_3$
(c) Ammoniacal $AgNO_3$ + Red lead
(d) Ammoniacal $AgNO_3$ + $HCHO$
105. When CH_3COCH_3 reacts with Cl_2 and $NaOH$, which of the following is formed [CPMT 1996]
- (a) $CHCl_3$ (b) CCl_4
(c) CCl_2H_2 (d) CH_3Cl
106. Which gives difference between aldehyde and ketone [CPMT 1994]
- (a) Fehling's solution (b) Tollen's reagent
(c) Schiff's reagent (d) Benedict's solution
(e) All of these
107. Aldehyde turns pink with [Bihar MEE 1997]
- (a) Benedict solution (b) Schiff reagent
(c) Fehling solution (d) Tollen's reagent
(e) Mollisch reagent
108. Which of the following would undergo aldol condensation [KCET 1998] [MP PMT 1986; BHU 1995]
- (a) $CCl_3.CHO$ (b) $CH_3 - \underset{\text{CH}_3}{\underset{\mid}{C}} - CHO$
(c) $CH_3.CH_2.CHO$ (d) $HCHO$
109. The reaction of acetaldehyde with conc. $KMnO_4$ gives [DPMT 1982; AIIMS 1996]
- (a) CH_3COOH (b) CH_3CH_2OH
(c) $HCHO$ (d) CH_3OH
110. When acetaldehyde is heated with Tollen's reagent, following is obtained [CPMT 1989; MP PET/PMT 1988]
- (a) Methyl alcohol (b) Silver acetate
(c) Silver mirror (d) Formaldehyde
111. Boiling point of acetone is [CPMT 1975, 89]
- (a) $56^\circ C$ (b) $60^\circ C$
(c) $100^\circ C$ (d) $90^\circ C$
112. Urotropine is
- (a) Hexamethylene tetramine
(b) Hexaethylene tetramine
(c) Hexamethylene diamine
(d) None of these
113. Magenta is [DPMT 1982; Kurukshetra CEE 1998]
- (a) Alkaline phenolphthalein
(b) Methyl red
(c) p-roaniline hydrochloride
(d) Red litmus
114. An aldehyde on oxidation gives [CPMT 1973, 03; DPMT 1983; Manipal MEE 1995]
- (a) An alcohol (b) An acid
(c) A ketone (d) An ether
115. The reaction of an aldehyde with hydroxylamine gives a product which is called [MP PET 1993; AFMC 2002]
- (a) Aminohydroxide (b) Hydrazone
(c) Semicarbazone (d) Oxime
116. Cannizzaro reaction is not shown by [BHU 1980; IIT 1983; KCET 1993; Bihar MEE 1995; RPMT 1997, 2000, 02]
- (a) $HCHO$ (b) C_6H_5CHO
(c) CH_3CHO (d) All of these
117. When acetone is heated with hydroxylamine, the compound formed is [MP PMT 1993]
- (a) Cyanohydrin (b) Oxime
(c) Semicarbazone (d) Hydrazone
118. The product of the reaction between ammonia and formaldehyde is
- (a) Urotropine (b) Formamide
(c) Paraformaldehyde (d) Methanol

119. Which of the following products is obtained by the oxidation of propionaldehyde [CPMT 1989]
 (a) Acetic acid
 (b) Formic acid and acetic acid
 (c) Propanoic acid
 (d) *n*-propyl alcohol
120. When acetaldehyde reacts with PCl_5 , the resulting compound is
 (a) Ethyl chloride (b) Ethylene chloride
 (c) Ethylidene chloride (d) Trichloro acetaldehyde
121. Benzaldehyde and acetaldehyde can be differentiated by
 (a) HCN (b) NH_2OH
 (c) Hydrazine (d) $NaOH$ solution
122. In the presence of a dilute base C_6H_5CHO and CH_3CHO react together to give a product. The product is [MP PET 1994]
 (a) $C_6H_5CH_3$ (b) $C_6H_5CH_2CH_2OH$
 (c) $C_6H_5CH_2OH$ (d) $C_6H_5CH=CHCHO$
123. Grignard's reagent reacts with ethanal (acetaldehyde) and propanone to give
 (a) Higher aldehydes with ethanal and higher ketones with propanone
 (b) Primary alcohols with ethanal and secondary alcohols with propanone
 (c) Ethers with ethanal and alcohols with propanone
 (d) Secondary alcohols with ethanal and tertiary alcohols with propanone
124. Base catalysed aldol condensation occurs with [IIT-JEE 1991]
 (a) Benzaldehyde
 (b) 2, 2-dimethyl propionaldehyde
 (c) Acetaldehyde
 (d) Formaldehyde
125. Benzaldehyde reacts with ammonia to form [CPMT 1989; AFMC 1998]
 (a) Benzaldehyde ammonia
 (b) Urotropine
 (c) Hydrobenzamide
 (d) Aniline
126. Glucose + Tollen's reagent $\rightarrow$ Silver mirror shows [CPMT 1997]
 (a) Presence of acidic group
 (b) Presence of alkaline group
 (c) Presence of ketonic group
 (d) Presence of aldehyde group
127. Fehling solution is [MP PMT 1989]
 (a) Ammoniacal cuprous chloride solution
 (b) Acidified copper sulphate solution
 (c) Copper sulphate and sodium hydroxide + Rochelle salt
 (d) None of these
128. Reduction of an aldehyde produces [MP PMT 1994; MP PET 2001]
 (a) Primary alcohol (b) Monocarboxylic acid
 (c) Secondary alcohol (d) Tertiary alcohol
129. Which of the following on reaction with conc. $NaOH$ gives an alcohol [MP PET 1996]
 (a) Methanal (b) Ethanal
 (c) Propanal (d) Butanal
130. Schiff's reagent is [MP PMT 1989]
 (a) Magenta colour solution decolourised with sulphurous acid
 (b) Ammoniacal cobalt chloride solution
 (c) Ammoniacal manganese sulphate solution
 (d) Magenta solution decolourised with chlorine
131. Pyrolysis of acetone gives $CH_2=C=O$ called [MP PMT 1992, 93]
 (a) Methylene oxide
 (b) Methyl carbon monoxide
 (c) Ketene
 (d) Methone
132. Which one of the following on oxidation will not give a carboxylic acid with the same number of carbon atoms [CBSE PMT 1992; MP PET 1996]
 (a) CH_3COCH_3 (b) CCl_3CH_2CHO
 (c) $CH_3CH_2CH_2OH$ (d) CH_3CH_2CHO
133. Acetal is obtained by reacting in the presence of dry HCl and alcohol with [MP PET 1996]
 (a) Aldehyde (b) Ketone
 (c) Ether (d) Carboxylic acid
134. The reagent with which both aldehyde and acetone react easily is [CPMT 1973, 74]
 (a) Fehling's reagent (b) Grignard reagent
 (c) Schiff's reagent (d) Tollen's reagent
135. Phenylmethanol can be prepared by reducing the benzaldehyde with
 (a) CH_3Br (b) Zn and HCl
 (c) CH_3Br and Na (d) CH_3I and Mg
136. Which of the following is used in the manufacture of thermosetting plastics
 (a) Formaldehyde (b) Acetaldehyde
 (b) Acetone (d) Benzaldehyde
137. Which compound undergoes iodoform reaction [DPMT 1984; CPMT 1989]
 (a) $HCHO$ (b) CH_3CHO
 (c) CH_3OH (d) CH_3COOH
138. Which does not react with Fehling solution [MNR 1983, 93]
 (a) Acetaldehyde (b) Benzaldehyde
 (c) Glucose (d) Formic acid
139. Which of the following compound will react with ethanolic KCN
 (a) Ethane (b) Acetyl chloride
 (c) Chlorobenzene (d) Benzaldehyde
140. Schiff's reagent gives pink colour with [EAMCET 1980; MP PMT 2000]
 (a) Aldehydes (b) Ethers
 (c) Ketones (d) Carboxylic acid
141. Acetaldehyde reacts with Cl_2 (in excess) to give [MP PMT 1997]
 (a) Chloral (b) Chloroform
 (c) Acetic acid (d) Trichloroacetic acid
142. The compound which reacts with Fehling solution is [CPMT 1989]
 (a) C_6H_5COOH (b) $HCOOH$
 (c) C_6H_5CHO (d) CH_2ClCH_3

143. Which one of the following undergoes reaction with 50% sodium hydroxide solution to give the corresponding alcohol and acid
(a) Butanal (b) Benzaldehyde
(c) Phenol (d) Benzoic acid

144. Which one of the following is reduced with zinc and hydrochloric acid to give the corresponding hydrocarbon
[AIEEE 2004]
(a) Acetamide (b) Acetic acid
(c) Ethyl acetate (d) Butan-2-one

145. Three molecules of acetone in the presence of dry HCl form
[MP PET 2004]
(a) Mesitylene (b) Phorone
(c) Glyoxal (d) Mesityl oxide

146. Aldehydes and ketones can be reduced to corresponding hydrocarbons by
[Kerala PMT 2004]
(a) Refluxing with water
(b) Refluxing with strong acids
(c) Refluxing with soda amalgam and water
(d) Refluxing with zinc amalgam and concentrated HCl
(e) Passing the vapour under heated PbO_2

147. Acetone reacts with iodine to form iodoform in the presence of
(a) $CaCO_3$ (b) $NaOH$
(c) KOH (d) $MgCO_3$

148. Cyanohydrin of which of the following forms lactic acid
[MHCET 2003]
(a) CH_3CH_2CHO (b) CH_3CHO
(c) $HCHO$ (d) CH_3COCH_3

149. Which of the following is used to detect aldehydes
[MHCET 2004]
(a) Million's test
(b) Tollen's reagent
(c) Neutral ferric chloride solution
(d) Molisch's test

150. Which of the following aldehydes give red precipitate with Fehling solution?
[MHCET 2004]
(a) Benzaldehyde (b) Salicylaldehyde
(c) Acetaldehyde (d) None of these

151. $A \longrightarrow (CH_3)_2C = CHCOCH_3$ A is
[MHCET 2004]
(a) Acetone (b) Acetaldehyde
(c) Propionaldehyde (d) Formaldehyde

152. The aldehyde which react with $NaOH$ to produce an alcohol and sodium salt is
[Pb. PMT 2004]
(a) $HCHO$ (b) CH_3CHO
(c) CH_3CH_2CHO (d) $CH_3CH_2CH_2CHO$

153. Acetaldehyde and Acetone can be distinguished by
[DCE 2003]
(a) Iododorm test
(b) Nitroprusside test
(c) Fehling's solution test
(d) DNP test

154. $OCH_3 - CHO \xrightarrow{OH^-} HOCH_2C - COOH$
The reaction given is
[DCE 2003]
(a) Aldol condensation (b) Knoevenagel reaction
(c) Cannizzaro reaction (d) None of these

155. The order of susceptibility of nucleophilic attack on aldehydes follows the order
[DCE 2002]
(a) $1^\circ > 3^\circ > 2^\circ$ (b) $1^\circ > 2^\circ > 3^\circ$
(c) $3^\circ > 2^\circ > 1^\circ$ (d) $2^\circ > 3^\circ > 1^\circ$

156. In Wolf-Kishner reduction, the carbonyl group of aldehydes and ketones is converted into
[Pb. CET 2000]
(a) $>CH_2$ group (b) $-CH_3$ group
(c) $-CH_2OH$ group (d) $>CHOH$ group

157. Which of the following react with $NaHSO_3$
[Pb. CET 2003]
(a) CH_3COCH_3 (b) CH_3CHO
(c) $HCHO$ (d) All of these

158. Fehling solution is
[Pb. CET 2003]
(a) $CuSO_4$ + lime (b) $CuSO_4 + NaOH(aq)$
(c) $CuSO_4 + Na_2CO_3$ (d) None of these

159. Wolf kishner reduction, reduces
[Pb. CET 2003]
(a) $-COOH$ group (b) $-C \equiv C -$ group
(c) $-CHO$ group (d) $-O -$ group

160. A compound has a vapour density of 29. On warming an aqueous solution of alkali, it gives a yellow precipitate. The compound is
[CPMT 2004; CPMT 2004]
(a) CH_3CH_2CHO (b) $CH_3CHOHCH_3$
(c) CH_3COCH_3 (d) CH_3CH_2COOH

161. Which responds to +ve iodoform test?
[Orissa JEE 2004]
(a) Butanol (b) Butan-1-ol
(c) Butanol-2 (d) 3-pentanone

162. The correct order of reactivity of $PhMgBr$ with
[IIT-JEE (Screening) 2004]
 $Ph - \overset{\overset{O}{\parallel}}{C} - Ph$ (I) $CH_3 - \overset{\overset{O}{\parallel}}{C} - H$ (II) $CH_3 - \overset{\overset{O}{\parallel}}{C} - CH_3$ (III)
(a) (I) > (II) > (III) (b) (III) > (II) > (I)
(c) (II) > (III) > (I) (d) (I) > (III) > (II)

163. The pair of compounds in which both the compounds give positive test with Tollen's reagent is
[IIT-JEE (Screening) 2004]
(a) Glucose and Sucrose
(b) Fructose and Sucrose
(c) Acetophenone and Hexanal
(d) Glucose and Fructose

164. The most appropriate reagent to distinguish between acetaldehyde and formaldehyde is
[UPSEAT 2004]
(a) Fehling's solution
(b) Tollen's reagent
(c) Schiff's reagent
(d) Iodine in presence of base

165. Silver mirror test can be used to distinguish between
[MP PET 2004]
(a) Ketone and acid (b) Phenol and acid
(c) Aldehyde and acid (d) Alcohol and phenol

166. Paraldehyde is
[CPMT 1985; MP PET 1992, 96; RPMT 2000]
(a) A trimer of formaldehyde
(b) A trimer of acetaldehyde
(c) A hexamer of formaldehyde
(d) A hexamer of acetaldehyde

167. Paraldehyde is used as a
[CBSE PMT 1984]

- (a) Medicine (b) Poison
(c) Polymer (d) Dye
168. Formalin is an aqueous solution of [BHU 1979; DPMT 1983]
(a) Formic acid (b) Formaldehyde
(c) Fluorescein (d) Furfuraldehyde
169. Hexamethylene tetramine is used as [MP PMT 1979, 84]
(a) Analgesic (b) Antipyretic
(c) Urinary antiseptic (d) All of these
170. Methyl ketone group is identified by [BCECE 2005]
(a) Iodoform test (b) Fehling solution
(c) Tollen's reagent (d) Schiff's reagent
171. Which of the following does not give Fehling solution test? [BCECE 2005]
(a) Acetone (b) Propanal
(c) Ethanal (d) Butanal
172. How will you convert butan-2-one to propanoic acid? [IIT 2005]
(a) Tollen's reagent (b) Fehling's solution
(c) $\text{NaOH}/\text{I}/\text{H}$ (d) $\text{NaOH}/\text{NaI}/\text{H}$
173. Ketones react with Mg-Hg over water gives [AFMC 2005]
(a) Pinacolone (b) Pinacols
(c) Alcohols (d) None of these
174. Which of the following will form two isomers with semi carbazide [Orissa JEE 2005]
(a) Benzaldehyde (b) Acetone
(c) Benzoquinone (d) Benzophenone
175. A compound $A \rightarrow C_5H_{10}Cl_2$ on hydrolysis gives $C_5H_{10}O$ which reacts with NH_2OH , forms iodoform but does not give fehling test. A is [DPMT 2005]
(a) $\begin{array}{c} \text{Cl} \\ | \\ \text{CH}_3 - \text{C} - \text{CH}_2 - \text{CH}_2 - \text{CH}_3 \\ | \\ \text{Cl} \end{array}$
(b) $\begin{array}{c} \text{Cl} \\ | \\ \text{CH}_3\text{CH}_2 - \text{C} - \text{CH}_2\text{CH}_3 \\ | \\ \text{Cl} \end{array}$
(c) $\begin{array}{c} \text{Cl} \\ | \\ \text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2 - \text{CH} \\ | \\ \text{Cl} \end{array}$
(d) $\begin{array}{c} \text{Cl} \quad \text{Cl} \\ | \quad | \\ \text{CH}_3 - \text{CH} - \text{CH} - \text{CH}_2 - \text{CH}_3 \end{array}$
176. $\text{CH}_3 - \text{CHO} + \text{HCN} \rightarrow A$; Compound A on hydrolysis gives [Kerala CET 2005]
(a) $\text{CH}_3 - \text{CH}_2 - \text{COOH}$
(b) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{NH}_2$
(c) $\text{CH}_3 - \text{CO} - \text{COOH}$
(d) $\text{CH}_3\text{CO} - \text{CH} = \text{NOH}$
(e) $\begin{array}{c} \text{CH}_3 - \text{CH} - \text{COOH} \\ | \\ \text{OH} \end{array}$
177. Which one does not give cannizzaro's reaction [Kerala CET 2005]
(a) Benzaldehyde

- (b) 2-methyl propanal
(c) *p*-methoxy benzaldehyde
(d) 2,2 dimethyl propanal
(e) Formaldehyde

Critical Thinking

Objective Questions

- Which of the following will fail to react with potassium dichromate and dilute sulphuric acid
(a) Ethyl alcohol (ethanol)
(b) Acetaldehyde (ethanal)
(c) Secondary propyl alcohol (2-propanol)
(d) Acetone (propanone)
- Acetone and acetaldehyde are differentiated by [CPMT 1987, 93]
(a) $\text{NaOH} + \text{I}_2$ (b) $\text{Ag}(\text{NH}_3)_2^+$
(c) HNO_2 (d) I_2
- Which of the following will react with water [IIT 1998]
(a) CHCl_3 (b) Cl_3CCHO
(c) CCl_4 (d) $\text{ClCH}_2\text{CH}_2\text{Cl}$
- An organic compound 'A' has the molecular formula $\text{C}_3\text{H}_6\text{O}$, it undergoes iodoform test. When saturated with dil. HCl it gives 'B' of molecular formula $\text{C}_9\text{H}_{14}\text{O}$. A and B respectively are [Tamil Nadu CET 2002]
(a) Propanal and mesitylene
(b) Propanone and mesityl oxide
(c) Propanone and 2,6-dimethyl -2, 5-heptadien-4-one
(d) Propanone and mesitylene oxide
- Which alkene is formed from the following reaction
 $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH} = \text{PPh}_3 + 2 - \text{Butanone}$ [Manipal 2001]
(a) 3-Methyl-3-heptene
(b) 4-Methyl-3-heptene
(c) 5-Methyl-3-heptene
(d) 1-Methyl-5-methane
- Compound 'A' (molecular formula $\text{C}_3\text{H}_8\text{O}$) is treated with acidified potassium dichromate to form a product 'B' (molecular formula $\text{C}_3\text{H}_6\text{O}$). 'B' forms a shining silver mirror on warming with ammoniacal silver nitrate. 'B' when treated with an aqueous solution of $\text{H}_2\text{NCONHNH}_2 \cdot \text{HCl}$ and sodium acetate gives a product 'C'. Identify the structure of 'C' [IIT-JEE (Screening) 2002]
(a) $\text{CH}_3\text{CH}_2\text{CH} = \text{NNHCONH}_2$
(b) $\begin{array}{c} \text{CH}_3 - \text{CH} = \text{NNHCONH}_2 \\ | \\ \text{CH}_3 \end{array}$
(c) $\begin{array}{c} \text{CH}_3\text{CH} = \text{NCONHNH}_2 \\ | \\ \text{CH}_3 \end{array}$
(d) $\text{CH}_3\text{CH}_2\text{CH} - \text{NCONHNH}_2$
- Which is not true about acetophenone [Manipal 2002]
(a) Reacts to form 2, 4-dinitrophenyl hydrazine
(b) Reacts with Tollen's reagent to form silver mirror

- (c) Reacts with $I_2 / NaOH$ to form iodoform
 (d) On oxidation with alkaline $KMnO_4$ followed by hydrolysis gives benzoic acid

8. The enol form of acetone, after treatment with D_2O , gives

[IIT-JEE (Screening) 1999]

- (a) $CH_3 - \overset{\overset{OD}{|}}{C} = CH_2$ (b) $CD_3 - \overset{\overset{O}{||}}{C} - CD_3$
 (c) $CH_2 = \overset{\overset{OH}{|}}{C} - CH_2D$ (d) $CD_2 = \overset{\overset{OD}{|}}{C} - CD$

9. The appropriate reagent for the transformation

[IIT-JEE (Screening) 2000]

- (a) $Zn(Hg), HCl$ (b) $NH_2NH_2 \cdot OH^-$
 (c) H_2 / Ni (d) $NaBH_4$
10. Which of the following has the most acidic hydrogen

[IIT-JEE (Screening) 2000]

- (a) 3-hexanone (b) 2, 4-hexanedione
 (c) 2, 5-hexanedione (d) 2, 3-hexanedione

11. Which of the following will be most readily dehydrated in acidic conditions

[IIT-JEE (Screening) 2000]

- (a) (b)
 (c) (d)

12.

Major Product is

[IIT-JEE (Screening) 2003]

- (a)
 (b)
 (c)
 (d)

(d)

13. Among the given compounds, the most susceptible to nucleophilic attack at the carbonyl group is [IIT 1997]

- (a) $MeCOCl$ (b) $MeCHO$
 (c) $MeCOOMe$ (d) $MeCOOCOMe$

14. Which of the following will give yellow precipitate with $I_2 / NaOH$ [IIT 1997]

- (a) $ICH_2COCH_2CH_3$
 (b) $CH_3COOCOCH_3$
 (c) CH_3CONH_2
 (d) $CH_3CH(OH)CH_2CH_3$

15. The product of acid hydrolysis of P and Q can be distinguished by

- $P = H_2C = \begin{matrix} OCOCH_3 \\ CH_3 \end{matrix}$ $Q = H_3C - CH = CH - OCOCH_3$
 (a) Lucas Reagent (b) 2,4-DNP
 (c) Fehling's Solution (d) $NaHSO_3$

16. On vigorous oxidation by permanganate solution $(CH_3)_2C = CH - CH_2CH_2CH_3$ gives [AIEEE 2002]

- (a) $CH_3 - \overset{\overset{OH}{|}}{C} - \overset{\overset{OH}{|}}{CH} - CH_2CH_3$
 (b) $CH_3 \begin{matrix} \diagup \\ \diagdown \end{matrix} CHCO_2H + CH_3COOH$
 (c) $CH_3 \begin{matrix} \diagup \\ \diagdown \end{matrix} CHOH + CH_3CH_2CH_2OH$
 (d) $CH_3 \begin{matrix} \diagup \\ \diagdown \end{matrix} C = O + CH_3CH_2COOH$

17. Which of the following reactions give benzo phenone

[Roorkee Qualifying 1998]

- (a) $2C_6H_6 + CCl_4 \xrightarrow[(ii)H_2O]{(i)AlCl_3}$
 (b) $C_6H_6 + C_6H_5COCl \xrightarrow{AlCl_3}$
 (c) $o - CH_3C_6H_4COC_6H_5 \xrightarrow{Heat}$
 (d) $o - HOOC - C_6H_4 - COC_6H_5 \xrightarrow[260^\circ C]{Cu}$

18. Aldehyde and ketones can decolourize by [CPMT 2003]

- (a) Bromine water (b) Quick lime

- (c) dil. H_2SO_4 (d) None of these
19. Which of the following statements regarding chemical properties of acetophenone are wrong
- (1) It is reduced to methyl phenyl carbinol by sodium and ethanol
 - (2) It is oxidised to benzoic acid with acidified $KMnO_4$
 - (3) It does not undergo iodoform electrophilic substitution like nitration at meta position
 - (4) It does not undergo iodoform reaction with iodine and alkali [Tamil Nadu CET 2001]
- (a) 1 and 2 (b) 2 and 4
(c) 3 and 4 (d) 1 and 3
20. The product(s) obtained via oxymercuration ($HgSO_4 + H_2SO_4$) of 1-butyne would be [IIT-JEE 1999]
- (a) $CH_3CH_2COCH_3$
(b) $CH_3CH_2CH_2CHO$
(c) $CH_3CH_2CHO + HCHO$
(d) $CH_3CH_2COOH + HCOOH$
21. The most reactive compound towards formation of cyanohydrin on treatment with KCN followed by acidification is
- (a) Benzaldehyde (b) *p*-Nitrobenzaldehyde
(c) Phenyl acetaldehyde (d) *p*-Hydroxybenzaldehyde
22. The key step in cannizzaro's reaction is the intermolecular shift of
- (a) Proton (b) Hydride ion
(c) Hydronium ion (d) Hydrogen bond
23. Benzophenone does not react with [BHU 2003]
- (a) RNH_2 (b) SO_3
(c) $NaOH$ (d) Na_2CO_3
24. The most suitable reagent for the conversion of $RCH_2OH \rightarrow RCHO$ is [AIIMS 2004]
- (a) $KMnO_4$
(b) $K_2Cr_2O_7$
(c) CrO_3
(d) PCC (Pyridine chloro chromate)
25. The conversion of acetophenone to acetanilide is best accomplished by using : [UPSEAT 2004]
- (a) Backmann rearrangement
(b) Curtius rearrangement
(c) Lossen rearrangement
(d) Hofmann rearrangement
26. Which of the following will not give iodoform test ? [UPSEAT 2004]
- (a) Isopropyl alcohol (b) Ethanol
(c) Ethanal (d) Benzyl alcohol
27. $MeO - \text{C}_6\text{H}_4 - CHO + (X) \xrightarrow[H_3O^+]{CH_3COONa}$
- $\text{C}_6\text{H}_5 - CH = CHCOOH$
- The compound (X) is [IIT-JEE 2005]
- (a) CH_3COOH (b) $BrCH_2 - COOH$
(c) $(CH_3CO)_2O$ (d) $CHO - COOH$
28. The major organic product formed from the following reaction

29. Products of the following reaction

- (a) $CH_3CHO + CH_3CH_2CHO$
(b) $CH_3COOH + CH_3CH_2CHO$
(c) $CH_3COOH + HOOCCH_2CH_3$
(d) $CH_3COOH + CO_2$
30. A compound, containing only carbon, hydrogen and oxygen, has a molecular weight of 44. On complete oxidation it is converted into a compound of molecular weight 60. The original compound is [KCET 2005]
- (a) An aldehyde (b) An acid
(c) An alcohol (d) an ether

[Orissa JEE 2003]

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

- Assertion : Acetic acid does not undergo haloform reaction.
Reason : Acetic acid has no alpha hydrogens. [IIT 1998]
- Assertion : Benzonitrile is prepared by the reaction of chlorobenzene with potassium cyanide.
Reason : Cyanide (CN) is a strong nucleophile. [IIT 1998]
- Assertion : Lower aldehyde and ketones are soluble in water but the solubility decreases as molecular mass increases.
Reason : Aldehydes and ketones can be distinguished by Tollen's reagent. [AIIMS 1994]
- Assertion : Acetaldehyde on treatment with alkaline gives aldol.
Reason : Acetaldehyde molecules contains α hydrogen atom. [AIIMS 1997]
- Assertion : Acetylene on treatment with alkaline $KMnO_4$ produce acetaldehyde.
Reason : Alkaline $KMnO_4$ is a reducing agent. [AIIMS 2000]
- Assertion : Acetophenone and benzophenone can be distinguished by iodoform test. [CBSE PMT 2005]

- Reason : Acetophenone and benzophenone both are carbonyl compounds. [AIIMS 2002]
7. Assertion : Isobutanal does not give iodoform test
Reason : It does not have α -hydrogen. [AIIMS 2004]
8. Assertion : Benzaldehyde is more reactive than ethanol towards nucleophilic attack.
Reason : The overall effect of $-I$ and $+R$ effect of phenyl group decreases the electron density on the carbon atom of $>C=O$ group in benzaldehyde.
9. Assertion : Aldol condensation can be catalysed both by acids and bases.
Reason : β -Hydroxy aldehydes or ketones readily undergo acid catalysed dehydration.
10. Assertion : Ketones are less reactive than aldehydes.
Reason : Ketones do not give schiff's test.
11. Assertion : Oximes are less acidic than hydroxyl amine.
Reason : Oximes of aldehydes and ketones show geometrical isomerism.
12. Assertion : The bond energy of $>C=O$ is less than $>C=C<$ in alkenes.
Reason : The carbon atom in carbonyl group is sp^2 hybridised.
13. Assertion : $R-C\equiv O^+$ is more stable than $R-C^+=O$.
Reason : Resonance in carbonyl compound provides C and O .
14. Assertion : Formaldehyde cannot be prepared by Rosenmund's reduction.
Reason : Acid chlorides can be reduced into aldehydes with hydrogen in boiling xylene using palladium or platinum as a catalyst supported on barium sulphate. This is known as Rosenmund's reduction.
15. Assertion : CH_3CHO reacts with NH_3 to form urotropine.
Reason : Urotropine is used as medicine in case of urinary troubles.
16. Assertion : α -Hydrogen atoms in aldehydes and ketones are acidic.
Reason : The anion left after the removal of α -hydrogen is stabilized by inductive effect.
17. Assertion : 2, 2-Dimethyl propanal undergoes Cannizzaro reaction with concentrated $NaOH$.
Reason : Cannizzaro is a disproportionation reaction.
18. Assertion : Benzaldehyde undergoes aldol condensation.
Reason : Aldehydes that do not have α -hydrogen undergo aldol condensation.

AS Answers and Solutions

Introduction

- $$\text{CH}_3 - \overset{\overset{\text{O}}{\parallel}}{\text{C}} - \text{H} + \text{HCN} \longrightarrow \text{CH}_3 - \overset{\overset{\text{OH}}{\mid}}{\underset{\underset{\text{CN}}{\mid}}{\text{C}}} - \text{H} \quad (\text{optically active})$$

Acetaldehyde Hydrogen Cyanide Acetaldehyde Cynohydrin
 - $$> \text{C} = \text{O}$$

sp^2 hybridised
- $$\text{CH}_3 \overset{\overset{\text{O}}{\parallel}}{\text{C}} \text{CH}_3$$

2 propanone
- $$\text{CHOCHO}$$
- $$\text{R} \begin{matrix} \nearrow \sigma \\ \searrow \sigma \end{matrix} \text{C} \begin{matrix} \pi \\ \searrow \sigma \end{matrix} = \text{O}$$
- $$\text{Cl} - \overset{\overset{\text{Cl}}{\mid}}{\underset{\underset{\text{Cl}}{\mid}}{\text{C}}} - \overset{\overset{\text{O}}{\parallel}}{\text{C}} - \text{H}$$

2, 2, 2, trichloroethanal
- Among Carbonyl Compounds, reactivity decrease with increase in alkyl groups as alkyl groups (+I effect) decrease positive character on C-atom. Thus, the correct order of reactivity is

$$\text{HCHO} > \text{CH}_3\text{CHO} > \text{C}_6\text{H}_5\text{CHO}$$

Preparation

13. (a) It is hydration of alkynes.

42. (a)

On the basis of product formation, it would be alkene

Properties

2. (c) It is cannizzaro reaction - 2

Benzaldehyde Benzylalcohol
 on reduction it gives benzylalcohol and not phenol.

9. (c) $C_6H_5CHOHCH_3 \xrightarrow{[O]} C_6H_5COCH_3$
1-Phenylethanol Acetophenone
 $C_6H_6 + CH_3COCl \xrightarrow[\text{reaction}]{\text{Friedel crafts}} C_6H_5COCH_3 + HCl$
10. (b) Wolf-Kishner reduction does not convert $>CO$ to $CHOH$ but converts it to $>CH_2$.
11. (c) Although both $CH_3CH_2COCH_3$ and $(CH_3)_3CCOCH_3$ contain α -hydrogen, yet $(CH_3)_3CCOCH_3$ does not undergo Aldol condensation due to steric hindrance.
12. (a) $C_6H_5CHO \xrightarrow[H^+ / H_2O]{CH_3MgBr} C_6H_5CH(OH)CH_3$
Benzaldehyde 2° Alcohol
13. (a) Chloral CCl_3CHO , has no α -hydrogen atom and hence does not undergo aldol condensation.
14. (b) Among the given compounds only acetone gives crystalline coloured derivative with 2, 4 DNP.
15. (d) Ethanal among the given compounds gives positive iodoform test.

19. (abd) Deuterium behaves like H and hence trideuteroacetaldehyde also undergoes aldol condensation but benzaldehyde does not since it has no α -hydrogen.

24. (b) Benzaldehyde on treatment with 50% aqueous or ethanolic alkali solution undergoes Cannizzaro's reaction like $HCHO$ (no α -hydrogen atom) i.e., one molecule is oxidised and one is reduced with the formation of benzoic acid and benzyl alcohol respectively.

25. (d) $2HCHO \xrightarrow[Conc.]{NaOH} CH_3OH + HCOONa$

It is a Cannizzaro's reaction.

It is aldol condensation reaction.

27. (d) $CH_3-CH_2-\overset{O}{\parallel}C-CH_2-CH_3$ do not have $CH_3-\overset{O}{\parallel}C-$ group

31. (c) CHI_3 is yellow compound when iodine reacts with $NaOH$ and ketone.

This reaction is called as Cannizzaro's reaction.

41. (d) The solution represented is fehling's and it has no tendency to oxidise benzaldehyde.

42. (a) Increasing alkyl group the reactivity decreases.

44. (d) All test for Aldehyde because ketone require strong oxidising agent.

45. (a) Silver mirror test is the test of aldehyde.

This reaction is called clemmenson's reduction.

52. (c) In cannizzaro's reaction the one substance is oxidized and other is reduced.

55. (c) Nucleophilic as addition of HCN , $NaHSO_3$ etc.

57. (c) Addition of HCN to carbonyl compounds is an example of nucleophilic addition.

58. (a) Acetone forms sodium bisulphate adduct but acetophenone does not. Aromatic ketones do not gives addition product with $NaHSO_3$.

60. (c) $CH_3 \rightarrow \overset{..}{O} \leftarrow CH_3$ The electron density of oxygen is highly increased therefore resistant its nucleophilic attack.

It is Perkin's reaction.

65. (a) Crossed aldol reaction gives benzyl alcohol and sodium formate.

66. (d) The substitution of alkoxy group of ester by an alcohol, is called trans-esterification. It occurs in presence of either an acid or base.

68. (a) In HCHO because α -Hydrogen atom is absent.

76. (d) The amount of enolic form is highest (76%) in acetyl acetone because keto group is a much better electron-withdrawing group.

85. (d) HI/Pt , Zn/Hg /conc. HCl and

used to the reduction of $-\overset{\text{O}}{\parallel}\text{C}-$ group into $-\text{CH}_2-$ group.

88. (a) Because acetone require stronger oxidising agent and hence not oxidized with Fehling solution to give brick red ppt.

While acetone do not react.

90. (d) Due to $\text{H} - \text{bonding}$ all are soluble in water.

102. (d) Cannizzaro's reaction involve self oxidation and self reduction.

Orange crystalline solid

106. (e) Fehling solution $\Rightarrow$ Alkaline $CuSO_4 + Na - K$ tartarate

Tollen's reagent $\Rightarrow NH_4OH + AgNO_3$

Schiff's reagent $\Rightarrow p$ -rosaniline hydrochloride or magenta

Benedict's solution $\Rightarrow$ Alkaline $CuSO_4 +$ Citrate ions

All these reagents are used to distinguish between aldehydes and ketones. Aldehydes reacts with all these reagents while ketones do not react.

107. (b) Schiff's reagent $\xrightarrow{SO_2}$ Colourless
- (Pink)

108. (c) $\beta \quad \alpha$
 CH_3-CH_2-CHO aldehydes having $\alpha-H$ atom can participate in aldol condensation. The H -atom attached to α carbon atom are called α -hydrogen.

112. (a) It is used as a medicine to treat urinary infections.

113. (c) p -rosaniline hydrochloride.

It is used for the identification of aldehydes.

116. (c) Cannizzaro's reaction is shown by aldehydes in which $\alpha-H$ atom is absent. CH_3CHO contains 3, $\alpha-H$ atoms thus, does not show this reaction.

121. (d) Benzaldehyde gives cannizzaro's reaction whereas acetaldehyde gives aldol condensation.

127. (c) $CuSO_4 + NaOH +$ Roschellesalt ($Na - K$ tartarate)

one carbon atom is less in the ketone group

137. (b) $\text{CH}_3\text{CHO} \xrightarrow[\text{I}_2]{\text{NaOH}} \text{CHI}_3$
Yellow ppt
138. (b) Fehling solution is a weak oxidising agent therefore unable to oxidise benzaldehyde.

This reaction is called benzoin condensation.

140. (a) Aldehyde + Schiff's reagent $\rightarrow$ Pink colour
(Colourless)
Ketone do not give this test.
141. (a) $\text{CH}_3\text{CHO} \xrightarrow{\text{Cl}_2} \text{CCl}_3\text{CHO} + 3\text{HCl}$
(Choral)
143. (b) Benzaldehyde will undergo Cannizzaro's reaction on treatment with 50% NaOH to produce benzyl alcohol and benzoic acid as it does not contain α -hydrogen

144. (d) Butane 2-one will get reduced to butane when treated with Zinc and hydrochloric acid following Clemmensen reduction, whereas Zn/HCl do not reduce ester, acid, amide
145. (b) Phoron

146. (d) $\text{RCHO} + 4\text{H} \xrightarrow{\text{Zn-Hg/HCl}} \text{R-CH}_3 + \text{H}_2\text{O}$
 $\text{R} > \text{C} = \text{O} + 4\text{H} \xrightarrow{\text{Zn-Hg/HCl}} \text{R} > \text{CH}_2 + \text{H}_2\text{O}$
147. (b) Acetone on iodination gives iodoform in the presence of NaOH

148. (b) We know that

Thus Lactic acid is formed.

149. (b) Tollen's reagent is used to detect aldehydes. Aldehyde reduce Tollen's reagent to give Silver mirror while these are oxidised to acid.

150. (c) Only aliphatic aldehyde reduce fehling solution. Hence, acetaldehyde give red ppt. with fehling solution.

151. (a) Two molecules of acetone condense in presence of dry HCl gas to form mesityl oxide.

152. (a) Formaldehyde and NaOH reacts to produce alcohol and sodium salt of an acid.

This reaction is Cannizzaro's reaction

153. (c) Acetaldehyde reduces Fehling solution giving red ppt. while acetone do not.

154. (c) It is an example of Cannizzaro reaction

155. (b) $\text{R}-\overset{+\delta}{\underset{\parallel}{\text{C}}}-\text{H}$; Susceptibility of nucleophilic attack on aldehyde is decreased by electron releasing effect of R group. Decreasing order of aldehyde towards nucleophilic attack is $1^\circ > 2^\circ > 3^\circ$ R group.

156. (a) Wolf kischner reduction : Hydrazine (NH_2-NH_2) followed by reaction with strong base like KOH reduce carbonyl group into alkyl group.

157. (d) Ketones and Aldehyde add to NaHSO_3 to give white precipitate

158. (d) Fehling's solution is the solution of $\text{CuSO}_4 + \text{NaOH}$ + Roschel salt (Sodium potassium tartarate). Aldehyde give red precipitate with Fehling's solution.

159. (c) It reduce $-\text{CHO}$ group into hydrocarbon.

160. (a) Molecular weight of the compound

$$= 2 \times \text{Vapour density}$$

$$= 2 \times 29 = 58$$

Molecular weight of $\text{CH}_3\text{CH}_2\text{CHO}$, $\text{CH}_3\text{CHOHCH}_3$, CH_3COCH_3 and $\text{CH}_3\text{CH}_2\text{COOH}$ are 58, 60, 58 and 74 respectively. Both $\text{CH}_3\text{CH}_2\text{CHO}$ and CH_3COCH_3 have molecular weight 58 but only aldehyde i.e., $\text{CH}_3\text{CH}_2\text{CHO}$ on warming with aqueous alkali gives yellow precipitate.

161. (c) $\text{CH}_3-\text{CH}_2-\overset{\text{OH}}{\underset{|}{\text{CH}}}-\text{CH}_3$ contain $\text{CH}_3-\overset{\text{OH}}{\underset{|}{\text{CH}}}-$ group by 2 butanol which it give +ve iodoform test.

162. (c) In nucleophilic addition reaction, the carbonyl compound will respond in preference which is sterically more exposed and electronically have intact positive charge over carbonyl carbon. So reactivity order towards reaction with PhMgBr is (II) > (III) > (I).

163. (d) Tollen's reagent oxidizes the compound having aldehyde group like glucose and also oxidizes α -hydroxy ketones having $-\text{COCH}_2\text{OH}$ group as in fructose.

164. (d) Acetaldehyde have $\text{CH}_3\text{CO}-$ group so it give positive iodoform test with I_2 and NaOH while formaldehyde does not have $-\text{CH}_3\text{CO}$ group so it will not give the positive haloform test.

165. (c) Aldehyde reduce silver mirror whereas acid do not reduce silver mirror.

168. (b) Formaline contains 40% HCHO , 8% CH_3OH and 52% water. It is used as biological preservative.

173. (b) Two molecules of ketones undergo reduction in the presence of Mg/Hg to form pinacol.

The product shows *E* and *Z* configuration

175. (a) As *A* reacts with hydroxylamine it means *A* may be aldehyde or ketone, but it does not react with fehling solution hence *A* must be a ketone. Secondly it forms iodoform which is a characteristic reaction of methyl ketone.

177. (b) Aldehyde, which does not have the $\alpha-\text{H}$ atom, gives cannizzaro's reaction on heating with conc. alkali solution (50%)

Critical Thinking Questions

- (d) Acetone oxidise by $\text{K}_2\text{Cr}_2\text{O}_7$ & conc. H_2SO_4 into carboxylic acid. It is not oxidised by dilute H_2SO_4 .
- (b) Acetaldehyde react with tollen's reagent while ketone do not react with tollen's reagent.
- (b) $\text{CCl}_3-\text{CHO} + \text{H}_2\text{O} \rightarrow \text{CCl}_3\cdot\text{CHO}\cdot\text{H}_2\text{O}$
(Chloral hydrate)

- (c) The compound *A* with formula $\text{C}_3\text{H}_6\text{O}$ gives iodoform test, it is propanone forms a compound *B* having carbon atoms three times, the number of carbon atoms in propanone, it is 2, 6-dimethyl-2, 5-heptadien-4-one.

6. (a) $\text{CH}_3-\text{CH}_2-\text{CH}_2\text{OH} \xrightarrow{[\text{O}]} \text{CH}_3-\text{CH}_2-\text{CHO}$
- (A) (B)

7. (b) Acetophenone is a ketone and does not react with Tollen's reagent to give silver mirror.

The enol form of acetone on treatment with D_2O undergoes enolisation, deuteration (addition of D_2O) and dehydration (removal of H_2O). The repeated enolisation, deuteration and dehydration ultimately gives $\text{CD}_3\cdot\text{COCD}_3$ (B).

9. (b) Both Zn(Hg) , HCl and NH_2NH_2 , OH^- can reduce $-\text{COCH}_3$ group to $-\text{CH}_2-\text{CH}_3$ group, but HCl will also bring about dehydration of alcohol to form alkene. Therefore, appropriate reagent for the conversion is NH_2NH_2 , OH^- .
10. (b) 2, 4-hexanedione (a 1, 3-diketone) has the most acidic hydrogen. This is because the carbanion left after the removal of H^+ is resonance stabilised in this case.

11. (a) Aldols (β -hydroxy aldehydes or β -hydroxyketones) readily undergo dehydration to form α , β -unsaturated aldehydes or ketones.

13. (a) Amongst aldehyde & the acid derivatives, acid chloride are the most susceptible to nucleophilic attack due to strong $-I$ effect & weak $+R$ effect of the Cl -atom as a result of which carbonyl carbon has the highest electron deficiency. The actual order is $\text{MeCOCl} > \text{MeCOOCMe} > \text{MeCOOMe} > \text{MeCHO}$.

Ketone (non-reducing) and aldehyde (reducing) can be distinguished by Fehling solution.

18. (d) Aldehyde & ketone are colourless & stable compound
19. (c) It undergoes electrophilic substitution at m -position and also gives iodoform test.
20. (a)
$$\text{CH}_3 - \text{CH}_2 - \text{C} \equiv \text{CH} + \text{H}_2\text{O} \rightarrow$$

But-1-yne

21. (b) Due to electron withdrawing nature of NO_2 group, the partial +ve charge on the carbon atom of the $>\text{C}=\text{O}$ group in p -nitrobenzaldehyde increases and hence becomes more susceptible to nucleophilic attack by CN^- ion.
22. (b) Cannizzaro reaction is an example of hydride ion (H^-) transfer reaction.
23. (d) Except Na_2CO_3 benzophenone react with rest of option.
24. (d) The alcohol can be converted to aldehyde group by treating with oxidising agent Pyridinium chloro chromate ($\text{C}_6\text{H}_5\text{NHCrO}_3\text{Cl}^-$) it is abbreviated as PCC and is called Collin's reagent. This reagent is used in non aqueous solvent like CH_2Cl_2 . It is a very good reagent because it checks the

further oxidation of aldehyde to carboxylic acid while rest oxidising agent oxidise aldehyde into carboxylic acid.

26. (d) Benzyl alcohol does not have the $\text{CH}_3\text{CO}-$ group or $\text{CH}_3\text{CH}_2\text{O}^-$ so it will not give the positive iodoform test.

27. (c) This is perkin reaction

30. (a) On complete oxidation the obtained compound shows increment in molecular weight of only 16. It means only one oxygen atom is added here. This condition is fulfilled by only aldehyde which on oxidation gives acid.

Hence, original compound must be

Assertion & Reason

3. (b) It is true that lower aldehyde and ketones are soluble in water but as the molecular mass increases their solubility decreases. On adding Tollen's reagent to a solution of Carbonyl compound if silver mirror is obtained then it is aldehyde. Therefore Tollen's reagent is used for the identification of aldehydes and ketones. Here, assertion and reason both are true but the reason is not the correct explanation of assertion.

4. (a) Carbonyl compounds having α -hydrogen atom condense to produce aldol in presence of alkali.

Acetaldehyde

5. (d) Acetylene, on treatment with alkaline KMnO_4 is oxidised to produce oxalic acid.

Therefore, both assertion and reason are false.

6. (b) Acetophenone and benzophenone can be distinguished by iodoform test. Both are carbonyl compounds. Assertion and reason both are true but reason is not the correct explanation of assertion.

Isobutanol has α -hydrogen atom.

Acetaldehyde, acetone and methyl ketones having CH_3CO group undergo haloform reaction. The halogen atoms of the methyl group are first replaced by hydrogen atoms. This reaction is used as a test of CH_3CO -group. Due to absence of CH_3CO -group isobutanol does not give iodoform test.

8. (a) Benzaldehyde is less reactive than ethanol towards nucleophilic attack. The combined effect of $-I$ and $+R$ effect of phenyl group is electron donating which increases the electron density on the carbon atom of the $\text{C}=\text{O}$ in benzaldehyde.

9. (b) Both carbanions (formed in presence of base) and enol form (formed in presence of an acid) act as nucleophiles and hence add on the carbonyl group of aldehydes and ketones to give aldols.
10. (b) The positive inductive effect of two alkyl groups in ketones makes the carbon atom less positive and makes it less reactive in comparison to aldehydes.
11. (e) Oximes are more acidic because, there is a delocalisation of π electrons (*i.e.*, resonance) and it stabilises it and its conjugate acid. But no such resonance exists in hydroxyl amine base (NH_2O^-)
12. (e) The bond energy of carbonyl group is 179 Kcal/mol and in $C=C$ the bond energy is 145.8 Kcal . The carbonyl group shows resonance and thus possesses higher bond energy.
- $$C=O \quad C^+ - O^- \longleftrightarrow$$
13. (b) Both carbon and oxygen are nonmetals and try to complete their octet. In $R-C \equiv O^+$ each has complete octet whereas in $R-C^+ = O$, carbon atom has incomplete octet.
14. (b) $HCHO$ cannot be prepared by Rosenmund's reduction because formyl chloride is unstable at room temperature.
15. (e) $HCHO$ reacts with NH_3 to form urotropine
- $$6HCHO + 4NH_3 \rightarrow (CH_2)_6N_4 + 6H_2O$$
16. (c) The anion left after the removal of α -hydrogen is stabilized by resonance effect.
17. (b) Aldehydes which do not contain α -hydrogens undergo Cannizzaro reaction.

2, 2 dimethyl propanal (no α hydrogen)

18. (d) Aldehydes having a methyl or methylene group in the α -position or more correctly having atleast one hydrogen atom in the α -position undergo dimerisation in presence of a base at low temperature to form β -hydroxy aldehydes called aldols.

Aldehydes and Ketones

 - $C_6H_5NHNH_2$
- Which of the following does not give yellow precipitate with I_2 and $NaOH$
[MP PET 1996]
 - C_2H_5OH
 - CH_3CHO
 - CH_3COCH_3
 - $HCHO$
- In this reaction

$$CH_3CHO + HCN \xrightarrow{H^+ / OH^-} CH_3CH(OH)COOH$$
 an asymmetric centre is generated. The acid obtained would be
 - 20% *D* + 80% *L*-isomer

- (b) *D*-isomer
(c) *L*-isomer
(d) 50% *D* + 50% *L*-isomer
15. Aldehydes are produced in atmosphere by [NCERT 1982]
(a) Oxidation of secondary alcohols
(b) Reduction of alkenes
(c) Reaction of oxygen atoms with hydrocarbons
(d) Reaction of oxygen atoms with ozone
16. Which of the following compounds will give positive test with Tollen's reagent [CBSE PMT 1994; Kurukshetra CEE 1998; AFMC 2002]
(a) Acetamide
(b) Acetaldehyde
(c) Acetic acid
(d) Acetone
17.
$$ArH + R - \overset{\overset{O}{\parallel}}{C} - Cl \xrightarrow{\text{Lewis acid}} Ar - \overset{\overset{O}{\parallel}}{C} - R + HCl$$
 is an example of
- (a) Friedel-Craft's alkylation
(b) Friedel-Craft's acylation
(c) Cannizzaro reaction
(d) Claisen condensation
18. Which of the following fails to answer the iodoform test. [CBSE PMT 1989]
(a) Pentanone-1
(b) Pentanone-2
(c) Propanone-2
(d) Ethanol
19. The reagent used for the separation of acetaldehyde from acetophenone is [AIIMS 2004]
(a) $NaHSO_4$
(b) $C_6H_5NHNH_2$
(c) NH_2OH
(d) $NaOH - I_2$

AS Answers and Solutions

(SET -27)

1. (a)
$$\underset{\text{Benzophenone}}{C_6H_5COC_6H_5} + KOH \xrightarrow{\text{Fusion}} \underset{\text{Benzene}}{C_6H_6} + \underset{\text{Pot. benzoate}}{C_6H_5COOK}$$

$$C_6H_5\overset{\overset{O}{\parallel}}{C}COOK + KOH \xrightarrow{\Delta} K_2CO_3 + \underset{\text{Benzene}}{C_6H_6}$$
2. (d) Acetophenone gives iodoform reaction while benzophenone does give this.
3. (c)
$$CH_3CHO + \underbrace{2Cu^{+2} + 5OH^-}_{\text{Fehling solution}} \rightarrow CH_3COO^- + \underset{\text{Red ppt.}}{Cu_2O} + 3H_2O$$

4. (a) The size of the alkyl group. Causes hindrance to attacking group. As the number and size of the alkyl groups increase the hindrance to the attack of nucleophile also increases.
Thus the reactivity follows the order

5. (b) Benzaldehyde does not have the α -hydrogen so it will undergoes cannizzaro's reaction.

6. (b) C_6H_5CHO Aldehydes – Those aldehyde in which $\alpha-H$ atom is absent can participate in Cannizzaro's reaction.

7. (c) $2CH_3-CO-CH_3 \xrightarrow{dil NaOH}$

8. (c) 

9. (a) Because alkyl group is absent and they have +ve inductive effect and increases the electron density on the carbonyl group.

10. (b) The compound having α -hydrogen will give iodoform test. Ethyl alcohol and secondary alcohols also give positive iodoform test because by the action of halogens in alkaline medium, they are oxidised to acetaldehyde and methyl ketones respectively.

11. (d) During reaction Ag^+ gets reduced Ag metal and forms silver mirror.

12. (ad) $C_6H_5NH_2$ and $C_6H_5NH.NH_2$ will give the compounds containing $>C=N$ -group.

13. (d) $HCHO \xrightarrow{I_2 / NaOH}$ No reaction

14. (d) $CH_3CHO + HCN \rightarrow CH_3CHOHCN \xrightarrow{\text{hydrolysis}}$

15. (c) Aldehydes are compounds containing C, H and O . So hydrocarbons react with atmospheric oxygen to give aldehydes.

16. (b) Tollen's reagent is ammoniacal silver nitrate solution. Its reacting species is Ag^+ . It oxidises aliphatic as well as aromatic aldehydes.

17. (b) $ArH + R-CO-Cl \xrightarrow{\text{anhyd. } AlCl_3} Ar-CO-R + HCl$

This reaction is Friedel-Craft's acylation.

18. (a) 1-pentanone is an impossible compound does not have

19. (a) $NaHSO_3$ gives the addition reaction with Aldehyde and only aliphatic ketone. Acetophenone is the aromatic ketone so it does not give the addition product with $NaHSO_3$ aldehyde from the addition product with $NaHSO_3$ which on treatment with acid or base give again aldehyde.

Chapter 28

Carboxylic acids and Their derivatives

Carboxylic Acids

Carboxylic acids are the compounds containing the carboxyl

The carboxyl group is made up of carbonyl ($>C=O$) and hydroxyl ($-OH$) group.

Classification

(1) Carboxylic acids are classified as monocarboxylic acids, dicarboxylic acids, tricarboxylic acids etc. depending on the number of $-COOH$ groups present in the molecule.

(2) Monocarboxylic acids of aliphatic series are commonly known as fatty acids such as palmitic acid ($C_{15}H_{31}COOH$) and stearic acid ($C_{17}H_{35}COOH$).

(3) The general formula for monocarboxylic acids is $C_nH_{2n+1}COOH$ or $C_nH_{2n}O_2$. Where n = number of carbon atoms.

(4) The carboxylic acids may be aliphatic or aromatic depending upon whether $-COOH$ group is attached to aliphatic alkyl chain or aryl group respectively.

Methods of preparation of monocarboxylic acid

(1) By oxidation of alcohols, aldehydes and ketones

Aldehyde can be oxidized to carboxylic acid with mild oxidising agents such as ammoniacal silver nitrate solution [Ag_2O or $Ag(NH_3)_2^+OH^-$]

Methanoic acid can not be prepared by oxidation method.

Ketones can be oxidized under drastic conditions using strong oxidising agent like $K_2Cr_2O_7$.

Methyl ketones can also be converted to carboxylic acid through the haloform reaction.

(2) By Hydrolysis of nitriles, ester, anhydrides and acid chloride

(i) Hydrolysis of nitriles

(ii) Hydrolysis of Esters

(iii) Hydrolysis of Anhydrides

(iv) Hydrolysis of acid chloride and nitro alkane

(v) **Hydrolysis of Trihalogen :**(3) **From Grignard Reagent**(4) **From Alkene or Hydro-carboxy-addition (Koch reaction)**(5) **Special methods**(i) **Carboxylation of sodium alkoxide**(ii) **Action of heat on dicarboxylic acid**(iii) **From acetoacetic ester**(iv) **Oxidation of alkene and alkyne**(v) **The Arndt-Eistert synthesis**(vi) **From acid amides**

the increase in the size of the alkyl group. All carboxylic acids are soluble in alcohol, ether and benzene etc.

□ The solubility of lower members of carboxylic acids is due to the formation of hydrogen bonds between the $-COOH$ group and water molecules.

□ Acetic acid exists in the solution in dimer form due to intermolecular hydrogen bonding. The observed molecular mass of acetic acid is 120 instead of 60.

(3) **Melting point**

(i) The melting points of carboxylic acids do not vary smoothly from one member to another.

(ii) The melting point of the acids having even number of carbon atoms are higher than those containing an odd number immediately above and below them.

(iii) The acids with even number of carbon atoms have the $-COOH$ group and the terminal $-CH_3$ group on the opposite side of the carbon chain.

(iv) In the case of odd numbers, the two groups lie on the same side of the chain.

the two terminal groups lie on the opposite sides of the chain

the two terminal groups lie on the same side of the chain

When the terminal groups lie on the opposite sides the molecules fit into each other more closely. More effective packing of the molecule in the lattice. Therefore, results into higher melting point.

(4) **Boiling point :** Boiling point of carboxylic acids increase regularly with increase of molecular mass. Boiling points of carboxylic acids are higher than those of alcohols of same molecular mass. This is due to intermolecular hydrogen bonding between two acid molecules.

**Acidic nature of monocarboxylic acids**(1) **Cause of acidic nature**

(i) A molecule of carboxylic acid can be represented as a resonance hybrid of the following structures.

(ii) Due to electron deficiency on oxygen atom of the hydroxyl group (Structure II), there is a displacement of electron pair of $O-H$ bond toward the oxygen atom. This facilitates the release of hydrogen as proton (H^+).

Physical properties of monocarboxylic acids

(1) **Physical state :** The first three members (upto 3 carbon atoms) are colourless, pungent smelling liquids. The next six members are oily liquids having unpleasant smell. The higher members are colourless and odourless waxy solids.

(2) **Solubility :** The lower members of the aliphatic carboxylic acid family (upto C_4) are highly soluble in water. The solubility decreases with

(iii) The resulting carboxylate ion also stabilized by resonance (As negative charge is dispersed on both the oxygen atom). This enhance the stability of carboxylate anion and make it weaker base or strong acid.

(2) Effect of substituent on acidic nature

(i) An electron withdrawing substituent ($-I$ effect) stabilizes the anion by dispersing the negative charge and therefore increases the acidity.

(I)

(II)

(ii) An electron releasing substituent ($+I$ effect) stabilizes negative charge on the anion resulting in the decrease of stability and thus decreased the acidity of acid.

Electron with drawing nature of halogen : $F > Cl > Br > I$

Thus, the acidic strength decreases in the order :

similarly :

(iii) Inductive effect is stronger at α -position than β -position similarly at β -position it is more stronger than at γ -position

Example:

(iv) Relative acid strength in different compounds

□ Greater the value of K_a or lesser the value of pK_a stronger is the acid, i.e. $pK_a = -\log K_a$

□ Acidic nature (K_a) $\propto$ 1/molecular weight

□ The formic acid is strongest of all fatty acids.

□ Acetic acid is less weak acid than sulphuric acid due to less degree of ionisation.

Chemical properties of monocarboxylic acids

(I) Reaction involving removal of proton from $-OH$ group

(i) **Action with blue litmus** : All carboxylic acids turn blue litmus red.

(ii) **Reaction with metals**

(iii) **Action with alkalis**

(iv) **Action with carbonates and bicarbonates**

□ Reaction of carboxylic acid with aqueous sodium carbonates solution produces bricks effervescence. However most phenols do not produce effervescence. Therefore, this reaction may be used to distinguish between carboxylic acids and phenols.

(2) **Reaction involving replacement of $-OH$ group** (i)

Formation of acid chloride

(ii) **Formation of esters (Esterification)**

(a) The reaction is shifted to the right by using excess of alcohol or removal of water by distillation.

(b) The reactivity of alcohol towards esterification.

tert-alcohol < *sec*-alcohol < *pri*-alcohol < methyl alcohol

(c) The acidic strength of carboxylic acid plays only a minor role.

When **methanol** is taken in place of **ethanol**, then reaction is called **trans esterification**.

(iv) **Formation of amides**

(v) **Formation of acid anhydrides**

(vi) **Reaction with organo-metallic reagents**

(3) **Reaction involving carbonyl ($>C=O$) group:**

Carboxylic acid are difficult to reduce either by catalytic hydrogenation or Na/C_2H_5OH

(4) **Reaction involving attack of carboxylic group ($-COOH$)**

When anhydrous alkali salt of fatty acid is heated with sodalime then

□ When sodium formate is heated with sodalime H_2 is evolved.
(Exception)

(ii) **Heating of calcium salts**

(iii) **Electrolysis : (Kolbe's synthesis)**

(iv) **Formation of Alkyl halide** (Hunsdiecker's reaction)

□ In Hunsdiecker reaction, one carbon atom less alkyl halide is formed from acid salt.

(v) **Formation of amines** (Schmidt reaction)

In Schmidt reaction, one carbon less product is formed.

(vi) **Complete reduction**

In the above reaction, the $-COOH$ group is reduced to a CH_3 group.

(5) **Reaction involving hydrogen of α -carbon**

Halogenation

(i) **In presence of U.V. light**

(ii) **In presence of Red P and diffused light [Hell Volhard-zelinsky reaction]**

Carboxylic acid having an α -hydrogen react with Cl_2 or Br_2 in the presence of a small amount of red phosphorus to give chloro acetic acid. The reaction is known as **Hell Volhard-zelinsky reaction**.

Individual members of monocarboxylic acids

Formic Acid or Methanoic acid ($HCOOH$)

Formic acid is the first member of monocarboxylic acids series. It occurs in the sting of bees, wasps, red ants, stinging nettles. and fruits. In traces it is present in perspiration, urine, blood and in caterpillar's.

(1) **Methods of preparation**

(i) **Oxidation of methyl alcohol or formaldehyde**

(ii) **Hydrolysis of hydrocyanic acid** : Formic acid is formed by the hydrolysis of HCN with acids or alkalis.

(iii) **Laboratory preparation**

The following procedure is applied for obtaining anhydrous formic acid.

(iv) **Industrial preparation** : Formic acid is prepared on industrial scale by heating sodium hydroxide with carbon monoxide at $210^\circ C$ under a pressure of about 10 atmospheres.

Sodium formate thus formed is distilled with sodium hydrogen sulphate, when anhydrous formic acid distils over.

(2) **Physical properties**

(i) It is a colourless pungent smelling liquid.

(ii) It melts at $8.4^\circ C$ and boils at $100.5^\circ C$.

(iii) It is miscible with water, alcohol and ether. It forms azeotropic mixture with water.

(iv) It is strongly corrosive and cause blisters on skin.

(v) It exists in aqueous solution as a dimer involving hydrogen bonding.

(3) **Uses** : Formic acid is used.

(i) In the laboratory for preparation of carbon monoxide.

(ii) In the preservation of fruits.

(iii) In textile dyeing and finishing.

- (iv) In leather tanning.
- (v) As coagulating agent for rubber latex.
- (vi) As an antiseptic and in the treatment of gout.
- (vii) In the manufacture of plastics, water proofing compounds.
- (viii) In electroplating to give proper deposit of metals.
- (ix) In the preparation of nickel formate which is used as a catalyst in the hydrogenation of oils.
- (x) As a reducing agent.
- (xi) In the manufacture of oxalic acid.

Acetic Acid (Ethanoic Acid) (CH_3COOH)

Acetic acid is the oldest known fatty acid. It is the chief constituent of vinegar and hence its name (Latin acetum = vinegar)

(1) Preparation

(i) By oxidation of acetaldehyde (Laboratory-preparation)

(ii) By hydrolysis of methyl cyanide with acid

(iii) By Grignard reagent

(iv) By hydrolysis of acetyl chloride, acetic anhydride or acetamide and ester

(v) Manufacture of acetic acid

(a) From ethyl alcohol (Quick vinegar process) : Vinegar is 6-10% aqueous solution of acetic acid. It is obtained by fermentation of liquors containing 12 to 15% ethyl alcohol. Fermentation is done by *Bacterium Mycoderma aceti* in presence of air at 30-35°C. The process is termed **acetous fermentation**.

It is a slow process and takes about 8 to 10 days for completion.

In this process, the following precautions are necessary:

- The concentration of the ethyl alcohol should not be more than 15%, otherwise the bacteria becomes inactive.
- The supply of air should be regulated. With less air the oxidation takes place only upto acetaldehyde stage while with excess of air, the acid is oxidised to CO_2 and water.

• The flow of alcohol is so regulated that temperature does not exceed 35°C, which is the optimum temperature for bacterial growth.

Acetic acid can be obtained from vinegar with the help of lime. The calcium acetate crystallised from the solution is distilled with concentrated sulphuric acid when pure acetic acid distils over.

(b) From acetylene : Acetylene is first converted into acetaldehyde by passing through 40% sulphuric acid at 60°C in presence of 1% HgSO_4 (catalyst).

The acetaldehyde is oxidised to acetic acid by passing a mixture of acetaldehyde vapour and air over manganous acetate at 70°C.

□ Acetylene required for this purpose is obtained by action of water on calcium carbide.

The yield is very good and the strength of acid prepared is 97%. The method is also quite cheap.

(c) By the action of CO on methyl alcohol : Methyl alcohol and carbon monoxide react together under a pressure of 30 atmospheres and 200°C in presence of a catalyst cobalt octacarbonyl, $\text{Co}(\text{CO})_8$, to form acetic acid.

(2) Physical properties

(i) At ordinary temperature, acetic acid is a colourless, corrosive liquid with a sharp pungent odour of vinegar. It has a sour taste.

(ii) Below 16.5°C, it solidifies as an icy mass, hence it is named glacial acetic acid.

(iii) It boils at 118°C. The high boiling point of acetic acid in comparison to alkanes, alkyl halides or alcohols of nearly same molecular masses is due to more stronger hydrogen bonding between acid molecules. This also explains dimer formation of acetic acid in vapour state.

(iv) It is miscible with water, alcohol and ether in all proportions.

(v) It is good solvent for phosphorus, sulphur, iodine and many organic compounds.

(3) **Uses** : It is used,

(i) As a solvent and a laboratory reagent.

(ii) As vinegar for table purpose and for manufacturing pickles.

(iii) In coagulation of rubber latex.

(iv) For making various organic compounds such as acetone, acetic anhydride, acetyl chloride, acetamide and esters.

(v) For making various useful metallic acetates, such as:

(a) Basic copper acetate which is used for making green paints.

(b) *Al*, *Fe* and *Cr* acetates which are used as mordants in dyeing.

(c) Lead tetra-acetate which is a good oxidising agent.

(d) Basic lead acetate which is used in the manufacture of white lead.

(e) Aluminium acetate which is used in the manufacture of water-proof fabrics.

(f) Alkali acetates which are used as diuretics.

Table : 28.1 Comparison of Formic Acid and Acetic Acid

Property	Formic acid	Acetic acid
1. Acidic nature,		

(i) With electro-positive metals	Forms salts, Hydrogen is evolved. $HCOOH + Na \rightarrow HCOONa + \frac{1}{2} H_2$	Forms salts. Hydrogen is evolved. $CH_3COOH + Na \rightarrow CH_3COONa + \frac{1}{2} H_2$
(ii) With bases	Forms salts. $HCOOH + NaOH \rightarrow HCOONa + H_2O$	Forms salts. $CH_3COOH + NaOH \rightarrow CH_3COONa + H_2O$
(iii) With carbonates and bicarbonates	Forms salts. Carbon dioxide is evolved. $HCOOH + NaHCO_3 \rightarrow HCOONa + H_2O + CO_2$	Forms salts. Carbon dioxide is evolved. $CH_3COOH + NaHCO_3 \rightarrow CH_3COONa + H_2O + CO_2$
2. Ester formation	Forms esters when treated with alcohols. $HCOOH + C_2H_5OH \rightarrow HCOOC_2H_5 + H_2O$	Forms esters when treated with alcohols. $CH_3COOH + C_2H_5OH \xrightarrow{H_2SO_4 (conc.)} CH_3COOC_2H_5 + H_2O$
3. Reaction with PCl_5	Forms formyl chloride which decomposes into CO and HCl . $HCOOH + PCl_5 \rightarrow HCOCl(HCl + CO) + POCl_3 + HCl$	Forms acetyl chloride which is a stable compound. $CH_3COOH + PCl_5 \rightarrow CH_3COCl + POCl_3 + HCl$
4. Heating of ammonium salt	Forms formamide. $HCOONH_4 \rightarrow HCONH_2 + H_2O$	Forms acetamide. $CH_3COONH_4 \rightarrow CH_3CONH_2 + H_2O$
5. Heating alone	It decomposes into CO and H_2 . $HCOOH \rightarrow CO_2 + H_2$	Unaffected
6. Heating with conc. H_2SO_4	Decomposed into CO and H_2O . $HCOOH \xrightarrow[H_2SO_4]{Conc.} CO + H_2O$	Unaffected
7. Reaction with Cl_2 in presence of red P	Unaffected	Forms mono, <i>di</i> or trichloro acetic acids.
8. Action of heat on salts, (i) Calcium salt	Forms formaldehyde. $(HCOO)_2Ca \rightarrow HCHO + CaCO_3$	Forms acetone. $(CH_3COO)_2Ca \rightarrow CH_3COCH_3 + CaCO_3$
(ii) Sodium salt	Forms sodium oxalate. $2HCOONa \xrightarrow{heat} \begin{matrix} COONa \\ \\ COONa \end{matrix} + H_2$	Unaffected.
(iii) Sodium salt with soda-lime	Forms sodium carbonate and H_2 . $HCOONa + NaOH \xrightarrow{CaO} Na_2CO_3 + H_2$	Forms sodium carbonate and methane. $CH_3COONa + NaOH \xrightarrow{CaO} CH_4 + Na_2CO_3$
9. Electrolysis of sodium or potassium salt	It evolves hydrogen.	It forms ethane.
10. On heating with P_2O_5	Unaffected	Forms acetic anhydride. $2CH_3COOH \xrightarrow{P_2O_5} (CH_3CO)_2O + H_2O$
11. Reducing nature, (i) Tollen's reagent	Gives silver mirror or black precipitate. $HCOOH + Ag_2O \rightarrow 2Ag + CO_2 + H_2O$	Unaffected.
(ii) Fehling's solution	Gives red precipitate $HCOOH + 2CuO \rightarrow Cu_2O + CO_2 + H_2O$	Unaffected.
(iii) Mercuric chloride	Forms a white ppt. which changes to greyish black. $HgCl_2 \rightarrow Hg_2Cl_2 \rightarrow 2Hg$	Unaffected.
(iv) Acidified $KMnO_4$	Decolourises	Unaffected.
12. Acid (neutral solution) + $NaHSO_4$ + Sodium nitroprusside.	Greenish blue colour.	Unaffected.

13. Acid (neutral solution) +
neutral ferric chloride

Red colour which changes to brown ppt. on heating.

Wine red colour.

Interconversions(1) **Ascent of series** : Conversion of formic acid into acetic acid.**Arndt-Eistert homologation** : This is a convenient method of converting an acid, RCOOH to RCH_2COOH .(2) **Descent of series** : Conversion of acetic acid into formic acid.**Conversion of Acetic acid into other organic compound**

Dicarboxylic acids

The acids containing two carboxylic groups are called dicarboxylic acids.

The saturated dicarboxylic acid are represented by the general formula $C_nH_{2n}(COOH)_2$ where $n = 0, 1, 2, 3$ etc.

According to IUPAC system, the suffix-dioic acid is added to the name of parent alkane, i.e. Alkane dioic acid.

Table : 28.2

Formula	Common name	IUPAC name
$HOOC-COOH$	Oxalic acid	Ethanedioic acid
$HOOCCH_2COOH$	Malonic acid	1,3-Propanedioic acid
$HOOCCH_2CH_2COOH$	Succinic acid	1,4-Butanedioic acid
$HOOC(CH_2)_3COOH$	Glutaric acid	1,5-Pentanedioic acid
$HOOC(CH_2)_4COOH$	Adipic acid	1,6-Hexanedioic acid

Oxalic Acid or Ethanedioic Acid

Oxalic acid is first member of dicarboxylic series.

It occurs as potassium hydrogen oxalate in the wood sorrel, rhubarb and other plants of oxalis group and as calcium oxalate in plants of rumex family.

It is found in the form of calcium oxalate in stony deposits in kidneys and bladder in human body.

Oxalic acid present in tomatoes.

(i) Methods of Preparation

(i) **By oxidation of ethylene glycol with acidified potassium dichromate**

(ii) **By hydrolysis of cyanogen with conc. hydrochloric acid :**

(iii) **By heating sodium or potassium in a current of carbon dioxide at 360°C**

(iv) **Laboratory preparation**

(v) **Industrial method**

Sodium formate is obtained by passing carbon monoxide over fine powdered of sodium hydroxide.

The sodium oxalate thus formed is dissolved in water and calcium hydroxide is added. The precipitate of calcium oxalate is formed which is separated by filtration. It is decomposed with calculated quantity of dilute sulphuric acid.

(2) Physical Properties

(i) It is a colourless crystalline solid. It consists of two molecules of water as water of crystallisation.

(ii) The hydrated form has the melting point $101.5^\circ C$ while the anhydrous form melts at $190^\circ C$.

(iii) It is soluble in water and alcohol but insoluble in ether.

(iv) It is poisonous in nature. It affects the central nervous system.

(3) Chemical Properties

(i) **Action of heat :** It becomes anhydrous.

(a) At $200^\circ C$, $(COOH)_2 \longrightarrow HCOOH + CO_2$

Formic acid

On further heating, formic acid also decomposes.

(b) **Heating with conc. H_2SO_4**

(ii) **Acidic nature**

Salt formation

(iii) **Esterification**

(iv) **Reaction with PCl_5 :**

(v) **Reaction with ammonia**

(vi) **Oxidation** : When oxalic acid is warmed with acidified KMnO_4 .

❑ Oxalic acid decolourises the acidic KMnO_4 solution.

(vii) **Reaction with ethylene glycol**

(ix) **Reaction with Glycerol** : At $100^\circ - 110^\circ\text{C}$, formic acid is formed. At 260° , allyl alcohol is formed.

(4) **Uses** : Oxalic acid (Polyprotic acid) is used,

(i) In the manufacture of carbon monoxide, formic acid and allyl alcohol.

(ii) As a laboratory reagent and as a standard substance in volumetric analysis.

(iii) In the form of antimony salt as a mordant in dyeing and calico printing.

(iv) In the manufacture of inks.

(v) For removing ink stains and rust stains and for bleaching straw, wood and leather.

(vi) In the form of ferrous potassium oxalate as developer in photography.

(5) **Analytical test**

(i) The aqueous solution turns blue litmus red.

(ii) The aqueous solution evolves effervescences with NaHCO_3 .

(iii) The neutral solution gives a white precipitate with calcium chloride solution. It is insoluble in acetic acid.

(iv) Oxalic acid decolourises hot potassium permanganate solution having dilute sulphuric acid.

(v) With hot conc. H_2SO_4 , it evolves carbon monoxide which burns with blue flame.

The acid occurs as calcium salt in sugar beet. It was so named because it was first obtained from malic acid (hydroxy succinic acid) by oxidation.

(1) **Methods of Preparation** : From acetic acid

(2) **Physical Properties**

(i) It is a white crystalline solid.

(ii) Its melting point is 135°C .

(iii) It is soluble in water and alcohol but sparingly soluble in ether.

(3) **Chemical Properties**(i) **Action of heat**

(a) **Heating at 150°C :**

(b) **Heating with P_2O_5 :**

(ii) **Reaction with aldehyde** : With aldehydes, α - β unsaturated acids are formed.

(4) **Uses** : Its diethyl ester (malonic ester) is a valuable synthetic reagent for preparation of a variety of carboxylic acids.

Succinic Acid or Butane-1,4-Dioic Acid :

It was first obtained by the distillation of yellow fossil, resin, amber and hence its name (Latin, *Succinum* = amber).

It is also formed in small amount during the fermentation of sugar.

(1) **Methods of Preparation**

(i) **From ethylene**

(ii) **From maleic acid [catalytic reduction]**

□ This is an industrial method.

(iii) **Reduction of tartaric acid or malic acid**(2) **Physical properties**

(i) It is a white crystalline solid. It melts at 188°C

(ii) It is less soluble in water. It is comparatively more soluble in alcohol.

(3) **Chemical Properties** : Succinic acid gives the usual reactions of dicarboxylic acid, some important reactions are :

(i) **Action of heat** : At 300°C (ii) **With ammonia**(iii) **Reaction with Br₂**(iv) **Reaction with ethylene glycol**

When sodium or potassium salt in aqueous solution is electrolysed, ethylene is obtained at anode.

(4) **Uses** : It finds use in volumetric analysis, medicine and in the manufacture of dyes, perfumes and polyester resins.

Adipic Acid or Hexane-1,6 –Dioic Acid

It was first obtained by the oxidation of fats (Latin, adeps = fat.)

(i) **Methods of Preparation**(i) **From benzene (In industries)**

Cyclohexanone

□ It is an industrial method.

(ii) **From tetrahydrofuran (THF)**(2) **Physical Properties**

(i) It is a white crystalline solid. Its melting point is 150°C .

(ii) It is fairly soluble in alcohol and ether but less soluble in water.

(3) **Chemical Properties**

It shows all the general reaction of dicarboxylic acids.

(i) **Action of heat**(ii) **Formation of Nylon-66 [Reaction with hexa methylene diamine]**

(4) **Uses** : It is used in the manufacture of several polymers.

Unsaturated Acids : When the double bond presents in the carbon chain of an acid is called unsaturated acid.

**Acrylic Acid or Prop-2-Enoic Acid**(1) **Methods of Preparation**

(i) From allyl alcohol

(ii) By oxidation of acrolein

(iii) From propionic acid: $\text{CH}_3\text{CH}_2\text{COOH} \xrightarrow[\text{HVZ reaction}]{\text{Br}_2/\text{P}}$ (iv) By heating β -hydroxy propionic acid

(v) From vinyl cyanide

(vi) From ethylene cyanohydrin

Industrial method : This is a new method of its manufacture.

(2) Physical Properties

- ☐ It is colourless pungent smelling liquid. Its boiling point is 141°C .
- ☐ It is miscible with water, alcohol and ether.
- ☐ It shows properties of an alkene as well as of an acid.

(3) Chemical Properties

(i) With nascent hydrogen (Na and CH_3OH)

(ii) **With halogens and halogen acids :** Markownikoff's rule is not followed.

(iii) **Oxidation :** In presence of dilute alkaline KMnO_4 .

☐ On vigorous oxidation, oxalic acid is formed.

(iv) Salt formation

(v) Ester formation

(vi)

With

 PCl_5 

(4) **Uses :** Its ester are used for making plastics such as Lucite and plexiglass.

Unsaturated dicarboxylic acids

The molecular formula of the simplest unsaturated dicarboxylic acid is $\text{HOOC} \cdot \text{CH} = \text{CH} \cdot \text{COOH}$. This formula, however represents two chemical compounds, maleic acid and fumaric acid, which are geometrical isomers.

Cis-form (Maleic acid)

Trans-form (Fumaric acid)

(1) Methods of Preparation of Maleic Acid

(i) By catalytic oxidation of 2-butene or benzene

(ii) From malic acid :

(2) Methods of Preparation of Fumaric Acid

(i) From maleic acid :

(ii) By oxidation of furfural with sodium chlorate

(iii) By heating malic acid at about 150°C for long time

$$\begin{array}{c} \text{CH}_2\text{COOH} \\ | \\ \text{CH}_2(\text{Br})\text{COOH} \end{array} \xrightarrow{\text{Alc. KOH}} \begin{array}{c} \text{HOOC}-\text{C}-\text{H} \\ || \\ \text{H}-\text{C}-\text{COOH} \end{array} + \text{KBr} + \text{H}_2\text{O}$$
$$\begin{array}{ccccc}
 \begin{array}{c} \text{COOH} \\ | \\ \text{H}-\text{C}-\text{OH} \\ | \\ \text{HO}-\text{C}-\text{H} \\ | \\ \text{COOH} \\ \text{Tartaric acid} \\ \text{(Racemic mixture)} \end{array} & \xleftarrow[\text{(Syn-addition)}]{\text{Alk. KMnO}_4} & \begin{array}{c} \text{H}-\text{C}-\text{COOH} \\ || \\ \text{HOOC}-\text{C}-\text{H} \\ \text{Fumaric acid (Trans)} \end{array} & \xrightarrow[\text{(anti-addition)}]{\text{Br}_2, \text{water}} & \begin{array}{c} \text{COOH} \\ | \\ \text{H}-\text{C}-\text{Br} \\ | \\ \text{H}-\text{C}-\text{Br} \\ | \\ \text{COOH} \\ \text{(Meso)} \end{array}
 \end{array}$$

(c) *Enzyme hydrolysis* : Enzyme like lipase, when added to an emulsion of fat in water, hydrolyses it into acid and glycerol in about two or three days.

(ii) **Hydrogenation** : In the presence of finely divided nickel, at low pressure the hydrogenation process is called hardening of oils.

(iv) **Drying** : Certain oils, containing glycerides of unsaturated fatty acids having two or three double bonds have the tendency of slowly absorbing oxygen from atmosphere and undergoing polymerisation to form hard transparent coating. This process is known as drying and such oils are called drying oils. Unsaturated oils such as linseed oil are, therefore, used as medium of paints and varnishes.

(v) **Rancidification** : On long storage in contact with air and moisture, oils and fats develop unpleasant smell. The process is known as rancidification. It is believed that rancidification occurs due to hydrolysis-oxidation.

(4) Analysis of oils and fats

(i) **Acid value** : It indicates the amount of free acid present in the oil or fat. It is defined as the number of milligrams of KOH required to neutralize the free acid present in one gram of the oil or fat. It is determined by dissolving a weighed amount of oil or fat in alcohol and

titrating it against a standard solution of KOH using phenolphthalein as an indicator.

