$$P + R \rightarrow T \text{ (fast)}$$
 The rate law expression for the reaction is [Kurukshetra CEE 2002]
 - $r = k[P]^2[Q]$
 - $r = k[P][Q]$
 - $r = k[A][R]$
 - $r = k[P]^2$
- Consider the following energy profile for the reaction. $X + Y \rightarrow R + S$. Which of the following deductions about the reaction is not correct
 
 - The energy of activation for the backward reaction is 80 kJ
 - The forward reaction is endothermic
 - ΔH for the forward reaction is 20 kJ
 - The energy of activation for the forward reaction is 60 kJ
- The minimum energy required for molecules to enter into the reaction is called [KCET 1986; EAMCET 1992; MP PMT 1993; MP PET 1994]
 - Potential energy
 - Kinetic energy
 - Nuclear energy
 - Activation energy
- The minimum energy necessary to permit a reaction is [NCERT 1989]
 - Internal energy
 - Threshold energy
 - Activation energy
 - Free energy
- The formation of gas at the surface of tungsten due to adsorption is the reaction of order [AIEEE 2002]
 - 0
 - 1
 - 2
 - insufficient data
- The time of completion of 90% of a first order reaction is approximately [MP PET 2002]
 - 1.1 times that of half life
 - 2.2 times that of half life
 - 3.3 times that of half life
 - 4.4 times that of half life
- In a photochemical reaction, the ratio of number of dissociate molecules and number of quanta of absorbed energy is called
 - Einstein
 - Quantum efficiency
 - Quantum constant
 - Planck constant
- A reaction rate constant is given by

$$k = 1.2 \times 10^{14} e^{-(25000 / RT)} \text{ sec}^{-1}$$
 It means [MP PET 1995]
 - $\log k$ versus $\log T$ will give a straight line with slope as – 25000
 - $\log k$ versus T will give a straight line with slope as – 25000
 - $\log k$ versus $\log 1/T$ will give a straight line with slope as – 25000
 - $\log k$ versus $1/T$ will give a straight line

1. (b) Temperature coefficient = $\frac{K_{35^{\circ}\text{C}}}{K_{25^{\circ}\text{C}}} = \text{between } 2 \text{ and } 3.$

2. (c) Arrhenius equation is : $K = Ae^{-E_a/RT}$

3. (b) The rate law expression for the reaction is $r = k[P][Q]$.

4. (a) E_a of backward reaction = $80 - 40 = 40\text{kJ}$

Hence (a) statement is wrong.

5. (d) The energy necessary for molecules to undergoes chemical reaction is known as Activation energy.

6. (b) Molecules undergoing reaction should cross over the minimum energy barrier or energy level known as threshold energy.

7. (a) The order of reaction for the formation of gas at the surface of tungsten due to adsorption is zero .

8. (c) For a first order reaction

$$K = \frac{2.303}{t} \log \frac{a}{(a-x)}$$

$$t = \frac{2.303}{k} \log \frac{100}{(100-90)} = \frac{2.303 \times t_{1/2}}{0.593} \times \log \frac{100}{10}$$

$$= 3.3 \times t_{1/2} \times \log 10 = 3.3 t_{1/2}$$

9. (b) It is also known as Quantum yield and indicated by ϕ .

10. (d) According to the Arrhenius equation a straight line is to be 'obtained by plotting the logarithm of the rate constant of a chemical reaction ($\log K$) against $1/T$.

Chapter 12 Electrochemistry

Electrochemistry is the branch of physical chemistry which deals with the relationship between electrical energy and chemical changes taking place in redox reactions

Electrolytes and Electrolysis

(1) **Definition** : “The substances whose aqueous solution undergo decomposition into ions when electric current is passed through them are known as **electrolytes** and the whole process is known as **electrolysis** or **electrolytic decomposition**.”

Solutions of acids, bases, salts in water and fused salts etc. are the examples of electrolytes. Electrolytes may be **weak** or **strong**. Solutions of cane sugar, glycerine, alcohol etc., are examples of **non-electrolytes**.

(2) **Electrolytic cell or Voltmeter** : The device in which the process of electrolysis or electrolytic decomposition is carried out is known as **electrolytic cell** or **voltmeter**.

(i) Voltmeter convert **electrical energy into chemical energy**.

(ii) The electrode on which oxidation takes place is called **anode** (or +ve pole) and the electrode on which reduction takes place is called **cathode** (or –ve pole)

(iii) During electrolysis in voltmeter **cations are discharged on cathode** and **anions on anode**.

(iv) In voltmeter, outside the **electrolyte** electrons flow from **anode to cathode** and **current** flow from **cathode to anode**.

For voltmeter, $E_{\text{cell}} = -ve$ and $\Delta G = +ve$.

(v) The anions on reaching the anode give up their electrons and converted into the neutral atoms.

(vi) On the other hand cations on reaching the cathode take up electrons supplied by battery and converted to the neutral atoms.

This overall change is known as **primary change** and products formed is known as **primary products**.

The primary products may be collected as such or they undergo further change to form molecules or compounds. These are called **secondary products** and the change is known as **secondary change**.

(3) **Preferential discharge theory** : According to this theory “If more than one type of ion is attracted towards a particular electrode, then the ion is discharged one which requires least energy or ions with lower discharge potential or which occur low in the electrochemical series”.

The potential at which the ion is discharged or deposited on the appropriate electrode is termed **the discharge or deposition potential**, (D.P.). The values of discharge potential are different for different ions.

The decreasing order of discharge potential or the increasing order of deposition of some of the ions is given below,

Table : 12.1 Products of electrolysis of some electrolytes

Electrolyte	Electrode	Product at cathode	Product at anode
Aqueous $NaOH$	Pt or Graphite	$2H^{+} + 2e^{-} \rightarrow H_2$	$2OH^{-} \rightarrow \frac{1}{2}O_2 + H_2O + 2e^{-}$
Fused $NaOH$	Pt or Graphite	$Na^{+} + e^{-} \rightarrow Na$	$2OH^{-} \rightarrow \frac{1}{2}O_2 + H_2O + 2e^{-}$

Aqueous NaCl	Pt or Graphite	$2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$	$2\text{Cl}^- \rightarrow \text{Cl}_2 + 2\text{e}^-$
Fused NaCl	Pt or Graphite	$\text{Na}^+ + \text{e}^- \rightarrow \text{Na}$	$2\text{Cl}^- \rightarrow \text{Cl}_2 + 2\text{e}^-$
Aqueous CuSO_4	Pt or Graphite	$\text{Cu}^{2+} + 2\text{e}^- \rightarrow \text{Cu}$	$2\text{OH}^- \rightarrow \frac{1}{2}\text{O}_2 + \text{H}_2\text{O} + 2\text{e}^-$
Aqueous CuSO_4	Cu electrode	$\text{Cu}^{2+} + 2\text{e}^- \rightarrow \text{Cu}$	Cu oxidised to Cu^{2+} ions
Dilute H_2SO_4	Pt electrode	$2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$	$2\text{OH}^- \rightarrow \frac{1}{2}\text{O}_2 + \text{H}_2\text{O} + 2\text{e}^-$
Conc. H_2SO_4	Pt electrode	$2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$	Peroxodisulphuric acid ($\text{H}_2\text{S}_2\text{O}_8$)
Aqueous AgNO_3	Pt electrode	$\text{Ag}^+ + \text{e}^- \rightarrow \text{Ag}$	$2\text{OH}^- \rightarrow \frac{1}{2}\text{O}_2 + \text{H}_2\text{O} + 2\text{e}^-$
Aqueous AgNO_3	Ag electrode	$\text{Ag}^+ + \text{e}^- \rightarrow \text{Ag}$	Ag oxidised to Ag^+ ions

(4) **Application of electrolysis** : Electrolysis has wide applications in industries. Some of the important applications are, as follows,

- Production of hydrogen by electrolysis of water.
- Manufacture of heavy water (D_2O).
- The metals like Na , K , Mg , Al , etc., are obtained by electrolysis of fused electrolytes.
- Non-metals like hydrogen, fluorine, chlorine are obtained by electrolysis.
- In this method pure metal is deposited at cathode from a solution containing the metal ions Ag , Cu etc.
- Compounds like NaOH , KOH , Na_2CO_3 , KClO_3 , white lead, KMnO_4 etc. are synthesised by electrosynthesis method.
- Electroplating** : The process of coating an inferior metal with a superior metal by electrolysis is known as *electroplating*. The aim of electroplating is, to prevent the inferior metal from corrosion and to make it more attractive in appearance. The object to be plated is made the cathode of an electrolytic cell that contains a solution of ions of the metal to be deposited.

For electroplating	Anode	Cathode	Electrolyte
With copper	Cu	Object	CuSO_4 + dilute H_2SO_4
With silver	Ag	Object	$\text{K}[\text{Ag}(\text{CN})_2]$
With nickel	Ni	Object	Nickel ammonium sulphate
With gold	Au	Object	$\text{K}[\text{Au}(\text{CN})_2]$
With zinc	Zn	Iron objects	ZnSO_4
With tin	Sn	Iron objects	SnSO_4

Thickness of coated layer : Let the dimensions of metal sheet to be coated be ($a \text{ cm} \times b \text{ cm}$).

Thickness of coated layer = $c \text{ cm}$

Volume of coated layer = $(a \times b \times c) \text{ cm}^3$

Mass of the deposited substance = Volume $\times$ density
= $(a \times b \times c) \times d \text{ g}$

$$\therefore (a \times b \times c) \times d = \frac{I \times t \times E}{96500}$$

Using above relation we may calculate the thickness of coated layer.

Faraday's laws of electrolysis

The laws, which govern the deposition of substances (In the form of ions) on electrodes during the process of electrolysis, is called **Faraday's laws of electrolysis**. These laws given by **Michael Faraday in 1833**.

(1) **Faraday's first law** : It states that,

"The mass of any substance deposited or liberated at any electrode is directly proportional to the quantity of electricity passed." i.e., $W \propto Q$

Where,

W = Mass of ions liberated in gm ,

Q = Quantity of electricity passed in Coulombs

= Current in Amperes (I) $\times$ Time in second (t)

$\therefore W \propto I \times t$ or $W = Z \times I \times t$

In case current efficiency (η) is given, then

$$W = Z \times I \times t \times \frac{\eta}{100}$$

where, Z = constant, known as **electrochemical equivalent** (ECE) of the ion deposited.

When a current of 1 Ampere is passed for 1 second (i.e., $Q = 1$), then, $W = Z$

Thus, **electrochemical equivalent** (ECE) may be defined as "the mass of the ion deposited by passing a current of one Ampere for one second (i.e., by passing Coulomb of electricity)". Its unit is gram per coulomb.

Coulomb is the unit of electrical charge.

$96500 \text{ Coulombs} = 6.023 \times 10^{23} \text{ electrons} = 1 \text{ mole electrons}$

$$1 \text{ Coulomb} = \frac{6.023 \times 10^{23}}{96500} = 6.28 \times 10^{18} \text{ electrons,}$$

or 1 electronic charge = $1.6 \times 10^{-19} \text{ Coulomb}$.