(ii) **Saponification value** : It is a measure of fatty acids present as esters in oils and fats. It is defined as the number of milligrams of KOH required to saponify one gram of the oil or fat or number of milligrams of KOH required to neutralize the free acids resulting from the hydrolysis of one gram of an oil or fat. It is determined by refluxing a Saponification number of fat or oil

$$= \frac{168,000}{M}, \quad \text{Where } M = \text{molecular mass}$$

(iii) **Iodine value** : Iodine value of a fat or oil is a measure of its degree of unsaturation. It is defined as the number of grams of iodine taken up by 100 grams of fat or oil for saturation. For a saturated acid glyceride, the iodine value is zero. Thus, the iodine value for a fat is low whereas for oil, it is high. As iodine does not react readily, in actual practice, iodine monochloride is used. Iodine monochloride is known as Wij's reagent.

(iv) **Reichert-Meissl value, (R/M value)** : It indicates the amount of steam volatile fatty acids present in the oil or fat. It is defined as the number of millilitres of 0.1 N KOH solution required to neutralize the distillate of 5 grams of hydrolysed fat. It is determined by hydrolysing a known weighed amount (5 grams) of the fat with alkali solution and the mixture is acidified with dilute sulphuric acid and steam distilled. The distillate is cooled, filtered and titrated against 0.1 N KOH.

(5) Uses

- (i) Many oils and fats are used as food material.
- (ii) Oils and fats are used for the manufacture of glycerol, fatty acids, soaps, candles, vegetable ghee, margarine, hair oils, etc.
- (iii) Oils like linseed oil, tung oil, etc., are used for the manufacture of paints, varnish, etc.
- (iv) Castor oil is used as purgative and codliver oil as a source of vitamins A and D. Almond oil is used in pharmacy. Olive oil is also used as medicine.
- (v) Oils are also used as lubricants and illuminants.

Table : 28.4 Difference between vegetable oils and Mineral oils

Property	Vegetable oils	Minerals oils
1. Composition	These are triesters of glycerol with higher fatty acids.	These are hydrocarbons (saturated). Kerosene oil-Alkanes from C_8 to C_{16} .
2. Source	Seeds root and fruits of plants.	These occur inside earth in the form of petroleum.
3. Hydrolysis	Undergo hydrolysis with alkali. Form soap and glycerol.	No hydrolysis occurs.
4. On adding NaOH and phenolphthalein	Decolourisation of pink colour occurs.	No effect.
5. Burning	Burns slowly	Burn very readily.
6. Hydrogenation	Hydrogenation occurs in presence of nickel catalyst. Solid glycerides (fats) are formed.	No hydrogenation occurs.

(6) **Soaps** : Soaps are the metallic salts of higher fatty acids such as palmitic, stearic, oleic, etc. The sodium and potassium salts are the common soaps which are soluble in water and used for cleansing purposes. Soaps of other metals such as calcium, magnesium, zinc, chromium, lead, etc., are insoluble in water. These are not used for cleansing purposes but for other purposes (lubricants, driers, adhesives, etc.)

Ordinary soaps (sodium and potassium) are the products of hydrolysis of oils and fats with sodium hydroxide or potassium hydroxide.

The oils and fats are mixed glycerides and thus soaps are mixtures of salts of saturated and unsaturated long chain carboxylic acids containing 12 to 18 carbon atoms. This process always yields glycerol as a byproduct.

For example,

Lactic Acid or α -hydroxy propionic acid or 2-hydroxy propanoic acid

It is the main constituent of sour milk. It is manufactured by fermentation of molasses by the micro-organism (*Bacterium acidilactici*-sour milk) in presence of CaCO_3 .

(1) Method of Preparation

From acetaldehyde :

(2) Physical Properties

It is a colourless syrupy liquid having a sour taste and smell.

It is hygroscopic and very soluble in water. It is optically active and exists in three distinct forms.

(3) Chemical Properties : It gives reactions of secondary alcoholic group and a carboxylic group.

Tartaric Acid. Or α, α' -Dihydroxy succinic acid or 2,3-Dihydroxy-Butane-1,4-Dioic acid

It is found as free or potassium salt in grapes, tamarind, and berries.

(1) Methods of Preparation

(i) **Argol** which separates as a crust during fermentation of grape juice is impure potassium hydrogen tartrate. Argol is boiled with limewater. Calcium tartrate is precipitated which is filtered. The solution contains

(3) Chemical Properties

potassium tartrate which is also precipitated by addition of CaCl_2 . The calcium salt is then decomposed with calculated quantity of dilute H_2SO_4 . The precipitate (CaSO_4) is filtered and the filtrate on concentration gives the crystals of tartaric acid.

(ii) Synthetic method

(iii) From glyoxal cyanohydrin :

(2) **Physical Properties** : It is a colourless crystalline compound. It is soluble in water and alcohol but insoluble in ether. It contains two asymmetric carbon atoms and thus shows optical isomerism (four forms). Natural tartaric acid is the dextro variety. It contains two secondary alcoholic groups and two carboxylic groups.

Optical Isomerism in tartaric acid

Optical active

- (i) **d** + Tartaric acid-Dextro-rotatory
- (ii) **l** - Tartaric acid-Levorotatory
- (iii) Meso tartaric acid-optically inactive due to internal compensation.

The image displays six chemical structures of aromatic carboxylic acids, each consisting of a benzene ring with a carboxyl group (COOH) and other substituents. The structures are arranged in two rows of three.

- Benzoic acid:** A benzene ring with a COOH group at the top position (1).
- O-toluic acid:** A benzene ring with a COOH group at the top position (1) and a CH_3 group at the ortho position (2).
- Phthalic acid:** A benzene ring with COOH groups at the top (1) and ortho (2) positions.
- Salicylic acid:** A benzene ring with a COOH group at the top position (1) and a hydroxyl group (OH) at the ortho position (2).
- Anthranilic acid:** A benzene ring with COOH and NH_2 groups at the top (1) and ortho (2) positions.
- m-Nitro benzoic acid:** A benzene ring with a COOH group at the top position (1) and a nitro group (NO_2) at the meta position (3).

Aromatic acid containing $-COOH$ group in the side chain, they are considered as aryl substituted aliphatic acid.

Examples

Benzoic Acid Phenyl acetic acid

Cinnamic acid

(1) Methods of Preparation

(i) From oxidation of Benzyl alcohol [Laboratory method]

(ii) From hydrolysis of nitriles or cyanides

(iii) From Grignard reagent

(v) From trihalogen derivatives of hydrocarbons

(vi) From benzene

(vii) From Toluene

Chromic trioxide in glacial acetic acid or Co-Mn acetate can also be taken in place of alkaline $KMnO_4$.

(viii) From o-xylene [Industrial method]

(ix) From naphthalene [Industrial method]

(2) Physical Properties

- It is a white crystalline solid.
- It has m.p. 394 K.
- It is sparingly soluble in cold water but fairly soluble in hot water, alcohol and ether.
- It has a faint aromatic odour and readily sublimes and is volatile in steam.

(3) **Acidity of Aromatic Carboxylic Acid** : Aromatic acid dissociates to give a carboxylate anion and proton.

Since the carboxylate anion ($ArCOO^-$) is resonance stabilised to a greater extent than the carboxylic acid ($ArCOOH$).

Effect of Substituents on Acidity : The overall influence of a substituent on acidity of substituted benzoic acids is due to two factors.

(i) **Inductive effect** : If the substituent exerts $-I$ effect, it increases the acidity of carboxylic acids, while if it exerts $+I$ effect it decreases the acidity. Inductive effect affects all positions, i.e., o -, m - and p -.

(ii) **Resonance effect** : Like inductive effect, if the resonance producing group exerts minus effect i.e., if it withdraws electrons, it increases the strength of the benzoic acid. Similarly, if the group causes $+R$ effect it decreases the acidity of benzoic acid. However, remember that resonance effect affects only o - and p - positions. Thus if resonance producing group is present in the m -position it will not exert its effect.

In case resonance and inductive effects both operate in the molecule, resonance effect being stronger overpowers the inductive effect.

Thus on the above basis, the following order of acidity can be explained.

Similarly :

Acidity is only due to electron withdrawing inductive effect of the $-NO_2$ group (resonance does not affect the m -position) while in the p -isomer acidity is due to electron withdrawing inductive as well as resonance effect.

The acidity of the three isomers of hydroxybenzoic acids follows the following order.

Resonance effect cannot operate and hence only the acid-strengthening $-I$ effect takes part with the result m -hydroxybenzoic acid is stronger acid than benzoic acid. Like other substituted benzoic acid.

Acidic character among benzoic acids having different electron releasing group.

(4) Chemical Properties :

(i) Reactions of carboxylic group

(ii) Reactions of aromatic ring

(i) Reactions of Carboxylic Group

(a) Reaction with metals

(b) Reaction with Alkalies Or NaHCO_3 Or Na_2CO_3 :

(c) Formation of Esters :

Aromatic acid (benzoic acid) having no group in its ortho positions can be readily esterified with alcohol in presence of a mineral acid.

The esterification of the various benzoic acids :

The substituted phenylacetic acid is easily esterified because $-COOH$ group is separated from benzene ring by $-CH_2-$ part.

The *ortho*-substituted benzoic acids can be easily esterified by treating the silver salt of the acid with alkyl halides, i.e.,

This is due to the fact that in such cases the attack of the alkyl group of the alkyl halides is on the oxygen atom of the $-COOH$ group but not on the sterically hindered carbon atom.

(d) Formation of acid chloride

(e) Reaction with NH_3 [Schmidt reaction] Benzoyl Chloride

(f) Reaction with sodalime

(g) Reaction with anhydride

(h) Reduction

(i) Decarboxylation

(j) Hunsdiecker reaction :

(ii) Reactions of Aromatic Ring

(a) Nitration

(b) Sulphonation

(c) Chlorination

(d) Reduction

(5) Uses : Benzoic acid is used,

(i) in medicine in the form of its salts especially as urinary antiseptic.

(ii) As sodium benzoate for preservation of food such as fruit juices, tomato ketchup, pickles etc.

(iii) In the preparation of aniline blue.

(iv) In treatment of skin diseases like eczema.

(6) General Tests

(i) Benzoic acid dissolves in hot water but separates out in the form of white shining flakes on cooling.

(ii) It evolves CO_2 with sodium bicarbonate, i.e., it gives effervescence with sodium carbonate.

(iii) Neutral ferric chloride gives a buff coloured precipitate.

(iv) When warmed with ethyl alcohol and a little conc. H_2SO_4 a fragrant odour of ethyl benzoate is obtained.

(v) When heated strongly with soda lime, benzene vapours are evolved which are inflammable.

Cinnamic Acid [β -Phenyl acrylic acid]

(1) Methods of preparation

(i) By Perkin's reaction

(ii) By Claisen condensation

(iii) By Knoevenagel reaction

(iv) Industrial method

(2) Physical Properties

(i) It is a white crystalline solid and its melting point 133°C .

(ii) It is sparingly soluble in water.

(iii) It exhibits geometrical isomerism.

Cinnamic acid (stable form) occurs in nature both free and as esters in balsams and resins.

(3) Chemical properties

Salicylic acid [O-Hydroxy benzoic acid];

Salicylic acid is present in many essential oils in the form of esters. Oil of winter green is a methyl ester of salicylic acid.

(1) Methods of preparation

(i) Kolbe Schmidt reaction

It is a commercial method. The reaction yields *o*- and *p*-isomers. Salicylic acid is more volatile and separated by steam distillation.

(ii) Reimer-Tiemann reaction

(iii) From benzene derivatives

(2) Physical properties

- (i) It is a colourless needle shaped crystalline compound.
- (ii) Its *m.p.* is 156°C .
- (iii) It is sparingly soluble in cold water but readily soluble in hot water, alcohol, ether and chloroform.
- (iv) It is steam volatile.
- (v) It is poisonous in nature. However, its derivative used in medicine internally and externally as antipyretic and antiseptic.

(3) Chemical properties**(i) Reaction with Na_2CO_3 , NaHCO_3 or NaOH** **(ii) Reaction with alcohols or phenols**

Methyl salicylate is an oily liquid (*oil of winter green*) with pleasant material. It is also used in medicine in the treatment of rheumatic pain and as a remedy for aches, sprains and bruises. It is used in perfumery and as a flavouring. It is used for making of iodex.

Salol is a white solid *m.pt.* 43°C . It is a good internal antiseptic. It is used in making of toothpastes. Salol absorbs ultraviolet light and its main use now is sun-screening agent and stabiliser of plastics.

(iii) Decarboxylation**(iv) Acetylation**

Aspirin is a white solid, melting point 135°C . It is used as antipyretic and pain killer (analgesic action).

(v) Reaction with ferric chloride solution**(vi) Reaction with PCl_5** **(vii) Bromination****(viii) Nitration**

There are three isomer (ortho, meta, para) of benzene dicarboxylic acid.

**(I) Methods of preparation****(i) By the oxidation of *o*-xylene :**

(ii) From naphthalene (Industrial method) : It is known as aerial oxidation.

**(2) Physical properties**

- (i) It is colourless crystalline compound.
- (ii) Its melting point is not sharp ($195\text{--}213^{\circ}\text{C}$).
- (iii) It is sparingly soluble in cold water but soluble in hot water, alcohol, ether, benzene etc.

(3) Chemical properties

• The important derivatives are given below :

Group replacing – OH	Name	Structure
(X = F, Cl, Br, I)	Acyl halide	$\begin{array}{c} \text{O} \\ \parallel \\ \text{R} - \text{C} - \text{X} \end{array}$
–NH ₂	Amide	$\begin{array}{c} \text{O} \\ \parallel \\ \text{R} - \text{C} - \text{NH}_2 \end{array}$
–OR'	ester	$\begin{array}{c} \text{O} \\ \parallel \\ \text{R} - \text{C} - \text{OR}' \\ \text{(R' may be R)} \end{array}$
–OOCR	anhydride	$\begin{array}{c} \text{O} \qquad \text{O} \\ \parallel \qquad \parallel \\ \text{R} - \text{C} - \text{O} - \text{C} - \text{R} \end{array}$

Reactivity

Acyl derivatives are characterised by nucleophilic substitution reactions.

The relative reactivities of various acyl compounds have been found to be in the following order:

Out of acid halides, the acid chlorides are more important ones.

The overall order of reactivity can be accounted for in terms of the following three factors:

(i) Basicity of the leaving group (ii) Resonance effects and (iii) Inductive effects.

(i) **Basicity of the leaving group** : Weaker bases are good leaving groups. Hence, the acyl derivatives with weaker bases as leaving groups are more reactive. Chloride ion is the weakest base while –NH₂ is the strongest base. Thus, acyl chlorides are most reactive and amides are least reactive.

(ii) **Resonance effect** : The leaving group in each case has an atom with lone pair of electrons adjacent to the carbonyl group. The compound exists, therefore, as a resonance hybrid.

This makes the molecule more stable. The greater the stabilization, the smaller is the reactivity of the acyl compound.

However, acyl chlorides are least affected by resonance. Due to lower stabilization, the acid chlorides are more reactive as the loss of –Cl is easier. Greater stabilization is achieved by resonance in esters and amides and thus, they are less reactive.

(4) **Uses** : It is used in the manufacture of plastics, dyes and other compounds such as phthalic anhydride, phthalimide, anthraquinone and fluorescein etc.

Acid derivatives

The compounds which are obtained by replacing the –OH of the carboxylic group by other atoms or groups such as X[–], –NH₂, –OR and O – C(=O) – R are known as acid derivatives.

- R – C(=O) – group is common to all the derivatives and is known as

acyl group and these derivatives are termed as acyl compound.

(iii) **Inductive effect** : Higher the $-I$ effect, more reactive is the acyl compound. Inductive effect of oxygen in ester is greater than nitrogen in amide, hence ester is more reactive than an amide.

where R may be alkyl or aryl group.

(1) **Methods of Preparation**

(i) **From carboxylic acid** :

$$RCOOH + PCl_5 \rightarrow RCOCl + POCl_3 + HCl$$

(ii) **Industrial method** : By distilling anhydrous sodium acetate

(iii) **With thionyl chloride** :

This is the best method because SO_2 and HCl are gases and easily escape leaving behind acyl chloride.

(2) **Physical properties** : The lower acyl chloride are mobile, colourless liquid while the higher members are coloured solids.

Acyl chloride have very pungent, irritating order and are strong lachrymators (tears gases)

They fume in air due to the formation of hydrochloric acid by hydrolysis.

They are readily soluble in most of the organic solvent. Acyl chloride don't form intermolecular hydrogen bonding. Therefore, their boiling points are lower than those of their parent acids.

(3) **Chemical properties**

(i) **Hydrolysis** : $CH_3COCl + HOH \rightarrow CH_3COOH + HCl$

Acetyl chloride Acetic acid

(ii) **Reaction with alcohols (alcoholysis)**

This reaction is called **Schotten Baumann reaction**.

(iii) **Reaction with salts of carboxylic acid**

(iv) **Reaction with benzene (acylation)** : This reaction is called friedel craft reaction.

(v) **Reaction with ammonia or amines** :

However, acyl chlorides react with amines to form substituted amides.

(vi) **Reduction** :

This reaction is called **Rosenmund reaction**.

(vii) **Reaction with organocadmium compounds (formation of ketones)**

(viii) **Reaction with diazomethane**

(ix) **Reaction with water**

(x) **Reaction with chlorine**

(xi) **Reaction with Grignard reagent**

(xii) **Reaction with KCN**(xiii) **Reaction with Salicylic acid**(xiv) **Reaction with ether**(xv) **Reaction with sodium peroxide (Peroxide formation)**(xvi) **Reaction with hydroxylamine and hydrazine**(4) **Uses**

(i) As an acetylating agent.

(ii) In the estimation and determination of number of hydroxyl and amino groups.

(iii) In the preparation of acetaldehyde, acetic anhydride, acetamide, acetanilide, aspirin, acetophenone etc.

where, $\text{R} = -\text{CH}_3, -\text{CH}_2\text{CH}_3, -\text{C}_6\text{H}_5$ (1) **Methods of preparation**(i) **Ammonolysis of acid derivatives**(ii) **From ammonium salts of carboxylic acids (Laboratory Method)**

Ammonium acetate is always heated in presence of glacial acetic acid to avoid the side product (CH_3COOH).

(iii) **By partial hydrolysis of alkyl cyanide :**(iv) **By heating carboxylic acid and urea**(2) **Physical properties**(i) **Physical state :** Formamide is a liquid while all other amides are solids.(ii) **Boiling points :** Amides have high boiling points than the corresponding acids.

Acetamide	Boiling points 494 K
Acetic Acid	Boiling points 391 K
Benzamide	Boiling points 563 K
Benzoic acid	Boiling points 522 K

The higher boiling points of amides is because of intermolecular hydrogen bonding

(iii) **Solubility :** The lower members of amide family are soluble in water due to the formation of hydrogen bonds with water.(3) **Chemical properties**

(i)

Hydrolysis(ii) **Amphoteric nature (Salt formation)**

It shows feebly acidic as well as basic nature.

(iii)

Reduction

(iv)

Dehydration(v) **Reaction with nitrous acid**

(vi) **Hofmann bromamide reaction or Hofmann degradation** : This is an important reaction for reducing a carbon atom from a compound, i.e., $-\text{CONH}_2$ is changed to $-\text{NH}_2$ group.

This reaction occurs in three steps:

□ In this reaction a number of intermediates have been isolated; *N*-bromamides, RCONHBr ; salts of these bromamides $[\text{RCONBr}^-] \text{K}^+$; Isocyanates, RNCO .

□ Nitrene rearranges to form isocyanate.

(vii) **Action with alcohol** :

(viii) **Reaction with grignard reagent**

(4) **Uses**

(i) In organic synthesis. The compounds like methyl cyanide, Methylamine and ethylamine can be prepared.

(ii) In leather tanning and paper industry.

(iii) As a wetting agent and as soldering flux.

Amides such as dimethyl formamide (DMF), dimethyl acetamide (DMA) are used as solvents for organic and inorganic compounds.

These are the most important class of acid derivatives and are widely distributed in nature in plants, fruits and flowers.

(1) **Methods of preparation**

(i) **From carboxylic acid [Esterification]** : Laboratory method.

□ With diazomethane is the best method.

(ii) **From acid chloride or acid anhydrides**

(iii) **From alkyl halide** :

(iv) **From ether** :

(v) **From Tischenko reaction** :

(2) **Physical properties**

(i) **Physical state and smell** : Esters are colourless liquids (or solids) with characteristic fruity smell. Flavours of some of the esters are listed below :

Ester	Flavour	Ester	Flavour
Amyl acetate	Banana	Isobutyl formate	Raspberry
Benzyl acetate	Jasmine	Ethyl butyrate	Pineapple
Amyl butyrate	Apricot	Octyl acetate	Orange

(ii) **Solubility** : They are sparingly soluble in water but readily soluble in organic solvents such as alcohol, ether etc.

(iii) **Boiling points** : Their boiling points are lower than the corresponding acids because of the absence of hydrogen bonding. i.e., ethyl acetate = 77.5°C.

(3) **Chemical properties**

(i) **Hydrolysis** :

Hydrolysis of ester by alkalies (NaOH) is known as saponification and leads to the formation of soaps

□ This reaction (saponification) is irreversible because a resonance stabilized carboxylate (acetate) ion is formed.

□ The acid hydrolysis of esters is reversible.

(ii) **Reaction with ammonia (ammonolysis)** :

(iii) **Reduction**

Reduction in presence of $\text{Na/C}_2\text{H}_5\text{OH}$ is known as Bouveault Blanc reduction.

The catalytic hydrogenation of ester is not easy and requires high temperature and pressure. The catalyst most commonly used is a mixture of oxides known as copper chromate ($\text{CuO.CuCr}_2\text{O}_4$).

(iv) **Reaction with PCl_5 or SOCl_2**

(v) **Reaction with alcohols**: On refluxing ester undergoes exchange of alcohols residues.

This reaction is known as alcoholysis or trans esterification.

(vi) **Reaction with Grignard reagents**

(vii) **Claisen condensation**

(viii) **Reaction with hydroxyl amine**

(ix) **Reaction with hydrazine**

(x) **Halogenation**

(xi) **Reaction with HI**

(4) **Uses**

(i) As a solvent for oils, fats, cellulose, resins etc.

(ii) In making artificial flavours and essences.

(iii) In the preparation of ethyl acetoacetate.

(5) **General Tests**

(i) It has sweet smell

(ii) It is neutral towards litmus

(iii) A pink colour is developed when one or two drops of phenolphthalein are added to dilute sodium hydroxide solution. The pink colour is discharged when shaken or warmed with ethyl acetate.

(iv) Ethyl acetate on hydrolysis with caustic soda solution forms two compounds, sodium acetate and ethyl alcohol.

(i) **Method of preparation**

(i) **From carboxylic acid**

(ii) **From carboxylic acid salt and acyl chloride [Laboratory method]**

(iii) **From acetylene**

(iv) **From acetaldehyde :**(2) **Physical properties**

(i) **Physical state :** Lower aliphatic anhydrides are colourless liquids with sharp irritating smell. The higher members of the family as well as the aromatic acid anhydrides are solids in nature.

(ii) **Solubility :** They are generally insoluble in water but are soluble in the organic solvents such as ether, acetone, alcohol, etc.

(iii) **Boiling points :** The boiling points of acid anhydrides are higher than those of carboxylic acids because of the greater molecular size.

(3) **Chemical Properties**(i) **Hydrolysis :**(ii) **Action with ammonia**

(iii) **Acetylation :** Acetic anhydride react with compound having active hydrogen.

(iv) **Action of dry HCl**(v) **Reaction with chlorine**(vi) **Reaction with PCl₅**(vii) **Friedel craft's reaction**(viii) **Reaction with acetaldehyde**(ix) **Reduction**(x) **Action with ether :**(xi) **Action with N₂O**(4) **Uses :** Acetic anhydride is used

(i) as an acetylating agent.

(ii) For the detection and estimation of hydroxyl and amino group.

(iii) in the manufacture of cellulose acetate, aspirin, phenacetin, acetamide, acetophenone, etc.

Urea may be considered as diamide of an unstable and dibasic carbonic acid from which both the hydroxyl groups have been replaced by $-\text{NH}_2$ groups.

First time isolated from urine in 1773 by Roule and hence the name urea was given.

It was the first organic compound synthesised in the laboratory from inorganic material (by heating a mixture of ammonium sulphate and potassium cyanate) by Wohler in 1828.

This preparation gave a death blow to Vital force theory.

It is the final decomposition product of protein's metabolism in man and mammals and is excreted along with urine.

Adults excrete about 30 grams of urea per day in the urine.

(i) **Method of preparation**

(i) **From urine :** Urine is treated with conc. nitric acid where crystals of urea nitrate $\text{CO}(\text{NH}_2)_2 \cdot \text{HNO}_3$ are obtained.

(ii) **Laboratory preparation**

(a) Wohler synthesis

□ The solid residue is extracted with alcohol and the extract evaporated when the crystals of urea are obtained. It can be recrystallised from water.

(b) From phosgene or alkyl carbonate

(iii) Industrial method

(a) By partial hydrolysis of calcium cyanide

The cyanamide is treated with dilute sulphuric acid at 40°C where partial hydrolysis occurs with the formation of urea.

or

(b) From carbon dioxide and ammonia

(2) **Physical properties** : Urea is a colourless, odourless crystalline solid. It melts at 132°C . It is very soluble in water, less soluble in alcohol but insoluble in ether, chloroform and benzene.

Crystal structure: In solid urea, both nitrogen atoms are identical.

This indicates that C–N bond in urea has some double bond character.

(3) Chemical Properties

(i) **Basic nature (Salt formation)**: It behaves as a weak monoacid base ($K_b = 1.5 \times 10^{-14}$). It forms salt with strong acid.

Urea is a stronger base than ordinary amide. It is due to the resonance stabilization of cation, the negatively charged oxygen atom is capable of coordination with one proton.

□ An aqueous solution of urea is neutral.

(ii) Hydrolysis

An enzyme, urease, present in soyabean and soil also brings hydrolysis.

(iii) Action of heat

Urea is identified by the test known as biuret test. The biuret residue is dissolved in water and made alkaline with a few drops of NaOH . When a drop of copper sulphate solution is added to the alkaline solution of biuret, a violet colouration is produced.

when heated rapidly at 170°C , polymerisation takes place:

(iv) Reaction with nitrous acid

(v) **Reaction with alkaline hypohalides**(vi) **Reaction with acetyl chloride or acetic anhydrides**(vii) **Reaction with hydrazine**(viii) **Reaction with ethanol**(ix) **Reaction with chlorine water**(x) **Dehydration**(xi) **Reaction with fuming sulphuric acid**(xii) **Formation of cyclic ureides**(xiii) **Reaction with formaldehyde**(4) **Uses**

(i) Mainly as a nitrogen fertilizer. It has 46.4% nitrogen.

(ii) In the manufacture of formaldehyde-urea plastic and semicarbazide.

(iii) As animal feed.

(iv) For making barbiturates and other drugs.

(v) As a stabilizer for nitrocellulose explosives.

(5) **General Tests**

(i) When heated with sodium hydroxide, ammonia is evolved.

(ii) When heated gently, it forms biuret which gives violet colouration with sodium hydroxide and a drop of copper sulphate solution.

(iii) Its aqueous solution with concentrated nitric acid gives a white precipitate.

(iv) On adding sodium nitrite solution and dil. HCl (i.e., HNO_2) to urea solution, nitrogen gas is evolved and gives effervescence due to carbon dioxide.

Tips & Tricks

✍ Oxidation of 1° alcohols and aldehyde cannot be carried out with alkaline $\text{K}_2\text{Cr}_2\text{O}_7$ since under these condition K_2CrO_4 is formed which does not act as an oxidising agent.

✍ During oxidation of alkyl benzenes with alkaline KMnO_4 or acidified $\text{K}_2\text{Cr}_2\text{O}_7$, the COOH group irrespective of its length. The ease of oxidation of alkyl benzenes follows the order.

Toluene > Ethyl benzene > Isopropyl benzene.

Tert butyl benzene however does not undergo oxidation to give benzoic acid since it does not have any benzylic H-atom.

✍ Carboxylic acids are stronger acids than phenols since carboxylate ion is better stabilized by resonance than phenoxide ion.

✍ The melting points of carboxylic acids show oscillation or alternation effect, i.e. melting point of an acid containing even number of carbon atom is higher than the next lower or higher homologue containing odd number of carbon atom, due to greater symmetry and close packing of molecules in the crystal lattice.

✍ Carboxylic acid do not give the characteristic reaction of the carbonyl group. The reason being that due to resonance, the double

bond character of the $C=O$ bond in carboxylic acid is greatly reduced as compared to that in aldehyde and ketone.

✍ The boiling point of acid derivatives follow the order.

✍ The boiling point of acid chloride and ester are lower than those of their parent acid due to absence of H -bonding in their molecule.

✍ The boiling points of acid anhydrides are higher than those of the acids from which they are derived because of stronger Vander Waal's forces of attraction owing to the larger size of their molecules.

✍ The melting points and boiling points of acid amide are much higher than those of the acids from which they are derived due to strong intermolecular H -bonding even though their molecular masses are almost identical.

✍ Aromatic acid chlorides are less reactive than aliphatic acid chlorides primarily due to greater electron donating effect of the benzene ring over alkyl group which tends to reduce the electron deficiency of aromatic acyl carbon.

✍ Phthalimide and succinimide on treatment with Br_2-KOH undergo Hofmann bromamide reaction to form anthranilic acid and β -aminopropionic acid respectively.

✍ Urea acts as a monoacidic base.

✍ Malonic acid on heating with P_2O_5 gives carbon suboxide (C_3O_2).

✍ Tamarind contain tartaric acid which does not exist in nature.

✍ Baking powder is a mixture of sodium bicarbonate and cream of tartar *i.e.* acid potassium hydrogen sulphate.

✍ Smell of ammonia in public urinals is due to hydrolysis of urea present in urine by the enzyme urease present in atmosphere.

✍ Tartar emetic (*i.e.* potassium antimony $D(+)$ tartrate is used to cause nausea and vomiting during treatment of poisoning.

✍ Magnesium citrate is used as an antacid.

✍ Succinic acid was prepared by the distillation of amber.

✍ Malic acid is found in apples, grapes etc.

Ordinary Thinking

Objective Questions

General Introduction of Carboxylic Acids and Their Derivatives

- Identify the wrong statement from the following [Tamil Nadu CET 2002]
 - Salicylic acid's a monobasic acid
 - Methyl salicylate is an ester
 - Salicylic acid gives violet colour with neutral ferric chloride as well as brisk effervescence with sodium bicarbonate
 - Methyl salicylate does not occur in natural oils
- Which of the following is optically active [BHU 1997]
 - Ethylene glycol
 - Oxalic acid
 - Glycerol
 - Tartaric acid
- Palmitic acid is [BHU 1997]
 - $C_{16}H_{31}COOH$
 - $C_{17}H_{35}COOH$
 - $C_{15}H_{31}COOH$
 - $C_{17}H_{31}COOH$
- Which one among the following represents an amide [MP PMT 1993]
 - 
 - 
 - 
 - 
- The name of the compound having the structure $ClCH_2CH_2COOH$ is [MP PET 1993]
 - 3-chloropropanoic acid
 - 2-chloropropanoic acid
 - 2-chloroethanoic acid
 - Chlorosuccinic acid
- Fats and oils are mixture of [CPMT 1993]
 - Glycerides and saturated fatty acids
 - Glycerides and unsaturated fatty acids
 - Glycerides of saturated and unsaturated fatty acids
 - Only saturated and unsaturated fatty acids
- Which one is not a glyceride [CPMT 1994]
 - Fat
 - Oil
 - Phospholipid
 - Soaps
- $(RCO)_2NH$ is
 - Primary amine
 - Secondary amine
 - Secondary amide
 - Tertiary amide
- Which of the following is the formula of tartaremetic [Manipal MEE 1995]
 - $\begin{array}{c} CH(OH)COOH \\ | \\ CH(OH)COOK \end{array}$
 - $\begin{array}{c} CH(OH)COONa \\ | \\ CH(OH)COO(SbO) \end{array}$
 - $\begin{array}{c} CH(OH)COOK \\ | \\ CH(OH)COOK \end{array}$
 - $\begin{array}{c} CH(OH)COOK \\ | \\ CH(OH)COONa \end{array}$
- Which compound is known as oil of winter green [MP PET/PMT 1998; CPMT 2002]
 - Phenyl benzoate
 - Phenyl salicylate
 - Phenyl acetate
 - Methyl salicylate
- Which of the following structure of carboxylic acid accounts for the acidic nature [JIPMER 1997]

(d) None of these

- Acetoacetic ester behaves as [CPMT 1988]
 - An unsaturated hydroxy compound
 - A keto compound
 - Both of these ways
 - None of these
- The general formula $(RCO)_2O$ represents [CPMT 1974; DPMT 1982; MP PMT 1996]
 - An ester
 - A ketone
 - An ether
 - An acid anhydride
- A tribasic acid is
 - Oxalic acid
 - Tartaric acid
 - Lactic acid
 - Citric acid
- Amphiphilic molecules are normally associated with [Orissa JEE 1997]
 - Isoprene based polymers
 - Soaps and detergents
 - Nitrogen based fertilizers e.g. urea
 - Pain relieving medicines such as aspirin
- Wax are long chain compounds belonging to the class [CPMT 1982, 93]
 - Acids
 - Alcohols
 - Esters
 - Ethers
- Glycine may be classed as all of the following except [JIPMER 1997]
 - A base
 - An acid
 - A zwitter ion
 - Optically active acid
- Which of the following is not a fatty acid [CPMT 1988]
 - Stearic acid
 - Palmitic acid
 - Oleic acid
 - Phenyl acetic acid
- Vinegar obtained from canesugar contains [CPMT 1980; DPMT 1982; KCET 1992; MP PMT 1994; AIIMS 1999]
 - Citric acid
 - Lactic acid
 - Acetic acid
 - Palmitic acid
- The general formula for monocarboxylic acids is [CPMT 2003]
 - C_nH_nCOOH
 - $C_nH_{2n+1}COOH$
 - $C_nH_{2n-1}COOH$
 - $C_nH_{2n}O_2$
- Number of oxygen atoms in a acetamide molecule is
 - 1
 - 2
 - 3
 - 4
- Urea is [CPMT 1984]
 - Monoacidic base
 - Diacidic base
 - Neutral
 - Amphoteric
- Fats and oils are [CPMT 1990]
 - Acids
 - Alcohols
 - Esters
 - Hydrocarbons
- The general formulas $C_nH_{2n}O_2$ could be for open chain [AIEEE 2003]
 - Diketones
 - Carboxylic acids
 - Diols
 - Dialdehydes
- $H - \overset{\overset{O}{\parallel}}{C} - Cl$ is called
 - Acetyl chloride
 - Formyl chloride
 - Chloretone
 - Oxochloromethane
- Urea
 - Is an amide of carbonic acid
 - It is diamide of carbonic acid
 - Gives carbonic acid on hydrolysis
 - Resembles carbonic acid

27. Which of the following acids is isomeric with phthalic acid
(a) Succinic acid (b) Salicylic acid
(c) 1, 4-benzene dicarboxylic acid (d) Methyl benzoic
28. The ester among the following is [Kerala PMT 2003]
(a) Calcium lactate (b) Ammonium acetate
(c) Sodium acetate (d) None of these
29. Sodium or potassium salts of higher fatty acids are called [MP PET 2003]
(a) Soaps (b) Terpenes
(c) Sugars (d) Alkaloids
30. Formamide is
(a) $HCONH_2$ (b) CH_3CONH_2
(c) $HCOONH_4$ (d) $(HCHO + NH_3)$
31. Oleic, stearic and palmitic acids are [CPMT 1997]
(a) Nucleic acids (b) Amino acids
(c) Fatty acids (d) None of these
32. Which one is called ethanoic acid [CPMT 1997]
(a) $HCOOH$ (b) CH_3COOH
(c) CH_3CH_2COOH (d) $CH_3CH_2CH_2COOH$
33. Vinegar is [CPMT 1997]
(a) $HCHO$ (b) $HCOOH$
(c) CH_3CHO (d) CH_3COOH
34. Which of these do not contain $-COOH$ group [CPMT 1997]
(a) Aspirin (b) Benzoic acid
(c) Picric acid (d) Salicylic acid
35. Vinegar obtained from sugarcane has [AFMC 2005]
(a) CH_3COOH (b) $HCOOH$
(c) C_6H_5COOH (d) CH_3CH_2COOH
36. Carbolic acid is [AFMC 2005]
(a) C_6H_5CHO (b) C_6H_6
(c) C_6H_5COOH (d) C_6H_5OH
37. The most acidic of the following is [J & K 2005]
(a) $ClCH_2COOH$ (b) C_6H_5COOH
(c) CD_3COOH (d) CH_3CH_2COOH
38. Which is most reactive of the following [J & K 2005]
(a) Ethyl acetate (b) Acetic anhydride
(c) Acetamide (d) Acetyl chloride
- (d) All of these
4. Tischenko reaction yields ester in the presence of catalyst which is
(a) $LiAlH_4$ (b) N -bromosuccinamide
(c) $Al(OC_2H_5)_3$ (d) $Zn - Hg / HCl$
5. Acetic acid is obtained when [NCERT 1975; CPMT 1977]
(a) Methyl alcohol is oxidised with potassium permanganate
(b) Calcium acetate is distilled in the presence of calcium formate
(c) Acetaldehyde is oxidised with potassium dichromate and sulphuric acid
(d) Glycerol is heated with sulphuric acid
6. Acetic acid is manufactured by the fermentation of [CPMT 1985]
(a) Ethanol (b) Methanol
(c) Ethanal (d) Methanal
7. $CO + NaOH \rightarrow$ [CPMT 1997; KCET 1999]
(a) $HCOONa$ (b) $C_2H_2O_4$
(c) $HCOOH$ (d) CH_3COOH
8. Carboxylic acids react with diazomethane to form [MP PMT/PET 1988; MP PMT 1990]
(a) Amine (b) Alcohol
(c) Ester (d) Amide
9. $C_2H_2 \xrightarrow[H_2SO_4]{HgOH, 1\%} A \xrightarrow{[O]} B$, B is [CBSE PMT 1991; BHU 1995]
(a) An acid (b) An aldehyde
(c) A ketone (d) Ethanol
10. Reimer-Tiemann reaction involves a [MP PET 1997]
(a) Carbonium ion intermediate
(b) Carbene intermediate
(c) Carbanion intermediate
(d) Free radical intermediate
11. The product D of the reaction
 $CH_3Cl \xrightarrow{KCN} (A) \xrightarrow{H_2O} (B) \xrightarrow{NH_3} (C) \xrightarrow{\Delta} (D)$ is [MP PET 1997]
(a) $CH_3CH_2NH_2$ (b) CH_3CN
(c) $HCONH_2$ (d) CH_3CONH_2
12. Which of the following on hydrolysis forms acetic acid [BHU 1997]
(a) CH_3CN (b) CH_3OH
(c) C_2H_5OH (d) $C_2H_5NH_2$
13. When benzyl alcohol is oxidised with $KMnO_4$, the product obtained is [SCRA 1991]
(a) Benzaldehyde (b) Benzoic acid
(c) CO_2 and H_2O (d) None of these
14. Which of the following gives benzoic acid on oxidation [CBSE PMT 1996]
(a) Chlorophenol (b) Chlorotoluene
(c) Chlorobenzene (d) Benzyl chloride
15. $(CH_3)_2CO \xrightarrow[(HCl)]{NaCN} A \xrightarrow[\Delta]{H_3O^+} B$ In the above sequence of reactions A and B are [CPMT 2000]
(a) $(CH_3)_2C(OH)CN, (CH_3)_2C(OH)COOH$
(b) $(CH_3)_2C(OH)CN, (CH_3)_2C(OH)_2$
(c) $(CH_3)_2C(OH)CN, (CH_3)_2CHCOOH$
(d) $(CH_3)_2C(OH)CN, (CH_3)_2C=O$

Preparation of Carboxylic Acids and Their Derivatives

1. Hydrolysis of $CH_3CH_2NO_2$ with 85% H_2SO_4 gives [KCET 1996]
(a) CH_3CH_2OH (b) C_2H_6
(c) $CH_3CH=NOH$ (d) CH_3COOH
2. When formic acid reacts with PCl_5 it forms [MNR 1982]
(a) Formyl chloride (b) Acetyl chloride
(c) Methyl chloride (d) Propionyl chloride
3. Laboratory method for the preparation of acetyl chloride is [RPMT 2003]
(a) $CH_3COOH + SOCl_2 \rightarrow CH_3COCl$
(b) $CH_3COOH + PCl_3 \rightarrow CH_3COCl$
(c) $CH_3COONa + PCl_3 \rightarrow CH_3COCl$

16. Two moles of acetic acid are heated with P_2O_5 . The product formed is [MP PET/PMT 1988]

(a) 2 moles of ethyl alcohol
(b) Formic anhydride
(c) Acetic anhydride
(d) 2 moles of methyl cyanide

17. Formic acid is obtained when [NCERT 1974]

(a) Calcium acetate is heated with conc. H_2SO_4
(b) Calcium formate is heated with calcium acetate
(c) Glycerol is heated with oxalic acid at $110^\circ C$
(d) Acetaldehyde is oxidised with $K_2Cr_2O_7$ and H_2SO_4

18. Acetyl chloride cannot be obtained by treating acetic acid with

(a) $CHCl_3$ (b) $SOCl_2$
(c) PCl_3 (d) PCl_5

19. *o*-xylene when oxidised in presence of V_2O_5 the product is

(a) Benzoic acid (b) Phenyl acetic acid
(c) Phthalic acid (d) Acetic acid

20. The reaction

is known as

[MP PMT 2002]

(a) Wurtz reactions
(b) Koch reaction
(c) Clemenson's reduction
(d) Kolbe's reaction

21. By aerial oxidation, which one of the following gives phthalic acid [Tamil Nadu CET 2002]

(a) Naphthalene (b) Benzene
(c) Mesitylene (d) Toluene

[CBSE PMT 2002]

(a)  (b) 
(c)  (d) $C_6H_5-\overset{\overset{O}{||}}{C}-C_6H_5$

23. Glacial acetic is obtained by [KCET 2002]

(a) Distilling vinegar
(b) Crystallizing separating and melting acetic acid
(c) Treating vinegar with dehydrating agent
(d) Chemically separating acetic acid

24. In esterification, OH^- ion for making H_2O comes from

[CPMT 1996]

(a) Acid (b) Alcohol
(c) Ketone (d) Carbohydrate

25. Heating a mixture of ethyl alcohol and acetic acid in presence of conc. H_2SO_4 produces a fruity smelling compound. This reaction is called [AIIMS 1996]

(a) Neutralisation (b) Ester hydrolysis
(c) Esterification (d) Williamson's synthesis

26. Product formed by heating a mixture of ammonium chloride and potassium cyanate is

(a) N_2O (b) NH_3
(c) CH_3NH_2 (d) H_2NCONH_2

27. Rearrangement of an oxime to an amide in the presence of strong acid is called [Kerala CET 2000]

(a) Curtius rearrangement (b) Fries rearrangement
(c) Backman rearrangement (d) Sandmeyer reaction

28. Which reagent will bring about the conversion of carboxylic acids into esters [CBSE PMT 2000]

(a) C_2H_5OH (b) Dry $HCl + C_2H_5OH$
(c) $LiAlH_4$ (d) $Al(OC_2H_5)_3$

29. The acid formed when propyl magnesium bromide is treated with carbon dioxide is [CPMT 1982, 84, 86; Pb. PMT 1998]

(a) C_3H_7COOH (b) C_2H_5COOH
(c) Both (a) and (b) (d) None of the above

30. CO_2 on reaction with ethyl magnesium bromide gives [BHU 1983]

(a) Ethane (b) Propanoic acid

(c) Acetic acid (d) None of these

31. Acetic anhydride is obtained from acetyl chloride by the reaction of

(a) P_2O_5 (b) H_2SO_4
(c) CH_3COONa (d) CH_3COOH

32. Hydrolysis of acetamide produces

[DPMT 1984; MP PMT 1994; MP PET 2001]

(a) Acetic acid (b) Acetaldehyde
(c) Methylamine (d) Formic acid

33. Ethyl acetate is obtained when methyl magnesium iodide reacts with [Tamil Nadu CET 2002]

(a) Ethyl formate (b) Ethyl chloroformate
(c) Acetyl chloride (d) Carbon dioxide

34. Sodium acetate reacts with acetyl chloride to form

[BIT 1992]

(a) Acetic acid (b) Acetone
(c) Acetic anhydride (d) Sodium formate

35. Ammonium acetate reacts with acetic acid at $110^\circ C$ to form

(a) Acetamide (b) Formamide
(c) Ammonium cyanate (d) Urea

36. Tischenko reaction is used for preparation of

(a) Ether (b) Ester
(c) Amide (d) Acid anhydride

37. The silver salt of a fatty acid on refluxing with an alkyl halide gives an [KCET 2004]

(a) Acid (b) Ester
(c) Ether (d) Amine

38. Which reaction is used for the preparation of α -Bromoacetic acid? [MP PET 2004; MP PET/PMT 1998]

(a) Kolbe's Reaction
(b) Reimer-Tiemann Reaction
(c) Hell volhard Zelinsky Reaction
(d) Perkin's Reaction

39. Tertiary alcohols (3°) having atleast four carbon atoms upon drastic oxidation yield carboxylic acid with [MH CET 2004]

(a) One carbon atom less
(b) Two carbon atoms less
(c) Three carbon atom less
(d) All the above three options are correct

40. When succinic acid is heated, product formed is [Pb. CET 2000]

(a) Succinic anhydride (b) Acetic acid
(c) CO_2 and methane (d) Propionic acid

41. In the reaction, $C_6H_5OH \xrightarrow{NaOH} (A) \xrightarrow[140^\circ C, (4-7 \text{ atm})]{CO_2} (B) \xrightarrow{HCl} (C)$, the compound (C) is [Pb. CET 2001]
 (a) Benzoic acid (b) Salicylaldehyde
 (c) Chlorobenzene (d) Salicylic acid
42. When an acyl chloride is heated with Na salt of a carboxylic acid, the product is [DCE 2003]
 (a) An ester (b) An anhydride
 (c) An alkene (d) An aldehyde
43. The compound X, in the reaction, is
 $X \xrightarrow{CH_3MgI} Y \xrightarrow{\text{hydrolysis}} Mg(OH)I + CH_3COOH$ [Pb. CET 2003]
 (a) CH_3CHO (b) CO_2
 (c) $(CH_3)_2CO$ (d) $HCHO$
44. $CH_3CONH_2 \xrightarrow{NaNO_2 / HCl} X$ [Pb. CET 2003]
 (a) CH_3COOH (b) $CH_3CO^+ N H_3 Cl^-$
 (c) CH_3NH_2 (d) CH_3CHO
45. Primary aldehyde on oxidation gives [DPMT 20004]
 (a) Esters (b) Carboxylic acid
 (c) Ketones (d) Alcohols
46. Toluene is oxidised to benzoic acid by [BHU 2004; CPMT 1985]
 (a) $KMnO_4$ (b) $K_2Cr_2O_7$
 (c) H_2SO_4 (d) Both (a) and (b)
47. 
 The compound (X) is [IIT 2005]
 (a) CH_3COOH (b) $BrCH_2 - COOH$
 (c) $(CH_3CO)_2O$ (d) $CHO - COOH$
48. Salicylic acid is prepared from phenol by [AFMC 2005]
 (a) Reimer Tiemann reaction
 (b) Kolbe's reaction
 (c) Kolbe-electrolysis reaction
 (d) None of these
49. Acetic acid will be obtained on oxidation of [J & K 2005]
 (a) Ethanol (b) Propanal
 (c) Methanal (d) Glyoxal
3. What will be the product, when carboxy phenol, obtained by Reimer Tiemann's process, is deoxidised with Zn powder [MP PMT 2003]
 (a)  (b) 
 (c)  (d) 
4. The  of a carboxylic acid HA was passed over MnO_2 at 573 K yields propanone. The acid HA is
 (a) Methanoic acid (b) Ethanoic acid
 (c) Propanoic acid (d) Butanoic acid
5. Which acid is strongest or Which is most acidic [CPMT 1982, 89; BIT 1992; MP PET 1996; MP PMT/PET 1988; MP PMT 1995, 97; RPMT 1997]
 (a) $Cl_2CH.COOH$ (b) $ClCH_2COOH$
 (c) CH_3COOH (d) $Cl_3C.COOH$
6. Ethyl acetate at room temperature is a
 (a) Solid (b) Liquid
 (c) Gas (d) Solution
7. Urea is a better fertilizer than ammonium sulphate because
 (a) It has greater percentage of nitrogen
 (b) It is more soluble
 (c) It is weakly basic
 (d) It does not produce acidity in soil
8. The reaction of acetamide with water is an example of [Kurukshetra CEE 1998; RPMT 2000]
 (a) Alcoholysis (b) Hydrolysis
 (c) Ammonolysis (d) Saponification
9. The acid which reduces Fehling solution is [KCET 1998]
 (a) Methanoic acid (b) Ethanoic acid
 (c) Butanoic acid (d) Propanoic acid
10. 
 The above shown polymer is obtained when a carbon compound is allowed to stand. It is a white solid. The polymer is
 (a) Trioxane (b) Formose
 (c) Paraformaldehyde (d) Metaldehyde
11. What will happen if $LiAlH_4$ is added to an ester [CBSE PMT 2000]
 (a) Two units of alcohol are obtained
 (b) One unit of alcohol and one unit of acid is obtained
 (c) Two units of acids are obtained
 (d) None of these
12. When anisole is heated with HI, the product is [CET Pune 1998]
 (a) Phenyl iodide and methyl iodide
 (b) Phenol and methanol
 (c) Phenyl iodide and methanol
 (d) Methyl iodide and phenol
13. When CH_3COOH reacts with $CH_3 - Mg - X$ [BVP 2003]
 (a) CH_3COX is formed (b) Hydrocarbon is formed
 (c) Acetone is formed (d) Alcohol is formed
14. Which class of compounds shows H-bonding even more than in alcohols
 (a) Phenols (b) Carboxylic acids
 (c) Ethers (d) Aldehydes

Properties of Carboxylic Acids and Their Derivatives

1. Which of the following acids has the smallest dissociation constant [IIT-JEE (Screening) 2002]
 (a) CH_3CHFCH_2COOH (b) FCH_2CH_2COOH
 (c) $BrCH_2CH_2COOH$ (d) $CH_3CHBrCH_2COOH$
2. What is obtained, when propene is treated with N-bromo succinimide [MP PMT 2003]
 (a)  (b) 
 (c)  (d) 

15. When propanamide reacts with Br_2 and $NaOH$ then which of the following compound is formed [Manipal 2001]
 (a) Ethyl alcohol (b) Propyl alcohol
 (c) Propyl amine (d) Ethylamine
16. Hydrolysis of an ester gives a carboxylic acid which on Kolbe's electrolysis yields ethane. The ester is [EAMCET 1997; Manipal PMT 2001]
 (a) Ethyl methanoate (b) Methyl ethanoate
 (c) Propylamine (d) Ethylamine
17. On prolonged heating of ammonium cyanate or urea, we get [DPMT 1982; CPMT 1979; MP PMT 1996]
 (a) N_2 (b) CO_2
 (c) Biurette (d) Ammonium carbonate
18. In the Gabriel's phthalimide synthesis, phthalimide is treated first with
 (a) C_2H_5I / KOH (b) Ethanolic Na
 (c) Ethanol and H_2SO_4 (d) Ether and $LiAlH_4$
19. Which of the following is the strongest acid [NCERT 1984]
 (a) CH_3COOH (b) $BrCH_2COOH$
 (c) $ClCH_2COOH$ (d) FCH_2COOH
20. Which of the following reduces Tollen's reagent [MP PMT 1991]
 (a) Acetic acid (b) Citric acid
 (c) Oxalic acid (d) Formic acid
21. Oxalic acid may be distinguished from tartaric acid by
 (a) Sodium bicarbonate solution
 (b) Ammonical silver nitrate solution
 (c) Litmus paper
 (d) Phenolphthalein
22. The reaction of $HCOOH$ with conc. H_2SO_4 gives [DPMT 1982, CPMT 1989; MP PET 1995; AIIMS 2000; Manipal 2001; Pb. CET 2002]
 (a) CO_2 (b) CO
 (c) Oxalic acid (d) Acetic acid
23. Sulphonation of benzoic acid produces mainly [CPMT 1982]
 (a) *o*-sulphobenzoic acid
 (b) *m*-sulphobenzoic acid
 (c) *p*-sulphobenzoic acid
 (d) *o*- and *p*-sulphobenzoic acid
24. Which one is strongest acid [MP PMT 1992]
 (a) CH_2FCOOH (b) $CH_2ClCOOH$
 (c) $CHCl_2COOH$ (d) CHF_2COOH
25. Which does not give silver mirror with ammoniacal $AgNO_3$ [MP PET 1992]
 (a) $HCHO$ (b) CH_3CHO
 (c) CH_3COOH (d) $HCOOH$
26. $2CH_3COOH \xrightarrow[300^\circ C]{MnO} A$, product 'A' in the reaction is [RPMT 2003]
 (a) CH_3CH_2CHO (b) CH_3-CH_2-OH
 (c) CH_3COCH_3 (d) $CH_3-\overset{\overset{O}{\parallel}}{C}-O-\overset{\overset{O}{\parallel}}{C}-CH_3$
27. Acetic acid is weak acid than sulphuric acid because [CPMT 2003]
 (a) It decompose on increasing temperature
 (b) It has less degree of ionisation
 (c) It has $-COOH$ group
 (d) None of these
28. In CH_3COOH and $HCOOH$, $HCOOH$ will be [CPMT 1975; DPMT 1982]
 (a) Less acidic (b) Equally acidic
- (c) More acidic (d) None
29. Acetic anhydride reacts with excess of ammonia to form [MP PET 1992]
 (a) $2CH_3COONH_4$
 (b) $2CH_3CONH_2$
 (c) $CH_3CONH_2 + CH_3COONH_4$
 (d) $2CH_3COOH$
30. In the following sequence of reactions, what is D [UPSEAT 2002]

 (a) Primary amine
 (b) An amide
 (c) Phenyl isocyanate
 (d) A chain lengthened hydrocarbon
31. Hydrolytic reaction of fats with caustic soda is known as [MP PMT/PET 1988; AMU 1988; KCET 2000; MP PET 2001]
 (a) Esterification (b) Saponification
 (c) Acetylation (d) Carboxylation
32. In the reaction
 $CH_3COOH \xrightarrow{LiAlH_4} (A) \xrightarrow{I_2+NaOH} (B) \xrightarrow{Ag(Dust)} (C)$
 the final product (C) is
 (a) C_2H_5I (b) C_2H_5OH
 (c) C_2H_2 (d) CH_3COCH_3
33. Reaction of ethyl formate with excess of CH_3MgI followed by hydrolysis gives [IIT (Screening) 1992]
 (a) *n*-propyl alcohol (b) Ethanol
 (c) Propanal (d) Isopropyl alcohol
34. Of the following four reactions, formic and acetic acids differ in which respect [CPMT 1990, 93]
 (a) Replacement of hydrogen by sodium
 (b) Formation of ester with alcohol
 (c) Reduction of Fehling solution
 (d) Blue litmus reaction
35. Formaldehyde and formic acid can be distinguished using [AFMC 1993]
 (a) Tollen's reagent (b) Fehling solution
 (c) Ferric chloride (d) Sodium bicarbonate
36. Ester and acetamide are distinguished by [BHU 1996]
 (a) Hydrolysis with strong acids or alkali
 (b) Derivatives of fatty acids
 (c) Both (a) and (b)
 (d) None of these
37. Acetic acid exists as a dimer in benzene solution. This is due to [MP PMT 1989; CPMT 1982]
 (a) Condensation
 (b) Presence of $-COOH$ group
 (c) Presence of α -hydrogen
 (d) Hydrogen bonding
38. Which of the following compounds will react with $NaHCO_3$ solution to give sodium salt and carbon dioxide [CBSE PMT 1999; BHU 1983, 2002]
 (a) Phenol (b) *n*-hexanol
 (c) Acetic acid (d) Both (a) and (b)
39. Acetic acid dissolved in benzene shows a molecular mass of [MP PET 1993]
 (a) 30 (b) 60
 (c) 120 (d) 240
40. The reaction

is called

[MP PMT 2003; KCET 1996]

- (a) Etard reaction (b) Perkin's reaction
(c) Claisen condensation (d) Claisen Schmidt reaction

41. Which is the strongest acid? (pK_a value is given in the bracket)

[MP PMT 1997; BHU 2003]

- (a) HCOOH (3.77) (b) $\text{C}_6\text{H}_5\text{COOH}$ (4.22)
(c) CH_3COOH (4.71) (d) $\text{CH}_3\text{CH}_2\text{COOH}$ (4.88)

42. In the presence of iodine catalyst, chlorine reacts with acetic acid to form

[MP PMT 1997]

- (a) $\text{CH}_3 - \overset{\overset{\text{O}}{\parallel}}{\text{C}} - \text{Cl}$ (b) $\text{CH}_2\text{Cl} - \overset{\overset{\text{O}}{\parallel}}{\text{C}} - \text{OH}$
(c) $\text{CH}_3 - \overset{\overset{\text{Cl}}{\mid}}{\underset{\underset{\text{Cl}}{\mid}}{\text{C}}} - \text{OH}$ (d) $\text{CH}_3 - \overset{\overset{\text{O}}{\parallel}}{\text{C}} - \text{O} - \text{Cl}$

43. The acid showing salt-like character in aqueous solution is

[MP PET/PMT 1998]

- (a) Acetic acid (b) Benzoic acid
(c) Formic acid (d) α -amino acetic acid

44. $\text{CH}_3\text{COOH} \xrightarrow[\text{P}_2\text{O}_5]{\Delta} \text{X}$. Identify X

[JIPMER 2000; CPMT 2003]

- (a) CH_3COCH_3 (b) CH_3CHO
(c) $(\text{CH}_3\text{CO})_2\text{O}$ (d) CH_4

45. Formic acid

[MP PET/PMT 1988]

- (a) Is immiscible with water
(b) Reduces the ammoniacal silver nitrate
(c) Is a weak acid nearly three and a half time weaker than acetic acid
(d) Is prepared by heating potassium hydroxide

46. Given below are some statements concerning formic acid, which of them is true

[CPMT 1983]

- (a) It is a weaker acid than acetic acid
(b) It is a reducing agent
(c) When its calcium salt is heated, it forms a ketone
(d) It is an oxidising agent

47. Which decolourises the colour of acidic KMnO_4

[CPMT 1991]

- (a) CH_3COOH (b) $\text{CH}_3\text{CH}_2\text{COOH}$
(c) $\text{COOH} \cdot \text{COOH}$ (d) $\text{CH}_3\text{COOC}_2\text{H}_5$

48. A colourless water soluble organic liquid decomposes sodium carbonate and liberates carbon dioxide. It produces black precipitate with Tollen's reagent. The liquid is [KCET 1989]

- (a) Acetaldehyde (b) Acetic acid
(c) Formaldehyde (d) Formic acid

49. The end product B in the sequence of reactions

[CPMT 1985]

- (a) An alkane
(b) A carboxylic acid
(c) Sodium salt of carboxylic acid
(d) A ketone

50. $\text{CH}_3\text{CH}_2\text{COOH} \xrightarrow{\text{Cl}_2/\text{Fe}} \text{X} \xrightarrow[\text{KO}_4]{\text{Alcoholic}} \text{Y}$

Compound Y is

[DPMT 1981; JIPMER 2000; AIEEE 2002]

- (a) $\text{CH}_3\text{CH}_2\text{OH}$ (b) $\text{CH}_3\text{CH}_2\text{CN}$
(c) $\text{CH}_2 = \text{CHCOOH}$ (d) $\text{CH}_3\text{CHClCOOH}$

51. In the precipitation of soap, which can be used instead of NaCl

- (a) Na (b) CH_3COONa
(c) Na_2SO_4 (d) Sodium silicate

52. Which of the following can possibly be used as analgesic without causing addiction and moon modification

[CBSE PMT 1997]

- (a) Morphine
(b) *N*-acetyl-para-aminophenol
(c) Drazepam
(d) Tetrahydrocannabinol

53. Which of the following esters cannot undergo Claisen self condensation

[CBSE PMT 1998]

- (a) $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_2 - \text{COOC}_2\text{H}_5$
(b) $\text{C}_6\text{H}_5\text{COOC}_2\text{H}_5$
(c) $\text{C}_6\text{H}_5\text{CH}_2\text{COOC}_2\text{H}_5$
(d) $\text{C}_6\text{H}_{11}\text{CH}_2\text{COOC}_2\text{H}_5$

54. When acetic acid is dissolved in benzene its molecular mass

[AFMC 1991]

- (a) Decreases
(b) Increases
(c) Either increases or decreases
(d) Suffers no change

55. Benzoic acid has higher molecular weight in benzene and less in water because

- (a) Water has lower freezing point and higher boiling point than benzene
(b) It dissociates to a greater extent in benzene than in water
(c) It associates in water and dissociates in benzene
(d) It dissociates in water and associates in benzene

56. What is the main reason for the fact that carboxylic acids can undergo ionization

[MNR 1993; Pb. PMT 2004]

- (a) Absence of α -hydrogen
(b) Resonance stabilisation of the carboxylate ion
(c) High reactivity of α -hydrogen
(d) Hydrogen bonding

57. Which of the following compounds will evolve hydrogen on treatment with metal

[CPMT 1974]

- (a) $\text{C}_2\text{H}_5\text{OH}$ (b) CH_3COOH
(c) (a) and (b) both (d) None of these

58. When urea is heated, it forms biurette, alkaline solution of which forms with CuSO_4 solution [AFMC 1980]

- (a) Violet colour (b) Red colour
(c) Green colour (d) Black colour

59. Which of the following would be expected to be most highly ionised in water

[AIIMS 1982]

- (a) $\text{CH}_2\text{ClCH}_2\text{CH}_2\text{COOH}$ (b) $\text{CH}_3\text{CHCl} \cdot \text{CH}_2 \cdot \text{COOH}$
(c) $\text{CH}_3 \cdot \text{CH}_2 \cdot \text{CCl}_2 \cdot \text{COOH}$ (d) $\text{CH}_3 \cdot \text{CH}_2 \cdot \text{CHCl} \cdot \text{COOH}$

60. Alkaline hydrolysis of esters is known as

[CPMT 1986, 88, 93; MNR 1986; MP PET 1993]

- (a) Saponification (b) Hydration
(c) Esterification (d) Alkalisiation

61. Which of the following undergoes hydrolysis when dissolved in water

[CPMT 1989]

- (a) CH_3COONa (b) CH_3CONH_2
(c) Both (a) and (b) (d) $\text{C}_6\text{H}_5\text{CH}_3$
62. Name the end product in the following series of reactions
 $\text{CH}_3\text{COOH} \xrightarrow{\text{NH}_3} \text{A} \xrightarrow[\text{P}_2\text{O}_5]{\Delta} \text{B}$ [DPMT 1984]
 (a) CH_4 (b) CH_3OH
 (c) Acetonitrile (d) Ammonium acetate
63. Reduction of carboxylic acids gives
 (a) Alcohol with hydrogen in presence of palladium
 (b) Alcohol with LiAlH_4
 (c) Aldehyde with LiAlH_4
 (d) Alcohol with 2HI(P)
64. Which of the following substances when boiled with caustic soda solution will evolve ammonia [BHU 1983]
 (a) Ethylamine (b) Aniline
 (c) Acetamide (d) Acetoxime
65. $\text{CH}_2 = \text{CH} - (\text{CH}_2)_5\text{COOH} \xrightarrow[\text{HBr}]{\text{Peroxide}} \text{Z}$
 where Z is [CPMT 1996]
 (a) $\text{CH}_3 - \underset{\text{Br}}{\text{CH}} - (\text{CH}_2)_5\text{COOH}$
 (b) $\text{BrCH}_2 - (\text{CH}_2)_6\text{COOH}$
 (c) $\text{CH}_2 = \text{CH} - (\text{CH}_2)_5 - \text{CH}_2\text{OH}$
 (d) $\text{C}_6\text{H}_5\text{COOH}$
66. HCOOH shows all tests of aldehyde because [CPMT 1996]
 (a) It has one aldehyde group
 (b) It is member of aldehyde
 (c) All acids show tests of aldehyde
 (d) Does not show any test
67. Which one of the following orders of acid strength is correct [CBSE PMT 2003]
 (a) $\text{RCOOH} > \text{HC} \equiv \text{CH} > \text{HOH} > \text{ROH}$
 (b) $\text{RCOOH} > \text{ROH} > \text{HOH} > \text{HC} \equiv \text{CH}$
 (c) $\text{RCOOH} > \text{HOH} > \text{ROH} > \text{HC} \equiv \text{CH}$
 (d) $\text{RCOOH} > \text{HOH} > \text{HC} \equiv \text{CH} > \text{ROH}$
68. The order of decreasing rate of reaction with ammonia is [Pb. PMT 1998]
 (a) Anhydrides, esters, ethers
 (b) Anhydrides, ethers, esters
 (c) Ethers, anhydrides, esters
 (d) Esters, ethers, anhydrides
69. Oxidation of toluene with CrO_3 in the presence of $(\text{CH}_3\text{CO})_2\text{O}_2$ gives a product 'A' which on treatment with aqueous NaOH produces [CBSE PMT 1995]
 (a) $\text{C}_6\text{H}_5\text{CHO}$ (b) $(\text{C}_6\text{H}_5\text{CO})_2\text{O}$
 (c) $\text{C}_6\text{H}_5\text{COONa}$ (d) 2, 4-diacetyl toluene
70. $\text{CH}_3\text{COOCH}_3 + \text{excess PhMgBr} \rightarrow \text{product} \xrightarrow{\text{H}^+} \text{X}$
 The product X is [Orissa JEE 2005]
 (a) 1, 1-diphenylethanol (b) 1, 1-diphenylmethanol
 (c) Methyl phenylethanol (d) Methyl phenylketone
71. Which of the following is most acidic [MP PMT 1995]
 (a) Formic acid (b) Chloroacetic acid
 (c) Propionic acid (d) Acetic acid
72. Urea on slow heating gives
 (a) $\text{NH}_2\text{CON} \cdot \text{HNO}_2$ (b) $\text{NH}_2\text{CONHCONH}_2$
 (c) HCNO (d) $\text{NH}_2\text{CONH}_2 \cdot \text{HNO}_3$
73. The principal organic product formed in the following reaction is
 $\text{CH}_2 = \text{CH}(\text{CH}_2)_8\text{COOH} + \text{HBr} \xrightarrow{\text{peroxide}}$ [Pb. PMT 1998]
 (a) $\text{CH}_3\text{CHBr}(\text{CH}_2)_8\text{COOH}$
 (b) $\text{CH}_2 = \text{CH}(\text{CH}_2)_8\text{COBr}$
 (c) $\text{CH}_2\text{BrCH}_2(\text{CH}_2)_8\text{COOH}$
 (d) $\text{CH}_2 = \text{CH}(\text{CH}_2)_7\text{CHBrCOOH}$
74. Which one of the following compound gives aspirin on reacting with acetic anhydride in presence of H_2SO_4 [EAMCET 2003]
 (a)  (b) 
 (c)  (d) 
75. An acyl halide is formed when PCl_5 reacts with an [CBSE PMT 1994; AIIMS 1998; CBSE PMT 2002]
 (a) Acid (b) Alcohol
 (c) Amide (d) Ester
76. Which one of the following orders is wrong with respect to the property indicated [CBSE PMT 1994]
 (a) Formic acid > acetic acid > propanoic acid (acid strength)
 (b) Fluoroacetic acid > chloroacetic acid > bromoacetic acid (acid strength)
 (c) Benzoic acid > phenol > cyclohexanol (acid strength)
 (d) Aniline > cyclohexylamine > benzamide (basic strength)
77. A fruity smell is produced by the reaction of $\text{C}_2\text{H}_5\text{OH}$ with [AFMC 2000]
 (a) PCl_5 (b) CH_3COCH_3
 (c) CH_3COOH (d) None of these
78. Which of the following orders of relative strengths of acids is correct [CPMT 2000]
 (a) $\text{FCH}_2\text{COOH} > \text{ClCH}_2\text{COOH} > \text{BrCH}_2\text{COOH}$
 (b) $\text{ClCH}_2\text{COOH} > \text{BrCH}_2\text{COOH} > \text{FCH}_2\text{COOH}$
 (c) $\text{BrCH}_2\text{COOH} > \text{ClCH}_2\text{COOH} > \text{FCH}_2\text{COOH}$
 (d) $\text{ClCH}_2\text{COOH} > \text{FCH}_2\text{COOH} > \text{BrCH}_2\text{COOH}$
79. When acetamide is treated with NaOBr , the product formed is [Haryana CEET]
 (a) CH_3CN (b) $\text{CH}_3\text{CH}_2\text{NH}_2$
 (c) CH_3NH_2 (d) None of the above
80. The fatty acid which shows reducing property is [Kerala CET 2000]
 (a) Acetic acid (b) Ethanoic Acid

81. (c) Oxalic acid (d) Formic acid
The reagent that can be used to distinguish between methanoic acid and ethanoic acid is [Kerala CET 2001, 02]
(a) Ammoniacal silver nitrate solution
(b) Neutral ferric Chloride solution
(c) Sodium carbonate solution
(d) Phenolphthalein
82. Hydrolysis of an ester gives acid *A* and alcohol *B*.
A reduces Fehling solution and oxidation of *B* gives *A*. The ester is
(a) Methyl formate (b) Ethyl formate
(c) Methyl acetate (d) Ethyl acetate [RPMT 2003]
83. Order of reactivity is [RPMT 2003]
$$\text{O}$$

$$\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{X} > \text{RCONH}_2 > \text{RCOOCOR} > \text{RCOOR}$$

(a) $\text{RCOX} > \text{RCOOCOR} > \text{RCOOR} > \text{RCONH}_2$
(b) $\text{RCOOR} > \text{RCONH}_2 > \text{RCOX} > \text{RCOOCOR}$
(c) $\text{RCOOCOR} > \text{RCOOR} > \text{RCOX} > \text{RCONH}_2$
84. Right order of acidic strength is [RPMT 2003]
(a) $\text{CH}_2\text{ClCOOH} > \text{HCOOH} > \text{C}_2\text{H}_5\text{COOH} > \text{CH}_3\text{COOH}$
(b) $\text{CH}_2\text{ClCOOH} > \text{HCOOH} > \text{CH}_3\text{COOH} > \text{C}_2\text{H}_5\text{COOH}$
(c) $\text{C}_2\text{H}_5\text{COOH} > \text{CH}_3\text{COOH} > \text{HCOOH} > \text{CH}_2\text{ClCOOH}$
(d) $\text{HCOOH} > \text{CH}_2\text{ClCOOH} > \text{CH}_3\text{COOH} > \text{C}_2\text{H}_5\text{COOH}$
85. Saponification of ethyl benzoate with caustic soda as alkali gives
(a) Benzyl alcohol and ethanoic acid
(b) Sodium benzoate and ethanol
(c) Benzoic acid and sodium ethoxide
(d) Phenol and ethanoic acid
(e) Sodium benzoate and ethanoic acid
86. Lactic acid on oxidation by alkaline potassium permanganate gives [Tamil Nadu CET 2002]
(a) Tartaric acid (b) Pyruvic acid
(c) Cinnamic acid (d) Propionic acid
87. $\text{RCOOH} \longrightarrow \text{RCH}_2\text{OH}$
This mode of reduction of an acid to alcohol can be affected only by
(a) Zn / HCl
(b) Na -alcohol
(c) Aluminium isopropoxide and isopropyl alcohol
(d) LiAlH_4
88. Which one of the following compounds forms a red coloured solution on treatment with neutral FeCl_3 solution [EAMCET 2003]
(a) CH_3COCH_3 (b) CH_3OCH_3
(c) $\text{CH}_3\text{CH}_2\text{OH}$ (d) CH_3COOH
89. Urea can be tested by [UPSEAT 1999; BVP 2003]
(a) Benedict test (b) Mullicken test
(c) Ninhydrin (d) Biuret test
90. What are the organic products formed in the following reaction [IIT 1995]
$$\text{C}_6\text{H}_5-\text{COO}-\text{CH}_3 \xrightarrow[2. \text{H}_2\text{O}]{1. \text{LiAlH}_4}$$

(a) $\text{C}_6\text{H}_5-\text{COOH}$ and CH_4
(b) $\text{C}_6\text{H}_5-\text{CH}_2-\text{OH}$ and CH_4
(c) $\text{C}_6\text{H}_5-\text{CH}_3$ and CH_3-OH
(d) $\text{C}_6\text{H}_5-\text{CH}_2-\text{OH}$ and CH_3-OH
91. Reaction between an acid and alcohol will give [Roorkee 1995]
(a) Higher *C* containing acid (b) Secondary alcohol
(c) Alkane (d) Ester
92. Benzoic acid gives benzene on being heated with *X* and phenol gives benzene on being heated with *Y*. Therefore *X* and *Y* are respectively [CBSE PMT 1997]
(a) Sodalime and copper (b) *Zn* dust and NaOH
(c) *Zn* dust and sodalime (d) Sodalime and zinc dust
93. The product obtained when acetic acid is treated with phosphorus trichloride is [MP PMT 1999] [CPMT 1989, 93, 94; RPMT 1997; AIIMS 1998; EAMCET 1998]
(a) $\text{CH}_3\text{COOPCl}_3$ (b) CH_3COOCl
(c) CH_3COCl (d) ClCH_2COOH
94. Acetyl chloride is reduced with LiAlH_4 the product formed is
(a) Methyl alcohol (b) Ethyl alcohol
(c) Acetaldehyde (d) Acetone
95. In the preparation of an ester, the commonly used dehydrating agent is [KCET 1992]
(a) Phosphorus pentoxide
(b) Anhydrous calcium carbide
(c) Anhydrous aluminium chloride
(d) Concentrated sulphuric acid
96. In the esterification reaction of alcohols [KCET 1984]
(a) OH^- is replaced by $\text{C}_6\text{H}_5\text{OH}$
(b) H^+ is replaced by sodium metal
(c) OH^- is replaced by chlorine
(d) OH^- is replaced by CH_3COO^- group
97. Lower carboxylic acids are soluble in water due to [MP PET 1999]
(a) Low molecular weight (b) Hydrogen bonding
(c) Dissociation into ions (d) Easy hydrolysis
98. [Kerala (Med.) 2001]
Acetamide reacts with P_2O_5 (phosphorus pentoxide) to give
(a) Methyl cyanide (b) Methyl cyanate
(c) Ethyl cyanide (d) Ethyl isocyanate
99. The reaction
$$\text{CH}_3\text{COOH} + \text{Cl}_2 \xrightarrow{\text{P}} \text{ClCH}_2\text{COOH} + \text{HCl}$$
 is called [NSE 2001; MP PET 2003]
(a) Hell-Volhard-Zelinsky reaction
(b) Birch reaction
(c) Rosenmund reaction
(d) Hunsdiecker reaction
100. An aqueous solution of urea [CPMT 1983]
(a) Is neutral
(b) Is acidic
(c) Is basic
(d) Can act as an acid and a base
101. Nitration of benzoic acid gives [MP PMT 1997]
(a) 3-nitrobenzoic acid (b) 2-nitrobenzoic acid
(c) 2, 3-dinitrobenzoic acid (d) 2, 4-dinitrobenzoic acid
102. The reagent used for converting ethanoic acid to ethanol is [KCET 1996; EAMCET 1998]
(a) LiAlH_4 (b) KMnO_4
(c) PCl_3 (d) $\text{K}_2\text{Cr}_2\text{O}_7 / \text{H}^+$
103. Which one of the following has the maximum acid strength [NCERT 1983]
(a) *o*-nitrobenzoic acid (b) *m*-nitrobenzoic acid
(c) *p*-nitrobenzoic acid (d) *p*-nitrophenol
104. When benzoic acid is treated with PCl_5 at 100°C , it gives [Orissa JEE 2003]
(a) Benzoyl chloride (b) *o*-chlorobenzoic acid
(c) *p*-chlorobenzoic acid (d) Benzyl chloride

105. Oxalic acid on being heated upto 90°C with conc. H_2SO_4 forms

[AFMC 1989; MP PET 1994; MP PMT 1989]

- (a) $\text{HCOOH} + \text{CO}_2$ (b) $\text{CO}_2 + \text{H}_2\text{O}$
(c) $\text{CO}_2 + \text{CO} + \text{H}_2\text{O}$ (d) $\text{HCOOH} + \text{CO}$

106. Benzoic acid is less acidic than salicylic acid because of

[Bihar MEE 1997]

- (a) Hydrogen bond (b) Inductive effect
(c) Resonance (d) All of these
(e) None of these

107. Lactic acid on heating with conc. H_2SO_4 gives

[MP PET 1996]

- (a) Acetic acid (b) Propionic acid
(c) Acrylic acid (d) Formic acid

108. Acetamide is

[MP PET 1990; RPMT 1999]

- (a) Acidic (b) Basic
(c) Neutral (d) Amphoteric

109. Silver benzoate reacts with bromine to form

[KCET 1996]

- (a)  (b) 
(c)  (d) 

110. Acetic anhydride reacts with diethyl ether in presence of anhydrous AlCl_3 to form

[MP PMT 1992]

- (a) Ethyl acetate (b) Methyl propionate
(c) Methyl acetate (d) Propionic acid

111. Treatment of benzoic acid with $\text{Cl}_2 / \text{FeCl}_3$ will give

[KCET 1998; CET Pune 1998]

- (a) *p*-chlorobenzoic acid (b) *o*-chlorobenzoic acid
(c) 2, 4-dichlorobenzoic acid (d) *m*-chlorobenzoic acid

112. Hinsberg's reagent is

[MP PMT 2003]

- (a)  (b) 
(c)  (d) 

113. Which of the following is the correct order of increasing strengths of carboxylic acids

- (a) $\text{CH}_2\text{FCOOH} < \text{CH}_3\text{COOH}$
 $< \text{CH}_2\text{ClCOOH} < \text{CCl}_3\text{COOH}$
(b) $\text{CH}_3\text{COOH} < \text{CH}_2\text{ClCOOH}$
 $< \text{CH}_2\text{FCOOH} < \text{CCl}_3\text{COOH}$
(c) $\text{CH}_2\text{ClCOOH} < \text{CH}_2\text{FCOOH}$
 $< \text{CCl}_3\text{COOH} < \text{CH}_3\text{COOH}$
(d) $\text{CCl}_3\text{COOH} < \text{CH}_2\text{ClCOOH}$
 $< \text{CH}_2\text{FCOOH} < \text{CH}_3\text{COOH}$

114. The weakest acid among the following is

[CPMT 1976, 82, 89; BHU 1982; CBSE PMT 1991; MP PMT 1989; Roorkee 1992; RPET 1999]

- (a) CH_3COOH (b) Cl_2CHCOOH
(c) ClCH_2COOH (d) Cl_3CCOOH

115. Consider the acidity of the carboxylic acids

- (a) PhCOOH (b) $o\text{-NO}_2\text{C}_6\text{H}_4\text{COOH}$
(c) $p\text{-NO}_2\text{C}_6\text{H}_4\text{COOH}$ (d) $m\text{-NO}_2\text{C}_6\text{H}_4\text{COOH}$

Which of the following order is correct?