(2) **Faraday's second law** : It states that,

"When the same quantity of electricity is passed through different electrolytes, the masses of different ions liberated at the electrodes are directly proportional to their chemical equivalents (Equivalent weights)." i.e.,

$$\frac{W_1}{W_2} = \frac{E_1}{E_2} \quad \text{or} \quad \frac{Z_1 I t}{Z_2 I t} = \frac{E_1}{E_2} \quad \text{or} \quad \frac{Z_1}{Z_2} = \frac{E_1}{E_2} \quad (\because W = Z I t)$$

Thus the electrochemical equivalent (Z) of an element is directly proportional to its equivalent weight (E), i.e.,

$E \propto Z$ or $E = FZ$ or $E = 96500 \times Z$

where, F = Faraday constant = 96500 C mol^{-1}

So, 1 Faraday = $1F$ = Electrical charge carried out by one mole of electrons.

$1F$ = Charge on an electron $\times$ Avogadro's number.

$$1F = e^- \times N = (1.602 \times 10^{-19} \text{ C}) \times (6.023 \times 10^{23} \text{ mol}^{-1}).$$

$$\text{Number of Faraday} = \frac{\text{Number of electrons passed}}{6.023 \times 10^{23}}$$

(3) **Faraday's law for gaseous electrolytic product** For the gases, we use

$$V = \frac{ItV_e}{96500}$$

where, V = Volume of gas evolved at $S.T.P.$ at an electrode

V_e = Equivalent volume = Volume of gas evolved at an electrode at $S.T.P.$ by 1 Faraday charge

(4) **Quantitative aspects of electrolysis** : We know that, one Faraday ($1F$) of electricity is equal to the charge carried by one mole (6.023×10^{23}) of electrons. So, in any reaction, if one mole of electrons are involved, then that reaction would consume or produce $1F$ of electricity. Since $1F$ is equal to 96,500 Coulombs, hence 96,500 Coulombs of electricity would cause a reaction involving one mole of electrons.

If in any reaction, n moles of electrons are involved, then the total electricity (Q) involved in the reaction is given by, $Q = nF = n \times 96,500 \text{ C}$

Thus, the amount of electricity involved in any reaction is related to,

- The number of moles of electrons involved in the reaction,
- The amount of any substance involved in the reaction.

Therefore, 1 Faraday or 96,500 C or 1 mole of electrons will reduce,

- 1 mole of monovalent cation, (b) 1/2 mole of divalent cation,
- 1/3 mole of trivalent cation, (d) 1/n mole of n valent cations.

Metallic and Electrolytic conductors

All substances do not conduct electrical current. The substances, which allow the passage of electric current, are called **conductors**. The best metal conductors are such as copper, silver, tin, etc. On the other hand, the substances, which do not allow the passage of electric current through them, are called **non-conductors or insulators**. Some common examples of insulators are rubber, wood, wax, etc.

The conductors are broadly classified into two types, Metallic and electrolytic conductors.

Metallic conduction	Electrolytic conduction
(i) It is due to the flow of electrons.	(i) It is due to the flow of ions.
(ii) It is not accompanied by decomposition of the substance. (Only physical changes occurs)	(ii) It is accompanied by decomposition of the substance. (Physical as well as chemical change occur)
(iii) It does not involve transfer of matter.	(iii) It involves transfer of matter in the form of ions.
(iv) Conductivity decreases with increase in temperature.	(iv) Conductivity increases with increases in temperature and degree of hydration due to decreases in viscosity of medium.

The electrolyte may, therefore, be defined as the substance whose aqueous solution or fused state conduct electricity accompanied by chemical decomposition. The conduction of current through electrolyte is due to the movement of ions.

On the contrary, substances, which in the form of their solutions or in their molten state do not conduct electricity, are called non-electrolytes.

Electrolytic conduction

When a voltage is applied to the electrodes dipped into an electrolytic solution, ions of the electrolyte move and, therefore, electric current flows through the electrolytic solution. The power of the electrolytes to conduct electric current is termed **conductance or conductivity**.

(1) **Ohm's law** : This law states that the current flowing through a conductor is directly proportional to the potential difference across it, i.e., $I \propto V$

where I is the current strength (In Amperes) and V is the potential difference applied across the conductor (In Volts)

$$\text{or } I = \frac{V}{R} \text{ or } V = IR$$

where R is the constant of proportionality and is known as resistance of the conductor. It is expressed in Ohm's and is represented as Ω . The above equation is known as Ohm's law. Ohm's law may also be stated as,

"the strength of current flowing through a conductor is directly proportional to the potential difference applied across the conductor and inversely proportional to the resistance of the conductor."

(2) **Resistance** : It measures the obstruction to the flow of current. The resistance of any conductor is directly proportional to the length (l) and inversely proportional to the area of cross-section (a) so that

$$R \propto \frac{l}{a} \text{ or } R = \rho \frac{l}{a}$$

where ρ (rho) is the constant of proportionality and is called specific resistance or resistivity. The resistance depends upon the nature of the material.

Units : The unit of resistance is ohm (Ω). In terms of SI, base unit is equal to $(\text{kgm}^2)/(\text{s}^3 \text{A}^2)$.

(3) **Resistivity or specific resistance** : We know that resistance R is

$$R = \rho \frac{l}{a}; \text{ Now, if } l = 1 \text{ cm, } a = 1 \text{ cm}^2 \text{ then } R = \rho$$

Thus, resistivity is defined as the resistance of a conductor of 1 cm length and having area of cross-section equal to 1 cm^2 .

Units : The units of resistivity are $\rho = R \cdot \frac{a}{l} = \text{Ohm} \frac{\text{cm}^2}{\text{cm}} = \text{Ohm.cm}$

Its SI units are Ohm metre (Ωm). But quite often Ohm centimetre (Ωcm) is also used.

(4) **Conductance** : It is a measure of the ease with which current flows through a conductor. It is an additive property. It is expressed as G . It is reciprocal of the resistance, i.e.,

$$G = \frac{1}{R}$$

Units : The units of conductance are reciprocal Ohm (ohm^{-1}) or mho. Ohm is also abbreviated as Ω so that Ohm^{-1} may be written as Ω^{-1} .

According to SI system, the units of electrical conductance is Siemens, S (i.e., $1 \text{ S} = 1 \Omega^{-1}$).

(5) **Conductivity** : The inverse of resistivity is called conductivity (or specific conductance). It is represented by the symbol, κ (Greek kappa). The IUPAC has recommended the use of term conductivity over specific conductance. It may be defined as, *the conductance of a solution of 1 cm length and having 1 sq. cm as the area of cross-section*. In other words, *conductivity is the conductance of one centimetre cube of a solution of an electrolyte*.

$$\text{Thus, } \kappa = \frac{1}{\rho}$$

Units : The units of conductivity are

$$\kappa = \frac{1}{\text{Ohm.cm}} = \text{Ohm}^{-1} \text{cm} \text{ or } \Omega^{-1} \text{cm}^{-1}$$

In SI units, l is expressed in m area of cross-section in m^2 so that the units of conductivity are $S m^{-1}$.

(6) **Molar conductivity or molar conductance** : Molar conductivity is defined as the conducting power of all the ions produced by dissolving one mole of an electrolyte in solution.

It is denoted by Λ (lambda). Molar conductance is related to specific conductance (κ) as,

$$\Lambda = \frac{\kappa}{M}$$

where, M is the molar concentration.

If M is in the units of molarity i.e., moles per litre (mol L^{-1}), the Λ may be expressed as,

$$\Lambda = \frac{\kappa \times 1000}{M}$$

For the solution containing 1 gm mole of electrolyte placed between two parallel electrodes of 1 sq. cm area of cross-section and one cm apart,

$$\text{Conductance}(G) = \text{Conductivity} = \text{Molar conductivity}(\Lambda)$$

But if solution contains 1 gm mole of the electrolyte therefore, the measured conductance will be the molar conductivity. Thus,

$$\text{Molar conductivity}(\Lambda) = 100 \times \text{Conductivity}$$

$$\text{In other words, } (\Lambda) = \kappa \times V$$

where V is the volume of the solution in cm^3 containing one gram mole of the electrolyte.

If M is the concentration of the solution in mole per litre, then

$$M \text{ mole of electrolyte is present in } 1000 \text{ cm}^3$$

$$1 \text{ mole of electrolyte is present in } = \frac{1000}{M} \text{ cm}^3 \text{ of solution}$$

$$\text{Thus, } \Lambda = \kappa \times \text{Volume in cm}^3 \text{ containing 1 mole of electrolyte.}$$

$$\text{or } \Lambda = \frac{\kappa \times 1000}{M}$$

Units of Molar Conductance : The units of molar conductance can be derived from the formula ,

$$\Lambda = \frac{\kappa \times 1000}{M}$$

The units of κ are $S \text{cm}^{-1}$ and units of Λ are,

$$\Lambda = S \text{cm}^{-1} \times \frac{\text{cm}^3}{\text{mol}} = S \text{cm}^2 \text{mol}^{-1} = S \text{cm}^2 \text{mol}^{-1}$$

According to SI system, molar conductance is expressed as $S \text{m}^2 \text{mol}^{-1}$, if concentration is expressed as mol m^{-3} .

(7) **Equivalent conductivity** : It is defined as the conducting power of all the ions produced by dissolving one gram equivalent of an electrolyte in solution.

It is expressed as Λ_e and is related to specific conductance as

$$\Lambda_e = \frac{\kappa \times 1000}{C} = \kappa \times \frac{1000}{M} \quad (M \text{ is Molarity of the solution})$$

where C is the concentration in gram equivalent per litre (or Normality). This term has earlier been quite frequently used. Now it is replaced by molar conductance. The units of equivalent conductance are $\text{Ohm}^{-1} \text{cm}^2 (\text{gmequiv})^{-1}$.

(8) Experimental measurement of conductance

(i) The conductance of a solution is reciprocal of the resistance, therefore, the experimental determination of the conductance of a solution involves the measurement of its resistance.

(ii) **Calculation of conductivity** : We have seen that conductivity (κ) is reciprocal of resistivity (ρ), i.e.,

$$\kappa = \frac{1}{\rho} \text{ and } \rho = R \frac{a}{l}$$

$$\therefore \kappa = \frac{1}{R} \left(\frac{l}{a} \right) \text{ or } \kappa = G \left(\frac{l}{a} \right)$$

where G is the conductance of the cell, l is the distance of separation of two electrodes having cross section area $a \text{cm}^2$.

The quantity $\left(\frac{l}{a} \right)$ is called cell constant and is expressed in

cm^{-1} . Knowing the value of cell constant and conductance of the solution, the specific conductance can be calculated as,

$$\kappa = G \times \text{Cell constant}$$

$$\text{i.e., Conductivity} = \text{Conductance} \times \text{Cell constant}$$

Factors affecting the electrolytic conductance

In general, conductance of an electrolyte depends upon the following factors,

(1) **Nature of electrolyte** : The conductance of an electrolyte depends upon the number of ions present in the solution. Therefore, the greater the number of ions in the solution the greater is the conductance. The number of ions produced by an electrolyte depends upon its nature. The strong electrolytes dissociate almost completely into ions in solutions and, therefore, their solutions have high conductance. On the other hand, weak electrolytes, dissociate to only small extents and give lesser number of ions. Therefore, the solutions of weak electrolytes have low conductance.

(2) **Concentration of the solution** : The molar conductance of electrolytic solution varies with the concentration of the electrolyte. In general, the molar conductance of an electrolyte increases with decrease in concentration or increase in dilution.

The molar conductance of strong electrolyte (HCl , KCl , KNO_3) as well as weak electrolytes (CH_3COOH , NH_4OH) increase with decrease in concentration or increase in dilution. The variation is however different for strong and weak electrolytes.

The variation of molar conductance with concentration can be explained on the basis of conducting ability of ions for weak and strong electrolytes.