[AIEEE 2004]

- (a) $b > d > a > c$ (b) $b > d > c > a$
(c) $a > b > c > d$ (d) $b > c > d > a$

116. On mixing ethyl acetate with aqueous sodium chloride, the composition of the resultant solution is

[AIEEE 2004]

- (a) $\text{CH}_3\text{COCl} + \text{C}_2\text{H}_5\text{OH} + \text{NaOH}$
(b) $\text{CH}_3\text{COONa} + \text{C}_2\text{H}_5\text{OH}$
(c) $\text{CH}_3\text{COOC}_2\text{H}_5 + \text{NaCl}$
(d) $\text{CH}_3\text{Cl} + \text{C}_2\text{H}_5\text{COONa}$

117. *o*-Toluic acid on reaction with $\text{Br}_2 + \text{Fe}$, gives

[AIIMS 2004]

- (a)  (b) 
(c)  (d) 

118. The reaction of an ester RCOOR' with an alcohol $\text{R}''\text{OH}$ in the presence of an acid gives

[Kerala PMT 2004]

- (a) RCOOH (b) $\text{R}'\text{COOH}$
(c) $\text{R}''\text{COOR}$ (d) RCOOR''
(e) $\text{R}'\text{COOR}''$

119. RCOOH on treatment with PCl_5 and KCN , is subjected to hydrolysis followed by Clemmensen's reduction, the product obtained is

[Kerala PMT 2004]

- (a) $\text{RCH}_2 - \text{COCl}$ (b) $\text{RCH}_2 - \text{COOH}$
(c) RCOCl (d) RCN
(e) $\text{R} - \text{OH}$

120. The reagent which does not give acid chloride on treating with a carboxylic acid is

[KCET 2004]

- (a) PCl_5 (b) Cl_2
(c) SOCl_2 (d) PCl_3

121. An organic compound is boiled with alcoholic potash. The product is cooled and acidified with HCl . A white solid separates out. The starting compound may be

[KCET 2004]

- (a) Ethyl benzoate (b) Ethyl formate
(c) Ethyl acetate (d) Methyl acetate

122. The OH group of an alcohol or the $-\text{COOH}$ group of a carboxylic acid can be replaced by $-\text{Cl}$ using

[CBSE PMT 2004]

- (a) Chlorine
(b) Hydrochloric acid
(c) Phosphorus pentachloride
(d) Hypochlorous acid

123. Which of the following is most acidic

[MP PET 2004]

- (a) Picric acid (b) *p*-nitrophenol
(c) *m*-nitrophenol (d) *o*-*p* dinitrophenol

124. Benedict's solution is not reduced by

[CPMT 2004]

- (a) Formaldehyde (b) Acetaldehyde
(c) Glucose (d) Acetic anhydride

125. CH_3COOH is reacted with $\text{CH} \equiv \text{CH}$ in presence of Hg^{++} , the product is

[DPMT 2004; BHU 1998]

- (a) $\text{CH}_3(\text{OOCCH}_3)$ (b) CH_3
 $\text{CH}_2(\text{OOCCH}_3)$ $\text{CH}_2-(\text{OOC}-\text{CH}_3)$

- (c) $\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}(\text{OOC}-\text{CH}_3)_2 \end{array}$ (d) None of these
126. Acetic acid reacts with PCl_5 to form [Pb. CET 2001]
 (a) CH_3COCl (b) CHCl_2COOH
 (c) CH_2ClCOOH (d) CH_3COOCl
127. $\text{CH}_3\text{COOC}_2\text{H}_5$ with excess of $\text{C}_2\text{H}_5\text{MgBr}$ and hydrolysis gives [MH CET 2004]
 (a) $\begin{array}{c} \text{CH}_3 - \text{C} = \text{O} \\ | \\ \text{C}_2\text{H}_5 \end{array}$ (b) $\begin{array}{c} \text{C}_2\text{H}_5 \\ | \\ \text{CH}_3 - \text{C} - \text{OH} \\ | \\ \text{C}_2\text{H}_5 \end{array}$
 (c) $\begin{array}{c} \text{CH}_3 - \text{C} = \text{O} \\ | \\ \text{CH}_3 \end{array}$ (d) $\begin{array}{c} \text{C}_2\text{H}_5 \\ | \\ \text{CH}_3 - \text{C} = \text{O} \\ | \\ \text{CH}_3 \end{array}$
128. Urea upon hydrolysis yields [Pb. CET 2001]
 (a) Acetamide (b) Carbonic acid
 (c) Ammonium hydroxide (d) NO_2
129. $\text{CH}_3\text{CHO} \xrightarrow{\text{HCN}} \text{A} \xrightarrow{\text{HOH}} \text{B}$. The product B is [Pb. CET 2003]
 (a) Malonic acid (b) Glycolic acid
 (c) Lactic acid (d) Malic acid
130. What is the % of acetic acid present in vinegar? [AFMC - 2004; MH CET 2003; CPMT 1974, 75]
 (a) 6–10% (b) 70–80%
 (c) 7–8% (d) 90–100%
131. Fruity smell is given by [MH CET 2004]
 (a) Esters (b) Alcohols
 (c) Chloroform (d) Acid anhydrides
132. Lactic acid molecule has [MH CET 2004]
 (a) One chiral carbon atom
 (b) Two chiral carbon atoms
 (c) No chiral carbon atom
 (d) As asymmetric molecule
133. 4-methyl benzene sulphonic acid reacts with sodium acetate to give [IIT-JEE (Screening) 2005]
 (a) ; CH_3COOH (b) ; SO_3
 (c) ; SO_3 (d) ; NaOH
134. In a set of reactions $\text{CH}_3\text{COOH} \xrightarrow{\text{SOCl}_2} \text{A} \xrightarrow[\text{Anhr. AlCl}_3]{\text{Benzene}} \text{B} \xrightarrow{\text{HCN}} \text{C} \xrightarrow{\text{HOH}} \text{D}$. The product D is [CBSE PMT 2005]
 (a)  (b) 
 (c)  (d) 

135. $\text{C}_6\text{H}_5\text{CHO} + \text{HCN} \rightarrow \text{C}_6\text{H}_5 - \text{C}(\text{H})(\text{OH}) - \text{CN}$
 The product would be [Pb. PMT 1998]
 (a) A racemate
 (b) Optically active
 (c) A meso compound
 (d) A mixture of diastereomers
136. What happens when 2-hydroxy benzoic acid is distilled with zinc dust, it gives [MP PET/PMT 1998]
 (a) Phenol (b) Benzoic acid
 (c) Benzaldehyde (d) A polymeric compound
137. $\text{CH}_3\text{CO}_2\text{C}_2\text{H}_5$ on reaction with sodium ethoxide in ethanol gives A, which on heating in the presence of acid gives B compound B is [AIIMS 2005]
 (a) $\text{CH}_3\text{COCH}_2\text{COOH}$ (b) CH_3COCH_3
 (c)  (d) $\text{CH}_2 = \text{C} \begin{array}{l} \text{OC}_2\text{H}_5 \\ \text{OC}_2\text{H}_5 \end{array}$
138. $\text{C}_6\text{H}_5\text{CONHCH}_3$ can be converted into $\text{C}_6\text{H}_5\text{CH}_2\text{NHCH}_3$ by [AIIMS 2005]
 (a) NaBH_4 (b) $\text{H}_2 - \text{Pd} / \text{C}$
 (c) LiAlH_4 (d) $\text{Zn} - \text{Hg} / \text{HCl}$
139. Among the following acids which has the lowest pK_a value [AIEEE 2005]
 (a) CH_3COOH (b) HCOOH
 (c) $(\text{CH}_3)_2\text{CH} - \text{COOH}$ (d) $\text{CH}_3\text{CH}_2\text{COOH}$
140. X is heated with soda lime and gives ethane. X is [AFMC 2005]
 (a) Ethanoic acid (b) Methanoic acid
 (c) Propanoic acid (d) Either (a) or (c)
141. Which of the following is an amphoteric acid [KCET 2005]
 (a) Glycine (b) Salicylic acid
 (c) Benzoic acid (d) Citric acid
142. Colouration of $\text{Br}_2 / \text{CCl}_4$ will be discharged by [Orissa JEE 2005]
 (a) Cinnamic acid (b) Benzoic acid
 (c) *o*-phthalic acid (d) Acetophenone
143. Order of hydrolysis for the following [DPMT 2005]
 (I) RCOCl (II) RCOOR
 (III) RCONH_2 (IV) $(\text{RCO})_2\text{O}$
 (a) I>IV>II>III (b) I>II>III>IV
 (c) I>III>II>IV (d) IV>III>II>I
144. If the enolate ion combines with carbonyl group of ester, we get [DPMT 2005]
 (a) Aldol (b) α, β -unsaturated ester
 (c) β -keto aldehyde (d) Acid
145. Which of the following compounds will react with NaHCO_3 solution to give sodium salt and carbon dioxide [DPMT 2005]
 (a) Acetic acid (b) *n*-hexanol
 (c) Phenol (d) Both (a) and (c)
146. A carboxylic acid is converted into its anhydride using [J & K 2005]
 (a) Thionyl chloride (b) Sulphur chloride
 (c) Sulphuric acid (d) Phosphorus pentoxide

Uses of Carboxylic Acids and Their Derivatives

1. The following compound is used as

[KCET 1996]

- (a) An anti-inflammatory agent
(b) Analgesic
(c) Hypnotic
(d) Antiseptic
2. To which of the following groups does soap belongs
[NCERT 1979; RPET 2000]
- (a) Esters
(b) Amines
(c) Salts of organic higher fatty acids
(d) Aldehydes
3. Aspirin is an acetylation product of [CBSE PMT 1998]
(a) *o*-hydroxybenzoic acid (b) *o*-dihydroxybenzene
(c) *m*-hydroxybenzoic acid (d) *p*-dihydroxybenzene
4. Which one is used as a food preservative
[MP PET 1989; KCET 1999]
- (a) Sodium acetate (b) Sodium propionate
(c) Sodium benzoate (d) Sodium oxalate
5. What makes a lemon sour
[CPMT 1972; CBSE PMT 1991; RPET 1999]
- (a) Tartaric acid (b) Oxalic acid
(c) Citric acid (d) Hydrochloric acid
6. The reagent used for protection of amino group during the nitration of aniline is [JIPMER 1997]
- (a) SOCl_2 / Pyridine (b) PCl_5
(c) Acetic acid (d) Acetic anhydride

Critical Thinking

Objective Questions

1. Ethyl ester $\xrightarrow[\text{excess}]{\text{CH}_3\text{MgBr}}$ P. The product P will be [IIT-JEE 2003]
- (a) (b)
- (c) (d)
2. Hydrogenation of $\text{C}_6\text{H}_5\text{CHOH}-\text{COOH}$ over $\text{Rh}-\text{Al}_2\text{O}_3$ catalyst in methanol gives [Roorkee Qualifying 1998]
- (a) $\text{C}_6\text{H}_5\text{CH}_2\text{COOH}$ (b) $\text{C}_6\text{H}_{11}\text{CHOHCOOH}$
(c) $\text{C}_6\text{H}_5\text{CHOHCH}_2\text{OH}$ (d) $\text{C}_6\text{H}_{11}\text{CH}_2\text{COOH}$
3. Which of the following has the most acidic proton
[Roorkee Qualifying 1998]
- (a) CH_3COCH_3 (b) $(\text{CH}_3)_2\text{C}=\text{CH}_2$
(c) $\text{CH}_3\text{COCH}_2\text{COCH}_3$ (d) $(\text{CH}_3\text{CO})_3\text{CH}$
4. In the anion HCOO^- the two carbon-oxygen bonds are found to be of equal length. What is the reason for it
- (a) Electronic orbitals of carbon atom are hybridised
(b) The $\text{C}=\text{O}$ bond is weaker than the $\text{C}-\text{O}$ bond
(c) The anion HCOO^- has two resonating structures
(d) The anion is obtained by removal of a proton from the acid molecule
5. An organic compound of molecular formula $\text{C}_4\text{H}_{10}\text{O}$ does not react with sodium. With excess of HI, it gives only one type of alkyl halide. The compound is [SCRA 2001]
- (a) Ethoxyethane (b) 2-Methoxypropane
(c) 1-Methoxypropane (d) 1-Butanol
6. When $\text{CH}_2=\text{CH}-\text{COOH}$ is reduced with LiAlH_4 , the compound obtained will be [AIEEE 2003]
- (a) $\text{CH}_3-\text{CH}_2-\text{COOH}$ (b) $\text{CH}_2=\text{CH}-\text{CH}_2\text{OH}$
(c) $\text{CH}_3-\text{CH}_2-\text{CH}_2\text{OH}$ (d) $\text{CH}_3-\text{CH}_2-\text{CHO}$
7. In a set of the given reactions, acetic acid yielded a product C
- $$\text{CH}_3\text{COOH} + \text{PCl}_5 \rightarrow \text{A} \xrightarrow[\text{anh. AlCl}_3]{\text{C}_6\text{H}_6} \text{B} \xrightarrow[\text{ether}]{\text{C}_2\text{H}_5\text{MgBr}} \text{C}$$
- Product C would be [CBSE PMT 2003]
- (a) (b) $\text{CH}_3\text{CH}(\text{OH})\text{C}_2\text{H}_5$
(c) $\text{CH}_3\text{COC}_6\text{H}_5$ (d) $\text{CH}_3\text{CH}(\text{OH})\text{C}_6\text{H}_5$
8. Carboxylic acids are more acidic than phenol and alcohol because of
- (a) Intermolecular hydrogen bonding
(b) Formation of dimers
(c) Highly acidic hydrogen
(d) Resonance stabilization of their conjugate base
9. $\text{R}-\text{CH}_2-\text{CH}_2\text{OH}$ can be converted into $\text{RCH}_2\text{CH}_2\text{COOH}$. The correct sequence of the reagents is [AIIMS 1997]
- (a) $\text{PBr}_3, \text{KCN}, \text{H}_3\text{O}^+$ (b) $\text{PBr}_3, \text{KCN}, \text{H}_2$
(c) $\text{HCN}, \text{PBr}_3, \text{H}^+$ (d) KCN, H^+
10. When propionic acid is treated with aqueous sodium bicarbonate CO_2 is liberated. The 'C' of CO_2 comes from [IIT-JEE (Screening) 1999]
- (a) Methyl group (b) Carboxylic acid group
(c) Methylene group (d) Bicarbonate
11. Benzoyl chloride is prepared from benzoic acid by [IIT-JEE (Screening) 2000]
- (a) $\text{Cl}_2, h\nu$ (b) SO_2Cl_2
(c) SOCl_2 (d) $\text{Cl}_2, \text{H}_2\text{O}$
12. Identify the correct order of boiling points of the following compounds
 $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$ (1), $\text{CH}_3\text{CH}_2\text{CH}_2\text{CHO}$ (2), $\text{CH}_3\text{CH}_2\text{CH}_2\text{COOH}$ (3) [IIT-JEE (Screening) 2002]
- (a) $1 > 2 > 3$ (b) $3 > 1 > 2$
(c) $1 > 3 > 2$ (d) $3 > 2 > 1$
13. The compound not soluble in acetic acid is [UPSEAT 2003; IIT-JEE 1986]
- (a) CaCO_3 (b) CaO
(c) CaC_2O_4 (d) $\text{Ca}(\text{OH})_2$
14. The *ortho/para* directing group among the following is [AIIMS 2003]
- (a) COOH (b) CN
(c) COCH_3 (d) NHCOCH_3
15. Iodoform test is not given by [BHU 1995]
- (a) Acetone (b) Ethyl alcohol
(c) Acetic acid (d) None of these

16. How will you convert butan-2-one to propanoic acid
[IIT-JEE (Screening) 2005]
(a) Tollen's reagent (b) Fehling's solution
(c) $\text{NaOH} / \text{I}_2 / \text{H}^+$ (d) $\text{NaOH} / \text{NaI} / \text{H}^+$
17. Which of the acids cannot be prepared by Grignard reagent
[MH CET 2004]
(a) Acetic acid (b) Succinic acid
(c) Formic acid (d) All of these

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

- Assertion : Carboxylic acid exist as dimer.
Reason : Carboxylic acid shows hydrogen bonding.
- Assertion : Trichloroacetic acid is stronger than acetic acid.
Reason : Electron withdrawing substituents decrease the activity.
- Assertion : First four aliphatic monocarboxylic acids are colourless.
Reason : Carboxylic acids with more than five carbon atoms are insoluble in water.
- Assertion : Carboxylic acids do not give characteristic reactions of carbonyl group.
Reason : Carboxylic acids exist as cyclic dimers in solid, liquid and even in vapour state.
- Assertion : Pure acetic acid is converted into ice like solid called glacial acetic acid.
Reason : Acetic acid is stronger than HCOOH .
- Assertion : The second dissociation constant of maleic acid is greater than fumaric acid.
Reason : Higher the dissociation constant of acid more is acidic character.
- Assertion : Lower acids on reacting with strong electropositive metals give effervescences of H_2 .
Reason : $\text{MeCOOC}_4\text{H}_9$ hydrolyses rapidly than MeCOOCH_3 .
- Assertion : Melting point of carboxylic acids shows a regular pattern.
Reason : Carboxylic acids are reduced to alkanes on reduction with HI in presence of red phosphorus.
- Assertion : Electron withdrawing groups decrease the acidity of carboxylic acids.
Reason : Substituents affect the stability of the conjugate base and acidity of carboxylic acids.
- Assertion : Fluoroacetic acid is stronger acid than bromoacetic acid.
Reason : Acidity depends upon the electron withdrawing effects of the fluorine and chlorine.
- Assertion : Aminoacetic acid is less acidic than acetic acid.
Reason : Amino group is electron donating in nature.

- Assertion : Carboxylic acids have higher boiling points than alkanes.
Reason : Carboxylic acids are resonance hybrids.
- Assertion : Both formic acid and oxalic acid decolourize KMnO_4 solution.
Reason : Both are easily oxidised to CO_2 and H_2O .
- Assertion : Esters which contain α - hydrogens undergo Claisen condensation.
Reason : LiAlH_4 reduction of esters gives acids.

AS Answers and Solutions

General Introduction of Carboxylic Acids and Their Derivatives

- (d) Methyl salicylate occurs in natural essential oils like winter green.
- (d) Tartaric acid have the chiral carbon (*) atom. So it is optically active.

- (c) Formula of palmitic acid is $\text{C}_{15}\text{H}_{31}\text{COOH}$.

4. (d) Amide group represent by the formula $-\text{CONH}_2$
5. (a) $\text{Cl}-\underset{\text{3 chloro}}{\text{CH}_2}-\underset{\text{2}}{\text{CH}_2}-\underset{\text{1}}{\text{COOH}}$
3 chloro propanoic acid

7. (d) Soaps are sodium salt of fatty acids e.g.- $\text{C}_{17}\text{H}_{35}\text{COONa}$
Sodium Stearate acid.

8. (c) $\text{R}-\text{CONH}_2$ (Primary amide) $(\text{RCO})_2\text{NH}$ (Secondary amide)

9. (c) CHOHCOOH is known as tartaric acid and its potassium salt is known as Tartaremetic.

11. (a) $\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{OH} \leftrightarrow \text{R}-\overset{\text{O}^-}{\parallel}{\text{C}}-\text{O}^+\text{H}$
It represent the acidic nature.

12. (c) $\text{CH}_3-\overset{\text{O}}{\parallel}{\text{C}}-\text{CH}_2-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-\text{C}_2\text{H}_5 \rightleftharpoons$
Acetoacetic ester (keto form)
 $\text{CH}_3-\overset{\text{OH}}{\underset{|}{\text{C}}}=\text{CH}-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-\text{C}_2\text{H}_5$
(enolic form)

13. (d) $2\text{RCOOH} \xrightarrow{-\text{H}_2\text{O}} (\text{RCO})_2\text{O}$
Acid anhydride

14. (d) $\text{HOOC}-\text{CH}_2-\overset{\text{OH}}{\underset{\text{COOH}}{\text{C}}}-\text{CH}_2-\text{COOH}$

It is citric acid consist three carboxylic group.

16. (c) Wax are long chain ester.
17. (d) Glycine do not have the chiral carbon so it is not optically active acid.

18. (d) Except phenyl acetic acid all rest acid are fatty acid.
19. (c) Vinegar contain 8-10% acetic acid.
20. (b,d) General formula of monocarboxylic acid is $\text{C}_n\text{H}_{2n+1}\text{COOH}$ or $\text{C}_n\text{H}_{2n}\text{O}_2$.
21. (a) Formula of Acetamide is CH_3CONH_2 which consist single oxygen atom.
22. (a) Urea behaves as a monoacidic base and react with nitric acid and form sparingly soluble nitrate.
23. (c) Fats and oil jointly known as lipid which are the ester of glycerol with high fatty acid.
26. (b) Urea is the diamide of carbonic acid.

So two mole of NH_3 required that why it is the diamide of carbonic acid.

27. (c) Phthalic acid is the isomer of 1, 4 benzene dicarboxylic acid because both have the same molecular formula but differ in their structure.

28. (d) Esters are RCOOR' , where OR' = alkyl group and $\text{R} = \text{H}$ or alkyl or aryl group.
29. (a) Soaps are the sodium or potassium salts of higher fatty acids.
33. (d) Vinegar is the diluted solution of acetic acid (CH_3COOH). It is formed by the fermentation of ethyl alcohol in the presence of enzyme acetobacter.

34. (c)
35. (a) Acetic acid is the chief constituent of vinegar and hence its name (Latin : acetum = vinegar).
36. (b) Phenol was discovered by Runge in the middle oil fraction of coal-tar distillation and named it 'carbolic acid' (carbo-coil, oleum = oil) or phenol containing 5% water in liquid at room temperature and it is termed as carbolic acid.
37. (a) Any electron withdrawing substituent (having -I-effect) stabilises the anion by dispersing the negative charge and therefore, increases the acidity. Chlorine is an electron withdrawing group.
38. (d) The order of reactivity of acid derivatives towards different reactions decreases in the order,

In other words, the reactivity decreases as the basicity of the leaving group increases i.e.,

Preparation of Carboxylic Acids and Their Derivatives

1. (d) $\text{CH}_3\text{CH}_2\text{NO}_2 + \text{H}_2\text{O} \xrightarrow{\text{H}_2\text{SO}_4} \text{CH}_3\text{COOH} + \text{NH}_2\text{OH}$
2. (a) $\text{HCOOH} + \text{PCl}_5 \rightarrow \text{HCOCl} + \text{POCl}_3 + \text{HCl}$
Formic acid Formyl chloride
4. (c) $2\text{CH}_3\text{CHO} \xrightarrow{\text{Al}(\text{OC}_2\text{H}_5)_3} \text{CH}_3\text{CH}_2\text{OH} + \text{CH}_3\text{COOH} \rightarrow \text{CH}_3\text{COOC}_2\text{H}_5 + \text{H}_2\text{O}$
Ethylacetate
5. (c) $\text{CH}_3\text{CHO} \xrightarrow[\text{H}_2\text{SO}_4]{\text{K}_2\text{Cr}_2\text{O}_7} \text{CH}_3\text{COOH}$
6. (a) $\text{C}_2\text{H}_5\text{OH} \xrightarrow{\text{Acetobacter}} \text{CH}_3\text{COOH}$
7. (a) $\text{CO} + \text{NaOH} \xrightarrow{\Delta} \text{HCOONa}$

10. (b) Reimer-Tiemann reaction involves a carbene intermediate.

It is called esterification reaction.

This reaction is known as Hell Volhard Zelinsky reaction.

42. (b) When an acyl halide is heated with acid salt, anhydrides are formed

43. (b) CO_2 adds to Grignard's reagent to yield acids.

44. (a) Amide, on treating with HNO_2 , give acids.

45. (b) Aldehydes are easily oxidised to carboxylic acids on treatment with common oxidising agents like nitric acid, potassium permanganate and dichromate etc.

47. (c) This is an example of Perkin's reaction. Therefore, (X) is Acetic anhydride.

The above given reaction is known as Reimer-Tiemann reaction.

49. (a) $\text{C}_2\text{H}_5\text{OH} \xrightarrow{[\text{O}]} \text{CH}_3\text{COOH}$

Properties of carboxylic acids and Their derivatives

1. (c) $\text{BrCH}_2\text{CH}_2\text{COOH}$ is least acidic or has less K_a i.e., dissociation constant. It is (a) due to lesser $-I$ effect of Br than F and (b) Br atom further away from $-\text{COOH}$ group.

3. (d) $\xrightarrow{\text{Zn Pdr}}$

5. (d) Presence of $-I$ effect chlorine atom increases the acidic nature by withdrawing electrons

8. (b) The reaction of acetamide with water is an example of hydrolysis.

9. (a) Methanoic acid resemble with aldehyde due to its structure. So

11. (a) $\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{R}' \xrightarrow{\text{LiAlH}_4} \text{R}-\text{CH}_2\text{OH} + \text{R}'\text{OH}$
- Two units of alcohols

13. (b) $\text{CH}_3\text{COOH} + \text{CH}_3-\text{Mg}-\text{X} \rightarrow \text{CH}_3-\text{CH}_3$

14. (b) Forms H -bonding by means two highly electronegative atoms present in it.

19. (d) $\text{F}-\text{CH}_2-\text{COOH} > \text{Cl}-\text{CH}_2-\text{COOH} >$

20. (d) Formic acid resemble with aldehyde due to its structure so it reduce Tollen's reagent.

24. (d) $\text{CHF}_2 - \text{COOH}$. Difluoroacetic acid is strongest because presence of two F atoms increases its acidic nature.
25. (c) CH_3COOH does not give silver mirror test.
26. (c) $2\text{CH}_3\text{COOH} \xrightarrow[300^\circ\text{C}]{\text{MnO}} \text{CH}_3\text{COCH}_3 + \text{CO}_2 + \text{H}_2\text{O}$
Acetone
27. (b) CH_3COOH is slightly ionised than H_2SO_4 .
28. (c) Presence of methyl group decreases the acidic character of acetic acid due to positive inductive effect (+I).
29. (c) $\text{CH}_3\text{CO} > \text{O} + 2\text{NH}_3 \rightarrow \text{CH}_3\text{CONH}_2 + \text{CH}_3\text{COONH}_4$
Acetamide Ammonium acetate
30. (c)
32. (c) $\text{CH}_3\text{COOH} \xrightarrow{\text{LiAlH}_4} \text{CH}_3\text{CH}_2\text{OH}$
 $\text{CH}_3\text{CH}_2\text{OH} \xrightarrow{\text{I}_2/\text{NaOH}} \text{CHI}_3 \xrightarrow{\text{Ag}} \text{C}_2\text{H}_2$
34. (c) $\text{HCOOH} + 2\text{Cu}^{+2} \xrightarrow[\text{Red ppt}]{\text{Fehling Solution}} \text{Cu}_2\text{O} + \text{H}_2\text{O} + \text{CO}_2$
Whereas $\text{CH}_3\text{COOH} \xrightarrow{\text{Fehling Solution}} \text{No reaction}$
35. (d) $\text{HCOOH} + \text{NaHCO}_3 \rightarrow \text{HCOONa} + \text{H}_2\text{O} + \text{CO}_2$
 $\text{HCHO} + \text{NaHCO}_3 \rightarrow \text{No reaction}$
37. (d) $\text{CH}_3 - \text{C} \begin{smallmatrix} \text{O} \cdots \cdots \text{HO} \\ \text{OH} \cdots \cdots \text{O} \end{smallmatrix} \text{C} - \text{CH}_3$.
Due to H-bonding
38. (c) $\text{CH}_3\text{COOH} + \text{NaHCO}_3 \rightarrow \text{CH}_3\text{COONa} + \text{H}_2\text{O} + \text{CO}_2$
39. (c) Acetic acid forms dimer in benzene due to which molecular mass becomes doubles.
42. (b) $\text{CH}_3\text{COOH} \xrightarrow{\text{I}_2/\text{Red p}} \text{CH}_2\text{Cl} - \text{COOH}$
44. (c) $\text{CH}_3\text{COOH} \xrightarrow{\Delta/\text{P}_2\text{O}_5} (\text{CH}_3\text{CO})_2\text{O}$
47. (c) $\text{COOH} + \text{KMnO}_4 + \text{H}_2\text{SO}_4 \rightarrow 2\text{CO}_2 + \text{H}_2\text{O} + \text{K}_2\text{SO}_4 + \text{MnSO}_4$
49. (c) $\text{R} - \text{X} \xrightarrow{\text{KCN}} \text{R} - \text{CN} \xrightarrow[\text{H}_2\text{O}]{\text{NaOH}} \text{R} - \text{COONa} + \text{NH}_3$
50. (c) $\text{CH}_3\text{CH}_2\text{COOH} \xrightarrow{\text{Cl}_2/\text{Fe}} \text{CH}_3 - \underset{\text{Cl}}{\text{CH}} - \text{COOH}$
 $\text{CH}_2 = \text{CH} - \text{COOH} \xleftarrow[\text{KOH}]{\text{Alcohol}}$

52. (b) N-acetyl paraamino phenol
53. (b) Because it does not have α -hydrogen atom.
54. (b) Molecular Mass increases due to dimer formation

55. (d)
In benzene solution
dimer (Association)
57. (c) $2\text{C}_2\text{H}_5\text{OH} + 2\text{Na} \rightarrow 2\text{C}_2\text{H}_5\text{ONa} + \text{H}_2$
 $2\text{CH}_3\text{COOH} + 2\text{Na} \rightarrow 2\text{CH}_3\text{COONa} + \text{H}_2$
59. (c) $\text{CH}_3 - \text{CH}_2 - \text{CCl}_2 - \text{COOH}$; α, α -dichloro butanoic acid is most acidic. Hence it will easily lose H^+ ions in solution.
62. (c) $\text{CH}_3\text{COOH} \xrightarrow{\text{NH}_3} \text{CH}_3\text{CONH}_2 \xrightarrow[\text{P}_2\text{O}_5]{\Delta} \text{CH}_3 - \text{C} \equiv \text{N}$
63. (b) $\text{CH}_3\text{COOH} \xrightarrow{\text{LiAlH}_4} \text{CH}_3\text{CH}_2\text{OH}$
64. (c) $\text{CH}_3\text{CONH}_2 + \text{NaOH} \xrightarrow{\text{Boil}} \text{CH}_3\text{COONa} + \text{NH}_3$
Acetamide
65. (b) $\text{CH}_2 = \text{CH} - (\text{CH}_2)_5\text{COOH} \xrightarrow[\text{HBr}]{\text{Peroxide}} \text{CH}_2 - (\text{CH}_2)_6 - \text{COOH}$
Br

70. (a)
- 1,1-diphenylethanol

77. (c) Alcohols react with acids to form esters which have fruity smell.

 78. (a) Acidity decreases with the decrease in electronegativity of halogen *i.e.*,
 $\text{FCH}_2\text{COOH} > \text{ClCH}_2\text{COOH} > \text{BrCH}_2\text{COOH}$

 80. (d) Formic acid, HCOOH shows reducing property.

 81. (a) HCOOH reduces ammoniacal silvernitrate solution, *i.e.*, Tollen's reagent but acetic acid does not.

 99. (a) In this reaction $\alpha\text{-H}$ is replaced by chlorine.

100. (a) Urea are neutral in nature in aqueous solution.

106. (a) Due to intramolecular hydrogen bonding.

108. (d) Acetamide can behave as weak acid as well as base.

112. (b) Benzene sulphonyl chloride is called Hinsberg's reagent.

 114. (a) $\text{CH}_3\text{COOH} < \text{ClCH}_2\text{COOH} < \text{ClCH}_2\text{COOH} < \text{Cl}_2\text{CHCOOH}$
 Increasing order of acidic nature.

 Electron withdrawing group, increases the acidity of benzoic acid, *O*-isomer will have higher acidity than corresponding *m* and *p*-isomer due to ortho effect.

The exchange of alcohol residue known as alcoholysis or transesterification

123. (a) It is picric acid because it has three $-NO_2$ group are arranged which are ortho and para position
124. (d) Benedict solution is readily reduced by aldehyde. It does not oxidise anhydrides

This reaction is an example of addition reaction.

126. (a) When acetic acid is reacted with PCl_5 the product formed are acetyl chloride, phosphoryl chloride and hydrochloric acid
- $$CH_3COOH + PCl_5 \rightarrow CH_3COCl + HCl + POCl_3$$
- Acetic acid Phosphorus Penta chloride Acetyl Chloride Hydro-Chloric acid Phosphoryl chloride

130. (a) Vinegar is 6 – 10% aqueous solution of acetic acid
131. (a) All esters are pleasant liquid having pleasant fruity smell. Many of them are used in perfumery, e.g. Benzyl acetate etc.
132. (a) Lactic acid has one asymmetric (chiral) carbon atom, hence it has $(2^n = 2)$ optical isomers.

133. (a) 4-methyl benzene sulphonic acid is stronger than acetic acid thus it will release acetic acid from sodium acetate.

137. (c) Claisen condensation

step II $\downarrow$ heated in presence of acid (H)

This reaction is known as Clemmenson reduction.

141. (a) Glycine is a amphoteric acid as it contains both acidic as well as basic groups.

142. (a) Cinnamic acid reacts with bromine in carbon tetrachloride to give dibromocinnamic acid.

143. (a) OF all the acid derivatives, acid chlorides, i.e. CH_3COCl is most reactive.

The order of reactivity of acid derivatives decreases in the following order,

144. (c) Reaction can be explained as follows

P_2O_5 acts as a dehydrating agent.

Uses of Carboxylic Acids and Their Derivatives

Critical Thinking Questions

5. (a) Since a single alkyl halide is formed on treatment with HI , it must be a symmetrical ether *i.e.*, ethoxyethane.

8. (d) Resonance stabilization of their conjugate base *i.e.*, carboxylate ion.

12. (b) $-\text{COOH}$ and $-\text{OH}$ group form the hydrogen bond by which they have high boiling point. $-\text{COOH}$ group show strong hydrogen bonding so it form dimer and have more boiling point than $-\text{OH}$ group. While $-\text{CHO}$ group do not form hydrogen bond. Thus the reactivity order are as $3 > 1 > 2$.

13. (c) CaC_2O_4 is a salt of oxalic acid which is more acidic than acetic acid, so it is insoluble in acetic acid.

14. (d) $-\text{COOH}$ and COCH_3 are meta directing group due to the

presence of $-\overset{\text{O}}{\parallel}{\text{C}}-$, similarly CN is also meta directing due to the presence of multiple bond while NHCOCH_3 is ortho/para directing group because of less electron density over $-\overset{\text{O}}{\parallel}{\text{C}}-$ group.

15. (c) Iodoform test is given by all the compounds having $\text{CH}_3-\overset{\text{O}}{\parallel}{\text{C}}-$ or $\text{CH}_3-\overset{\text{O}}{\underset{\text{OH}}{\text{C}}}-$ group.

17. (c) Formic acid can not be prepared by grignard's reagent. Higher acids are prepared by the reaction of CO_2 on grignard's reagent

Assertion & Reason

1. (a) Carboxylic acid exist as dimer due to the formation of hydrogen bonding.

2. (c) Trichloro acetic acid is stronger than acetic acid because the electron withdrawing group withdraw electrons from the carboxylate base and thus increasing the acid strength.

3. (c) Carboxylic acids ($RCOOH$) dissolves in water due to hydrogen bonding between H -atom of $-COOH$ group and O -atom of water. As alkyl portion R is non polar and lyophobic, this effect predominates as $-R$ gets larger (over five carbon atoms).
4. (b) As carboxylic acids are resonance stabilized they do not contain true carbonyl group as is present in carbonyl compounds.

5. (c) Formic acid is stronger than acetic acid

Presence of CH_3 group in acetate ion shows $+I.E$, and there by intensifying charge on O^- of acetate ion than formate ion or acetate ion is destabilized. Thus formate ion is more stable than acetate ion or $HCOOH$ loses proton more easily than CH_3COOH .

6. (e) Both fumaric and maleic acids have two ionisable H^+ i.e. protons. The maleate monoanion shows intramolecular H -bonding and thus requires more energy to give maleate dianion. It is therefore second dissociation of fumaric acid is more than maleic acid since former does not show intramolecular H -bonding.
7. (c) Larger is the size of alkyl group of ester, greater is the steric effect and thus lesser will be rate of hydrolysis.

8. (e) The melting point of an aliphatic carboxylic acid containing an even number of carbon atoms is higher than the next lower and next higher homologue containing odd number of carbon atoms.
9. (e) Electron withdrawing groups increase the acidity of carboxylic acids by stabilising the conjugate base through delocalisation of the negative charge by inductive and resonance effects.
10. (a) The larger the electron withdrawing inductive effect the greater is the acidity.
11. (c) In aminoacetic acid, NH_2 group is electron repelling in nature.
12. (b) Boiling points of carboxylic acids are higher due to their tendency to associate and form dimers to a greater extent by hydrogen bonding.
13. (a) Both formic acid and oxalic acid behave as reducing agent and decolourise acidified $KMnO_4$ solution.
- $$2KMnO_4 + 3H_2SO_4 \rightarrow K_2SO_4 + 2MnSO_4 + 3H_2O + 5[O]$$
14. (c) Esters containing α -hydrogens on treatment with a base form a carbanion which brings about nucleophilic acyl substitution at the carbonyl group of the other molecule of the ester to form β -keto esters.

Carboxylic acids and
Their derivatives

SET Self Evaluation Test -28

1. Which of the following is the weakest acid [CPMT 2001]
- (a)  (b) CH_3COOH
- (c) HCOOH (d) 
2. Pyruvic acid is obtained by [AFMC 1995]
- (a) Oxidation of acetaldehyde cyanohydrin
(b) Oxidation of acetone cyanohydrin
(c) Oxidation of formaldehyde cyanohydrin
(d) None of these
3. The product obtained by dry distillation of calcium formate on reacting with ammonia yields
- (a) Formamide (b) Acetamide
(c) Acetaldehyde ammonia (d) Urotropine
4. In the reaction
- $$\text{C}_8\text{H}_6\text{O}_4 \xrightarrow{\Delta} \text{X} \xrightarrow{\text{NH}_3}$$
- The compound X is [Roorkee Qualifying 1998]
- (a) Phthalic anhydride (b) Phthalic acid
(c) o-xylene (d) Benzoic acid
5. Ethyl acetate reacts with CH_3MgBr to form [MP PET 1999]
- (a) Secondary alcohol (b) Tertiary alcohol
(c) Primary alcohol and acid (d) Acid
6. In quick vinegar process of acetic acid, the temperature of mixture is [RPMT 2003]
- (a) 300 K (b) 427 K
(c) 500 K (d) 350 K
7. Formic acid can reduce [CPMT 1987]
- (a) Tollen's reagent (b) Mercuric chloride
(c) KMnO_4 (d) All of these
8. 0.2 gm of fine animal charcoal is mixed with half litre of acetic acid (–SM) solution and shaken for 30 minutes [BHU 1998]
- (a) The concentration of the solution decreases
(b) Concentration increases
(c) Concentration remains same
(d) None of these
9. Dimerisation in carboxylic acid is due to [KCET 2002]
- (a) Ionic bond
(b) Covalent bond
(c) Coordinate bond
(d) Intermolecular hydrogen bond
10. A colourless organic compound gives brisk effervescences with a mixture of sodium nitrite and dil. HCl . It could be [CPMT 1978]
- (a) Glucose (b) Oxalic acid
(c) Urea (d) Benzoic acid
11. What is formed when benzoyl chloride reacts with aniline in presence of sodium hydroxide [BHU 1996]
- (a) Acetanilide (b) Benzanilide
(c) Benzoic acid (d) Azobenzene
12. Strong acid among the following is [CBSE PMT 1992; AFMC 1998; BHU 2000]
- (a) CF_3COOH (b) CBr_3COOH
(c) CH_3COOH (d) CCl_3COOH
13. Aspirin is obtained by the reaction of salicylic acid with [AFMC 1998]
- (a) Acetone (b) Acetaldehyde
(c) Acetyl chloride (d) Acetic anhydride
14. Oxalic acid when reduced with zinc and H_2SO_4 gives [Tamil Nadu CET 2001]
- (a) Glyoxallic acid (b) Glyoxal
(c) Glycollic acid (d) Glycol
15. A distinctive and characteristic functional group in fats is [NCERT 1981; MP PET 1995]
- (a) A ketonic group
(b) An ester group
(c) A peptide group
(d) An alcoholic group
16. Which substance will give amide when heated with NH_3 [CPMT 1997]
- (a) Potassium (b) Hydrogen
(c) Ethane (d) Nitrogen
17. Which acid has least pK_a value [CPMT 1982]
- (a) $\text{Cl}_3\text{C.COOH}$ (b) $\text{Cl}_2\text{CH.COOH}$
(c) $\text{Cl.CH}_2\text{COOH}$ (d) CH_3COOH

1. (a) Phenol is a weaker acid than carboxylic acids.

Fehling solution -

Mercury chloride -

CO_2 evolve with brisk effervescence.

11. (b) It is known as Schotten Baumann reaction.

12. (a) Due to -I effect of three F atom CF_3COOH is a strong acid.

15. (b) Fat is the ester of higher acids & glycerol.

17. (a) $(\text{Cl}_3\text{C} - \text{COOH})$ Trichloroacetic acid has least pK_a value and is most acidic.

8. (a) Activated charcoal adsorbed the impurity of acetic acid by which the concentration of acetic acid solution decrease.

9. (d) Intermolecular hydrogen bonding leads to dimerisation of carboxylic acid in non-aqueous solvents.

Chapter 29

Nitrogen Containing Compounds

The important nitrogen containing organic compounds are alkyl nitrites (*RONO*), nitro-alkanes (*RNO*), aromatic nitro compounds (*ArNO*), alkyl cyanides (*RCN*), alkyl isocyanides (*RNC*), amines ($-NH$), aryl diazonium salts (*ArNCl*), amides ($-CONH$) and oximes ($>C=N OH$).

Alkyl nitrites and nitro alkanes

Nitrous acid exists in two tautomeric forms.

Corresponding to these two forms, nitrous acid gives two types of derivatives, i.e., alkyl nitrites and nitro alkanes.

It is important to note that nitro alkanes are better regarded as nitro derivatives of alkanes, while alkyl nitrites are regarded as alkyl esters of nitrous acid.

(i) **Alkyl nitrites** : The most important alkyl nitrite is ethyl nitrite.

Ethyl nitrite (C_2H_5ONO)

(i) **General methods of preparation** : It is prepared

(a) By adding concentrated HCl or H_2SO_4 to aqueous solution of sodium nitrite and ethyl alcohol at very low temperature ($0^\circ C$).

(b) From Ethyl iodide

(c) By the action of N_2O_3 on ethyl alcohol.

(ii) **Physical properties**

(a) At ordinary temperature it is a gas which can be liquified on cooling to a colourless liquid, (boiling point $17^\circ C$) having characteristic smell of apples.

(b) It is insoluble in water but soluble in alcohol and ether.

(iii) **Chemical properties**

(a) **Hydrolysis** : It is hydrolysed by aqueous alkalis or acids into ethyl alcohol.

(b) **Reduction** :

Small amount of hydroxylamine is also formed.

(iv) **Uses**

(a) Ethyl nitrite dilates the blood vessels and thus accelerates pulse rate and lowers blood pressure, so it is used as a medicine for the treatment of asthma and heart diseases (angina pectoris).

(b) Its 4% alcoholic solution (known as **sweet spirit of nitre**) is used in medicine as a diuretic.

(c) Since it is easily hydrolysed to form nitrous acids, it is used as a source of nitrous acid in organic synthesis.

□ **Isoamyl nitrite** is used as an antispasmodic in angina pectoris and as a restorative in cardiac failure.

(2) **Nitro alkanes or Nitroparaffins** : Nitro alkanes are regarded as nitro derivatives of hydrocarbons.

(i) **Classification** : They are classified as primary, secondary and tertiary depending on the nature of carbon atom to which nitro groups is linked.

(ii) **General methods of preparation**

(a) By heating an alkyl halide with aqueous alcoholic solution of silver nitrite

Some quantity of alkyl nitrite is also formed in this reaction. It can be removed by fractional distillation since alkyl nitrites have much lower boiling points as compared to nitro alkanes.

(b) By the direct nitration of paraffins (Vapour phase nitration)

With higher alkanes, a mixture of different nitro alkanes is formed which can be separated by **fractional distillation**.

(c) By the action of sodium nitrite on α -halo carboxylic acids

(d) By the hydrolysis of α -nitro alkene with water or acid or alkali (Recent method)

(e) Tertiary nitro alkanes are obtained by the oxidation of *t*-alkyl amines with KMnO_4 .

(iii) **Physical properties**

(a) Nitro alkanes are colourless, pleasant smelling liquids.

(b) These are sparingly soluble in water but readily soluble in organic solvents.

(c) Their boiling points are much higher than isomeric alkyl nitrites due to polar nature.

(d) Again due to polar nature, nitro alkanes are excellent solvents for polar and ionic compounds.

□ 1° and 2° - Nitro alkanes are known to exist as tautomeric mixture of nitro-form and aci-form.

(iv) **Chemical properties**

(a) **Reduction** : Nitro alkanes are reduced to corresponding primary amines with Sn and HCl or Fe and HCl or catalytic hydrogenation using nickel as catalyst.

However, when reduced with a neutral reducing agent (**Zinc dust + NH_4Cl**), nitro alkanes form **substituted hydroxylamines**.

(b) **Hydrolysis** : Primary nitro alkanes on hydrolysis form hydroxylamine and carboxylic acid.

secondary nitro alkanes on hydrolysis form ketones.

(c) **Action of nitrous acid** : Nitrous acid reacts with primary, secondary and tertiary nitro alkanes differently.

Tertiary nitro alkanes do not react with nitrous acid.

(d) **Thermal decomposition** :

On rapid heating nitro alkanes decompose with great violence.

(e) **Halogenation** : Primary and secondary nitro alkanes are readily halogenated in the α -position by treatment with chlorine or bromine.

(f) **Condensation with aldehyde** :

(g) **Reaction with grignard reagent** : The aci-form of nitroalkane reacts with Grignard reagent forming alkane.

□ The nitrogen of $-\text{NO}_2$ carrying a positive charge exerts a powerful $-I$ effect and thus activates the hydrogen atom of the α -carbon. Thus the important reactions of nitroalkanes are those which involve α -hydrogen atom of primary and secondary nitroalkanes (**tertiary nitroalkanes have no α -hydrogen atom and hence do not undergo such type of reactions**).

□ **Acidic character** : The α -hydrogen atom of primary and secondary nitroalkanes are weakly acidic and thus can be abstracted by strong alkalis like aq. NaOH . Therefore, 1° and 2° nitroalkanes dissolve in aq. NaOH to form salts. For examples.

Thus 1° and 2° nitroalkanes are acidic mainly due to following two reasons,

(a) Strong electron withdrawing effect of the $-\text{NO}_2$ group.

(b) Resonance stabilisation of the carbanion (I) formed after the removal of proton.

The aci-form of nitroalkanes is relatively more acidic because it produces relatively more conjugate base.

(v) **Uses** : Nitro alkanes are used,

(a) As solvents for polar substances such as cellulose acetate, synthetic rubber etc.

(b) As an explosive.

(c) For the preparation of amines, hydroxylamines, chloropicrin etc.

Table : 29.1 Distinction between Ethyl nitrite and Nitro ethane

Test	Ethyl nitrite ($\text{C}_2\text{H}_5\text{ONO}$)	Nitro ethane ($\text{C}_2\text{H}_5\text{NO}_2$)
------	--	--

	(Alkyl nitrite, $RONO$)	(Nitro alkane, RNO_2)
Boiling point	Low, $17^\circ C$	Much higher, $115^\circ C$
Reduction with metal and acid (Sn/HCl) or with $LiAlH_4$	Gives alcohol + hydroxyl amine or NH_2 . $C_2H_5ONO + 4H \rightarrow C_2H_5OH + NH_2OH$ $RONO + 6H \rightarrow ROH + NH_3 + H_2O$	Gives corresponding primary amine. $C_2H_5NO_2 + 6H \rightarrow C_2H_5NH_2 + 2H_2O$ $RNO_2 + 6H \rightarrow RNH_2 + 2H_2O$
Action of $NaOH$ (alkalies).	Readily hydrolysed to give corresponding alcohol and sodium nitrite (decomposition). $C_2H_5ONO + NaOH \rightarrow C_2H_5OH + NaNO_2$ $RONO + NaOH \rightarrow ROH + NaNO_2$	Not decomposed, i.e., alcohols are not produced. But it may form soluble sodium salt, because in presence of alkali the nitro form changes into aci form, which dissolves in alkalies to form sodium salt. $CH_3 - CH = N \begin{matrix} \nearrow OH \\ \searrow O \end{matrix} \xrightarrow{NaOH} CH_3 - CH = N \begin{matrix} \nearrow ONa \\ \searrow O \end{matrix}$
Action of HNO_2 ($NaNO_2/HCl$)	No action with nitrous acid.	Primary nitro alkanes forms nitrolic acid, which dissolve in alkali to give red solution. Secondary nitro alkane yields pseudo-nitrol, which dissolves in alkali to give blue solution. Tertiary nitro alkanes does not react with nitrous acid.

Aromatic Nitro Compounds

Aromatic nitro compounds are the derivatives of aromatic hydrocarbons in which one or more hydrogen atom (s) of the benzene nucleus has been replaced by nitro ($-NO_2$) group.

(i) Preparation

(i) **Nitration (Direct method)** : The number of $-NO_2$ groups introduced in benzene nucleus depends upon the nature and concentration of the nitrating agent, temperature of nitration and nature of the compound to be nitrated.

(a) **The nature of the nitrating agent** : For example,

(b) **Temperature of nitration** : For example,

(c) **Nature of the compound to be nitrated** : Presence of electron-releasing group like $-OH$, $-NH_2$, $-CH_3$, $-OR$, etc., in the nucleus facilitates nitration. Thus aromatic compounds bearing these groups (i.e. phenol, aniline, toluene, etc.) can be nitrated readily as compared to benzene. Thus benzene is not affected by dilute HNO_3 while phenol, aniline and toluene forms the corresponding *ortho*- and *para*-nitro compounds.

On the other hand, nitration of aromatic compounds having electron withdrawing groups like $-NO_2$, $-SO_3H$ requires powerful nitrating agent (like fuming HNO_3 + conc. H_2SO_4) and a high temperature.

(ii) **Indirect method** : The aromatic nitro compounds which can not be prepared by direct method may be prepared from the corresponding amino compound.

(2) Physical properties

(i) Aromatic nitro compounds are insoluble in water but soluble in organic solvents.

(ii) They are either pale yellow liquids or solids having distinct smells. For example, *nitro benzene* (oil of Mirabane) is a pale yellow liquid having a smell of bitter almonds.

(3) Chemical properties

(i) Resonance in nitrobenzene imparts a partial double bond character to the bond between carbon of benzene nucleus and nitrogen of the $-NO_2$ group with the result the $-NO_2$ group is firmly bonded to the ring and therefore cannot be replaced by other groups, i.e., it is very inert.

(ii) **Displacement of the $-NO_2$ group** : Although resonance bond of nitrobenzene cannot be replaced by other groups, but if an *ortho* or *para* $-NO_2$ group is present on the benzene ring of nitrobenzene in the *o*- or *p*-position, it can be replaced by a nucleophile. For example,

(iii) **Reduction** : Aromatic nitro compounds can be reduced to a variety of product as shown below in the case of nitrobenzene.

The nature of the final product depends mainly on the *nature (acidic, basic or neutral) of the reduction medium and the nature of the reducing agent.*

(a) *Reduction in acidic medium*

Nitrobenzene
Aniline
 Reduction of dinitrobenzene with ammonium sulphide reduces only
 one – NO_2 group (***selective reduction***)

(b) *m*-Dinitro benzene
Reduction in neutral medium :

(c) *Reduction in alkaline medium :*

Azoxybenzene on further reduction yields azobenzene and hydrazobenzene.

(d) *Electrolytic reduction :*

- *Weakly acidic medium* of electrolytic reduction gives **aniline**.
- *Strongly acidic medium* gives phenylhydroxylamine which rearranges to ***p*-aminophenol**.

- Alkaline medium of electrolytic reduction gives all the mono- and di-nuclear reduction products mentioned above in point (c).

(iv) **Electrophilic substitution** : Since $-NO_2$ group is deactivating and m -directing, electrophilic substitution (halogenation, nitration and sulphonation) in simple aromatic nitro compounds (e.g. nitrobenzene) is very difficult as compared to that in benzene. Hence vigorous reaction

conditions are used for such reaction and the new group enters the *m*-position.

Although nitrobenzene, itself undergoes electrophilic substitution under drastic conditions, nitrobenzene having activating groups like alkyl, $-OR$, $-NH$ etc. undergoes these reactions relatively more readily.

Sym-trinitrobenzene (TNB) is preferentially prepared from easily obtainable TNT rather than the direct nitration of benzene which even under drastic conditions of nitration gives poor yields.

(v) **Nucleophilic Substitution**: Benzene is inert to nucleophiles, but the presence of $-NO_2$ group in the benzene ring activates it towards $SNAr$ at o - and p -positions to nucleophiles.

(vi) **Effect of the $-NO_2$ group on other nuclear substituents**

(a) *Effect on nuclear halogen* : The nuclear halogen is ordinarily inert, but if it carries one or more electron-withdrawing groups (like $-NO$) in σ - or p -position, the halogen atom becomes active for nucleophilic substitutions and hence can be easily replaced by nucleophiles ($KOH, NH_3, NaOC_2H_5$).

2, 4-Dinitrochlorobenzene

(Where, $Nu = OH, NH_2, OC_2H_5$)

Cyanides and Isocyanides

Hydrogen cyanide is known to exist as a tautomeric mixture.

Hence, it forms two types of alkyl derivatives which are known as alkyl cyanides and alkyl isocyanides.

(i) Alkyl Cyanides

(i) Methods of preparation

(a) From alkyl halides: The disadvantage of this method is that a mixture of nitrile and isonitrile is formed.

Industrially, alkyl cyanides are prepared by passing a mixture of carboxylic acid and ammonia over alumina at 500°C.

(c) From Grignard reagent

(d) From primary amines: Primary amines are dehydrogenated at high temperature to form alkyl cyanides. This is also a **commercial method**.

(e) From oximes:

(ii) Physical properties

(a) Alkyl cyanides are neutral substance with pleasant odour, similar to bitter almonds.

(b) Lower members containing upto 15 carbon atoms are liquids, while higher members are solids.

(c) They are soluble in water. The solubility decreases with the increase in number of carbon atoms in the molecule.

(d) They are soluble in organic solvents.

(e) They are poisonous but *less poisonous than HCN*

(iii) Chemical properties

(a) Hydrolysis

(b) Effect on phenolic -OH group: The acidity of the phenolic hydroxyl group is markedly increased by the presence of -NO₂ group in *o*- and *p*-position.

The decreasing order of the acidity of nitrophenols follows following order

Increased acidity of *o*- and *p*-nitrophenols is because of the fact that the presence of electron-withdrawing -NO₂ group in *o*- and *p*-position (*s*) to phenolic -OH group stabilises the phenoxide ions (recall that acidic nature of phenols is explained by resonance stabilisation of the phenoxide ion) to a greater extent.

Due to increased acidity of nitrophenols, the latter react with phosphorus pentachloride to give good yields of the corresponding chloro derivative, while phenol itself when treated with PCl₅ gives poor yield of chlorobenzene.

(4) Uses

(i) On account of their high polarity, aromatic nitro compounds are used as solvents.

(ii) Nitro compounds like TNT, picric acid, TNB etc. are widely used as **explosives**.

(iii) These are used for the synthesis of aromatic amino compounds.

(iv) Nitro benzene is used in the preparation of shoe polish and scenting of cheap soaps.

(b) **Reduction** : When reduced with hydrogen in presence of *Pt* or *Ni*, or *LiAlH₄* (Lithium aluminium hydride) or sodium and alcohol, alkyl cyanides yield primary amines.

However, when a solution of alkyl cyanides in ether is reduced with stannous chloride and hydrochloric acid and then steam distilled, an aldehyde is formed (**Stephen's reaction**).

(c) *Reaction with Grignard reagent* : With grignard's reagent, an alkyl cyanide forms a ketone which further reacts to form a tertiary alcohol.

(d) *Alcohololysis* :

(iv) **Uses :** Alkyl cyanides are important intermediates in the organic synthesis of a large number of compounds like acids, amides, esters, amines etc.

(2) Alkyl Isocyanides

(i) *Methods of preparation*

(a) *From alkyl halides :*

(b) *From primary amines (Carbylamine reaction) :*

(c) *From N-alkyl formamides :*

(ii) *Physical properties*

(a) Alkyl isocyanides are colourless, unpleasant smelling liquids.

(b) They are insoluble in water but freely soluble in organic solvents.

(c) Isonitriles are much more poisonous than isomeric cyanides.

(iii) *Chemical properties*

(a) *Hydrolysis :*

$$(b) \text{ Reduction: } R-N \rightleftharpoons C + 4H \xrightarrow[300^\circ C]{Ni} RNHCH_3$$

Alkylisocyanide secondary amine

(c) *Action of heat* : When heated for sometime at 250°C , a small amount of isonitrile changes into isomeric nitrile.

(d) *Addition reaction*: Alkyl isocyanide give addition reactions due to presence of unshared electron pair on carbon atom.

The following are some of the addition reactions shown by alkyl isocyanides.

(iv) **Uses :** Due to their unpleasant smell, alkyl isocyanides are used in detection of very minute leakage. Carbylamine reaction is used as a test for the detection of primary amino group.

☐ *Methyl isocyanate (MIC) gas was responsible for Bhopal gas tragedy in Dec. 1984.*

□ Cyanides have more polar character than isocyanides. Hence cyanides have high boiling points and are more soluble in water. However, both isomers are more polar than alkylhalides, hence their boiling points are higher than the **corresponding alkyl halides**.

□ Being less polar, isocyanides are not attacked by OH ions.

Table : 29.2 Comparison of Alkyl Cyanides and Alkyl Isocyanides

Test	Ethyl cyanide	Ethyl isocyanide
Smell	Strong but pleasant	Extremely unpleasant
Dipole moment	More ($\approx 4D$)	Less ($\approx 3D$)
B.P.	$98^{\circ}C$ (i.e. High)	$78^{\circ}C$ (i.e. low)
Solubility in water.	Soluble	Insoluble
Hydrolysis with acids	Gives propionic acid (Acid, in general)	Give ethyl amine (1° amine, in general)
Hydrolysis with alkalies	Same as above	No action
Reduction	Gives propylamine (1° amine, in general)	Gives ethylmethyl amine (2° amine, in general)
Stephen's reaction	Gives propionaldehyde (Aldehyde, in general)	Does not occur
Heating ($250^{\circ}C$)	No effect	Ethyl cyanide is formed

Amines

Amines are regarded as **derivatives of ammonia** in which one, two or all three hydrogen atoms are replaced by alkyl or aryl group.

The characteristic groups in primary, secondary and tertiary amines

In addition to above amines, tetra-alkyl derivatives similar to ammonium salts also exist which are called **quaternary ammonium compounds**.

(i) **Simple and mixed amines** : Secondary and tertiary amines may be classified as **simple** or **mixed** amines according as all the alkyl or aryl groups attached to the nitrogen atom are same or different. For example,

The aliphatic amines have **pyramidal shape** with one electron pair. In amines, N undergoes **sp³ hybridisation**.

(2) General methods of preparation

(i) **Methods yielding mixture of amines (Primary, secondary and tertiary)**

(a) **Hofmann's method** : The mixture of amines (1°, 2° and 3°) is formed by the **alkylation of ammonia with alkyl halides**.

The primary amine may be obtained in a good yield by using a large excess of ammonia. The process is also termed as **ammonolysis of alkyl halides**. It is a nucleophilic substitution reaction.

(b) **Ammonolysis of alcohols** :

Primary amine may be obtained in a good yield by using a excess of ammonia.

(ii) **Methods yielding primary amines**

(a) **Reduction of nitro compounds**

(b) **Reduction of nitriles (Mendius reaction)**

The start can be made from alcohol or alkyl halide.

This sequence gives an amine containing one more carbon atom than alcohol.

(c) **By reduction of amides with LiAlH₄**

(d) **By reduction of oximes** : The start can be made from an aldehyde or ketone.

(e) **Hofmann's bromamide reaction or degradation (Laboratory method)** : By this method the **amide (-CONH₂) group is converted into primary amino (-NH₂) group**.

This is the most convenient method for preparing primary amines.

This method gives an **amine containing one carbon atom less than amide**.

(f) **Gabriel phthalimide synthesis** : This method involves the following three steps.

• Phthalimide is reacted with **KOH** to form potassium phthalimide.

• The potassium salt is treated with an alkyl halide.

• The product **N-alkyl phthalimide** is put to hydrolysis with hydrochloric acid when primary amine is formed.

When hydrolysis is difficult, the *N*-alkyl phthalimide can be treated with hydrazine to give the required amine.

(g) By decarboxylation of α -amino acids

(h) By means of a Grignard reagent and chloramine :

(i) By hydrolysis of Isocyanides or Isocyanates

(j) By Schmidt reaction :

In this reaction the acyl azide ($\text{R} \text{---} \text{CON}_3$) and alkyl isocyanate ($\text{R} \text{---} \text{NCO}$) are formed as an intermediate.

The overall reaction which proceeds by the elimination of nitrogen from acyl azide followed by acidic or alkaline hydrolysis to yield primary amine containing one carbonless, is called **Curtius Degradation**.

The method uses acid chloride to prepare primary amine through acyl azide.

The mechanism of **curtius rearrangement** is very similar to Hofmann degradation.

Schmidt reaction converts $\text{R} \text{---} \text{COOH}$ to $\text{R} \text{---} \text{NH}_2$, which is a modification of curtius degradation. In this reaction a carboxylic acid is warmed with sodium azide (NaN_3) and conc. H_2SO_4 . The carboxylic acid is

directly converted to the primary amine without the necessity of isolating alkyl azide.

(k) By Ritter reaction : It is a good method for preparing primary amines having α -tertiary alkyl group.

(l) Reductive amination of aldehydes and ketones :

This reaction probably takes place through the formation of an imine (Schiff's base).

The primary amine can also be converted into sec. or tert. amines by the following steps

(m) By reduction of azide with NaBH_4

(n) By Leuckart reaction : Aldehydes or ketones react with ammonium formate or with formamide to give formyl derivative of primary amine.

These formyl derivatives are readily hydrolysed by acid to yield primary amine.

This is called Leuckart reaction, i.e.,

□ On commercial scale, ethylamine is obtained by heating a mixture of ethylene and ammonia at 450°C under 20 atmospheric pressure in presence of cobalt catalyst.

(iii) **Methods yielding secondary amines**

(a) **Reaction of primary amines with alkyl halides**

Secondary amine formed by this method always possesses one $-\text{CH}_3$ group linked directly to nitrogen.

(c) **Reaction of *p*-nitroso-dialkyl aniline with strong alkali solution**:

This is one of the best method for preparing pure secondary amines.

(d) **Hydrolysis of dialkyl cyanamide**

(e) **Reduction of *N*-substituted amides**: Reduction of *N*-substituted amides with LiAlH_4 yields secondary amines.

Alkyl β -amino ketones are formed by the action of ketone with formaldehyde and NH_3 (or primary or secondary amines).

The product is referred to as Mannich base and the reaction is called **Mannich Reaction**.

Which can be reduced to alkyl amines.

(iv) **Methods yielding tertiary amines**

(a) **Reaction of alkylhalides with ammonia**

(b) **Reduction of *N*, *N*-disubstituted amides**: The carbonyl group is converted into $-\text{CH}_2-$ group.

(c) **Decomposition of tetra-ammonium hydroxides**: The tetra-alkyl ammonium hydroxides are formed when corresponding halides are treated with moist silver oxide.

The hydroxides thus formed on heating decompose into tertiary amines. Tetramethyl ammonium hydroxide gives methyl alcohol as one of the products while all other tetra-alkyl ammonium hydroxides give an olefin and water besides tertiary amines.

(3) **Separation of mixture of amines**: When the mixture consists of salts of primary, secondary and tertiary amines along with quaternary salt, **it is first distilled with KOH solution**. The mixture of three amines distills over leaving behind non-volatile quaternary salt.

$\text{R}_4\text{N}^+ \text{I}^-$ (non-volatile tetra-alkyl ammonium salt) has no reaction with KOH , however remains as residue.

This mixture is separated into primary, secondary and tertiary amines by the application of following methods.

(i) **Fractional distillation**: The boiling points of primary, secondary and tertiary amines are quite different, i.e., the boiling point of CH_3NH_2 is 17°C , $(\text{CH}_3)_2\text{NH}$ is 56°C and $(\text{C}_2\text{H}_5)_3\text{N}$ is 95°C and thus, these can be separated by fractional distillation. This method is used satisfactorily in industry.

(ii) **Hofmann's method**: The mixture of three amines is treated with diethyl oxalate. The primary amine forms a solid oxamide, a secondary amine gives a liquid oxamic ester while tertiary amine does not react.

Primary amine is recovered when solid oxamide is heated with caustic potash solution and collected as distillate on distilling the reaction mixture.

The liquid (mixture of oxamic ester + tertiary amine) is subjected to fractional distillation when tertiary amine distils over.

The remaining liquid is distilled with KOH to recover secondary amine.

(iii) **Hinsberg's method**: It involves the treatment of the mixture with benzene sulphonyl chloride, i.e., **Hinsberg's reagent** ($\text{C}_6\text{H}_5\text{SO}_2\text{Cl}$). The solution is then made alkaline with aqueous alkali to form **sodium or potassium salt of monoalkyl benzene sulphonamide** (soluble in water).

The secondary amine forms *N,N*-dialkyl benzene sulphonamide which does not form any salt with NaOH and remains as insoluble in alkali solution.

Tertiary amine does not react.

The above alkaline mixture of the amines is extracted with ether.

Two distinct layers are formed. Lower layer, the aqueous layer consists of sodium salt of *N*-alkyl benzene sulphonamide (primary amine) and upper layer, the ether layer consists of *N,N*-dialkyl benzene sulphonamide (secondary amine) and tertiary amine.

Two layers are separated. The upper layer is fractionally distilled. One fraction obtained is tertiary amine and the other fraction is treated with concentrated HCl to recover secondary amine hydrochloride which gives free secondary amine on distillation with NaOH .

The aqueous layer is acidified and hydrolysed with dilute HCl . The hydrochloride formed is then distilled with NaOH when primary amine distils over.

(4) Physical properties

(i) Lower amines are gases or low boiling point liquids and possess a **characteristic ammonia like smell (fishy odour)**. Higher members are solids.

(ii) **The boiling points rise gradually with increase of molecular mass**. Amines are polar compounds like NH_3 and have comparatively higher boiling points than non-polar compounds of similar molecular masses. This is due to the presence of **intermolecular hydrogen bonding**.

(iii) Amines are soluble in water. This is due to hydrogen bonding between amine and water molecules. Amines are also soluble in benzene and ether.

Solubility decreases with increase of molecular mass.

(5) **Chemical properties**: The main reactions of amines are due to the presence of a lone pair of electrons on nitrogen atom. Amines are **electrophilic reagents** as the lone pair of electrons can be donated to electron seeking reagents, (i.e., electrophiles).

Except the amines containing tertiary butyl group, all **lower aliphatic amines are stronger bases than ammonia because of + I (inductive) effect**. The alkyl groups, which are electron releasing groups, increase the electron density around the nitrogen thereby increasing the availability of the lone pair of electrons to proton or Lewis acids and making the amine more basic (larger K). Thus, it is expected that the basic nature of amines should be in the order tertiary > secondary > primary, but the **observed order in the case of lower members is found to be as secondary > primary > tertiary**. This anomalous behaviour of tertiary amines is **due to steric factors**, i.e., crowding of alkyl groups cover nitrogen atom from all sides and thus makes the approach and bonding by a proton relatively difficult which results the maximum steric strain in tertiary amines. The electrons are there but the path is blocked, resulting the reduced in its basicity.

(i) The order of basic nature of various amines has been found **to vary with nature of alkyl groups**.

Alkyl group Relative strength

$\text{CH}_3 -$	$\text{RNH}_2 > \text{RNH} > \text{RN} > \text{NH}_3$
$\text{CH}_3 -$	$\text{RNH}_2 > \text{RNH} > \text{NH}_2 > \text{RN}$
$(\text{CH}_3)_2\text{CH} -$	$\text{RNH}_2 > \text{NH}_2 > \text{RNH} > \text{RN}$
$(\text{CH}_3)_3\text{C} -$	$\text{NH}_2 > \text{RNH}_2 > \text{RNH} > \text{RN}$

(ii) **Basic nature of aromatic amines**: In aniline or other aromatic amines, the lone pair present on nitrogen atom is **delocalized with benzene ring by resonance**.

But anilinium ion is less resonance stabilized than aniline.

Thus, electron density is less on *N* atom due to which **aniline or other aromatic amines are less basic than aliphatic amines**.

However, any group which when present on benzene ring has **electron withdrawing effect** ($-\text{NO}_2$, $-\text{CN}$, $-\text{SO}_3\text{H}$, $-\text{COOH}$, $-\text{Cl}$, C_6H_5 , etc.) **decreases basicity of aniline** (Nitroaniline is less basic than aniline as nitro group is electron withdrawing group ($-I$ group) and aniline is more basic than diphenyl amine), while a group which has **electron repelling effect** ($-\text{NH}_2$, $-\text{OR}$, $\text{R}-$, etc.) **increases basicity of aniline**. Toluidine is more basic than aniline as $-\text{CH}_3$ group is electron repelling group ($+I$ group).

Further greater the value of K or lower the value of pK , stronger will be the base. The basic character of some amines have the following order,

N-alkylated anilines are stronger bases than aniline because of steric effect. Ethyl group being bigger than methyl has more steric effect, so *N*-ethyl aniline is stronger base than *N*-methyl aniline. Thus, basic character is,

In Toluidines –*p*-isomer > *m*- > *o*-

Chloroanilines –*p*-isomer > *m*- > *o*-

Phenylene diamines –*p*-isomer > *m*- > *o*-

Nitroanilines –*m*-isomer > *p*- > *o*-

□ Aniline is less basic than ammonia. The phenyl group exerts –(inductive) effect, i.e., it withdraws electrons. This results to the lower availability of electrons on nitrogen for protonation.

□ Ethylamine and acetamide both contain an amino group but acetamide does not show basic nature. This is because lone pair of electrons on nitrogen is delocalised by resonance with the carbonyl group which makes it less available for protonation.

□ The compounds with least 's' character (*sp*-hybridized) is most basic and with more 's' character (*sp*-hybridized) is least basic. Examples in decreasing order of basicity are,

□ Electron withdrawing (CH_3 , –) groups decrease electron density on nitrogen atom and thereby decreasing basicity.

□ Electron withdrawing inductive effect of the –OH group decreases the electron density on nitrogen. This effect diminishes with distance from the amino group.

(iii) **Salt formation** : Amines being basic in nature, combine with mineral acids to form salts.

(iv) **Nature of aqueous solution** : Solutions of amines are alkaline in nature.

The aqueous solutions of amines behaves like NH_4OH and give ferric hydroxide precipitate with ferric chloride and blue solution with copper sulphate.

(v) **Reaction with alkyl halides (Alkylation)**

(vi) **Reaction with acetyl chloride (Acylation)**

Tertiary amines do not react since they do not have replaceable hydrogen on nitrogen.

Therefore, all these above reactions are used to distinguish between 1°, 2° and 3°-amines.

(vii) **Action of sodium**

(viii) **Action of halogens**

(ix) **Reaction with Grignard reagent**

(x) **Carbylamine reaction** : This reaction is shown by only **primary amines**. This is a test of primary amines and is used to distinguish primary amines from secondary and tertiary amines.

Isocyanides are bad smelling compounds and can be easily detected.

(xi) **Reaction with nitrous acid**

(a) Primary amines form alcohols with nitrous acid ($NaNO_2$, HCl). Nitrogen is eliminated.

Methyl amine is an exception to this reaction, i.e.,

(b) Secondary amines form nitrosoamines which are water insoluble yellow oily liquids.

Nitrosoamine on warming with phenol and conc. H_2SO_4 give a brown or red colour which soon changes to blue green. The colour changes to red on dilution and further changes to blue or violet with alkali. This colour change is referred to **Liebermann's nitroso reaction** and is used for the test of secondary amines.

(c) Tertiary amines react nitrous acid to form nitrite salts which are soluble in water. These salts on heating give alcohols and nitrosoamines.

This reaction (nitrous acid test) is used to make distinction between primary, secondary and tertiary amines.

(xii) **Reaction with carbon di sulphide**: This **Hofmann's mustard oil reaction** is used as a test for primary amines.

(xiii) **Oxidation**: All the three types of amines undergo oxidation. The product depends upon the nature of oxidising agent, class of amine and the nature of the alkyl group.

(a) **Oxidation of primary amines**

(b) **Oxidation of secondary amines**

(c) **Oxidation of tertiary amines**: Tertiary amines are not oxidised by potassium permanganate but are oxidised by Caro's acid or Fenton's reagent to amine oxides.

(xiv) **Reaction with other electrophilic reagents**

(xv) **Ring substitution in aromatic amines**: Aniline is more reactive than benzene. The presence of amino group activates the aromatic ring and directs the incoming group preferably to ortho and para positions.

This reaction is used as a test for aniline (white ppt.).

However, if monosubstituted derivative is desired, aniline is first acetylated with acetic anhydride and then halogenation is carried out. After halogenation, the acetyl group is removed by hydrolysis and only monosubstituted halogen derivative is obtained.

It may be noted that $-NH_2$ group directs the attacking group at *o*- and *p*-positions and therefore, both *o*- and *p*-derivatives are obtained.

Acetylation deactivates the ring and controls the reaction to monosubstitution stage only because acetyl group is electron withdrawing group and therefore, the electron pair of N-atom is withdrawn towards the carbonyl group.

(b) **Nitration**: Aromatic amines cannot be nitrated directly because they are readily oxidized. This is because, HNO_3 is a strong oxidising agent and results in partial oxidation of the ring to form a black mass.

Therefore, to solve this problem, nitration is carried out by protecting the $-NH_2$ group by acetylation. The acetylation deactivates the ring and therefore, controls the reaction.

The hydrolysis of nitroacetanilides removes the protecting acyl group and gives back amines.

(c) Sulphonation

Table: 29.3 Distinction between primary, secondary and tertiary amines

Test	Primary amine	Secondary amine	Tertiary amine
Action of CHCl_3 and alcoholic KOH . (Carbylamine test)	Bad smelling carbylamine (Isocyanide) is formed.	No action.	No action.
Action of CS_2 and HgCl_2 . (Mustard oil test)	Alkyl isothiocyanate is formed which has pungent smell like mustard oil.	No action.	No action.
Action of nitrous acid.	Alcohol is formed with evolution of nitrogen.	Forms nitrosoamine which gives green colour with phenol and conc. H_2SO_4 (Liebermann's test).	Forms nitrite in cold which on heating gives nitrosoamine which responds to Liebermann's test.
Action of acetyl chloride.	Acetyl derivative is formed.	Acetyl derivative is formed.	No action.
Action of Hinsberg's reagent.	Monoalkyl sulphonamide is formed which is soluble in KOH .	Dialkyl sulphonamide is formed which is insoluble in KOH .	No action.
Action of methyl iodide.	3 molecules (moles) of CHI_3 to form quaternary salt with one mole of primary amine.	2 moles of CHI_3 to form quaternary salt with one mole of secondary amine.	One mole of CHI_3 to form quaternary salt with one mole of tertiary amine.

□ Aniline does not form alcohol with nitrous acid but it forms benzene diazonium chloride which **shows dye test**.

Aniline

Aniline was first prepared by **Unverdorben (1826) by dry distillation of indigo**. In the laboratory, it can be prepared by the reduction of nitrobenzene with tin and hydrochloric acid.

Aniline produced combines with $\text{H}_2\text{SnCl}_6 (\text{SnCl}_4 + 2\text{HCl})$ to form a double salt.

From double salt, aniline is obtained by treating with conc. caustic soda solution.

On a commercial scale, aniline is obtained by reducing nitrobenzene with iron filings and hydrochloric acid.

The sulphanilic acid exists as a dipolar ion (structure II) which has acidic and basic groups in the same molecule. Such ions are called **Zwitter ions or inner salts**.

(6) Uses

(i) Ethylamine is used in solvent extraction processes in **petroleum refining** and as a **stabiliser** for **rubber latex**.

(ii) The quaternary ammonium salts derived from long chain aliphatic tertiary amines are widely used as detergents.

(iii) Aliphatic amines of low molecular mass are used as solvents.

Aniline is also obtained on a large scale by the action of amine on chlorobenzene at 200°C under 300-400 atm pressure in presence of cuprous catalyst.

Properties Aniline when freshly prepared is a **colourless oily liquid (b.p. 184°C)**. It has a characteristic unpleasant odour and is not poisonous in nature. It is heavier than water and is only slightly soluble. It is soluble in alcohol, ether and benzene. Its colour changes to dark brown on standing.

It shows all the characteristic reactions discussed earlier.

Uses : (1) It is used in the preparation of diazonium compounds which are used in dye industry.

(2) Anils (Schiff's bases from aniline) are used as antioxidants in rubber industry.

(3) It is used for the manufacture of its some derivatives such as acetamide, sulphanilic acid and sulpha drugs, etc.

(4) It is used as an accelerator in vulcanizing rubber.

Some important conversions

(1) Conversion of methylamine to ethylamine (Ascent)

(2) Conversion of ethylamine to methylamine (Descent)

(3) Conversion of ethylamine to acetone

(4) Conversion of propionic acid to

(i) Ethylamine, (ii) *n*-Butylamine.

(5) Conversion of ethylene to 1,4-diaminobutane

Diazonium salts

The diazonium salts have the general formula ArN_2^+X^- , where X may be an anion like Cl^- , Br^- etc. and the group $\text{N}_2^+(-\text{N} \equiv \text{N}^+)$ is called diazonium ion group.

(i) **Nomenclature** : The diazonium salts are named by adding the word diazonium to the name of the parent aromatic compound to which they are related followed by the name of the anion. For example,

The diazonium salt may contain other anions also such as NO_3^- , HSO_4^- , BF_4^- etc.

(2) Preparation of diazonium salts :

The reaction of converting aromatic primary amine to diazonium salt is called **diazotisation**.

(3) Physical properties of diazonium salts

(i) Diazonium salts are generally colourless, crystalline solids.

(ii) These are readily soluble in water but less soluble in alcohol.

(iii) They are unstable and explode in dry state. Therefore, they are generally used in solution state.

(iv) Their aqueous solutions are neutral to litmus and conduct electricity due to the presence of ions.

(4) Chemical properties of diazonium salts

(i) **Substitution reaction** : In substitution or replacement reactions, nitrogen of diazonium salts is lost as N_2 and different groups are introduced in its place.

(a) Replacement by $-\text{OH}$ group

(b) Replacement by hydrogen

(c) Replacement by $-\text{Cl}$ group

This reaction is called **Sandmeyer reaction**.

When the diazonium salt solution is warmed with copper powder and the corresponding halogen acid, the respective halogen is introduced. The reaction is a modified form of Sandmeyer reaction and is known as **Gattermann reaction**.

(d) Replacement by iodo ($-\text{I}$) group

(e) Replacement by -F group

This reaction is called **Balch-Schiemann reaction**.

(f) Replacement by Cyano (-CN) group

The nitriles can be hydrolysed to acids.

This method of preparing carboxylic acids is more useful than carbonation of Grignard reagents.

(g) Replacement by -NO₂ group

(h) Replacement by thio (-SH) group

(ii) **Coupling reactions** : The diazonium ion acts as an electrophile because there is positive charge on terminal nitrogen. It can react with nucleophilic aromatic compounds ($\text{Ar}-\text{H}$) activated by electron donating groups ($-\text{OH}$ and $-\text{NH}_2$), which as strong nucleophiles react with aromatic diazonium salts. Therefore, benzene diazonium chloride couples with electron rich aromatic compounds like phenols and anilines to give azo compounds. The azo compounds contain $-\text{N}=\text{N}-$ bond and the reaction is called **coupling reaction**.

Coupling occurs para to hydroxy or amino group. All azo compounds are strongly coloured and are used as dyes. Methyl orange is an important dye obtained by coupling the diazonium salt of sulphanilic acid with *N*, *N*-dimethylaniline.

□ Diazonium salts are highly **useful intermediates** in the synthesis of large variety of aromatic compounds. These can be used to prepare many classes of organic compounds especially aryl halides in pure state. For example, 1, 2, 3-tribromo benzene is not formed in the pure state by direct bromination of benzene. However, it can be prepared by the following sequence of reaction starting from *p*-nitroaniline through the formation of diazonium salts as :

(5) Uses of diazonium salts

- For the manufacture of azo dyes.
- For the industrial preparation of important organic compounds like *m*-bromotoluene, *m*-bromophenol, etc.

(iii) For the preparation of a variety of useful halogen substituted arenes.

Tips & Tricks

- ✍ Alkyl nitrites are the esters of nitrous acid.
- ✍ Nitroparaffins are used as solvents for oils, fats, resins, esters, rubbers and cellulose etc. nitromethane is used as high power fuel in racing automobiles.
- ✍ Nitrobenzene is good solvent in friedel crafts reaction because it dissolves $AlCl_3$.
- ✍ All amines have basic properties. The basic property, that is, the tendency of primary, secondary and tertiary amines to bind a proton, is due to the unshared pair of electrons on the nitrogen. When a proton is bound, positive ion is formed and originally electrically neutral amine takes on the charge of the proton. When ions are formed in this way, they are called onium ions. The ion formed in case of amines are substituted ammonium ions. The hydronium ion, H_3O^+ is also the onium ion, which belongs to the class of oxonium ions.
- ✍ Some derivatives of ammonia arranged in order of decreasing basicity are $(CH_3)_3NOH$, $(CH_3)_3NH$, CH_3NH_2 , $(CH_3)_2N$, NH_3 , CH_3NH , CH_3NHCH_3 , CH_3NH_2 , $(CH_3)_2NH$, CH_3CONH_2 .
- ✍ In water the basicity follows the order : Primary < Tertiary < Secondary amine, with reference to hydronium ion, H_3O^+ . In this case solvation factor and steric effect alter, to some extent, the order of basicity because of inductive effect alone.
- ✍ In a non-polar solvent such as benzene, using trichloroacetic acid as the reference acid, the basicity follows the order Tertiary < Secondary < Primary amines. The solvation factor is absent but steric effect upsets the inductive effect of alkyl groups.
- ✍ Carylamine test is specific for primary amines.

Ordinary Thinking

Objective Questions

Introduction of Nitrogen Containing Compounds

- Cyanide ion is
 - Nucleophilic
 - Electrophilic
 - Strongly acidic
 - Non-reactive and neutral
- Compounds containing both amino and COOH groups are known as
 - Diamines
 - Unknown
 - Amino acids
 - Enzymes
- Which of the following is 1° amine
 - Ethylene diamine
 - Dimethyl amine
 - Trimethyl amine
 - N*-methyl aniline
- C_3H_9N represents [AMU 1988]
 - Primary amine
 - Secondary amine
 - Tertiary amine
 - All of these
- $(CH_3)_2C.CH_2.CO.CH_3$ is [MP PET/PMT 1988]

$$\begin{array}{c} | \\ NH_2 \end{array}$$

 - Diacetone
 - Acetoneamine
 - Diacetoneamine
 - Aminoacetone
- A secondary amine is [KCET 1992]
 - An organic compound with two $-NH_2$ groups
 - A compound with two carbon atoms and an $-NH_2$ group
 - A compound with an $-NH_2$ group on the carbon atom in number 2 position
 - A compound in which two of the hydrogens of NH_3 have been replaced by organic groups
- The structural formula of methyl aminomethane is [MP PMT 1991]
 - $(CH_3)_2CHNH_2$
 - $(CH_3)_3N$
 - $(CH_3)_2NH$
 - CH_3NH_2
- Allyl isocyanide has [IIT 1995]
 - 9 sigma bonds and 4 pi bonds
 - 8 sigma bonds and 5 pi bonds
 - 8 sigma bonds, 3 pi bonds and 4 non-bonding electrons
 - 9 sigma bonds, 3 pi bonds and 2 non-bonding electrons
- Triaminobenzene is a [BHU 1996]
 - 2° amine
 - 3° amine
 - 1° amine
 - Quarternary salt
- $CH_2 = CH - CH_2 - NH - CH_3$ is a [RPET 2000]
 - Secondary amine
 - Primary amine
 - Tertiary amine
 - None of these
- Leakage of which gas was responsible for the Bhopal tragedy in 1984
 - $CH_3 - N = C = O$
 - $CH_3 - C - N = S$
 - $CHCl_3$
 - C_6H_5COCl
- Which of the following is not a nitro-derivative [DCE 2004]
 - $C_6H_5NO_2$
 - CH_3CH_2ONO
 - $CH_3CH - N \begin{array}{l} \nearrow O \\ \searrow O \end{array}$
 - $C_6H_4(OH)NO_2$
- Acetonitrile is: [MP PMT 2004]
 - C_2H_5CN
 - CH_3CN
 - CH_3COCN
 - $C_6H_5CH_2CN$
- In alkyl cyanide alkyl group attached with [BCECE 2005]
 - C* of *CN* group
 - N* of *CN* group
 - Either *C* or *N* of *CN* group
 - Both *C* and *N* of *CN* group
- Number of isomeric primary amines obtained from $C_4H_{11}N$ are
 - 3
 - 4
 - 5
 - 6

Preparation of Nitrogen Containing Compounds

- Amides may be converted into amines by reaction named after [CPMT 1974; MP]
 - Perkin
 - Claisen
 - Hoffmann
 - Kolbe
- Reaction $CH_3CONH_2 \xrightarrow{NaOBr}$ gives [CPMT 1983, 93, 97]
 - CH_3Br
 - CH_4
 - CH_3COBr
 - CH_3NH_2
- Acetamide is treated separately with the following reagents. Which would give methyl amine [IIT 1983; CPMT 1988, 94; MP PET 1993; MP PMT 1996; AIIMS 1998]
 - PCl_5
 - $NaOH + Br_2$

- (c) Sodamine (d) Hot conc. H_2SO_4
4. The amine formed from an amide by means of bromine and alkali has
 (a) Same number of C atoms as that of amide
 (b) One less C atom than that of amide
 (c) One more C atom than that of amide
 (d) Two more C atoms than that of amide
5. $CH_3CN \xrightarrow{Na+C_2H_5OH} X$
 The compound X is [MP PMT 1983; BHU 1984]
 (a) CH_3CONH_2 (b) $CH_3CH_2NH_2$
 (c) C_2H_6 (d) CH_3NHCH_3
6. Ethylamine can be prepared by the action of bromine and caustic potash on [CPMT 1994]
 (a) Acetamide (b) Propionamide
 (c) Formamide (d) Methyl cyanide
7. Ethylamine can be obtained by the [CPMT 1985]
 (a) Action of NH_3 on ethyl iodide
 (b) Action of NH_3 on ethyl alcohol
 (c) Both (a) and (b)
 (d) None of the above
8. Aniline is usually purified by [CPMT 1983, 93; JIPMER 1997]
 (a) Steam distillation (b) Simple distillation
 (c) Vacuum distillation (d) Extraction with a solvent
9. Reduction of nitroalkanes yields
 (a) Acid (b) Alcohol
 (c) Amine (d) Diazo compounds
10. Acetamide changes into methylamine by
 (a) Hofmann bromamide reaction
 (b) Hofmann reaction
 (c) Friedel-Craft's reaction
 (d) Hinsberg reaction
11. When methyl iodide is heated with ammonia, the product obtained is
 (a) Methylamine
 (b) Dimethylamine
 (c) Trimethylamine
 (d) A mixture of the above three amines
12. Acetanilide can be prepared from aniline and which of the following
 (a) Ethanol (b) Acetaldehyde
 (c) Acetone (d) Acetic anhydride
13. Reduction of nitroalkanes in neutral medium (e.g. Zn / NH_4Cl) forms mainly
 (a) $R-NH_2$ (b) $R-NHOH$
 (c) $R-N=N-Cl$ (d) All of these
14. Nitrosobenzene can be prepared by oxidizing aniline from
 (a) H_2SO_4 (b) H_2SO_5
 (c) H_2SO_3 (d) $K_2Cr_2O_7$
15. The Hinsberg's method is used for
 (a) Preparation of primary amines
 (b) Preparation of secondary amines
 (c) Preparation of tertiary amines
 (d) Separation of amine mixtures
16. Which one of the following compound gives a secondary amine on reduction
 (a) Nitromethane (b) Nitrobenzene
 (c) Methyl isocyanide (d) Methyl cyanide
17. Chloropicrin is manufactured by the reaction between Cl_2 , $NaOH$ and
 (a) Nitromethane (b) Nitroethane
- (c) Nitrophenol (d) Nitrostyrene
18. In the reaction

$$R-\overset{\overset{O}{\parallel}}{C}-OH \xleftarrow{H_3O^+} X \xrightarrow{[H]} RCH_2NH_2; 'X' \text{ is}$$
 [MP PMT 1990]
 (a) Isonitrile (b) Nitrile
 (c) Nitrite (d) Oxime
19. When ethanol is mixed with ammonia and passed over alumina the compound formed is [CBSE PMT 1990]
 (a) $C_2H_5NH_2$ (b) C_2H_4
 (c) $C_2H_5OC_2H_5$ (d) CH_3OCH_3
20. Which of the following reactions does not yield an amine [CPMT 1989, 93]
 (a) $RX + NH_3 \longrightarrow$
 (b) $RCH=NOH + [H] \xrightarrow[C_2H_5OH]{Na}$
 (c) $RCN + H_2O \xrightarrow{H^+}$
 (d) $RCONH_2 + 4H \xrightarrow{LiAlH_4}$
21. Identify 'B' in the reaction
 Acetamide $\xrightarrow[\Delta]{P_2O_5} A \xrightarrow{4H} B$ [MP PET 1995]
 (a) CH_3NH_2 (b) $CH_3CH_2NH_2$
 (c) CH_3CN (d) CH_3COONH_4
22. Which of the following gives primary amine on reduction [MP PMT 1995]

$$CH_3-CH_2-\overset{\overset{O}{\parallel}}{N} \rightarrow O$$
 (a) $CH_3-CH_2-\overset{\overset{O}{\parallel}}{N} \rightarrow O$
 (b) $CH_3-CH_2-O-N=O$
 (c) $CH_3CH_2NO_3$
 (d) None of these
23. Which of the following is converted into an alcohol on treatment with HNO_2 [MP PET 1996; MP PMT 1999]
 (a) Methyl amine (b) Aniline
 (c) Dimethyl amine (d) Triethyl amine
24. Which of the following gives RNC , when reacted with $CHCl_3$ and KOH [MP PET 1996]
 (a) RNH_2 (b) R_2NH
 (c) R_3N (d) $R_4N^+Cl^-$
25. When aniline reacts with $NaNO_2$ and dil. HCl at $0^\circ - 5^\circ C$, the product formed is [MP PMT 1996; AIIMS 1996]
 (a) Nitroaniline
 (b) Benzene diazonium chloride
 (c) Benzene
 (d) Trinitroaniline
26. Starting from propanoic acid, the following reactions were carried out

$$\text{Propanoic acid} \xrightarrow{SOCl_2} X \xrightarrow{NH_3} Y \xrightarrow{Br_2+KOH} Z$$
 What is the compound Z
 (a) CH_3-CH_2-Br
 (b) $CH_3-CH_2-NH_2$
 (c) $CH_3-CH_2-C \begin{smallmatrix} \nearrow O \\ \searrow Br \end{smallmatrix}$
 (d) $CH_3-CH_2-CH_2-NH_2$
27. In the reaction

the final product (C) is

- (a) Ammonium acetate (b) Acetamide
(c) Amino methane (d) Ethanal

28. In the following reaction, X is

[CPMT 1999]

- (a) Benzoic acid (b) Salicylic acid
(c) Phenol (d) Aniline

29. Which of the following reactions will not give primary amine

[CPMT 1999]

30. Carbylamine reaction is given by

[BHU 1996; EAMCET 1990]

- (a) 1° amine (b) 3° amine
(c) 2° amine (d) Quarternary salts

31. The reaction

is known as

[BHU 1996]

- (a) Carbylamine reaction
(b) Reimer-Tiemann reaction
(c) Kolbe reaction
(d) Hofmann's degradation

What is Z?

[CPMT 1996]

- (a) $\text{CH}_3\text{CH}_2\text{NH}_2$ (b) $\text{CH}_3\text{CH}_2\text{NC}$
(c) $\text{CH}_3\text{CH}_2\text{CH}_3$ (d) NH_2CONH_2

33. Which of the following reacts with chloroform and a base to form phenyl isocyanide

[AFMC 1997]

- (a) Aniline (b) Phenol
(c) Benzene (d) Nitrobenzene

34. Aromatic primary amine when treated with cold HNO_2 gives [Pb. CET 2002; DCE 1999]

- (a) Benzyl alcohol (b) Nitro benzene
(c) Benzene (d) Diazonium salt

35. Which of the following compound is the strongest base

[BHU 1999]

- (a) Ammonia (b) Aniline
(c) Methylamine (d) N-methyl aniline

36. Nitrobenzene combines with hydrogen in the presence of platinum to produce

[BHU 1999]

- (a) Toluene (b) Benzene
(c) Aniline (d) Azobenzene

[RPET 2000]

- (c) (d)

38. Ethyl amine on heating with CS_2 in presence of HgCl_2 forms

- (a) $\text{C}_2\text{H}_5\text{NCS}$ (b) $(\text{C}_2\text{H}_5)_2\text{S}$
(c) $(\text{C}_2\text{H}_5)_2\text{CS}$ (d) $\text{C}_2\text{H}_5(\text{CS})_2$

39. Which of the following reacts with $\text{NaNO}_2 + \text{HCl}$ to give phenol [MP PMT 2000]

- (a) $\text{C}_6\text{H}_5\text{CH}_2\text{NHCH}_3$ (b) $(\text{CH}_3)_2\text{NH}$
(c) CH_3NH_2 (d) $\text{C}_6\text{H}_5\text{NH}_2$

40. Which of the following reactions give RCONH_2

[Roorkee 2000]

41. When chlorobenzene is treated with NH_3 in presence of Cu_2O in xylene at 570 K. The product obtained is

[Pb. PMT 2000]

- (a) Benzylamine (b) Diazonium salt
(c) Schiff's base (d) Aniline

42. Nitrobenzene can be prepared from benzene by using a mixture of conc. HNO_3 and conc. H_2SO_4 . In the nitrating mixture, HNO_3 acts as a

[BHU 2001]

- (a) Base (b) Acid
(c) Catalyst (d) Reducing agent

43. The rate determining step for the preparation of nitrobenzene from benzene is

[AIIMS 2001]

- (a) Removal of NO_2^+ (b) Removal of NO_3^+
(c) Formation of NO_2^+ (d) Formation of NO_3^+

44. In this reaction

[RPMT 2002; AFMC 2002]

- (a) Aniline hydrochloride
(b) Nitro aniline
(c) Benzenediazonium chloride
(d) None of these

45. The diazonium salts are the reaction products in presence of excess of mineral acid with nitrous acid and

[MP PET 2002]

- (a) Primary aliphatic amine
(b) Secondary aromatic amine
(c) Primary aromatic amine
(d) Tertiary aliphatic amine

46. In acid medium nitrobenzene is reduced to aniline as shown in the reaction

The reducing agent used in this reaction is

[Orissa JEE 2002]

- (a) LiAlH_4 (b) Sn/HCl
(c) Na/alcohol (d) H_2/Ni

47. When aniline is treated with sodium nitrite and hydrochloric acid at 0°C, it gives

[Orissa JEE 2003]

- (a) Phenol and N_2 (b) Diazonium salt
(c) Hydrazo compound (d) No reaction takes place

48. $\text{CH}_3\text{NO}_2 \xrightarrow{\text{Sn} + \text{HCl}} \text{CH}_3\text{X}$, the 'X' contain

19. Chloroform when treated with aniline and alcoholic KOH gives [CPMT 1986; EAMC 1986]

MP PMT 1997; Pb. PMT 1999]

- (a) Phenyl cyanide (b) Phenyl isocyanide
(c) Chlorobenzene (d) Phenol
20. Which of following do not react with HNO_2
(a) Primary nitroalkanes (b) Secondary nitroalkanes
(c) Tertiary nitroalkanes (d) All of these
21. Primary amines can be distinguished from secondary and tertiary amines by reacting with [CPMT 1983]
(a) Chloroform and alcoholic KOH
(b) Methyl iodide
(c) Chloroform alone
(d) Zinc dust
22. Which of following is not an usual method for preparation of primary amine
(a) Hofmann's method (b) Curtius reaction
(c) Schmidt reaction (d) Friedel-Craft's reaction
23. A solution of methyl amine
(a) Turns blue litmus red
(b) Turns red litmus blue
(c) Does not affect red or blue litmus
(d) Bleaches litmus
24. Mark the correct statement [CPMT 1974; DPMT 1983; MP PMT 1994]
(a) Methyl amine is slightly acidic
(b) Methyl amine is less basic than NH_3
(c) Methyl amine is stronger base than NH_3
(d) Methyl amine forms salts with alkalies
25. The product of mustard oil reaction is
(a) Alkyl isothiocyanate (b) Dithio carbonamide
(c) Dithio ethylacetate (d) Thioether
26. Which of the following is azo- group
(a) $-N =$ (b) $-N = N -$
(c) $-NH -$ (d) $-CO - NH -$
27. 'Oil of mirbane' is
(a) Aniline (b) Nitrobenzene
(c) *p*-nitroaniline (d) *p*-aminoazobenzene
28. The maximum number of $-NO_2$ groups that can be introduced by nitration in benzene is usually
(a) 4 (b) 2
(c) 3 (d) 6
29. Nitrobenzene at room temperature is
(a) Gas (b) Liquid
(c) Solid (d) Solution
30. In the explosive amatol, TNT is mixed with [CPMT 1988]
(a) Ammonium citrate (b) Ammonium nitrate
(c) Ammonium oxalate (d) Ammonium sulphate
31. By reduction of nitrosobenzene which of the following is not obtained
(a)  (b) 
(c)  (d) 
32. By the presence of a halogen atom in the ring, basic properties of aniline is
(a) Increased (b) Decreased
(c) Unchanged (d) Doubled
33. In the mustard oil reaction, an amine is treated with
(a) Na / C_2H_5OH (b) Sn / HCl
(c) CS_2 (d) $K_2Cr_2O_7 / H_2SO_4$
34. Primary nitro compounds when react with HNO_2 forms crystalline solids which on treatment with $NaOH$ gives
(a) Red solution (b) Blue solution
(c) White precipitate (d) Yellow colouration
35. Secondary nitro compounds when react with HNO_2 forms crystalline solids which one on treatment with $NaOH$ gives
(a) Red solution (b) Blue solution
(c) White precipitate (d) Yellow colouration
36. Which of the following possess powerful mustard smell (and are called mustard oils)
(a) Alkyl isocyanates (b) Alkyl cyanates
(c) Alkyl isothiocyanates (d) Alkyl thiocyanates
37. On heating acetamide in presence of P_2O_5 , which of the following is formed [MP PMT 1992; MP PET 1994; Kurukshetra CEE 1998]
(a) Ammonium acetate (b) Acetonitrile
(c) NH_3 (d) Methylamines
38. When chloroform reacts with ethyl amine in presence of alcoholic KOH , the compound formed is [CPMT 1983; MP PMT 1993; CBSE PMT 1997; BHU 1999; AIEEE 2002]
(a) Ethyl cyanide (b) Ethyl isocyanide
(c) Formic acid (d) An amide
39. When methyl cyanide is hydrolysed in presence of alkali, the product is [MP PMT 1993; BCECE 2005]
(a) Acetamide (b) Methane
(c) $CO_2 + H_2O$ (d) Acetic acid
40. Hofmann's hypobromite reaction affords a method of [MP PMT 1993]
(a) Preparing a tertiary amine
(b) Preparing a mixture of amines
(c) Stepping down a series
(d) Stepping up a series
41. The compound which on reaction with aqueous nitrous acid on HNO_2 at low temperature produces an oily nitrosoamine is [IIT 1981; CPMT 1983; Kurukshetra CEE 1998; MP PMT 2001]
(a) Diethylamine (b) Ethylamine
(c) Aniline (d) Methylamine
42. Identify the product Z in the series
 $CH_3CN \xrightarrow{Na + C_2H_5OH} X \xrightarrow{HNO_2} Y \xrightarrow[H_2SO_4]{K_2Cr_2O_7} Z$ [AIIMS 1983; JIPMER 2001]
(a) CH_3CHO (b) CH_3CONH_2
(c) CH_3COOH (d) CH_3CH_2NHOH
43. The end product of the reactions is
 $C_2H_5NH_2 \xrightarrow{HNO_2} A \xrightarrow{PCl_5} B \xrightarrow{H.NH_2} C$ [CPMT 1988, 89, 93; DCE 1999; JIPMER 2000]
(a) Ethyl cyanide (b) Ethyl amine
(c) Methyl amine (d) Acetamide
44. Primary and secondary amines are distinguished by [AMU 1988; MP PMT 1996]
(a) Br_2 / KOH (b) $HClO_4$
(c) HNO_2 (d) NH_3
45. Which one of the following will give a primary amine on hydrolysis
(a) Nitroparaffin (b) Alkyl cyanide
(c) Oxime (d) Alkyl isocyanide
46. Methyl amine reacts with HNO_2 giving [RPMT 1997]
(a) $CH_3O - N = O$ (b) $CH_3 - O - CH_3$

- (c) CH_3OH (d) (a) and (b) both
47. Nitrobenzene on reduction by zinc and NH_4Cl gives [CPMT 1989, 94; BHU 1996; Pb. PMT 1999]
 (a) Aniline (b) Nitrosobenzene
 (c) Hydrazobenzene (d) Phenylhydroxyl amine
48. The decreasing order of the basic character of the three amines and ammonia is [MP PET/PMT 1988; KCET 1990]
 (a) $\text{NH}_3 > \text{CH}_3\text{NH}_2 > \text{C}_2\text{H}_5\text{NH}_2 > \text{C}_6\text{H}_5\text{NH}_2$
 (b) $\text{C}_2\text{H}_5\text{NH}_2 > \text{CH}_3\text{NH}_2 > \text{NH}_3 > \text{C}_6\text{H}_5\text{NH}_2$
 (c) $\text{C}_6\text{H}_5\text{NH}_2 > \text{C}_2\text{H}_5\text{NH}_2 > \text{CH}_3\text{NH}_2 > \text{NH}_3$
 (d) $\text{CH}_3\text{NH}_2 > \text{C}_2\text{H}_5\text{NH}_2 > \text{C}_6\text{H}_5\text{NH}_2 > \text{NH}_3$
49. Correct order of increasing basicity is [CBSE PMT 1992]
 (a) $\text{NH}_3 < \text{C}_6\text{H}_5\text{NH}_2 < (\text{C}_2\text{H}_5)_2\text{NH} < \text{C}_2\text{H}_5\text{NH}_2 < (\text{C}_2\text{H}_5)_3\text{N}$
 (b) $\text{C}_6\text{H}_5\text{NH}_2 < \text{NH}_3 < (\text{C}_2\text{H}_5)_3\text{N} < (\text{C}_2\text{H}_5)_2\text{NH} < \text{C}_2\text{H}_5\text{NH}_2$
 (c) $\text{C}_6\text{H}_5\text{NH}_2 < \text{NH}_3 < \text{C}_2\text{H}_5\text{NH}_2 < (\text{C}_2\text{H}_5)_3\text{N} < (\text{C}_2\text{H}_5)_2\text{NH}$
 (d) $\text{C}_6\text{H}_5\text{NH}_2 < (\text{C}_2\text{H}_5)_3\text{N} < \text{NH}_3 < \text{C}_2\text{H}_5\text{NH}_2 < (\text{C}_2\text{H}_5)_2\text{NH}$
50. Among the following compounds nitrobenzene, benzene, aniline and phenol, the strongest basic behaviour in acid medium is exhibited by [KCET 1993]
 (a) Phenol (b) Aniline
 (c) Nitrobenzene (d) Benzene
51. Aniline on treatment with excess of bromine water gives [AFMC 1990; MP PMT 1991; RPMT 1997]
 (a) Aniline bromide (b) α -bromoaniline
 (c) p -bromoaniline (d) 2, 4, 6-tribromoaniline
52. Unpleasant smelling carbylamines are formed by heating alkali and chloroform with [KCET 1987, 2000, 01]
 (a) Any amine (b) Any aliphatic amine
 (c) Any aromatic amine (d) Any primary amine
53. When an organic compound was treated with sodium nitrite and hydrochloric acid in the ice cold, nitrogen gas was evolved copiously. The compound is [KCET 1986]
 (a) A nitro compound
 (b) A primary amine
 (c) An aliphatic primary amine
 (d) An aromatic primary amine
54. Aniline reacts with alkyl halide to give [KCET 1984]
 (a) Amino compound
 (b) Tertiary compound
 (c) Quaternary ammonium compound
 (d) Azomethane
55. Aniline on treatment with conc. HNO_3 + conc. H_2SO_4 mixture yields [AIIMS 1992]
 (a) α - and p -nitroanilines (b) m -nitroanilines
 (c) A black tarry matter (d) No reaction
56. Which statement is not correct [MP PMT 1995]
 (a) Amines form hydrogen bond
 (b) Ethyl amine has higher boiling point than propane
 (c) Methyl amine is more basic than ammonia
 (d) Dimethyl amine is less basic than methyl amine
57. Which of the following is not used as an explosive [MP PET 1996]
 (a) Trinitrotoluene (b) Trinitrobenzene
 (c) Picric acid (d) Nitrobenzene
58. Primary amines react with nitrous acid to yield
 (a) Insoluble nitrite salts (b) Yellow oily layer
 (c) Nitrogen gas (d) Azo dye
59. Which of the following has the smell of bitter almonds
 (a) Nitromethane (b) Nitroethane
 (c) Nitrobenzene (d) Aniline
60. The reaction of HNO_2 with 'A' gives quaternary ammonium salt. A is [MP PMT 1997]
 (a) Methyl amine (b) Dimethyl amine
 (c) Trimethyl amine (d) Aniline
61. Reaction of nitrous acid with aliphatic primary amine in the cold gives [MP PET/PMT 1998; CBSE PMT 1994]
 (a) A diazonium salt (b) An alcohol
 (c) A nitrite (d) A dye
62. In presence of acid, hydrolysis of methyl cyanide gives [MP PET/PMT 1998]
 (a) Acetic acid (b) Methylamine
 (c) Methyl alcohol (d) Formic acid
63. The amine which does not react with acetyl chloride is or Which of the following cannot be acetylated [MP PET 1999; MP PMT 1999]
 (a) CH_3NH_2 (b) $(\text{CH}_3)_2\text{NH}$
 (c) $(\text{CH}_3)_3\text{N}$ (d) None of these
64. The fusion of sodium with amine gives mainly [MP PMT 1999; CPMT 2002]
 (a) NaCN (b) NaN_3
 (c) NaSCN (d) NaNO_2
65. Which of the following is most basic [MP PMT 1999]
 (a) $\text{C}_6\text{H}_5\text{NH}_2$ (b) $(\text{CH}_3)_2\text{NH}$
 (c) $(\text{CH}_3)_3\text{N}$ (d) NH_3
66. In reaction

$$\text{CH}_3\text{CN} + 2\text{H} \xrightarrow[\text{Ether}]{\text{HCl}} \text{X} \xrightarrow{\text{Boiling H}_2\text{O}} \text{Y}; \text{ the term Y is}$$
 [CBSE PMT 1999]
 (a) Acetone (b) Ethylamine
 (c) Acetaldehyde (d) Dimethylamine
67. The following compound can be classified as N - N dimethyl propanamine, N -methyl aniline and aniline [Bihar MEE 1996]
 (a) Primary, secondary, tertiary
 (b) Primary, tertiary, secondary
 (c) Secondary, tertiary, primary
 (d) Tertiary, primary, secondary
 (e) None of these
68. Which of the following compounds does not react with NaNO_2 and HCl [KCET 1996]
 (a) $\text{C}_6\text{H}_5\text{OH}$ (b) $\text{C}_6\text{H}_5\text{NH}_2$
 (c) $(\text{CH}_3)_3\text{CNO}_2$ (d) $(\text{CH}_3)_3\text{CHNO}_2$
69. In the reduction of nitrobenzene, which of the following is the intermediate [CPMT 1999]
 (a) $\text{C}_6\text{H}_5\text{N} = \text{O}$
 (b) $\text{C}_6\text{H}_5\text{NH} - \text{NH} - \text{C}_6\text{H}_5$
 (c) $\text{C}_6\text{H}_5 - \text{N} = \text{N} - \text{C}_6\text{H}_5$
 (d) $\text{C}_6\text{H}_5\text{N} = \overset{\text{O}}{\underset{\uparrow}{\text{N}}} - \text{C}_6\text{H}_5$
70. Aniline when treated with conc. HNO_3 gives [KCET 1996]
 (a)  (b) 
 (c)  (d) 

71. Which one of the following is not a base [EAMCET 1997]
 (a) N_2H_4 (b) NH_2OH
 (c) $(CH_3)_3N$ (d) HN_3

72. *p*-Nitrobromobenzene can be converted to *p*-nitroaniline by using $NaNH_2$. The reaction proceeds through the intermediate named [Orissa JEE 2005]

- (a) Carbocation (b) Carbanion
 (c) Benzyne (d) Dianion
73. If methyl is alkyl group, then which order of basicity is correct
 (a) $R_2NH > RNH_2 > R_3N > NH_3$
 (b) $R_2NH > R_3N > RNH_2 > NH_3$
 (c) $RNH_2 > NH_3 > R_2NH > R_3N$
 (d) $NH_3 > RNH_2 > R_2NH > R_3N$

74. Which of the following has the minimum heat of dissociation [Roorkee Qualifying 1998]

- (a) $(CH_3)_3N \rightarrow BF_3$
 (b) $(CH_3)_3N \rightarrow B(CH_3)_2F$
 (c) $(CH_3)_3N \rightarrow B(CH_3)_2F$
 (d) $(CH_3)_3N \rightarrow B(CH_3)_3$

75. The major product (70% to 80%) of the reaction between *m*-dinitrobenzene with NH_4HS is

76. Which one is less alkaline [CPMT 1997]

77. In the diazotisation of aniline with sodium nitrite and hydrochloric acid, an excess of hydrochloric acid is used primarily to
 (a) Suppress the concentration of free aniline available for coupling
 (b) Suppress hydrolysis of phenol
 (c) Insure a stoichiometric amount of nitrous acid
 (d) Neutralize the base liberated

78. A primary amine can be converted to an alcohol by the action of
 (a) Alkali (b) Nitrous acid
 (c) Reducing agent (d) Oxidising agent

79. Arrange the following in increasing order of basicity CH_3NH_2 , $(CH_3)_2NH$, $C_6H_5NH_2$, $(CH_3)_3N$ [AFMC 1997]

- (a) $(CH_3)_3N < (CH_3)_2NH < CH_3NH_2 < C_6H_5NH_2$
 (b) $(CH_3)_3N > (CH_3)_2NH > CH_3NH_2 > C_6H_5NH_2$
 (c) $C_6H_5NH_2 < (CH_3)_3N < CH_3NH_2 < (CH_3)_2NH$
 (d) $C_6H_5NH_2 > (CH_3)_3N > CH_3NH_2 > (CH_3)_2NH$

80. In the reaction

The compound *B* is

- (a) Acetic acid (b) Acetone
 (c) Acetaldehyde (d) Ethyl alcohol

81. CH_3CN is known as acetonitrile because [AMU 1999]

- (a) It contains an aceto group

- (b) On hydrolysis it gives acetic acid
 (c) Both (a) and (b)
 (d) None of these

82. What is formed, when nitrobenzene is reduced using zinc and alkali [BHU 2000; AIIMS 2000; CBSE PMT 2000; MH CET 2003]

- (a) Phenol (b) Aniline
 (c) Nitrosobenzene (d) Hydrazobenzene

83. $RCOCl + 2Me_2NH \rightarrow A + Me_2NH_2Cl^-$

Here *A* is [RPMT 1997]

- (a) $RCON \begin{smallmatrix} \swarrow Me \\ \searrow Me \end{smallmatrix}$ (b) $RCONH_2$
 (c) $RCONHMe$ (d) $(RCO)_2NH$

84. Decreasing order of basicity is [RPET 2000]

- (1) CH_3CONH_2 (2) $CH_3CH_2NH_2$
 (3) $Ph-CH_2CONH_2$
 (a) $1 > 2 > 3$ (b) $2 > 1 > 3$
 (c) $3 > 2 > 1$ (d) None of these

85. Among the following, the strongest base is

[UPSEAT 2000; IIT-JEE (Screening) 2000]

- (a) $C_6H_5NH_2$ (b) $p-NO_2C_6H_4NH_2$
 (c) $m-NO_2-C_6H_4NH_2$ (d) $C_6H_5CH_2NH_2$

86. Aniline and methyl amine can be differentiated by

[DPMT 2000]

- (a) Reaction with chloroform and aqueous solution of KOH
 (b) Diazotisation followed by coupling with phenol
 (c) Reaction with HNO_2
 (d) None of these

87. The amine which can react with $C_6H_5-SO_2-Cl$ to form a product insoluble in alkali shall be [AMU 2000]

- (a) Primary amine
 (b) Secondary amine
 (c) Tertiary amine
 (d) Both primary and secondary amines

88. A mixture of benzene and aniline can be separated by

[KCET (Engg.) 2001]

- (a) Hot water (b) dil. HCl
 (c) dil. $NaOH$ (d) Alcohol

89. Nitrobenzene on further excessive nitration gives

[AFMC 2001]

- (a) Trinitrobenzene (b) *m*-dinitrobenzene
 (c) *p*-dinitrobenzene (d) All of these

90. The compound *A* with following sequence of reaction gave benzoic acid [CET Pune 1998]

- (a) Nitrobenzene (b) Aniline
 (c) Benzaldehyde (d) Amides

91. Which of the following chemicals are used to manufacture methyl isocyanate that caused "Bhopal Tragedy"

- (i) Methylamine (ii) Phosgene
 (iii) Phosphine (iv) Dimethylamine

[AIIMS 2005]

- (a) (i) and (iii) (b) (iii) and (iv)
 (c) (i) and (ii) (d) (ii) and (iv)

92. An isocyanide on hydrolysis gives

[AMU 2001]

- (a) An amide
 (b) A carboxylic acid and ammonia
 (c) A *N*-substituted amide
 (d) A 1-amine and formic acid

93. Methyl isocyanide on hydrolysis gives

[UPSEAT 2001]

- (a) CH_3NH_2 (b) $HCOOH$
(c) CH_3COOH (d) Both (a) and (b)
94. Pure aniline is a [UPSEAT 2001]
(a) Colourless solid
(b) Brown coloured solid
(c) Colourless liquid
(d) Brown coloured liquid
95. Reduction of methyl isocyanide gives [RPMT 2002]
(a) Ethylamine (b) Methylamine
(c) Dimethylamine (d) Trimethylamine
96. Reaction of aniline with benzaldehyde is [RPMT 2002]
(a) Polymerisation (b) Condensation
(c) Addition (d) Substitution
97. In the reaction $C_6H_5CHO + C_6H_5NH_2 \rightarrow C_6H_5N = HCC_6H_5 + H_2O$, the compound $C_6H_5N = CHC_6H_5$ is known as [RPMT 2000; AIIMS 2002; AMU 2001]
(a) Aldol (b) Schiff's reagent
(c) Schiff's base (d) Benedict reagent
98. The unshared pair of electrons on a cyanide ion can act as [Kerala (Med.) 2002]
(a) Isocyanide centre (b) Amido centre
(c) Cationic centre (d) Nucleophilic centre
99. Electrophilic substitution of  with bromine gives [Kerala (Med.) 2002]
(a) 1, 4, 6-tribromo aniline
(b) 2, 4, 6-tribromo aniline
(c) 4-bromo aniline
(d) 3-bromo aniline
100. Mustard gas is obtained by [MP PET 2002]
(a) The action of dilute acids on mustard seeds
(b) Treating ethylene with mustard oil
(c) Treating sulphur chloride with ethylene
(d) None of these
101. Which of the following is capable of forming a zwitter ion [JIPMER 2002]
(a) C_6H_5-OH (b) $C_6H_4(NH_2)_2$
(c) CH_2OH (d) H_2N-CH_2-COOH
 $\quad \quad \quad |$
 $\quad \quad \quad CH_2OH$
102. Which one of the following reducing agents is likely to be the most effective in bringing about the following change [AMU 2002]
$$R-\overset{\overset{O}{\parallel}}{C}NH_2 \rightarrow RCH_2NH_2$$

(a) H_2-Ni (b) $NaBH_4$
(c) $LiAlH_4$ (d) Na -alcohol
103. During acetylation of amines what is replaced by acetyl groups
(a) Hydrogen atom attached to nitrogen atom
(b) One or more hydrogen atoms attached to carbon atom
(c) One or more hydrogen atoms attached to nitrogen atom
(d) Hydrogen atoms attached to either carbon atom or nitrogen atom
104. Hydrolysis of acetonitrile in acidic medium produces [CPMT 2003; RPMT 2003]
(a) CH_3CH_2OH (b) CH_3COOH

- (c) CH_3NC (d) CH_3COOCH_3
105. Which has a pyramidal structure [UPSEAT 2003]
(a) Trimethylamine (b) Methanol
(c) Acetylene (d) Water
106. Ethyl amine on acetylation gives [BHU 2002; BVP 2003]
(a) N-ethyl acetamide
(b) Acetamide
(c) Methyl acetamide
(d) None
107. The refluxing of $(CH_3)_2NCOCH_3$ with acid gives [BHU 2002; BVP 2003]
(a) $(CH_3)_2NH + CH_3COOH$
(b) $(CH_3)_2NCOOH + CH_4$
(c) $2CH_3OH + CH_3CONH_2$
(d) $2CH_3NH_2 + CH_3COOH$
108. *p*-chloro aniline and anilinium hydrogen chloride can be distinguished by [UPSEAT 2003]
(a) Sandmeyer reaction
(b) Carbyl amine reaction
(c) Hinsberg's reaction
(d) $AgNO_3$

Product 'A' in above reaction is [RPMT 2003]

- (a)  (b) 
(c)  (d) None of these

110. Product obtained by electrolytic reduction of nitrobenzene in presence of H_2SO_4 is [RPMT 2003]
(a) *o*-amino phenol (b) *m*-amino phenol
(c) *p*-amino phenol (d) None of these

The product 'B' is

[RPMT 2003]

112. Identify the product Z in the following reaction
$$C_6H_5NH_2 \xrightarrow{(AC)_2O} X \xrightarrow{Br_2 / CCl_4} Y \xrightarrow{HOH} Z$$

[Kerala (Med.) 2003]

- (a) *p*-Bromoaniline (b) *p*-Bromoacetophenone
(c) *o*-Bromoacetophenone (d) *o*-Bromoacetanilide
113. Benzaldehyde condenses with *N,N*-dimethylaniline in presence of anhydrous $ZnCl_2$ to give [Kerala (Med.) 2003]
(a) Michler's ketone (b) Azo dye
(c) Malachite green (d) Buffer yellow
114. The correct order of reactivity towards the electrophilic substitution of the compounds aniline (I) benzene (II) and nitrobenzene (III) is [CBSE PMT 2003]
(a) I > II > III (b) III > II > I
(c) II > III > I (d) I < II > III
115. The final product C, obtained in this reaction

116. The correct order of increasing basic nature for the bases NH_3 , CH_3NH_2 and $(CH_3)_2NH$ is [AIEEE 2003]
(a) $CH_3NH_2 < NH_3 < (CH_3)_2NH$
(b) $(CH_3)_2NH < NH_3 < CH_3NH_2$
(c) $NH_3 < CH_3NH_2 < (CH_3)_2NH$
(d) $CH_3NH_2 < (CH_3)_2NH < NH_3$
117. Nitrobenzene gives *N*-phenylhydroxylamine by [AIIMS 2003]
(a) Sn/HCl (b) $H_2/Pd - C$
(c) $Zn/NaOH$ (d) Zn/NH_4Cl
118. Among the following the weakest base is [AIIMS 2003]
(a) $C_6H_5CH_2NH_2$ (b) $C_6H_5CH_2NHCH_3$
(c) $O_2NCH_2NH_2$ (d) CH_3NHCHO
119. The correct order of basicity of amines in water is : [Pb. CET 2003]
(a) $(CH_3)_2NH > (CH_3)_3N > CH_3NH_2$
(b) $CH_3NH_2 > (CH_3)_2NH > (CH_3)_3N$
(c) $(CH_3)_3N > (CH_3)_2NH > CH_3NH_2$
(d) $(CH_3)_3N > CH_3NH_2 > (CH_3)_2NH$

120. Complete the following reaction : [MHCET 2004]
 $R-NH_2 + H_2SO_4 \rightarrow$
(a) $[R-NH_3]^+ HSO_4^-$ (b) $[R-NH_3]_2^+ SO_4^{2-}$
(c) $R-NH_2 \cdot H_2SO_4$ (d) No reaction

121. Which of the following compound reacts with chloroform and a base to form phenyl isocyanide ? [MHCET 2003]
(a) Phenol (b) Aniline
(c) Benzene (d) Nitro benzene
122. Which one doesn't liberate NH_3 when undergoes hydrolysis
(a) Acetanilide (b) Acetonitrile
(c) Acetamide (d) Phenyl isocyanide
123. A nitrogen containing organic compound gave an oily liquid on heating with bromine and potassium hydroxide solution. On shaking the product with acetic anhydride, an antipyretic drug was obtained. The reactions indicate that the starting compound is
(a) Aniline (b) Benzamide
(c) Acetamide (d) Nitrobenzene
124. Benzamide on reaction with $POCl_3$ gives [IIT-JEE 2004]
(a) Aniline (b) Chlorobenzene
(c) Benzyl amine (d) Benzonitrile
125. Among the following which one does not act as an intermediate in Hofmann rearrangement [AIIMS 2005]
(a) $RNCO$ (b) $RCO\ddot{N}$
(c) $RCO\ddot{N}HBr$ (d) RNC
126. Aniline reacts with which of these to form Schiff base [AFMC 2004]
(a) Acetic acid (b) Benzaldehyde
(c) Acetone (d) NH_3
127. Which of the following does not reduce Tollen's reagent [Kerala PMT 2004]
(a) CH_3CHO (b) C_6H_5NHOH
(c) $HCOOH$ (d) $C_6H_5NO_2$
(e) None of these
128. Which one of the following compound is most basic ? [UPSEAT 2004]

- (a) (A) (b) (B)
(c) (C) (d) All are equally basic
129. Which one of the following methods is neither meant for the synthesis nor for separation of amines [AIEEE 2005]
(a) Hinsberg method (b) Hofmann method
(c) Wurtz reaction (d) Curtius reaction
130. Aniline in a set of reactions yielded a product D.

 The structure of product D would be [CBSE PMT 2005]
(a) $C_6H_5CH_2NH_2$ (b) $C_6H_5NHCH_2CH_3$
(c) C_6H_5NHOH (d) $C_6H_5CH_2OH$
131. Electrolytic reduction of nitrobenzene in weakly acidic medium gives
(a) Aniline (b) Nitrosobenzene
(c) *N*-Phenylhydroxylamine (d) *p*-Hydroxylaniline
132. Among the following compounds $C_3H_7NH_2$, NH_3 , CH_3NH_2 , $C_2H_5NH_2$ and $C_6H_5NH_2$, the least basic compound is
(a) $C_3H_7NH_2$ (b) NH_3
(c) CH_3NH_2 (d) $C_6H_5NH_2$
(e) $C_2H_5NH_2$

133. The reduction of which of the following compound would yield secondary amine ? [DCE 2004]

- (a) Alkyl nitrite
- (b) Carbylamine
- (c) Primary amine
- (d) Secondary nitro compound

134. Azo dye is prepared by the coupling of phenol and : [Pb. CET 2000]

- (a) Diazonium chloride
- (b) *o*-nitro aniline
- (c) Benzoic acid
- (d) Chlorobenzene

135. $C_6H_5NH_2 \xrightarrow{NaNO_2/HCl} X \xrightarrow{Cu_2(CN)_2} Y \xrightarrow{H_2O/H^+} Z$
Z is identified as : [Pb. PMT 2004]

- (a) $C_6H_5-NH-CH_3$
- (b) C_6H_5-COOH
- (c) $C_6H_5-CH_2-NH_2$
- (d) $C_6H_5-CH_2-COOH$

136. When acetamide reacts with Br_2 and caustic soda, then we get :

- (a) Acetic acid
- (b) Bromoacetic acid
- (c) Methyl amine
- (d) Ethyl amine

137. In the reaction

the term Y is:

- (a) Acetone
- (b) Ethyl amine
- (c) Acetaldehyde
- (d) Dimethyl amine

138. Reaction of cyclohexanone with dimethylamine in the presence of catalytic amount of an acid forms a compounds if water during the reaction is continuously removed. The compound formed is generally known as [AIEEE 2005]

- (a) A Schiff's base
- (b) An enamine
- (c) An imine
- (d) An amine

139. $R-NH-COH \xrightarrow[\text{pyridine}]{POCl_3} \text{product}$

In the given reaction what will be the product [BHU 2005]

- (a) $R-N=C=O$
- (b) $R-\overset{+}{N} \equiv C^-$
- (c) $R-C \equiv N$
- (d) None of these.

140. Which of the following is secondary pollutant.

- (a) CO
- (b) NO
- (c) PAN
- (d) SO_2

141. Nitration of aniline also gives *m*-nitro aniline, in strong acidic medium because [Kerala CET 2005]

- (a) In electrophilic substitution reaction amino group is meta directive
- (b) In spite of substituents nitro group always goes to *m*- position
- (c) In strong acidic medium, nitration of aniline is a nucleophilic substitution reaction
- (d) In strong acidic medium aniline present as anilinium ion
- (e) Strong acid, gives nitrate anion, which attacks at *m*-position

142. Identify the product in following order

- (a) 3, 4, 5 -Tribromobenzene
- (b) 1, 2, 3 - Tribromobenzene
- (c) 2, 4, 6 - Tribromobenzene
- (d) 3, 4, 5 - Tribromo nitro benzene
- (e) 3, 4, 5 - Tribromo phenol

143. The correct order of basicity in amines

- (i) $C_4H_9NH_2$
- (ii) CH_3NH_2
- (iii) $(CH_3)_2NH$
- (iv) $(CH_3)_3N$

[Kerala CET 2005]

- (a) (i) < (iv) < (ii) < (iii)
- (b) (iv) < (iii) < (ii) < (i)
- (c) (i) < (ii) < (iii) < (iv)
- (d) (ii) < (iii) < (iv) < (i)
- (e) (iv) < (iii) < (ii) < (i)

Tests for Nitrogen Containing Compounds

1. When acetamide reacts with Br_2 and caustic soda, then we get

[DPMT 1983; BHU 1997; Orissa JEE 2002; CPMT 1971, 78, 79, 81, 85, 2000, 03; MP PMT 1989; MP PET 1995, 2002]

- (a) Acetic acid
- (b) Bromoacetic acid
- (c) Methyl amine
- (d) Ethane

2. In organic compounds, nitrogen is tested in Lassaigne's test as

- (a) $NaNH_2$
- (b) $NaCN$
- (c) $NaNO_2$
- (d) $NaNO_3$

3. Liebermann's nitroso reaction is used for testing

- (a) Primary amines
- (b) Secondary amines
- (c) Tertiary amines
- (d) All the above

4. A nauseating smell in the carbylamine test for primary amines is due to the formation of [MP PET 1993]

- (a) Isocyanide
- (b) Chloroform
- (c) Cyanide
- (d) DDT

5. A positive carbylamine test is given by [IIT-JEE 1999]

- (a) *N,N*-dimethylaniline
- (b) 2, 4-dimethylaniline
- (c) *N*-methyl-*o*-methylaniline
- (d) *p*-methylbenzylamine

6. The colour of *p*-amino azobenzene is [BHU 1997]

- (a) Orange
- (b) Congo red
- (c) Bismark brown
- (d) Indigo

7. When primary amine is heated with CS_2 in presence of excess mercuric chloride, it gives isothiocyanate. This reaction is called [KCET 1998; CPMT 1999]

- (a) Hofmann bromide reaction
- (b) Hofmann mustard oil reaction
- (c) Carbylamine reaction
- (d) Perkin reaction

8. Diazo-coupling is useful to prepare some [CPMT 1999]

- (a) Dyes
- (b) Proteins
- (c) Pesticides
- (d) Vitamins

9. Carbylamine test is used in the detection of [DCE 1999]

- (a) Aliphatic 2° amine
- (b) Aromatic 1° amine
- (c) Aliphatic 1° amine
- (d) Both aliphatic and aromatic 1° amines

10. Which of the following substance does not give iodoform test

- (a) C_6H_5CN
- (b) RNH_2
- (c) CH_3OH
- (d) All

11. Which one of the following compounds when heated with KOH and a primary amine gives carbylamine test

[Orissa JEE 2005]

- (a) CHCl_3 (b) CH_3Cl
(c) CH_3OH (d) CH_3CN

Critical Thinking

Objective Questions

1. The compound

forms nitroso amines when the substituents are

[Roorkee 1999]

- (a) $R_1 = \text{CH}_3, R_2 = R_3 = \text{H}$
(b) $R_1 = R_2 = \text{H}, R_3 = \text{C}_2\text{H}_5$
(c) $R_1 = \text{H}, R_2 = R_3 = \text{CH}_3$
(d) $R_1 = \text{CH}_3, R_2 = \text{C}_2\text{H}_5, R_3 = \text{H}$

2. The action of nitrous acid on ethyl amine gives

[DPMT 1982; CPMT 1971, 89, 94;
MP PET 1993, 2001; RPMT 1997; Pb. PMT 1999]

- (a) Ethane (b) Ammonia
(c) Ethyl alcohol (d) Nitroethane

3. Aniline when diazotized in cold and then treated with dimethyl aniline gives a coloured product. Its structure would be

4. Indicate which nitrogen compound amongst the following would undergo Hofmann's reaction (i.e. reaction with Br_2 and strong KOH) to furnish the primary amine ($\text{R}-\text{NH}_2$)

[CBSE PMT 1989]

- (a) $\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{NH}\cdot\text{CH}_3$ (b) $\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}\cdot\text{NH}_4$
(c) $\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{NH}_2$ (d) $\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{NHOH}$

[BHU 1995]

- (c) (d)

6. The correct order of basicities of the following compounds is

[IIT-JEE (Screening) 2001]

- (a) $2 > 1 > 3 > 4$ (b) $1 > 3 > 2 > 4$
(c) $3 > 1 > 2 > 4$ (d) $1 > 2 > 3 > 4$

7. Which of the following would be most reactive towards nitration [AMU 2000; UP

- (a) Benzene (b) Nitro benzene
(c) Toluene (d) Chloro benzene

8. Aniline reacts with acetaldehyde to form

[MHCET 2004; AFMC 2004]

- (a) Schiff's base (b) Carbylamine
(c) Imine (d) None of these

9. *p*-chloroaniline and anilinium hydrochloride can be distinguished by

- (a) Sandmeyer reaction (b) NaHCO_3
(c) AgNO_3 (d) Carbylamine test

[CPMT 1986, 2001; MP PET 1992;
KCET (Engg./Med.) 2000]

- (a) NH_2 (b) SnCl_2
(c) Cl (d) NH_4^+Cl^-

[BHU 2000; Pb. PMT 2000; Kerala 2003]

- (a) Phenyl isocyanide (b) Benzyl amine
(c) Benzyl chloride (d) None of these

12. The order of basic strength among the following amines in benzene solution is [AIIMS 1991; RPMT 2002]

- (a) $\text{CH}_3\text{NH}_2 > (\text{CH}_3)_3\text{N} > (\text{CH}_3)_2\text{NH}$
(b) $(\text{CH}_3)_2\text{NH} > \text{CH}_3\text{NH}_2 > (\text{CH}_3)_3\text{N}$
(c) $\text{CH}_3\text{NH}_2 > (\text{CH}_3)_2\text{NH} > (\text{CH}_3)_3\text{N}$
(d) $(\text{CH}_3)_3\text{N} > \text{CH}_3\text{NH}_2 > (\text{CH}_3)_2\text{NH}$

13. The refluxing of $(\text{CH}_3)_2\text{NCOCH}_3$ with acid gives

[KCET 1996]

- (a) $2\text{CH}_3\text{NH}_2 + \text{CH}_3\text{COOH}$
(b) $2\text{CH}_3\text{OH} + \text{CH}_3\text{COOH}$
(c) $(\text{CH}_3)_2\text{NH} + \text{CH}_3\text{COOH}$
(d) $(\text{CH}_3)_2\text{NCOOH} + \text{CH}_4$

14. Order of basicity of ethyl amines is [MP PMT/PET 1988]

- (a) Secondary > Primary > Tertiary
(b) Primary > Secondary > Tertiary
(c) Secondary > Tertiary > Primary
(d) Tertiary > Primary > Secondary

15. The following reaction is [KCET 1996]

- (a) Nucleophilic substitution
(b) Electrophilic substitution
(c) Free radical substitution
(d) None of these
16. RNH_2 reacts with $C_6H_5SO_2Cl$ in aqueous KOH to give a clear solution. On acidification a precipitate is obtained which is due to the formation of [Roorkee 2000]

- (b) $R - N^-SO_2C_6H_5K^+$
(c) $R - NHSO_2C_6H_5$
(d) $C_6H_5SO_2NH_2$

17. If N and S are present in an organic compound during Lassaigne test, then both changes into [CPMT 1997]

- (a) Na_2S and $NaCN$
(b) $NaSCN$
(c) Na_2SO_3 and $NaCN$
(d) Na_2S and $NaCNO$

18. The strongest base among the following is

19. Nitroso amines ($R_2N - N = O$) are soluble in water. On heating them with concentrated H_2SO_4 they give secondary amines. The reaction is called [AFMC 1998; AIIMS 1998; BHU 2002]

- (a) Perkin's reaction
(b) Fittig's reaction
(c) Sandmeyer's reaction
(d) Liebermann's nitroso reaction

20. A primary amine is formed an amide by the treatment of bromine and alkali. The primary amine has : [BHU 2004]

- (a) 1 carbon atom less than amide
(b) 1 carbon atom more than amide
(c) 1 hydrogen atom less than amide
(d) 1 hydrogen atom more than amide

21. The structural formula of Indigo dye is : [DPMT 2004]

22. Which of the following is the strongest base ? [AIEEE 2004]

23. The following compound on hydrolysis in aqueous acetone will give

- (a) Mixture of (K) and (L) (v) Mixture of (K) and (M)
(c) Only (M) (d) Only (K)

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

1. Assertion : Benzene diazonium chloride does not give tests for nitrogen.
 Reason : N_2 gas loss takes place during heating
 [AIIMS 1999]
2. Assertion : Amines are basic in nature.
 Reason : Presence of lone pair of electron on nitrogen atom.
 [AIIMS 1999]
3. Assertion : Methyl isocyanide reacts with ozone to form methyl isocyanate.
 Reason : Methyl isocyanate was responsible for Bhopal tragedy.
4. Assertion : Alkyl cyanide can be prepared by carbylamine reaction.
 Reason : Ethyl amine when heated with chloroform in presence of alcoholic KOH, cyanide is formed.
5. Assertion : CN^- ion is an ambident nucleophile.
 Reason : Nucleophiles are electron rich species.
6. Assertion : Sulphanilic acid exists as dipolar ion whereas *p*-aminobenzoic acid does not.
 Reason : Carboxyl group being more acidic than $-SO_3H$ group can easily transfer a H^+ to the amino group.
7. Assertion : Nitrating mixture used for carrying out nitration of benzene consists of conc. HNO_3 + conc. H_2SO_4 .
 Reason : In presence of H_2SO_4 , HNO_3 acts as a base and produces NO_2^+ ions.
8. Assertion : In order to convert $R-Cl$ to pure $R-NH_2$, Gabriel phthalimide synthesis can be used.
 Reason : With proper choice of alkyl halides, phthalimide synthesis can be used to prepare 1°, 2° or 3° amines.
9. Assertion : Ammonolysis of alkyl halides involves the reaction between alkyl halides and alcoholic ammonia.
 Reason : Reaction can be used to prepare only 2° amines.
10. Assertion : Nitroalkanes, but not nitroarenes can be distilled at normal atmospheric pressure.
 Reason : Nitroalkanes are sparingly soluble in water while nitroarenes are insoluble.
11. Assertion : In Hofmann bromide reaction, the amine formed has one carbon atom less than the parent 1° amide.
 Reason : *N*-methyl acetamide undergoes Hofmann bromamide reaction.
12. Assertion : Nitrobenzene does not undergo Friedel Craft alkylation.
 Reason : Nitrobenzene is used as solvent in laboratory and industry.
13. Assertion : Ammonia is less basic than water.
 Reason : Nitrogen is less electronegative than oxygen.
14. Assertion : The reaction between a diazo salt and an aromatic amine or a phenol, giving an aminoazo

- or hydroxyazo compounds is called coupling reaction.
- Reason : Condensation of diazonium salt with phenol is carried out in weakly acidic medium.
 15. Assertion : Carbylamine reaction involves the reaction between 1° amine and chloroform in basic medium.
 Reason : In carbylamine reaction, $-NH_2$ group is converted into $-NC$ group.
 16. Assertion : Me_3N reacts with BF_3 whereas Ph_3N does not.
 Reason : The electron pair on nitrogen atom in Ph_3N is delocalised in the benzene ring and is not available to boron in BF_3 .
 17. Assertion : *p*-Anisidine is weaker base than aniline.
 Reason : $-OCH_3$ group in anisidine exerts $-R$ effect.
 18. Assertion : Lower aldehydes and ketones are soluble in water but the solubility decreases as the molecular mass increases.
 Reason : Distinction between aldehydes and ketones can be made by Tollen's test.
 [AIIMS 1999]
 19. Assertion : Aniline hydrogen sulphate on heating forms a mixture of ortho and para aminobenzene sulphonic acids.
 Reason : The sulphonic acid group is electron withdrawing.
 [AIIMS 1996]
 20. Assertion : $p-O_2N-C_6H_5COCH_3$ is prepared by Friedel Crafts acylation of nitrobenzene.
 Reason : Nitrobenzene easily undergoes electrophilic substitution reaction.
 [AIIMS 2005]
 21. Assertion : Alkyl isocyanides in acidified water give alkyl formamides.
 Reason : In isocyanides, carbon first acts as a nucleophile and then as an electrophile.
 [AIIMS 2005]

Answers and Solutions

Introduction of Nitrogen Containing Compounds

4. (d) C_3H_9N can form all the 3 amines.
 $CH_3CH_2CH_2-NH_2$, $CH_3-CH_2-NH-CH_3$
 1° amine 2° amine
 $CH_3-\overset{\overset{CH_3}{|}}{N}-CH_3$
 3° amine
5. (c) $(CH_3)_2C=O + H \cdot CH_2-COCH_3 + NH_3$
 $\downarrow$
 $(CH_3)_2C-NH-CH_2-COCH_3$
 NH_2
 diacetoneamine
8. (d) Allyl isocyanide. $CH_2=CH-CH_2-N \equiv C$
9. (c)
- NH_2 NH_2
 NH_2 1°
 NH_2
 1° amine
12. (b) $CH_3CH_2-O-N=O$ is a nitrite derivative, hence it is not a nitro derivative.
13. (b) CH_3CN is called acetonitrile....
15. (b) Four 1° amines are possible
 $CH_3CH_2CH_2CH_2NH_2$, $(CH_3)_2CHCH_2NH_2$,
 $CH_3CH(NH_2)CH_2CH_3$, $(CH_3)_3CNH_2$

Preparation of Nitrogen Containing Compounds

1. (c) Hofmann's bromamide reaction
 $CH_3-CO-NH_2 + Br_2 + 4KOH \xrightarrow{H_2O}$
 Acetamide
 $CH_3NH_2 + K_2CO_3 + 2KBr + 2H_2O$
 Methyl amine
2. (d) $CH_3CONH_2 \xrightarrow{NaOBr} CH_3NH_2$.
3. (b) $CH_3CONH_2 + Br_2 + 4NaOH \rightarrow$
 Acetamide
 $CH_3NH_2 + Na_2CO_3 + 2NaBr + 2H_2O$
 Methyl amine

4. (b) $CH_3-CO-NH_2 \xrightarrow{NaOH / Br_2} CH_3-NH_2$
 Hofmann's bromamide (2c) (1c)
5. (b) $CH_3C \equiv N + 4[H] \xrightarrow{Na + C_2H_5OH} CH_3CH_2NH_2$
 Reduction
6. (b) $CH_3-CH_2-CO-NH_2 + Br_2 + 4KOH \rightarrow$
 Propionamide
 $CH_3CH_2NH_2 + K_2CO_3 + 2KBr + 2H_2O$
7. (c) $C_2H_5I + NH_3 \rightarrow HI + C_2H_5-NH_2$
 $C_2H_5OH + NH_3 \rightarrow H_2O + C_2H_5-NH_2$
9. (c) $CH_3-CH_2-NO_2 + 6[H] \xrightarrow{Sn / HCl}$
 Nitro ethane
 $CH_3-CH_2-NH_2 + 2H_2O$
 Ethyl amine
11. (d) $CH_3I \xrightarrow{NH_3, \Delta} CH_3NH_2 \xrightarrow{CH_3I} (CH_3)_2NH$
 Methyl amine Dimethyl amine
 $\xrightarrow{CH_3I} (CH_3)_3N$
 Trimethylamine
12. (d)
- NH_2 CH_3-CO
 CH_3-CO
 Aniline Acetic anhydride
 $NH-CO-CH_3$ CH_3COOH
 Acetanilide
16. (c) $CH_3-N \equiv C + 4[H] \xrightarrow{\text{Reduction}} CH_3-NH-CH_3$
 2° amine
17. (a) $CH_3NO_2 + 3Cl_2 + 3NaOH \rightarrow$
 Nitromethane
 $CCl_3-NO_2 + 3NaCl + 3H_2O$
 (chloropicrin)
18. (b)
- $R-C \equiv N$ $Nitrile$
 $\xrightarrow{\text{Reduction } [H]}$ $R-CH_2-NH_2$ 1° amine
 $\xrightarrow{\text{Hydrolysis } H_3O^+ / \text{alumina}}$ $R-COOH + NH_3$ acid
19. (a) $C_2H_5OH + NH_3 \xrightarrow{P_2O_5, \text{alumina}} C_2H_5NH_2 + H_2O$.
20. (c) $R-CN + H_2O \xrightarrow{H_2O / H^+} RCOOH + NH_3$
 It yield amine when reduced as -
 $R-CN + H_2 \rightarrow R-CH_2-NH_2$
21. (b) $CH_3CONH_2 \xrightarrow{P_2O_5} CH_3CN \xrightarrow{4H} CH_3CH_2NH_2$
22. (a) $CH_3-CH_2-\overset{\overset{O}{||}}{N} \rightarrow O + 3H_2 \rightarrow CH_3CH_2NH_2 + 2H_2O$.
23. (a) $CH_3NH_2 \xrightarrow{NO_2} CH_3OH + N_2 + H_2O$
 Methyl amine
24. (a) $R-NH_2 + CHCl_3 + 3KOH \rightarrow R-NC + 3KCl + 3HO$
 1° -amine
25. (b)
- NH_2 N_2Cl
 $NaNO_2 / HCl$
 $0^\circ - 5^\circ C$
 Aniline Benzene diazonium chloride $2H_2O$.

Properties of Nitrogen Containing Compounds

- (d) Tertiary amine does not react with nitrous acid because in it α -H atom is absent.
- (d) Due to +ve I.E. of alkyl group, N-atom of amines acquires partial -ve charge and thus electron pair is easily donated.

The compounds in which both amino ($-\text{NH}_2$) as well as acidic ($-\text{COOH}$) group is present is called amino acid.

Presence of $-\text{NO}_2$ group decreases electron density at o - and p - positions. Hence, incoming electrophile goes to m position. Therefore it is m -directing group.

12. (b) Only primary aromatic amines can undergo diazotisation.

20. (c) Because in tertiary nitroalkanes α -H atom is absent.

21. (a) Primary amine reacts with CHCl_3 and alc. KOH to form isocyanide while secondary and tertiary amines do not react.

22. (d) Friedel-Craft's reaction is used for the preparation of alkyl benzene or acetophenone. It is not a method to prepare amine.

This litmus paper test shows basic nature of amine.

24. (c) Presence of alkyl group increases electron density on nitrogen atom due to +I effect. Thus basic nature increases.

25. (a) Mustard oil reaction

3-nitro group can be introduced.

50. (b) Because the N atom in aniline has a lone pair to donate and also due to +I effect of $-NH_2$ group.

Nitration of aniline without protecting the amino group is not possible because HNO_3 is a strong oxidising agent which oxidises aniline.

In methyl amine only one electron releasing group is present but in dimethyl amine two electron releasing groups are present which increase the basicity higher in dimethyl amine.

57. (d) Nitro compounds are not explosive but stable compound.

63. (c) 3° amine cannot be Acetylated because replaceable H-atom is absent.

67. (e) Because N-N dimethyl propanimine

68. (c) Replaceable H^- is absent.

76. (a) Because of presence of electron withdrawing group - NO_2 .

77. (a) To suppress the concentration of the aniline available for coupling other rise coupling occurs.

Me = Methyl.

86. (b) Phenol react with aniline to give diazonium salt by coupling but Methyl amine not react with phenol.

87. (b) $C_6H_5SO_2Cl$ is called Hinsberg's reagent they react with sec amine to form a product in soluble in

alkalies. This reaction used to separate 1° , 2° and 3° amine from their mixture.

88. (b) A mixture of benzene and aniline can be separated by dil. HCl .

91. (c) Methyl isocyanate is industrially prepared by the action of methyl amine with phosgene.

92. (d) $R-NC + 2H_2O \rightarrow RNH_2 + HCOOH$.

93. (d) $CH_3-NC + 2H_2O \rightarrow CH_3NH_2 + HCOOH$

95. (c) $CH_3NC + 4H \xrightarrow[ether]{LiAlH_4} (CH_3)_2NH$.

102. (a) $R-\overset{\overset{O}{\parallel}}{C}-NH_2 \xrightarrow{H_2-Ni} R-CH_2-NH_2$

104. (b) $CH_3CN + 2H_2O \xrightarrow{HCl} CH_3COOH + NH_3$

106. (a) $CH_3CH_2NH_2 + CH_3COCl \rightarrow CH_3CH_2NHCOCH_3 + HCl$
N Ethylacetanilide

107. (a) $\begin{matrix} CH_3 \\ \diagup \\ NH \end{matrix} + CH_3COOH \rightarrow \begin{matrix} CH_3 \\ \diagup \\ N-\overset{\overset{O}{\parallel}}{C}-CH_3 \end{matrix}$

108. (d) Anilinium hydrogen chloride produces chloride ion which gives white precipitate with $AgNO_3$. In fact anilium chloride is a part of aniline.

119. (a) Basicity of amines increase with increase in number of $-CH_3$ groups (or any group which cause +I effect), due to increase in electron density on N atom. As a rule, the basicity of t-amine should be more than that of s-amine, but actually it is found to be lesser than s-amines. This is due to steric hindrance of bulkier alkyl groups, which decreases the availability of lone pair of electron on the N atom of the amino group. Hence the correct order of basicity is :
 $(CH_3)_2NH > (CH_3)_3N > CH_3NH_2$

120. (b) Amines are basic in nature, hence form salts with acid.

121. (b) We know that

Thus in this reaction phenyl isocyanide is produced. this is called carbylamine reaction.

122. (d) Isocyanides on hydrolysis forms primary amines not ammonia

123. (b) $C_6H_5CONH_2 + Br_2 + KOH \rightarrow C_6H_5CONHBr + KBr + H_2O$

125. (d) (i) $RCNH_2 + Br_2 + KOH \rightarrow RCONHBr + KBr + H_2O$
(ii) $RCONHBr + KOH \rightarrow RNCO + KBr + H_2O$
(iii) $RNCO + 2KOH \rightarrow RNH_2 + K_2CO_3$
 $RCONH_2 + Br_2 + 4KOH \rightarrow RNH_2 + 2KBr + K_2CO_3 + 2H_2O$

126. (b) Aniline reacts with benzaldehyde and forms Schiff's base (benzal aniline) or anils.

1398 Nitrogen Containing Compounds

Acetamide

(Methyl amine)

Acetaldehyde

Carbylamine

Secondary amine

Benzene

diazonium chloride

p-hydroxyazobenzene

 Thus product Z is identified as $\text{C}_6\text{H}_5\text{COOH}$

Ether

 The reason for this is that, in acidic condition protonation of $-\text{NH}_2$ group gives anilinium ion ($+\text{NH}_3$), which is of deactivating nature and of m-directive nature.

Tests for Nitrogen Containing Compounds

Acetamide

Methyl amine

Orange Colour

 Benzenediazonium
chloride

p-amino azo benzene (yellow dye)

11. (a) CHCl_3 gives carbylamine test.

Critical Thinking Questions

1. (c) $R_1 = \text{H}$ and $R_2 = R_3 = \text{CH}_3$

Sec. amine reacts with Nitrous acid to form nitroso amine yellow liquid.

2. (c) $\text{CH}_3\text{CH}_2\text{NH}_2 + \text{HNO}_2 \rightarrow \text{CH}_3\text{CH}_2\text{OH} + \text{N}_2 + \text{H}_2\text{O}$
Ethylamine Ethylalcohol

4. (c) Hofmann degradation of amide

6. (b) The relative basic character of $1^\circ, 2^\circ$ and 3° amines also depends upon the nature of the alkyl group.

R	Relative basic strength
$-\text{CH}_3$	$\text{R}_2\text{NH} > \text{R}-\text{NH}_2 > \text{R}_3\text{N} > \text{NH}_3$
$-\text{C}_2\text{H}_5$	$\text{R}_2\text{NH} > \text{R}-\text{NH}_2 > \text{NH}_3 > \text{R}_3\text{N}$
$-\text{CHMe}_2$	$\text{R}-\text{NH}_2 > \text{NH}_3 > \text{R}_2\text{NH} > \text{R}_3\text{N}$
$-\text{CMe}_3$	$\text{NH}_3 > \text{R}-\text{NH}_2 > \text{R}_2\text{NH} > \text{R}_3\text{N}$

7. (b) The nitrogroup is very firmly linked to the benzene nucleus and does not undergo any displacement reaction. Nitro group deactivates the benzene nucleus.

9. (bc) (1) With $\text{NaHCO}_3 \rightarrow$

But p-chloro aniline is basic not acidic it does not liberate CO_2 .

p-chloro aniline does not contain ionic chlorine so it does not give white ppt with AgNO_3

11. (a) $\text{C}_6\text{H}_5-\text{NH}_2 + \text{CHCl}_3 + 3\text{KOH} \rightarrow$

12. (b) $(\text{CH}_3)_2\text{NH} > \text{CH}_3\text{NH}_2 > (\text{CH}_3)_3\text{N}$
 $K_b = 5.4 \times 10^{-4} \quad 4.5 \times 10^{-4} \quad 0.6 \times 10^{-4}$

13. (c) $(\text{CH}_3)_2\text{NCOCH}_3 + \text{HCl} / \text{H}_2\text{O}$

14. (a) Order of basicity of amines

(i) $2^\circ > 1^\circ > 3^\circ$

(ii) $\text{R}_2\text{NH} > \text{RNH}_2 > \text{ArCH}_2-\text{NH}_2 > \text{NH}_3 > \text{ArNH}-\text{R} >$

$\text{ArNH}_2 > \text{ArNH}-\text{Ar}$

Because OH^- is nucleophile.

16. (c) $\text{C}_6\text{H}_5\text{SO}_2\text{Cl} + \text{RNH}_2 \rightarrow \text{RNHSO}_2\text{C}_6\text{H}_5 \xrightarrow{\text{KOH}} \text{RNKSO}_2\text{C}_6\text{H}_5$
 soluble in KOH

17. (b) When sulphur and nitrogen both are present in organic compound during Lassaigne's Test, both changes into "sodium thiocyanate". (NaSCN) which gives a blood red colouration with Ferric ion.

18. (c)  does not have aromaticity by which the Lone pair of electron of Nitrogen does not delocalised in benzene ring so it will be strong base on other hand rest 3 have aromaticity i.e., they follow the huckel rule so the electron pair of Nitrogen delocalised in ring by resonance & resulting they become less basic.

19. (d) Liebermann's Nitroso reaction.

21. (c) The class of Indigo dye is Indigoid or vat dye. Indigo dyes are insoluble in water.
22. (d) Lone pair of $\ddot{\text{N}}$ are not taking part in conjugation whereas in other parts lone pairs are taking part in conjugation

Assertion and Reason

1. (a) It is true that benzene diazonium chloride does not respond Lassaigne test of nitrogen because benzene diazonium chloride losses N_2 on Slight heat and thus it can't react with sodium metal.
2. (a) Amines are basic due to the presence of a lone pair of electrons on nitrogen atom. The lone pair can be easily donated.
3. (b) The reason being that the terminal carbon atom in isocyanide has electron-deficient carbon having a sextet of electrons and hence undergoes addition reactions with ozone.
4. (d) When primary amines are heated with chloroform in the presence of alcoholic KOH , isocyanides are formed. This reaction is known as carbylamine reaction. eg. ethyl amine gives ethyl isocyanide on treatment with CHCl_3 and alcoholic KOH .

5. (b) Nucleophilic species which have more than one site of reaction are called ambident nucleophiles.

6. (c) $-\text{SO}_3\text{H}$ group being more acidic than $-\text{CO}_2\text{H}$ group can easily transfer a proton to the amino group.
7. (a) $\text{HNO}_3 + 2\text{H}_2\text{SO}_4 \rightleftharpoons 2\text{HSO}_4^- + \text{NO}_2^+ + \text{H}_3\text{O}^+$
8. (c) Only primary aliphatic amines can be prepared by Gabriel phthalimide reaction.
9. (c) Reaction can be used to prepare 1° , 2° , 3° amines and finally quarternary ammonium salts.
10. (b) Nitroarene cannot be distilled under normal atmospheric pressure. This is because either they decompose or they explode on strong heating.
11. (c) Only 1° amines undergo Hofmann bromamide reaction. Since $\text{CH}_3\text{CONHCH}_3$ is a 2° amine therefore, it does not undergo Hofmann bromamide reaction.
12. (b) Nitrobenzene does not undergo Friedel Craft reaction because nitro group deactivate the ring towards electrophilic substitution and drastic conditions are needed to carry out the electrophilic substitution reactions.
13. (e) Ammonia is more basic than water. It is because nitrogen being less electronegative than oxygen has a greater tendency to donate electrons.
14. (c) Condensation of diazonium salt with phenol is carried out in weakly alkaline medium, ($\text{pH} = 9$). This is due to the fact that in strongly acid medium the $-\text{OH}$ of a phenol remains unionised, and an amine forms a salt. Phenol exists as phenoxide ion and the latter is readily substituted by electrophiles than phenol itself. Thus, in phenol, coupling is carried out in alkaline medium.
15. (a) $\text{RNH}_2 + \text{CHCl}_3 + 3\text{KOH}(\text{alc}) \rightarrow \text{R}-\text{N} \equiv \text{C} + 3\text{KCl} + 3\text{H}_2\text{O}$
17. (d) p -Anisidine is a stronger base than aniline. $-\text{OCH}_3$ group in anisidine exerts $+R$ - effect.
18. (b) Solubility of aldehydes and ketones decrease as the molecular mass increase.
20. (d) The nitro group strongly deactivates the benzene ring towards electrophilic substitution. Nitrobenzene does not undergo Friedel-Craft acylation reaction.
21. (a) In an isocyanide, first an electrophile and then a nucleophile add at the carbon to form a species which usually undergoes further transformations.

Nitrogen Containing Compounds

SET Self Evaluation Test -29

- Melting points are normally the highest for [AIIMS 2004]
 - Tertiary amides
 - Secondary amides
 - Primary amides
 - Amines
- Amines behave as [Karnataka (Med.) 1999]
 - Lewis acids
 - Lewis bases
 - Aprotic acids
 - Amphoteric compounds
- Which of the following compound gives dye test [MP PET/PMT 1998]
 - Aniline
 - Methylamine
 - Diphenylamine
 - Ethylamine
- In hydrolysis of aniline, the reagent used is [AFMC 1995]
 - Dil. HCl
 - Acetyl chloride
 - CH_3OH
 - None of these
- A nitrogen containing organic compound on heating with chloroform and alcoholic KOH , evolved very unpleasant smelling vapour. The compound could be [BHU 2002; BVP 2003]
 - N,N -dimethyl amine
 - Nitrobenzene
 - Aniline
 - Benzamide
- The reaction between a primary amine, chloroform and few drops of alcoholic KOH is known as [MNR 1987; MP PMT 1994; Bihar MEE 1996; AIIMS 1998; MP PET 2002]
 - Cannizzaro reaction
 - Carbylamine reaction
 - Wurtz's reaction
 - Reimer-Tiemann reaction
- Nitrolim is [BVP 2004]
 - $CaC_2 + N_2$
 - $CaCN_2 + C$
 - $Ca(CN)_2 + C$
 - $Ca(CN)_2 + NH_4CN$
- Phenyl isocyanides are prepared from which of the following reactions [CBSE PMT 1999]
 - Rosenmund's reaction
 - Carbylamine reaction
 - Reimer-Tiemann reaction
 - Wurtz reaction
- On strong heating, ammonium acetate gives [MNR 1995]
 - Acetamide
 - Methyl cyanide
 - Urea
 - Formamide
- Aniline is separated from a mixture by [UPSEAT 2000, 01]
 - Fractional crystallization
 - Fractional distillation
 - Vacuum distillation
 - Steam distillation
- Molecular formula of chloropicrin is [MH CET 2003]
 - $CHCl_3NO_2$
 - CCl_3NO_3
 - CCl_2NO_2
 - CCl_3NO_2
- In amines, the hybridisation state of N is [CPMT 1999]
 - sp
 - sp^2
 - sp^3
 - sp^2d
- Foul smelling compound formed, during carbyl amine reaction is :
 - Alcohol
 - Aldehyde
 - Alkyl isocyanide
 - Carboxylic acid
- The end product of the reaction [Kerala PMT 2004]

ethylamine $\xrightarrow{HNO_2} A \xrightarrow{PCl_5} B \xrightarrow{KCN} C$ is

 - Ethyl amine
 - Diethyl amine
 - Propane nitrite
 - Triethyl amine
 - Methyl amine

1. (c) The higher boiling points of amide is because of Intermolecular hydrogen bonding

Due to intermolecular hydrogen bonding they have high boiling point than amine and amongst amide the order of Boiling point are

Primary > Sec > Tertiary

This is because of alkyl group by which the carbonyl oxygen do not form the hydrogen bond (other molecule) so primary amide have high boiling point and Tertiary amides does not have to form bond with O of other amide and have least B.P

2. (b) In amines nitrogen has a lone pair of e^- . It can donate a lone pair. So amines behave as a Lewis base.
3. (a) Basically all the Azo dye are derivatives of aniline.
4. (a) All amines react with mineral acids such as HCl , H_2SO_4 , HNO_3 etc. to form salts which are soluble in water.
5. (c) $C_6H_5NH_2 + CHCl_3 + 3KOH \rightarrow C_6H_5NC + 3KCl + 3H_2O$
(Alc)

6. (b) $CH_3NH_2 + CHCl_3 + 3KOH \rightarrow \overset{\oplus}{R}N \equiv \overset{\ominus}{C} + 3KCl + 3H_2O$
Isocyanide

7. (b) Nitrolium is a mixture of calcium cyanamide and carbon.

Carbyl amine reaction.

14. (c) $C_2H_5NH_2 + HNO_2 \rightarrow C_2H_5OH + N_2 + H_2O$
(A)

9. (b) $CH_3COONH_4 \xrightarrow{\Delta} CH_3CONH_2 \xrightarrow{\Delta} CH_3CN + H_2O$
10. (d) Steam distillation is used for separation of aniline from mixture. Aniline is insoluble in water but it is steam soluble.
11. (d) Molecular formula of chloropicrin is CCl_3NO_2
12. (c) It is similar that of NH_3 except H is replaced by -R group.

13. (c) On heating $CHCl_3$ with ethanolic KOH and primary amine, isocyanide is formed and is readily detected by its offensive odour. This is called as carbyl amine test.

Answers and Solutions

Introduction of Nitrogen Containing Compounds

4. (d) C_3H_9N can form all the 3 amines.
 $CH_3CH_2CH_2-NH_2$, $CH_3-CH_2-NH-CH_3$
 1° amine 2° amine
 $CH_3-\overset{\overset{CH_3}{|}}{N}-CH_3$
 3° amine
5. (c) $(CH_3)_2C=O + H \cdot CH_2-COCH_3 + NH_3$
 $\downarrow$
 $(CH_3)_2C-CH_2-COCH_3$
 $|$
 NH_2
 diacetoneamine
8. (d) Allyl isocyanide. $CH_2=CH-CH_2-N \equiv C$
9. (c)
- NH_2 NH_2 1°

 NH_2
12. (b) $CH_3CH_2-O-N=O$ is a nitrite derivative, hence it is not a nitro derivative.
13. (b) CH_3CN is called acetonitrile....
15. (b) Four 1° amines are possible
 $CH_3CH_2CH_2CH_2NH_2$, $(CH_3)_2CHCH_2NH_2$,
 $CH_3CH(NH_2)CH_2CH_3$, $(CH_3)_3CNH_2$

Preparation of Nitrogen Containing Compounds

1. (c) Hofmann's bromamide reaction
 $CH_3-CO-NH_2 + Br_2 + 4KOH \xrightarrow{H_2O}$
 Acetamide
 $CH_3NH_2 + K_2CO_3 + 2KBr + 2H_2O$
 Methyl amine
2. (d) $CH_3CONH_2 \xrightarrow{NaOBr} CH_3NH_2$.
3. (b) $CH_3CONH_2 + Br_2 + 4NaOH \rightarrow$
 Acetamide
 $CH_3NH_2 + Na_2CO_3 + 2NaBr + 2H_2O$
 Methyl amine

4. (b) $CH_3-CO-NH_2 \xrightarrow{NaOH / Br_2} CH_3-NH_2$
 Hofmann's bromamide (2c) (1c)
5. (b) $CH_3C \equiv N + 4[H] \xrightarrow{Na+C_2H_5OH} CH_3CH_2NH_2$
 Reduction
6. (b) $CH_3-CH_2-CO-NH_2 + Br_2 + 4KOH \rightarrow$
 Propionamide
 $CH_3CH_2NH_2 + K_2CO_3 + 2KBr + 2H_2O$
7. (c) $C_2H_5I + NH_3 \rightarrow HI + C_2H_5-NH_2$
 $C_2H_5OH + NH_3 \rightarrow H_2O + C_2H_5-NH_2$
9. (c) $CH_3-CH_2-NO_2 + 6[H] \xrightarrow{Sn / HCl}$
 Nitro ethane
 $CH_3-CH_2-NH_2 + 2H_2O$
 Ethyl amine
11. (d) $CH_3I \xrightarrow{\Delta, NH_3} CH_3NH_2 \xrightarrow{CH_3I} (CH_3)_2NH$
 Methyl amine Dimethyl amine
 $\xrightarrow{CH_3I} (CH_3)_3N$
 Trimethylamine
12. (d)
- NH_2 $NH-CO-CH_3$

 Aniline Acetic anhydride Acetanilide
16. (c) $CH_3-N \equiv C + 4[H] \xrightarrow{\text{Reduction}} CH_3-NH-CH_3$
 2° amine
17. (a) $CH_3NO_2 + 3Cl_2 + 3NaOH \rightarrow$
 Nitromethane
 $CCl_3-NO_2 + 3NaCl + 3H_2O$
 (chloropicrin)
18. (b)
- $R-C \equiv N$ $Nitrile$
 $\xrightarrow{\text{Reduction } [H]} R-CH_2-NH_2$ 1° amine
 $\xrightarrow{\text{Hydrolysis}} R-COOH + NH_3$ acid
19. (a) $C_2H_5OH + NH_3 \xrightarrow{Al_2O_3, 600^\circ C} C_2H_5NH_2 + H_2O$.
20. (c) $R-CN + H_2O \xrightarrow{H_2O / H^+} RCOOH + NH_3$
 It yields amine when reduced as –
 $R-CN + H_2 \rightarrow R-CH_2-NH_2$
21. (b) $CH_3CONH_2 \xrightarrow{P_2O_5} CH_3CN \xrightarrow{4H} CH_3CH_2NH_2$
22. (a) $CH_3-CH_2-\overset{\overset{O}{||}}{N} \rightarrow O + 3H_2 \rightarrow CH_3CH_2NH_2 + 2H_2O$.
23. (a) $CH_3NH_2 \xrightarrow{NO_2} CH_3OH + N_2 + H_2O$
 Methyl amine
24. (a) $R-NH_2 + CHCl_3 + 3KOH \rightarrow R-NC + 3KCl + 3HO$
 1° -amine
25. (b)
- NH_2 N_2Cl

 Aniline Benzene diazonium chloride
26. (b) $CH_3CH_2COOH \xrightarrow{SOCl_2} CH_3CH_2COCl + SO_2 + HCl$

1394 Nitrogen Containing Compounds

35. (c) Methyl amine is the strongest base.