For weak electrolytes the variation of Λ with dilution can be explained on the bases of number of ions in solution. The number of ions furnished by an electrolyte in solution depends upon the degree of dissociation with dilution. With the increase in dilution, the degree of dissociation increases and as a result molar conductance increases. The limiting value of molar conductance (Λ^0) corresponds to degree of dissociation equal to 1 i.e., the whole of the electrolyte dissociates.

Thus, the degree of dissociation can be calculated at any concentration as,

$$\alpha = \frac{\Lambda^c}{\Lambda^0}$$

where α is the degree of dissociation,

Λ^c is the molar conductance at concentration C and

Λ^0 is the molar conductance at infinite dilution.

For strong electrolytes, there is no increase in the number of ions with dilution because strong electrolytes are completely ionised in solution at all concentrations (By definition). However, in concentrated solutions of strong electrolytes there are strong forces of attraction between the ions of opposite charges called inter-ionic forces. Due to these inter-ionic forces the conducting ability of the ions is less in concentrated solutions. With dilution, the ions become far apart from one another and inter-ionic forces decrease. As a result, molar conductivity increases with dilution. When the concentration of the solution becomes very-very low, the inter-ionic attractions become negligible and the molar conductance approaches the limiting value called molar conductance at infinite dilution. This value is characteristic of each electrolyte.

(3) **Temperature** : The conductivity of an electrolyte depends upon the temperature. With increase in temperature, the conductivity of an electrolyte increases.

Migration of ions

Electricity is carried out through the solution of an electrolyte by **migration of ions**. Therefore,

(1) Ions move toward oppositely charged electrodes at different speeds.

(2) During electrolysis, ions are discharged or liberated in equivalent amounts at the two electrodes, *no matter what their relative speed is*.

(3) Concentration of the electrolyte changes around the electrode due to difference in the speed of the ions.

(4) Loss of concentration around any electrode is proportional to the speed of the ion that moves away from the electrode, so

$$\frac{\text{Loss around anode}}{\text{Loss around cathode}} = \frac{\text{Speed of cation}}{\text{Speed of anion}}$$

The relation is valid only when the discharged ions do not react with atoms of the electrodes. But when the ions combine with the material of the electrode, the concentration around the electrode shows an increase.

Transport number or Transference number

(1) **Definition** : "The fraction of the total current carried by an ion is known as transport number, transference number or Hittorf number may be denoted by sets symbols like t and t or t and t or n and n ."

From this definition,

$$t_a = \frac{\text{Current carried by an anion}}{\text{Total current passed through the solution}}$$

$$t_c = \frac{\text{Current carried by a cation}}{\text{Total current passed through the solution}}$$

evidently, $t_a + t_c = 1$.

(2) **Determination of transport number** : Transport number can be determined by *Hittorf's method, moving boundary method, emf method and from ionic mobility*.

(3) **Factors affecting transport number**

A rise in temperature tends to bring the transport number of cation and anion more closer to 0.5

(4) **Transport number and ionic mobility** : Ionic mobility or Ionic conductance is the conductivity of a solution containing 1 g ion, at infinite dilution, when two sufficiently large electrodes are placed 1 cm apart.

$$\text{Ionic mobilities}(\lambda_a \text{ or } \lambda_c) \propto \text{speeds of ions}(u_a \text{ or } u_c)$$

Unit of ionic mobility is Ohm⁻¹ cm or VScm

Ionic mobility and transport number are related as,

$$\lambda_a \text{ or } \lambda_c = t_a \text{ or } t_c \times \lambda_\infty$$

Absolute ionic mobility is the mobility with which the ion moves under unit potential gradient. Its unit is cm sec⁻¹.

$$\text{Absolute ionic mobility} = \frac{\text{Ionic mobility}}{96,500}$$

Kohlrausch's law

(i) **Kohlrausch law** states that, "At time infinite dilution, the molar conductivity of an electrolyte can be expressed as the sum of the contributions from its individual ions" i.e., $\Lambda_m^\infty = \nu_+ \lambda_+^\infty + \nu_- \lambda_-^\infty$, where, ν_+ and ν_- are the number of cations and anions per formula unit of electrolyte respectively and, λ_+^∞ and λ_-^∞ are the molar conductivities of the cation and anion at infinite dilution respectively. The use of above equation in expressing the molar conductivity of an electrolyte is illustrated as,

The molar conductivity of HCl at infinite dilution can be expressed as,

$$\Lambda_{HCl}^\infty = \nu_{H^+} \lambda_{H^+}^\infty + \nu_{Cl^-} \lambda_{Cl^-}^\infty; \text{ For HCl, } \nu_{H^+} = 1 \text{ and } \nu_{Cl^-} = 1.$$

So, $\Lambda_{HCl}^\infty = (1 \times \lambda_{H^+}^\infty) + (1 \times \lambda_{Cl^-}^\infty)$; Hence, $\Lambda_{HCl}^\infty = \lambda_{H^+}^\infty + \lambda_{Cl^-}^\infty$

(2) **Applications of Kohlrausch's law** : Some typical applications of the Kohlrausch's law are described below,

(i) **Determination of Λ_m^∞ for weak electrolytes** : The molar conductivity of a weak electrolyte at infinite dilution (Λ_m^∞) cannot be determined by extrapolation method. However, Λ_m^∞ values for weak electrolytes can be determined by using the Kohlrausch's equation.

$$\Lambda_{CH_3COOH}^\infty = \Lambda_{CH_3COONa}^\infty + \Lambda_{HCl}^\infty - \Lambda_{NaCl}^\infty$$

(ii) **Determination of the degree of ionisation of a weak electrolyte** : The Kohlrausch's law can be used for determining the degree of ionisation of a weak electrolyte at any concentration. If λ_m^c is the molar conductivity of a weak electrolyte at any concentration C and, λ_m^∞ is the molar conductivity of a electrolyte at infinite dilution. Then, the degree of

$$\text{ionisation is given by, } \alpha_c = \frac{\Lambda_m^c}{\Lambda_m^\infty} = \frac{\Lambda_m^c}{(\nu_+ \lambda_+^\infty + \nu_- \lambda_-^\infty)}$$

Thus, knowing the value of Λ_m^c , and Λ_m^∞ (From the Kohlrausch's equation), the degree of ionisation at any concentration (α_c) can be determined.

(iii) **Determination of the ionisation constant of a weak electrolyte** : Weak electrolytes in aqueous solutions ionise to a very small extent. The extent of ionisation is described in terms of the degree of ionisation (α). In solution, the ions are in dynamic equilibrium with the unionised molecules. Such an equilibrium can be described by a constant called **ionisation constant**. For example, for a weak electrolyte AB , the ionisation equilibrium is, $AB \rightleftharpoons A^+ + B^-$; If C is the initial concentration of the electrolyte AB in solution, then the equilibrium concentrations of various species in the solution are, $[AB] = C(1 - \alpha)$, $[A^+] = C\alpha$ and $[B^-] = C\alpha$

$$\text{Then, the ionisation constant of } AB \text{ is given by, } K = \frac{[A^+][B^-]}{[AB]} = \frac{C\alpha.C\alpha}{C(1 - \alpha)} = \frac{C\alpha^2}{(1 - \alpha)}$$

We know, that at any concentration C , the degree of ionisation (α) is given by, $\alpha = \Lambda_m^c / \Lambda_m^\infty$

$$\text{Then, } K = \frac{C(\Lambda_m^c / \Lambda_m^\infty)^2}{[1 - (\Lambda_m^c / \Lambda_m^\infty)]} = \frac{C(\Lambda_m^c)^2}{\Lambda_m^\infty (\Lambda_m^\infty - \Lambda_m^c)}; \text{ Thus, knowing}$$

Λ_m^∞ and Λ_m^c at any concentration, the ionisation constant (K) of the electrolyte can be determined.

(iv) **Determination of the solubility of a sparingly soluble salt** : The solubility of a sparingly soluble salt in a solvent is quite low. Even a saturated solution of such a salt is so dilute that it can be assumed to be at infinite dilution. Then, the molar conductivity of a sparingly soluble salt at infinite dilution (Λ_m^∞) can be obtained from the relationship,

$$\Lambda_m^\infty = \nu_+ \lambda_{+}^\infty + \nu_- \lambda_{-}^\infty \quad \text{.....(i)}$$

The conductivity of the saturated solution of the sparingly soluble salt is measured. From this, the conductivity of the salt (κ_{salt}) can be obtained by using the relationship, $\kappa_{\text{salt}} = \kappa_{\text{sol}} - \kappa_{\text{water}}$, where, κ_{water} is the conductivity of the water used in the preparation of the saturated solution of the salt.

$$\Lambda_{\text{salt}}^\infty = \frac{1000 \kappa_{\text{salt}}}{C_m} \quad \text{.....(ii)}$$

From equation (i) and (ii) ;

$$C_m = \frac{1000 \kappa_{\text{salt}}}{(\nu_+ \lambda_{+}^\infty + \nu_- \lambda_{-}^\infty)}, \quad C_m \text{ is the molar concentration of the}$$

sparingly soluble salt in its saturated solution. Thus, C_m is equal to the solubility of the sparingly soluble salt in the *mole per litre* units. The solubility of the salt in *gram per litre* units can be obtained by multiplying C_m with the molar mass of the salt.

Electrochemical or Galvanic cell

“Electrochemical cell or Galvanic cell is a device in which a spontaneous redox reaction is used to convert chemical energy into electrical energy i.e. electricity can be obtained with the help of oxidation and reduction reaction”.

(i) **Characteristics of electrochemical cell** : Following are the important characteristics of electrochemical cell,

Fig. 12.1

(i) Electrochemical cell consists of two vessels, two electrodes, two electrolytic solutions and a salt bridge.

(ii) The two electrodes taken are made of different materials and usually set up in two separate vessels.

(iii) The electrolytes are taken in the two different vessels called as half - cells.

(iv) The two vessels are connected by a salt bridge/porous pot.

(v) The electrode on which oxidation takes place is called the **anode** (or - ve pole) and the electrode on which reduction takes place is called the **cathode** (or + ve pole).

(vi) In electrochemical cell, ions are discharged only on the cathode.

(vii) Like electrolytic cell, in electrochemical cell, from outside the electrolytes electrons flow from anode to cathode and current flow from cathode to anode.

(viii) For electrochemical cell, $E_{\text{cell}} = +ve$, $\Delta G = -ve$.

(ix) In a electrochemical cell, cell reaction is exothermic.

(2) Salt bridge and its significance

(i) Salt bridge is U - shaped glass tube filled with a gelly like substance, agar - agar (plant gel) mixed with an electrolyte like KCl , KNO_3 , NH_4NO_3 etc.

(ii) The electrolytes of the two half-cells should be inert and should not react chemically with each other.

(iii) The cation as well as anion of the electrolyte should have same ionic mobility and almost same transport number, viz. KCl , KNO_3 , NH_4NO_3 etc.

(iv) The following are the functions of the salt bridge,

(a) It connects the solutions of two half - cells and completes the cell circuit.

(b) It prevent transference or diffusion of the solutions from one half cell to the other.

(c) It keeps the solution of two half - cells electrically neutral.

(d) It prevents liquid - liquid junction potential i.e. the potential difference which arises between two solutions when they contact with each other.

(3) Representation of an electrochemical cell

The cell may be written by arranging each of the pair left - right, anode - cathode, oxidation - reduction, negative and positive in the alphabetical order as,

(4) **Reversible and irreversible cells** : A cell is said to be reversible if the following two conditions are fulfilled

(i) The chemical reaction of the cell stops when an exactly equal external *emf* is applied.