50. (a) Halogen have $-I$ and $+M$ effect by which its electron delocalized in benzene ring by resonance & due to its $-I$ effect its bonded with benzene ring and cannot be substitute by CN^- & show the inertness against KCN while other option gives Aromatic nitrile

51. (c) Secondary amines gives oily nitrosamine with nitrous acid.
 $(\text{CH}_3\text{CH}_2)_2\text{NH} + \text{HONO} \rightarrow (\text{CH}_3\text{CH}_2)_2\text{N.NO} + \text{H}_2\text{O}$
 oily

52. (a) When aniline is treated with HNO_2 at $0-5^\circ\text{C}$ then diazonium salt is formed and by the coupling of diazonium salt and phenol azo dyes are prepared.

54. (a)

p -nitrobenzene from p -nitroaniline. Azo dye

Properties of Nitrogen Containing Compounds

- (d) Tertiary amine does not react with nitrous acid because in it α -H atom is absent.
- (d) Due to +ve I.E. of alkyl group, N -atom of amines acquires partial $-ve$ charge and thus electron pair is easily donated.

The compounds in which both amino ($-\text{NH}_2$) as well as acidic ($-\text{COOH}$) group is present is called amino acid.

Presence of $-\text{NO}_2$ group decreases electron density at o - and p - positions. Hence, incoming electrophile goes to m position. Therefore it is m -directing group.

10. (c)  + 3H₂O
sym-trinitro benzene
11. (c) $\text{CH}_3 - \text{CH}_2 - \text{NH}_2 \xrightarrow[\text{[O]}]{\text{KMnO}_4} \text{CH}_3 - \text{CH} = \text{NH}$ (Aldimine)
Ethylamine
 $\xrightarrow{\text{H}_3\text{O}^+} \text{CH}_3 - \text{CHO}$ (Acetaldehyde)
12. (b) Only primary aromatic amines can undergo diazotisation.
13. (b) $\text{R} - \text{CH}_2 - \text{NH}_2 + \text{O} = \text{CH} - \text{R} \rightarrow \text{R} - \text{CH}_2 - \text{N} = \text{CH} - \text{R} + \text{H}_2\text{O}$
1° amine Aldimine
14. (c) $\text{CH}_3 - \text{CO} - \text{NH}_2 + \text{HNO}_2 \rightarrow \text{CH}_3\text{COOH} + \text{N}_2 \uparrow + \text{H}_2\text{O}$
Acetamide Acetic acid
15. (c) 
Nitrobenzene m-dinitrobenzene
-NO₂ group is meta directing group.
16. (a) $\text{R} - \text{O} - \text{N} = \text{O} + 6[\text{H}] \xrightarrow{\text{Sn/HCl}} \text{ROH} + \text{NH}_3 + \text{H}_2\text{O}$
Alkyl nitrite Alcohol
17. (d) $\text{CH}_3 - \text{CH}_2 - \text{NH}_2 + \text{HCl} \rightarrow \text{CH}_3\text{CH}_2 - \text{NH}_3^+ \text{Cl}^-$
Ethyl ammonium chloride
Amines are basic in nature they react with acid to form salt.
18. (a) $(\text{CH}_3)_2\text{NH} > \text{CH}_3\text{NH}_2 > (\text{CH}_3)_3\text{N} > \text{NH}_3$
2° amine is most basic 1° amine 3° amine Ammonia is least basic
19. (b) 
Aniline Phenyl isocyanide
20. (c) Because in tertiary nitroalkanes α-H atom is absent.
21. (a) Primary amine reacts with CHCl₃ and alc. KOH to form isocyanide while secondary and tertiary amines do not react.
22. (d) Friedel-Craft's reaction is used for the preparation of alkyl benzene or acetophenone. It is not a method to prepare amine.
23. (b) Red $\xrightarrow{\text{CH}_3\text{NH}_2}$ Blue
(Litmus paper)
This litmus paper test shows basic nature of amine.
24. (c) Presence of alkyl group increases electron density on nitrogen atom due to +I effect. Thus basic nature increases.
25. (a) Mustard oil reaction
 $\text{CH}_3 - \text{CH}_2 - \text{NH}_2 + \text{CS}_2 \xrightarrow{\text{HgCl}_2} \text{CH}_3 - \text{CH}_2 - \text{N} = \text{C} = \text{S} + \text{H}_2\text{S}$
Ethyl amine Ethyl isothiocyanate
28. (c) 
1, 3, 5-trinitrobenzene

3- nitro group can be introduced.

34. (a) $\text{R} - \text{CH}_2 - \text{NO}_2 \xrightarrow{\text{HNO}_2} \text{R} - \text{C}(\text{NO}) - \text{NO}_2$
1° nitro Nitroloic acid
 $\xrightarrow{\text{NaOH}} \text{R} - \text{C}(\text{NO}) - \text{NO}_2 \rightarrow \text{R} - \text{C}(\text{NO}) - \text{O}^- \text{Na}^+$
(Blood red)
35. (b) $(\text{R})_2\text{CH} - \text{NO}_2 \xrightarrow{\text{HNO}_2} (\text{R})_2\text{C}(\text{NO}) - \text{NO}_2$
 $\xrightarrow{\text{NaOH}} \text{Blue colour.}$
37. (b) $\text{CH}_3\text{CONH}_2 \xrightarrow{\text{P}_2\text{O}_5} \text{CH}_3 - \text{C} \equiv \text{N} + \text{H}_2\text{O}$
Acetamide Acetonitrile
38. (b) $\text{CHCl}_3 + \text{C}_2\text{H}_5\text{NH}_2 + 3\text{KOH} \rightarrow \text{C}_2\text{H}_5\text{N} \equiv \text{C} + 3\text{KCl} + 3\text{H}_2\text{O}$
Ethyl isocyanide
39. (d) $\text{CH}_3 - \text{C} \equiv \text{N} + 2\text{H}_2\text{O} \rightarrow \text{CH}_3\text{COOH} + \text{NH}_3$
Methyl cyanide Acetic acid
40. (c) $\text{CH}_3\text{CONH}_2 + \text{Br}_2 + 4\text{KOH} \rightarrow \text{CH}_3\text{NH}_2 + \text{K}_2\text{CO}_3 + 3\text{KBr} + 2\text{H}_2\text{O}$
(2c) (1c)
41. (a) $(\text{C}_2\text{H}_5)_2\text{NH} + (\text{aq.})\text{HONO} \rightarrow (\text{C}_2\text{H}_5)_2\text{N} - \text{N} = \text{O} + \text{H}_2\text{O}$
Diethyl nitrosoamine
42. (c) $\text{CH}_3 - \text{C} \equiv \text{N} \xrightarrow[\text{Reduction}]{\text{Na+EtOH}} \text{CH}_3 - \text{CH}_2 - \text{NH}_2$
 $\xrightarrow{\text{HNO}_2} \text{CH}_3\text{CH}_2 - \text{OH} \xrightarrow[\text{H}_2\text{SO}_4]{\text{K}_2\text{Cr}_2\text{O}_7} \text{CH}_3\text{COOH}$
43. (b) $\text{C}_2\text{H}_5\text{NH}_2 \xrightarrow{\text{HNO}_2} \text{C}_2\text{H}_5\text{OH} \xrightarrow{\text{PCl}_5} \text{C}_2\text{H}_5\text{Cl}$
Ethyl amine Ethyl alcohol
 $\xrightarrow{\text{NH}_3} \text{C}_2\text{H}_5\text{NH}_2$
Ethyl amine
44. (c) $\text{CH}_3\text{CH}_2 - \text{NH}_2 + \text{HNO}_2 \rightarrow \text{CH}_3\text{CH}_2 - \text{OH} + \text{N}_2 + \text{H}_2\text{O}$
1° Alcohol
 $(\text{CH}_3\text{CH}_2)_2\text{NH} + \text{HNO}_2 \rightarrow (\text{CH}_3\text{CH}_2)_2\text{N} - \text{N} = \text{O} + \text{H}_2\text{O}$
2° Nitroso amine
45. (d) $\text{RN} \equiv \text{C} + 2\text{H}_2\text{O} \xrightarrow{\text{Hydrolysis}} \text{RNH}_2 + \text{HCOOH}$
Alkyl isocyanide 1° amine Formic acid
46. (d) $\text{CH}_3\text{NH}_2 + 2\text{HNO}_2 \rightarrow \text{CH}_3 - \text{O} - \text{N} = \text{O} + \text{N}_2 + 2\text{H}_2\text{O}$
 $2\text{CH}_3\text{NH}_2 + 2\text{HNO}_2 \rightarrow \text{CH}_3 - \text{O} - \text{CH}_3 + 2\text{N}_2 + 3\text{H}_2\text{O}$
47. (d) 
Phenyl hydroxyl amine
50. (b) Because the N atom in aniline has a lone pair to donate and also due to +I effect of -NH₂ group.
51. (d) 
52. (d) $\text{R} - \text{NH}_2 + \text{CHCl}_3 + 3\text{NaOH} \rightarrow \text{RN} \equiv \text{C} + 3\text{NaCl} + 3\text{H}_2\text{O}$
The unpleasant smell is due to the formation of isocyanide.

Nitration of aniline without protecting the amino group is not possible because HNO_3 is a strong oxidising agent which oxidises aniline.

In methyl amine only one electron releasing group is present but in dimethyl amine two electron releasing groups are present which increase the basicity higher in diethyl amine.

Me = Methyl.

102. (a) $R-\overset{\overset{O}{\parallel}}{C}-NH_2 \xrightarrow{H_2-Ni} R-CH_2-NH_2$
104. (b) $CH_3CN + 2H_2O \xrightarrow{HCl} CH_3COOH + NH_3$
106. (a) $CH_3CH_2NH_2 + CH_3COCl \rightarrow CH_3CH_2NHCOCH_3 + HCl$
N Ethylacetanilide
107. (a) $\begin{matrix} CH_3 \\ >NH \\ CH_3 \end{matrix} + CH_3COOH \rightarrow \begin{matrix} CH_3 \\ >N-\overset{\overset{O}{\parallel}}{C}-CH_3 \end{matrix}$
108. (d) Anilinium hydrogen chloride produces chloride ion which gives white precipitate with $AgNO_3$. In fact anilium chloride is a part of aniline.
109. (b) 
110. (c) 
 Nitrobenzene Phenyl hydroxyl amine p-amino phenol
113. (c) $C_6H_5CH=O +$ 
 Anyhydrous $ZnCl_2$
115. (d) 
119. (a) Basicity of amines increase with increase in number of $-CH_3$ groups (or any group which cause +I effect), due to increase in electron density on N atom. As a rule, the basicity of t-amine should be more than that of s-amine, but actually it is found to be lesser than s-amines. This is due to steric hindrance of bulkier alkyl groups, which decreases the availability of lone pair of electron on the N atom of the amino group. Hence the correct order of basicity is :
 $(CH_3)_2NH > (CH_3)_3N > CH_3NH_2$
120. (b) Amines are basic in nature, hence form salts with acid.
 $2RNH_2 + H_2SO_4 \rightarrow [RNH_3^+]_2SO_4^{2-}$
121. (b) We know that
 $C_6H_5NH_2 + CHCl_3 + 3KOH \rightarrow C_6H_5NC + 3KCl + 3H_2O$
Aniline Chloroform phenyl isocyanide

Thus in this reaction phenyl isocyanide is produced, this is called carbylamine reaction.

122. (d) Isocyanides on hydrolysis forms primary amines not ammonia
123. (b) $C_6H_5CONH_2 + Br_2 + KOH \rightarrow C_6H_5CONHBr + KBr + H_2O$
 $\downarrow KOH$
 $K_2CO_3 + C_6H_5NH_2 \xleftarrow{2KOH} C_6H_5NCO + KBr + H_2O$
 $C_6H_5NH_2 + (CH_3CO)_2O \rightarrow CH_3CONHC_6H_5 + CH_3COOH$
Acetanilide (antipyretic)
124. (d) 
 Benzonitrile
125. (d) (i) $RCNH_2 + Br_2 + KOH \rightarrow RCONHBr + KBr + H_2O$
 (ii) $RCONHBr + KOH \rightarrow RNCO + KBr + H_2O$
 (iii) $RNCO + 2KOH \rightarrow RNH_2 + K_2CO_3$
 $RCONH_2 + Br_2 + 4KOH \rightarrow RNH_2 + 2KBr + K_2CO_3 + 2H_2O$
126. (b) Aniline reacts with benzaldehyde and forms Schiff's base (benz aniline) or anils.
 $C_6H_5-NH_2 + O=CHC_6H_5 \xrightarrow[-H_2O]{\Delta} C_6H_5N=CHC_6H_5$
 Benzylidene aniline
127. (d) $CH_3CONH_2 + Br_2 + 4KOH \xrightarrow{-2H_2O} CH_3NH_2 + 2KBr + 2K_2CO_3$
Acetamide (Methyl amine)
128. (b)  is most basic
130. (d) 
131. (a) 
132. (d) $C_6H_5NH_2$ is least basic compound due to resonance by which the Lone pair of nitrogen takes part in resonance & due to unavailability of lone pair on N Aniline become less basic. The Lone pair of N is delocalized into benzene ring by resonance
133. (b) Carbyamine (or isocyanides) give secondary amine on reduction.
 $R-N \equiv C \xrightarrow{Ni/H_2} R-NH-CH_3$
Carbylamine Secondary amine
134. (a) Azo dye is prepared by the coupling of phenol and diazonium chloride.

 Benzene diazonium chloride

Thus product Z is identified as C_6H_5COOH

136. (c) This is Hofmann-bromide reaction. In this reaction one carbon less amines are formed from amides.

139. (b) *N*-alkyl formamides when dehydrated with $POCl_3$ in presence of pyridine give isocyanides.

140. (c) Pollutants which are formed by reaction amongst the primary pollutants (persist in the environment in the form they are passed into it) are called as secondary pollutants. e.g. peroxyacyl nitrates (PAN) are formed through reaction between nitrogen oxides and hydrocarbons in the presence of sunlight.

The reason for this is that, in acidic condition protonation of $-NH_2$ group gives anilinium ion ($+NH_3$), which is of deactivating nature and of *m*-directive nature.

143. (a) Basicity order is
 $C_4H_5NH_2 < (CH_3)_3N < CH_3NH_2 < (CH_3)_2NH$
 $(CH_3)_3N$ is less basic due to steric effect while $C_4H_5NH_2$ is less basic due to resonance.

8. (a) Diazo-coupling is useful to prepare some dyes.

Critical Thinking Questions

1. (c) $R_1 = H$ and $R_2 = R_3 = CH_3$

Sec. amine reacts with Nitrous acid to form nitroso amine yellow liquid.

4. (c) Hofmann degradation of amide

6. (b) The relative basic character of 1° , 2° and 3° amines also depends upon the nature of the alkyl group.

Tests for Nitrogen Containing Compounds

R	Relative basic strength
$-CH_3$	$R_2NH > R-NH_2 > R_3N > NH_3$
$-C_2H_5$	$R_2NH > R-NH_2 > NH_3 > R_3N$
$-CHMe_2$	$R-NH_2 > NH_3 > R_2NH > R_3N$
$-CMe_3$	$NH_3 > R-NH_2 > R_2NH > R_3N$

7. (b) The nitro group is very firmly linked to the benzene nucleus and does not undergo any displacement reaction. Nitro group deactivates the benzene nucleus.

9. (bc) (i) With $NaHCO_3 \rightarrow$

But p-chloro aniline is basic not acidic it does not liberate CO_2 .

14. (a) Order of basicity of amines
- (i) $2^\circ > 1^\circ > 3^\circ$
- (ii) $R_2NH > RNH_2 > ArCH_2-NH_2 > NH_3 > ArNH-R > ArNH_2 > ArNH-Ar$

17. (b) When sulphur and nitrogen both are present in organic compound during Lassaigne's Test, both changes into "sodium

thiocyanate". ($NaSCN$) which gives a blood red colouration with Ferric ion.

18. (c)  does not have aromaticity by which the Lone pair of electron of Nitrogen does not delocalised in benzene ring so it will be strong base on other hand rest 3 have aromaticity i.e., they follow the huckel rule so the electron pair of Nitrogen delocalised in ring by resonance & resulting they become less basic.

19. (d) Liebermann's Nitroso reaction.

21. (c) The class of Indigo dye is Indigoid or vat dye. Indigo dyes are insoluble in water.

22. (d) Lone pair of $\ddot{N}$ are not taking part in conjugation whereas in other parts lone pairs are taking part in conjugation

Assertion and Reason

- (a) It is true that benzene diazonium chloride does not respond Lassaigne test of nitrogen because benzene diazonium chloride losses N_2 on Slight heat and thus it can't react with sodium metal.
- (a) Amines are basic due to the presence of a lone pair of electrons on nitrogen atom. The lone pair can be easily donated.
- (b) The reason being that the terminal carbon atom in isocyanide has electron-deficient carbon having a sextet of electrons and hence undergoes addition reactions with ozone.
- (d) When primary amines are heated with chloroform in the presence of alcoholic KOH , isocyanides are formed. This reaction is known as carbylamine reaction. eg. ethyl amine gives

ethyl isocyanide on treatment with $CHCl_3$ and alcoholic KOH .

5. (b) Nucleophilic species which have more than one site of reaction are called ambident nucleophiles.
 $:\bar{C} = N : \longleftrightarrow :C = \bar{N} :$
6. (c) $-SO_3H$ group being more acidic than $-CO_2H$ group can easily transfer a proton to the amino group.
7. (a) $HNO_3 + 2H_2SO_4 \rightleftharpoons 2HSO_4^- + NO_2^+ + H_3O^+$
8. (c) Only primary aliphatic amines can be prepared by Gabriel phthalimide reaction.
9. (c) Reaction can be used to prepare 1°, 2°, 3° amines and finally quarternary ammonium salts.
10. (b) Nitroarene cannot be distilled under normal atmospheric pressure. This is because either they decompose or they explode on strong heating.
11. (c) Only 1° amines undergo Hofmann bromamide reaction. Since $CH_3CONHCH_3$ is a 2° amine therefore, it does not undergo Hofmann bromamide reaction.
12. (b) Nitrobenzene does not undergo Friedel Craft reaction because nitro group deactivate the ring towards electrophilic substitution and drastic conditions are needed to carry out the electrophilic substitution reactions.
13. (e) Ammonia is more basic than water. It is because nitrogen being less electronegative than oxygen has a greater tendency to donate electrons.
14. (c) Condensation of diazonium salt with phenol is carried out in weakly alkaline medium, ($pH = 9$). This is due to the fact that in strongly acid medium the $-OH$ of a phenol remains unionised, and an amine forms a salt. Phenol exists as phenoxide ion and the latter is readily substituted by electrophiles than phenol itself. Thus, in phenol, coupling is carried out in alkaline medium.
15. (a) $RNH_2 + CHCl_3 + 3KOH(alc) \rightarrow R-N \equiv C + 3KCl + 3H_2O$
17. (d) p -Anisidine is a stronger base than aniline.
 $-OCH_3$ group in anisidine exerts $+R$ - effect.
18. (b) Solubility of aldehydes and ketones decrease as the molecular mass increase.
20. (d) The nitro group strongly deactivates the benzene ring towards electrophilic substitution.
 Nitrobenzene does not undergo Friedel-Craft acylation reaction.
21. (a) In an isocyanide, first an electrophile and then a nucleophile add at the carbon to form a species which usually undergoes further transformations.

Chapter 30 Polymer

Polymers are compound of very high molecular masses formed by the combination of a large number of simple molecules.

The simple molecules which combine to give polymers are called monomers. The process by which the simple molecule (i.e. monomers) are converted into polymers is called polymerisation.

Example : Polyethylene

❑ All polymers are macromolecule but all macromolecules are not polymers because polymer consist repeating unit of monomer e.g., chlorophyll is a macromolecule but not a polymer.

Classification of polymers

(1) **Classification based on source of availability** : They are classified as

- (i) Natural polymers (ii) Synthetic polymers
- (iii) Semi-synthetic polymers

(i) **Natural polymers** : The polymers obtained from nature (plants and animals) are called natural polymers. These polymers are very essential for life. They are as under.

(a) **Starch** : It is polymer of glucose and it is food reserve of plant.

(b) **Cellulose** : It is also a polymer of glucose. It is a chief structural material of the plant both starch and cellulose are made by plants from glucose produced during photosynthesis.

(c) **Proteins** : These are polymers of α -amino acids, they have generally 20 to 1000 α amino acid joined together in a highly organized arrangement. These are building blocks of animal body and constitute an essential part of our food.

(d) **Nucleic acids** : These are polymers of various nucleotides. For example RNA and DNA are common nucleotides.

❑ It may be noted that polymers such as polysaccharides (starch, cellulose), proteins and nucleic acids etc. which control various life processes in plants and animals are also called **biopolymers**.

(ii) **Synthetic polymers** : The polymers which are prepared in the laboratories are called synthetic polymers. These are also called man made polymers. For example polyethene, PVC nylon, teflon, bakelite terylene, synthetic rubber etc.

(iii) **Semisynthetic polymers** : These polymers are mostly derived from naturally occurring polymers by chemical modifications. For example

cellulose is naturally occurring polymers, cellulose on acetylation with acetic anhydride in the presence of sulphuric acid forms cellulose diacetate polymers. It is used in making thread and materials like films glasses etc. Vulcanized rubber is also an example of semisynthetic polymers used in making tyres etc. gun cotton which is cellulose nitrate used in making explosive.

❑ **Semi-synthetic polymers** : Rayon and other cellulose derivatives like cellulose nitrate, cellulose acetate etc., are semi-synthetic polymers. These are thermoplastic polymers. Viscose rayon in the form of a thin transparent film is known as cellophane. Cellophane is softened with glycerol. Unlike plastic sheets it absorbs water.

❑ **Rayon** : Rayon is a man made material which consists of purified cellulose in the form of long fibres. Cellulose is treated with cold NaOH solution to purify it and then treated with CS_2 to form a viscose solution. This is why rayon is sometimes called viscose rayon. This solution is allowed to pass through fine pores in metal cylinder, into a dilute solution of H_2SO_4 . This results in the formation of long fibres. Rayon fibre is chemically identical to cotton but has a shine like silk. As such rayon is also known as **artificial silk**. Rayon is used on a large scale for making textiles, tyre-chord, carpets and surgical dressings. Unlike fully synthetic polymers, it absorbs moisture and is bio-degradable.

(2) **Classification based upon structure** : On the basis of structure of polymers these can be classified as

- (i) Linear polymers (ii) Branched chain polymers
- (iii) Cross linked polymers

(i) **Linear polymers** : These are polymers in which monomeric units are linked together to form linear chain. These linear polymers are well packed and have high magnitude of intermolecular forces of attraction and therefore have high densities, high tensile (pulling) strength and high melting points. Some common example of linear polymers are high density polyethylene nylon, polyester, PVC, PAN etc.

(ii) **Branched chain polymers** : These are polymers in which the monomers are joined to form long chains with side chains or branches of different lengths. These branched chain polymers are irregularly packed and therefore, they have low tensile strength, low density, boiling point and melting points than linear polymers. Some common examples are low density polythene, glycogen, starch etc. (Amylopectin).

(iii) **Cross linked polymers** : These are polymers in which monomers unit are crosslinked together to form a three dimensional network polymers.

These polymers are hard, rigid and brittle because of network structure e.g., Bakelite, melamine formaldehyde resin etc.

(3) **Classification based upon molecular forces** : Depending upon the intermolecular forces, the polymers have been classified into four type.

- (i) Elastomers (ii) Fibres
(iii) Thermoplastics (iv) Thermosetting polymers

(i) **Elastomers** : The polymers that have elastic character like rubber (a material that can return to its original shape after stretching is said to be elastic) are called elastomers. In elastomers the polymers chains are held together by weak intermolecular forces. Because of the presence of weak forces, the polymers can be easily stretched by applying small stress and regains their original shape when the stress is removed. The most important example of elastomers is natural rubber.

(ii) **Fibres** : These are the polymers which have strong intermolecular forces between the chain. These forces are either hydrogen bonds or dipole-dipole interaction. Because of strong forces, the chains are closely packed giving them high tensile strength and less elasticity. Therefore, these polymers have sharp melting points. These polymers are long, thin and thread like and can be woven in fabric. Therefore, these are used for making fibres.

Example : Nylon 66, dacron, silk etc.

(iii) **Thermoplastics** : These are the polymers which can be easily softened repeatedly when heated and hardened when cooled with little change in their properties. The intermolecular forces in these polymers are intermediate between those of elastomers and fibres. There is no cross linking between the chain. The softening occurs as the polymer chain move more and more freely because of absence of cross link. When heated, they melt and form a fluid which can be moulded into any desired shapes and then cooled to get the desired product.

Example : Polythene, polystyrene, PVC, teflon etc.

(iv) **Thermosetting polymers** : These are the polymers which undergo permanent change on heating. They become hard and infusible on heating. They are generally prepared from low molecular mass semifluid substances. When heated they get highly cross linked to form hard infusible and insoluble products. The cross links hold the molecule in place so that heating does not allow them to move freely. Therefore a thermosetting plastic is cross linked and is permanently rigid.

Example : Bakelite, melamine formaldehyde resin etc.

□ Plasticizers do lower the softening point (so called melting point) of a polymer. A plasticizer cannot convert a thermosetting polymer into thermoplastic one. In fact plasticizers can convert a hard and brittle plastic into soft and easily pliable. Plasticizers reduce the interparticle forces between polymer molecules. **Plasticizers** are generally high-boiling esters or high-boiling haloalkanes. They are added to plastics to make them soft and rubber-like. For example, polyvinyl chloride as such is hard, stiff and glass-like, but the addition of plasticizers like dioctylphthalate (DOP) or dibutylphthalate (DBP) can make it soft and rubber like. Similarly, chlorinated paraffin wax (CPW) is used as a plasticizer in polythene. On long exposure to air and sunlight, these plasticizers evaporate and the plastic articles become hard and brittle.

Table : 30.1 Difference between thermoplastic and thermosetting polymers

Thermoplastic polymers	Thermosetting polymers
(1) These soften and melt on heating.	These do not soften on heating but rather become hard in case prolonged heating is done these start burning.
(2) These can be remoulded recast and reshaped.	These can not be remoulded or reshaped.
(3) These are less brittle and soluble in some organic solvents.	These are more brittle and insoluble in organic solvents.
(4) These are formed by addition polymerisation.	These are formed by condensation polymerisation.
(5) These have usually linear structures. Ex. Polyethylene, PVC, teflon.	These have three dimensional cross linked structures. Ex. Bakelite, urea, formaldehyde, resin.

(4) **Classification based upon mode of synthesis** : They are of two types on the basis of their synthesis.

- (i) Addition polymers (ii) Condensation polymers

(i) **Addition polymers** : A polymer formed by direct addition of repeated monomers without the elimination of by product molecule is called addition polymers. For example,

(ii) **Condensation polymers** : A polymer formed by the condensation of two or more than two monomers with the elimination of simple molecule like water, ammonia, HCl, alcohol etc. is called condensation polymers. For example,

Table : 30.2 Difference between addition and condensation polymers

Addition polymers	Condensation polymers
Formed by addition reaction.	Formed by condensation process with elimination of small molecules like H_2O .
Molecular mass is a whole number multiple of the monomer.	Molecular mass is not whole number multiple of the monomer units.
Generally involve one monomer unit.	Generally involve more than one monomer unit.
Monomers are unsaturated molecules.	Monomer units must have two active functional groups.
They are generally chain growth polymers.	They are generally step growth polymers.

(5) **Classification based upon the nature of monomer** : On the basis of nature of monomer. Polymer are of two types

- (i) Homopolymers (ii) Copolymers

(i) **Homopolymers** : A polymer formed from one type of monomers is called **homopolymer**. For example, polythene is a homopolymer of monomer ethene.

(ii) **Copolymers** : A polymer formed from two or more different monomers is called **copolymer** or **mixed polymer**. For example, nylon-66 is a polymer of two types of monomers : hexamethylenediamine and adipic acid.

For example copolymerisation of vinyl chloride with vinylidene chloride (1, 1 dichloroethane) in a 1 : 4 ratio forms a copolymer known as saran.

Copolymerisation of monomer mixtures often leads to the formation of polymers which have quite different properties than those of either corresponding homopolymer. For example, a mixture of styrene and methyl methacrylate can form a copolymer.

The composition of the copolymer depends on the proportion of the monomers and their reactivity. It may be noted that some monomers do not polymerise at all but copolymerize. For example, maleic anhydride does not polymerise as such. However, it copolymerises with styrene in a highly symmetrical manner to form styrene maleic anhydride copolymer.

It may be noted that many types of copolymers can be obtained depending upon the distribution of monomer units in the chain. Two monomers can combine in either regular fashion (although this is rare) or random fashion. For example, if monomer *A* is copolymerised with monomer *B*, the resultant product may have a random distribution of the two units throughout the chain or it might have alternating distribution.

$(-A-B-A-B-A-B-A-B-)$ Alternating copolymer

$(-A-A-A-B-A-B-B-A-B-)$ Random copolymer

The exact distribution of monomer units depends on the initial proportion of the two-reactant monomers and their reactivities. Most copolymers have varying distributions. Two other types of copolymers that can be prepared under certain conditions are called block copolymers and graft copolymers.

(a) **Block copolymers** are those in which different blocks of identical monomer units alternate with each other as

These are prepared by initiating the polymerisation of one monomer as if growing a homopolymer and then adding an excess of second monomer to the active reaction mixture.

(b) **Graft polymers** are those in which homopolymer branches of one monomer units are grafted on the homopolymer chains of another monomer units as :

These are prepared by radiation of γ -rays on a completed homopolymer chain in the presence of the second monomer. The high energy radiation knocks hydrogen atoms of the homopolymer chain at random points resulting radical sites for initiation of the added monomer. By careful control of the polymerisation reaction, we can produce copolymers of desired properties by combination of different monomers in various ratios and geometric arrangements.

General methods and mechanism of polymerisation

(i) **Chain growth or addition polymerisation** : It involve a series of reaction each of which consumes a reactive particle and produces another similar one. The reactive particle may be free radicals or ion (cation or

anion) to which monomers get added by a chain reaction. The polymers thus formed are known as chain growth polymers. Chain growth polymerisation is an important reaction of alkenes and conjugated dienes or indeed of all kinds of compounds that contain carbon-carbon double bond polythene, polypropylene, polybutadiene, teflon PVC, polystyrene are some of chain growth polymers. It is based on three mechanism

- (i) Free radical mechanism (ii) Cation mechanism
(iii) Anion mechanism

Each mechanism of polymerisation reaction involves an initiator of their corresponding nature. The addition polymerisation reaction is very rapid and is also characterized by three steps *i.e.* chain initiation, chain propagation and chain termination step.

(i) **Free-radical mechanism** : Free-radical polymerisation is initiated by organic peroxide or other reagents which decompose to give free radicals. Following steps are involved.

(a) **Chain initiation** : Organic peroxides undergo homolytic fission to form free radicals.

(b) **Chain propagation** : Free radical adds to an alkene molecule to form a new free radical.

The free radical formed attacks another alkene molecule and the process continues in building a long chain.

(c) **Chain termination** : The chain reaction comes to halt when two free radical chains combine.

□ **Benzoyl or t-Butyl peroxide are common initiators, used.**

Free radical polymerisation can also be initiated by a mixture of ferrous sulphate and hydrogen peroxide ($FeSO_4 + H_2O_2$).

(ii) **Cationic mechanism** : Cationic polymerisation is initiated by use of acids such as H_2SO_4 , HF or BF_3 in H_2O . The following steps are involved :

(a) **Chain initiation** : The acid furnishes proton.

The proton adds to the carbon of the double bond of the alkene to form a carbonium ion.

(b) **Chain propagation** : The carbonium ion combines with another molecule of alkene to form a new carbonium ion and the process continues to form a long chain.

(c) **Chain termination** : The chain may be halted by combination with negative ion or loss of a proton.

(iii) **Anionic polymerisation** : This type of polymerisation is initiated by anion (Bases nucleophiles) it proceeds through the formation of carbanion. The initiation may be brought about by K^+NH_2^- or L^+NH_2^- .

The following steps are involved

(a) **Chain initiation** :

(b) **Chain propagation** :

(c) **Termination** :

Chain transfer agents : In Vinylic polymerisation various other molecules react with main growing chain to interrupt the further growth of the original chain. This leads to lowering of average molecular mass of the polymer such reagents are called chain transfer agents. The common example CCl_4 , CBr_4 etc.

For example in the presence of CCl_4 styrene polymerizes to form a polymer of lower average molecular mass which also contains some chlorine.

Chain transfer agents determinate chain reaction and inhibit further polymerisation and are also called inhibitors.

(2) **Step growth or condensation polymerisation** : In this type of polymerisation monomers generally contain two functional groups, i.e., difunctional monomers. In this process no initiator is needed and each step is the same type of chemical reaction. Since in this polymerisation reaction the polymer is formed in a stepwise manner. It is called step growth polymer and the process is called step growth polymerisation. The process for two monomer *A* and *B* may be expressed as.

Alternatively, step growth can proceed as

Some common examples of step growth polymers are

Polymers	Monomers
Nylon-66	Hexamethylenediamine and adipic acid
Bakelite	Phenol and formaldehyde
Dacron (polyester)	Terephthalic acid and ethylene glycol

Rubber

It is a polymer which is capable of returning to its original length, shape or size after being stretched or deformed. It is the example of elastomer. Rubber are of two types.

(1) Natural rubber

(2) Synthetic rubber

(1) **Natural rubber** : It is obtained as latex from rubber trees. The latex is coagulated with acetic acid or formic acid. The coagulated mass is then squeezed.

The raw natural rubber is a soft gummy and sticky mass. It is insoluble in water, dil. Acids and alkalis but soluble in benzene, chloroform, ether, petrol and carbon disulphide. It absorb a large amount of water. It has low elasticity and tensile strength.

Destructive distillation of natural rubber gives mainly isoprene (2-methyl butadiene).

Thus isoprene is a monomer of natural rubber the no. of isoprene unit are 11,000 to 20,000 which linked together in a chain.

(2) **Synthetic rubber** : The synthetic rubber is obtained by polymerising certain organic compounds which may have properties similar to rubber and some desirable properties. Most of these are derived from butadiene derivatives and contain carbon-carbon double bonds. The synthetic rubbers are either homopolymers of 1, 3 butadiene or copolymer in which one of the monomers is 1, 3 butadiene or its derivative so that the polymer has the availability of double bonds for its vulcanization. Some important examples are Neoprene, styrene, butadiene rubber (SBR) thiokol, silicones, polyurethane, rubber etc.

Vulcanization of rubber : The process of heating natural rubber with sulphur to improve its properties is called vulcanization. Vulcanization was introduced by Charles Goodyear.

Although natural rubber is thermoplastic substance in which there are no cross link between the polymer chain and it on vulcanization set into a given shape which is retained.

Name of polymer	Abbreviat-ion	Starting materials (monomers)	Nature of polymer	Properties	Applications
(i) Polyolefines (a) Polyethylene or polyethene	LDPE (Low density polyethene)	$CH_2 = CH_2$	Low density homopolymer (branched) chain growth.	Transparent, moderate tensile strength, high toughness.	Packing material carry bags, insulation for electrical wires and cables.
	HDPE (high density polyethene)	$CH_2 = CH_2$	High density homopolymer (linear) chain growth.	Translucent, chemically inert, greater tensile strength, toughness.	Manufacture of buckets, tubs, house ware, pipes, bottles and toys.
(b) Polypropylene or polypropene	PP	$CH_3CH = CH_2$	Homopolymer, linear, chain growth.	Harder and stronger than polyethene.	Packing of textiles and foods, liners for bags, heat shrinkage wraps, carpet fibres, ropes, automobile mouldings, stronger pipes and bottles.
(c) Polystyrene or Styron or styrofoam		$C_6H_5CH = CH_2$	Homopolymer, linear, chain growth	Transparent	Plastic toys, house hold wares, radio and television bodies, refrigerator linings.
(ii) Polyhaloolefines (a) Polyvinyl chloride	PVC	$CH_2 = CH - Cl$ Vinylchloride	Homopolymer chains growth	Thermoplastic	(i) Plasticised with high boiling esters PVC used in rain coats, hand bags, shower curtains, fabrics, shoe soles, vinyl flooring (ii) Good electrical insulator (iii) Hose pipes.
(b) Polytetrafluoroet-hylene or Teflon	PTFE	$F_2C = CF_2$	Homopolymer, high melting point	Flexible and inert to solvents boiling acids even aqua regia. Stable upto 598 K.	(i) For nonstick utensiles coating (ii) Making gaskets, pump packings valves, seals, non lubricated bearings.
(c) Polymonochlorotri-fluoroethylene	PCTFE	$ClFC = CF_2$	Homopolymer	Less resistant to heat and chemicals due to presence of chlorine atoms.	Similar to those of teflon.
(iii) Formaldehyde resins (a) Phenol formaldehyde resin or Bakelite		Phenol and formaldehyde	Copolymer, step growth	Thermosetting polymer, hard and brittle	(i) With low degree polymerisation as bindings glue for wood varnishes, lacquers. (ii) With high degree polymerisation for combs, for mica table tops, fountain pen barrels electrical goods (switches and plugs).
(b) Melamine formaldehyde resin		Melamine and formaldehyde	Copolymer, step growth	Thermosetting polymer, hard but not so breakable.	Non-breakable crockery.
(iv) Polyacrylates (a) Polymethacrylate (lucite, acrylite and plexiglass and perspex)	PMMA	$\begin{array}{c} CH_3 \\ \\ CH_2 = C - C O O C H_3 \end{array}$	Copolymer	Hard transparent, excellent light transmission, optical clarity better than glass takes up colours.	Lenses light covers lights, shades signboards transparent domes skylight aircraft window, dentures and plastic jewellery.

(b) Polyethylacrylate		$CH_2 = CH - COOC_2H_5$	Copolymer	Tough, rubber like product	
-----------------------	--	-------------------------	-----------	----------------------------	--

Table : 30.6 Fibre

Name of polymer	Abbreviation	Starting materials	Nature of polymer	Properties	Applications
(i) Polyesters (a) Terylene or Dacron or mylar	PET (Polyethylene terephthalate)	$HO - CH_2 - CH_2 - OH$ and Ethylene glycol Ethane -1, 2-diol 	Copolymer, step growth linear condensation polymer	Fibre crease resistant, low moisture absorption, not damaged by pests like moths etc.	For wash and wear fabrics, tyre cords seat belts and sails.
(b) Glyptal or alkyd resin		$HO - CH_2 - CH_2 - OH$ and Ethylene glycol and  Phthalic acid	Copolymer, linear step growth condensation polymer	Thermoplastic, dissolves in suitable solvents and solutions on evaporation leaves a tough but not flexible film.	Paints and lacquers.
(ii) Polyamides (a) Nylon-66		$HO - C(=O) - [CH_2]_4 - C(=O) - OH$ Adipic acid and $H_2N - [CH_2]_6 - NH_2$ Hexamethylenediamine	Copolymer, linear, step growth condensation polymer	Thermoplastic high tensile strength abrasion resistant.	Textile fabrics, bristles for brushes etc.
(b) Nylon-610		$H_2N - [CH_2]_6 - NH_2$ Hexamethylene diamine and $HOOC - [CH_2]_8 - COOH$ Sebacic acid	Copolymer, linear, step growth	Thermoplastic, high tensile strength, abrasion resistant	(i) Textile fabrics, carpets, bristles for brushes etc. (ii) Substitute of metals in bearings. (iii) Gears elastic hosiery.
(c) Nylon-6 or Perlon		 Caprolactam or $H_2N - [CH_2]_5 - COOH$ Aminocaproic acid	Homopolymer, linear	Thermoplastic high tensile strength abrasion resistant.	Mountaineering ropes, tyre cords, fabrics.
(iii) Polyacrylonitrile or orlon or acrilon	PAN	$CH_2 = CH - CN$	Copolymer	Hard, horny and high melting materials.	Orlon, acrilon used for making clothes, carpets blankets and preparation of other polymers.

❑ Copolymer of acrylonitrile (40%) and vinyl chloride (60%) is called *dynel* it is used in hair wigs.

❑ Artificial silk is the term given to fibres derived from cellulose. The most important process for the production of artificial silk is viscose process. The difference between natural and artificial silk is natural silk contain nitrogen while artificial silk may not have nitrogen. Natural silk on burning gives a smell of burning hair and shrinks into a ball of cinder while artificial silk gives a thread of ash.

Biodegradable polymers

These are the polymers which are degraded by micro-organisms within a suitable period so that biodegradable polymers and their degraded products do not cause any serious affects on the environment.

In biological systems, biopolymers degrade mainly by enzymatic hydrolysis and to some extent by oxidation. Therefore, in view of the disposal problems of polymer waste and for developing polymers for other

safe uses in human systems, attempts have been made to develop biodegradable synthetic polymers. These synthetic polymers mostly have functional groups which are normally present in biopolymers and lipids.

Among these aliphatic polyesters are one important class of biodegradable polymers which are commercially potential biomaterials. The common examples of biodegradable polymers are polyhydroxy butyrate (PHB), polyhydroxy butyrate -*co*- β -hydroxy valerate (PHBV), polyglycolic acid (PGA), polylactic acid (PLA), poly (ϵ -caprolactone) (PCL), etc.

Uses : Biodegradable polymers are used mainly for medical goods such as surgical sutures, tissue in growth materials or for controlled drug release devices, plasma substitutes etc. The decomposition reactions usually involve hydrolysis (either enzymatically induced or by non-enzymatic mechanisms) to non-toxic small molecules which can be metabolized by or excreted from the body. These are also finding use in agriculture materials

(such as films, seed coatings), fast food wrappers, personal hygiene products, etc.

(i) **Polyhydroxy butyrate (PHB)**

Polyhydroxy butyrate (PHB) is obtained from hydroxy butyric acid (3-hydroxy butanoic acid)

(ii) **Poly-Hydroxybutyrate-co-β-Hydroxy valerate (PHBV)** : It is copolymer of 3-hydroxy butanoic acid and 3-hydroxy pentanoic acid, in which the monomer units are joined by ester linkages.

The properties of PHBV vary according to the ratio of both the acids. 3-Hydroxy butanoic acid provides stiffness while 3-Hydroxypentanoic acid gives flexibility to the copolymer.

(iii) **Polyglycolic acid (PGA)** : Polyglycolic acid (PGA) is obtained by the chain polymerisation of cyclic dimer of glycolic acid, $\text{HO}-\text{CH}_2-\text{COOH}$.

(iv) **Poly lactic acid (PLA)** : Poly lactic acid (PLA) is obtained by polymerisation of the cyclic dimer of lactic acid ($\text{HO}-\text{CH}(\text{CH}_3)\text{COOH}$) or by microbiological synthesis of lactic acid followed by the polycondensation and removal of water by evaporation.

(v) **Poly (ε-caprolactone) (PCL)** : It is obtained by chain polymerisation of the lactone of 6-hydroxy hexanoic acid.

Uses : PGA and PLA (90 : 10) is used to make absorbable structure to close an internal of external wound and has replaced cat gut these are completely degraded and absorbed by the body within 15 days to one month of the surgery.

Polyhydroxybutyrate (PHB) and (PHBV) have been used for making films for packaging and into moulded items.

Molecular masses of polymers

A polymer sample contains chain of varying lengths and therefore its molecular mass is always expressed as an average on the other hand natural polymer such as proteins contain chain of identical length and therefore they have definite molecular mass.

The molecular mass of a polymer can be expressed in two ways.

(1) Number average molecular mass ($\bar{M}_N$)

(2) Weight average molecular mass ($\bar{M}_W$).

(i) **Number average molecular mass ($\bar{M}_N$)** : If $N_1, N_2, N_3, \dots$ are the number of molecules with molecular masses $M_1, M_2, M_3, \dots$ respectively, then the number average molecular mass is

$$\bar{M}_N = \frac{N_1 M_1 + N_2 M_2 + N_3 M_3 + \dots}{N_1 + N_2 + N_3 + \dots}$$

$$\text{This may be expressed as : } \bar{M}_N = \frac{\sum N_i M_i}{\sum N_i}$$

Where N_i is the number of molecules of the i th type with molecular mass M_i .

(2) **Weight average molecular mass ($\bar{M}_W$)** : If $m_1, m_2, m_3, \dots$ are the masses of species with molecular masses $M_1, M_2, M_3, \dots$ respectively, then the weight average molecular mass is

$$\bar{M}_W = \frac{m_1 M_1 + m_2 M_2 + m_3 M_3 + \dots}{m_1 + m_2 + m_3 + \dots} \quad \text{or} \quad = \frac{\sum m_i M_i}{\sum m_i}$$

$$\text{But } m_i = N_i M_i, \text{ so that } \bar{M}_W = \frac{\sum N_i M_i^2}{\sum N_i M_i}$$

where N_i is the number of molecules of mass M_i .

□ **Polydispersity index** : The ratio of weight average molecular mass to the number average molecular mass is called **polydispersity index, PDI**.

$$PDI = \frac{\bar{M}_W}{\bar{M}_N}$$

This gives an idea about the homogeneity of a polymer.

(i) The polymers whose molecules have nearly same molecular masses are called **monodisperse polymers**. For these molecules, $\bar{M}_W = \bar{M}_N$ and therefore, PDI is one.

(ii) The polymers whose molecules have wide range of molecular masses are called **polydisperse polymers**. For these polymers, $\bar{M}_W > \bar{M}_N$ and therefore, their PDI is greater than one.

Thus, it may be concluded that in general, **natural polymers are more homogeneous than synthetic polymers**.

For natural polymers, PDI is usually unity and therefore, natural polymers are monodisperse.

For synthetic polymers, the PDI is greater than one and therefore $\bar{M}_W$ is always greater than $\bar{M}_N$. $\bar{M}_N$ is always determined by employing methods which depend upon the number of molecules present in the polymer sample. For example, colligative property such as osmotic pressure is used. On the other hand, weight average molecular mass is measured by using the methods such as light scattering and ultracentrifugation, sedimentation, etc. which depend upon the mass of individual molecules.

(3) Polymer in increasing order of their intermolecular forces are polythene < Buna S < Nylon-66.

(4) We always use purest monomer in free radical polymerisation reaction because the impurities can act as chain transfer agent and may combine with the free radical to slow down the reaction or even stop the reaction.

(5) Benzoquinone inhibit the free radical polymerisation of vinyl derivative because it combine with free radical intermediate to form a non reactive radical which is highly stabilized by resonance because of the lack of reactivity of the new radical formed, it inhibit the further progress of the chain reaction. Therefore the reaction stops.

(6) A thin film of polyester is known as Mylar film.

(7) PET plastic commonly used for soft drink bottles, transparent jars and bottles for use in kitchen are made up of polyethylene terephthalate.

(8) Glyptal resins or Alkyd resins obtained from ethylene glycol and phthalic acid are thermoplastic. However, resins obtained from glycerol and phthalic acid are thermosetting polymers, due to the formation of cross-links by the third $-OH$ group present in glycerol.

(9) Thermosetting plastics are also called heat setting plastics whereas thermoplastics are called cold setting plastics.

(10) Latex is a colloidal dispersion of rubber in water. It is not a colloidal solution of isoprene in water or any other solvent.

(11) Polymerisation of isoprene by free radical mechanism (in the presence of Na and heat) gives a product which is different from natural rubber (Natural rubber is a polymer of isoprene). The synthetic product so obtained is a mixture of *cis* and *trans* configurations and resembled Gutta percha. Gutta percha is a naturally occurring polymer in plants. It is all *trans*-stereoisomer and is non-elastic.

(12) Terylene is a British name of Dacron.

(13) Co-polymer of vinyl chloride 90% and vinyl acetate 10% is called VINYLON.

(14) Co-polymer of acrylonitrile 40% and vinyl chloride 60% is called DYNEL.

(15) Co-polymer of vinyl chloride and vinylidene chloride is called SARAN.

(16) Plasticizers cannot convert a thermosetting polymer into thermoplastic one. It converts a hard and brittle plastic into soft and easily pliable one at room temperature.

(17) Free radical polymerisation of isoprene do not give Gutta percha (Gutta percha is a natural polymer). The synthetic product so obtained resembles Gutta percha.

(18) Co-ordination polymerisation of isoprene gives a product similar to natural rubber.

(19) Latex is not a colloidal dispersion of isoprene in water.

Advance level information

(1) Thermocol is polystyrene foamed with vapour of pentane.

(2) Cups used for hot drinks are made up of polystyrene. It does not become soft like other plastics at temperatures near boiling point of water.

(3) A major development of co-ordination polymerisation is *stereochemical control*. For example Propene could polymerise to any of the three different arrangements.

(i) **Isotactic (Same order)** : When groups are arranged on one side of the chain. All *Y* group *i.e.* on one side and all *Z* groups on the opposite side of the chain.

(ii) **Syndiotactic (Alternating order)** : The *Y* and *Z* groups lie alternately on each side of the chain.

(iii) **Atactic (Random order)** : The *Y* and *Z* groups are arranged in a random fashion.

(4) Addition polymers, generally, have only carbon atoms in their main chain. On the other hand, condensation polymers, generally, have atoms other than carbon atoms, in their main chain.

(5) **Polyurethanes** : Polyurethanes are polymers obtained by the polymerisation of a urethane.

It is used for heat and sound insulation in the form of polyurethane foam. Mattresses, cushions and pillows made out of polyurethane foam are washable and long lasting.

(6) **Epoxy resins** : These are obtained by copolymerisation of epichlorohydrin and bisphenol-A. These resins have good adhesive strength. These are used for making adhesives (Araldite, M-seal etc.) for making glass reinforced plastic (fibre glass), for lamination, to impart crease resistance and shrinkage control to cotton, rayon and for making anti-skid surface for highways.

(7) **Polycarbonates** : These are obtained by copolymerisation of diphenyl carbonate and bisphenol-A. It has very high optical transparency, high impact strength over wide range of temperature. It is used for making bullet-proof glass, baby-feed bottles, fridge containers, mixi jars etc.

(8) Thermoplastics are also called cold setting polymers. They are moulded when hot but set into the required shape only on cooling. Thermosetting polymers are also called heat setting polymers. Such polymers are supplied in the partially polymerised form.

(9) On long exposure to air and sun-light thermo-plastics becomes brittle. It is due to the evaporation of plasticizer with time. The faint smell associated with various thermoplastics is due to slow evaporation of this plasticizer.

(10) High density polyethene is a linear polymer. Carry bags made out of it are not so soft and make a crackling sound when crushed in hands. You can easily tear them in one direction, but not at right angle to it. Plastic twine is made out of such a polymer. They have very high tensile strength in one direction (along the polymer chain) and a low tensile strength at

right angle to it. Such carry bags are used to carry clothes, note-books etc. Carry bags made of low density polyethene are soft, make no noise when crushed with hands, have same tensile strength in all directions. Such carry bags are used to carry heavy objects (vegetables, fruits etc.)

(11) **Kevlar** is a nylon-polymer and is obtained by condensation copolymerization of terephthalic acid with 1, 4-diaminobenzene (*p*-phenylenediamine). The fibres of this polymer are so strong that they are used to make bullet-proof vests.

(12) **Lexan** is a polycarbonate(polyester) and is prepared by condensation copolymerization of diethyl carbonate and bisphenol A. It has unusually high impact strength and hence is used in making bullet-proof windows and safety or crash helmets.

(13) **Nomex** is a polyamide made from *m*-phthalic acid and *m*-diaminobenzene. It is known for its fire-resistant properties and is used in protective clothing for firefighters, astronauts and race car drivers.

(14) **Ebonite** is high sulphur (20-30 %S) rubber and is obtained by vulcanization of natural rubber.

(15) **Rayon** was originally called artificial silk but now the name rayon is given to all fibres obtained by chemical treatment of cellulose. Thus, artificial silk is polysaccharide, *i.e.*, cellulose derivative.

Tips & Tricks

✍ Nucleic acids and proteins though macromolecules are also regarded as polymers

✍ Diphenylamine is added as an antioxidant to rubber to protect it from degradation on exposure to air.

✍ Plasticizers are non volatile liquid such as di-*n*-butylphthalate, tricresyl phosphates which are added to a polymer such as PVC to make it soft and readily workable on heating.

✍ Low density polythene is a branched polymer and is prepared by free radical polymerization while high density polythene is a linear polymer and is prepared by coordination polymerization.

✍ Coordination polymerization was developed by Zeigler and natta.

✍ Neoprene is a synthetic rubber. It is superior to natural rubber in its stability to aerial oxidation and resistance to oils, gasoline and solvents.

✍ Super glue is a polymer of methyl α -cyanoacrylate.

✍ Polyurethanes are obtained by condensation of toluene diisocyanate with ethylene glycol. During polymerization, low boiling liquid such as Freon-II are added to the reaction mixture. The heat of polymerization vaporizes the volatile liquid producing bubble which convert the viscous polymer to a frothy mass of polyurethane foam.

✍ Ebonite is high sulphur (20-30%S) rubber and is obtained by vulcanization of natural rubber.

Ordinary Thinking

Objective Questions

Classification of Polymer

- Which one among the following is a thermosetting plastic
[MP PMT 1993, 95; AIIMS 1999]
(a) PVC (b) PVA
(c) Bakelite (d) Perspex
- The basis on the mode of their formation, the polymers can be classified
[MP PET 1999]
(a) As addition polymers only
(b) As condensation polymers only
(c) As copolymers
(d) Both as addition and condensation polymers
- Thermoplastics are
(a) Linear polymers (b) Highly cross-linked
(c) Both (a) and (b) (d) Crystalline
- 'Cis-1, 4-polyisoprene' is
(a) Thermoplastic (b) Thermosetting plastic
(c) Elastic (rubber) (d) Resin
- 'Shellac' secreted by lac insects is
(a) Natural plastic (b) Natural resin
(c) Natural elastic (d) Any of these
- Which of the following is not a polymer
(a) Gun cotton
(b) Perspex
(c) Shellac (eg. lac shellac)
(d) Wax (eg. bees wax)
- Which of the following is not a polymer
(a) Wool (b) Cotton
(c) Leather (d) Fat
- Melware are
(a) Thermosetting (b) Thermoplastic
(c) Both (a) and (b) (d) None of these
- Among the following a natural polymer is
[MP PET 1993; BCECE 2005]
(a) Cellulose (b) PVC
(c) Teflon (d) Polyethylene
- Which of the following is thermoplastic
(a) Nylon (b) Polyethylene
(c) Terylene (d) All of these
- Which of the following is an example of condensation polymer
(a) Nylon
(b) Bakelite
(c) Urea-formaldehyde resin
(d) All of these
- Which of the following is a natural polymer
(a) Polyester (b) Glyptal
(c) Starch (d) Nylon-6
- Which is a naturally occurring polymer
[BHU 1980]
(a) Polythene (b) PVC
(c) Acetic acid (d) Protein
- Which of the following is a branched polymer
(a) Low density polymer (b) Polyester
(c) High density polymer (d) Nylon
- Which is the monomer of polypeptide
(a) Propene (b) Butadiene
(c) Adipic acid (d) Amino acid
- Which of the following is an addition polymer
(a) Glucose (b) Polyethylene
(c) Ethylene (d) Terylene
- Which one of the following is a linear polymer
[KCET 1998]
(a) Amylopectin (b) Glycogen
(c) Starch (d) Amylose
- Which of the following polymer is an example of fibre
[AIIMS 2000; Pb. CET 2001]
(a) Silk (b) Dacron
(c) Nylon-66 (d) All of these
- Natural rubber is which type of polymer
[DCE 2002]
(a) Condensation polymer (b) Addition polymer
(c) Co-ordination polymer (d) None of these
- Polyethylene is
[DCE 2003]
(a) Random copolymer (b) Homo polymer
(c) Alternate copolymer (d) Crosslinked copolymer
- Which of the following is a biodegradable polymer
[AIIMS 2004]
(a) Cellulose (b) Polythene
(c) Polyvinyl chloride (d) Nylon-6
- Which of the following is an example of condensation polymers
[MP PMT 1995; BHU 2000; UPSEAT 2004]
(a) Polythene (b) PVC
(c) Orlon (d) Terylene
- Nylon is not a
[KCET 2004]
(a) Condensation polymer (b) Polyamide
(c) Copolymer (d) Homopolymer
- Which of the following is not an example of additional polymer [KCET 2001; CBS]
(a) Terylene (b) Polypropylene
(c) Polyethylene (d) Polystyrene
- Polythene is
(a) Thermoplastic (b) Thermosetting
(c) Both (a) and (b) (d) None of these
- Bakelites are
(a) Rubber (b) Rayon
(c) Resins (d) Plasticisers
- Which of the following is a step-growth polymer
(a) Polyisoprene (b) Polythene
(c) Nylon (d) Polyacrylonitrile
- An example of chain growth polymer is [Pb. PMT 1999]
(a) Nylon-66 (b) Bakelite
(c) Terylene (d) Teflon
- Which of the following is synthetic rubber
[NCERT 1978]
(a) Buna-S (b) Neoprene
(c) Both (a) and (b) (d) None of these
- Which of the following is a linear polymer
(a) Nylons
(b) Bakelite
(c) Low density polythene

- (d) Melamine-formaldehyde polymer
31. Which of the following is not an example of natural polymer [BHU 1987]
- (a) Wool (b) Silk
(c) Leather (d) Nylon
32. Which of the following is a chain growth polymer
- (a) Nylon-6 (b) Dacron
(c) Glyptal (d) Polypropylene
33. Natural rubber is a [MP PMT 1994]
- (a) Polyester (b) Polyamide
(c) Polyisoprene (d) Polysaccharide
34. Which of the following is not a synthetic polymer [MP PET 1999]
- (a) Polyethylene (b) PVC
(c) Nylon (d) Cellophane
35. Nylon-66 is a [RPET 1999; MP PMT 1993]
- (a) Natural polymer (b) Condensation polymer
(c) Addition polymer (d) Substitution polymer
36. A condensation polymer among the following polymers is [KCET 2002]
- (a) PVC (b) Teflon
(c) Decron (d) Polystyrene
37. Which of the following is not a natural polymer [AFMC 2003]
- (a) Cellulose (b) Protein
(c) PVC (d) Nucleic acid
38. Which of the following is not correct regarding terylene [Kerala PMT 2004]
- (a) Step-growth polymer
(b) Synthetic fibre
(c) Condensation polymer
(d) It is also called decron
(e) Thermosetting plastic
39. Which is not a polymer [DPMT 2005]
- (a) Sucrose (b) Enzyme
(c) Starch (d) Teflon
- (b) Isotactic polyvinylchloride
(c) Syndiotactic polyvinylchloride
(d) All of these
5. Monomers are converted to polymer by [DCE 2002]
- (a) Hydrolysis of monomers
(b) Condensation reaction between monomers
(c) Protonation of monomers
(d) None of these
6. Polymer formation from monomers starts by [AIIEE 2002]
- (a) Condensation reaction between monomers
(b) Coordinate reaction between monomers
(c) Conversion of monomer to monomer ions by protons
(d) Hydrolysis of monomers
7. When condensation product of hexamethylenediamine and adipic acid is heated to $553\text{ K } (80^\circ\text{C})$ in an atmosphere of nitrogen for about 4-5 hours, the product obtained is [DCE 2002; MHCET 2004]
- (a) Solid polymer of nylon 66
(b) Liquid polymer of nylon 66
(c) Gaseous polymer of nylon 66
(d) Liquid polymer of nylon 6
8. Polymerization of glycol with dicarboxylic acids is
- (a) Addition polymerisation
(b) Condensation polymerisation
(c) Telomerisation
(d) Any of these
9. The 'mercerised cellulose' is chemically prepared by
- (a) Acetylation (b) Mercuriation
(c) Halogenation (d) Hydrolysis
10. The plastics if are hard, become soft and readily workable by addition of certain compounds called
- (a) Catalysts (b) Telomers
(c) Plasticisers (d) Vulcaniser
11. The alkyd resins are condensation polymers obtained from dibasic acids and
- (a) Phenol (b) Glycol
(c) Glycerol (d) Formaldehyde
12. Celluloid is
- (a) A thermoplastic material obtained from caprolactam and urea
(b) A thermoplastic material obtained from cellulose nitrate and camphor
(c) A thermosetting material obtained from urea and formaldehyde
(d) A thermosetting material obtained from glycerol and phthalic anhydride
13. The product of addition polymerisation reaction is [KCET 1993]
- (a) PVC (b) Nylon
(c) Terylene (d) Polyamide
14. Example of condensation polymer is [RPMT 1999]
- (a) Formaldehyde $\rightarrow$ meta-formaldehyde
(b) Acetaldehyde $\rightarrow$ para-aldehyde
(c) Acetone $\rightarrow$ mesityl oxide
(d) Ethene $\rightarrow$ polyethene
15. Complete hydrolysis of cellulose gives [AIIEE 2003]

General Methods of Preparation and Mechanism of Polymerisation

1. Which of the following is a syndiotactic polymer in $[-CH_2 - C(YZ)-]_n -$
- (a) All Y groups lie on one side of the chain and all Z groups on the other side
(b) The Y and Z groups lie alternately on each side of the chain
(c) The Y and Z groups are arranged in a random fashion
(d) Y and Z groups are same
2. Polymers of the type $Z - Mn - Y$, i.e. those which contain a foreign molecule in addition to the recurring unit are known as
- (a) Semisynthetic polymers (b) Atactic polymers
(c) Telomers (d) Plasticiser
3. In the natural rubber 'Caoutchouc', the isoprene units are joined by
- (a) Head-to-head (b) Tail-to-tail
(c) Head-to-tail (d) All of these
4. The degree of crystallinity of which of the following is highest
- (a) Atactic polyvinylchloride

- (a) D-fructose (b) D-ribose
(c) D-glucose (d) L-glucose
16. Which of the following can be polymerised to polythene
(a) Ethylene (b) Ethylene chlorohydrin
(c) Ethyl acetate (d) Ethylmethyl ketone
17. Polypropylene can be obtained by polymerisation of
(a) $CH \equiv CH$ (b) $CH_2 = CH_2$
(c) $CH_3 - CH = CH_2$ (d) $CH_3 - C \equiv CH$
18. When heated with zinc chloride, lactides forms a linear polymer which may be
(a) Polystyrene (b) Polyamide
(c) Polyester (d) Polythene
19. Which of the following has been used in the manufacture of non-inflammable photographic films
(a) Cellulose nitrate
(b) Cellulose acetate
(c) Cellulose xanthate
(d) Cellulose perchlorate
20. The phenol-formaldehyde resins are formed by polymerisation of phenol and formaldehyde by
(a) Addition polymerisation
(b) Condensation polymerisation
(c) Both (a) and (b)
(d) None of these
21. PVC is obtained by polymerization of
(a) $CH_2 = CH - CH_2 - Cl$ (b) $CH_2 = CH - Cl$
(c) $CH_3 - Cl$ (d) $CH_3 - CHCl_2$
22. The monomers used in the production of nylon-66 are
[CBSE 1999; RPET 2000; KCET 2000; Kurukshetra CEE 2002]
(a) Hexamethylene diamine and ethylene glycol
(b) Adipic acid and ethylene glycol
(c) Adipic acid and hexamethylene diamine
(d) Dimethyl terephthalate and ethylene glycol
23. A raw material used in making nylon is
[NCERT 1980; MP PET 2004]
(a) Adipic acid (b) Butadiene
(c) Ethylene (d) Methyl methacrylate
24. Nylon is formed when a dicarboxylic acid is treated with a
(a) Dihydric alcohol (b) Polyhydric alcohol
(c) Diamine (d) Diester
25. Vinyl chloride can be converted into PVC. In this reaction, the catalyst used is
(a) Peroxides (b) Cuprous chloride
(c) Anhydrous zinc chloride (d) Anhydrous $AlCl_3$
26. Terylene is [BHU 2000]
(a) An addition polymer with a benzene ring in every repeating unit
(b) A condensation polymer with a benzene ring in every repeating unit
(c) An addition polymer with two carbon atoms in every repeating unit
(d) A condensation polymer with two nitrogen atoms in every repeating unit
27. Teflon is a polymer of the monomer or Teflon is obtained by the polymerisation of [CPMT 1986, 91; MP PET/PMT 1998; AIIMS 2002]
(a) Monofluoroethene (b) Difluoroethene
(c) Trifluoroethene (d) Tetrafluoroethene
28. The catalyst used in the manufacture of polyethene by Ziegler method is [KCET 1993, 99]
(a) Titanium tetrachloride and triphenyl aluminium
(b) Titanium tetrachloride and trimethyl aluminium
(c) Titanium dioxide
(d) Titanium isopropoxide
29. Acetate rayon is prepared from [Kurukshetra CEE 1998]
(a) Acetic acid (b) Glycerol
(c) Starch (d) Cellulose
30. The compound required for the formation of a thermosetting polymer with methanol is [CBSE 1992, 95; MNR 1993; JIPMER 1999; BHU 2000; AFMC 2000; MP PET 2003; RPMT 2002]
(a) Benzene (b) Phenyl amine
(c) Benzaldehyde (d) Phenol
31. Which polymer is formed by chloroethene [RPET 1999]
(a) Teflon (b) Polyethene
(c) PVC (d) Nylon
32. The starting material for the preparation of styrene is [MP PMT 2001]
(a) Ethane (b) Ethene
(c) Ethyne (d) Vinyl chloride
33. The catalyst used for the polymerisation of olefins is [Kerala (Engg.) 2002]
(a) Ziegler Natta catalyst
(b) Wilkinson's catalyst
(c) Pd-catalyst
(d) Zeise's salt catalyst
34. Rayon yarns are obtained from [MP PET 2001]
(a) Polymethylene (b) Polyesters
(c) Cellulose (d) Styrene
35. Which one of the following monomers gives the polymer neoprene on polymerization [CBSE PMT 2003]
(a) $CF_2 = CF_2$ (b) $CH_2 = CHCl$
(c) $CCl_2 = CCl_2$ (d) $CH_2 = \overset{Cl}{\underset{|}{C}} - CH = CH_2$
36. Terylene is the polymer of [AFMC 1993; Manipal MEE 1995; KCET 1998; 2001]
(a) Ethylene glycol and terephthalic acid
(b) Melamine and formaldehyde
(c) Vinyl chloride and formaldehyde
(d) Hexamethylene diamine and adipic acid
37. The compound used in the manufacture of terylene is [MP PET 1996]

- (a) Ethylene (b) Vinyl chloride
(c) Ethylene glycol (d) Adipic acid
38. PVC is prepared by the polymerisation of [Pb. CET 2002]
(a) Ethylene (b) 1-chloropropene
(c) Propene (d) 1-chloroethene
39. Condensation product of caprolactum is [BCECE 2005]
(a) Nylon-6 (b) Nylon-66
(c) Nylon-60 (d) Nylon-6,10
- (a) Nitrogen (b) $KMnO_4$
(c) Nitrogen dioxide (d) Potassium chlorate
13. Ethylene-propylene rubber (EPR) is
(a) Unsaturated, stereoregular
(b) Saturated, stereoregular
(c) Atactic, unsaturated
(d) Syndiotactic, unsaturated
14. The monomeric units of terylene are glycol and which of the following

Composition, Properties and Uses of Polymer

1. Discovery of 'nylon' is associated with
(a) Newyork and London (b) Newyork and Longuet
(c) Nyholm and London (d) None of these
2. Which of the following is resistant to boiling aqua-regia
(a) Polythene (b) Perspex
(c) Teflon (d) Bakelite
3. Nylon polymers are
(a) Acidic (b) Basic
(c) Amphoteric (d) Neutral
4. Nylon yarns are usually
(a) Highly inflammable
(b) Non-inflammable
(c) Both (a) and (b) types are known
(d) Uncertain inflammability
5. Which of the following is a synthetic polymer
(a) Rubber (b) Perspex
(c) Protein (d) Cellulose
6. The mass average molecular mass & number average molecular mass of a polymer are respectively 40,000 and 30,000. The polydispersity index of polymer will be [Kerala CET 2005]
(a) < 1 (b) > 1
(c) 1 (d) 0
(e) -1
7. In the process of forming 'mercerised cellulose' the swelling of cellulose is caused by
(a) Water (b) Na_2CO_3
(c) Aq. NaOH (d) Aq. HCl
8. 'Rayon' is
(a) Natural silk (b) Artificial silk
(c) Natural plastic or rubber (d) Synthetic plastic
9. As the molecular weight increases the tensile strength of polymers
(a) Increases (b) Decreases
(c) Remains unchanged (d) Uncertain
10. Triethyl aluminium titanium chloride used in plastic industry is a
(a) Vulcaniser (b) Plasticiser
(c) Ziegler-Natta catalyst (d) Telomer
11. Glyptals are chiefly employed in
(a) Toy making (b) Surface coating
(c) Photofilm making (d) Electrical insulators
12. The sterile gauze (or cotton) used in medicine is obtained by oxidising cellulose with
(a) Nitrogen (b) $KMnO_4$
(c) Nitrogen dioxide (d) Potassium chlorate
13. Ethylene-propylene rubber (EPR) is
(a) Unsaturated, stereoregular
(b) Saturated, stereoregular
(c) Atactic, unsaturated
(d) Syndiotactic, unsaturated
14. The monomeric units of terylene are glycol and which of the following
- (a)  (b) 
(c)  (d) 
15. Neoprene, a synthetic rubber contains which of the following element besides C and H
(a) N (b) O
(c) Cl (d) F
16. Acrylic resins are
(a) Colourless and transparent
(b) Dark brown and thermosetting
(c) Dark brown and thermoplastic
(d) White like milk
17. Which of the following has a higher glass-transition temperature
(a) Polyethylene (b) Polypropylene
(c) Polyvinylchloride (d) Polystyrene
18. A polymer with the high chemical stability has $M.P.$ $327^\circ C$ and the density of complete crystalline sample is 2.3 g/cm^3 . It can be
(a) PVC (b) Teflon
(c) Melamine (d) Bakelite
19. The process of vulcanisation makes rubber
(a) Soluble in water (b) Elastic
(c) Hard (d) Soft
20. Terylene is a [AFMC 1989; MP PET 1994; RPET 1999; Kerala (med.) 2002; MP PMT 2004]
(a) Polyamide (b) Polyester
(c) Polyethylene (d) Polypropylene
21. $F_2C = CF_2$ is the monomer of [CBSE PMT 2000]
(a) Nylon-6 (b) Buna-S
(c) Glyptal (d) Teflon
22. Molecular mass of a polymer is
(a) Small (b) Very small
(c) Negligible (d) Large
23. Which of the following has cross-links
(a) Vulcanised rubber
(b) Nylon
(c) Phenol-formaldehyde resins
(d) Both (a) and (c) are correct
24. Orlon is a polymer of [NCERT 1984; BHU 1995; AFMC 1997; DCE 2001]
(a) Styrene (b) Tetrafluoro ethylene
(c) Vinyl chloride (d) Acrylonitrile
25. Caprolactam is the monomer of [DCE 2000]
(a) Nylon-6 (b) Glyptal

- (c) P.T.F.E. (d) Melamine
26. Which of the following intermolecular forces are present in 'nylon – 66' [JIPMER 1997]
(a) Vander Waals (b) Hydrogen bonding
(c) Dipole-dipole interaction (d) None of these
27. Neoprene is a polymer of [AFMC 1993; NCERT 1980, 84, 86; CBSE 1991; DCE 2001]
(a) Propene (b) Vinyl chloride
(c) Chloroprene (d) Butadiene
28. Polyvinyl chloride is
(a) An isomer of vinyl chloride
(b) An addition product of vinyl chloride
(c) An allotrope polymer of vinyl chloride
(d) A polymer of hydrated vinyl chloride
29. Which of the following polymers are hard
(a) Linear (b) Cross-linked
(c) Branched chain (d) Thermoplastic
30. Which of the following has the largest molecular mass
(a) Monomer (b) Dimer
(c) Polymer (d) Oligomer
31. Heating of rubber with sulphur is known as [CBSE PMT 1989]
(a) Galvanisation (b) Vulcanisation
(c) Bessemerisation (d) Sulphonation
32. $CH_2 = CH_2$ is a [MP PMT 1986; CBSE PMT 1991]
(a) Monomer (b) Polymer
(c) Isomer (d) Equimer
33. Which of the following fibres are made of polyamides [CPMT 1982; NCERT 1981; MNR 1992; DCE 1999; UPSEAT 2001, 02]
(a) Dacron (b) Orlon
(c) Nylon (d) Rayon
34. Which is not a polymer [CPMT 1994]
(a) Ice (b) Starch
(c) Protein (d) Cellulose
35. Acrylonitrile forms [BHU 1995]
(a) Terylene (b) Orlon
(c) PVC (d) Bakelite
36. Synthetic fibres like nylon-66 are very strong because
(a) They have high molecular weights and high melting points
(b) They have a high degree of cross-linking by strong C – C bond
(c) They have linear molecules consisting of very long chains
(d) They have linear molecules interlinked with forces like hydrogen bonding
37. Natural rubber contains several thousand units of X linked together in the polymer chain. X is [NCERT 1980, 84; BHU 1983; CBSE PMT 1991; MP PMT 2001]
(a) Neoprene (b) Isoprene
(c) Chloroprene (d) Styrene
38. Natural rubber is basically a polymer of or The monomer of natural polymer rubber is [MP PMT 1993, 95, 98, 99, 2000, 01; RPET 2000; MP PMT/PET 1998; MP PET 1994, 95, 98, 2001; BHU 1999; 2001; CBSE PMT 1999]
(a) Neoprene (b) Isoprene
(c) Chloroprene (d) Butadiene
39. What is not true about polymers [MP PET 1999]
(a) Polymers do not carry any charge
(b) Polymers have high viscosity
(c) Polymers scatter light
(d) Polymers have low molecular weight
40. The synthetic polymer which resembles natural rubber is [Bihar MEE 1996; DCE 2004]
(a) Neoprene (b) Chloroprene
(c) Glyptal (d) Nylon
41. Which one is a polymer compound [CPMT 1997; Bihar MEE 1997]
(a) SO_2 (b) CO_2
(c) CH_4 (d) PVC
42. Which one of the following is used to make 'non-stick' cookware [CBSE PMT 1999]
(a) PVC
(b) Polystyrene
(c) Polyethylene terephthalate
(d) Polytetrafluoroethylene
43. The polymer used for making contact lenses for eyes is [AMU 1999]
(a) Polymethylmethacrylate (b) Polyethelene
(c) Polyethylacrylate (d) Nylon-6
44. Which polymer is used for making magnetic recording tapes [AMU 1999]
(a) Dacron (b) Acrilan
(c) Glyptal (d) Bakelite
45. Characteristic property of Teflon is [RPET 2000]
(a) 2000 poise viscosity
(b) High surface tension
(c) Non-inflammable and resistant to heat
(d) Highly reactive
46. Which of the following is not a polymer [MP PET 2001]
(a) Silk (b) DNA
(c) DDT (d) Starch
47. Nylone 66 is [RPMT 2002; MH CET 2003; AFMC 1998]
(a) Polyamide (b) Polyester
(c) Polystyrene (d) Polyvinyl
48. Isoprene is a valuable substance for making [MP PET 2002; UPSEAT 2004]
(a) Propene (b) Liquid fuel
(c) Synthetic rubber (d) Petrol
49. Terylene is used for making [AFMC 2002]
(a) Silks (b) Fabrics
(c) Seat belts (d) All of these
50. Nylon threads are made of [MP PMT 2001, 03; AIEEE 2003]
(a) Polyvinyl polymer (b) Polyester polymer
(c) Polyamide polymer (d) Polyethylene polymer
51. Nylon – 66 is [RPMT 2003]
(a) $\left[-\overset{\overset{O}{\parallel}}{C}-(CH_2)_4-\overset{\overset{O}{\parallel}}{C}-NH-(CH_2)_6-NH- \right]_n$

52. Which of the following is currently used as a tyre cord
[Kerala (Med.) 2003]

- (a) Terelene (b) Polyethylene
(c) Polypropylene (d) Nylon - 6

53. PVC is polymer of [CPMT 2003]

- (a) $CH_2 = CH_2$ (b) $CH_2 = CH - Cl$
(c) $CH_2 = CH - CH_2Cl$ (d) $CH_3 - CH = CH - Cl$

54. Teflon is a polymer of [Kerala PMT 2004]

- (a) Tetrafluoro ethane
(b) Tetrafluoro propene
(c) Difluorodichloro ethane
(d) Difluoro ethene
(e) Trifluoro ethene

55. Which of the following is used in vulcanization of rubber
[MH CET 2004]

- (a) SF_6 (b) CF_4
(c) Cl_2F_2 (d) C_2F_2

56. PVC is used for [Orissa JEE 2002]

- (a) Manufacture of cosmetics
(b) Manufacture of tyres
(c) Manufacture of nonstick pans
(d) Manufacture of plastic pipes

57. Polythene is a resin obtained by polymerisation of or The monomer unit in polythene is

[CPMT 1983; JIPMER 1997; MP PMT 2002]

- (a) Butadiene (b) Ethylene
(c) Isoprene (d) Propylene

58. The monomer of the polymer

[MH CET 2004; CBSE PMT 2005]

- (a) $H_2C = C \begin{array}{l} \swarrow CH_3 \\ \searrow CH_3 \end{array}$ (b) $(CH_3)_2C = C(CH_3)_2$
(c) $CH_3CH = CHCH_3$ (d) $CH_3CH = CH_2$

59. The monomer of Nylon-6 is/are [DPMT 2004]

60. Which of the following is teflon

[MP PMT 2000, 03]

61. Thermosetting plastics are

- (a) Soluble in water (b) Soluble in alcohol
(c) Soluble in benzene (d) Insoluble

62. Cellulose is

- (a) $(C_6H_{10}O_5)_n$ (b) $(C_3H_3N_3)_n$
(c) $(C_3H_6N_6)_n$ (d) $(C_{12}H_{22}O_{11})_n$

63. The molecular weight of cellulose varies between

- (a) 1000 to 20000 (b) 20000 to 500000
(c) 100 to 200 (d) 1000000 to 5000000

64. The value of n in the formula $(C_5H_{10}O_5)_n$ for inulin is about

- (a) 30 (b) 300
(c) 3000 (d) 300000

65. 'Starch' consists of two fractions; one is α -amylose and the other is

- (a) Amylopectin (b) Glycogen
(c) Pecticamide (d) Alginic acid

66. The process of heat-softening, moulding and cooling to rigidity can be repeated for which plastics

- (a) Thermoplastics (b) Thermosetting plastics
(c) Both (a) and (b) (d) None of the above

67. In the trinitrocellulose each glucose unit contains how many $-OH$ groups

- (a) 2 (b) 3
(c) 4 (d) 5

68. Shellac contains mainly

- (a) Cellulose
(b) Polyhydroxy organic acids
(c) Polyamides
(d) Polyesters

69. In elastomer, intermolecular forces are

[AIIMS 2000; BHU 2004]

- (a) Nil (b) Weak
(c) Strong (d) Very strong

70. Cellulose is a polymer of [CBSE PMT 2002]

- (a) Fructose (b) Ribose
(c) Glucose (d) Sucrose

71. Which of the following polymer has ester linkage

[BVP 2004]

- (a) Nylon-66 (b) PVC
(c) Terylene (d) SBR
72. Acrilan is a hard, horny and a high melting material. Which of the following represents its structure [CBSE PMT 2003]
- (a) $\left(-CH_2 - \underset{\text{Cl}}{\underset{|}{CH}} - \right)_n$ (b) $\left(-CH_2 - \underset{\text{CN}}{\underset{|}{CH}} - \right)_n$
(c) $\left(-CH_2 - \underset{\text{COOCH}_3}{\underset{|}{C}} - \right)_n$ (d) $\left(CH - \underset{\text{COOC}_2\text{H}_5}{\underset{|}{C}} - \right)_n$
73. Which of the following has amide links
(a) Protein (b) Nylon
(c) Peptide (d) All of these
74. Which of the following is a polyamide [AIEEE 2005]
(a) Teflon (b) Nylon -66
(c) Terylene (d) Bakelite
75. Which of the following is fully fluorinated polymer [AIEEE 2005]
(a) Neoprene (b) Teflon
(c) Thiokol (d) PVC
76. Three dimensional molecules with cross links are formed in the case of a [KCET 2005]
(a) Thermoplastic (b) Thermosetting plastic
(c) Both (d) None

Critical Thinking

Objective Questions

1. Trans-form of polyisoprene is
(a) Gutta-percha (b) Hydrochloride rubber
(c) Buna-N (d) Synthetic rubber
2. Wash and wear clothes are manufactured using
(a) Nylon fibres (b) Cotton mixed with nylon
(c) Terylene fibres (d) Wool fibres
3. In the manufacture of polythene by the Ziegler process using ethylene, the temperature for proper polymerisation required is
(a) Below 10°C (b) 10° to 50°C
(c) 50° to 80°C (d) 80° to 140°C
4. High density polyethylene (HDPE) can be prepared from ethylene by
(a) Ziegler-Natta process
(b) Heating with peroxides
(c) Condensing in sealed tubes
(d) Condensing with styrenes
5. Perlon is [AFMC 2001]
(a) Rubber (b) Nylon-6
(c) Terylene (d) Oxlon
6. Styrene at room temperature is
(a) Solid (b) Liquid
(c) Gas (d) Colloidal solution
7. Which one of the following can be used as monomer in a polymerisation reaction [MP PMT 1993]
(a) $\text{CH}_3\text{CH}_2\text{Cl}$ (b) $\text{CH}_3\text{CH}_2\text{OH}$

- (c) C_6H_6 (d) C_3H_6
8. The Ziegler-Natta catalysts are
(a) Stereospecific
(b) Non-metallic complexes
(c) Gaseous catalysts
(d) Universal in all polymerisation reactions
9. Melamine is
(a) Gas (b) Yellow liquid
(c) White crystalline solid (d) Colloidal solution
10. Glyptal is a
(a) Viscose rayon (b) Nylon
(c) Polystyrene (d) Alkyd resin
11. Which of the following is not polyamide [AFMC 2000; CBSE PMT 2001; KCET 2001]
(a) Nylon-66 (b) Protein
(c) Glyptal (d) Nylon-6
12. Which of the following statement is correct regarding the drawbacks of raw rubber [AIIMS 2001]
(a) It is plastic in nature
(b) It has little durability
(c) It has large water-absorption capacity
(d) All of these
13. Which of the following is a chain growth polymer [CBSE PMT 2004]
(a) Polystyrene (b) Protein
(c) Starch (d) Nucleic acid
14. 'Celanese silk' is
(a) Cellulose trinitrate (b) Cellulose acetate
(c) Cellophane (d) Pyroxylin
15. Ebonite is [CBSE PMT 2000]
(a) Poloprene (b) Natural rubber
(c) Synthetic rubber (d) Highly vulcanized rubber
16. Polymer used in bullet proof glass is [MP PET 2004]
(a) Lexane (b) PMMA
(c) Nomex (d) Kevlar

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : The time of vulcanisation and temperature is increased by adding accelerators.
Reason : By vulcanising, a material of high tensile strength can be obtained.
2. Assertion : Hydrogenation is the process of converting an oil into a fat, called vegetable ghee.
Reason : Hydrogenation as carried out in presence of a catalyst usually finely divided nickel.