(ii) The chemical reaction of the cell is reversed and the current flows in opposite direction when the external *emf* is slightly higher than that of the cell. Any other cell, which does not obey the above two conditions, is termed as irreversible. Daniell cell is reversible but $Zn | H_2SO_4 | Ag$ cell is irreversible in nature

(5) **Types of electrochemical cells** : Two main types of electrochemical cells have been reported, these are,

(i) **Chemical cells** : The cells in which electrical energy is produced from the energy change accompanying a chemical reaction or a physical process are known as chemical cells. Chemical cells are of two types,

(a) **Chemical cells without transference** : In this type of chemical cells, the liquid junction potential is neglected or the transference number is not taken into consideration. In these cells, one electrode is reversible to cations while the other is reversible to the anions of the electrolyte.

(b) **Chemical cells with transference** : In this type of chemical cells, the liquid-liquid junction potential or diffusion potential is developed across the boundary between the two solutions. This potential develops due to the difference in mobilities of +ve and -ve ions of the electrolytes.

(6) **Concentration cells** : “A cell in which electrical energy is produced by the transference of a substance from a system of high concentration to one at low concentration is known as **concentration cells**”. Concentration cells are of two types.

(i) **Electrode concentration cells** : In these cells, the potential difference is developed between two electrodes at different concentrations dipped in the same solution of the electrolyte. For example, two hydrogen electrodes at different gaseous pressures in the same solution of hydrogen ions constitute a cell of this type.

$$E_{\text{cell}} = \frac{0.0591}{2} \log \left(\frac{p_1}{p_2} \right) \text{ at } 25^\circ \text{C} \text{ If } p_1 > p_2, \text{ oxidation occurs at L. H.}$$

S. electrode and reduction occurs at R. H. S. electrode.

In the amalgam cells, two amalgams of the same metal at two different concentrations are immersed in the same electrolytic solution.

The *emf* of the cell is given by the expression,

$$E_{\text{cell}} = \frac{0.0591}{n} \log \frac{C_1}{C_2} \text{ at } 25^\circ \text{C}$$

(ii) **Electrolyte concentration cells** : In these cells, electrodes are identical but these are immersed in solutions of the same electrolyte of different concentrations. The source of electrical energy in the cell is the tendency of the electrolyte to diffuse from a solution of higher concentration to that of lower concentration. With the expiry of time, the two concentrations tend to become equal. Thus, at the start the *emf* of the cell is maximum and it gradually falls to zero. Such a cell is represented in the following manner (C_2 is greater than C_1).

The *emf* of the cell is given by the following expression,

$$E_{\text{cell}} = \frac{0.0591}{n} \log \frac{C_{2(R.H.S.)}}{C_{1(L.H.S.)}} \text{ at } 25^\circ \text{C}$$

The concentration cells are used to determine the solubility of sparingly soluble salts, valency of the cation of the electrolyte and transition point of the two allotropic forms of metal used as electrodes, etc.

(7) **Heat of reaction in an electrochemical cell** : Let n Faraday charge flows out of a cell of *emf* E , then

$$-\Delta G = nFE \quad \text{.....(i)}$$

Gibbs – Helmholtz equation from thermodynamics may be given as

$$\Delta G = \Delta H + T \left(\frac{\partial \Delta G}{\partial T} \right)_p \quad \text{.....(ii)}$$

From equation (i) and (ii) we get,

$$-nFE = \Delta H + T \left[\frac{\partial(-nFE)}{\partial T} \right]_p = \Delta H - nFT \left(\frac{\partial E}{\partial T} \right)_p$$

$$\Delta H = -nFE + nFT \left(\frac{\partial E}{\partial T} \right)_p$$

where $\left(\frac{\partial E}{\partial T} \right)_p$ = Temperature coefficient of cell

$$\text{Case I: When } \left(\frac{\partial E}{\partial T} \right)_p = 0, \text{ then } \Delta H = -nFE$$

$$\text{Case II: When } \left(\frac{\partial E}{\partial T} \right)_p > 0, \text{ then } nFE > \Delta H, \text{ i.e. process inside the}$$

cell is endothermic.

$$\text{Case III: When } \left(\frac{\partial E}{\partial T} \right)_p < 0, \text{ then } nFE < \Delta H, \text{ i.e., process inside the}$$

cell is exothermic.

Some Commercial cell (Batteries)

One of the main use of galvanic cells is the generation of portable electrical energy. These cells are also popularly known as **batteries**. The term battery is generally used for two or more Galvanic cells connected in series. Thus, a **battery** is an arrangement of electrochemical cells used as an energy source. The basis of an electrochemical cell is an oxidation – reduction reaction.

Types of commercial cells : There are mainly two types of commercial cells,

(i) **Primary cells** : In these cells, the electrode reactions cannot be reversed by an external electric energy source. In these cells, reactions occur only once and after use they become dead. Therefore, they are **not chargeable**. Some common example are, dry cell, mercury cell, Daniell cell and alkaline dry cell

(i) Voltaic cell

Fig. 12.2
Cathode : Cu rod
Anode : Zn rod
Emf : 1.08 V

Cathode : Cu rod

Electrolyte : dil. H_2SO_4

At cathode : $Cu^{2+} + 2e^- \rightarrow Cu$

At Anode : $Zn \rightarrow Zn^{2+} + 2e^-$

Over all reaction : $Zn + Cu^{2+} \rightarrow Zn^{2+} + Cu$

(ii) Daniel cell

Fig. 12.3
Cathode : Cu rod
Anode : Zn rod
Emf : 1.1 V

Cathode : Cu rod

Electrolyte : dil. H_2SO_4

At cathode : $Cu^{2+} + 2e^- \rightarrow Cu$

At Anode : $Zn \rightarrow Zn^{2+} + 2e^-$

Over all reaction : $Zn + Cu^{2+} \rightarrow Zn^{2+} + Cu$

(iii) Leclanche cell (Dry cell)

Fig. 12.4

Cathode : Graphite rod Anode : Zn rod

Electrolyte : Paste of $NH_4Cl + ZnCl_2$ in starch

Emf : 1.2 V to 1.5 V

At cathode : $NH_4^+ + MnO_2 + 2e^- \rightarrow MnO(OH)^- + NH_3$

At Anode : $Zn \rightarrow Zn^{2+} + 2e^-$

Over all reaction :

(iv) Mercury cell

Cathode : Mercury (II) oxide

Electrolyte : Paste of $\text{KOH} + \text{ZnO}$

Anode : Zn rod

Emf : 1.35 V

(2) **Secondary cells :** In the secondary cells, the reactions can be reversed by an external electrical energy source. Therefore, these cells can be **recharged** by passing electric current and used again and again. These are also called **storage cells**. Examples of secondary cells are, lead storage battery and nickel – cadmium storage cell.

In charged	Lead storage cell	Alkali cell
		
Positive electrode	Perforated lead plates coated with PbO_2	Perforated steel plate coated with $\text{Ni}(\text{OH})_2$
Negative electrode	Perforated lead plates coated with pure lead	Perforated steel plate coated with Fe
Electrolyte	dil. H_2SO_4	20% solution of $\text{KOH} + 1\% \text{LiOH}$
During charging	Chemical reaction At anode : $\text{PbSO}_4 + 2\text{H}^+ + 2e^- \rightarrow \text{Pb} + \text{H}_2\text{SO}_4$ At cathode : $\text{PbSO}_4 + \text{SO}_4^{2-} + 2\text{H}_2\text{O} - 2e^- \rightarrow \text{PbO}_2 + 2\text{H}_2\text{SO}_4$ Specific gravity of H_2SO_4 increases and when specific gravity becomes 1.25 the cell is fully charged. Emf of cell: When cell is fully charged then $E = 2.2 \text{ volt}$	Chemical reaction At anode : $\text{Ni}(\text{OH})_2 + 2\text{OH}^- - 2e^- \rightarrow \text{Ni}(\text{OH})_3$ At cathode : $\text{Fe}(\text{OH})_2 + 2\text{K}^+ + 2e^- \rightarrow \text{Fe} + 2\text{KOH}$ Emf of cell : When cell is fully charged then $E = 1.36 \text{ volt}$
During discharging	Chemical reaction At anode : $\text{Pb} + \text{SO}_4^{2-} - 2e^- \rightarrow \text{PbSO}_4$ At cathode : $\text{PbO}_2 + 2\text{H}^+ + 2e^- + \text{H}_2\text{SO}_4 \rightarrow \text{PbSO}_4 + 2\text{H}_2\text{O}$ Specific gravity of H_2SO_4 decreases and when specific gravity falls below 1.18 the cell requires recharging. Emf of cell : When emf of cell falls below 1.9 volt the cell requires recharging.	Chemical reaction At anode : $\text{Fe} + 2\text{OH}^- - 2e^- \rightarrow \text{Fe}(\text{OH})_2$ At cathode : $\text{Ni}(\text{OH})_3 + 2\text{K}^+ + 2e^- \rightarrow \text{Ni}(\text{OH})_2 + 2\text{KOH}$ Emf of cell : When emf of cell falls below 1.1 V it requires charging.
Efficiency	80%	60%

Fuel cells

These are Voltaic cells in which the reactants are continuously supplied to the electrodes. These are designed to convert the energy from the combustion of fuels such as H_2 , CO , CH_4 , etc. directly into electrical energy. The common example is **hydrogen-oxygen fuel cell** as described below,

In this cell, hydrogen and oxygen are bubbled through a porous carbon electrode into concentrated aqueous sodium hydroxide or potassium hydroxide. Hydrogen (the fuel) is fed into the anode compartment where it is oxidised. The oxygen is fed into cathode compartment where it is reduced. The diffusion rates of the gases into the cell are carefully regulated to get maximum efficiency. The net reaction is the same as burning of hydrogen and oxygen to form water. The reactions are

Each electrode is made of porous compressed carbon containing a small amount of catalyst (Pt , Ag or CoO). This cell runs continuously as long as the reactants are fed. Fuel cells convert the energy of the fuel

directly into electricity EMF of fuel cell is 1.23 V. This cell has been used for electric power in the **Apollo space programme**. The important advantages of fuel cells are

Fig. 12.6

(i) **High efficiency :** The fuel cells convert the energy of a fuel directly into electricity and therefore, they are more efficient than the conventional methods of generating electricity on a large scale by burning hydrogen, carbon fuels. Though we expect 100 % efficiency in fuel cells, so far **60 – 70% efficiency** has been attained. The conventional methods of production of electrical energy involve combustion of a fuel to liberate heat

which is then used to produce electricity. The efficiency of these methods is only about 40%.

(2) **Continuous source of energy** : There is no electrode material to be replaced as in ordinary battery. The fuel can be fed continuously to produce power. For this reason, $H_2 - O_2$ fuel cells have been used in space crafts.

(3) **Pollution free working** : There are no objectionable byproducts and, therefore, they do not cause pollution problems. Since fuel cells are efficient and free from pollution, attempts are being made to get better commercially practical fuel cells.

Electrode Potential

(i) When a metal (M) is placed in a solution of its ions (M), either of the following three possibilities can occur, according to the **electrode potential solution pressure theory of Nernst**.

(i) A metal ion M^+ collides with the electrode, and undergoes no change.

(ii) A metal ion M^+ collides with the electrode, gains n electrons and gets converted into a metal atom M , (i.e. the metal ion is reduced).

(iii) A metal atom on the electrode M may lose an electrons to the electrode, and enter to the solution as M^{n+} , (i.e. the metal atom is oxidised). $M(s) \longrightarrow M^{n+}(aq) + ne^-$.