3. Assertion : In vulcanisation of rubber, sulphur cross links are introduced.
Reason : Vulcanisation is a free radical initiated chain reaction.
4. Assertion : Bakelite is a thermosetting polymer.
Reason : Bakelite can be melted again and again without any change.
5. Assertion : Teflon has high thermal stability and chemical inertness.
Reason : Teflon is a thermoplastic.

AS Answers and Solutions

Classification of Polymer

- (c) Bakelite is thermosetting polymer. It becomes infusible on heating and can not be remoulded
- (c) Natural rubber is the only addition polymer of nature and is known as *Cis*-1,4-polyisoprene.
- (d) Wax is a molecular solid.
- (a) It is present in the cell wall of plant.
- (c) Starch is a natural polymer and other are synthetic.
- (d) Protein is a natural polymer of α -amino acids.
- (d) Amylose is a linear polymer of α -D-Glucose
 $(\text{-Glucose-Glucose-Glucose-})_n$
 $(C_1-C_4 \alpha\text{-linkage})$
- (d) Silk is protein fibre. Dacron is polyester fibre and Nylon-66 is polyamide fibre.
- (b) Natural rubber is addition polymer of isoprene (2-methyl-1,3-butadiene)

- (b) Polyethylene is a homopolymer
 $n \text{CH}_2 = \text{CH}_2 \rightarrow \text{-(CH}_2 - \text{CH}_2\text{)}_n$
- (a) Cellulose is the natural fibre which are biodegradable polymer rest are synthetic polymer which are not biodegradable.
- (d) Nylon is the copolymer of Hexamethylene diamine and adipic acid. It is not a homo-polymer because homopolymer formed by two same monomer unit.
- (a) Thermoplastic are those which becomes soft on heating and can be remoulded again.
- (c) Resins are amorphous organic solids or semisolids which usually have a typical lustre and are often transparent or translucent.
- (c) Step growth polymerization involves condensation reaction between two difunctional monomer to produce dimer which in turn, produce, tetramer and so on with the loss of simple molecules like H_2O , NH_3 , HCl etc.
- (c) Buna-S and Neoprene both are synthetic rubber.
- (d) Nylon is a synthetic polymer.

35. (b) Nylon-66 is manufactured by the condensation polymerization of adipic acid and hexamethylenediamine with the loss of H_2O as steam.
36. (c) The polymer formed by the condensation polymerisation is known as condensation polymer. Decron (Terylene) is a condensation polymer. It is formed by the condensation polymerisation of terephthalic acid and ethylene glycol.
37. (c) PVC is a synthetic polymer made by vinyl chloride.
38. (e) Terylene is fibre not a thermosetting plastic because on heating they melt and do not show plastic property while rest option are true regarding to Terylene
39. (a) Sucrose is a disaccharides which upon acid or enzymatic hydrolysis gives only two molecules of monosaccharides.
- Sucrose $\xrightarrow{H^+ \text{ or invertase}}$ D(+)-glucose + D(-)-fructose

General methods of preparation and mechanism of Polymerisation

1. (b) There are 3 stereo chemical arrangements are possible
- (i) Isotactic (Same order):- Here groups are arranged on one side of the chain. All Y groups lie on one side and all Z groups on the opposite side of the chain.

From steric effects, the polymer formed has head to tail configuration.

4. (c) Syndiotactic polyvinylchloride

In this arrangement the chlorine atoms are alternately arranged. The polymer is stereoregular and has high crystallinity.

7. (b) The condensation polymerisation of hexamethylene diamine and adipic acid is done in solution form by interface technique. In this liquid nylon polymer is obtained.

8. (b) Condensation Polymerization because loss of water molecule takes place.
10. (c) eg- PVC is extremely stiff and hard but the addition of *d*-*n* butyl phthalate Plasticizers makes it soft and rubber like.
14. (c) Polymers formed by condensation process with elimination of small molecule like H_2O, CO_2 etc. are known as condensation polymers.

15. (c) D-glucose is the monomer of cellulose.
16. (a) $nCH_2 = CH_2 \rightarrow (-CH_2 - CH_2 -)_n$
Ethylene Polythene
17. (c) $nCH_3 - CH = CH_2 \rightarrow (-CH_2 - \underset{CH_3}{\underset{|}{CH}} -)_n$
Propene Polypropylene
21. (b) $n(CH_2 = CH - Cl) \rightarrow (-CH_2 - \underset{Cl}{\underset{|}{CH}} -)_n$
Vinyl chloride (PVC)
22. (c) Adipic acid ($HOOC - (CH_2)_4 - COOH$) and Hexamethylene diamine ($NH_2 - (CH_2)_6 - NH_2$)
27. (d) Tetrafluoroethene ($CF_2 = CF_2$).
29. (d) Rayon fibre is chemically identical to cotton but has a shine like silk, rayon is also called a regenerated fibre because during its preparation. Cellulose is regenerated by dissolving it in $NaOH$ and CS_2 .
30. (d) When phenol react with $HCHO$ form bakelite which is a thermosetting polymer.
31. (c) Generally chloroethene (vinyl chloride) formed PVC polyvinyl chloride.
33. (a) $Al(C_2H_5)_3 + TiCl_4$ is Ziegler Natta catalyst.
37. (c) Terylene is a polymer of ethylene glycol and terephthalic acid.
38. (d) PVC is polyvinyl chloride, a polymer of vinyl chloride.

Composition, properties and uses of Polymers

1. (a) Nylon was simultaneously discovered in New York and London.

2. (c) Teflon is flexible, inert to solvents and to boiling with acids even to aqua - regia and is stable upto 598 K.

4. (c) Both highly inflammable and Non-inflammable

5. (b) Perspex is a synthesized polymer.

6. (b) Average number molecular weight $\overline{M}_n = 30,000$

Average mass molecular weight $\overline{M}_w = 40,000$

$$\text{Polydispersity index (PDI)} = \frac{\overline{M}_w}{\overline{M}_n} = \frac{40,000}{30,000} = 1.33$$

7. (c) Cellulose forms a translucent mass on treatment with conc.

NaOH which imparts a silky lustre to cotton. This process is mercerisation and the cotton so produced is known as mercerised cotton.

8. (b) 'Rayon' is man-made fibre which consists of purified cellulose in the form of long threads. Rayon resembles silk in appearance. Hence called as artificial silk.

10. (c) Ziegler-Natta catalyst $(C_2H_5)_3Al + TiCl_4$

14. (c) Terylene is made from glycol and Terephthalic acid

15. (c) $n(CH_2 = \underset{\text{Cl}}{\underset{|}{C}} - CH = CH_2) \rightarrow \left[CH_2 - \underset{\text{Cl}}{\underset{|}{C}} = CH - CH_2 \right]_n$
Chloroprene Neoprene

19. (c)

22. (d) Polymer always consists of hundreds to thousands of repeating structural units. Hence they have very high molecular mass.

24. (d) Acrylonitrile is a hard, horny and high melting material. It is used in the manufacture of oron and Acrilan fibres which are used for making clothes, carpets and blankets.

27. (c) $n(CH_2 = \underset{\text{Cl}}{\underset{|}{C}} - CH = CH_2) \rightarrow (-CH_2 - \underset{\text{Cl}}{\underset{|}{C}} = CH - CH_2 -)_n$
Chloroprene Neoprene

34. (a) Ice is a molecular solid.

36. (d) They have linear molecules interlinked with forces like hydrogen bonding.

37. (b) Isoprene $(CH_2 = \underset{\text{CH}_3}{\underset{|}{C}} - CH = CH_2)$

38. (b) $n CH_2 = \underset{\text{CH}_3}{\underset{|}{C}} - CH = CH_2 \rightarrow \left[-CH_2 - \underset{\text{CH}_3}{\underset{|}{C}} = CH - CH_2 - \right]_n$
Natural rubber

39. (d) Polymers have high molecular weight.

40. (a) In Neoprene monomer unit is

while Isoprene $(CH_2 = \underset{\text{CH}_3}{\underset{|}{C}} - CH = CH_2)$ is the monomer of natural rubber.

42. (d) Teflon has great chemical inertness and high thermal stability, hence used for making non-stick utensils. For this purpose, a thin layer of teflon is coated on the inner side of the vessel.

43. (a) Also known as PMMA. It is a transparent, excellent light transmitter and its optical clarity better than glass so it is used in the preparation of lenses for eyes.

45. (c) Teflon is non-inflammable and resistant to heat so it is used in coating, particularly in non-sticking frying pans.

46. (c) DDT is an organic compound used as insecticide not is a polymer.

47. (a) All the nylons are polyamides.

48. (c) Rubber is a polymer of isoprene. Its chemical formula is $(C_5H_8)_n$.

54. (a) $nCF_2 = CF_2 \longrightarrow [-CF_2 - CF_2 -]_n$
Tetrafluoro ethane Teflon

55. (a) SF_6 is used in the vulcanisation of rubber. Sulphur is heated with polymer to introduce cross-linking and thus, form tough polymer.

58. (a) $H_2C = \begin{array}{l} \text{CH}_3 \\ \diagup \\ C \\ \diagdown \\ \text{CH}_3 \end{array}$

59. (b) The monomer used in the preparation of Nylon-6 is caprolactam.

64. (a) 30-Inulin $(C_5H_{10}O_5)_{30}$ is found in the "Roots of Dahaliya".

69. (b) Polymer chain in elastomer are held together by weak intermolecular forces eg. Vulcanised rubber.

71. (c) Terylene has ester linkage. It is the polymer of ethylene glycol with terephthalic acid. It is used in textile industry.

74. (b) Nylons are polyamide fibres.

76. (b) Thermosetting plastics have three dimensional cross-linked structure. Such polymers are prepared in two steps. The first step is the formation of long chain molecules which are capable of further reaction with each other. The second step is the application of heat which cause a reaction to occur between the chains, thus producing a complex cross-linked polymer.

Critical Thinking Questions

- (a) Guttapercha rubber is very hard horny material consisting of trans 1, 4 - polyisoprene polymer
- (c) The fibre of terylene is highly crease - resistant, durable and has low moisture content. It is also not damaged by pests like moths and mildew. It is therefore used for the manufacture of wash and wear fabrics. It is also blended with cotton (Terycot) and wool (Terywool) to increase their resistance to wear and tear.
- (c) The reaction carried out at temp. $50^{\circ}\text{--}80^{\circ}\text{C}$.
- (a) HDPE is prepared by co-ordination polymerization which occurs through the intermediate formation of co-ordination complexes. For example, ethylene first forms a co-ordination complex with the transition metal titanium by donating its π - electrons. The π complex thus formed then reacts stepwise with a large number of ethylene molecules ultimately leading to the formation of a polymer. The polythene so obtained has high density (0.97 g/cm^3) and higher *m.pt.* (403K) as compare to LDPE (density- 0.92 g/cm^3 and *m.pt.* 384K)
- (b) Perlon is Nylon-6. It is prepared from a single monomer having a potential amino group of one end and a potential carbonyl group of other end.
- (b) Styrene at room temperature is liquid.
- (d)
$$n \underset{\text{Propene}}{\text{CH}_3 - \text{CH} = \text{CH}_2} \rightarrow \left(\underset{\text{Polypropene}}{\text{CH}_2 - \underset{\text{CH}_3}{\text{CH}} - } \right)_n$$
- (a) Ziegler Natta catalyst is a mixture of TiCl_4 and $(\text{C}_2\text{H}_5)_3\text{Al}$ used in the synthesis of stereoregular polymers.
- (c) Melamine is the phenol-urea resin which are white crystalline solid.
- (d) Glyptal is a polymer of phthalic acid and Glycol.
- (c) Glyptal is an alkyd resin of ethylene glycol ($\text{HO} - \text{CH}_2 - \text{CH}_2 - \text{OH}$).

- (d) The raw rubber is plastic in nature. It becomes soft at high temperature. It has little durability and it has large water absorption capacity.
- (a) Chain growth polymers involve a series of reaction each of which consume a reactive particles & produces another similar one. The reactive particles may be free radicals or ions (cation or anion) to which monomers get added by a chain reaction. It is an important reaction of alkenes & conjugated dienes or indeed of all kinds of compounds that contains $\text{C}=\text{C}$ double bond

- (b) Cellulose acetate known as celanese silk.
- (d) Ebonite is a hard and highly (20-30%) vulcanized rubber.
- (b) PMMA is used in bullet proof glass.

Assertion & Reason

- (e) The time of vulcanisation is reduced by adding accelerators and activators.
- (b) Hydrogenation or hardening of oil is a process in which various unsaturated radicals of fatty glycerides are converted into more highly or completely saturated glycerides by the addition of hydrogen in the presence of a catalyst, usually finely divided nickel.
- (b) Vulcanisation is a process of treating natural rubber with sulphur or some compounds of sulphur under heat so as to modify its properties. This cross-linking give mechanical strength to the rubber.
- (c) Bakelite can be heated only once.
- (b) Due to the presence of strong $\text{C}-\text{F}$ bonds, teflon has high thermal stability and chemical inertness.

Polymer

SET Self Evaluation Test -30

 - Polymers
 - Copolymer
 - Addition
 - Condensation polymer
- Which one of the following polymers will not catch fire [MP PET 1994]
 - $(-CF_2 - CF_2 -)_n$
 - $(-CH_2 - CH_2 -)_n$
 - $(-\underset{\underset{Cl}{|}}{CH} - \underset{\underset{Cl}{|}}{CH} -)_n$
 - $(-CH_2 - \underset{\underset{Cl}{|}}{CH} -)_n$

AS Answers and Solutions

(SET -30)

- (d) Caprolactum is the monomer of nylon -6.
- (d) Nylon-66- It is a polymer containing alitrogen

Chapter 31 Biomolecules

All living bodies are composed of several lifeless substances which are present in their cells in a very complex but highly organised form. These are called biomolecules. Some common examples are carbohydrates, proteins, enzymes, nucleic acids, lipids, amino acids, fats etc :

Living organisms → Organs → Tissues → Cells → Organelles → Biomolecules.

Carbohydrates

The carbohydrates are naturally occurring organic substances. They are present in both plants and animals.

"Carbohydrates are defined as a class of compounds that include polyhydric aldehydes or polyhydric ketones and large polymeric compounds that can be broken down (hydrolysed) into polyhydric aldehydes or ketones."

Carbohydrates contain $>C=O$ and $-OH$ groups. A carbonyl compound reacts with an alcohol to form hemiacetal.

The name of simpler carbohydrates end is -ose. Carbohydrate with an aldehydic structure are known as aldoses and those with ketonic structure as ketoses. The number of carbon atom in the molecule is indicated by Greek prefix.

Table : 31.1

Number of carbon atoms in the molecule	Aldose	Ketose
3	Aldotriose	Ketotriose
4	Aldotetrose	Ketotetrose
5	Aldopentose	Ketopentose
6	Aldohexose	Ketohexose
7	Aldoheptose	Ketoheptose

Monosaccharides

These are the simplest one unit non-hydrolysable sugars. They have the general formula $C_nH_{2n}O_n$ where n varies from 3 to 9 carbon atoms. About 20 monosaccharides occur in nature. The simplest are trioses ($n=3$)

The most important naturally occurring monosaccharides are pentoses and hexoses. A common pentose is ribose and two common hexoses are glucose and fructose.

Except ketotriose {dihydroxyacetone}, all aldose and ketoses {monosaccharides} contain asymmetric carbon atoms and are optically active.

Glucose; ($C_6H_{12}O_6$) or Aldo-hexose

Glucose is known as **dextrose** because it occurs in nature as the optically active dextrorotatory isomer. It is also called grape sugar as it is found in most sweet fruits especially grapes.

(i) Preparation :

(i) Laboratory method

HCl (dil.) is used for hydrolysis. Glucose being much less soluble in alcohol than fructose separates out by crystallising on cooling.

(ii) **Manufacture** : It is obtained on a large scale by the hydrolysis of starch (corn starch or potato starch) with dilute sulphuric acid or hydrochloric acid.

A thin paste of starch is boiled with dilute acid till the hydrolysis is complete. The excess of acid is neutralised with chalk (calcium carbonate) and the filtrate containing glucose is decolourised with animal charcoal. The solution is concentrated and evaporated under reduced pressure. Glucose is obtained in crystalline form.

(2) **Physical properties** : It is a colourless crystalline solid, melts at 146°C . It is readily soluble in water. From aqueous solution, it separates as a crystalline monohydrate ($\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$) which melts at 86°C . It is sparingly soluble in alcohol but insoluble in ether. It is less sweet (three-fourth) than cane sugar. It is optically active and the ordinary naturally occurring form is (+) glucose or dextro form. It shows **mutarotation**.

(3) Chemical properties

(i) Alcoholic reactions (Reactions due to $-\text{OH}$ group) :

(a) Reaction with acid chlorides and acid anhydride

This shows that a molecule of glucose contains 5 $-\text{OH}$ groups.

(b) Reaction with PCl_5

(c) Reaction with metallic hydroxides

Glucose behaves as a weak acid. Instead of $\text{Ca}(\text{OH})_2$ we can take other metallic hydroxide like $\text{Ba}(\text{OH})_2$, $\text{Sr}(\text{OH})_2$, $\text{Cu}(\text{OH})_2$ etc to form glucosate which is soluble in water.

(d) Formation of glycosides

This reaction shows the presence of ring structure in glucose.

(ii) Reactions of carbonyl group (Aldehydic group)

(a) Reduction

On prolonged heating with concentrated HI and red phosphorus at 110°C , glucose forms a mixture of 2-iodohexane and n -hexane.

(b) Oxidation

Reaction with Fehling solution

Reaction with Tollen's reagent

Reaction with Bromine water

Reaction with Nitric acid

(c) Reaction with HCN

(d) Reaction with hydroxyl amine

(e) **Reaction with Phenyl hydrazine (Fischer's mechanism)** : When warmed with excess of phenyl hydrazine, glucose first forms phenylhydrazone by condensation with $-\text{CHO}$ group.

(iii) Miscellaneous reactions

(a) Fermentation

(b) **Dehydration** : When heated strongly or when treated with warm concentrated sulphuric acid, glucose is dehydrated to give a black mass (sugar carbon).

(c) **Reaction with alkalis** : When warmed with concentrated alkali, glucose first turns yellow; then brown and finally gives a resinous mass.

A dilute solution of glucose, when warmed with dilute solution of alkali, some glucose is converted into fructose and mannose. **D-glucose** and **D-mannose** are **epimers**.

On treatment with conc. HCl , glucose can also form hydroxymethyl furfural.

This on acid treatment gives laevulic acid

(4) Uses

- (i) In the preservation of fruits and preparation of jams and jellies.
- (ii) In the preparation of confectionary and as a sweetening agent.
- (iii) As a food for patients, invalids and children.
- (iv) In the form of calcium glucosate as medicine in treatment of calcium deficiency.
- (v) As a reducing agent in silvering of mirrors.
- (vi) As a raw material for alcoholic preparations.
- (vii) In industrial preparation of vitamin-C.
- (viii) In the processing of tobacco.
- (ix) As an intravenous injection to the patients with lower glucose content in blood.

(5) Test of glucose

- (i) When heated in a dry test tube, it melts, turns brown and finally black, giving a characteristic smell of burnt sugar.
- (ii) When warmed with a little conc. H_2SO_4 , it leaves a charred residue of carbon.
- (iii) When it is boiled with dilute NaOH solution, it first turns yellow and then brown.
- (iv) **Molisch's test** : This is a general test for carbohydrates. Two or three drops of alcoholic solution of α -naphthol is added to 2 mL of glucose solution. 1 mL of concentrated H_2SO_4 is added carefully along the sides

of the test tube. The formation of a violet ring, at the junction of two liquids confirms the presence of a carbohydrate.

(v) **Silver mirror test** : A mixture of glucose and ammonical silver nitrate is warmed in a test tube. Appearance of silver mirror on the inner walls confirms glucose.

(vi) **Fehling's solution test** : A little glucose is warmed with Fehling's solution. A red precipitate of cuprous oxide is formed.

(vii) **Osazone formation** : Glucose on heating with excess of phenyl hydrazine in acetic acid gives a yellow crystalline compound, m.p. 205°C .

(6) Structure of glucose

(i) **Open chain structure** : The structure of D -glucose as elucidated by Emil Fischer is,

(b) Ordinary α (Specific rotation = 52.5°) fresh aqueous solution has specific rotation, $[\alpha]_D + 111^\circ$. On keeping the solution for some time; α -glucose slowly changes into an equilibrium mixture of α -glucose (36%) and β -glucose (64%) and the mixture has specific rotation $+ 52.5$.

Similarly a fresh aqueous solution of β -glucose having specific rotation, $[\alpha]_D + 19.7^\circ$, on keeping (standing) gradually changes into the same equilibrium mixture (having, specific rotation $+ 52.7^\circ$). So an aqueous solution of glucose shows a physical property, known as **mutarotation**, i.e., a change in the value of specific rotation (muta=change; rotation = specific rotation) is called **mutarotation**.

(c) Fischer and Tollen's proposed that the ring or the internal hemiacetal is formed between C^1 and C^4 . It means the ring is **Furan type** or 5-membered ring; this is called **Furanose structure**,

However according to Haworth and Hirst the ring is formed between C^1 and C^5 . It means the ring is **Pyran type** or 6-membered ring, this is called **Pyranose structure**.

(d) *Haworth structure* : The two forms of D-glucose are also shown by **Haworth** projection formula which are given below,

Fructose, fruit sugar ($C_6H_{12}O_6$) or ketohexose

It is present in abundance in fruits and hence is called **fruit sugar**. It is also present in cane sugar and honey alongwith glucose in combined form. The polysaccharide **inulin** is a polymer of fructose and gives only fructose on hydrolysis. Since naturally occurring fructose is laevorotatory, it is also known as **laevulose**.

(1) Preparation :

(i) Hydrolysis of cane sugar

The solution having equal molecules of D-glucose and D-fructose is termed **invert sugar** and the process is known as **inversion**.

□ The excess of sulphuric acid is neutralised by adding milk of lime. A little more of lime is added which converts both glucose and fructose into calcium glucosate and calcium fructose respectively.

(ii) Hydrolysis of inulin with dilute sulphuric acid

(2) **Properties** : The anhydrous fructose is a colourless crystalline compounds. It melts at $102^\circ C$. It is soluble in water but insoluble in benzene and ether. It is less soluble in water than glucose. It is the **sweetest** of all sugars and its solution is laevorotatory. Like glucose, it also shows **mutarotation**.

Table : 31.2 Comparison between glucose and fructose

Property	Glucose	Fructose
Molecular formula	$C_6H_{12}O_6$	$C_6H_{12}O_6$
Nature	Polyhydroxy aldehyde.	Polyhydroxy ketone
Melting point	$146^\circ C$	$102^\circ C$
Optical activity of natural form	Dextrorotatory	Laevorotatory
With ethyl alcohol	Almost insoluble	More soluble
Oxidation		
(a) With bromine water	Gluconic acid	No reaction
(b) With nitric acid	Saccharic acid (Glucaric acid)	Mixture of glycollic acid, tartaric acid and trihydroxy glutaric acid
Reduction	Sorbitol	Mixture of sorbitol and mannitol
Calcium hydroxide	Forms calcium glucosate, soluble in water	Forms calcium fructosate, insoluble in water
Molisch's reagent	Forms a violet ring	Forms a violet ring
Fehling's solution	Gives red precipitate	Gives red precipitate
Tollen's reagent	Forms silver mirror	Forms silver mirror
Phenyl hydrazine	Forms osazone	Forms osazone
Resorcinol + HCl (dil.) (Selivanoff's test)	No colouration	Gives red or brown colour or precipitate
Freshly prepared ammonium molybdate sol. + few drops of acetic acid (Pinoff's test).	Light blue colour	Bluish green colour on heating
Alcoholic α -naphthol + HCl (conc.) (Furfural test)	No colouration	A purple colour (violet) on boiling

□ Fructose gives reactions similar to glucose. The difference in properties is due to the fact that it contains a ketonic group while glucose contains an aldehydic group.

Interconversions :

(1) **Chain Lengthening of Aldoses (Killiani-Fischer synthesis)** : The conversion of an aldose to the next higher member involves the following steps :

- Formation of a cyanohydrin.
- Hydrolysis of $-CN$ to $-COOH$ forming aldonic acid.
- Conversion of aldonic acid into lactone by heating.
- The lactone is finally reduced with sodium amalgam or sodium borohydride to give the higher aldose.

(2) Chain Shortening of aldoses

(i) An aldose can be converted to the next lower member by **Ruff****Degradation.**

It involves two steps.

(ii) **By Wohl's method**(3) **Conversion of an aldose to the isomeric Ketose** Three steps are involved,(4) **Conversion of a ketose to the isomeric aldose**

The disaccharides yield on hydrolysis two monosaccharides. Those disaccharides which yield two hexoses on hydrolysis have a general formula $\text{C}_{12}\text{H}_{22}\text{O}_{11}$. The hexoses obtained on hydrolysis may be same or different.

The hydrolysis is done by dilute acids or enzymes. The enzymes which bring hydrolysis of sucrose, lactose and maltose are *invertase*, *lactase* and *maltase*, respectively. Out of the three disaccharides, sucrose (cane-sugar) is the most important as it is an essential constituent of our diet.

In disaccharides, the two monosaccharides are joined together by glycoside linkage. A glycoside bond is formed when hydroxy group of the hemiacetal carbon of one monosaccharide condenses with a hydroxy group of another monosaccharide giving –O– bond.

(i) **Sucrose; Cane-sugar [$\text{C}_6\text{H}_{12}\text{O}_6$]** : It is our common table sugar. It is obtained from sugar cane and sugarbeets. It is actually found in all photosynthetic plants.

(i) **Properties** : It is a colourless, odourless, crystalline compound. It melts at $185 - 186^\circ\text{C}$. It is very soluble in water, slightly soluble in alcohol and insoluble in ether. It is dextrorotatory but does not show **mutarotation**. It is a non-reducing sugar as it does not reduce Tollen's or Fehling's reagent. Sucrose, on heating slowly and carefully, melts and then if allowed to cool, it solidifies to pale yellow glassy mass called 'Barley sugar'. When heated to 200°C , it loses water to form brown amorphous mass called *Caramel*. On strong heating, it chars to almost pure carbon giving smell of burnt sugar. It is composed of α -D-glucopyranose unit and a β -D-fructofuranose unit. These units are joined by α - β -glycosidic linkage between C-1 of the glucose unit and C-2 of the fructose unit.

(ii) **Uses**

(a) As a sweetening agent for various food preparations, jams, syrups, sweets, etc.

(b) In the manufacture of sucrose octa-acetate required to denature alcohol, to make paper transparent and to make anhydrous adhesives.

(2) **Inversion of cane-sugar** : The hydrolysis of sucrose by boiling with a mineral acid or by enzyme invertase, produces a mixture of equal molecules of D-glucose and D-fructose.

Sucrose solution is dextrorotatory. Its specific rotation is $+66.5^\circ$. But on hydrolysis, it becomes laevorotatory. The specific rotation of D-glucose is $+52^\circ$ and of D-fructose is -92° . Therefore, the net specific rotation of an equimolar mixture of D-glucose and D-fructose is.

$$\frac{+52^\circ - 92^\circ}{2} = -20^\circ$$

Disaccharides

Thus, in the process of hydrolysis of sucrose, the specific rotation changes from $+66.5^\circ$ to -20° , i.e., from dextro it becomes laevo and it is said that inversion has taken place. The process of hydrolysis of sucrose is thus termed as **inversion of sugar** and the hydrolysed mixture having equal molar quantities of D-glucose and D-fructose is called **invert sugar**. The enzyme that brings the inversion is named as **invertase**.

Table : 31.3 Distinction between glucose and sucrose

Test	Glucose	Sucrose
With conc. H_2SO_4 in cold	No effect	Charring occurs and turns black
Molisch's reagent	Violet ring is formed	Violet ring is formed
With $NaOH$	Turns yellow	No effect
With Tollen's Solution	Gives silver mirror	No effect
With Fehling's solution	Gives red precipitate of Cu_2O	No effect
On heating with phenyl hydrazine	Gives yellow precipitate of glucosazone	No effect, i.e., does not form osazone
Aqueous resorcinol + conc. HCl solution	No effect	Reddish-brown precipitate which dissolves in ethanol.

Polysaccharide (Starch and cellulose)

Polysaccharides are polymer of monosaccharide. The most important polysaccharides are starch and cellulose. They have a general formula $(C_6H_{10}O_5)_n$. Starch (Amylum) is most widely distributed in vegetable kingdom. It is found in the leaves, stems, fruits, roots and seeds. Concentrated form of starch is present in wheat, corn, barley, rice, potatoes, nuts, etc. It is the most important food source of carbohydrates.

(i) **Starch and its derivatives** : Starch is a white amorphous substance with no taste or smell. When heated to a temperature between $200 - 250^\circ C$, it changes into dextrin. At higher temperature charring occurs. When boiled with dilute acid, starch ultimately yields glucose.

Both n and n_1 , are unknown, but n is believed to be greater than n_1 .

When treated with enzyme, *diastase*, it yields maltose.

Starch solution gives a blue colour with a drop of iodine which disappears on heating to $75 - 80^\circ C$ and reappears on cooling. The exact chemical nature of starch varies from source to source. Even the starch obtained from same source consists of two fractions

- amylose and
- amylopectin.

Amylose is a linear polymer while amylopectin is a highly branched polymer. Both are composed of α -D-glucose units linked by glycosidic linkages. The number of D-glucose units in amylose range from 60 – 300. It

is soluble in hot water, Amylopectin consists of D-glucose units from 300 – 600. It is insoluble in water.

Uses : Starch and its derivatives are used

- As the most valuable constituent of food as rice, bread, potato and corn-flour, etc.
- In the manufacture of glucose, dextrin and adhesives (starch paste).
- In paper and textile industry.
- In calico printing as a thickening agent for colours.
- Nitro starch is used as an explosive.
- Starch-acetate is a transparent gelatin like mass and is used mainly for making sweets.

(2) **Cellulose** : It is found in all plants and so is the most abundant of all carbohydrates. It is the material used to form cell walls and other structural features of the plants. Wood is about 50% cellulose and the rest is lignin. Cotton and paper are largely composed of cellulose.

Pure cellulose is obtained by successively treating cotton, wool, flax or paper with dilute alkali, dilute HCl or HF . This treatment removes mineral matter, water, alcohol and ether. Cellulose is left behind as a white amorphous powder.

Cellulose is insoluble in water and in most of the organic solvents. It decomposes on heating but does not melt. It dissolves in ammoniacal copper hydroxide solution (Schwitzer's reagent). Cellulose also dissolves in a solution of zinc chloride in hydrochloric acid.

When it is treated with concentrated H_2SO_4 in cold, it slowly passes into solution. The solution when diluted with water, a starch like substance amyloid is precipitated and is called **parchment paper**. When boiled with dilute H_2SO_4 , it is completely hydrolysed into D-glucose.

The cattle, goats and other ruminants can feed directly cellulose (grass, straw, etc.) as they have digestive enzymes (cellulases) capable of hydrolysing cellulose into glucose. Man and many other mammals lack the necessary enzymes in their digestive tract and thus cannot use cellulose as food stuff.

Cellulose is a straight chain polysaccharide composed of D-glucose units which are joined by β -glycosidic linkages between C-1 of one glucose

unit and C-4 of the next glucose unit. The number of D-glucose units in cellulose ranges from 300 to 50000.

Uses : Cellulose is used

(i) As such in the manufacture of cloth (cotton), canvas and gunny bags (jute) and paper (wood, bamboo, straw, etc.)

(ii) In the form of cellulose nitrates for the manufacture of explosives (gun-powder), medicines, paints and lacquers. The cellulose nitrates with camphor yield *celluloid* which is used in the manufacture of toys, decorative articles and photographic films.

(iii) In the form of cellulose acetate for the manufacture of rayon (artificial silk) and plastics.

Table : 31.4 Distinction between glucose, sucrose, starch

Test	Glucose	Sucrose	Starch
With iodine solution	No effect	No effect	Blue colour
With Fehling's solution	Gives red precipitate	No effect	No effect
With Tollen's reagent	Gives silver mirror	No effect	No effect
With phenyl hydrazine	Forms yellow osazone	No effect	No effect
Solubility in water	Soluble	Soluble	Insoluble
Taste	Sweet	Sweet	No taste

Amino acids

Proteins are a class of biologically important compounds. They are crucial to virtually all processes in living systems. Some of them are hormones which serve as chemical messengers that coordinate certain biochemical activities. Some proteins serve to transport the substances through the organism. Proteins are also found in toxins (poisonous materials) as well as in antibiotics. All the proteins are made up of many amino acid units linked together into a long chain. An amino acid is a bifunctional organic molecule that contains both a carboxyl group, $-COOH$, as well as an amine group, $-NH_2$.

The proteins differ in the nature of R-group bonded to α -carbon atom. The nature of R-group determines the properties of proteins. There are about 20 amino acids which make up the bio-proteins. Out of these 10 amino acids (non-essential) are synthesised by our bodies and rest are essential in the diet (essential amino acids) and supplied to our bodies by food which we take because they cannot be synthesised in the body. The α -amino acids are classified into the following four types and tabulated as under,

Table : 31.5

Amino acids with non polar side chain :	
Name / Structure	Three letter symbol / One letter code
Glycine : CH_2 $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$	Gly / G

Alanine : CH_3CH $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$	Ala / A
Valine : $(CH_3)_2CH-CH$ $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$ (Essential)	Val / V
Leucine : $(CH_3)_2CH-CH_2CH$ $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$ (Essential)	Leu / L
Isoleucine : $CH_3-CH-CH_2CH$ $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$ $\quad \quad \quad $ $\quad \quad \quad CH_3$ (Essential)	Ile / I
Phenyl alanine : $C_6H_5CH_2CH$ $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$ (Essential)	Phe / F
Proline : $\begin{matrix} H_2C-CH_2 \\ \quad \quad \\ H_2C \quad CHCOOH \\ \quad \quad \quad \\ \quad \quad \quad N \\ \quad \quad \quad \\ \quad \quad \quad H \end{matrix}$	Pro / P

Amino acids with polar but neutral side chain :

Name / Structure	Three letter symbol / One letter code
Tryptophan : $\begin{matrix} H \\ \\ N \\ \\ CH \\ \\ C-CH_2-CH-COOH \\ \\ NH_2 \end{matrix}$ (Essential)	Trp / W
Serine : $HO-CH_2-CH$ $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$	Ser / S
Threonine : $CH_3CHOH-CH$ $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$ (Essential)	Thr / T
Tyrosine : $HO-C_6H_4-CH_2-CH$ $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$	Tyr / Y
Cysteine : $HS-CH_2-CH$ $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$	Cys / C
Methionine : $CH_3-S-CH_2-CH_2-CH$ $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$ (Essential)	Met / M
Asparagine : $\begin{matrix} H_2N \\ \\ C=O \\ \\ C-CH_2-CH \\ \quad \quad \quad \\ \quad \quad \quad COOH \end{matrix}$ $\begin{matrix} \nearrow NH_2 \\ \searrow COOH \end{matrix}$	Asn / N

$\begin{array}{c} \text{H}_2\text{N} \\ \\ \text{Glutamine : } \text{C} \begin{array}{l} \nearrow \text{CH}_2\text{CH}_2\text{CH}_3 \\ \searrow \text{O} \end{array} \end{array}$	$\begin{array}{c} \text{NH}_2 \\ \\ \text{COOH} \end{array}$	Gln Q
Amino acids with acidic side chains :		
$\text{Aspartic acid : } \text{HOOC} \cdot \text{CH}_2 \cdot \text{CH} \begin{array}{c} \nearrow \text{NH}_2 \\ \searrow \text{COOH} \end{array}$	$\begin{array}{c} \text{NH}_2 \\ \\ \text{COOH} \end{array}$	Asp D
$\text{Glutamic acid : } \text{HOOC} \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{CH} \begin{array}{c} \nearrow \text{NH}_2 \\ \searrow \text{COOH} \end{array}$	$\begin{array}{c} \text{NH}_2 \\ \\ \text{COOH} \end{array}$	Glu E

(1) Methods of preparation of α -amino acids

(i) **Amination of α -halo acids**

Lab preparation of glycine

The ammonium salt so obtained is boiled with copper carbonate and cooled when blue colour needles of copper salt of glycine are obtained.

It is now dissolved in water and H_2S is passed till whole of the copper precipitates as copper sulphide leaving glycine as the aqueous solution.

(ii) *Gabriel phthalimide synthesis*

(iv) **Strecker synthesis**

(v) **From natural protein** : Natural proteins are hydrolysed with dil. HCl or H_2SO_4 at $250^\circ C$ in an autoclave when a mixture of α -amino acids is obtained. This mixture is esterified and the various esters are separated by fractional distillation. The esters are then hydrolysed into respective α -amino acids.

(2) Physical properties

(i) Amino acids are colourless, crystalline substances having sweet taste. They melt with decomposition at higher temperature (more than 200°C). They are soluble in water but insoluble in organic solvents.

(ii) Except glycine, all the α -amino acids are optically active and have an asymmetric carbon atom (α -carbon atom). Hence, each of these amino acids can exist in two optical isomers. In proteins, however, only one isomer of each is commonly involved.

(iii) **Zipper ion and isoelectric point** : Since the $-NH_2$ group is basic and $-COOH$ group is acidic, in neutral solution it exists in an internal ionic form called a **Zipper ion** where the proton of $-COOH$ group is transferred to the $-NH_2$ group to form **inner salt**, also known as **dipolar ion**.

The Zwitter ion is dipolar, charged but overall electrically neutral and contains both a positive and negative charge.

(3) **Chemical properties** : Amino acids are amphoteric in nature. Depending on the pH of the solution, the amino acid can donate or accept proton.

When an ionised form of amino acid is placed in an electric field, it will migrate towards the opposite electrode. Depending on the pH of the medium, following three things may happen

- In acidic solution (low pH), the positive ion moves towards cathode.
- In basic solution (high pH), the negative ion moves towards anode.
- The Zwitter ion does not move towards any of the electrodes.

The intermediate pH at which the amino acid shows no tendency to migrate towards any of the electrodes and exists the equilibrium when placed in an electric field is known as **isoelectric point**.

This is characteristic of a given amino acid and depends on the nature of R -linked to α -carbon atom.

(i) **Action of heat**

(a) For α -amino acids

(b) For β -amino acids

(c) For γ and δ amino acids

These lactams have stable five or six membered rings.

(ii) α -amino acids show the reactions of $-\text{NH}_2$ group, $-\text{COOH}$ groups and in which both the groups are involved.

□ Proline is the only natural α -amino acid which is a secondary amine.

□ Only achiral α -amino acid found in protein is glycine.

(iii) **Formation of proteins-peptide bond** : Proteins are formed by joining the carboxyl group of one amino acid to the α -amino group of another amino acid. The bond formed between two amino acids by the elimination of a water molecule is called a **peptide linkage or bond**. The peptide bond is simply another name for amide bond.

The product formed by linking amino acid molecules through peptide linkages, $-\text{CO}-\text{NH}-$, is called a **peptide**. Peptides are further designated as *di*, *tri*, *tetra* or *penta* peptides accordingly as they contain two, three, four or five amino acid molecules, same or different, joined together in the following fashions.

When the number of amino molecules is large, the product is termed polypeptide which may be represented as,

(4) **Composition** : Composition of a protein varies with source. An approximate composition is as follows :

Carbon 50-53%; hydrogen 6-7%; oxygen 23-25%; nitrogen 16-17%; Sulphur about 1%. Other elements may also be present, *e.g.*, phosphorus (in nucleoproteins), iodine (in thyroid proteins) and iron (in haemoglobin).

(5) **Structure of proteins** : The structure of proteins is very complex. The **primary structure** of a protein refers to the number and sequence of the amino acids in its **polypeptide chains** (discussed in the formation of proteins). The primary structure is represented beginning with the amino acid whose amino group is free (the *N*-terminal end) and it forms the one end of the chain. Free carboxyl group (*C*-terminal end) forms the other end of the chain.

Side chains may have basic groups or acidic groups as $-NH_2$ in lysine and $-COOH$ in aspartic acid. Because of these acidic and basic side chains, there are positively and negatively charged centres. Though the peptide linkage is stable, the reactivity is due to these charged centres in the side chains.

Primary structure tells us nothing about the shape or conformation of the molecule. Most of the bonds in protein molecules being single bonds can assume infinite number of shapes due to free rotation about single bonds. However, it has been confirmed that each protein has only a single three dimensional conformation. The fixed configuration of a polypeptide skeleton is referred to as the **secondary structure** of a protein. It gives information :

- About the manner in which the protein chain is folded and bent;
- About the nature of the bonds which stabilise this structure.

Secondary structure of protein is mainly of two types

(i) **α -helix** : This structure is formed when the chain of α -amino acids coils as a right handed screw (called α -helix) because of the formation of **hydrogen bonds** between amide groups of the same peptide chain, *i.e.*, *NH* group in one unit is linked to carbonyl oxygen of the third unit by hydrogen bonding. This hydrogen bonding between different units is responsible for holding helix in a position. The side chains of these units project outward from the coiled backbone.

Such proteins are elastic, *i.e.*, they can be stretched. On stretching weak hydrogen bonds break up and the peptide chain acts like a spring. The hydrogen bonds are reformed on releasing the tension. Wool and hair have α -helix structure.

(ii) **β -pleated sheet** : A different type of secondary structure is possible when polypeptide chains are arranged side by side. The chains are held together by a very large number of hydrogen bonds between $C=O$ and NH of different chains. Thus, the chains are bonded together forming a sheet. These sheets can slide over each other to form a three dimensional structure called a beta pleated sheet. Silk has a beta pleated structure.

Globular proteins possess tertiary structure. In general globular proteins are very tightly folded into a compact spherical form.

(6) **Classification of proteins** : According to chemical composition, proteins are divided into two classes

(i) **Simple proteins** : Simple proteins are composed of chains of amino acid units only joined by peptide linkages. These proteins on hydrolysis yield only mixture of amino acids. Examples are :

Egg albumin, serum globulins, glutenin in wheat, coryzenin in rice, tissue globulin, etc.

(ii) **Conjugated proteins** : The molecules of conjugated proteins are composed of simple proteins and non protein material. The non-protein material is called **prosthetic group** or **cofactor**. These proteins on hydrolysis yield amino acids and non-protein material. Examples are

Mucin in saliva (prosthetic group, carbohydrate), casein in milk (prosthetic group, phosphoric acid), haemoglobin in blood (prosthetic group, iron pigment), etc.

According to molecular shape, proteins are divided into two types

(i) **Fibrous proteins** : These are made up of polypeptide chains that run parallel to the axis and are held together by strong hydrogen and disulphide bonds. They can be stretched and contracted like a thread. These are usually insoluble in water. Examples are : α -keratin (hair, wool, silk and nails); myosin (muscles); collagen (tendons, bones), etc.

(ii) **Globular proteins** : These have more or less spherical shape (compact structure). α -helices are tightly held up by weak attractive forces of various types: Hydrogen bonding, disulphide bridges, ionic or salt bridges. These are usually soluble in water. Examples are: Insulin, pepsin, haemoglobin, cytochromes, albumins, etc.

Proteins can also be classified on the basis of their function

Table : 31.6

Protein	Function	Examples
Enzymes	Biological catalysts, vital to all living systems.	Trypsin, pepsin.
Structural proteins	Proteins that hold living systems together.	Collagen.
Harmones	Act as messengers.	Insulin.
Transport proteins	Carry ions or molecules from place to another in the living system.	Haemoglobin.
Protective proteins (antibiotics)	Destroy any foreign substance released into the living system.	Gamma globulin.
Toxins	Poisonous in nature.	Snake venom.

(7) **General and physical characteristic of proteins**

(i) Most of them (except chromoproteins) are colourless, tasteless, and odourless. Many are amorphous but few are crystalline. They are nonvolatile and do not have a sharp melting point .

(ii) Most of them are insoluble in water and alcohol. But many of them dissolve in salt solutions, dilute acids and alkalies. Some proteins such as keratins (skin, hair and nails) are completely insoluble.

(iii) Protein molecules are very complex and possess very high molecular masses. They are hydrophilic colloids which cannot pass through vegetable or animal membrane. On addition of sodium chloride, ammonium sulphate magnesium sulphate, etc., some proteins are precipitated. The precipitate can be filtered and redissolved in water.

(iv) The solution of proteins are optically active. Most of them are laevorotatory. The optical activity is due to the presence of asymmetric carbon atoms in the constituent α -amino acids.

(v) **Isoelectric point** : Every protein has a characteristic isoelectric point at which its ionisation is minimum. Like amino acids, proteins, having charged groups (NH_3^+ and COO^-) at the ends of the peptide chain, are amphoteric in nature. In strong acid solution, protein molecule accepts a proton while in strong basic solution it loses a proton. **The pH at which the protein molecule has no net charge is called its isoelectric point.** This property can be used to separate proteins from mixture by electrophoresis.

(vi) **Denaturation** : The structure of the natural proteins is responsible for their biological activity. These structures are maintained by various attractive forces between different parts of the polypeptide chains. The breaking of these forces by a physical or a chemical change makes the proteins to lose all or part of their biological activity. This is called denaturation of proteins. The denaturing of proteins can be done by adding chemicals such as acids, bases, organic solvents, heavy metal ions, or urea. It can also be done with the help of heat and ultraviolet light. Denaturation can be irreversible or reversible. In irreversible denaturation, the denatured protein does not return to its original shape. For example, the heating of white of an egg (water soluble) gives a hard and rubbery insoluble mass.

(8) Chemical properties

(i) **Salt formation** : Due to presence of both $-\text{NH}_2$ and $-\text{COOH}$ groups in proteins, they form salts with acids and bases. Casein is present in milk as calcium salt.

(ii) **Hydrolysis** : The simple proteins are hydrolysed by acids, alkalies or enzymes to produce amino acids. Following steps are involved in the hydrolysis and the final product is a mixture of amino acids.

Protein $\rightarrow$ Proteose $\rightarrow$ Peptone $\rightarrow$ Polypeptide $\rightarrow$ Simple peptide $\rightarrow$ Mixture of amino acids

(iii) **Oxidation** : Proteins are oxidised on burning and putrefaction. The products include amines, nitrogen, carbon dioxide and water. The bad smell from decaying dead animals is largely due to the formation of amines by bacterial oxidation of body proteins.

(9) Test of proteins

(i) **Biuret test** : On adding a dilute solution of copper sulphate to alkaline solution of protein, a violet colour is developed. This test is due to the presence of peptide ($-\text{CO}-\text{NH}-$) linkage.

(ii) **Xanthoproteic test** : Some proteins give yellow colour with concentrated nitric acid (formation of yellow stains on fingers while working with nitric acid in laboratory). The formation of yellow colour is due to reaction of nitric acid with benzenoid structures. Thus, when a protein solution is warmed with nitric acid a yellow colour may be developed which turns orange on addition of NH_4OH solution.

(iii) **Millon's test** : When millon's reagent (mercurous and mercuric nitrate in nitric acid) is added to a protein solution, a white precipitate which turns brick red on heating, may be formed. This test is given by proteins which yield tyrosine on hydrolysis. This is due to presence of phenolic group.

(iv) **Ninhydrin test** : This test is given by all proteins. When a protein is boiled with a dilute solution of ninhydrin, a violet colour is produced.

(v) **Nitroprusside test** : Proteins containing $-\text{SH}$ group give this test. When sodium nitroprusside solution is added to proteins having $-\text{SH}$ group, a violet colour is developed.

(vi) **Molisch's test** : This test is given by those proteins which contain carbohydrate residue. On adding a few drops of alcoholic solution of α -naphthol and concentrated sulphuric acid to the protein solution, a violet ring is formed.

(vii) **Hopkins-Cole test** : On adding concentrated sulphuric acid down the side containing a solution of protein and glyoxylic acid, a violet colour is developed.

(10) Uses

(i) Proteins constitute as essential part of our food. Meat, eggs, fish, cheese provide proteins to human beings.

(ii) **In textile** : Casein (a milk protein) is used in the manufacture of artificial wool and silk.

(iii) **In the manufacture of amino acids** : Amino acids, needed for medicinal use and feeding experiments, are prepared by hydrolysis of proteins.

(iv) **In industry** : Gelatin (protein) is used in food products, capsules and photographic plates. Glue (protein) is used as adhesive and in sizing paper. Leather is obtained by tanning the proteins of animal hides.

(v) **In controlling body processes** : Haemoglobin present in blood is responsible for carrying oxygen and carbon dioxide. Hormones (proteins) control various body processes.

(vi) **As enzymes** : Reactions in living systems always occur with the aid of substances called enzymes. Enzymes are proteins produced by living systems and catalyse specific biological reactions.

Important enzymes tabulated as under,

Table : 31.7

Enzymes	Reaction catalysed
Urease	Urea $\rightarrow$ CO_2 + NH_3
Invertase	Sucrose $\rightarrow$ Glucose + Fructose

Maltase	Maltose $\rightarrow$ 2 Glucose
Amylase	Starch $\rightarrow$ n Glucose
Pepsin	Proteins $\rightarrow$ Amino acids
Trypsin	Proteins $\rightarrow$ Amino acids
Carbonic anhydrase	$H_2CO_3 \rightarrow H_2O + CO_2$
Nuclease	DNA, RNA $\rightarrow$ Nucleotides

Nucleic acids

In every living cell there are found nucleo-proteins which are made up of proteins and natural polymers of great biological importance called nucleic acids.

Two types of nucleic acids are found in biological systems, these are Deoxyribonucleic acid (DNA) and Ribonucleic acid (RNA)

The nucleic acid was first isolated by Friedrich Miescher in 1868 from the nuclei of pus cells and was named nuclein. The term nuclein was given by Altman.

(i) **Composition** : Nucleic acids like proteins and carbohydrates are polymer. The simple units that make up the nucleic acid are called **nucleotides**. Nucleotides are themselves composed of following three simple molecules.

(i) **Nitrogenous base** : These are heterocyclic organic compound having two or more nitrogen atoms in ring skeleton. These are called bases because the lone pairs of electrons on the nitrogen atoms make them as Lewis bases.

Their structures are given below

(a) **Pyrimidine derivatives**

(b) **Purine derivatives**

(ii) **Five carbon sugar (Pentose)** : In RNA, the sugar is ribose where as in DNA, the sugar is deoxyribose.

Both differ only at carbon atom 2' in the ring.

(iii) **Phosphoric acid, H_3PO_4** : Phosphoric acid forms esters to $-OH$ groups of the sugars to bind nucleotide segments together. A molecule called **nucleoside** is formed by condensing a molecules of the base with the appropriate pentose. (i.e., Base + Sugar).

This nucleotide is the building block of both DNA and RNA. The nucleic acids are condensation polymers of the nucleotide monomers and are formed by the creation of an ester linkage from phosphoric residue on one nucleotide to the hydroxy group on carbon 3' in the pentose of the second nucleotide. The result is a very long chain possessing upto a billion or so nucleotides units in DNA.

Thus, the formation of a nucleic acid can be summarised in the following general way

(2) **Structure** : The sequence of bases along the DNA and RNA chain establishes its primary structure which controls the specific properties of the nucleic acid. An RNA molecule is usually a single chain of ribose-containing nucleotides. DNA molecule is a long and highly complex, spirally twisted, double helix, ladder like structure. The two polynucleotide chains or strands are linked up by hydrogen bonding between the nitrogenous base molecules of their nucleotide monomers. Adenine (purine) always links with thymine (pyrimidine) with the help of two hydrogen bonds and guanine (purine) with cytosine (pyrimidine) with the help of three hydrogen bonds. Hence, the two strands extend in opposite directions, i.e., are antiparallel and complementary. The following fundamental relationship exist.

☐ *Thymine combines only with deoxyribose sugar and uracil only with ribose sugar. Other bases can combine with either of the two sugars.*

- The sum of purines equals the sum of pyrimidines.
- The molar proportion of adenine equals to that of thymine.
- The molar proportion of guanine equals to that of cytosine.

☐ *The double helix is 20 Å. It completes a spiral at every 10 nucleotide pairs at a length of 34 Å. Sequences of monomers (nucleotides) may present innumerable variations. Evidently, innumerable varieties of DNA exist in the organism.*

☐ *Watson, Crick and Wilkins were awarded Noble prize in 1962 for suggesting the structure of DNA.*

Fig 9.1 Helical structure of DNA as suggested by Watson and Crick

DNA	RNA
It has a double helix structure.	It has a single helix structure.
Sugar unit is deoxyribose.	Sugar unit is Ribose.
Base units are adenine, guanine, thymine and cytosine.	It contains uracil base instead of thymine, other bases being same as those in DNA.
Responsible for inheritance of character.	It is responsible for protein synthesis.

(3) **Functions of nucleic acid** : Nucleic acid have two important functions

(i) Replication and (ii) Protein synthesis.

(i) **Replication** : The genetic information for the cell is contained in the sequence of the bases A, T, G and C (adenine, thymine, guanine and cytosine) in the DNA molecule. The sequence of bases in one chain of the double helix controls the sequence in other chain. The two chains fit together like a hand and a glove. They separate and about the hand is formed a new glove, and inside the glove is formed a new hand. Thus, the pattern is preserved in the two new molecules of DNA.

[If one strand of DNA has the sequence ATGCTTGA, then the sequence of complimentary strand will be TACGAAC].

(ii) **Synthesis of proteins** : The DNA contains the genetic code and directs protein synthesis through RNA. The double helix of DNA partially uncoils and about the individual strands are formed chains of RNA. The new chains contain ribose instead of deoxyribose and the base sequence is different which is determined by DNA, i.e., opposite each adenine of DNA, there appears on RNA a uracil; opposite guanine, cytosine; opposite thymine, adenine, opposite cytosine, guanine. Thus, AATCAGTT on DNA becomes UUAGUCAA on RNA.

One kind of RNA, called messenger RNA, carries a message to the ribosome, where protein synthesis actually takes place. At the ribosome, messenger RNA calls up a series of transport RNA molecules, each of which is loaded with a particular amino acid. The order in which the transport RNA molecules are called (the sequence in which the amino acids are arranged to form the protein chain) depends upon the sequence of bases along the messenger RNA chain. Thus GAU is the code for aspartic acid; UUU, phenyl alanine; GUG, valine. There are 64-three letter code words

(codons) and only 20-odd amino acids, so that more than one codon call the same amino acid.

The relation between the nucleotide triplets and the amino acids is called Genetic code. Nirenberg, Holley and Khorana presented the genetic code for which they were awarded Noble prize in 1968.

(4) **Mutation** : A mutation is a chemical or physical change that alters the sequence of bases in DNA molecule. Anything that causes mutation is called **mutagen**. A mutation results from ultraviolet light, ionisation radiations, chemicals or viruses. The changes in sequence of bases in DNA are repaired by special enzymes in the cell. If it is not, the protein produced has no biological activity and the cell dies.

These mutations often prove harmful and give rise to symptoms that cause diseases. Sickle-cell anaemia is one such example. Such disease is passed from one generation to the next generation.

Lipids

Lipids are constituents of plants and tissues which are insoluble in water but soluble in organic solvents such as chloroform, carbon tetrachloride, ether or benzene. They include a large variety of compounds of varying structures such as oils and fats; phospholipids, steroids, etc. Lipids are mainly made of carbon, hydrogen and oxygen. The number of oxygen atoms in a lipid molecule is always small as compared to the number of carbon atoms. Sometimes small amounts of phosphorus, nitrogen and sulphur are also present. They have a major portion of their structure like a hydrocarbon (aliphatic or fused carbon rings). Lipids serve as energy reserve for use in metabolism and as a major structural material in cell membranes for regulating the activities of cell and tissues.

Simple lipids are esters of glycerol with long chain monocarboxylic acids which can be saturated or unsaturated. These are generally called glycerides of fats and oils. Waxes are esters of fatty acids with certain alcohols, not glycerol. Fats and oils have biological importance but waxes have no value as these are not digested.

The functions of triglycerides are the following

- (1) They are energy reserves in the cells and tissues of living system. When digested, triglycerides are hydrolysed to fatty acids and glycerol.
- (2) Catabolism of fatty acids form acetyl-coenzyme-A. Most of the energy of fatty acids is converted into ATP.
- (3) Acetyl coenzyme is the starting material for the synthesis of many compounds.
- (4) Fats deposited beneath the skin and around the internal organs minimize loss of body heat and also act as cushions to absorb mechanical impacts.

Another very important class of lipids are the phospholipids. These are polar lipids and like the fats, are esters of glycerol. In this case, however, only two fatty acid molecules are esterified to glycerol, at the first and second carbon atom. The remaining end position of the glycerol is esterified to a molecule of phosphoric acid, which in turn is also esterified to another alcohol. This gives a general structure.

The alcoholic compound linked to phosphoric group may be choline, ethanol, amine, serine or inositol. The phosphate groups forms a polar end, i.e., hydrophilic (water-attracting) and the two fatty acid chains constitute the non-polar tail, i.e., hydrophobic (water repelling). This structure gives the phospholipids good emulsifying and membrane forming properties.

Cell membranes are composed of phospholipids and proteins in about equal proportion. The phospholipids in the membrane appear to be arranged in a double layer or bilayer in which the non-polar tails face each

other, thereby exposing the polar heads to the aqueous environment on either side of the membrane. Proteins found in the membrane are embedded in the mosaic formed by the lipids. Phospholipids facilitate the transport of ions and molecules in and out of the cell and regulate the concentration of molecules and ions within the cell. They provide structural support for certain proteins.

The above mentioned lipids are mainly straight chain compounds. There is a third class of lipids which are not straight chain compounds. They are called **Sterols**. The sterols are composed of fused hydrocarbon rings and a long hydrocarbon side chain. Cholesterol is most important compound of this class and is found in animals only. It exists either free or as ester with a fatty acid. Cholesterol is also the precursor of hormones. Cholesterol and its esters are insoluble in water. So they are deposited in the arteries and veins if the blood cholesterol rises. This leads to high blood pressure and heart diseases. Cholesterol is a part of animal cell membrane and is used to synthesised steroid hormones, vitamin-D and bile salts.

Energy cycle or metabolism

A cell has small molecules (micromolecules) as well as large molecules (macromolecules). The chemical reactions of a living organism can be divided into main two types

(1) *The chemical reactions by which the large molecules are constantly broken down into smaller ones* are called **catabolism**.

(2) *The chemical reactions by which the macromolecules are synthesised within the cell* are called **anabolism**.

The two processes i.e., degradation and synthesis are collectively called **metabolism**. Catabolism reactions are usually accompanied by *release of energy* whereas anabolism reactions require energy to occur.

The primary energy found in living cells is chemical energy, which can be easily stored, transferred and transformed. For this, the living cells contain a chemical compound called **adenosine triphosphate** (ATP). It is regarded as **energy currency** of living cells because it can trap, store and release small packets of energy with ease.

ATP consists of a purine base called **adenine** linked to a five carbon sugar named **ribose** which is further attached to **three molecules of phosphate**.

ATP is energy rich molecule this is because of the presence of four negatively charged oxygen atom very close to each other. These four negatively charged *o*-atoms experience very high repulsive energy.

ADP can change to ATP in the presence of inorganic phosphate. This process is called **phosphorylation**.

Digestion of food

Digestion is the process by which complex constituents of food are broken down into simple molecules by a number of enzymes in mouth, stomach and small intestine. The simple molecules thus formed are absorbed into blood stream and reach various organs.

Raw food may be taken as such or after cooking. It is chewed in the mouth and swallowed when it passes through a long passage in the body called alimentary canal. During this passage it gets mixed with various enzymes in different parts of the alimentary canal. The carbohydrates, proteins and fats are converted into simpler forms which are then carried by blood to different parts of the body for utilization. Digestion of food can be summarized in the following form

After digestion, there are present glucose, aminoacids, fatty acids along with vitamins and mineral salts. Undigested food and secretions are pushed forward into the rectum from where these are excreted.

Vitamins

In addition to air, water, carbohydrates, proteins, fats and mineral salts, certain organic substances required for regulating some of the body processes and preventing certain diseases are called **vitamins**. These compounds cannot be synthesised by an organism. On the basis of solubility, the vitamins are divided into two groups.

- (1) Fat soluble; Vitamin A, D, E and K.
- (2) Water soluble; Vitamin B and C.

Table : 31.9

Name	Sources	Functions	Effects of deficiency
Water soluble vitamins			
Vitamin B (Thiamine or Aneurin) ($C_4H_7NO_4S$)	Rice polishings, wheat flour, oat meal, eggs, yeast, meat, liver, etc.	Major component of co-enzyme co-carboxylase required for carbohydrate and amino acid metabolism.	Beri-beri , loss of appetite and vigour, constipation, weak heart beat, muscle atrophy, even paralysis.
Vitamin B or G (Riboflavin or Lactoflavin) ($C_{17}H_{20}NO_6$)	Cheese, eggs, yeast, tomatoes, green vegetables, liver, meat, cereals, etc.	Combines with phosphoric acid to form coenzyme FAD essential for oxidative metabolism.	Cheilosis , digestive disorders, burning sensations in skin and eyes, headache, mental depression, scaly dermatitis at angles of nares, corneal opacity, etc.
Vitamin B (Pantothenic acid) ($C_8H_{14}ON_4$)	All food; more in yeast, liver, kidneys, eggs, meat, milk, sugarcane, groundnut, tomatoes.	Important component of Co-A required for oxidative metabolism.	Dermatitis , in cocks; greying of hairs, retarded body and mental growth, reproductive debility.
Vitamin B or P-P (Nicotinic acid or Niacin) $C_6H_4NO_2$ ($C_6H_5N-COOH$)	Fresh meat, liver, fish, cereals, milk, pulses, yeast, etc.	Active group in coenzyme NAD required for oxidative metabolism.	Pellagra , dermatitis, diarrhoea, dementia, muscle atrophy, inflammation of mucous membrane of gut.
Vitamin B (Pyridoxine or Adermin) ($C_8H_{10}ON_4$)	Milk, cereals, fish, meat, liver, yeast synthesised by intestinal bacteria.	Important coenzyme required in protein and amino acid metabolism.	Dermatitis, anaemia , convulsions, nausea, insomnia, vomiting, mental disorders, depressed appetite.
Vitamin H (Biotin) ($C_8H_{16}NO_6S$)	Yeast, vegetables, fruits, wheat, chocolate, eggs, groundnut synthesised by intestinal bacteria.	Essential for fat synthesis and energy production.	Skin lesions , loss of appetite, weakness, hairfall, paralysis.
Folic acid group	Green vegetables, soyabean, yeast, kidneys, liver, synthesised by intestinal bacteria.	Essential for synthesis of DNA and maturation of blood corpuscles.	Retarded growth, anaemia .
Vitamin B (Cyanocobalamin) ($C_{56}H_{84}ON_6PCo$)	Meat, fish, liver, eggs, milk synthesised by intestinal bacteria.	Required for chromosome duplication and formation of blood corpuscles.	Retarded growth, pernicious anaemia
Vitamin C (Ascorbic acid) ($C_6H_8O_6$)	Lemon, orange and other citrus fruits, tomatoes, green vegetables, potatoes, carrots, pepper, etc.	Essential for formation of collagen, cartilage, bone, teeth, connective tissue and RBCs and for iron metabolism.	Wound-healing and growth retarded, scurvy , breakdown of immune defence system, spongy and bleeding gums, fragile blood vessels and bones, exhaustion, nervous breakdown, high fever.
Fat soluble vitamins			
Vitamin A (Retinol or Axerophthol) ($C_{20}H_{30}O$)	Synthesised in cells of liver and intestinal mucous membrane from carotenoid pigments found in milk, butter, kidneys, egg yolk, liver, fish oil, etc.	Essential for synthesis of visual pigments; growth and division of epithelial cells.	Xerophthalmia-keratinized conjunctive and opaque and soft cornea. Stratification and keratinization in epithelia of skin, respiratory passages, urinary bladder, ureters and intestinal mucosa, night-blindness , impaired growth, glandular secretion and reproduction.
Vitamin D	Synthesised in skin cells in sunlight	Regulates absorption of calcium	Rickets with osteomalacia; soft and

(Ergocalciferol), (Sun shine vitamin) $C_{28}H_{44}O$ and cholecalciferol	from 7-dehydro-cholesterol also found in butter, liver, kidneys, egg yolk, fish oil, etc.	and phosphorus in intestine, mineral deposition in bones and teeth.	fragile teeth.
Vitamin E group Tocopherols (α, β, γ) ($C_{55}H_{102}O$)	Green vegetables, oil, egg yolk, wheat, animal tissues.	Essential for proper spermatogenesis, pregnancy, lactation and muscular function.	Sterility (impotency) and muscular atrophy.
Vitamin K (Phylloquinone) ($C_{45}H_{72}O$)	Carrots, lettuce, cabbage, tomatoes, liver, egg yolk, cheese; synthesized by colon bacteria.	Essential for synthesis of prothrombin in liver, which is required for blood clotting.	Haemorrhages , excessive bleeding in injury, poor coagulation of blood.

Tips & Tricks

✍ Monosaccharides which differ in configuration at C_1 and C_2 in aldoses in ketoses are called **anomers**. Thus α -D glucose and β -D glucose are anomers and so are α -D fructose and β -D fructose.

✍ Monosaccharides which differ in configuration at a carbon atom other than the anomeric carbon are called epimers. Thus glucose and mannose which differ in configuration at C_2 are called C_2 epimers while glucose and galactose which differ in configuration at C_4 are called C_4 epimers.

✍ In amino acids $-COO^-$ group acts as the base while $-NH_3^+$ acts as the acid.

✍ Insulin is a protein hormone. It consists of 51 amino acids arranged in two polypeptide chains containing 21 and 30 α amino acids residues respectively. The two peptide chains are held together by two cystine disulphide cross links.

✍ Certain enzymes are associated with coenzymes mostly derived from vitamins for their biological activity.

✍ Each segment of a DNA molecule that codes for a specific protein or a polypeptide is called gene and the relationship between the nucleotide triplet and the amino acids is called the genetic code.

✍ Phospholipids are major constituents of cell walls.

✍ The deficiency of essential amino acids causes the disease called kwashiorkor.

✍ Lecithin (present in eggs) and cephalins are phospholipids in which two of the hydroxyl groups of glycerol are esterified with palmitic acid whereas the third OH group in lecithin is esterified with choline ($CH_3N^+(CH_2CH_2)_3OH$) while in cephalin it is esterified with ethanolamine, $NH_3^+CH_2CH_2OH$.

✍ Adenosine (ribose + adenine) is a nucleoside while adenosine monophosphate (AMP), adenosine diphosphate and adenosine triphosphate (ATP) are all nucleotides.

✍ Haemoglobin is a globular protein and the red colour of haemoglobin is due to the iron protoporphyrin complex called the heme.

✍ The bicarbonate/carbonic acid system *i.e.*, HCO_3^-/H_2CO_3 acts as the buffer and maintains the pH of blood between 7.36-7.42.

✍ Vitamin C is a derivative of monosaccharide *i.e.*, glucose while Vitamin D is derivative of steroid *i.e.* ergosterol.

✍ Vitamin K and Vitamin A contain isoprene units.

✍ Of all the vitamins, Vitamin B₁₂ does not occur in plants but occurs only in animals and micro organisms. In fact, it is exclusively synthesized by the micro organisms and is conserved in the liver. Vitamin B₁₂ has been found in rain water where its presence is attributed to micro organisms sucked up by the winds.