Thus, "the electrode potential is the tendency of an electrode to lose or gain electrons when it is in contact with solution of its own ions."

(2) The magnitude of electrode potential depends on the following factors,

(i) Nature of the electrode, (ii) Concentration of the ions in solution, (iii) Temperature.

(3) **Types of electrode potential** : Depending on the nature of the metal electrode to lose or gain electrons, the electrode potential may be of two types,

(i) **Oxidation potential** : When electrode is negatively charged with respect to solution, i.e., it acts as anode. Oxidation occurs.

(ii) **Reduction potential** : When electrode is positively charged with respect to solution, i.e. it acts as cathode. Reduction occurs.

(4) **Standard electrode potential** : "If in the half cell, the metal rod (M) is suspended in a solution of one molar concentration, and the temperature is kept at 298 K, the electrode potential is called **standard electrode potential**, represented usually by E° ". 'or'

The standard electrode potential of a metal may be defined as "the potential difference in volts developed in a cell consisting of two electrodes, the pure metal in contact with a molar solution of one of its ions and the normal hydrogen electrode (NHE)".

Standard oxidation potential for any half - cell = -(Standard reduction potential)

Standard reduction potential for any half - cell = -(Standard reduction potential)

(5) Reference electrode or reference half - cells

It is not possible to measure the absolute value of the single electrode potential directly. Only the difference in potential between two electrodes can be measured experimentally. It is, therefore, necessary to couple the electrode with another electrode whose potential is known. This electrode is termed as **reference electrode or reference half - cells**. Various types of half - cells have been used to make complete cell with spontaneous reaction in forward direction. These half - cells have been summarised in following table,

Table : 12.2 Various Types of Half - cells

Type	Example	Half - cell reaction	$Q =$	Reversible to	Electrode Potential (oxdn), $E =$
Gas ion half - cell	$Pt(H_2) H^+(aq)$ $Pt(Cl_2) Cl^-(aq)$	$\frac{1}{2} H_2(g) \rightarrow H^+(aq) + e^-$ $Cl^-(aq) \rightarrow \frac{1}{2} Cl_2(g) + e^-$	$[H^+]$ $\frac{1}{[Cl^-]}$	H^+ Cl^-	$E^0 - 0.0591 \log[H^+]$ $E^0 + 0.0591 \log[Cl^-]$
Metal - metal ion half - cell	$Ag Ag^+(aq)$	$Ag(s) \rightarrow Ag^+(aq) + e^-$	$[Ag^+]$	Ag^+	$E^0 - 0.0591 \log[Ag^+]$
Metal insoluble salt anion half - cell	$Ag, AgCl Cl^-(aq)$	$Ag(s) + Cl^-(aq) \rightarrow AgCl(s) + e^-$	$\frac{1}{[Cl^-]}$	Cl^-	$E^0 + 0.0591 \log[Cl^-]$
Calomel electrode	$Hg, Hg_2Cl_2 Cl^-(aq)$	$2Hg(l) + 2Cl^-(aq) \rightarrow Hg_2Cl_2(s) + 2e^-$	$\frac{1}{[Cl^-]^2}$	Cl^-	$E^0 + 0.0591 \log[Cl^-]$
Metal - metal oxide hydroxide half - cell	$Hg, HgO OH^-(aq)$	$Hg(l) + 2OH^-(aq) \rightarrow HgO(s) + H_2O(l) + 2e^-$	$\frac{1}{[OH^-]^2}$	OH^-	$E^0 + 0.0591 \log[OH^-]$
Oxidation - reduction half - cell	$Pt Fe^{2+}_{(aq)}, Fe^{3+}_{(aq)}$	$Fe^{2+}(aq) \rightarrow Fe^{3+}(aq) + e^-$	$\frac{[Fe^{3+}]}{[Fe^{2+}]}$	Fe^{2+}, Fe^{3+}	$E^0 - 0.0591 \log \frac{[Fe^{3+}]}{[Fe^{2+}]}$

Cell potential or EMF of the cell

(i) "The difference in potentials of the two half - cells of a cell known as **electromotive force (emf)** of the cell or cell potential"

The difference in potentials of the two half - cells of a cell arises due to the flow of electrons from anode to cathode and flow of current from cathode to anode.

(2) The *emf* of the cell or cell potential can be calculated from the values of electrode potentials of two the half - cells constituting the cell. The following three methods are in use :

(i) When oxidation potential of anode and reduction potential of cathode are taken into account

$$E_{\text{cell}}^0 = \text{Oxidation potential of anode} + \text{Reduction potential of cathode} = E_{\text{ox}}^0(\text{anode}) + E_{\text{red}}^0(\text{cathode})$$

(ii) When reduction potentials of both electrodes are taken into account

$$E_{\text{cell}}^0 = \text{Reduction potential of cathode} - \text{Reduction potential of anode}$$

$$= E_{\text{Cathode}}^0 - E_{\text{Anode}}^0 = E_{\text{right}}^0 - E_{\text{left}}^0$$

(iii) When oxidation potentials of both electrodes are taken into account

$$E_{\text{cell}}^0 = \text{Oxidation potential of anode} - \text{Oxidation potential of cathode} = E_{\text{ox}}^0(\text{anode}) - E_{\text{ox}}^0(\text{cathode})$$

(3) Difference between emf and potential difference

Emf	Potential difference
It is the potential difference between two electrodes when no current is flowing in the circuit.	It is the difference of the electrode potentials of the two electrodes when the cell is under operation.
It is the maximum voltage that the cell can deliver.	It is always less than the maximum value of voltage which the cell can deliver.
It is responsible for the steady flow of current in the cell.	It is not responsible for the steady flow of current in the cell.

(4) Cell EMF and the spontaneity of the reaction :

$$\text{We know, } \Delta G = -nFE_{\text{cell}}$$

Nature of reaction	ΔG (or ΔG°)	E_{cell} (or E_{cell}^0)
Spontaneous	–	+
Equilibrium	0	0
Non – spontaneous	+	–

Nernst's equation

(1) Nernst's equation for electrode potential

The potential of the electrode at which the reaction,

takes place is described by the equation,

$$E_{M^{n+}/M} = E_{M^{n+}/M}^0 - \frac{RT}{nF} \ln \frac{[M(s)]}{[M^{n+}(aq)]}$$

$$\text{or } E_{M^{n+}/M} = E_{M^{n+}/M}^0 - \frac{2.303 RT}{nF} \log \frac{[M(s)]}{[M^{n+}(aq)]}$$

above eq. is called the **Nernst equation**.

Where,

$$E_{M^{n+}/M} = \text{the potential of the electrode at a given concentration,}$$

$$E_{M^{n+}/M}^0 = \text{the standard electrode potential}$$

$$R = \text{the universal gas constant, } 8.31 \text{ J K}^{-1} \text{ mol}^{-1}$$

$$T = \text{the temperature on the absolute scale,}$$

$$n = \text{the number of electrons involved in the electrode reaction,}$$

$$F = \text{the Faraday constant : } (96500 \text{ C}),$$

$$[M(s)] = \text{the concentration of the deposited metal,}$$

$[M^{n+}(aq)] = \text{the molar concentration of the metal ion in the solution,}$

The concentration of pure metal $M(s)$ is taken as unity. So, the Nernst equation for the M^{n+}/M electrode is written as,

$$E_{M^{n+}/M} = E_{M^{n+}/M}^0 - \frac{2.303 RT}{nF} \log \frac{1}{[M^{n+}(aq)]}$$

At 298 K, the Nernst equation for the M^{n+}/M electrode can be written as,

$$E_{M^{n+}/M} = E_{M^{n+}/M}^0 - \frac{0.0591}{n} \log \frac{1}{[M^{n+}(aq)]}$$

For an electrode (half - cell) corresponding to the electrode reaction,

The Nernst equation for the electrode is written as,

$$E_{\text{half-cell}} = E_{\text{half-cell}}^0 - \frac{2.303 RT}{nF} \log \frac{[\text{Reduced form}]}{[\text{Oxidised form}]}$$

At 298 K, the Nernst equation can be written as,

$$E_{\text{half-cell}} = E_{\text{half-cell}}^0 - \frac{0.0591}{n} \log \frac{[\text{Reduced form}]}{[\text{Oxidised form}]}$$

(2) Nernst's equation for cell EMF

For a cell in which the net cell reaction involving n electrons is,
 $aA + bB \rightarrow cC + dD$

The Nernst equation is written as,

$$E_{\text{cell}} = E_{\text{cell}}^0 - \frac{RT}{nF} \ln \frac{[C]^c [D]^d}{[A]^a [B]^b}$$

$$\text{Where, } E_{\text{cell}}^0 = E_{\text{cathode}}^0 - E_{\text{anode}}^0$$

The E_{cell}^0 is called the standard cell potential.

$$\text{or } E_{\text{cell}} = E_{\text{cell}}^0 - \frac{2.303 RT}{nF} \log \frac{[C]^c [D]^d}{[A]^a [B]^b}$$

At 298 K, above eq. can be written as,

$$\text{or } E_{\text{cell}} = E_{\text{cell}}^0 - \frac{0.0592}{n} \log \frac{[C]^c [D]^d}{[A]^a [B]^b}$$

It may be noted here, that the concentrations of A , B , C and D referred in the eqs. are the concentrations at the time the cell *emf* is measured.

(3) **Nernst's equation for Daniell's cell :** Daniell's cell consists of zinc and copper electrodes. The electrode reactions in Daniell's cell are,

Therefore, the Nernst equation for the Daniell's cell is,

$$E_{\text{cell}} = E_{\text{cell}}^0 - \frac{2.303 RT}{2F} \log \frac{[Cu(s)][Zn^{2+}(aq)]}{[Zn(s)][Cu^{2+}(aq)]}$$

Since, the activities of pure copper and zinc metals are taken as unity, hence the Nernst equation for the Daniell's cell is,

$$E_{cdl} = E_{cell}^0 - \frac{2.303RT}{2F} \log \frac{[Zn^{2+}(aq)]}{[Cu^{2+}(aq)]}$$

The above eq. at 298 K is,

$$E_{cdl} = E_{cell}^0 - \frac{0.0591}{2} \log \frac{[Zn^{2+}(aq)]}{[Cu^{2+}(aq)]} V$$

For Daniell's cell, $E_{cell}^0 = 1.1 V$

(4) Nernst's equation and equilibrium constant

For a cell, in which the net cell reaction involving n electrons is,
 $aA + bB \rightarrow cC + dD$

The Nernst equation is

$$E_{Cell} = E_{cell}^0 - \frac{RT}{nF} \ln \frac{[C]^c [D]^d}{[A]^a [B]^b} \quad \text{.....(i)}$$

At equilibrium, the cell cannot perform any useful work. So at equilibrium, E_{Cell} is zero. Also at equilibrium, the ratio

$$\frac{[C]^c [D]^d}{[A]^a [B]^b} = \left[\frac{[C]^c [D]^d}{[A]^a [B]^b} \right]_{\text{equilibrium}} = K_c$$

Relationship between potential, Gibbs energy and equilibrium constant

The electrical work (electrical energy) is equal to the product of the EMF of the cell and electrical charge that flows through the external circuit i.e.,

$$W_{\max} = nFE_{cell} \quad \text{.....(i)}$$

According to thermodynamics the free energy change (ΔG) is equal to the maximum work. In the cell work is done on the surroundings by which electrical energy flows through the external circuit, So

$$-W_{\max} = \Delta G \quad \text{.....(ii)}$$

from eq. (i) and (ii) $\Delta G = -nFE_{cell}$

In standard conditions $\Delta G^0 = -nFE_{cell}^0$

Where ΔG^0 = standard free energy change

$$\text{But } E_{cell}^0 = \frac{2.303}{nF} RT \log K_c$$

$$\therefore \Delta G^0 = -nF \times \frac{2.303}{nF} RT \log K_c$$

$$\Delta G^0 = -2.303 RT \log K_c \text{ or } \Delta G = \Delta G^0 + 2.303 RT \log Q$$

$$\Delta G^0 = -RT \ln K_c \quad (2.303 \log X = \ln X)$$

Electrochemical series

(1) The standard reduction potentials of a large number of electrodes have been measured using standard hydrogen electrode as the reference electrode. These various electrodes can be arranged in increasing or decreasing order of their reduction potentials. The arrangement of elements in order of increasing reduction potential values is called **electrochemical series**. It is also called **activity series**, of some typical electrodes.