Ordinary Thinking

Objective Questions

Carbohydrates

- The change in optical rotation, with time, of freshly prepared solution of sugar is known as [CPMT 1982, 85; BHU 1997]
 - Rotatory motion
 - Inversion
 - Specific rotation
 - Mutarotation
- Gun-cotton is
 - Nitrosucrose
 - Nitrocellulose
 - Nitroglucose
 - Nitropicrin
- Which of the following monosaccharide is a pentose [CPMT 1982, 87, 89, 93]
 - Galactose
 - Glucose
 - Fructose
 - Arabinose
- Amide group is present in
 - Lipids
 - Carbohydrates
 - Amino acids
 - Proteins
- Which of the following is a carbohydrate
 - Leucine
 - Albumin
 - Inulin
 - Maltase
- General formula for carbohydrates is
 - $C_nH_{2n}O_{2n+2}$
 - $C_x(H_2O)_{2x}$
 - $C_x(H_2O)_y$
 - None of these
- Benedict solution provides [CPMT 1983]
 - Ag^+
 - Li^+
 - Cu^{+2}
 - Ba^{+2}
- Glucose gives silver mirror with Tollen's reagent. It shows the presence of [MNR 1981; CPMT 1974, 81; MP PMT 1994]
 - An acidic group
 - An alcoholic group
 - A ketonic group
 - An aldehydic group
- A certain compound gives negative test with ninhydrin and positive test with Benedict's solution. The compound is [NCERT 1978; KCET 2000]
 - A protein
 - A monosaccharide
 - A lipid
 - An amino acid
- An organic compound answers Molisch's test as well as Benedict's test. But it does not answer Seliwanoff's test. Most probably, it is [KCET 2003]
 - Sucrose
 - Protein
 - Fructose
 - Maltose
- Glucose when heated with CH_3OH in presence of dry HCl gas gives α and β -methyl glucosides because it contains [CPMT 1982, 85]
 - An aldehyde group
 - A $-CH_2OH$ group
 - A ring structure
 - Five hydroxyl groups
- Which one is a disaccharide [CPMT 1981, 83]
 - Glucose
 - Fructose
 - Xylose
 - Sucrose
- Molecular formula $C_6H_{12}O_6$ is of
 - Glucose
 - Fructose
 - Both (a) and (b)
 - None of these
- Hydrolysis of sucrose is called [BHU 1979, 83; Pb. PMT 1999; Pb. CET 2000]
 - Esterification
 - Saponification
 - Inversion
 - Hydration
- In the 'glycolipids', the two sugars known to occur are glucose and
 - Fructose
 - Lactose
 - Galactose
 - Sucrose
- The 'epimerisation' involves
 - Change of configuration
 - Addition of one more 'C'
 - Substitution of a 'C'
 - Conversion of $-CHO$ to $-C=O$
- The compound which does not contain an asymmetric carbon atom is
 - Glycolaldehyde
 - Glyceraldehyde
 - Glucose
 - Galactose
- Which of the following sign indicate that the sugar is actually 'dextrorotatory'
 -
 - +
 - R -
 - All of these
- The standard compound for determination of configuration in the 'sugar chemistry' is
 - Glycolaldehyde
 - Glyceraldehyde
 - Glucose
 - Fructose
- Sugars are
 - Optically active polyhydroxy aldehydes
 - Optically active polyhydroxy ketones
 - Optically active polyhydroxy aldehydes or ketones
 - Polyhydroxy aldehydes or ketones which may or may not be optically active
- Molecular formula of pentahydroxy acid obtained when glucose is oxidised with Br_2 water is
 - $C_6H_{12}O_7$
 - $C_6H_{12}O_8$
 - $C_6H_{12}O_6$
 - $C_6H_{10}O_6$
- The 'phosphoglycerides' occur in
 - The brain and the spinal chord
 - Nails and hairs
 - Oils and fats
 - Waxes
- Sucrose is a [CPMT 1983]
 - Monosaccharide
 - Disaccharide
 - Trisaccharide
 - Polysaccharide
- The commonest disaccharide has the molecular formula [CPMT 1982; Manipal MEE 1995; MP PET 1999; AIIMS 1999]
 - $C_{10}H_{18}O_9$
 - $C_{10}H_{20}O_{10}$
 - $C_{18}H_{22}O_{11}$
 - $C_{12}H_{22}O_{11}$
- On complete hydrolysis of starch, we finally get [MNR 1982; DPMT 1979; CBSE PMT 1991; MP PMT 1987; MP PET 1993]
 - Glucose
 - Fructose
 - Glucose and fructose
 - Sucrose
- Which is monosaccharide
 - Glucose
 - Fructose
 - Galactose
 - All of these
- Which is polysaccharide
 - Starch
 - Cellulose
 - Glycogen
 - All of these
- The calorific values of fats, carbohydrates and proteins vary in the order
 - Fats > Carbohydrates > Proteins
 - Fats > Proteins > Carbohydrates

- (c) Carbohydrates > Proteins > Fats
(d) Proteins > Carbohydrates > Fats
29. Gun-cotton is obtained when conc. nitric acid reacts with
(a) Glycerine (b) Glycol
(c) Cellulose (d) Starch
30. A carbohydrate consists of [NCERT 1971]
(a) C and O (b) C, H and O
(c) C, H, N and O (d) C and H
31. Glucose forms many derivatives. The derivative which will help to prove the furanose structure is [AIIMS 1980; DPMT 1985]
(a) Acetyl (b) Benzoyl
(c) Osazone (d) Isopropylidene
32. Glucose and fructose form [MP PMT 1986]
(a) Same osazone
(b) Same acid on oxidation
(c) Same alcohol when reduced
(d) Different osazone
33. On heating with conc. H_2SO_4 , sucrose gives [DPMT 1984]
(a) CO and CO_2 (b) CO and SO_2
(c) CO, CO_2 and SO_2 (d) None of these
34. The letter 'D' in carbohydrates represents
(a) Its direct synthesis (b) Its dextrorotation
(c) Its mutarotation (d) Its configuration
35. Starch can be used as an indicator for the detection of traces of
(a) Glucose in aqueous solution
(b) Protein in blood
(c) Iodine in aqueous solution
(d) Urea in blood
36. It is best to carry out reactions with sugars in neutral or acid medium and not in alkaline medium. This is because in alkaline medium sugars undergo one of the following changes
(a) Racemisation (b) Decomposition
(c) Inversion (d) Rearrangement
37. Which one of the following compounds is found abundantly in nature [BHU 1983; Manipal MEE 1995; DCE 2004]
(a) Fructose (b) Starch
(c) Glucose (d) Cellulose
38. The substance that forms the plant cell walls is or Which carbohydrates is an essential constituents of plant cells [KCET 1984; MP PET 1999; CPMT 2002]
(a) Cellulose (b) Sucrose
(c) Vitamins (d) Starch
39. Sugar can be tested in urine by
(a) Molisch test (b) Dunstan's test
(c) Benedict's test (d) Legal's test
40. When sucrose is heated with conc. HNO_3 the product is [CPMT 1979]
(a) Sucrose nitrate (b) Formic acid
(c) Oxalic acid (d) Citric acid
41. Amylopectin is [KCET 2005]
(a) Water soluble
(b) Water insoluble
(c) Forms colloidal solution with water
(d) Both (b) and (c)
42. Which of the following statements about ribose is incorrect [CPMT 1985]
(a) It is a polyhydroxy compound
(b) It is an aldehyde sugar
(c) It has six carbon atoms
(d) It exhibits optical activity
43. Maltose contains how many oxygen atoms
(a) 6 (b) 10
(c) 11 (d) 22
44. The correct name of 'sucrose' is
(a) α -D-glucopyranosyl- β -D-fructofuranoside
(b) β -D-glucopyranosyl- β -D-fructofuranoside
(c) α -D-glucopyranosyl- α -D-fructofuranoside
(d) β -D-glucopyranosyl- α -L-fructofuranoside
45. Sucrose is
(a) Laevorotatory (b) Dextrorotatory
(c) Racemic mixture (d) Optically inactive
46. The hydrolysis of sucrose produces a mixture which is
(a) Laevorotatory
(b) Dextrorotatory
(c) Equally both (+) and (-) rotatory
(d) Optically inactive
47. Sucrose is
(a) A reducing sugar
(b) Not a reducing sugar
(c) Partial reducing sugar
(d) Mixed sugar
48. Sucrose contains which of the following groups [CPMT 1988]
(a) $-CHO$ (b) $>C=O$
(c) Both (a) and (b) (d) None of these
49. The fructose molecule in sucrose exists as
(a) Furanose (b) Pyranose
(c) Open chain (d) All
50. Which one of the following is laevorotatory [AIIMS 1982; DPMT 1989]
(a) Glucose (b) Sucrose
(c) Fructose (d) None of these
51. Chemically 'digestion' is [NCERT 1978]
(a) Hydrolysis (b) Change in bacteria
(c) Hydrogenation (d) Dehydrogenation
52. Which one of the following is the reagent used to identify glucose
(a) Neutral ferric chloride
(b) Chloroform and alcoholic KOH
(c) Ammoniacal silver nitrate
(d) Sodium ethoxide
53. Sucrose on hydrolysis gives [MP PMT 1993; Bihar MEE 1997]
(a) Two molecules of glucose
(b) Two molecules of fructose
(c) One molecule each of glucose and fructose
(d) One molecule each of glucose and mannose
54. Which of the following is a disaccharide [CPMT 1990, 94]
(a) Lactose (b) Starch
(c) Cellulose (d) Glucose
55. Glucose cannot be classified as [CPMT 1989]
(a) A hexose (b) A carbohydrate
(c) An oligosaccharide (d) An aldose

56. The reagent which forms crystalline osazone derivative when reacted with glucose, is [CPMT 1990]
(a) Fehling solution (b) Phenylhydrazine
(c) Benedict solution (d) Hydroxylamine
57. An enzyme which brings about the conversion of starch into maltose is known as [BHU 1979]
(a) Maltase (b) Zymase
(c) Invertase (d) Diastase
58. Canesugar on hydrolysis gives [MADT Bihar 1984; NCERT 1977; AMU 1985]
(a) Glucose and maltose (b) Glucose and lactose
(c) Glucose and fructose (d) Only glucose
59. Glucose is a [CPMT 1984]
(a) Monosaccharide (b) Disaccharide
(c) Trisaccharide (d) Polysaccharide
60. Which carbohydrate is used in silvering of mirrors [BHU 1973; CPMT 1991]
(a) Sucrose (b) Starch
(c) Glucose (d) Fructose
61. A carbohydrate that cannot be hydrolysed to simpler forms is called
(a) Disaccharide (b) Monosaccharide
(c) Polysaccharide (d) Trisaccharide
62. If monosaccharide contains an aldehyde group, it is known as
(a) Epimer (b) Osone
(c) Osazone (d) Aldose
63. If a monosaccharide contains a ketogroup, it is known as
(a) Ketose (b) Osone
(c) Epimer (d) Osazone
64. The aqueous solution of a carbohydrate gives dark blue colour with iodine. It is
(a) Glucose (b) Fructose
(c) Sucrose (d) Starch
65. Which of the following carbohydrates is a disaccharide
(a) Glucose (b) Fructose
(c) Raffinose (d) Maltose
66. Optical activity is shown by
(a) Glucose (b) Fructose
(c) Sucrose (d) All of these
67. Which is a reducing sugar
(a) Glucose (b) Fructose
(c) Galactose (d) All of these
68. The ultimate product of oxidation of most of hydrogen and carbon in foodstuffs are [CPMT 1981]
(a) H_2O alone (b) CO_2 alone
(c) H_2O and CO_2 (d) None of these
69. Osazone formation involves only 2 carbon atoms of glucose because of [MP PMT 1986]
(a) Chelation (b) Oxidation
(c) Reduction (d) Hydrolysis
70. Glucose will show mutarotation when solvent is [MP PMT 1986]
(a) Acidic (b) Basic
(c) Neutral (d) Amphoteric
71. Glucose contains [CPMT 1982]
(a) One $-CHO$ group
(b) Five $-OH$ groups
(c) One primary alcoholic group
(d) Four secondary alcoholic groups
(e) All are correct
72. Carbohydrates are stored in human body as [MP PMT 1999; Kerala PMT 2004]
(a) Glucose (b) Glycogen
(c) Starch (d) Fructose
73. An example of a disaccharide made up of two units of the same monosaccharides is [KCET 1989; MP PET 1996; AFMC 2005]
(a) Sucrose (b) Maltose
(c) Lactose (d) None of these
74. The sugar present in fruits is [KCET 1984]
(a) Fructose (b) Glucose
(c) Sucrose (d) Galactose
75. Carbohydrates are [MADT Bihar 1983]
(a) Hydrates of carbon
(b) Polyhydroxy aldehydes or ketones
(c) Polyhydroxy acid compounds
(d) None of these
76. Glucose and fructose are [Bihar MADT 1982]
(a) Isotopes
(b) Isotones
(c) Isomers
(d) Homologues of each other
77. Hydrolytic conversion of sucrose into glucose and fructose is known as [BHU 1979, 97]
(a) Induction (b) Saponification
(c) Inversion (d) Esterification
78. Starch is a polymer of [DPMT 1982; CPMT 1975, 80; MP PMT 1994]
(a) Glucose (b) Fructose
(c) Both (a) and (b) (d) None of these
79. To become a carbohydrate a compound must contain at least
(a) 2 carbons (b) 3 carbons
(c) 4 carbons (d) 6 carbons
80. Lactose on hydrolysis gives [KCET 1983]
(a) Two glucose molecules
(b) Two galactose molecules
(c) A galactose molecule and a fructose molecule
(d) A galactose molecule and a glucose molecule
81. An example of non-reducing sugar is [KCET 1988]
(a) Cane sugar (b) Fructose
(c) Lactose (d) Cellobiose
82. Cellulose is a polymer of [KCET 1984]
(a) L-fructose (b) D-mannose
(c) D-glucose (d) Amylose
83. The intermediate compound formed in the conversion of starch to glucose is [KCET 1984]
(a) Lactose (b) Sucrose
(c) Maltose (d) Fructose

84. Invertase brings about the conversion of [KCET 1986]
 (a) Starch to glucose
 (b) Sucrose to glucose and fructose
 (c) Maltose to glucose
 (d) Glucose to C_2H_5OH and CO_2
85. Which of the following pentoses will be optically active

$$\begin{array}{c} CHO \\ | \\ HCOH \\ | \\ HOCH \\ | \\ HCOH \\ | \\ CH_2OH \\ I \end{array} \quad \begin{array}{c} CHO \\ | \\ HCOH \\ | \\ HCOH \\ | \\ HOCH \\ | \\ CH_2OH \\ II \end{array} \quad \begin{array}{c} CHO \\ | \\ HCOH \\ | \\ HCOH \\ | \\ HCOH \\ | \\ CH_2OH \\ III \end{array}$$

 [MP PET 1994]
 (a) All (b) II and III
 (c) I (d) II
86. α -D-glucose and β -D-glucose differ from each other due to difference in one of the carbons with respect to its [CBSE PMT 1995; AFMC 1999]
 (a) Size of hemiacetal ring (b) Number of OH groups
 (c) Configuration (d) Conformation
87. Which carbohydrates has highest abundance in human blood
 (a) D-fructose (b) D-glucose
 (c) Sucrose (d) Lactose
88. Formation of silver mirror by glucose shows that it is a/an
 (a) Oxidising agent (b) Acid
 (c) Reducing agent (d) A salt of silver
89. Which of the following statements is right
 (a) Cellulose are linear polymers of β -glucose molecules with β -1,4-linkages
 (b) Starches are polymers of α -glucose molecules with β -1,4-linkages and some β -1,6-cross-linkages
 (c) Proteins are polyamides of β -amino acids
 (d) The structural information about their biosynthesis is contained in a class of compounds called nucleic acids, e.g. RNA and DNA
90. The number of atoms in the cyclic structure of D-fructose is [MP PMT 1997]
 (a) 5 (b) 6
 (c) 4 (d) 7
91. Which is used in motion picture films
 (a) Cellulose acetate (b) Glucose acetate
 (c) Starch acetate (d) Sucrose acetate
92. Glucose reacts with acetic anhydride to form [KCET 1996]
 (a) Mono-acetate (b) Tetra-acetate
 (c) Penta-acetate (d) Hexa-acetate
93. Which of the following does not show any reducing test of aldehyde [CMT 1996; Orissa JEE 2004]
 (a) Sucrose (b) Fructose
 (c) Maltose (d) Lactose
94. When amylases catalyse the hydrolysis of starch, the final product obtained is chiefly [Pb. PMT 1998]
 (a) Cellobiose (b) Glucose
 (c) Maltose (d) Sucrose
95. Galactose is converted into glucose in [AFMC 1998]
 (a) Mouth (b) Stomach
 (c) Liver (d) Intestine
96. Which among the following is the simplest [CPMT 1999]
 (a) Glucose (b) Cellulose
 (c) Starch (d) None of these
97. Indigestible carbohydrate, which is also a constituent of our diet, is
 (a) Cellulose (b) Galactose
 (c) Maltose (d) Starch
98. Starch is converted into maltose by the [DPMT 1979; CPMT 1982; BHU 1999]
 (a) Maltase (b) Invertase
 (c) Zymase (d) Diastase
99. The disaccharide present in milk is [CPMT 1982, 87, 91; MP PET 2001]
 (a) Maltose (b) Lactose
 (c) Sucrose (d) Cellobiose
100. Carbohydrates are used by body mainly [DCE 1999]
 (a) For obtaining vitamins
 (b) As source of energy
 (c) For all its developmental needs
 (d) For building muscles
101. In the viscose process the solvent for cellulose consists of [MP PET 1995]
 (a) Ether and alcohol
 (b) Copper sulphate and ammonia
 (c) Sodium hydroxide and carbon disulphide
 (d) Acetic acid and acetic anhydride
102. Which of the following does not reduce Benedict's solution [KCET 2000]
 (a) Sucrose (b) Aldehyde
 (c) Glucose (d) Fructose
103. In polysaccharides the linkage connecting monosaccharide units is called
 (a) Glycoside linkage (b) Nucleoside linkage
 (c) Glycogen linkage (d) Peptide linkage
104. Blood sugar is the same as [DPMT 2000]
 (a) Glucose (b) Galactose
 (c) Glycogen (d) Fructose
105. Glucose has functional group [MH CET 2000]
 (a) Aldehydic
 (b) Aldehydic and alcoholic
 (c) Alcoholic
 (d) Ketonic and alcoholic
106. Which of the following is an aldohexose [KCET (Engg.) 2001]
 (a) Cellulose (b) Sucrose
 (c) Glucose (d) Raffinose
107. The pH value is maximum in case of [Kerala (Med.) 2000]
 (a) Milk (b) Proteins
 (c) Minerals (d) Carbohydrates

108. An invert sugar is [AFMC 2000] [MP PMT 2003]
(a) Isorotatory (b) Dextrorotatory
(c) Laevorotatory (d) Optically inactive
109. The change in optical rotation with time of freshly prepared solutions of sugar is known as [JIPMER 2000]
(a) Maturation (b) Rotatory motion
(c) Inversion (d) Specific rotation
110. Yeast cell derive their energy from glucose by [AIIMS 2001]
(a) Glycolysis (b) Respiration formation
(c) Formation (d) None of these
111. Which of the following is correct statement [CBSE PMT 2001]
(a) Troleins are amino acid
(b) α -hydrogen is present in fructose
(c) Starch is polymer of α -glucose
(d) Amylose is compound of cellulose
112. Which of the following is a aldohexose [KCET 2001]
(a) Cellulose (b) Sucrose
(c) Galactose (d) Raffinose
113. The ultimate product of the hydrolysis of starch is [DPMT 2001]
(a) Fructose (b) Glucose
(c) Sucrose (d) None of these
114. Raffinose is [Pb. PMT 2001]
(a) Trisaccharide (b) Monosaccharide
(c) Disaccharide (d) None of these
115. A sugar, that is not a disaccharide, among the following is [KCET (Med./Engg.) 2002]
(a) Lactose (b) Galactose
(c) Sucrose (d) Maltose
116. To detect the reducing and non reducing sugars, which of the following test is used [MH CET 2002]
(a) Molisch test (b) Biuret test
(c) Fehling's test (d) Millions test
117. Which of the following is a disaccharide [MH CET 2002]
(a) Glucose (b) Ribulose
(c) Lactose (d) Arabinose
118. On heating glucose with Fehling's solution we get a precipitate whose colour is [CPMT 1979; CBSE PMT 1988; KCET 1992; DPMT 1983, 86; MP PMT 1996]
(a) Yellow (b) Red
(c) Black (d) White
119. Glycolysis is [CBSE PMT 2003]
(a) Conversion of glucose to haem
(b) Oxidation of glucose to glutamate
(c) Conversion of pyruvate to citrate
(d) Oxidation of glucose to pyruvate
120. Which of the following is an example of ketohexose [Orissa JEE 2003]
(a) Mannose (b) Galactose
(c) Maltose (d) Fructose
121. The safest and the most common alternative of sugar is
(a) Glucose (b) Aspartame
(c) Saccharin (d) Cyclodextrin
122. The specific rotation of equilibrium mixture of α -D-glucose and β -D-glucose, is [MP PMT 2003]
(a) $+19^\circ$ (b) $+112^\circ$
(c) $+52^\circ$ (d) $+100^\circ$
123. The charring of sugar, when treated with conc. H_2SO_4 , is due to
(a) Oxidation (b) Reduction
(c) Dehydration (d) Hydrolysis
124. Which among the following is the simplest sugar [Pb. CET 2002]
(a) Glucose (b) Cellulose
(c) Starch (d) Glycogen
125. Glucose and mannose are [Orissa JEE 2004]
(a) Epimers (b) Anomers
(c) Ketohexoses (d) Disaccharides
126. On hydrolysis, which produces only glucose [BVP 2004]
(a) Galactose (b) Maltose
(c) Sucrose (d) None
127. Pick out the one which does not belong to the family [KCET 2004]
(a) Pepsin (b) Cellulose
(c) Ptyalin (d) Lipase
128. Which of the following is the sweetest sugar [MP PMT 1997; CBSE PMT 1999; AIIMS 2000 Manipal MEE 1995; CPMT 1996; BHU 1997;]
(a) Glucose (b) Fructose
(c) Lactose (d) Sucrose
129. Oxidation of glucose is one of the most important reactions in a living cell. What is the number of ATP molecules generated in cells from one molecule of glucose [CBSE PMT 1995]
(a) 38 (b) 12
(c) 18 (d) 28
130. Glucose has difference from fructose in that it [BHU 2005]
(a) Does not undergo hydrolysis
(b) Gives silver mirror with Tollen's reagent
(c) Monosaccharide
(d) None of these
131. In fructose, the possible optical isomers are [Orissa JEE 2005]
(a) 12 (b) 8
(c) 16 (d) 4
132. If an aqueous solution of glucose is allowed to freeze than crystal of which will be separated out first [DPMT 2005]
(a) Glucose (b) Water
(c) Both of these (d) None of these
133. Which is false [J & K 2005]
(a) Glucose is a disaccharide
(b) Starch is a polysaccharide
(c) Glucose and fructose are not anomers
(d) Invert sugar consists of glucose and fructose

Proteins, Amino Acids and Enzymes

1. Insulin is [CBSE PMT 1991]

- (a) An amino acid (b) Protein [NCERT 1984; MP PET 1999; MP PMT 2001]
(c) A carbohydrate (d) A lipid
2. Peptides are
(a) Esters (b) Salts
(c) Amides (d) Ketones
3. The proteins which are insoluble in water are
(a) Fibrous proteins (b) Globular proteins
(c) Both (a) and (b) (d) None of these
4. Irreversible precipitation of proteins is called
(a) Denaturation (b) Hydrolysis
(c) Rearrangement (d) Electrophoresis
5. The proteins with a prosthetic group are called
(a) Pseudo proteins (b) Complex proteins
(c) Conjugated proteins (d) Polypeptides
6. The prosthetic group of haemoglobin is
(a) Porphin (b) Haem
(c) Globin (d) Globulin
7. When collagen is boiled with water, it forms
(a) Precipitate (b) Solution
(c) Gelatin (d) Complex collagen
8. Which of the following is not essential amino acid
(a) Valine (b) Lysine
(c) Histidine (d) Glycine
9. Amino acids are
(a) Liquids
(b) Volatile solids
(c) Non-volatile crystalline compounds
(d) Mixture of amines and acids
10. Isoelectric point is a
(a) Specific temperature
(b) Suitable concentration of amino acid
(c) Hydrogen ion concentration that does not allow migration of amino acid under electric field
(d) Melting point of an amino acid under the influence of electric field
11. Proteins are hydrolysed by enzymes into [CPMT 1981; BHU 1987; MP PMT 1994, 2002]
(a) Dicarboxylic acids (b) Hydroxy acids
(c) Amino acids (d) Aromatic acids
12. Proteins when heated with conc. HNO_3 give a yellow colour. This is [CPMT 1989]
(a) Oxidising test (b) Xanthoprotic test
(c) Hoppe's test (d) Acid-base test
13. Enzymes are [DPMT 1980; MP PMT 1993, 96]
(a) Proteins (b) Minerals
(c) Oils (d) Fatty acids
14. Proteins are built up of [CPMT 1981, 99; BHU 1987; CBSE PMT 2001; MP PMT 1987, 96; KCET 1984]
(a) Dicarboxylic acids (b) Amino acids
(c) Alcohols (d) Hydroxy acids
15. The main structural feature of proteins is [MNR 1987; MP PET 1993, 97, 2004]
(a) The ester linkage (b) The ether linkage
(c) The peptide linkage (d) All of these
16. Pepsin enzyme hydrolyses
(a) Proteins to amino acids
(b) Fats to fatty acids
(c) Glucose to ethyl alcohol
(d) Polysaccharides to monosaccharides
17. Which one of the following proteins transports oxygen in the blood stream [MP PMT 1993]
(a) Myoglobin (b) Insulin
(c) Albumin (d) Haemoglobin
18. Enzymes are [MP PET 1993]
(a) Living organisms
(b) Dead organisms
(c) Complex nitrogenous substances produced in living cells
(d) None of these
19. Which is an essential constituent of diet [AFMC 1980]
(a) Starch (b) Glucose
(c) Carbohydrate (d) Protein
20. Proteins can be used
(a) As food (b) In textile
(c) As enzyme (d) All of these
21. Which of the following foodstuffs contains nitrogen [DPMT 1986; MH CET 2002]
(a) Carbohydrates (b) Fats
(c) Proteins (d) None of these
22. pH in stomach is approximately
(a) 7 (b) 2.0
(c) 6.5 (d) 10
23. The helical structure of proteins is established by [CPMT 1988]
(a) Peptide bonds (b) Dipeptide bond
(c) Hydrogen bond (d) Vander Waal's forces
24. Natural silk is a
(a) Polyester (b) Polyamide
(c) Polyacid (d) Polysaccharide
25. Protein contains [CPMT 1975; MP PMT 2002]
(a) C, H, O and N (b) Only C and H
(c) Cl, H and O (d) All of these
26. The end product of protein digestion is [CPMT 1981; KCET 1984]
(a) Amino acid (b) Glucose
(c) Glycerol (d) Oxalic acid
27. Protein can be most easily removed from [MNR 1988]
(a) Alkanes (b) Alkenes
(c) Alkynes (d) Benzene
28. Which of the following contains the highest percentage of protein
(a) Groundnut (b) Cow's milk
(c) Egg (d) Wheat
29. The enzyme ptylin used for the digestion of food is present in [CPMT 1981; Pb. P]
(a) Saliva (b) Blood
(c) Intestines (d) Adrenal glands
30. Which one of the following is an amino acid [KCET 1984]
(a) CH_3CONH_2 (b) $\text{CH}_3\text{CONHCH}_3$
(c) CH_3NHCHO (d) $\text{NH}_2\text{CH}_2\text{COOH}$
31. Biuret test is used for the detection of [KCET 1993]

- (a) Saturated oils (b) Sugars
(c) Proteins (d) Fats
32. Out of the following the best category of proteins is [SCRA 1991]
(a) Polyamides (b) Polythioethers
(c) Glycerides (d) Polysaccharides
33. The molecular weight of protein is [KCET 1984]
(a) < 10000 (b) > 10000
(c) > 1000 (d) > 1000 and < 10000
34. Which of the following is not a classification of proteins [KCET 1984]
(a) Enzymes (b) Antibodies
(c) Antigens (d) Hormones
35. The protein that is a structural material is [KCET 1984]
(a) Albumin (b) Oxytocin
(c) Haemoglobin (d) Keratin
36. For α -amino acids having the structure

$$\begin{array}{c} R - CH - CO_2H \\ | \\ NH_2 \end{array}$$
 Which of the following statements are true
 (A) Water solubility is maximum at a pH when concentrations of anions and cations are equal
 (B) They give ninhydrin test
 (C) On reacting with nitrous acid give off N_2
 [MP PET 1994]
 (a) All (b) B and C
 (c) A and B (d) A
37. Which of the following reacts with haemoglobin in the blood to form carboxyhaemoglobin [Manipal MEE 1995]
(a) CO (b) CO_2
(c) $HCOOH$ (d) H_2CO_3
38. Secondary structure of a protein refers to [CBSE PMT 1995]
(a) Mainly denatured proteins and structures of prosthetic groups
(b) Three dimensional structure, specially the bond between amino acid residues that are distant from each other in the polypeptide chain
(c) Linear sequence of amino acid residues in the polypeptide chain
(d) Regular folding patterns of continuous portions of the polypeptide chain
39. Of the following statements about enzymes which ones are true
 (i) Enzymes lack in nucleophilic groups
 (ii) Enzymes are highly specific both in binding chiral substrates and in catalyzing their reactions
 (iii) Enzymes catalyse chemical reactions by lowering the activation energy
 (iv) Pepsin is a proteolytic enzyme [CBSE PMT 1995]
 (a) (i) and (iv) (b) (i) and (iii)
 (c) (ii), (iii) and (iv) (d) (i)
40. Proteins are composed of [MP PMT 1995; J & K 2005]
(a) α -amino acids (b) Carbohydrates
(c) Vitamins (d) Mineral salts
41. Read the following statements carefully
 (A) Albumin is a simple protein
 (B) The amino acid alanine contains an acidic side chain
 (C) Insulin is a hormone
 (D) Muscles contain the protein keratin
 Point out the wrong statements in the above set of statements
 (a) A, B (b) C, D
 (c) A, C (d) B, D
42. Enzymes in the living systems [CPMT 1999; AIIMS 2000; CBSE PMT 1997; MP PET 1999;]
 (a) Provide energy
 (b) Provide immunity
 (c) Transport oxygen
 (d) Catalyse biological processes
43. Which of the following statements about proteins is not true [MP PET 2001]
 (a) Amino acid residues join together to make a protein molecule
 (b) Proteins are polymers with formula $(C_6H_{10}O_5)_n$
 (c) Eggs are rich in protein
 (d) Pulses are good source of proteins
44. Enzymes [AIIMS 1996]
 (a) Accelerate biochemical reactions
 (b) Have optimum activity at body temperature
 (c) Consist of amino acids
 (d) Have all these properties
45. The functional group which is found in amino acid is [AFMC 1998; AIEEE 2002]
 (a) $-COOH$ group (b) $-NH_2$ group
 (c) $-CH_3$ group (d) Both (a) and (b)
46. Amino acids are produced on hydrolysis of [AIIMS 1996]
 (a) Nucleic acid (b) Carbohydrates
 (c) Fats (d) Proteins
47. Enzymes belong to which class of compounds [KCET 1996]
 (a) Polysaccharides
 (b) Polypeptides
 (c) Polynitrogen heterocyclic compounds
 (d) Hydrocarbons
48. By the action of enzymes, the rate of biochemical reaction [CBSE PMT 1994]
 (a) Decreases (b) Increases
 (c) Does not change (d) Either (a) or (c)
49. Metal present in blood is [CPMT 1997]
 (a) Al (b) Mg
 (c) Cu (d) Fe
50. Which compound can exist in a dipolar (zwitter ion) state [Pb. PMT 1998]
 (a) $C_6H_5CH_2CH(N=CH_2)COOH$
 (b) $(CH_3)_2CH.CH(NH_2)COOH$
 (c) $C_6H_5CONHCH_2COOH$
 (d) $HOOC.CH_2CH_2COCOCH_3$
51. What is the monomer of polypeptide [KCET 1998; JIPMER 1999; Pb. CET 2002]
 (a) Amino acid (b) Glucose
 (c) Nucleoside (d) Nucleotide
52. Which of the following enzymes is not useful in the digestion of proteins [KCET 1998]

- (a) Chymotrypsin (b) Pepsin [Pb. PMT 2000]
(c) Trypsin (d) Lipase
53. Haemoglobin is [CBSE PMT 1997; BHU 2004]
(a) An enzyme (b) A globular protein
(c) A vitamin (d) A carbohydrate
54. Albumin proteins are most abundant in [BHU 1998]
(a) Meat (b) Milk
(c) Egg (d) Soyabean
55. Dialysis can separate [BHU 1998]
(a) Glucose and fructose
(b) Glucose and sucrose
(c) Glucose and NaCl
(d) Glucose and proteins
56. Which one of the following is an example of a globular protein
(a) Keratin (b) Insulin
(c) Collagen (d) Myoglobin
57. Leucine amino acids is the [Pb. PMT 1999]
(a) Essential (b) Non-essential
(c) Aromatic (d) Basic
58. Which of the following tests is not used for testing proteins [Kerala PMT 1999; KCET 1999]
(a) Millon's test (b) Molisch's test
(c) Biuret test (d) Ninhydrin test
59. Amino acids usually exist in the form of Zwitter ions. This means that it consists of [KCET 2000]
(a) The basic group $-NH_2$ and the acidic group $-COOH$
(b) The basic group $-NH_3^+$ and the acidic group $-CO_2^-$
(c) The basic group $-CO_2^-$ and the acidic group NH_3^+
(d) No acidic or basic group
60. The most important energy carrier in all the living cells is [MP PET 2000; KCET 2000]
(a) AMP (b) ATP
(c) ADP (d) UDP
61. The 10% energy transfer law of food chain was given by [BHU 2000]
(a) Stanley (b) Weismann
(c) Lindemann (d) Tansley
62. Which of the following is a conjugated protein [BHU 2000]
(a) Glycoprotein (b) Phosphoprotein
(c) Chromoprotein (d) All of these
63. The number of essential amino acids in man is [CBSE PMT 2000]
(a) 8 (b) 10
(c) 18 (d) 20
64. Pick out wrong combination [DCE 2000]
(a) $Fe^{+2} \rightarrow$ Haemoglobin
(b) $Mg^{2+} \rightarrow$ Photosynthesis
(c) $Se^{2+} \rightarrow$ Krebs Cycle
(d) $CO^{+2} \rightarrow$ Vitamin B-12
65. The decomposition of complex organic compounds into simpler compound with the help of enzyme is known as
(a) Catabolism (b) Anabolism
(c) Fermentation (d) Metabolism
66. A biological catalyst is essentially [Pb. PMT 2000; BHU 2004]
(a) A carbohydrates (b) An amino acids
(c) A nitrogen molecule (d) Fats
67. The test used for identifying peptide linkage in proteins is [KCET (Engg.) 2001]
(a) Borsche's test (b) Molisch's test
(c) Ninhydrin test (d) Biuret test
68. Which of the following is not a function of proteins [MP PMT 2001]
(a) Nails formation
(b) Skin formation
(c) Muscle formation
(d) Providing energy for metabolism
69. The helical structure of proteins is stabilized by [MP PMT 2001]
(a) Peptide bonds (b) Dipeptide bond
(c) Hydrogen bond (d) Vander Waal's forces
70. The optically inactive amino acid is [MP PMT 2001; BHU 2005]
(a) Lysine (b) Glycine
(c) Arginine (d) Alanine
71. Which α amino acid can cross link peptide chains [AIIMS 2001]
(a) Serine (b) Cysteine
(c) Glutamine (d) Tyrosine
72. Amino acids are the building blocks of [MH CET 2001]
(a) Fat (b) Vitamin
(c) Protein (d) Carbohydrate
73. Which of the following protein destroys the antigen when it enters in body cell [AIIMS 2001; Pb. PMT 2004]
(a) Antibodies (b) Insulin
(c) Chromoprotein (d) Phosphoprotein
74. An antibiotic with a broad spectrum [AFMC 2001]
(a) Kills the antibodies
(b) Acts on a specific antigen
(c) Acts on different antigens
(d) Acts on both the antigens and antibodies
75. Antibodies are [CBSE PMT 2001]
(a) Carbohydrate (b) Globular protein
(c) Immunoglobulins (d) Cellulose compounds
76. Excess of Na^+ ions in our system causes [BHU 2001]
(a) High B.P. (b) Low B.P.
(c) Diabetes (d) Anaemia
77. The example of a protein is [MP PET 2003]
(a) Narvone (b) Lacithin
(c) Cellulose (d) Insulin
78. Enzymes are made up of [CBSE PMT 2002]
(a) Carbohydrates
(b) Edible proteins
(c) Nitrogen containing carbohydrates
(d) Proteins with specific structure

79. Chlorophyll contains [RPMT 2002]
 (a) Fe (b) Na
 (c) Mg (d) Zn
80. Which one of the following biomolecules is insoluble in water [AIIMS 2005]
 (a) α -Keratin (b) Haemoglobin
 (c) Ribonuclease (d) Adenine
81. A nanopeptide contains peptide linkages [KCET 2005]
 (a) 10 (b) 8
 (c) 9 (d) 18
82. Identify the incorrect statement [Kerala (Med.) 2003]
 (a) An octa deca peptide contains 18 amino acid residues and 17 peptide bonds
 (b) Addition of an inert gas into a system in thermodynamic equilibrium for the dissociation of PCl_5 shifts the equilibrium to the left.
 (c) When gold dissolves in aquaregia the complex formed is chloroauric acid
 (d) In the extraction of aluminium purified bauxite is dissolved in molten fluorospar
 (e) If the pH value of a solution is to be decreased from 5 to 3, the hydrogen ion concentration must be increased twice the initial value.
83. α -helix is found in [Kerala (Engg.) 2002]
 (a) DNA (b) RNA
 (c) Lipid (d) Protein
84. The main structural of protein is [UPSEAT 2000, 02]
 (a) The ester linkage (b) The ether linkage
 (c) The peptide linkage (d) All of these
85. Among the following, the achiral amino acid is [AIIMS 2003]
 (a) 2-Ethylalanine
 (b) 2-Methylglycine
 (c) 2-Hydroxymethyl serine
 (d) Tryptophan
86. Which of the following could act as a propellant or rockets [CBSE PMT 2003]
 (a) Liquid hydrogen + liquid nitrogen
 (b) Liquid oxygen + liquid argon
 (c) Liquid hydrogen + liquid oxygen
 (d) Liquid nitrogen + liquid oxygen
87. Which amino acid has aromatic ring [CPMT 2003]
 (a) Alanine (b) Glycine
 (c) Tyrosine (d) Lysine
88. The pH value of the solution in which a particular amino acid does not migrate under the influence of an electric field is called the [Kerala (Med.) 2003]
 (a) Eutectic point (b) Yielding point
 (c) Neutralisation point (d) Effusion
 (e) Isoelectric point
89. Which part of the protein molecule is responsible for function and activity of the proteins [AMU 2002]
 (a) Secondary structure (b) Peptide bond
 (c) Primary structure (d) Binding sites
90. The Structural formula of an amino acid, isoleucine is

91. The process by which synthesis of protein takes place based on the genetic information present in m -RNA is called [KCET 2003; Kerala CET 2005]
 (a) Translation (b) Transcription
 (c) Replication (d) Messenger hypothesis
92. Which of the following is used in our body as a fuel for muscles and nerves and to build and repair body tissues? [DCE 2003]
 (a) Cane sugar (b) Fructose
 (c) Proteins (d) Glucose
93. Which enzyme convert glucose into alcohol [Pb. CET 2003]
 (a) Invertase (b) Zymase
 (c) Maltase (d) Diastase
94. Which one of the following structures represents the peptide chain [CBSE PMT MP PET 1994; Bihar MEE 1997; Orissa JEE 1997]
 (a)
$$\begin{array}{ccccccc} \text{H} & & \text{H} & & \text{H} & & \text{O} \\ | & & | & & | & & || \\ -\text{N}- & \text{C}- & \text{C}- & \text{N}- & \text{C}- & \text{C}- & \text{N}- & \text{C}- \\ | & & || & & | & & | & \\ & & \text{O} & & & & \text{O} & \end{array}$$
- (b)
$$\begin{array}{ccccccc} \text{H} & & \text{O} & & \text{H} & & \\ | & & || & & | & & \\ -\text{N}- & \text{C}- & \text{C}- & \text{C}- & \text{N}- & \text{C}- & \text{C}- & \text{N}- & \text{C}- & \text{C}- \\ | & & | & & | & & | & & | & \\ & & & & \text{H} & & \text{O} & & & \end{array}$$
- (c)
$$\begin{array}{ccccccc} \text{H} & & & & \text{O} & & \\ | & & & & || & & \\ -\text{N}- & \text{C}- & \text{N}- & \text{C}- & \text{NH}- & \text{C}- & \text{NH}- \\ | & & | & & & & \\ & & \text{O} & & \text{H} & & \end{array}$$
- (d)
$$\begin{array}{ccccccc} \text{H} & & & & \text{H} & & \\ | & & & & | & & \\ -\text{N}- & \text{C}- & \text{C}- & \text{C}- & \text{C}- & \text{N}- & \text{C}- & \text{C}- & \text{C}- \\ | & & | & & | & & | & & | \\ & & \text{O} & & & & & & \end{array}$$

95. The correct statement in respect of protein haemoglobin is that it
 (a) Acts as an oxygen carrier in the blood
 (b) Forms antibodies and offers resistance to diseases
 (c) Functions as a catalyst for biological reactions
 (d) Maintains blood sugar level

96. Identify the correct statement regarding enzymes

[AIEEE 2004]

[MP PMT 2003]

- (a) Enzymes are specific biological catalysts that cannot be poisoned
(b) Enzymes are normally heterogeneous catalysts that are very specific in their action
(c) Enzymes are specific biological catalysts that can normally function at very high temperature ($T \sim 1000K$)
(d) Enzymes are specific biological catalysts that possess well-defined active sites
97. A biological catalyst is essentially [BHU 2004]
(a) An enzyme
(b) A carbohydrate
(c) An amino acid
(d) A nitrogen compound
98. Which synthesis was done by Stanley Millar [CPMT 1979]
(a) Amino acid (b) Protein
(c) Virus (d) Vitamin
99. The bond that determines the secondary structure of proteins is or secondary structure of protein is due to [NCERT 1984; MP PET 1996; MP PMT 1997]
(a) Coordinate bond
(b) Covalent bond
(c) Hydrogen bond
(d) Peptide bond
9. Which of the following indicates the number of free $-OH$ groups in an oil or fat
(a) Iodine value
(b) Acid value
(c) Acetyl value
(d) Saponification value
10. Which of the following is not glyceride
(a) Lipids (simple) (b) Phospholipids
(c) Sphingolipids (d) All
11. The most important food reserves of animals and plants are [MP PET 1993]
(a) Carbohydrates (b) Proteins
(c) Vitamins (d) Fats
12. Which of the following gives maximum energy in metabolic processes [CPMT 1991; MP PET 1999]
(a) Proteins (b) Carbohydrates
(c) Lipids (d) Vitamins
13. The energy change produced by the combustion of food is called the 'calorific value'. The highest calorific value is given by [NCERT 1984; AFMC 1988]
(a) Proteins (b) Fats
(c) Carbohydrates (d) Vitamins
14. Cell membrane contains
(a) Alternate layers of phospholipid and coline
(b) Double layers of phospholipid
(c) Double layers of phospholipid with polar ends projected outside
(d) Double layers of phospholipid with polar ends projected inside
15. Which of the following compounds do not belong to lipids [AFMC 1998]
(a) Fats (b) Amino acids
(c) Phospholipids (d) Carbohydrates
16. Which is not a macromolecule [BHU 1998]
(a) DNA (b) Starch
(c) Palmitate (d) Insulin
17. A distinctive and characteristic functional group of fats is [Kerala (Med.) 1999; AFMC 2005]
(a) An ester group
(b) A peptide group
(c) A ketonic group
(d) An alcoholic group
18. The waxes are long chain compounds of fatty acids, which belong to the class of [BHU 1999; AFMC 2005]
(a) Esters (b) Ethers
(c) Alcohols (d) Acetic acid
19. Hydrolytic reaction of fats, with caustic soda, is known as [Kerala (Med.) 2000; Pb. PMT 2004; MNR 1988]
(a) Acetylation (b) Carboxylation
(c) Saponification (d) Esterification
20. Fat consists of [MH CET 2002]
(a) Monohydroxy carboxylic acid
(b) Monohydroxy aliphatic carboxylic acid
(c) Monohydroxy aliphatic, saturated carboxylic acid
(d) Dihydroxy aliphatic carboxylic acid
21. The alcohol obtained by the hydrolysis of oils and fats is [KCET 2001]
(a) Glycol (b) Glycerol

Fats and Lipids

1. Tripalmitin is
(a) A protein (b) An enzyme
(c) A lipid (d) A carbohydrate
2. On hydrolysis, all lipids yield
(a) Monocarboxylic acids (b) Monohydric alcohols
(c) Monohaloalkanes (d) Enzymes
3. Which of the following is not a lipid
(a) Oils (b) Fats
(c) Waxes (d) Proteins
4. The 'acid value' of an oil or fat is measured in terms of weight of
(a) NH_4OH (b) $NaOH$
(c) KOH (d) CH_3COOH
5. The 'saponification value' of an oil or fat is measured in terms of
(a) NH_4OH (b) $NaOH$
(c) KOH (d) C_6H_5OH
6. The 'iodine value' of an oil indicates
(a) Its boiling point
(b) Inflammability
(c) Unsaturation present in acid contents
(d) Solubility of salt in oils
7. Hardening of oils is caused by
(a) H_2 (b) N_2
(c) O_2 (d) CO_2
8. Which of the following is obtained when an oil is hydrolysed with alkali
(a) Fat (b) Wax
(c) Soap (d) Vitamin

- (c) Propanol (d) Pentanol [MP PET 1996]
22. Iodine value is related to [MP PET 2002]
(a) Fats and oils (b) Alcohols
(c) Esters (d) Hydrocarbons
23. Phospholipids are esters of glycerol with [CBSE PMT 2003]
(a) Three phosphate groups
(b) Three carboxylic acid residues
(c) Two carboxylic acid residues and one phosphate group
(d) One carboxylic acid residue and two phosphate groups
24. Oils and fats are jointly called [MP PET 2003]
(a) Lipids (b) Soaps
(c) Proteins (d) Polymer
25.
$$\begin{array}{c} \text{CH}_2\text{OOCR}' \\ | \\ \text{CHOOOCR}'' \\ | \\ \text{CH}_2\text{OOCR}''' \end{array} \xrightarrow[\text{Hydrolysis}]{\text{Enzyme}} \begin{array}{c} \text{CH}_2\text{OH} \quad \text{R}'\text{COOH} \\ | \quad \quad \quad + \\ \text{CHOH} + \text{R}''\text{COOH} \\ | \quad \quad \quad + \\ \text{CH}_2\text{OH} \quad \text{R}'''\text{COOH} \end{array}$$

The enzyme used in the above reaction is [AMU 2003]
(a) Amylase (b) Lactase
(c) Lipase (d) Invertase
26. Oleic, stearic and palmitic acids are [Pb. CET 2002]
(a) Fatty acid (b) Amino acid
(c) Nucleic acid (d) Essential acid
27. An example for a saturated fatty acid, present in nature is [KCET 2005]
(a) Oleic acid (b) linoleic acid
(c) Linolenic acid (d) Palmitic acid

Vitamin, Hormone and Nucleic acid

1. A nucleotide consists of
(a) Base and sugar (b) Base and phosphate
(c) Sugar and phosphate (d) Base, sugar and phosphate
2. Which of the following is responsible for heredity character
(a) DNA (b) RNA
(c) Proteins (d) Hormones
3. The base adenine occurs in [MP PMT 1995]
(a) DNA only (b) RNA only
(c) DNA and RNA both (d) Protein
4. The protein which maintains blood sugar level in the human body [KCET 1992; MP PMT 1995]
(a) Haemoglobin (b) Oxytocin
(c) Insulin (d) Ptyalin
5. Which of the following statements about the assembly of nucleotides in a molecule of deoxyribose nucleic acid (DNA) is correct
(a) A pentose of one unit connects to a pentose of another
(b) A pentose of one unit connects to the base of another
(c) A phosphate of one unit connects to a pentose of another
(d) A phosphate of one unit connects to the base of another
6. Vitamin A is present in [MP PET 1995, 2000]
(a) Cod liver oil (b) Carrot
(c) Milk (d) In all of these
7. Ascorbic acid is a [Bihar CEE 1995; MP PET 1995]
(a) Vitamin (b) Enzyme
(c) Protein (d) Carbohydrate
8. The chemical name of vitamin C is [J & K 2005]
(a) Ascorbic acid (b) Folic acid
(c) Nicotinic acid (d) Tartaric acid
9. Which of the following is not a constituent of RNA
(a) Ribose (b) Phosphate
(c) Adenine (d) Pyridine
10. Which one is found in ATP ribonucleotide
(a) Guanine (b) Uracil
(c) Adenine (d) None of these
11. Which of the following proteins acts as a messenger in living system
(a) Hormone (b) Enzyme
(c) Protective protein (d) Transport protein
12. Which substance is not present in nucleic acid [MP PET/PMT 1998]
(a) Cytosine (b) Adenine
(c) Thymine (d) Guanidine
13. The deficiency of vitamin B₁ causes [CPMT 1994; MP PMT 1999; BHU 2000]
(a) Beri-beri (b) Scurvy
(c) Rickets (d) Anaemia
14. Which of the following is not present in nucleic acids [MP PMT 1999]
(a) Uracil (b) 2-aminopyridine
(c) Thymine (d) Adenine
15. In nucleic acids, the sequence is [AIIMS 1996]
(a) Base-phosphate-sugar (b) Phosphate-base-sugar
(c) Sugar-base-phosphate (d) Base-sugar-phosphate
16. The segment of DNA which acts as the instructional manual for the synthesis of the protein is [Pb. PMT 1998]
(a) Nucleoside (b) Nucleotide
(c) Ribose (d) Gene
17. The double helical structure of DNA was proposed by [KCET 1998]
(a) Watson and Crick (b) Meicher
(c) Emil Fischer (d) Khorana
18. A segment of DNA molecule which codes or specifies for one polypeptide chain is called [KCET 1998]
(a) Phosphate group (b) Adenine
(c) Gene (d) Amino acid
19. In DNA, the complementary bases are [CBSE PMT 1998]
(a) Uracil and adenine; cytosine and guanine
(b) Adenine and thymine; guanine and cytosine
(c) Adenine and thymine; guanine and uracil
(d) Adenine and guanine; thymine and cytosine
20. The structure of DNA is [AFMC 1999]
(a) Linear (b) Single helix
(c) Double helix (d) Triple helix
21. Vitamin B₁₂ is [Manipal MEE 1995]
(a) Riboflavin (b) Cobalamin
(c) Thiamine (d) Pyridoxine
22. A gene is a segment of a molecule of [AIIMS 1999]
(a) DNA (b) m-RNA
(c) t-RNA (d) Protein
23. The deficiency of vitamin-C causes [MP PMT 2000; CPMT 2000]
(a) Scurvy (b) Rickets
(c) Pyrrhohea (d) Pernicious Anaemia
24. DNA contains the sugar [MP PMT 2000]
(a) Deoxyribose (b) Ribose
(c) D-Fructose (d) D-glucose
25. Which of the following is not a sex hormone [MP PMT 2000]

- (a) Testosterone (b) Estrone
(c) Estradiol (d) Cortisone
26. Acquired immune deficiency syndroms (AIDS) is characterised
(a) Killer T-cells
(b) Reduction in number of helper T-cells
(c) An autoimmune disease
(d) Inability of body to produce interferons
27. The base present in DNA, but not in RNA is
[KCET (Engg.) 2001; NCERT 1978; Manipal MEE 1985; MP PMT 1994, MP PET 1995; DCE 2004]
(a) Guanine (b) Adenine
(c) Uracil (d) Thymine
28. Mutation of DNA occurs due to changes in the sequence of one of the following [MP PMT 2001]
(a) Bases (b) Ribose units
(c) Phosphate units (d) Sugar units
29. Which of the following is not true about vitamins [AFMC 2001]
(a) They are vital for life
(b) They help in digestion
(c) They were named by "Funic"
(d) Their deficiency causes diseases
30. Blood calcium level can be increased by the administration of
(a) Glucagon (b) Calcitonin
(c) Thyroxine (d) Parathormone
31. The first hormone chemically synthesised in the laboratory is [BHU 2002]
(a) Cortisone (b) Insuline
(c) Adrenaline (d) Estrone
32. Purine derivative among the following bases is [KCET (Med./Engg.) 2002; MPPET 2004]
(a) Guanine (b) Cytosine
(c) Thymine (d) Uracil
33. RNA is different from DNA because RNA contains [AIEEE 2002, 04]
(a) Ribose sugar and thymine
(b) Ribose sugar and uracil
(c) Deoxyribose sugar and thymine
(d) Deoxyribose sugar and uracil
34. Deficiency of which vitamin causes rickets [MP PET 2002]
(a) Vitamin-D (b) Vitamin-B
(c) Vitamin-A (d) Vitamin-K
35. Which do the following vitamins has isoprene units in its structure
(a) Vitamin A (b) Vitamin C
(c) Vitamin B₂ (d) Vitamin D
36. The reason for double helical structure of DNA is operation of [CBSE PMT 2003; DPMT 2004]
(a) Vander Waal's forces
(b) Dipole-dipole interaction
(c) Hydrogen bonding
(d) Electrostatic attractions
37. The tripeptide hormone present in most living cells is... [KCET 2003]
(a) Glutathione (b) Glutamine
(c) Oxytocin (d) Ptyalin
38. The function of DNA in an organism is [DCE 2003]
(a) To assist in the synthesis of RNA molecule
(b) To store information of heredity characteristics
(c) To assist in the synthesis of proteins and polypeptides
(d) All of these
39. The hormone that helps in the conversion of glucose to glycogen in
(a) Adrenaline (b) Insulin
(c) Cortisone [AIIMS 2000] (d) Bile acids
40. Insulin production and its action in human body are responsible for the level of diabetes. This compound belongs to which of the following categories [AIEEE 2004]
(a) An enzyme (b) A hormone
(c) A co-enzyme (d) An antibiotic
41. Codon is present in [Pb. PMT 2004]
(a) t-RNA (b) m-RNA
(c) r-RNA (d) All of these
42. Energy is stored in our body in the form of [CBSE PMT 2001; KCET 2003]
(a) ATP (b) ADP
(c) Fats (d) Carbohydrates
43. Nucleic acid is a polymer of [MP PMT 2004]
(a) Nucleosides (b) α -amino acids
(c) Nucleotides (d) Glucose
44. A nucleoside on hydrolysis gives [KCET 2004]
(a) A heterocyclic base and orthophosphoric acid
(b) An aldopentose, a heterocyclic base and orthophosphoric acid
(c) An aldopentose and a heterocyclic base [AFMC 2001]
(d) An aldopentose and orthophosphoric acid
45. An alternation in the base sequence of nucleic acid molecule is called [Kerala PMT 2004]
(a) Replication (b) Mutation
(c) Duplication (d) Dislocation
(e) Flocculation
46. Vitamin B₆ is known as [DCE 2004]
(a) Pyridoxin (b) Thiamine
(c) Tocopherol (d) Riboflavin

Critical Thinking

Objective Questions

1. Number of chiral carbons in β -D-(+)-glucose is [CBSE PMT 2004; MHCET 2004]
(a) Three (b) Four
(c) Five (d) Six
2. The nucleoside having two possible binding sites is [AIIMS 2004]
(a) Thymine (b) Cytosine
(c) Guanine (d) Adenine
3. Subunits present in haemoglobin are [AIIMS 2003]
(a) 2 (b) 3
(c) 4 (d) 5
4. A sequence of how many nucleotides in messenger RNA makes a codon for an amino acid [CBSE PMT 2004]
(a) One (b) Two
(c) Three (d) Four
5. Chargaff's rule states that in an organism [CBSE PMT 2003]
(a) Amounts of all bases are equal
(b) Amount of adenine (A) is equal to that of thymine (T) and the amount of guanine (G) is equal to that of cytosine (C)
(c) Amount of adenine (A) is equal to that of guanine (G) and the amount of thymine (T) is equal to that of cytosine (C)

- (d) Amount of adenine (*A*) is equal to that of cytosine (*C*) and the amount of thymine (*T*) is equal to guanine (*G*)
6. DNA multiplication is called [Kerala (Med.) 2000]
(a) Translation (b) Transduction
(c) Transcription (d) Replication
7. Insulin is a protein which plays the role of [KCET 1986]
(a) An antibody (b) A hormone
(c) An enzyme (d) A transport agent
8. Proteins fulfil several functions in living systems. An example of a protein which acts as a hormone is [KCET 1985]
(a) Casein (b) Oxytocin
(c) Trypsin (d) Keratin
9. Pick out the unsaturated fatty acid from the following [KCET 2004; MHCET 2002]
(a) Stearic acid (b) Lauric acid
(c) Oleic acid (d) Palmitic acid
10. Vitamin B_{12} contains metal [Bihar MEE 1997; RPET 1999; Pb. PMT 1999; AFMC 2002; CBSE PMT 2003; CPMT 2003; MP PMT 2003]
(a) *Ca* (II) (b) *Zn* (II)
(c) *Fe* (II) (d) *Co* (III)
11. The number of molecules of ATP produced in the lipid metabolism of a molecule of palmitic acid is [CBSE PMT 1998]
(a) 130 (b) 36
(c) 56 (d) 86
12. Protein can be most easily removed from [UPSEAT 2000, 02]
(a) Alkanes (b) Alkenes
(c) Alkynes (d) Benzene
13. The enzyme which hydrolyses triglycerides to fatty acids and glycerol is called [CBSE PMT 2004]
(a) Zymase (b) Pepsin
(c) Maltase (d) Lipase
14. The helical structure of protein is stabilized by [CBSE PMT 2004]
(a) Ether bonds (b) Peptide bonds
(c) Dipeptide bonds (d) Hydrogen bonds
15. The cell membranes are mainly composed of [CBSE PMT 2005]
(a) Carbohydrates (b) Proteins
(c) Phospholipids (d) Fats
16. A compound of mol. wt. 180 is acetylated to give a compound of mol. wt. 390. The number of amino groups in the initial compound is [KCET 1996]
(a) 2 (b) 4
(c) 5 (d) 6
17. Starting with three different amino acid molecules, how many different tripeptide molecules are formed [Kerala PMT 1999; KCET 1999]
(a) 12 (b) 9
(c) 8 (d) 6
18. Which one of the following is a polysaccharide [NDA 1999]
(a) Nylon (b) Amylose
(c) Ribose (d) Polyethylene
19. Which of the following is not an acidic amino acid
(a) Lysine (b) Arginine
(c) Aspartic acid (d) Histidine
20. Proteins do not respond to
(a) Biuret test (b) Heller's ring test
(c) Ninhydrin test (d) Lucas test
21. Alkyl benzene sulphonates can be conductivity used as detergents in hard water, unlike soaps, as [AMU 2002]
(a) They are highly soluble in water
(b) Their Ca^{++} / Mg^{++} salts are water soluble
(c) They are non-ionic
(d) Their Ca^{++} / Mg^{++} salts are insoluble in water
22. When glucose reacts with bromine water, the main product is [Pb. CET 2003; BHU 2003]
(a) Acetic acid (b) Saccharic acid
(c) Glyceraldehyde (d) Gluconic acid
23. A zwitter ion is [KCET 1989]
(a) A positively charged ion without a metal atom in it
(b) A negatively charged ion without metal atom in it
(c) An ion with positive and negative charges at different points on it
(d) A heavy ion with a small charge on it
24. Ribose is an example of [KCET 1998]
(a) Ketohexose (b) Aldopentose
(c) Disaccharide (d) Aldoheose
25. The two forms of *D*-glucopyranose obtained from the solution of *D*-glucose are called [IIT JEE Screening 2005]
(a) Isomer (b) Anomer
(c) Epimer (d) Enantiomer
26. Sucrose molecule is made up of [KCET 2005]
(a) A gluco pyranose and a fructo pyranose
(b) A gluco pyranose and a fructo furanose
(c) A gluco furanose and a fructo pyranose
(d) A gluco furanose and a fructo furanose

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

- Assertion : Glycine is amphoteric in nature.
Reason : Glycine contains both acid and basic groups. [AIIMS 1996]
- Assertion : Hydrolysis of sucrose is known as inversion of cane sugar.
Reason : Sucrose is a disaccharide. [AIIMS 1997]
- Assertion : Proteins on hydrolysis produce amino acids.
Reason : Amino acids contain $-NH_2$ and $-COOH$ groups. [AIIMS 1998]
- Assertion : Sucrose undergo mutarotation.
Reason : Sucrose is a disaccharide. [AIIMS 2000]

5. Assertion : DNA molecules and RNA molecules are found in the nucleus of a cell.
Reason : On heating the enzyme do not lose their specific activity. [AIIMS 2002]
6. Assertion : All Amino acids exist as Zwitter ions.
Reason : Amino acids have both $-NH_2$ and $-COOH$ group. [AIIMS 2002]
7. Assertion : Activity of an enzyme is pH -dependent.
Reason : Change in pH affects the solubility of the enzyme in water. [AIIMS 2003]
8. Assertion : Glycosides are hydrolyzed in acidic conditions.
Reason : Glycosides are acetals. [AIIMS 2003]
9. Assertion : Haemoglobin is an oxygen carrier.
Reason : Oxygen binds as O_2^- to Fe of haemoglobin. [AIIMS 2003]
10. Assertion : Carboxypeptidase is an exopeptidase.
Reason : It cleaves the N -terminal bond. [AIIMS 2004]
11. Assertion : Sucrose is a non-reducing sugar.
Reason : It has glycosidic linkage. [AIIMS 2004]
12. Assertion : Sucrose is a disaccharide.
Reason : Sucrose is dextro rotatory.
13. Assertion : Fructose reduces Fehling's solution and Tollen's reagent.
Reason : Fructose does not contain any aldehyde group.
14. Assertion : The specific rotation of a freshly prepared solution of α -glucose decreases from $+112^\circ$ to 52.7° while that of β glucose increase from $+19^\circ$ to 52.7° .
Reason : The change in specific rotation of an optically active compound with time to an equilibrium value is called mutarotation.
15. Assertion : α -amino acids exist as dipolar ions or zwitter ions.
Reason : α -amino acids are the building blocks of proteins.
16. Assertion : Valine is an essential amino acid.
Reason : The lack of essential amino acids in the diet causes Kwashiorkor.
17. Assertion : Sequence of bases in DNA is TGAACCTT and sequence of bases in m -RNA is CATTAAAC.
Reason : In DNA nitrogenous bases have hydrogen bonds.
18. Assertion : Millon's test is a test to identify carbohydrates.
Reason : Millon's reagent is solution of mercurous nitrate and mercuric nitrate in nitric acid containing little nitrous acid.
19. Assertion : ATP molecules are energy rich molecules.
Reason : ATP consists of a purine base adenine, pentose sugar ribose and a string of three phosphate groups.
20. Assertion : Solubilities of protein is minimum at the isoelectric point.
Reason : At isoelectric point, protein molecule behaves as a zwitter ion.
21. Assertion : Amino acids are soluble in benzene and ether.
Reason : Amino acids exist as zwitter ions.
22. Assertion : A solution of sucrose in water is dextrorotatory but on hydrolysis in presence of little hydrochloric acid, It becomes laevorotatory.
Reason : Sucrose on hydrolysis gives unequal amounts of glucose and fructose as.
23. Assertion : Treatment of D -glucose with alkali affords an equilibrium mixture consisting of D -mannose, D -fructose and starting substance D -glucose.

Reason : The reaction involves an intermediate in which hybridization of C_2 changes from sp^3 to sp^2 .

Answers and Solutions

Carbohydrates

1. (d) α -D-Glucose $\rightleftharpoons$ Equilibrium mixture $\rightleftharpoons$
 $[\alpha]_D^{+112^\circ}$ (36%) $[\alpha]_D^{+52^\circ}$ (0.02%)

Glucose has two forms α and β . When either of these two is dissolved in water and allowed to stand, it gets converted to an equilibrium mixture of α and β forms.

2. (b) Gun-cotton is a nitrocellulose or cellulose trinitrate which is used in explosive and as a binder for solid rocket propellant.
3. (d) Arabinose is an aldopentose $HOCH_2-(CHOH)_3-CHO$
4. (d) In proteins amide group is present
 $(-NH-\underset{\substack{| \\ R}}{CH}-\underset{\substack{|| \\ O}}{C}-NH-\underset{\substack{| \\ R}}{CH}-\underset{\substack{|| \\ O}}{C}-)_n$
Amino or peptide bond
5. (c) Inulin is a carbohydrate which is stored in "Roots of Dahlia".
6. (c) Carbohydrates are hydrates of carbon. Their general formula is $C_x(H_2O)_y$.
8. (d) Glucose + Tollen's reagent $\rightarrow$ Gluconic acid + Ag-mirror.
9. (b) Protein gives blue-violet colour with ninhydrin
(2, 2-dihydroxyindane-1, 3-diene)
Carbohydrates gives brown red ppt. with benedict's solution
(Alk. $CuSO_4$ + Citrate ions)
11. (c) A ring structure

 α -Methyl glucoside β -Methyl glucoside39. (c) Glucose + Benedict's solution $\rightarrow$ Red colour (Cu_2O).40. (c) Sucrose $\xrightarrow{\text{conc. HNO}_3}$ Oxalic acid.

41. (b) Amylopectin is not soluble in water.

43. (c) $\text{C}_{12}\text{H}_{22}\text{O}_{11}$
Maltose

47. (b) Sucrose is not a reducing sugar.

57. (d) Starch $\xrightarrow{\text{Diastase}}$ Maltose.58. (c) $\text{C}_{12}\text{H}_{22}\text{O}_{11} + \text{H}_2\text{O} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + \text{C}_6\text{H}_{12}\text{O}_6$
Cane sugar Glucose Fructose

61. (b) Monosaccharide cannot be hydrolysed to simple forms.

64. (d) Starch + $\text{I}_2 \rightarrow$ Blue colour.

66. (d) Glucose and sucrose are dextrorotatory Fructose is levorotatory

68. (c) Food shift + $\text{O}_2 \rightarrow \text{CO}_2 + \text{H}_2\text{O}$
(C and H)

70. (c) In neutral solvent, glucose shows mutarotation.

73. (b) Maltose $\xrightarrow[\text{Maltase}]{\text{Hydrolysis}}$ glucose + glucose.79. (b) 3 carbons e.g. Glyceraldehyde $\begin{array}{c} \text{CH}_2-\text{CH}-\text{CHO} \\ | \quad | \\ \text{OH} \quad \text{OH} \end{array}$ 83. (c) Starch $\xrightarrow{\text{Diastase}}$ Maltose $\xrightarrow{\text{Maltase}}$ glucose.

85. (a) All are optically active.

86. (c)

90. (a)

93. (a) In sucrose the two monosaccharide units joined by α -1, 2 glycoside bond. Since sucrose does not have hemiacetal carbon. Therefore it is non-reducing sugar.94. (c) Starch $\xrightarrow{\text{Amylase}}$ Maltose.

96. (a) Glucose is the simplest carbohydrate i.e. monosaccharide rest are polysaccharide.

97. (a) We can't digest cellulose which is a polysaccharide.

98. (d) Diastase enzyme converts starch into maltose.

99. (b) Lactose is present in milk (Glucose + Galactose).

100. (b) Carbohydrates are rich source of energy.

102. (a) Sucrose is a non-reducing sugar it does not give any test with Benedict's solution.

103. (a) That is called glycosidic linkage.

108. (c) Invert sugar is laevo rotatory.

111. (c) Starch is polymer of α -glucose.114. (a) Raffinose ($\text{C}_{18}\text{H}_{32}\text{O}_{16}$) is a trisaccharide118. (b) Glucose + Fehling solution $\rightarrow$ Gluconic acid + Cu_2O
(Red ppt)123. (c) Charring of sugar, when it is treated with sulphuric acid (H_2SO_4) is due to dehydration. In this reaction water is removed from the sugar.

124. (a) Glucose is a monosaccharide while others are polysaccharide. So glucose is the simplest sugar.

125. (a) Glucose and mannose are epimers because they both differ in configuration at C-2 and the isomer which differs at C₂ position known as epimers of each other.126. (b) $\text{C}_{12}\text{H}_{22}\text{O}_{11} + \text{H}_2\text{O} \xrightarrow{\text{Hydrolysis}} \text{C}_6\text{H}_{12}\text{O}_6 + \text{C}_6\text{H}_{12}\text{O}_6$
Maltose Glucose Glucose

127. (b) Pepsin, ptyalin and lipase are enzymes while cellulose is not the enzyme.

Sugar	Relative sweetness
Sucrose	100
Glucose	74
Lactose	16
Fructose	173

129. (a) $C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O + 38ATP$
131. (b) Fructose has three chiral centres and hence $2^3 = 8$ optical isomers are possible.
132. (b) Freezing point is the temperature at which the liquid and the solid form of the same substance are in equilibrium and hence have the same vapour pressure. Due to lower vapour pressure of the solution, solid form of a solution separates out at a lower temperature. The decrease is called depression in freezing point.
- When solid is the solute, it is solvent that freezes. Hence in the given question water will be separated out first.
133. (a) Glucose is a monosaccharide having chemical composition $C_6H_{12}O_6$.

Proteins, Amino Acids and Enzymes

1. (b) Insulin is a protein consists of 51 amino acids in two chains. α and β
- α - 21 amino acids, β - 30 amino acids
- It is secreted by pancreas for controlling the sugar level in blood.
3. (a) Fibrous proteins are insoluble in water.
4. (a) Protein $\xrightarrow[\text{or change in pH}]{\text{Heated}}$ Denatured protein
5. (c) Simple protein + non - protein material $\rightarrow$ Conjugated protein
(Prosthetic group or co-factor)
6. (b) Heme $\rightarrow Fe^{+2}$ to which the porphyrine ring is attached to central atom by co-ordinate linkage.
7. (c) It is insoluble in water and used in food products capsules and photographic plates.
9. (c) Amino acids are non volatile crystalline compound.
10. (c) Isoelectric point is a pH at which zwitter ions do not migrate towards any of the electrode.
11. (c) Protein $\xrightarrow[\text{(Acidic medium in stomach)}]{\text{Enzyme}}$ Amino acid
12. (b) Protein + conc. $HNO_3 \rightarrow$ Yellow colour
- [This test is given by a protein which consists of α -amino acids containing a benzene ring such as tyrosine, phenylalanine etc. The yellow colour is due to nitration of benzene ring.]
14. (b) Proteins are polymers of amino acids.
- Amino acid $\rightarrow$ Dipeptide $\rightarrow$ Polypeptide $\rightarrow$ Protein.
21. (c) Proteins are nitrogenous compounds.
22. (b) In stomach medium is strongly acidic. Hence, $pH = 2$.
30. (d) Glycine $\rightarrow NH_2 - CH_2 - COOH$.
34. (c) Antigens are polysaccharides present on RBC's surface.
37. (a) $Hb + CO \rightarrow HbCO$
- carboxy haemoglobin it is 20 times more stable than oxyhaemoglobin.
40. (a) Peptides are formed by condensation of α - amino acids.
- $$H_2N - CH_2COOH + H_2N - CH_2 - COOH$$
- $$\xrightarrow[-H_2O]{\text{peptide bond}} H_2N - CH_2 - CONH - CH_2COOH$$

41. (d) Muscles contain myoglobin $CH_3 - CH \begin{array}{l} NH_2 \\ \diagdown \\ COOH \end{array}$
- alanine contains side chain of methyl group.
43. (b) It is the general formula for polysaccharides.
50. (b) $(CH_3)_2 \cdot CH \cdot \underset{\substack{| \\ NH_2}}{CH} - COOH \rightleftharpoons (CH_3)_2 - CH \cdot \underset{\substack{| \\ NH_3^+}}{CH} - COO^-$
52. (d) Lipase is used in lipid metabolism.
- Lipid $\xrightarrow{\text{Lipase}}$ Fatty acid + Glycerol
53. (b) Haemoglobin is a globular protein.
59. (c) Zwitter ion is a dipolar ion containing both a positive and negative charge in the following form $R - \underset{\substack{| \\ NH_3^+}}{CH} - COO^-$
Zwitterion
- The basic group CO_2^- and acidic group NH_3^+ .
63. (b) The amino acids which can't be synthesised by human body so they are essential to take from diet. They are 10 in number.
66. (b) Biological catalysts are enzymes and all enzymes are nucleic acid.
68. (d) Protein is a body building substance not energy giving substance.
76. (a) Na^+ and K^+ controls blood pressure and heart beat so excess of Na^+ ion increases B.P.
80. (a) This protein is found in hair, nail, muscle etc.
81. (b) The peptide bond is formed between two amino acids by the elimination of a water molecule. A dipeptide contains one peptide linkage. A tripeptide contains two peptide linkages. Similarly, a nanopptide contains 8 peptide linkages.
91. (a) Synthesis of polypeptide known as translation. For this process three types of RNA are essential.
92. (c) Protein is used in our body as a fuel for muscles and nerves and to build and repair body tissues.
93. (b) Zymase enzyme converts glucose into alcohol. It is found in the yeast.
- $$C_6H_{12}O_6 \xrightarrow[\text{glucose}]{\text{zymase}} 2C_2H_5OH + 2CO_2$$
- ethyl alcohol
94. (a) In peptide linkage i.e., $-CONH-$ group, the carboxyl group of one amino acid molecule forms an amide by combination with the amino group of the next amino acid molecule with the liberation of water molecule.
- $$\begin{array}{ccccccc} H & & O & & H & & R_1 & & H & & O \\ | & & || & & | & & & & | & & || \\ -N- & & C- & & N- & & C- & & N- & & C- \\ & & / & & \backslash & & / & & \backslash & & / \\ & & H & & R & & H & & O & & C \\ & & & & & & & & & & \backslash \\ & & & & & & & & & & R_2 \end{array}$$
95. (a) Four Fe^{2+} ions of each haemoglobin can bind with 4 molecules of O_2 and it is carried as oxyhaemoglobin.
- $$Hb_4 + 4O_2 \rightarrow Hb_4O_8$$
96. (d) Enzymes are shape selective specific biological catalysts which normally function effectively at body temperature.
97. (a) An enzyme (protein) is a biological catalyst.
98. (a) Amino acid synthesis was done by Stanley Miller.

Fats and Lipids

4. (c) Acid value is the number of 1 mg of KOH required to neutralise 1 gm of the fat or oil.
5. (c) Saponification value is the number of mg of KOH required to neutralize the fatty acid resulting from the complete hydrolysis of 1gm. of oil or fat.
6. (c) Iodine number is the number of gms of I_2 which combine with 100 gm of oil or fat. It shows the degree of unsaturation of acids in fat or oil.
7. (a) Oil(unsaturated) + $H_2 \xrightarrow{Ni}$ Fat (saturated)
8. (c) Oil + $NaOH$ (alkali) $\xrightarrow{\text{Saponification}}$ Glycerol + Soap
11. (d) Fats are called energy bank of the body. Stored below the dermis as subcutaneous fats.
12. (c)
13. (b) 1gm carbohydrate on oxidation gives 17 kJ of energy while 1 gm fat provide 37 kJ of energy.
18. (a) Waxes are esters of higher fatty acids.
19. (c) Oil/fat + Alkali $\xrightarrow{\text{Saponification}}$ Soap + Glycerol.
21. (b)
$$\begin{array}{c} CH_2OOCR \\ | \\ CHOOOCR \\ | \\ CH_2OOCR \\ \text{Lipid or} \\ \text{Triglyceride} \end{array} + H_2O \rightarrow \begin{array}{c} CH_2OH \\ | \\ CHOH \\ | \\ CH_2OH \\ \text{Glycerol or} \\ \text{Trihydric alcohol} \end{array} + 3R-COOH$$

Monocarboxylic acid
26. (a) Oleic acid, stearic acid and palmitic acids are produced by the hydrolysis of fats and the acid produced by hydrolysis of fats are called fatty acid.
27. (d) Oleic acid - $C_{17}H_{33}COOH$, linoleic acid- $C_{17}H_{31}COOH$, linolenic acid - $C_{17}H_{29}COOH$, palmitic acid - $C_{15}H_{31}COOH$.
- Saturated monocarboxylic acids form a homologous series which has a general formula $C_nH_{2n+1}COOH$ or $C_nH_{2n}O_2$. Only palmitic acid follows this.

Vitamin, Hormone and Nucleic acid

1. (d) $\text{Nitrogen base} + \text{Sugar} + \text{Phosphate}$
Nucleoside
3. (c) Adenine is a purine base common in both RNA and DNA.
4. (c) Insulin hormone is secreted by pancreas.
8. (a) 
19. (b) Adenine $\equiv$ Thymine, Guanine $\equiv$ Cytosine
2 hydrogen bonds 3 hydrogen bonds
21. (c) Vitamin B_1 is thiamine. Its main source is cereals.
22. (a) Gene is a part of the DNA molecule that codes for a specific protein.
25. (d) Cortisone is not a sex hormone, it regulates metabolism of fats, carbohydrates, proteins etc.
27. (d) Thymine is present in DNA while in RNA there is Uracil.
28. (a) Mutation is a chemical change in the sequence of Nitrogenous bases along the DNA strand which can lead to the synthesis of protein with altered amino acid sequence.

39. (b) Insulin is a hormone secreted by the pancreas that lowers blood glucose level by promoting the uptake of glucose by cells and the conversion of glucose to glycogen by the liver and skeletal muscle.
40. (b) Insulin is a proteinaceous hormone secreted by β cells of islets of Langerhans of pancreas in our body.
41. (b) Codon is present in m -RNA, which is responsible for translation.
42. (a) Energy is stored in our body in the form of A.T.P
43. (c) Nucleic acid is a polymer of nucleotides.
44. (c) Nucleoside on hydrolysis gives an aldopentose and a heterocyclic base purine and pyrimidine.
45. (b) An alteration in the base sequence of nucleic acid molecule is called mutation which can be by radioactive ray, by adaptation etc.
46. (a) Vitamin B_6 is called pyridoxin. It is found in fruits, green-vegetables, milk, etc. Due to its deficiency, anaemia disease is caused.

Critical Thinking Questions

1. (b) 
- This structure of β -D glucose has four asymmetric carbon atom
2. (c) It is Guanine having two possible binding sites.
3. (c) Four sub units are present in haemoglobin.
4. (c) The four bases in m -RNA : adenine, cytosine, guanine and Uracil have been shown to act in the form of triplet; each triplet behaving as a code for the synthesis of a particular amino acid.
5. (b) According to Chargaff's rule amount of adenine(A) is equal to that of thymine(T) and the amount of guanine(G) is equal to that of cytosine(C).
6. (d) Multiplication of DNA is called replication.
7. (b) Insulin is a hormone which decreases sugar level in the blood.
8. (b) Oxytocin hormone secreted by posterior pituitary gland plays an important role in child birth and milk ejection for feeding baby.
9. (c) Except oleic acid stearic acid, Lauric acid and Palmitic acid are saturated fatty acid. Oleic acid is unsaturated fatty acid.
10. (d) CO (III) Transition metal is present in vitamin B_{12} .
11. (a) 130 molecules of ATP produced in the lipid metabolism of a molecule of palmitic acid.
12. (d) Protein is insoluble in benzene.
13. (d)
$$\begin{array}{c} H \quad OH \\ | \quad | \\ CH_2O - C - COR \\ | \quad | \\ CHO - C - COR \\ | \quad | \\ CH_2O - C - COR \end{array} \xrightarrow[\text{Hydrolysis}]{\text{Lipase}} \begin{array}{c} CH_2OH \\ | \\ CHOH \\ | \\ CH_2OH \\ \text{Glycerol} \end{array} + R-COOH$$

Fatty acid
14. (d) α -helix structure is formed when the chain of α -amino acid coil as a right handed screw because of the formation of hydrogen bonds between amide groups of the same peptide

chain *i.e.*, *NH* group in one unit is linked to carbonyl oxygen of the third unit by hydrogen bonding. This *H*-bonding is responsible for holding helix in a position.

15. (b) Three types of chemicals enter the composition of all membranes proteins, lipids and carbohydrates, proteins content varies from 46–76% lipids 20–53%, while Carbohydrate content is 1–8%

16. (c) Difference in mass of compound

$$= 390 - 180 = 210$$

wt. of CH_3CO - group is = 43

Therefore no. of $-NH_2$ group = $\frac{210}{43} = 4.88 = 5$.

17. (d) Six type of tripeptide molecules are formed.
18. (b) Amylose is a polysaccharide.
19. (c) Aspartic acid is an amino acid with acidic side chain.

Lysine, Arginine and Histidine all are basic amino acids.

20. (d) Lucas test is used for the distinction of alcohols.
21. (d) Because their Ca^{++} / Mg^{++} salts are insoluble in water.
22. (d) Glucose on reaction with bromine water followed by oxidation gives gluconic acid

- 23.** (c) $NH_3^+ - CH_2 - COO^-$
dipolar ion
(Zwitterion or internal salt)

- 24.** (b) Ribose is an example of aldopentose.

α -D(+)-Glucopyranose and β -D(+)-Glucopyranose
 β -D(+)-Glucopyranose. These are anomers (a pair of
 stereoisomers which differ in configuration only around C_1
 are called anomers).

26. (b) Sucrose is composed of α -D-glucopyranose unit and a β -D-fructofuranose unit. These units are joined by α - β -glycosidic linkage between C-1 of the glucose unit and C-2 of the fructose unit.

Assertion and Reason

1. (a) Glycine is an amino acid, it contains both NH_2 as well as $-COOH$ groups and therefore, its aqueous solution form Zwitter ion which is amphoteric in nature.

Therefore, both assertion and reason are true.

2. (b) Hydrolysis of sucrose is known as inversion of canesugar because sucrose produce equimolecular mixture of glucose and fructose. Sucrose is dextro-rotatory which glucose and fructose mixture is laevorotatory. Sucrose is disaccharide.

3. (b) Proteins on hydrolysis gives α -amino acid because amino acids are the building block of proteins. It is also fact that amino acids contain both $-NH_2$ and $-COOH$ group.

Here assertion and reason both are correct but reason is not a correct explanation of assertion.

4. (e) Sucrose does not undergo mutarotation. Glucose and fructose shows mutarotation because they have two forms α and β . It is fact that sucrose is a disaccharide. Therefore, assertion is false but reason is true.

5. (d) Here, both the reason and assertion are false, DNA occurs in nucleus of the cell while RNA is found mainly in cytoplasm of the cell. On heating, enzymes lose their specific activity.

6. (a) All amino acid possesses amino as well as carboxylic group. $-NH_2$ group is basic while $-COOH$ group is acidic. Therefore, they behave as zwitter ion (dipolar ion). Here, both assertion and reason are true and reason is a correct explanation.

7. (b) The assertion that activity of an enzyme is pH dependent is correct. The reason that change in pH affects the solubility of enzyme in water is also true but the reason is not the correct explanation of assertion. Change in pH cause denaturation of enzyme.

8. (d) Glycosides are formed by treating glucose with methanol in presence of dry HCl gas. They cannot be hydrolysed in acidic conditions. They are not acetals but they are hemiacetals.

9. (c) The assertion is correct that haemoglobin is an oxygen carrier and the reason that oxygen binds as O_2^- to Fe of haemoglobin is incorrect, because oxygen binds as O_2 to Fe of haemoglobin part.

10. (c) Carboxypeptidase is an exopeptidase because it breaks the peptide chain at terminal ends.

Carboxypeptidase cleaves carboxy-terminal amino acids that have aromatic or branched aliphatic side chains.

- II. (a) Sucrose is a non reducing sugar as it does not reduce Tollen's or Fehling's reagent, due to absence of free aldehyde or ketone group. It contains stable acetal or ketal structure which cannot be opened into a free carboxyl group.

Sugar is composed of α -D-glucopyranose unit and β -D-fructofuranose unit. These units are joined by α - β -glycosidic linkage between C-1 of the glucose unit and C-2 of the fructose unit.

12. (b) Carbohydrates which upon hydrolysis yield two molecules of the same or different monosaccharides are called disaccharides. For example, sucrose on acid hydrolysis give one molecule of glucose and fructose.

13. (b) Fructose on warming with dilute alkali, gives rise to an equilibrium mixture of glucose, fructose and mannose. The ability of fructose to reduce Fehling solution and Tollen's reagent is probably due to the isomerisation of fructose to

glucose and mannose (this is called Lobry de Bruyn and Elkenstein rearrangement).

14. (b) Glucose exists in two forms, *i.e.*, α -D-glucose with a specific rotation of $+112^\circ$ and β -D-glucose with a specific rotation of $+19^\circ$. However, when either of these two forms is dissolved in water and allowed to stand. it gets converted into the same equilibrium mixture of both the α - and β -forms with a small amount of open chain form. As a result of this equilibrium, the specific rotation of a freshly prepared solution of α -glucose decreases from $+112^\circ$ to 52.7° while that of β glucose increases from $+19^\circ$ to 52.7° .
15. (b) In acidic medium $-\text{COOH}$ group acts as the base and accepts a proton. As a result, α -amino acids exist as cations in acidic medium and migrate towards cathode under the influence of an electric field. In alkaline medium $\overset{+}{\text{N}}\text{H}_3$ group acts as the acid and thus loses a proton. As a result, α -amino acids exist as anion and migrate towards anode under the influence of an electric field. However at some intermediate value of pH , the concentration of cationic form and anionic form will become equal and hence there is no net migration of α -amino acid under the influence of an electric field.
16. (b) Valine is an essential amino acid. The amino acids which the body cannot synthesize are called essential amino acid.
17. (e) Sequence of bases in DNA is TGAACCTT. Since according to base-pairing principle, T in DNA faces A in m -RNA, while G faces C and A faces U . Therefore, sequence of bases in m -RNA is ACUUGGAA.
18. (e) Millons test is a test for proteins. When Millon's reagent is added to the aqueous solution of a protein, a white precipitate is formed.
19. (b) ATP has four negatively charged oxygen atoms very close to each other. So the repulsive forces between them is high. On hydrolysis of ATP, a H_2PO_4^- ion is eliminated and the number of negatively charged oxygen atoms decreases. Thus, repulsive forces decreases and a large amount of energy is set free. When ATP changes to ADP, which in turn changes into AMP, energy is released at each step. This is how ATP can act as a source of energy.
20. (e) Solubility of protein is maximum at the isoelectric point.
21. (e) Amino acids are soluble in polar solvents like H_2O , NaOH and HCl and insoluble in non-polar solvents like benzene, ether etc.
22. (c) Sucrose on hydrolysis gives equal amounts of glucose and fructose. Since glucose has less positive and fructose has more negative magnitude of rotation, therefore, change in the sign of rotation is observed.

Biomolecules

SET Self Evaluation Test -31

1. Which does not show mutarotation
(a) Sucrose (b) Maltose
(c) Glucose (d) Fructose
2. Artificial silk is
(a) Polyamides (b) Polyesters
(c) Polyacids (d) Polysaccharides
3. Which of the following is a protein [Pb. CET 2003]
(a) Pepsin (b) Adrenaline
(c) ATP (d) Glutamin
4. Glucose gives many reactions of aldehyde, because [CPMT 1977]
(a) It is hydrolysed to acetaldehyde
(b) It is a polyhydroxy ketone
(c) It is a cyclic aldehyde
(d) It is a hemiacetal in equilibrium with its aldehyde form in solution
5. Glucose in blood can be quantitatively determined with [JIPMER 2002]
(a) Tollen's reagent
(b) Benedict's solution
(c) Alkaline iodine solution
(d) Bromine water
6. Which of the following ions can cause coagulation of proteins [Kerala (Med.) 1999]
(a) Na^+ (b) Ag^+
(c) Ca^{++} (d) Mg^{++}
7. Glucose reacts with methyl alcohol to give [CPMT 1985]
(a) α -methyl glucoside
(b) β -methyl glucoside
(c) Both (a) and (b)
(d) None of these
8. Molisch's test is done for the detection of [BHU 1987]
(a) Alkyl halide (b) Carbohydrate
(c) Alkaloid (d) Fat
9. Which of the following is not an amino acid [MP PET/PMT 1998]
(a) Glycine (b) Alanine
(c) Histidine (d) Benzidine
10. A substance forms zwitter ion. It can have functional groups [DCE 2002]
(a) $-NH_2, -COOH$ (b) $-NH_2, -SO_3H$
(c) Both (d) None of these
11. Which functional group participates in disulphide bond formation in proteins [CBSE PMT 2005]
(a) Thiolactone (b) Thiol
(c) Thioether (d) Thioester
12. Schweitzer's reagent used for dissolving cellulose in the manufacture of artificial silk is [Roorkee 1999]
(a) $CuSO_4 \cdot 5H_2O$
(b) CuI
(c) $[Cu(NH_3)_4]SO_4$
(d) $Cu(CH_3COO)_2 \cdot Cu(OH)_2$
13. Which one of the following statements is true for protein synthesis (translation) [AIIMS 2005]
(a) Amino acid are directly recognized by *m*-RNA
(b) The third base of the codon is less specific
(c) Only one codon codes for an amino acid
(d) Every *t*-RNA molecule has more than one amino acid attachment site.
14. In both DNA and RNA, heterocyclic base and phosphate ester linkages are at [AIEEE 2005]
(a) C'_5 and C'_2 respectively of the sugar molecule
(b) C'_2 and C'_5 respectively of the sugar molecule
(c) C'_1 and C'_5 respectively of the sugar molecule
(d) C'_5 and C'_1 respectively of the sugar molecule
15. Which of the following biomolecules contain non-transition metal ion [KCET 2005]
(a) Vitamin B_{12} (b) Chlorophyll
(c) Haemoglobin (d) Insulin
16. An example of a sulphur containing amino acid is [KCET 2005]
(a) Lysine (b) Serine
(c) Cysteine (d) Tyrosine
17. Which of the following is not present in a nucleotide [KCET 2005]
(a) Cytosine (b) Guanine
(c) Adenine (d) Tyrosine

Chapter 32 Chemistry in Action

Chemistry plays very important role in our every day life from the starting, it has been in the service of mankind. Our daily needs of food, clothing, shelter, potable water, medicines etc. are in one or the other manner connected with chemical compounds, processes and principles. We always owe a debt to chemists for their important contributions for giving us life saving drugs, synthetic fibres, synthetic detergents, variety of cosmetics, preservatives for our food, fertilizers, pesticides etc. There is no aspect of our life that is not affected by the developments in chemistry. Thus the mankind owes much to chemistry because it has improved the quality of life.

Dyes

Dye is a natural or synthetic colouring matter which is used in solution to stain materials especially fabrics. All the coloured substances are not dyes. A coloured substance is termed as a dye if it fulfils the following conditions,

- ☐ It must have a suitable colour.
- ☐ It can be fixed on the fabric either directly or with the help of mordant.
- ☐ When fixed it must be fast to light and washing, *i.e.*, it must be resistant to the action of water, acids and alkalies, particularly to alkalies as washing soda and soap have alkaline nature.

(i) **Theory of Dyes** : A dye consists of a chromophore group and a salt forming group called **anchoric group**. In 1876, **Otto witt** put forth a theory as to correlate colour with molecular structure (constitution). The theory is named '**The Chromophore Auxochrome Theory**' and its main postulates are,

(i) The colour of the organic compounds is due to the presence of certain multiple bonded groups called **chromophores**. Important chromophores are,

[Chromophore-Greek word, Chroma = *colour*, Phorein = *to bear*].

The presence of chromophore is not necessarily sufficient for colour. To make a substance coloured, the chromophore has to be conjugated with an extensive system of alternate single and double bonds as exists in aromatic compounds.

The chromophore part of the coloured substance (dye) absorbs some wavelengths from white light and reflects back the complementary colour. A coloured compound having a chromophore is known as **chromogen**.

(ii) Certain groups, while not producing colour themselves, when present along with a chromophore in an organic substance, intensify the colour. Such colour assisting groups are called **auxochromes** (Greek word, Auxanien = *to increase*; Chrome = *colour*), *i.e.* they make the colour deep and fast and fix the dye to the fabric. The auxochromes are acidic or basic functional groups. The important auxochromes are,

Acidic : $-\text{OH}$ (Hydroxy), $-\text{SO}_3\text{H}$ (Sulphonic), $-\text{COOH}$ (Carboxylic)

Basic : $-\text{NH}_2$ (Amino), $-\text{NHR}$ (Alkylamino), $-\text{NR}_2$ (Dialkylamino)

Example :

However, Otto witt chromophore-Auxochrome concept fails to explain the colour of certain dye stuffs like indigo.

(2) **Classification of Dyes** : Dyes are classified to their chemical constitution or by their application to the fibre.

(i) **Classification of dyes according to their chemical structure**

(a) **Nitro and Nitroso dyes** : These dyes contain nitro or nitroso groups as the chromophores and $-\text{OH}$ as auxochrome. A few example are,

(b) **Azo dyes** : The azo dyes contain one or more azo groups – $N=N$ –, as the chromophore. Azo dyes constitute the largest and most important group of synthetic dyes. These can be prepared by diazotising an aromatic amine and subsequent coupling with a suitable aromatic phenol or amine.

The important azo dyes are the following.

Azo dyes are highly coloured. Azo dyes can be further divided into acid, basic, direct, ingrain or developed dyes, etc., on the basis of mode of application.

(c) **Tri aryl methane dyes** : In these dyes, the central carbon is bonded to three aromatic rings. One of which is in the quinonoid form (the chromophore). Malachite green is the typical example of this class.

Rosaniline and crystal violet are other two important dyes of this class.

(d) **Anthraquinone dyes** : Para quinonoid chromophore is present in these anthracene type dyes. Alizarin is a typical anthraquinone dye.

(e) **Phthaleins** : Products obtained by condensation of phthalic anhydride with phenols in presence of dehydrating agents like conc. H_2SO_4 or anhydrous zinc chloride are called phthaleins.

(f) **Indigo dyes** : These dyes contain the carbonyl chromophore. Indigo is the oldest known dye.

Another indigo dye is royal blue in colour which is dibromo derivative of indigo. It is called Tyrian blue.

Common 'Neel' used as a blueing agent in laundry to remove yellowish tint on white clothes or in whitewashing is not indigo. It is ultramarine blue – an inorganic complex silicate of aluminium and sodium with about 13% sulphur.

(ii) **Classification of dyes according to their application**

(a) **Direct dyes** : Direct dyes can be directly applied to the fibre, both animal and vegetable, by dipping in hot aqueous solution of the dye. These dyes are most useful for those fabrics which can form hydrogen bonds, i.e., for cotton, rayon, wool, silk and nylon. Martius yellow and congo red act as direct dyes. Examples : Martius yellow, congo red.

(b) Acid dyes : These are usually salts of sulphonic acids and can be applied to wool, silk and nylon. The presence of sulphonic acid group makes them water soluble. These dyes are applied from an acidic bath. The polar acidic groups interact with the basic groups of the fabric. Orange-I is an excellent acid dye.

(c) Basic dyes : These are the hydrochlorides or zinc chloride salts of colour bases having basic groups. These dyes react with anionic sites present on the fabric to attach themselves. These dyes colour fibers of nylons and polyesters. Aniline yellow, Magenta (Rosaniline) and Malachite green are the examples of basic dyes.

❑ Acid and basic dyes are actually direct dyes.

(d) Mordant dyes : These dyes have no natural affinity for the fabric and are applied to it with the help of certain additional substances known as mordants. A mordant (Latin mordere = to bite) is any substance which can be fixed to fabric and reacts with the dye to produce colours on fabric. Three types of mordants are commonly used,

- Acidic mordants like tannic acid which are used with basic dyes.
- Basic mordants such as metallic hydroxides or albumin which are used with acidic dyes.
- Metallic mordants like salts of aluminium, chromium, iron, tin, etc., which are used with acidic dyes.

Actually the mordant forms an insoluble coordination compound between the fabric and the dye and binds the two. Alizarin is a typical mordant dye. It gives different colours depending on the metal ion used. For example, with Al^{3+} , alizarin gives a rose red colour; with Ba^{2+} , a blue colour; with Fe^{3+} , a violet colour and with Cr^{3+} , a brownish red colour.

The process of mordant dyeing consists in impregnating the fabric with mordant in presence of wetting agent followed by soaking of the fabric into the solution of dye.

(e) Vat dyes : These dyes are insoluble in water and cannot be applied directly. These dyes on reduction with sodium hydrosulphite ($NaHSO_3$) in a vat form a soluble compound which has great affinity for cotton and other cellulose fibres. The cloth is soaked in the solution of a reduced dye and then hung in air or treated with oxidants like perboric acid. As a result, the colourless compound is oxidised to insoluble dye which is now bound to the fabric. The colourless and reduced state of the dye is called the Leuco base. The common examples of vat dyes are indigo and tyrian purple. These are mostly used on cotton.

(f) Ingrain dyes (developed dyes) : Ingrain dyes are those which are synthesised directly on the fabric. Examples of this type of dyes are azo dyes. The fabric is immersed in the solution of coupling reagent (usually a phenol or naphthol). Then it is dipped in the solution of suitable diazonium salt. Both react to form the dye whose molecules are adsorbed on the surface of fabric. The ingrain dyeing is particularly suitable for cotton fabrics.

(g) Disperse dyes : These dyes are used to colour synthetic fabrics such as nylon, orlon, polyesters and cellulose acetate which have tightly packed structures. The dyes are dispersed in a colloidal form in water. The fabric is immersed in the colloidal dispersion of the dye when fine dye particles are trapped within the polymer structure of the fabric. Examples of this type of dyes are monoazodye and anthraquinone dye.

Drugs and Chemotherapy

Drugs may be a single chemical substance or a combination of two or more different substances. An ideal drug should satisfy the following requirements,

- ❑ When administrated to the ailing individual or host, its action should be localised at the site where it is desired to act. In actual practice, there is no drug which behaves in this manner.
- ❑ It should act on a system with efficiency and safety.
- ❑ It should have minimum side effects.
- ❑ It should not injure host tissues or physiological processes.
- ❑ The cell should not acquire resistance to the drug after sometime.

Very few drugs satisfy all the above requirements. Each drug has an optimum dose, below which it has no action and above this level it becomes a poison.

The term *chemotherapy*, which literally means chemical therapy or chemical treatment was coined in 1913 by **Paul Ehrlich**, the father of modern chemotherapy. He defined chemotherapy as the use of chemicals (drugs) to injure or destroy infections micro-organisms without causing any injury to the host.

Chemicals (drugs) used in chemotherapy are usually classified according to their action.

(i) **Antipyretic** : Antipyretic is a drug which is responsible for lowering the temperature of feverish body. The central nervous system, especially the hypothalamus, plays an important role in maintaining the balance between the heat production and heat loss in order to regulate the body temperature. Hypothalamus is, thus, known as the *thermostat* of the body.

The antipyretic drug helps to reset the thermostat at normal temperature. Heat production is not inhibited but heat loss is increased by increased peripheral blood flow which increases the rate of perspiration. This causes body to lose heat and subsequently lowers the body temperature.

Aspirin is an important antipyretic. The other antipyretics are phenacetin, paracetamol, novalgin and phenyl butazone.

Aspirin should not be taken empty stomach. Some persons are allergic to aspirin.

The usual allergic reaction is rashes on skin, lowering of blood pressure, profuse sweating, intense thirst, nausea and vomiting. Calcium and sodium salts of aspirin are more soluble and less harmful.

The derivatives of *p*-aminophenol are used as antipyretic. The main limitation of these derivatives is that they may act on red blood cells and thus, they may be harmful in moderate doses. The important derivatives are,

It is highly toxic and hence not considered as a safe drug. Oxyphenyl butazone is less toxic and is used in place of phenyl butazone.

(2) **Analgesics** : Drugs which relieve or decrease pain are termed analgesics. These are of two types,

(i) **Narcotics** : These are mainly opium and its products such as morphine, codeine and heroin. These produce analgesia and sleep and in high doses cause unconsciousness. They are very potent drugs and their chronic use leads to addiction.

(ii) **Non-narcotics** : These are the drugs which are not potent and do not cause addiction. Common drugs are aspirin and algin. These drugs also have antipyretic properties.

(3) **Antimicrobials** : These are the chemical substances used to cure infections due to micro-organisms. These are also called microbes. Any organism which causes disease is called **pathogen**.

The control of microbial diseases can be achieved by the following three ways,

- By drugs which kill the organism in the body (**bactericidal**).
- By drugs which inhibit or arrest the growth of the organism (**bacteriostatic**) and
- By increasing immunity and resistance to infection of the body (**immunity**).

Antimicrobial substances may be synthetic chemicals like *sulphonamides*, *paraamino salicylic acid* or they may be antibiotics like tetracycline, penicillin, chloramphenicol, etc.

The common example of antimicrobial drug is *sulphanilamides* which are effective in wide range of micro-organisms. These are structural analogues of *p*-amino benzoic acid.

(i) **Antiseptics** : The chemical substances which are used to kill or prevent the growth of micro-organisms are called **antiseptics**. These are not harmful to living tissues and can be safely applied on wounds, cuts, ulcers, diseased skin surfaces. These are also used to reduce odours resulting from bacterial decomposition of the body or in the mouth. They are, therefore mixed with deodorants, face powders and breath purifiers. We all must be familiar with antiseptic creams like *furacin*, *soframycin* etc.

(ii) **Disinfectants** : The chemical substances which are used to kill microorganisms but they cannot be applied on living tissues are called **disinfectants**. Therefore, disinfectants also kill micro organisms but these are not safe for living tissues. Disinfectants play a major role in water treatment and in public health sanitation. These are commonly applied to inanimate objects such as floors, instruments, etc.

The same substance can act as disinfectant as well as antiseptic depending upon its concentration. For example, a 0.2% solution of **phenol** acts as antiseptic and its 1% solution acts as disinfectant.

The common examples are,

- Cl₂** is used for making water fit for drinking at a concentration 0.2 to 0.4 ppm.
- Dettol** is an antiseptic. It is a mixture of chloroxylenol and terpenol in a suitable solvent. Chloroxylenol has both antiseptic and disinfectant properties.
- Bithional** is antiseptic which is generally added to medicated soaps to reduce the odour produced by bacterial decomposition of organic matter on the skin.

- Iodine** is powerful antiseptic. It is used as a tincture of iodine which is 2-3% iodine solution of alcohol-water.
- Low concentrations of **sulphur dioxide** are used for sterilizing and preservation of squashes.
- A dilute aqueous solution of **boric acid** is used as a weak antiseptic for eyes. It also forms a part of antiseptic baby talcum powders.
- Iodoform** is also used as an antiseptic powder for wounds.
- Hydrogen peroxide** is also used as non-irritating strong antiseptic.

(i) **Hexachlorophene** is mainly used in soaps, creams, dusting powders and emulsions.

(j) **Amyl metacresol** (5-methyl-2-pentyl phenol) is an antiseptic which is used commonly as a mouthwash or gargles in infections of the mouth and throat.

(k) A naturally occurring phenol derivative, **thymol** is used as a powerful disinfectant than phenol.

Several naturally occurring penicillins have been isolated all of these have the empirical formula, $C_9H_{11}O_4SN_2R$

Table : 32.1

Name	Value of R	Chemical name
Penicillin-G or II		Benzyl penicillin

General structure of penicillin

Penicillin -F or I	$-CH_2 - CH = CH - CH_2 - CH_3$	2-Pentenyl penicillin
Penicillin-K or IV	$-(CH_2)_6 - CH_3$	n-Heptyl penicillin
Penicillin-X or III		p-Hydroxy benzyl penicillin
Penicillin-Y or V		Phenoxy methyl penicillin
Ampicillin		Benzyl amine penicillin
Methicillin		2, 6- dimethoxy phenyl penicillin

The commonly used antibiotics are :

(i) **Streptomycin** : It was discovered in 1944 by Waksman. It is effective against tuberculosis. It is also used for other common infections like throat, lungs, ears and kidney. It is very effective in the treatment of meningitis and pneumonia. Streptomycin is an amino base and forms salts that are very soluble in water. The sulphate and calcium chloride double salts are white amorphous powders. The molecule contains two strongly basic guanido groups and a weakly basic methylamino group.

(l) Some organic dyes are also effective antiseptics. These are used for the treatment of infectious diseases. The common examples of antiseptic dyes are **gentian violet** and **methylene blue**.

(5) **Antibiotics** : A chemical substance produced by or derived from living cells which is capable of inhibiting the life processes or even destroying micro-organism is called **Antibiotics**.

The first antibiotic, discovered by Alexander Fleming in 1929 from the mould *penicillium notatum*, was penicillin. In 1938, Ernst Chain and Howard Florey isolated penicillin in pure form and proved its effectiveness as an antibiotic. It was introduced into medical practice in 1941. Penicillin is used against large number of infections caused by various cocci, gram positive bacteria, etc. It is an effective drug for pneumonia, bronchitis, sore throat and abscesses.

Streptomycin is rapidly absorbed after intramuscular injection. Oral administration of streptomycin is of no value in the treatment.

(ii) **Chloramphenicol** : It is a broad spectrum antibiotic. It was first isolated from a species of *streptomyces*. It has been produced synthetically on commercial basis. It is white or greyish white needle like crystalline substance. It has a bitter taste. One gram of chloramphenicol is soluble in about 400 ml of water. It is freely soluble in alcohol.

It is effective against certain gram-positive and gram-negative bacteria, some rickettsiae and viruses. It is very effective in the treatment of typhoid fever, para-typhoid fevers, diarrhoea and dysentery. *It is also specific for influenza, meningitis, pneumonia, whooping cough and urinary tract infection.*

Chloramphenicol may cause serious complications and hence it should not be used indiscriminately or for minor infections. Chloramphenicol in high concentrations inhibits the growth of animal and plant cells.

(iii) **Tetracyclines** : The tetracyclines contain hydronaphthacene skeleton as the characteristic structural unit. The structures of tetracyclines are given as follows,

Tetracyclines are broad spectrum antibiotics and are effective against a number of types of bacteria, larger viruses, protozoa, parasites and typhus fever. These can be given orally.

(6) **Sulpha drugs** : These are synthetic chemotherapeutic agents which contain sulphonamide, $-SO_2NH_2$ group in their structure. These were the first effective chemotherapeutic agents to be widely used for the cure of bacterial infections in humans. They have also been found to be active against gram-positive and gram negative cocci, bacilli and protozoa. At present sulphanilamides have been largely replaced by antibiotics for the treatment of most of the bacterial diseases. Some successful sulphanilamides are given below,

Table 32.2

Name of drug	Uses
Sulphapyridine	Used to cure pneumonia.
Sulphadiazine	Used to cure pneumonia, throat infections, meningitis, etc.
Sulphaguanidine	Used to cure bacillary dysentery.
Sulphathiazole	Useful against staphylococcal infections and bubonic plague.
Succinyl sulphathiazole	Useful in intestinal infections such as bacillary dysentery and cholera.

Chlordiazepoxide

Sulpha acetamide

Used to cure urinary tract infections.

(7) **Antihistamines** : Antihistamines are chemical substances which diminish or abolish the main actions of histamine released in the body and hence prevent the allergic reactions. In other words, antihistamines are also called *anti-allergic drugs*.

The common antihistamine drugs are *diphenylhydramine (Benadryl)*, *pheniramine maleate (Avil)*, *chlorpheniramine (Zet)*, *Promethazine*, *triprolidine (actidil)*, *Antazoline (antistine)*, *Dimethindene (foristal)*.

(8) **Anaesthetics** : It may be defined as those drugs which produce insensibility to the vital functions of all types of cell especially of nervous system. Anaesthetics may be classified into two groups on the basis of their applications,

(i) **General anaesthetics** : These depress the central nervous system to such an extent that all sensitivity to pain or feeling is lost, *i.e.*, they produce unconsciousness all over the body. *These are used for major surgical operations.* These may be used in the form of gas, *e.g.*, nitrous oxide, cyclopropane, ethylene, either or may be given in the injection form, *e.g.*, sodium pentothal.

Sodium pentothal

(ii) **Local anaesthetics** : These affect only a part of the body insensitive to pain or feeling. Common local anaesthetics are : *xylocaine (used in jelly form)*, *ethyl chloride (used in spray form)* and *procaine (used in injection)*. These are used for *small surgical operations like tooth extraction, stitching of a wound or incision of an abscess*. Some other modern local anaesthetics are; α -eucaine, orthocaine (orthoform) and dimethisoquin.

(9) **Tranquillizer or Hypnotics** : The chemical substances used for the treatment of stress, mild and severe mental diseases are called **tranquillizers**. These are used to release mental tension and reduce anxiety.

Meprobamate

For releasing tension

These derivatives are called as barbiturates.

These are also called *psychotherapeutic drugs*. These drugs make the patient passive and help to control their emotional distress or depression.

The most commonly used tranquillizers are barbituric acid and its derivatives such as *veronal*, *amytal*, *mebutal*, *seconal* and *luminal*.

Barbituric acid

Luminal

Seconal

Valium

Serotonin

Equanil

Used in depression and hypertension

* It may be noted that different terms are used for drugs which are used to cure mental diseases. Some of these terms are ,

(i) **Sedatives** : These act as depressant and suppress the activities of central nervous system. They are given to patients who are mentally agitated and violent. Sedatives give a feeling of calmness, relaxation or drowsiness in the body. Their high doses induce sleep. The common sedatives are *valium*, *barbiturates* (obtained from barbituric acid).

(ii) **Antidepressants** : These drugs are given to patients with shattered confidence. These produce a feeling of well being and confidence in the person of depressed mood. Therefore, these are also called *mood booster drugs*. The common examples are *vitalin*, *cocain*, *methedrine* etc.

(10) **Anti-Malarials** : Malaria is highly wide spread infectious disease, caused by sporozoa of genus *plasmodium*. It is characterised clinically by periodic fever, anaemia and enlargement of liver and spleen. The four species, *Plasmodium vivax*, *Plasmodium malariae*, *Plasmodium ovale* and *Plasmodium falciparum* are responsible for malaria in man. Thus, there are four types of malaria,

Protozoa	Malaria caused
<i>Plasmodium vivax</i>	Fever on alternate days
<i>Plasmodium malariae</i>	Fever once in three days
<i>Plasmodium ovale</i>	Fever once in three days
<i>Plasmodium falciparum</i>	Fever once in four days

The chemotherapy of malaria is connected with different stages in the cycle of malarial parasite. The mosquito injects the parasite into the blood of a human being. It immediately goes to the liver cells where it multiplies. Once the parasites have grown in number, these come to blood

and enter the red blood corpuscles where they also multiply. Eventually, the red cells burst liberating the parasites as well as toxins. These toxins cause fever, chills and rigour. The liberated parasites attack the fresh red cells and the cycle continues. Depending upon the periodicity of this cycle in the red cells fever comes on alternate days, once in three days or once in four days. Some of the liberated parasites go back to liver and continue the cycle there.

Choice of an antimalarial drug depends on the point of its action on the life cycle of the malarial parasite. Various drugs used are :

(i) **Primaquine** : It destroys sporozites in the liver. It is too toxic, and its long term use is not advisable.

(ii) **Chloroquine, proquanil and pyrimethamine** : These kill the parasites in blood.

(ii) **Antifertility drugs** : These are the chemical substances used to control the pregnancy. These are also called *oral contraceptives*. The basic aim of antifertility drugs is to prevent conception or fertilization.

Oral contraceptives belong to the class of natural products known as steroids.

These control the female menstrual cycle and ovulation. The birth control pills are essentially a mixture of estrogen and *progesterone derivatives* which are more potent than the natural hormones.

These common pills are used for a combination of progesterone, norethindrone and estrogen ethynylestradiol.

Mifepristone is a synthetic steroid which blocks the effects of progesterone and is used as a "morning after pill" in many countries.

Ormeloxifene (*Centronorm Saheli*) has also been developed and tested at the Central Drug Research Institute, Lucknow as an effective antifertility drug to acceptable degree. The oral contraceptives are commonly known as *pills* or *oral pills* and have been used worldwide for birth control.

Drugs or Medicines from plants

❑ Bark of willow tree which contains salicylic acid. It is used to get relief from pain and fever.

❑ Alkaloid Reserpine from *Rauwolfia serentina* for high blood pressure (hypertension).

❑ Alkaloid Quinine from Cinchona tree for Malaria.

Table : 32.3

Chemicals in Medicines

Analgesics	Relieve pain	Aspirin, ibuprofen, diclofenac sodium, naproxen, narcotics (morphine, codeine, heroin).
Antipyretics	Lower body temperature	Aspirin, paracetamol, phenacetin.
Antiseptics and disinfectants	Kill or prevent the growth of micro-organisms.	0.2% phenol (antiseptic), 1% phenol (disinfectant), chlorine, dettol (chloroxylenol and terpenol), bithional, iodine, boric acid.
Tranquilizers	Treatment of stress, mental diseases	Derivatives of barbituric acid (veronal, amytal, membutal, luminal, seconal), chlordiazepoxide, meprobamate, valium, serotonin.
Antimicrobials	Cure infections due to micro-organisms (microbes)	Antibiotics, Sulphonamides
Anti fertility drugs	Birth control	Oral contraceptives, estrogen (ethynylestradiol) and progesterone (norethidrone), mifepristone.
Antibiotics	Produced by micro-organisms and can inhibit the growth of other micro-organisms.	Penicillin, tetracycline, chloramphenicol, ampicillin, amoxicillin Sulpha drugs (sulphanilamide, sulphadiazine, sulphaguanidine)
Antacids	Remove excess acid in stomach	Magnesium hydroxide, magnesium carbonate, magnesium trisilicate, aluminium hydroxide gel, sodium bicarbonate, aluminium phosphate, prazole, lansoprazole.

Rocket Propellant

Rocket propellants consist of rocket engines powered by propellants. These are used both in space vehicles as well as in offensive weapons such as missiles. The propellants are chemical substances which on ignition provide thrust for the rocket to move forward. These substances are called **rocket propellants**. A propellant is a combination of **an oxidiser** and **a fuel** which when ignited undergoes combustion to release large quantities of hot gases. The passage of hot gases through the nozzle of the rocket motor provides the necessary thrust for the rocket to move forward according to Newton's third law of motion.

The function of a rocket propellant is similar to that of petrol in a motor car except that in the later case, the oxygen needed for burning the fuel is taken from the atmospheric air.

(i) **Types of rocket propellants** : Depending upon the physical state, propellants can be classified as :

(i) **Solid propellants** : The solid propellants are mixtures of solid fuel and a solid oxidiser. These are further divided into two classes,

(a) **Composite propellants** : These are solid propellants which use polymeric binder such as polyurethane or polybutadiene as a fuel and a solid oxidiser such as ammonium perchlorate, nitrate or chlorate. The performance of these propellants can be increased by using some additives such as finely divided magnesium or aluminium metal along with the fuel.

(b) **Double base propellants** : These are solid propellants which mainly use nitroglycerine and nitrocellulose. The nitrocellulose gels in nitroglycerine set in as a solid mass.

The main **disadvantage** of solid propellants is that these propellants once ignited will continue burning with predetermined rate. These cannot be regulated.

(ii) **Liquid propellants** : These consist of an oxidizer such as liquid oxygen, nitrogen tetroxide (N_2O_4) or nitric acid and a fuel such as kerosene, alcohol, hydrazine or liquid hydrogen. These are further classified as,

(a) **Monopropellants** : The propellants in which a single chemical compound acts as fuel as well as oxidizer are called monopropellants. For example, hydrazine, nitromethane, methyl nitrate, hydrogen peroxide, etc. Except hydrazine, the other compounds contain both the oxidizer and the fuel elements in the same molecule.

(b) **Bipropellants** : These are propellants in which the fuel and oxidiser are stored separately but are allowed to combine at the time of combustion. For example, kerosene and liquid oxygen.

☐ **Hydrazine can act both as a monoliquid as well as a biliquid propellant.** Hydrazine ($H_2N - NH_2$) acts as a monoliquid propellant as it decomposes exothermally into hot gaseous mixture of N_2 and H_2 ,

As a biliquid propellant with liquid oxygen as oxidiser,

Advantages of Biliquid Propellants over Solid Propellants

☐ The biliquid propellants give higher thrust than solid propellants.

☐ The thrust generated by liquid propellants can be controlled by switching on and off the flow of propellants. On the other hand, the thrust cannot be controlled in solid propellants.

(iii) **Hybrid propellants** : These are the propellants which consist of solid fuel and a liquid oxidiser. For example, liquid N_2O_4 (liquid oxidiser) and acrylic rubber (solid fuel).

(2) Examples of Propellants used in Different Rockets

(i) **Saturn booster rocket** of American space programme used a mixture of kerosene and liquid oxygen as the propellant in the initial stage whereas liquid oxygen and liquid hydrogen were used as propellant in high altitudes.

(ii) Russian rockets such as **Proton** used a liquid propellant consisting of kerosene and liquid oxygen.

(iii) The Indian satellites SLV-3 and ASLV used composite solid propellants.

(iv) The rocket PLSV will use solid propellant in the first and third stages and liquid propellant in second and fourth stages. The liquid propellant will consist of N_2O_4 and unsymmetrical dimethyl hydrazine (UDMH) and N_2O_4 and monomethyl hydrazine (MMH) respectively.

(3) Calculation of specific impulse of propellant

The function of rocket propellant is based on specific impulse which measures the kinetic energy producing ability of the propellant. The specific impulse (I_s) can be calculated from the following equation,

$$I_s = \frac{1}{g} \sqrt{\left(\frac{2\gamma}{\gamma - 1} \right) \left(\frac{gRT_c}{M} \right) \left(1 - \frac{P_e}{P_c} \right)^{\frac{\gamma - 1}{\gamma}}}$$

Where,

γ = Ratio of specific heat at constant pressure to specific heat at constant volume.

T_c = Combustion chamber temperature.

M = Average molecular mass of exhaust products.

P_e = External pressure

P_c = Chamber pressure, and

R = Gas constant

The above equation shows that the conditions favouring high specific impulse are high chamber temperature and pressure, low molecular mass of exhaust products and low external pressure.

The higher the temperature and pressure achieved in the chamber, the higher the kinetic energy of the gases escaping through the nozzle.

Chemical in cosmetics

The word cosmetics is derived from the Greek word *Kosmetikos*. It means decorating, beautifying or improving complexion of skin. In India from the ancient times *Henna* has been used to decorate hands and some other parts of the body. Some of the cosmetics which find use in daily life are discussed below,

(1) **Creams** : Creams are used for facial make-up. These are often classified as : cleansing creams, cold creams, vanishing creams, sunburn creams and bleach creams.

(i) **Cleansing creams** : Remove facial make up, surface grime, lipstick and oil.

(ii) **Cold creams** : Lubricate the skin and prevent roughness and chaffing.

(iii) **Vanishing creams** : Keep the skin cool and oily.

(iv) **Sunburn creams** : Save the skin from sunburn in summer.

(v) **Bleach cream** : Exert a bleaching effect on dark skin.

(2) **Perfumes** : Perfumes are the materials, used to provide fragrance. Several requirements have to be fulfilled to make a good perfume and any material, which just gives good smell, may not be a perfume.

A perfume invariably consists of three ingredients : a vehicle, fixative and odour producing substance.

(i) **Vehicle** : The vehicle is also called solvent. The role of the solvent is to keep the odour-producing substances in solution. Ethanol and water mixture is the most common vehicle used in perfumery.

(ii) **Fixative** : The function of the fixative is to equalize the rate of evaporation of various odouriferous components of the perfume by suitably adjusting their volatility. *Sandalwood oil* finds use as fixative. Other substances used as fixative are *benzoin*, *glyceryl diacetate* and esters of cinnamyl alcohol.

(iii) **Odorous substances** : Both natural and synthetic substances are used to impart odour to a perfume. For example, terpenoids like linalool which occur in essential oils are natural odour producing compounds, while anisaldehyde (*p*-methoxybenzaldehyde), is a synthetic odour producing compound.

(3) **Talcum powder** : Talcum powder is used to reduce irritation of the skin. Talcum powders like face powders contain talc ($Mg_3(OH)_2Si_4O_{10}$). Chalk, zinc oxide, zinc stearate and a suitable perfume act as the other main constituents of talcum powder. Often specific ingredients like antiseptic and cooling agents are added. The role of the talc is to act as a powder base and to make skin smooth. Chalk absorbs secretion (perspiration) without showing any evidence of such absorption. Zinc oxide masks enlarged pores and minor blemishes, whereas zinc stearate makes powder adhere to skin. Baby talcum powders contain considerable amounts of zinc stearate for adhesiveness and boric acid, for antiseptic purposes. Talcum powders need to be dusted with care to prevent inhalation of the fine particles, which irritate the lungs.

(4) **Deodorants** : As the name suggests, deodorants are applied primarily to mask the body odour. The body odour results from the bacterial action following perspiration. A deodorant must therefore, possess antibacterial properties. Aluminium salts, have been found to possess excellent

antibacterial properties. In addition to aluminium salts, ZnO , ZnO_2 and $(C_{17}H_{35}COO)_2Zn$ also find use in deodorant preparations because they are astringents as well as antiseptics. Phenolic antibacterials, which have figured as effective body deodorant are parachlorometaxylenol and dichlorometaxylenol having following structures.

Dichlorometaxylenol

p-Chlorometaxylenol

Powder formulations generally have deodorants.

Chemicals in food

Many chemicals are added to food for their preservation and enhancing their appeal. These include flavourings, sweeteners, dyes, antioxidants, fortifiers, emulsifiers and antifoaming agents. With the exception of the preservatives, fortifying agents, antioxidants and artificial sweeteners, the remaining classes of chemicals mentioned above are added either for ease in processing or for cosmetic purposes, in the real sense these have no nutritive value.

(1) **Antioxidants** : Antioxidants are the important and necessary food additives. These compounds retard the action of oxygen on the food and thereby help in its preservation. These act as sacrificial materials, i.e., these are more reactive towards oxygen than are the materials they are protecting. They also reduce the rate of involvement of free radicals in the aging process. The two most familiar antioxidants used are *butylated hydroxy toluene (BHT)* and *butylated hydroxy anisole (BHA)*. The addition of *BHA* to butter increases its storage life from months to years. The two have the following structures.

Sometimes *BHT* and *BHA* are added in combination with citric or ascorbic acids to produce a more active synergistic effect. Sulphur dioxide and sulphite are useful antioxidants for wine and beers, sugars syrups and cut peeled or dried fruits and vegetables.

(2) **Preservatives** : The preservatives prevent spoilage of food due to microbial growth. The most common preservative used is sodium benzoate, C_6H_5COONa . It is metabolized by conversion to hippuric acid, $C_6H_5CONHCH_2COOH$ which ultimately is excreted in the urine. Salts of propionic acid and sorbic acid are also used as preservatives.

(3) **Artificial sweetener** : The artificial sweeteners are another type of food additives. The first popular artificial sweetener was saccharin. It was marketed as its water soluble sodium or calcium salt. Saccharin is approximately 300 times sweeter than cane sugar. It has proved to be a lifesaver for countless diabetics and is of great value to people who need to control intake of calories.

Besides saccharin, the other commonly marketed artificial sweeteners are described here.

Aspartame is unstable at cooking temperatures, limiting its use as a sugar substitute to cold foods and soft drinks. Alitame is more stable than aspartame during cooking. One potential problem with alitame and similar type of high-potency sweeteners is the difficulty in controlling sweetness of food. Sucralose is predicted to become a great commercial success.

Table : 32.4

Artificial Sweetner	Structural Formula	Sweetness value in comparison to cane sugar
---------------------	--------------------	---

Aspartame	$ \begin{array}{ccccccc} & O & H & H & O & H & H & O \\ & & & & & & & \\ HO - & C - & C - & C - & C - & N - & C - & C - O - CH_3 \\ & & & & & & & \\ & & H & NH_2 & & H & C - H - & \\ & & & & & & & \\ & & & & & & \text{From phenylalanine} & \\ & & & & & & \text{methyl ester} & \\ & & & & & & \text{From aspartic acid} & \\ & & & & & & \text{C}_6\text{H}_5 & \end{array} $	160
Saccharin		300
Dulcin		500
Sucralose		650
Alitame		2000

(4) **Edible colours** : Edible colours used for food are essentially dyes. The use of food dyes is extremely wide spread. They are used to colour everything from meat to fruit. For example, dyes are used to dye orange peels so that oranges retain their colour. Colour is one of the ingredients in fruit juices. There is a great deal of controversy over the potential harm the dyes may cause. This controversy becomes more meaningful particularly keeping in view the fact that food dyes add nothing to the nutritive value of food. The use of azo dyes has raised considerable anxiety in that some of them are dangerous for young children and asthma patients. Tetrazine, a very widely used dye is especially a suspect. However, natural dyes like *Carotene* are safe food edible colours. For protection of consumer interests, the government of India have passed Prevention of Food Adulteration act (PFA).

Pheromones, Sex Attractants

A major drawback with chemical insecticides is their lack of specificity. Non-specificity of insecticides may kill helpful insects, such as honeybees, which aid in pollination. The more specific we make our insect control, the less we disrupt the environment. Although, in the past, it looked as if specific control was beyond the scope of chemistry, but some developments have shown that it is entirely possible to control populations of certain insects very effectively and specifically using substances known as **pheromones**.

Pheromones provide chemical means of establishing communication.

There are sex, trail and defense pheromones to mention a few. One of the most important roles pheromones play is as **sex attractants**. Sex pheromones tell the honeybee which flower to pollinate. The sex pheromones are remarkably powerful. A few hundred molecules may be all that are necessary to invoke a response. In addition to this fascinating parameter, it has been claimed that the sex attractants in some species can attract males from over two miles away. (The sex attractants are usually emitted by the females, although there are some male insects which also produce them). By baiting a trap with a small amount of sex attractant of an insect pest, one can collect all the males in the vicinity. They may then be disposed of or

sterilized. Since mating cannot take place, the reproductive cycle is halted and the pest is controlled. The advantages to this method are immediately obvious. It is very specific since, (except in very rare instances), each insect has its own attractant. There is no spraying, hence no pesticide residues. In addition, the concentration of the attractants is so small that there would be no effect on any other species, even indirectly. For example, the gypsy moth attractants, attracts male moths in the area when a trap is baited with only $1 \times 10^{-9} \text{ g}$. Gypsy moths are highly voracious eaters and will completely denude trees if they go unchecked.

Names and structures of some pheromones

Plant Growth Hormones

These are the organic substances which are synthesized in minute quantities in one part of the plant body and are transported to another part where they influence specific physiological processes to regulate growth, differentiation and development.

Plant growth hormones are grouped into two main types : (i) growth promoters (e.g., auxins, gibberellins, cytokinins etc.) and (ii) growth inhibitors (e.g. ethylene, abscisic acid, maleic hydrazide etc.) Many of these hormones, especially the synthetic ones are now-a-days widely used in agricultural practices e.g., as weedicides (2, 4-Dichlorophenoxyacetic acid or 2, 4-D), as rooting hormones (Naphthalene acetic acid or N.A.A. etc.), to induce flowering in certain plants (e.g., N.A.A., I.B.A.), to prevent pre-mature fruit drop (e.g., 2, 4-D, I.A.A., I.B.A., etc.), for storage of potato tubers—where they prevent sprouting (e.g., N.A.A.), to increase sweetness of fruits (e.g., I.B.A.), to increase yield of certain crops (e.g. gibberellins increase yield of pea, bean tomatoes, pepper, cucumber, lettuce, cabbage, etc.), in tissue culture (e.g. cytokinins), artificial ripening fruits like banana, mango (e.g. ethylene).

Detergents

As a result of high dissolving power, the naturally occurring water always contains dissolved materials, particularly ionic substances. Hard water contains certain metal ions, such as Ca^{2+} and Mg^{2+} . These ions react with soap, (sodium salts of stearic and similar organic acids), to produce a curdy precipitate of calcium and magnesium salts. This precipitate adheres to clothing and blocks the ability of soaps to remove oil and grease from fabrics. Synthetic detergents are very similar to the salts of fatty acids found in soap, except that they are manufactured chemically from materials others than animal fats, Examples include salts called **sodium alkylbenzenesulphonates**, which have the general structure.

❑ The anions of synthetic detergents do not precipitate in the presence of $\text{Ca}^{+2} / \text{Mg}^{+2}$, so their cleansing action is not affected by hard water.

Types of detergents

(i) **Anionic detergent** : Long chain alcohols are used in the manufacture of some of the synthetic anionic detergents. The long chain alcohols are treated with concentrated sulphuric acid to form alkyl hydrogen sulphates of high molecular mass and finally the alkyl sulphates are neutralized with alkali to form salts.

❑ The single anionic detergents is largest use today in household detergents is alkylbenzene-sulphonate.

(2) **Cationic detergent** : These are mostly acetates or chlorides of quaternary amines. Being more expensive than the anionic detergents they find limited use. Such detergents however, possess germicidal properties and are used quite extensively as germicides. **Cetyltrimethyl-ammonium chloride**, is an example.

(3) **Non ionic detergent** : Esters of high molecular mass formed by reactions between polyethylene glycol and stearic acid.

Some liquid dishwashing detergents are of nonionic type.

Detergent molecules associated with branched hydrocarbon tail which is a source of pollution.

The hydrocarbon side chain stops bacteria from attacking and breaking the chains. This results in slow degradation of detergent molecules leading to their accumulation. These days the amount of branching can be kept to a minimum. Unbranched chains are more prone to attack by bacteria so the detergents are more easily biodegraded and pollution is prevented.

New High Performance Materials

(i) **Carbon fibres** : These fibres are stronger than steel, stiffer than titanium and lighter than aluminium. Carbon fibres are produced in a number of ways, and from a variety of starting materials or precursors such as viscose rayon, polyacrylonitrile, pitch, resins, gases such as (methane, and benzene). Their characteristics are strongly influenced by the manufacturing techniques employed.

Carbon fibres reinforced in a light weight matrix, generally an epoxy resin, polyester resin or polyamide, are called Carbon Fibre Reinforced Plastics (CFRP). When the carbon fibres are reinforced in a carbon matrix, they are known as Carbon Fibre Reinforced Carbon (CFRC), commonly known as carbon-carbon composites.

On the basis of the characteristics of carbon fibres, carbon fibre reinforced plastics (CFRP) and carbon fibre reinforced carbons (CFRC), their applications can be broadly classified into three categories,

- (i) High technology sector including aerospace, military and nuclear fields.
- (ii) General engineering sector including sports, transportation and chemical fields.
- (iii) Biomedical sector.

Carbon fibres in India are mainly used in defence sector as nose tips and head shields of missiles (like 'Agni') by DRDO, Hyderabad, and in the aerospace sector by ISRO and other aerospace organizations for producing components parts, nozzles of rockets/missiles.

(2) **Ceramics** : The term ceramics comes from the Greek word *keramikos* which means burnt stuff, indicating thereby, that desirable properties of these materials are normally achieved through a high-temperature heat treatment process called firing. In the past, the most important materials in this class were the traditional ceramics, prepared from clay, (kaolinite) a silicate. In the category of traditional ceramics we have porcelain, bricks, tiles, glass and temperature resistant ceramics.

Most ceramic materials fall into an application-classification scheme which is given below,

- (i) **Clay products** : Porcelain, pottery, tablewares, sanitary fittings, building bricks, tiles and sewer pipes.
- (ii) **Glass ceramics** : Kitchenware.
- (iii) **Refractory materials** : Refractory bricks used as furnace linings.
- (iv) **Abrasive ceramics** : Cutting and grinding tools. (familiar examples are silicon and tungsten carbides).

Recently, a family of ceramics have been found to be superconductors with high critical temperatures. One such material is yttrium, barium, copper oxide, which has a critical temperature of about 92 K. New super conduction ceramic materials reported to have even higher

critical temperatures have been and are currently being developed. Several of these materials and their critical temperatures are listed below,

Super conducting ceramic materials and their critical temperatures.

Material	Elements present in the material	Critical temp./K
$YBa_2Cu_3O_7$	Y, Ba, Cu, O	92
$Bi_2Sr_2Ca_2Cu_3O_{10}$	Bi, Sr, Ca, Cu, O	110
$Tl_2Ba_2Ca_2Cu_3O_{10}$	Tl, Ba, Ca, Cu, O	125
$HgBa_2Ca_2Cu_2O_8$	Hg, Ba, Ca, Cu, O	153

Numerous applications of super conducting materials exist. Some of these are,

- ☐ Electrical power transmission.
- ☐ Magnets for high energy particle accelerators.
- ☐ High speed switching and signal transmission for computer.

Tips & Tricks

✍ APC mixture contains Aspirin, phenacetin and caffeine.

✍ India launched its first satellite Arya bhatta in March-1978.

✍ Microalloys are materials obtained by adding small amounts of alloying material to steel to improve its mechanical properties. The common microalloying elements are vanadium, titanium, tellurium, boron etc.

Ordinary Thinking

Objective Questions

Dyes and Pigment

- An azo dye is fixed on fabrics by the process applicable in
 - Vat dyes
 - Mordant dyes
 - Developed dyes
 - Substantive dyes
- Red ink is prepared from
 - Phenol
 - Aniline
 - Congo red
 - Eosin
- The blue print process involves the use of
 - Indigo dyes
 - Vat dyes
 - Iron compounds
 - Zinc compounds
- An azo dye is formed by interaction of an aromatic diazonium chloride with
 - A phenol
 - An aliphatic primary amine
 - Benzene
 - Nitrous acid
- Alizarin belongs to the class of
 - Vat dyes
 - Mordant dyes
 - Substantive dyes
 - Reactive dyes
- An insoluble coloured compound formed by action of metallic salts on dyes is known as
 - Lake
 - Mordant
 - Dye intermediate
 - None of these
- Alizarin dye obtained from the root of madder plant is anthraquinone derivative. Its structure corresponds to
 - 1, 2-dihydroxy anthraquinone
 - 2, 3-dihydroxy anthraquinone
 - 1, 4-dihydroxy anthraquinone
 - 1-hydroxy anthraquinone
- To which class of dyes does phenolphthalein belong
 - Azo dyes
 - Nitro dyes
 - Triphenyl methane dyes
 - Phthalein dyes
- Alizarin a mordant dye is not used in
 - Cotton dyeing
 - Printing
 - Painting
 - Chromium lakes for wood dyeing
- The rose odour from an ester is formed by the action of $HCOOH$ on
 - Pine oil
 - Olive oil
 - Geraniol
 - Turpentine oil
- Which of the following is dye
 - Methyl orange
 - Orange I
 - Aniline yellow
 - All of these
- Which of the following is an example of basic dye
 - Alizarin
 - Malachite green
 - Indigo
 - Orange I
- Which of the following is a direct dye
 - Phenolphthalein
 - Congo red
 - Alizarin
 - Indigo
- Which of the following is a vat dye and often used in dyeing jeans
 - Indigo
 - Alizarin
 - Picric acid
 - Crystal violet
- Which of the following is not a chromophore
 - $-N=N-$
 - $-NO$
 - $-NO_2$
 - $-NH_2$
- The compounds used to fix a dye to the fabric is known as
 - Mordant
 - Azeotrope
 - Bleaching agents
 - Lake
- Which one is disperse dye
 - Congo red
 - Alizarin
 - Celliton
 - None of these
- Malachite green is a direct dye for silk and wool. It is prepared by condensing
 - Benzaldehyde and dimethyl aniline
 - Carbonyl chloride and dimethyl aniline
 - Benzene diazonium chloride with dimethyl aniline
 - None of the above
- Fluorescein, a well known dye is obtained by the reactions of
 - Phthalic anhydride and phenol
 - Phthalic anhydride and resorcinol
 - Succinic acid and resorcinol
 - Phthalic anhydride and catechol
- Indigo shows *cis-trans* isomerism. Which is the stable form of Indigo
 - Cis
 - Trans
 - Either cis or trans
 - Both of the above
- Which is the wrong statement with regards to Indigo
 - Indigo was extracted in India from plants of the 'Indigo ferra' group
 - The chemical structure of Indigo was determined by Baeyer, a German chemist who also synthesized it
 - Indigo is a dark blue solid soluble in water giving a blue solution
 - Indigo is fixed to fabrics by the vat process
- Which of the following structures represents a colourless substance
 - $$C_6H_5 - N = \underset{\substack{| \\ O}}{N} - C_6H_5$$

[CPMT 1990]

- (b) $C_6H_5 - N = N - C_6H_5$
 (c) $C_6H_5 - NH - NH - C_6H_5$
 (d) None of these
23. Identify the wrong statement regarding alizarin
 (a) Alizarin was extracted from the roots of the madder plant
 (b) It's chemical name is 1, 2-dihydroxy anthraquinone
 (c) It is fixed to fabrics by using mordants like aluminium sulphate giving fast red colour
 (d) It has red crystal soluble in alkalies and the solution imparts red colour to fabrics
24. Methyl orange is an indicator in acid-alkali titration. It gives
 (a) Yellow colour in alkaline medium
 (b) Red colour in acid medium
 (c) Yellow colour in acid medium
 (d) Yellow colour in alkaline medium and red colour in acid medium
25. A dye imparts red colour on fabric. What colour of light was absorbed by the dye
 (a) Blue (b) Red
 (c) Green (d) Orange
26. Which of the following is an azo dye [Delhi CEE 1996]
 (a) Orange-I (b) Phenolphthalein
 (c) Malachite green (d) Methylene blue
27. An example of anthraquinone dye is [Haryana CEET 1999]
 (a) Alizarin (b) Basic acid
 (c) Methylene blue (d) Phenolphthalein
28. Which of the following is a basic dyes [Pb. PMT 1998; AFMC 2004]
 (a) Congo Red (b) Aniline Yellow
 (c) Alizarin (d) Indigo
29. The dyes which are applied to the fabric in the colourless reduced state and then oxidised to coloured state are called [DPMT 2004]
 (a) Vat dyes (b) Disperse dyes
 (c) Triphenyl methane dye (d) Azo dyes
- (c) Antibiotic (d) Mordant dye
7. Antiseptic chloroxylenol is [KCET 2005]
 (a) 4-chloro-3, 5-dimethylphenol
 (b) 3-chloro-4, 5-dimethylphenol
 (c) 4-chloro-2, 5-dimethylphenol
 (d) 5-chloro-3, 4-dimethylphenol
8. Which of the following is an insecticide
 (a) Bakelite (b) TNT
 (c) BHC (d) Aspirin
9. Which of the following drugs is an analgesic
 (a) Sulphaguanidine (b) Paludrin
 (c) Analgin (d) Iodex
10. Aspirin is [AMU (Aligarh) 1985, BHU 1998, 2005]
 (a) Antibiotic (b) Antipyretic
 (c) Sedative (d) Psychedelic
11. Which of the following drugs is a tranquilizer and sedative
 (a) Sulphadiazine (b) Papaverine
 (c) Equanil (d) Mescaline
12. Which of the following is a hypnotic drug
 (a) Luminal (b) Salol
 (c) Catechol (d) Chemisol
13. An antipyretic is [BHU 1986; CET 1998]
 (a) Quinine (b) Paracetamol
 (c) Luminal (d) Piperazine
14. The drug used as an antidepressant is [BHU 1986, 87]
 (a) Luminol (b) Tofranil
 (c) Mescaline (d) Sulphadiazine
15. Chloramine-T is a
 (a) Disinfectant (b) Antiseptic
 (c) Analgesic (d) Antipyretic
16. Streptomycin is effective in the treatment of
 (a) Tuberculosis (b) Malaria
 (c) Typhoid (d) Cholera
17. Which of the following is not an antiseptic drug
 (a) Iodoform (b) Dettol
 (c) Gammexane (d) Genatian violet
18. Which is used for sterilization of water in water supply system of cities
 (a) Chlorine (b) Sulphurdioxide
 (c) Potassium permanganate (d) DDT
19. A drug effective in the treatment of pneumonia, bronchitis, etc, is
 (a) Streptomycin (b) Chloramphenicol
 (c) Penicillin (d) Sulphaguanidine
20. Aspirin is obtained by the reaction of CH_3COCl with
 (a) Phenol (b) Benzoic acid
 (c) Salicylic acid (d) Benzaldehyde
21. Salol can be used as
 (a) Antiseptic (b) Antipyretic
 (c) Analgesic (d) None of these
22. The drug which is effective in curing malaria is
 (a) Quinine (b) Aspirin
 (c) Analgin (d) Equanil
23. Morphine is
 (a) Anaesthetic (b) Analgesic

Drugs and Medicines

1. An antibiotic with a broad spectrum [AFMC 2001]
 (a) Kills the antibodies
 (b) Acts on a specific antigen
 (c) Acts on different antigens
 (d) Acts on both the antigens and antibodies
2. Penicillin was first discovered by
 (a) A. Fleming (b) Tence and Salke
 (c) S.A. Waksna (d) Lewis Pasteur
3. A medicine which promotes the secretion of urine is called
 (a) Uretic (b) Monouretic
 (c) Diuretic (d) Triuretic
4. An example of a psychedelic agent is [BHU 1986]
 (a) DNA (b) LSD
 (c) DDT (d) TNT
5. Veronal, a barbiturate drug is used as
 (a) Anaesthetic (b) Sedative
 (c) Antiseptic (d) None of these
6. Acetoxy benzoic acid is [Kurukshetra CET 1998]
 (a) Antiseptic (b) Aspirin

- (c) Antiseptic (d) Antibiotics
24. Which of the following is a hallucinogenic drug
(a) Methedrine (b) Calmpose
(c) LSD (d) Seconal
25. Heroin is a derivative of
(a) Cocaine (b) Morphine
(c) Caffeine (d) Nicotine
26. The first viral disease detected in human being was
(a) Cold (b) Influenza
(c) Small pox (d) Yellow fever
27. The formulation of dettol contains
(a) Chloroxylenol (b) Terpineol
(c) Alcohol (d) All of these
28. Interferon is – Connected with
(a) Tonic (b) Virus
(c) Carbohydrate (d) Ore of iron
29. Measles is a disease which belongs to the category of
(a) Bacterial disease (b) Viral disease
(c) Veneral disease (d) Protozoan disease
30. Which are insecticides
(a) Baygon (b) Savine
(c) Methoxy chlor (d) All of these
31. Which one is a bacterial disease
(a) Amoebic dysentery (b) Gonorrhoea
(c) Cholera (d) Mumps
32. Which of the following is an alkaloid
(a) Nicotine (b) Piperine
(c) Coniine (d) All of these
33. Which of the following is not antibiotic
(a) Tetracyclin (b) Neomycin
(c) Carbomycin (d) Cyclohexane
34. Phenacetin is used as
(a) Antipyretic (b) Antiseptic
(c) Antimalarial (d) Analgesic
35. Morphine is
(a) An alkaloid (b) An enzyme
(c) A carbohydrate (d) A protein
36. Substance used for bringing down temperature in high fever are called [DCE 2002; AIEEE 2005]
(a) Pyretics (b) Antipyretics
(c) Antibiotics (d) Antiseptics
37. A large number of antibiotics have been isolated from
(a) Bacteria actinomycetes
(b) Acids
(c) Alkanals
(d) Bacteria rhizobium
38. Hydrazine as a drug is also used in the treatment of
(a) Typhoid (b) Cholera
(c) Malaria (d) Tuberculosis
39. Arsenic drugs are mainly used in the treatment of [AIIMS 1992]
(a) Jaundice (b) Typhoid
(c) Syphilis (d) Cholera
40. The substances which effect the central nervous system and induce sleep are called
(a) Tranquillizers (b) Antipyretics
(c) Analgesics (d) None of these
41. Which one is communicable disease
(a) Scurvy (b) Diabetes
(c) Beri-Beri (d) Chollera
42. An antibiotic contains nitro group attached to aromatic nucleus. It is
(a) Penicillin (b) Streptomycin
(c) Tetracycline (d) Chloramphenicol
43. 2, 4-dichloro phenoxyacetic acid is used as a
(a) Fungicide (b) Insecticide
(c) Herbicide (d) Moth repellent
44. Sulpha drugs are used for
(a) Precipitating bacteria
(b) Removing bacteria
(c) Decreasing the size of bacteria
(d) Stopping the growth of bacteria
45. 'Placedo' is often given to patients. It is
(a) An antidepressant
(b) A broad spectrum antibiotic
(c) A sugar pill
(d) A tonic
46. Bithional is an example of
(a) Disinfectant (b) Antiseptic
(c) Antibiotic (d) Analgesic
47. Various phenol derivatives, tincture of iodine (2– 3% I₂ in water / alcohol) and some dyes like methylene blue are
(a) Antiseptics (b) Disinfectants
(c) Analgesics (d) Antipyretics
48. Which of the following is not an antipyretic
(a) Aspirin (b) Paracetamol
(c) Barbituric acid (d) Phenacetin
49. The insecticide containing 99% γ – isomer of benzene hexachloride is known as
(a) Lindane (b) TNT
(c) Malathion (d) Methoxychlor
50. Which of the following is not a chlorinated insecticide
(a) DDT (b) Methoxychlor
(c) Parathion (d) BHC
51. Sulphaguadine is used for
(a) Dysentery
(b) Urinary infections
(c) Antiseptic
(d) Antipyretic
52. Which is correct about vanillin
(a) A flavouring agent having vanilla flavour
(b) *o*-hydroxy-*m*-methoxy benzaldehyde
(c) A food additive
(d) All of these
53. Which is correct about saccharin
54. The following compound is used as [Kurukshetra CET 1996; AIEEE 2002]

- (b) It is 600 times sweeter than sugar
(c) It is used as sweetening agent
(d) All of these

- (a) An anti-inflammatory compound
(b) Analgesic
(c) Hypnotic
(d) Antiseptic

55. The correct structure of the drug paracetamol is

[DCE 2001]

56. An ester used as medicine is

[KCET 2002]

- (a) Ethyl acetate (b) Methyl acetate
(c) Methyl salicylate (d) Ethyl benzoate

57. The use of chemicals for treatment of diseases is called as

[Kerala PMT 2002]

- (a) Homoeotherapy (b) Isothermotherapy
(c) Angiotherapy (d) Physiotherapy
(e) Chemotherapy

58. Substance used for the preservation of coloured fruit juices is

- (a) Benzene (b) Benzoic acid
(c) Phenol (d) Sodium meta bisulphite

59. Which of the following acts as an antioxidant in edible oils

- (a) Vitamin B (b) Vitamin C
(c) Vitamin D (d) Vitamin E

60. Amoxillin is semi-synthetic modification of

[Pb. PMT 1998]

- (a) Penicillin (b) Streptomycin
(c) Tetracycline (d) Chloroamphenicol

61. Which of the following is an antidiabetic drug

[KCET 1998]

- (a) Insulin (b) Penicillin
(c) Chloroquine (d) Aspirin

62. Which of these is a hypnotic

[AFMC 2001, 05]

- (a) Metaldehyde (b) Acetaldehyde
(c) Paraldehyde (d) None of these

63. Which one is an antibiotic

- (a) Aspirin (b) Chloromycetin
(c) Chloroquin (d) Madribon

64. Which of the following term means pain killing

- (a) Antibiotic (b) Analgesic
(c) Antipyretic (d) Penicillin

65. 2-Acetoxy benzoic acid is used as an

[KCET 2004]

- (a) Antimalarial (b) Antidepressant
(c) Antiseptic (d) Antipyretic

66. Which of the following is used as an antibiotic

[Pb. CET 2002]

- (a) Ciprofloxacin (b) Paracetamol
(c) Ibuprofen (d) Tocopherol

67. When salicylic acid is treated with acetic anhydride we get

[DCE 2002]

- (a) Aspirin (b) Paracetamol
(c) Salol (d) None of these

68. Which of the following is not an antibiotic

[BVP 2004]

- (a) Penicillin (b) Sulphaguanidine
(c) Chloramphenicol (d) None of these

69. Which of the following is not a broad spectrum antibiotic

[DPMT 2005]

- (a) Tetracycline (b) Chloromycetin
(c) Penicillin (d) None of these

Rocket - Propellant and Other

1. A biliquid propellant contains

- (a) Liquid hydrazine
(b) A mixture of liquid fuel and a liquid oxidizer
(c) A solid rocket fuel
(d) A liquid fuel which can also act as an oxidizer

2. A hybrid rocket propellant uses

- (a) A liquid oxidizer and a solid fuel
(b) A composite solid propellant
(c) A biliquid propellant
(d) A solid, liquid and gas as a propellant

3. Which of these is not used as a fuel in the rocket propellants

- (a) Liquid He (b) Liquid hydrogen
(c) Kerosene (d) Liquid hydrazine

4. A space rocket is propelled by

- (a) An automobile engine (b) Rocket propellant
(c) Nuclear submarine (d) Steam engine

5. The propellant in the proposed PSLV rocket of the Indian space programme shall consist of

- (a) A composite solid propellant
(b) Biliquid propellants such as N_2O_4 + unsymmetrical dimethyl hydrazine (UDMH) and N_2O_4 monomethyl hydrazine (MMH)
(c) Both (a) and (b) in different stages of rocket propulsion
(d) Kerosene and liquid oxygen

6. Which of the following is not used in rocket propellants

- (a) $H_2(l)$ (b) $O_2(l)$
(c) $N_2H_4(l)$ (d) All of these

7. Thrust imparted to the rocket is governed by the

- (a) Third law of thermodynamics
(b) Gravitational law
(c) Newton's third law
(d) None of these

8. A space rocket is propelled by

- (a) An automobiled engine
(b) Nuclear engine
(c) Steam engine
(d) Mixture of fuel and oxidiser called propellant

9. A composite solid propellant consists of

- (a) Polyurethane or polybutadiene and ammonium perchlorate
(b) Nitroglycerine and nitrocellulose
(c) Hydrazine and N_2O_4
(d) Kerosene and liquid oxygen

10. Which of the following represents a biliquid propellant

- (a) Nitroglycerine + nitrocellulose
(b) N_2O_4 + acrylic rubber
(c) N_2O_4 + unsymmetrical dimethyl hydrazine
(d) None of these

11. What type of a propellant is used in rocket SLV-3 which was fired by India

- (a) Solid propellant

- (b) Monomethyl hydrazine + liquid N_2O_4
 (c) Unsymmetrical dimethyl hydrazine liquid N_2O_4
 (d) Liquid oxygen
12. Which of the following is used as an oxidiser in rocket propellants
 (a) Kerosene (b) Nitric acid
 (c) Liquid oxygen (d) Liquid hydrogen
13. A combination of nitrocellulose and nitroglycerine is a propellant of the type
 (a) Hybrid propellant
 (b) Mono propellant
 (c) Double base propellant
 (d) Biliquid propellant
14. Which is the relation between the specific I_s impulse and the critical temperature T_c attained in a rocket blast
 (a) $I_s \geq T_c$ (b) I_s and T_c^2
 (c) $I_s \geq T_c^{1/2}$ (d) $I_s \geq 1/T_c$
15. The chemical compounds released by one species of animals in order to influence the behaviour of the other members of the same species are called
 (a) Pheromones (b) Hormones
 (c) Nucleic acid (d) Steroids
16. Structurally biodegradable detergent should contain [AIIMS 1994]
 (a) Normal alkyl chain (b) Branched alkyl chain
 (c) Phenyl side chain (d) Cyclohexyl side chain
17. Which of the following is not used in rocket propellants
 (a) $H_2(l)$ (b) $O_2(l)$
 (c) Methane (d) $N_2H_4(l)$
18. Which of the following is not used in nail polish
 (a) Acetone (b) Cellulose nitrate
 (c) Red dye (d) Benzene
19. One of the oxidants used with liquid propellants is [Kerala PMT 2001]
 (a) Ammonium perchlorate
 (b) Nitrocellulose
 (c) Sulphuric acid
 (d) Dinitrogen tetroxide (N_2O_4)
 (e) Phosphorus pentoxide
20. Detergents are prepared by the action of H_2SO_4 followed by neutralization by starting with [MP PMT 1990]
 (a) Cholesterol (b) Lauryl alcohol
 (c) Cyclohexanol (d) *p*-Nitrophenol
21. Pheromones are chemicals
 (a) Formed by fermentation process of fungi
 (b) Secreted by endocrine glands of man
 (c) Secreted outside the body of insects
 (d) Plant growth hormones
22. Which of the following could act as a propellant for rocket [CBSE PMT 2003]
 (a) Liquid hydrogen + Liquid nitrogen
 (b) Liquid oxygen + Liquid argon
 (c) Liquid hydrogen + Liquid oxygen
 (d) Liquid nitrogen + Liquid oxygen
23. Sodium alkyl benzene sulphonate is used as [MP PMT 2004]

- (a) Soap (b) Fertilizers
 (c) Pesticides (d) Detergents

Critical Thinking

Objective Questions

1. The structure given below is known as [Kerala (Med.) 2003]

- (a) Penicilline *F* (b) Penicillin *G*
 (c) Penicillin *K* (d) Ampicillin
 (e) Sulphadiazine
2. Aspirin is chemically [CPMT 1989; AMU (Aligarh) 1992; DCE 2004]
 (a) Methyl salicylate (b) Ethyl salicylate
 (c) Acetyl salicylic acid (d) *o*-hydroxy benzoic acid
3. Which of the following can possibly be used as analgesic without causing addiction and any modification [CBSE 1997]
 (a) Morphine
 (b) *N*-acetylparaaminophenol
 (c) Diazepam
 (d) Tetra hydrocatenol
4. Further growth of cancerous cells in the body is arrested by
 (a) Physiotherapy (b) Chemotherapy
 (c) Electrotherapy (d) Psychotherapy
5. Which one of the following is known as broad spectrum antibiotics [BHU 1999; Haryana CET 1999; Pb. CET 2001]
 (a) Streptomycine (b) Ampicillin
 (c) Chloramphenicol (d) Penicillin *G*
6. Which of the following is a local anaesthetic [Pb. CET 2003]
 (a) Diazepam (b) Procaine
 (c) Mescaline (d) None of the above
7. Which of the following is molecular disease
 (a) Allergy
 (b) Cancer
 (c) German measles
 (d) Sickle-cell-anaemia
8. Which statement is false [CBSE PMT 1994]
 (a) Some disinfectants can be used antiseptics at low concentration
 (b) Sulphadiazine is a synthetic antibacterial
 (c) Ampicillin is a natural antibiotic
 (d) Aspirin is analgesic and antipyretic both
9. Tranquilisers are substances used for the treatment of [Kerala PMT 2002]
 (a) Cancer (b) AIDS
 (c) Mental diseases (d) Physical disorders
 (e) Blood infection
10. Which one is acidic dye [DCE 1996]
 (a) Methyl orange (b) Methyl red
 (c) Phenolphthalein (d) All of these

11. Alizarin gives a red colour by mordanting it with the sulphate of a metal. The metal ion involved is

- (a) Cr^{3+} (b) Fe^{3+}
(c) Al^{3+} (d) Sn^{2+}

12. SLV-3 rockets use

- (a) Solid propellants
(b) Liquid propellants
(c) Hybrid propellants
(d) Composite solid propellants

13. Which of the following represents a synthetic detergent

- (a) $C_{15}H_{31}COOK$
(b) $CH_3[CH_2]_{16}COONa$

- (d) None of these

14. Which of the following groups is not an auxochrome

- (a) $-N(CH_3)_2$ (b) $-OH$
(c) $-OCH_3$ (d) $>C=N$

15. Specific impulse of a rocket and the critical temperature of the fuel reacted in the motor of the rocket has the relationship

- (a) $I_s \propto T_c$ (b) $I_s \propto 1/T_c$
(c) $I_s \propto \sqrt{T_c}$ (d) $I_s \propto \sqrt{1/T_c}$

16. Parathion is

[JIPMER 2001]

- (a) An organic phosphorus compound
(b) Chlorinated aromatic compound
(c) Chlorinated aliphatic compound
(d) Benzene derivative

17. The principal buffer present in human blood

[Kerala PMT 2004]

- (a) $NaH_2PO_4 + Na_2HPO_4$
(b) $H_3PO_4 + NaH_2PO_4$
(c) $CH_3COOH + CH_3COONa$
(d) $Na_2HPO_4 + Na_3PO_4$
(e) $H_2CO_3 + HCO_3^-$

18. Which of the following represents soap

[DCE 2004]

- (a) $C_{17}H_{35}COOK$ (b) $C_{17}H_{35}COOH$
(c) $C_{15}H_{31}COOH$ (d) $(C_{17}H_{35}COO)_2Ca$

19. Asthma patient use a mixture of for respiration

[DCE 2003]

- (a) O_2 and N_2O (b) O_2 and He
(c) O_2 and NH_3 (d) O_2 and CO

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Fluorescein is an adsorption indicator.
Reason : Fluorescein indicator is a dye. [AIIMS 1994]
2. Assertion : The drugs which act on the central nervous system and help in reducing anxiety are called antibiotics.
Reason : Pencillin is an antibiotic.
3. Assertion : Equanil is a tranquilizer.
Reason : Equanil is used to cure depression and hypertension.
4. Assertion : Tetracyclin is a broad spectrum antibiotic.
Reason : Tetracyclin is effective against a number of types of bacteria, large viruses and typhus fever.
5. Assertion : Antiseptics are applied to living tissues.
Reason : Iodine is a powerful antiseptic.
6. Assertion : Sedatives are given to patients who are mentally agitated and violent.
Reason : Sedatives are used to suppress the activities central nervous system.

AS Answers and Solutions

Dyes and Pigment

- (c) In grain or developed dyes are those which are synthesised directly on the fabric *e.g.* azo dyes. Ingrain dyeing is particularly suitable for cotton fabric.
- (d) Eosin is Red dyes.
- (c) The blue print process involve the use of iron compound.
- (a) $\text{C}_6\text{H}_5\text{N}_2\text{Cl}^+ + \text{C}_6\text{H}_5\text{OH} \rightarrow \text{C}_6\text{H}_5\text{N}=\text{N}-\text{C}_6\text{H}_4\text{OH}$
 Benzene diazonium chloride + Phenol $\rightarrow$ *p*-hydroxy azo benzene
 This is coupling reaction in which benzene diazonium chloride react with phenol or aromatic amine to give dyes.
- (b) A mordant is any substance which can be fixed to the fibre and which can be dyed later on mostly hydroxide or basic salts of chromium aluminium and iron are used as mordant. A dye which imparts different colours in the presence of different mordant is referred to as a mordant dye. For ex. alizarin is a mordant dye when mordanted with aluminium salt solution. It imparts rose red colour to fabric but the same fabric is dyed blue when it is mordanted with barium salt and it dyes violet is mordant with Ferric salt.
- (a) The process is called lake.
- (a) Alizarin is 1,2 dihydroxy anthraquinone *i.e.*,

- (d) It belong to phthalein dyes.
- (c) It is the mordant dye so not use in painting.
- (c) $\text{C}_{10}\text{H}_{17}\text{OH}$ (Geraniol) a liquid terpene alcohol forms ester of rose odour with HCOOH .
- (b) Basic dyes contain NH_2 or $-\text{NR}_2$ groups as colour bearing group or colour enhancing groups they are generally used for Wool, cotton, leather, paper, polyester, nylon etc. *e.g.* aniline yellow, crysodine G, butter yellow, malachite green etc.
- (b) Direct dyes stick to the fibre through hydrogen bonding. They belong to the class of azo dyes. They are used to dye the fabric directly by placing it in not aqueous solution of dye *e.g.* martius yellow, Congored etc.
- (a) Vat dyes are insoluble compounds which up on reduction give soluble (leucoform) product. The product may be either coloured or colourless and have affinity for specific fabrics *e.g.* Indigo.
- (d) A dye molecule is made up of two different part (i) Chromophore (ii) Auxochrome. The groups which produce colour in a compound *i.e.*, chromophores are usual unsaturated groups like nitro, nitroso, azo, azoxy, carbonyl and olefinic

bonds Auxochrome are usually acidic / basic functional group like $-\text{OH}$, $-\text{COOH}$, $-\text{SO}_3\text{H}$, $-\text{NH}_2$, $-\text{NHR}$, $-\text{NR}_2$.

A compound containing only a chromophore may be coloured material but not a dye. For example azo benzene is red coloured but not a dye. Where as para amino azobenzene (aniline yellow) is a dye.

- (c) Disperse dye are usually applied in the form of dispersion of finely divided dye in a soap solution in the presence of Phenol, Cresol, Benzoic acid etc. They are mainly used to dye decron, nylon, synthetic fibre. Example Celliton (blue).
- (a) Malachite green prepared by the condensation of Benzaldehyde and dimethyl aniline.
- (b) Fluorescin is obtained by the reaction of Phthalic anhydride and resorcinol.
- (b) Trans form of Indigo is more stable.
- (c) Indigo is dark blue solid insoluble in water.
- (d) Methyl orange is yellow in alkaline medium and red in acedic medium.
- (c) Green is the complimentary colour of red.
- (a) Orange-I is an acid azodye.
- (a) Alizarin is an example of anthraquinon dye.
- (b) Aniline yellow is a basic dyes.
- (a) Vat dyes are insoluble compounds which reduction give soluble (leucoform) product. The product may be either coloured or colourless a have affinity for specific fabrics *e.g.* Indigo.

Drugs and Medicines

- (c) Broad spectrum antibiotics act on different antigens.
- (a) A. Fleming discovered penicillin in 1929.
- (b) A psychedelic drug produce visual and auditory hallucinations *e.g.* Lysergic and diethyl amide (LSD)
- (b) Acetyl salicylic acid is also called acetoxy benzoic acid
- (a)
Chloroxylenol
(4-chloro-3,5-dimethylphenol)
- (c) BHC *i.e.*, benzene hexachloride is an insecticide.
- (c) An analgesic drugs is one which relieves or decrease the pain *e.g.*, analgin, aspirin (belongs to non-narcotics and morphine, codein, heroin (belongs to narcotics class)
- (b) Aspirin is antipyretic *i.e.*, a drug which is responsible for lowering the temperature of Feverish organism to normal, other antipyretic drugs are paraacetamol, Phenacetin.
- (c) Tranquilizers reduce anxiety and tension they are also called psychototropic drugs. These are of two type.

- (a) Sedative the drugs used for violent and mentally agitated patient e.g., Equanil and diazepam.
- (b) Antidepressant – The drug are used to patients who are highly depressed and lose self confidence e.g. tofranil vitalin, amphetamine etc.

12. (a) These drugs produce sleep and are habit forming common example of hypnotic drugs are Luminal and Saconal.
13. (b) Paracetamol is an antipyretic.
15. (b) Antiseptic drugs causes destruction of micro-organism that produce septic disease e.g. Dettol, Savlon acriflavin, Boric acid, Phenol Iodoform, $KMnO_4$ and some dyes such as Chloramine T, methylene blue.
16. (a) It is the very effective antibiotics for tuberculosis.
17. (c) It is an insecticide.
19. (c) Penicillin is an effective medicine for Pneumonia disease.

21. (a) Salol is Phenyl Salicylate used as antiseptic.
22. (a) Substance used for the treatment of malaria are antimalarial e.g. Quinine, chloroquine.
23. (b) Morphine is analgesic.
25. (b) Heroin is acyl derivative of morphine.
26. (d) Yellow fever was the first viral disease detected in human being.
27. (d) Dettol (antiseptic) is a mixture of 4.8% chloroxylenol + 9.9% tepineol and absolute alcohol.
30. (d) All are insecticides.
32. (d) All these are alkaloids.
33. (d) Rest all are antibiotic.
35. (a) It is an alkaloid a class of organic compound basic nature of plant origin containing atleast one nitrogen atom in a ring structure of molecule.
36. (b) It is antipyretic i.e., a drug which is responsible for lowering the temperature of feverish organism to normal.
39. (c) Arsenic drugs are poisonous for syphilis.
41. (d) T.B., Cholera etc. are Communicable diseases.
42. (d) Chloramphenicol is

43. (c) It is herbicide (kill herbs)
44. (d) Sulpha drugs (antibacterial and nonantibiotic) are group of drugs which are derivative of sulphanilamide.
46. (a) Bithional has disinfectant nature (kill bacteria)
47. (a) Antiseptic drugs cause destruction of micro-organism that produce septic disease e.g. Dettol, Savlon, Boric acid, Phenol,

Iodoform $KMnO_4$ and some dye such as Chloramine T methylene blue, gentian violet.

48. (c) Rest all are antipyretic, Barbituric acid is tranquilizer.
49. (a) Lindane or gammexane is γ isomer of BHC.

52. (d) All are characteristics of Vanillin.
53. (d) All are characteristics of Saccharin.
54. (b) It is acetyl salicylic acid i.e., aspirin analgesic and antipyretic.
55. (b) Paracetamol act as analgesic and antipyretic.
56. (c) Oil of winter green or methyl Salicylate is used as medicine.
58. (b) Benzoic acid used as preservative as a Sodium Benzoate.
59. (d) Vitamin E is an antioxidant present in edible oils.
60. (a) Amoxillin is semisynthetic modification of Penicillin
61. (a) Insulin is an antidiabetic drug.
62. (c) Paraldehyde is a hypnotic.
63. (b) Chloromycetin is an antibiotic.
64. (b) Analgesic means Painkiller.
66. (a) Ciprofloxacin is used as antibiotic while Paracetamol, Ibuprofen and tocopherol are respectively antipyretic, pain killer and Vit. E.

68. (b) Antibiotics are those drugs, which act against bacterial and viral infections e.g., Chloramphenicol Streptomycin, Penicillin, Tetracycline etc. Sulphaguanidine is a Sulphadrug.
69. (c) Penicillin is not a broad spectrum antibiotic since it is active against infections caused by gram positive bacteria only.

Rocket – Propellant and Other

1. (b) Biliquid Propellant – A double base propellant is a high strength, high modulus gel of cellulose nitrate (gun cotton) in glyceryl trinitrate or a similar solvent.
2. (a) Hybrid Propellant – A hybrid propellant consists of a solid fuel and liquid oxidizer to provide propulsion energy and working substance e.g. Solid acrylic rubber and liquid N_2O_4
4. (b) Rocket propellant are used as fuel for space rock.
6. (d) All are fuel.
7. (c) It is based on Newton's third law.
14. (c) When specific impulse is greater than critical temperature, then rocket blast takes place. So the condition $I_s \geq T_c^{1/2}$ is right.
16. (b) Structurally biodegradable detergent contain normal (or Linear) alkyl chain.

17. (c) Methane is not used as a rocket propellant.
18. (d) Benzene (a Carcinogenic) is not used as a solvent in nail polish.
19. (d) Dinitrogen tetroxide is used as an oxidant with liquid propellant.
20. (b) Detergents can be obtained by the sulphonation of Lauryl alcohol followed by neutralisation.
21. (c) Pheromones are chemical secreted outside the body of the insects.
22. (c) Liquid hydrogen + Liquid oxygen Could act as a propellant or rocket.
23. (d) It is used as detergents.
12. (a) Solid propellants or composite propellants are mixture of polymeric binders (such as polyurethane or polybutadiene as fuel) and ammonium per chlorate as oxidiser. These are used in SLV-3 and ASLV rockets.
13. (c) The most widely used domestic detergent is the sodium dodecyl benzene sulphonate (SDS).

(Sodium dodecyl benzene sulphonate)

14. (d) $>C=N$ is not an auxochrome.
15. (c) The energy of propellant is measured in terms of a specific impulse. Is inside the motor of the rocket. It depend up on the flame temperature and average molecular mass of the gaseous products coming out of the rocket nozzle. The specific impulse is given by the following relationship with the average molecular mass M and the flame temperature, T
- $$I_s = \sqrt{T_c / M}.$$

16. (a) "Parathion" is an organic phosphorus compounds.
17. (e) $H_2CO_3 + HCO_3^-$ buffer present in human blood, which maintain pH of blood.
18. (a) Soaps are the sodium or potassium salt of higher fatty acids. e.g., $C_{17}H_{37}COOK$ (Potassium stearate). These are obtained by alkaline hydrolysis of oils and fats. The reaction is called saponification.
19. (b) A mixture of O_2 and He is used for respiration as helium is inert and light gas and diffuse rapidly.

Critical Thinking Questions

1. (b) It is the known structure of penicillin G
2. (c) Aspirin an antibiotic chemically Acetyl Salicylic acid

3. (c) "Diazepam" can be used as analgesic without addition and modification.
4. (b) Paul Ehrlich, the father of chemotherapy defined it to injure or destroy infection micro-organism by the use of drugs without causing any injury to the host.
5. (c) Chloramphenicol is broad spectrum antibiotic used in the treatment of typhoid, dysentery, acute fever.
6. (b) The anaesthetics produce temporary insensibility to the vital function of all type of cells, specially of nervous system and are used during surgical operations.
- These are classified as (a) General anesthetic – producing unconsciousness all over the body e.g. N_2O , Cyclo propane, chloroform (b) Local anesthetic – effect only the part of body e.g. Xylocaine, Procain etc.
7. (b) "Cancer" is known as molecular disease.
8. (c) Ampicillin is a synthetic antibiotic.
9. (c) "Tranquillisers" are medicines used to treat mental diseases. They are called psychotherapeutic drugs.
10. (a) Acid dyes are characterised by the presence of $-COOH$, $-SO_3H$ or Phenolic group. They are applied in the presence of acidic solution. They are usually applied to Wool, Silk, Nylon. They have affinity for cotton. Common examples are Orange I, Orange II, Methyl red etc.
11. (c) "Alizarin" is a typical mordant dye gives different colours depending on the metal ion used, for example with Al^{+3} , alizarin gives a rose red colour.

Co-ordination compound of alizarin with Al^{+3} as follow

Coordination compound of Alizarin with Al^{+3}

Assertion & Reason

1. (b) It is correct that fluorescein is an absorption indicator. It is also true that fluorescein indicator is a dye. Therefore, both assertion and reason are true but reason is not a correct explanation for assertion.
2. (e) The drugs which act on the central nervous system and help in reducing anxiety are called tranquilizers.
3. (a) Tranquilizers are chemicals which are used to cure mental diseases.
4. (a) Broad spectrum antibiotics are those medicines which are effective against several different types of harmful micro organisms.
5. (b) Antiseptics are those chemicals which kill or prevent the growth of micro organism. Antiseptics do not harm the living tissues and can be applied on cuts and wounds. They help to reduce odours resulting from the bacterial decomposition in the mouth on the body.
6. (a) A small dose of sedative produces a feeling of relaxation, calmness and drowsiness.

Chemistry in Action

SET Self Evaluation Test -32

1. Chloramphenicol is used in the treatment of which of the following [MP PET 2000] (a) Malachite green
(a) Typhoid (b) Congo red
(b) Pneumonia (c) Indigo
(c) Headache and fever (d) Turmeric
(d) Bronchitis
2. A substance which can act both as antiseptic and disinfectant is [MGIMS Wardha 2001] 9. Paracetamol is/are [KCET 1997]
(a) Aspirin (a) Both antipyretic and analgesic
(b) Chloroxylenol (b) Analgesic
(c) Bithional (c) Antipyretic
(d) Phenol (d) Antimalaric
3. Cocaine is 10. Which is plant growth inhibitor
(a) Vitamin (a) Ethylene
(b) Poison (b) IAA
(c) Medicine (c) Abscissic acid
(d) Antipyretic (d) Auxins
4. Penicillin is a 11. Indigo belongs to the class of [Pb. CET 1998]
(a) Hormone (a) Mordant dyes
(b) Antibiotic (b) Vat dye
(c) Antipyretic (c) Direct dye
(d) Vitamin (d) Disperse dye
5. One of the most widely used drug in medicine, iodox is [CPMT 1989] 12. Aspirin is a/an [Pb. CET 2000]
(a) Methyl salicylate (a) Analgesic and antipyretic
(b) Ethyl salicylate (b) Antibiotic
(c) Acetyl salicylic acid (c) Insecticide
(d) *o*-hydroxy benzoic acid (d) Herbicide
6. Which of the following is a natural dye 13. Artificial sweetener used in soft drinks is [DCE 2002]
(a) Martius yellow (a) Aspartame
(b) Alizarin (b) Cellulose
(c) Phenolphthalein (c) Fructose
(d) Orange I (d) Glucose
7. Which is an explosive 14. During glycolysis acetyl co-enzyme is formed from [DCE 2002]
(a) Toluene (a) Pyruvate with a loss of carbonyl group
(b) R.D.X. (b) Citric acid cycle
(c) *p*-Nitrophenol (c) Directly from glucose
(d) All of these (d) None of these
8. A certain dye was prepared from a plant grown on a large scale in India. Name the dye

1. (a,b) It is a broad spectrum antibiotic. It is effective against certain gram-positive and gram-negative bacteria and some rickettsiae and viruses. It is very effective in the treatment of typhoid fever, gitis, pneumonia, whooping cough.

2. (d) Phenol has antiseptic as well as disinfectant (Kill Bacteria) quality.
3. (c) "Cocaine" is used as medicine to produce general or local insensibility to pain and other sensations.
4. (b) Penicillin is broad spectrum antibiotic. It is first antibiotic, discovered by A. Fleming in 1929. From penicillium notatum fungi.
5. (a) Methyl salicylate also known as oil of wintergreen is used as medicine iodex in treatment of rheumatic pains are remedy for aches, sprains and bruises.
6. (b) Dyes are the natural or synthetic chemical used to impart colour to Fabric Plastic., paper etc. including food item. For their pleasant appearance. Alizarin (orange red) is extracted from the root of madder plant also synthesized now a day.

13. (a) Artificial sweetener is "Aspartame". Its chemical formula is
- $$\begin{array}{c}
 \text{H}_2\text{NCH}-\text{CONH}-\text{CH}-\text{COOCH}_3 \\
 | \qquad \qquad | \\
 \text{CH}_2\text{OOH} \quad \text{CH}_2\text{C}_6\text{H}_5
 \end{array}$$
14. (a) During glycolysis acetyl CO - enzyme is obtained from pyruvate with a loss of carbonyl group.

7. (b) RDX is an explosive.
8. (c) Indigo is obtained in India by plants.
9. (a) It is acetyl salicylic acid and used as analgesic and antipyretic.
10. (c) Absciscic acid is a plant growth Inhibitor.
11. (b) It is Vat dyes which are insoluble compounds which up on reduction give soluble (Leucoform product). The product may be either coloured or colourless and have affinity for specific fabrics e.g. Indigo.
12. (a) Aspirin is an acetyl derivative of salicylic acid. It is an analgesic and antipyretic drug.