(2) Characteristics of Electrochemical series

(i) The negative sign of standard reduction potential indicates that an electrode when joined with SHE acts as anode and oxidation occurs on this electrode. For example, standard reduction potential of zinc is -0.76

volt. When zinc electrode is joined with SHE, it acts as anode ($-ve$ electrode) i.e., oxidation occurs on this electrode. Similarly, the $+ve$ sign of standard reduction potential indicates that the electrode when joined with SHE acts as cathode and reduction occurs on this electrode.

(ii) The substances, which are stronger reducing agents than hydrogen are placed above hydrogen in the series and have negative values of standard reduction potentials. All those substances which have positive values of reduction potentials and placed below hydrogen in the series are weaker reducing agents than hydrogen.

(iii) The substances, which are stronger oxidising agents than H^+ ion are placed below hydrogen in the series.

(iv) The metals on the top (having high negative value of standard reduction potentials) have the tendency to lose electrons readily. These are active metals. The activity of metals decreases from top to bottom. The non-metals on the bottom (having high positive values of standard reduction potentials) have the tendency to accept electrons readily. These are active non-metals. The activity of non-metals increases from top to bottom.

Table : 12.3 Standard reduction electrode potentials at 298K

Element	Electrode Reaction (Reduction)	Standard Electrode Reduction potential E^0 , volt
Li	$Li^+ + e^- = Li$	-3.05
K	$K^+ + e^- = K$	-2.925
Ba	$Ba^{2+} + 2e^- = Ba$	-2.90
Sr	$Sr^{2+} + 2e^- = Sr$	-2.89
Ca	$Ca^{2+} + 2e^- = Ca$	-2.87
Na	$Na^+ + e^- = Na$	-2.714
Mg	$Mg^{2+} + 2e^- = Mg$	-2.37
Al	$Al^{3+} + 3e^- = Al$	-1.66
Mn	$Mn^{2+} + 2e^- = Mn$	-1.18
Zn	$Zn^{2+} + 2e^- = Zn$	-0.7628
Cr	$Cr^{3+} + 3e^- = Cr$	-0.74
Fe	$Fe^{2+} + 2e^- = Fe$	-0.44
Cd	$Cd^{2+} + 2e^- = Cd$	-0.403
Co	$Co^{2+} + 2e^- = Co$	-0.27
Ni	$Ni^{2+} + 2e^- = Ni$	-0.25
Sn	$Sn^{2+} + 2e^- = Sn$	-0.14
Pb	$Pb^{2+} + 2e^- = Pb$	-0.12
H_2	$2H^+ + 2e^- = H_2$	0.00
Cu	$Cu^{2+} + 2e^- = Cu$	+0.337
I ₂	$I_2 + 2e^- = 2I^-$	+0.535
Hg	$Hg^{2+} + 2e^- = Hg$	+0.885
Ag	$Ag^+ + e^- = Ag$	+0.799
Br ₂	$Br_2 + 2e^- = 2Br^-$	+1.08
Pt	$Pt^{2+} + 2e^- = Pt$	+1.20
Cl ₂	$Cl_2 + 2e^- = 2Cl^-$	+1.36
Au	$Au^{3+} + 3e^- = Au$	+1.50
F ₂	$F_2 + 2e^- = 2F^-$	+2.87

(3) Application of Electrochemical series

(i) **Reactivity of metals:** The activity of the metal depends on its tendency to lose electron or electrons, i.e., tendency to form cation (M^{n+}). This tendency depends on the magnitude of standard reduction potential. The metal which has high negative value (or smaller positive value) of standard reduction potential readily loses the electron or electrons and is converted into cation. Such a metal is said to be chemically active. The *chemical reactivity of metals decreases from top to bottom in the series*. The metal higher in the series is more active than the metal lower in the series. For example,

(a) Alkali metals and alkaline earth metals having high negative values of standard reduction potentials are chemically active. These react with cold water and evolve hydrogen. These readily dissolve in acids forming

corresponding salts and combine with those substances which accept electrons.

(b) Metals like *Fe, Pb, Sn, Ni*, Co, etc., which lie a little down in the series do not react with cold water but react with steam to evolve hydrogen.

(c) Metals like *Cu, Ag* and *Au* which lie below hydrogen are less reactive and do not evolve hydrogen from water.

(ii) **Electropositive character of metals** : The electropositive character also depends on the tendency to lose electron or electrons. Like reactivity, the electropositive character of metals decreases from top to bottom in the electrochemical series. On the basis of standard reduction potential values, metals are divided into three groups

(a) **Strongly electropositive metals** : Metals having standard reduction potential near about -2.0 volt or more negative like alkali metals, alkaline earth metals are strongly electropositive in nature.

(b) **Moderately electropositive metals** : Metals having values of reduction potentials between 0.0 and about -2.0 volt are moderately electropositive *Al, Zn, Fe, Ni, Co*, etc., belong to this group.

(c) **Weakly electropositive** : The metals which are below hydrogen and possess positive values of reduction potentials are weakly electropositive metals. *Cu, Hg, Ag*, etc., belong to this group.

(iii) Displacement reactions

(a) *To predict whether a given metal will displace another, from its salt solution*: A metal higher in the series will displace the metal from its solution which is lower in the series, i.e., The metal having low standard reduction potential will displace the metal from its salt's solution which has higher value of standard reduction potential. A metal higher in the series has greater tendency to provide electrons to the cations of the metal to be precipitated.

(b) *Displacement of one nonmetal from its salt solution by another nonmetal*: A non-metal higher in the series (towards bottom side), i.e., having high value of reduction potential will displace another non-metal with lower reduction potential, i.e., occupying position above in the series. The non-metal's which possess high positive reduction potentials have the tendency to accept electrons readily. These electrons are provided by the ions of the nonmetal having low value of reduction potential. Thus, Cl_2 can displace bromine and iodine from bromides and iodides.

[The activity or electronegative character or oxidising nature of the nonmetal increases as the value of reduction potential increases.]

(c) **Displacement of hydrogen from dilute acids by metals** : The metal which can provide electrons to H^+ ions present in dilute acids for reduction, evolve hydrogen from dilute acids.

The metal having negative values of reduction potential possess the property of losing electron or electrons.

Thus, the metals occupying top positions in the electrochemical series readily liberate hydrogen from dilute acids and on descending in the series tendency to liberate hydrogen gas from dilute acids decreases.

The metals which are below hydrogen in electrochemical series like *Cu, Hg, Au, Pt*, etc., do not evolve hydrogen from dilute acids.

(d) **Displacement of hydrogen from water** : Iron and the metals above iron are capable of liberating hydrogen from water. The tendency decreases from top to bottom in electrochemical series. Alkali and alkaline earth metals liberate hydrogen from cold water but *Mg, Zn* and *Fe* liberate hydrogen from hot water or steam.

(iv) **Reducing power of metals**: Reducing nature depends on the tendency of losing electron or electrons. More the negative reduction potential, more is the tendency to lose electron or electrons. Thus reducing nature decreases from top to bottom in the electrochemical series. The power of the reducing agent increases, as the standard reduction potential becomes more and more negative. Sodium is a stronger reducing agent than zinc and zinc is a stronger reducing agent than iron. (decreasing order of reducing nature)

Alkali and alkaline earth metals are strong reducing agents.

(v) **Oxidising nature of non-metals** : Oxidising nature depends on the tendency to accept electron or electrons. More the value of reduction potential, higher is the tendency to accept electron or electrons. Thus, oxidising nature increases from top to bottom in the electrochemical series. The strength of an oxidising agent increases as the value of reduction potential becomes more and more positive.

F_2 (Fluorine) is a stronger oxidant than Cl_2, Br_2 and I_2, Cl_2 (Chlorine) is a stronger oxidant than Br_2 and I_2

Thus, in **electrochemical series**

(vi) **Thermal stability of metallic oxides** : The thermal stability of the metal oxide depends on its electropositive nature. As the electropositivity decreases from top to bottom, the thermal stability of the oxide also decreases from top to bottom. The oxides of metals having high positive reduction potentials are not stable towards heat. The metals which come below copper form unstable oxides, i.e., these are decomposed on heating.

(vii) **Extraction of metals** : A more electropositive metal can displace a less electropositive metal from its salt's solution. This principle is applied for the extraction of *Ag* and *Au* by cyanide process. silver from the solution containing sodium argento cyanide, $NaAg(CN)_2$, can be obtained by the addition of zinc as it is more electro-positive than *Ag*.

Corrosion

(i) When metals are exposed to atmospheric conditions, they react with air or water in the environment to form undesirable compounds (usually oxides). This process is called **corrosion**. Almost all metals except the least active metals such as gold, platinum and palladium are attacked by environment i.e., undergo corrosion. For example, silver tarnishes, copper

develops a green coating, lead or stainless steel lose their lustre due to corrosion. Corrosion causes enormous damage to building, bridges, ships and many other articles made of iron.

Thus **corrosion** is a process of deterioration of a metal as a result of its reaction with air or water (environment) surrounding it.

In case of iron, corrosion is called rusting. Chemically, rust is hydrated form of ferric oxide, $Fe_2O_3 \cdot xH_2O$. Rusting of iron is generally caused by moisture, carbon dioxide and oxygen present in air. It has been observed that rusting takes place only when iron is in contact with moist air. Iron does not rust in dry air and in vacuum.

(2) **Factors which affect corrosion** : The main factors which affect corrosion are

More the reactivity of metal, the more will be the possibility of the metal getting corroded.

The impurities help in setting up voltaic cells, which increase the speed of corrosion

Presence of electrolytes in water also increases the rate of corrosion

Presence of CO_2 in natural water increase rusting of iron.

(v) When the iron surface is coated with layers of metals more active than iron, then the rate of corrosion is retarded.

A rise in temperature (with in a reasonable limit) increases the rate of corrosion.

(3) **Classification of corrosion process** : Depending upon the nature of corrosion, and the factors affecting it, the corrosion may be classified as follows.

(i) **Chemical corrosion** : Such corrosion, generally takes place when

(a) Reactive gases come in contact with metals at high temperatures e.g., corrosion in chemical industry.

(b) Slow dissolution of metal takes place when kept in contact with non conducting media containing organic acids.

(ii) **Bio-chemical corrosion or Bio-corrosion**: This is caused by the action of microorganisms. Soils of definite composition, stagnant water and certain organic products greatly favour the bio-corrosion.

(iii) **Electrochemical corrosion** : It occurs in a gaseous atmosphere in the presence of moisture, in soils and in solutions.

(4) **Mechanism of rusting of iron : Electrochemical theory of rusting.**

The overall rusting involves the following steps,

(i) Oxidation occurs at the anodes of each electrochemical cell. Therefore, at each anode neutral iron atoms are oxidised to ferrous ions.

Thus, the metal atoms in the lattice pass into the solution as ions, leaving electrons on the metal itself. These electrons move towards the cathode region through the metal.

Fig. 12.7

(ii) At the cathodes of each cell, the electrons are taken up by hydrogen ions (reduction takes place). The H^+ ions are obtained either from water or from acidic substances (e.g. CO_2) in water

The hydrogen atoms on the iron surface reduce dissolved oxygen.

Therefore, the overall reaction at cathode of different electrochemical cells may be written as,

(iii) The overall redox reaction may be written by multiplying reaction at anode by 2 and adding reaction at cathode to equalise number of electrons lost and gained i.e.

$$(E_{\text{Cell}} = 1.67V)$$

The ferrous ions are oxidised further by atmospheric oxygen to form rust.

It may be noted that salt water accelerates corrosion. This is mainly due to the fact that salt water increases the electrical conduction of electrolyte solution formed on the metal surface. Therefore, rusting becomes more serious problem where salt water is present.

(5) **Corrosion protection** : Corrosion of metals can be prevented in many ways. Some commonly used methods are

(i) **By surface coating**

(a) By applying, oil, grease, paint or varnish on the surface.

(b) By coating/depositing a thin layer of any other metal which does not corrode. For example, iron surface can be protected from corrosion by depositing a thin layer of zinc, nickel or chromium on it. Copper/brass can be protected by coating it with a thin layer of tin. Tinning of brass utensils is a very common practice in our country.

(c) **By Galvanization** : Prevention of corrosion of iron by Zn coating.

(ii) **By connecting metal to a more electropositive metal** : As long as the more electropositive metal is there, the given metal does not get corroded. For example, iron can be protected from corrosion by connecting it to a block/plate of zinc or magnesium. This method of corrosion protection is called **cathodic protection**.

(iii) **By forming insoluble phosphate or chromate coating** : Metal surfaces are treated with phosphoric acid to form an insoluble phosphate. Formation of a thin chromate layer also prevents the corrosion of metals.

(iv) **Using anti - rust solutions** : Solutions of alkaline phosphates and alkaline chromates are generally used as anti - rust solutions. For example, iron articles are dipped in boiling alkaline sodium phosphate solutions, when a protective insoluble sticking film of iron phosphate is formed.

Tips & Tricks

✍ When two or more ions compete at the electrodes then the ion with higher reduction potential gets liberated at the cathode while the one with lower reduction potential at the anode.

✍ Cell constant is determined with the help of conductivity bridge,

where a standard solution of KCl is used.

- ✍ If the external EMF is slightly more than the actual EMF , the current will flow into the cell and reverse reaction takes place.
- ✍ Identification of cathode and anode is done by the use of galvanometer.
- ✍ KCl / $NaCl$ / NH_4Cl etc., can not be used in the salt bridge of a cell containing silver salt as one of the electrodes as Cl^- ions form a ppt. of $AgCl$ with silver ion.
- ✍ Weston cell is a common example of standard cell. The emf of a standard cell does not change with temperature.
- ✍ In Appolo moon flights, $H_2 - O_2$ fuel cell was the source of energy and drinking water.
- ✍ Conductivity water is the highly purified water whose on conductance is very small. It is prepared by the demineralisation of ordinary water by passing through cation and anion exchange resins.

Ordinary Thinking

Objective Questions

Electrolytes and Electrolysis

- Which of the following will not conduct electricity in aqueous solution [AMU 1982, 83]
 - Copper sulphate
 - Sugar
 - Common salt
 - None of these
- Strong electrolytes are those which [MNR 1983]
 - Dissolve readily in water
 - Conduct electricity
 - Dissociate into ions at high dilution
 - Completely dissociate into ions at all dilutions
- In aqueous solution, strong electrolytes [AMU 1983, 84]
 - Are partially ionized
 - Do not ionise
 - Ionise almost completely
 - Form polymers
- An electrolyte [KCET 1984; MP PET/PMT 1988]
 - Forms complex ions in solution
 - Gives ions only when electricity is passed
 - Possesses ions even in solid state
 - Gives ions only when dissolved in water
- Electrolytes when dissolved in water dissociates into ions because [CPMT 1974, 78; MNR 1983]
 - They are unstable
 - The water dissolves it
 - The force of repulsion increases
 - The forces of electrostatic attraction are broken down by water
- Electrolyte can conduct electricity because
 - Their molecules contain unpaired electrons, which are mobile
 - Their molecules contain loosely held electrons which get free under the influence of voltage
 - The molecules break up into ions when a voltage is applied
 - The molecules are broken up into ions when the electrolyte is fused or is dissolved in the solvent
- Which one of the following metals could not be obtained on electrolysis of aqueous solution of its salts [IIT 1990]
 - Ag
 - Mg
 - Cu
 - Cr
- Which of the following aqueous solution will conduct an electric current quite well [MP PMT 1987]
 - Glycerol
 - HCl
 - Sugar
 - Pure water
- On the electrolysis of aqueous solution of sodium sulphate, on cathode we get [MP PMT 1992, 2002]
 - Na
 - H₂
 - SO₂
 - SO₃
- Electrolysis involves oxidation and reduction respectively at [CPMT 1973; AMU 1983; NCERT 1983, 84; MH CET 2001]
 - Anode and cathode
 - Cathode and anode
 - At both the electrodes
 - None of the above
- Which of the following compounds will not undergo decomposition on passing electricity through aqueous solution
 - Sugar
 - Sodium Chloride
 - Sodium Bromide
 - Sodium Acetate
- During the electrolysis of an electrolyte, the number of ions produced, is directly proportional to the [AFMC 2002]
 - Time consumed
 - Electro chemical equivalent of electrolysis
 - Quantity of electricity passed
 - Mass of electrons
- When the sample of copper with zinc impurity is to be purified by electrolysis, the appropriate electrodes are [AIEEE 2002]

Cathode	Anode
(a) Pure zinc	Pure copper
(b) Impure sample	Pure copper
(c) Impure zinc	Impure sample
(d) Pure copper	Impure sample
- In the electrolytic cell, flow of electrons is from [IIT Screening 2003]
 - Cathode to anode in solution
 - Cathode to anode through external supply
 - Cathode to anode through internal supply
 - Anode to cathode through internal supply
- An electric current is passed through an aqueous solution of the following. Which one shall decompose [NCERT 1972]
 - Urea
 - Glucose
 - AgNO₃
 - Ethyl alcohol
- The electric conduction of a salt solution in water depends on the
 - Shape of its molecules
 - Size of its molecules
 - Size of solvent molecules
 - Extent of its ionization
- A solution of sodium sulphate in water is electrolysed using inert electrodes. The products at the cathode and anode are respectively [IIT 1987, 96]
 - H₂, O₂
 - O₂, H₂
 - O₂, Na
 - O₂, SO₂
- On electrolysis a solution of dilute H₂SO₄ between platinum electrodes, the gas evolved at the anode is [NCERT 1977, 79; MNR 1980; CBSE PMT 1992]
 - SO₂
 - SO₃
 - O₂
 - H₂
- The addition of a polar solvent to a solid electrolyte results in
 - Polarization
 - Association
 - Ionization
 - Non-liberation of heat
- During the electrolysis of fused NaCl, which reaction occurs at anode [NCERT 1973; AFMC 1992; MP PMT 2002]
 - Chloride ions are oxidized
 - Chloride ions are reduced
 - Sodium ions are oxidised
 - Sodium ions are reduced
- The amount of ion discharged during electrolysis is not directly proportional to [NCERT 1973]
 - Resistance
 - Time
 - Current
 - Chemical equivalent of the ion
- Electrolysis of aqueous HCl solution produces [CPMT 1987]
 - H₂ gas at the anode
 - H₂ gas at the cathode
 - Cl₂ gas at the cathode

- (d) Cl_2 and O_2 gases both at the anode
23. During electrolysis of $NaCl$ solution, part of the reaction is $Na^+ + e^- \rightarrow Na$. This is termed as [NCERT 1984]
(a) Oxidation (b) Reduction
(c) Deposition (d) Cathode reaction
24. When a solution of an electrolyte is heated the conductance of the solution [KCET 1991]
(a) Increases because of the electrolyte conducts better
(b) Decreases because of the increased heat
(c) Decreases because of the dissociation of the electrolyte is suppressed
(d) Increases because the electrolyte is dissociated more
25. The passage of current liberates H_2 at cathode and Cl_2 at anode. The solution is [EAMCET 1979,87]
(a) Copper chloride in water (b) $NaCl$ in water
(c) H_2SO_4 (d) Water
26. Pure water does not conduct electricity because it [Manipal MEE 1995]
(a) Has a low boiling point
(b) Is almost totally unionized
(c) Is neutral
(d) Is readily decomposed
27. Which is responsible for electrical conduction of molten sodium chloride [MADT Bihar 1995]
(a) Free electrons
(b) Free ions
(c) Free molecules
(d) Atoms of sodium and chlorine
28. In electrolysis of aqueous copper sulphate, the gas at anode and cathode is [AFMC 1995]
(a) O_2 and H_2 (b) SO_2 and H_2
(c) H_2 and O_2 (d) SO_3 and O_2
29. Use of electrolysis is [AFMC 1995]
(a) Electroplating (b) Electrorefining
(c) (a) and (b) both (d) None of these
30. Sodium is made by the electrolysis of a molten mixture of about 40% $NaCl$ and 60% $CaCl_2$ because [CBSE PMT 1995]
(a) $CaCl_2$ helps in conduction of electricity
(b) This mixture has a lower melting point than $NaCl$
(c) Ca^{++} can displace Na from $NaCl$
(d) Ca^{++} can reduce $NaCl$ to Na
31. Electrolysis is a process in which the cations and anions of the electrolyte are [MP PET 1995]
(a) Hydrated (b) Hydrolysed
(c) Charged (d) Discharged
32. Degree of ionisation of a solution depends upon [BHU 1998]
(a) Temperature (b) Nature of the electrolyte
(c) Nature of the solvent (d) None of these
33. Which of the following is non-electrolytes [KCET (Med.) 1999]
(a) $NaCl$ (b) $CaCl_2$
(c) $C_{12}H_{22}O_{11}$ (d) CH_3COOH
34. When a molten ionic hydride is electrolysed [JIPMER 1999]
(a) Hydrogen is liberated at the cathode
(b) Hydrogen is liberated at the anode
(c) There is no reaction
(d) H^- ions produced migrate to the cathode
35. During electrolysis, the species discharged at cathode are [AFMC 2000]
(a) Ions (b) Cation
(c) Anion (d) All of these
36. Electrolysis of molten anhydrous calcium chloride produces [AIIMS 2000]
(a) Calcium (b) Phosphorus
(c) Sulphur (d) Sodium
37. Which of the following properties of pure metal makes it more useful than the corresponding alloy [RPET 2000]
(a) It is harder than corresponding alloy
(b) It has high density
(c) It can be extracted easily
(d) It conducts heat and electricity easily
38. Which of the following liberate hydrogen on reaction with dilute H_2SO_4 [Roorkee 2000]
(a) Fe (b) Cu
(c) Al (d) Hg
39. Which one of the following material conducts electricity [Kerala (Med.) 2003]
(a) Diamond
(b) Crystalline sodium chloride
(c) Barium sulphate
(d) Fused potassium chloride
(e) Molten sulphur
40. Which of the following metals will give H_2 on reaction with $NaOH$
(a) Mg (b) Ba
(c) Ca (d) Sr
41. Which of the following is not a non electrolyte [J & K 2005]
(a) Acetic acid (b) Glucose
(c) Ethanol (d) Urea

Faraday's law of electrolysis

1. Amount of electricity that can deposit 108 gm of silver from $AgNO_3$ solution is [AFMC 1993; MP PMT 2004]
(a) 1 ampere (b) 1 coulomb
(c) 1 faraday (d) None of the above
2. When 9.65 coulombs of electricity is passed through a solution of silver nitrate (atomic weight of $Ag = 107.87$ taking as 108) the amount of silver deposited is [EAMCET 1992; KCET 2000]
(a) 10.8 mg (b) 5.4 mg
(c) 16.2 mg (d) 21.2 mg
3. Three faradays electricity was passed through an aqueous solution of iron (II) bromide. The weight of iron metal (at. wt. = 56) deposited at the cathode (in gm) is [EAMCET 1991]
(a) 56 (b) 84
(c) 112 (d) 168
4. A silver cup is plated with silver by passing 965 coulombs of electricity, the amount of silver deposited is [EAMCET 1990; MP PET 1994, 97]
(a) 9.89 g (b) 107.87 g

- (c) 1.0787 g (d) 1.002 g
5. The atomic weight of Al is 27. When a current of 5 Faradays is passed through a solution of Al^{+++} ions, the weight of Al deposited is [NCERT 1984]
(a) 27 gm (b) 36 gm
(c) 45 gm (d) 39 gm
6. An apparatus used for the measurement of quantity of electricity is known as a [BHU 1979]
(a) Calorimeter (b) Cathetometer
(c) Coulometer (d) Colorimeter
7. The unit of electrochemical equivalent is [EAMCET 1980]
(a) Gram (b) Gram/ampere
(c) Gram/coulomb (d) Coulomb/gram
8. A certain current liberated 0.504 gm of hydrogen in 2 hours. How many grams of copper can be liberated by the same current flowing for the same time in a copper sulphate solution [NCERT 1973, 77; CPMT 1979, 89; AIIMS 1987]
(a) 12.7 gm (b) 15.9 gm
(c) 31.8 gm (d) 63.5 gm
9. What weight of copper will be deposited by passing 2 Faradays of electricity through a cupric salt (Atomic weight of $Cu = 63.5$) [NCERT 1975; CPMT 1977, 79]
(a) 2.0 gm (b) 3.175 gm
(c) 63.5 gm (d) 127.0 gm
10. If the current is passed into the solution of an electrolyte [AIIMS 1979]
(a) Anions move towards anode, cations towards cathode
(b) Anions and cations both move towards anode
(c) Anions move towards cathode, cations towards anode
(d) No movement of ions takes place
11. Unit of Faraday is
(a) Ampere (b) Coulomb
(c) Coulomb mole^{-1} (d) Coulomb Sec^{-1}
12. On passing 0.1 Faraday of electricity through aluminium chloride, the amount of aluminium metal deposited on cathode is ($Al = 27$) [MP PMT 1991]
(a) 0.9 gm (b) 0.3 gm
(c) 0.27 gm (d) 2.7 gm
13. Which of the following represents the first law of Faraday [MP PMT 1991]
(a) $E = mc^2$ (b) $E = hv$
(c) $m = ect$ (d) $PV = nRT$
14. 5 amperes is passed through a solution of zinc sulphate for 40 minutes. Find the amount of zinc deposited at the cathode [CBSE PMT 1996]
(a) 40.65 gm (b) 4.065 gm
(c) 0.4065 gm (d) 65.04 gm
15. In an electroplating experiment m g of silver is deposited, when 4 amperes of current flows for 2 minutes. The amount (in gms) of silver deposited by 6 amperes of current flowing for 40 seconds will be [MNR 1991]
(a) $4m$ (b) $m/2$
(c) $m/4$ (d) $2m$
16. On passing 3 ampere of electricity for 50 minutes, 1.8 gram metal deposits. The equivalent mass of metal is [MP PMT 1992]
(a) 20.5 (b) 25.8
(c) 19.3 (d) 30.7
17. The desired amount of charge for obtaining one mole of Al from Al^{3+}
(a) $3 \times 96500 C$ (b) 96500 C
- (c) $\frac{96500}{3} C$ (d) $\frac{96500}{2} C$
18. On passing one faraday of electricity through the electrolytic cells containing Ag^+ , Ni^{+2} and Cr^{+3} ions solution, the deposited Ag (At. wt. = 108), Ni (At. wt. = 59) and Cr (At. wt. = 52) is [AIIMS 1982]
- | | Ag | Ni | Cr |
|-----|----------|----------|----------|
| (a) | 108 gm | 29.5 gm | 17.3 gm |
| (b) | 108 gm | 59.0 gm | 52.0 gm |
| (c) | 108.0 gm | 108.0 gm | 108.0 gm |
| (d) | 108 gm | 117.5 gm | 166.0 gm |
19. One Faraday of electricity when passed through a solution of copper sulphate deposits [CPMT 1978]
(a) 1 mole of Cu (b) 1 gm atom of Cu
(c) 1 molecule of Cu (d) 1 gm equivalent of Cu
20. When 1 coulomb of charge is passed through electrolyte solution, then the mass deposited is equal to
(a) Equivalent weight
(b) Atomic weight
(c) Electrochemical equivalent
(d) Chemical equivalent
21. The platinum electrodes were immersed in a solution of cupric sulphate and electric current passed through the solution. After some time it was found that colour of copper sulphate disappeared with evolution of gas at the electrode. The colourless solution contains [NCERT 1984]
(a) Platinum sulphate (b) Copper hydroxide
(c) Copper sulphate (d) Sulphuric acid
22. On passing C ampere of electricity through a electrolyte solution for t second, m gram metal deposits on cathode. The equivalent weight E of the metal is [MP PMT 1990]
(a) $E = \frac{C \times t}{m \times 96500}$ (b) $E = \frac{C \times m}{t \times 96500}$
(c) $E = \frac{96500 \times m}{C \times t}$ (d) $E = \frac{C \times t \times 96500}{m}$
23. How many Faradays are required to generate one gram atom of magnesium from $MgCl_2$ [MADT Bihar 1982]
(a) 1 (b) 2
(c) 3 (d) 4
24. To deposit 0.6354 gm of copper by electrolysis of aqueous cupric sulphate solution, the amount of electricity required (in coulombs) is
(a) 9650 (b) 4825
(c) 3860 (d) 1930
25. In electrolysis of a fused salt, the weight of the deposit on an electrode will not depend on [CPMT 1973]
(a) Temperature of the bath
(b) Current intensity
(c) Electrochemical equivalent of ions
(d) Time for electrolysis
26. Faraday's laws of electrolysis will fail when [NCERT 1971]
(a) Temperature is increased
(b) Inert electrodes are used
(c) A mixture of electrolytes is used
(d) In none of these cases
27. According to the first law of Faraday, the weight of a substance discharge at the electrode is
(a) $W = ZQ$ (b) $W = eF$
(c) $W = \frac{Z}{F} It$ (d) $W = ZI$

28. When 0.04 faraday of electricity is passed through a solution of CaSO_4 , then the weight of Ca^{2+} metal deposited at the cathode is [BHU 1996]
 (a) 0.2 gm (b) 0.4 gm
 (c) 0.6 gm (d) 0.8 gm
29. A current 2.0 A is passed for 5 hours through a molten metal salt deposits 22 g of metal (At. wt. = 177). The oxidation state of the metal in the metal salt is [KCET 1996]
 (a) +1 (b) +2
 (c) +3 (d) +4
30. How many atoms of calcium will be deposited from a solution of CaCl_2 by a current of 25 milliamperes flowing for 60 seconds
 (a) 4.68×10^{18} (b) 4.68×10^{15}
 (c) 4.68×10^{12} (d) 4.68×10^9
31. On passing 0.5 faraday of electricity through NaCl , the amount of Cl deposited on cathode is [BHU 1997; RPET 1999]
 (a) 35.5 gm (b) 17.75 gm
 (c) 71 gm (d) 142 gm
32. What is the amount of chlorine evolved when 2 amperes of current is passed for 30 minutes in an aqueous solution of NaCl [BHU 1998; AIIMS 1999]
 (a) 66 g (b) 1.32 g
 (c) 33 g (d) 99 g
33. On passing a current through KCl solution, 19.5 g of potassium is deposited. If the same quantity of electricity is passed through a solution of aluminium chloride, the amount of aluminium deposited is [EAMCET 1997]
 (a) 4.5 g (b) 9.0 g
 (c) 13.5 g (d) 27 g
 (e) None is correct
34. Electrolysis rules of Faraday's states that mass deposited on electrode is proportional to [CBSE PMT 2000]
 (a) $m \propto I^2$ (b) $m \propto Q$
 (c) $m \propto Q^2$ (d) None of these
35. A current being passed for two hour through a solution of an acid liberating 11.2 litre of oxygen at NTP at anode. What will be the amount of copper deposited at the cathode by the same current when passed through a solution of copper sulphate for the same time [BVP 2003]
 (a) 16 g (b) 63 g
 (c) 31.5 g (d) 8 g
36. In a metal oxide, there is 20% oxygen by weight. Its equivalent weight is [Pb. PMT 2000]
 (a) 40 (b) 64
 (c) 72 (d) 32
37. On the basis of the information available from the reaction $\frac{4}{3}\text{Al} + \text{O}_2 \rightarrow \frac{2}{3}\text{Al}_2\text{O}_3$, $\Delta G = -827 \text{ kJ mol}^{-1}$ of O_2 the minimum *emf* required to carry out an electrolysis of Al_2O_3 is ($F = 96500 \text{ C mol}^{-1}$) [CBSE PMT 2003]
 (a) 8.56 V (b) 2.14 V
 (c) 4.28 V (d) 6.42 V
38. Then during electrolysis of a solution of AgNO_3 , 9650 coulombs of charge pass through the electroplating bath, the mass of silver deposited in the cathode will be [AIEEE 2003]
 (a) 1.08 g (b) 10.8 g
 (c) 21.6 g (d) 108 g
39. Total charge on 1 mole of a monovalent metal ion is equal to [DPMT 2001]
 (a) $9.65 \times 10^4 \text{ Coulomb}$ (b) $6.28 \times 10^{18} \text{ Coulomb}$
 (c) $1.6 \times 10^{-19} \text{ Coulomb}$ (d) None of these
40. When an electric current is passed through acidulated water 112 ml of hydrogen gas at N.T.P. collect at the cathode in 965 seconds. The current passed, in amperes is [MNR 1991; UPSEAT 2001]
 (a) 1.0 (b) 0.5
 (c) 0.1 (d) 2.0
41. How much chlorine will be liberated on passing one ampere current for 30 minutes through NaCl solution [BVP 2003]
 (a) 0.66 mole (b) 0.33 mole
 (c) 0.66 gm (d) 0.33 gm
42. The number of electrons involved in redox reactions when a Faraday of electricity is passed through an electrolyte in solution is [NCERT 1982; Pb. PMT 1999]
 (a) 6×10^{23} (b) 6×10^{-23}
 (c) 96500 (d) 8×10^{19}
43. Coulomb is equal to [Orissa JEE 2002]
 (a) ampere $\times$ second (b) ampere $\times$ minute
 (c) watt $\times$ second (d) volt $\times$ second
44. The energy required to release 1 electron from He^+ is..... [Orissa JEE 2002]
 (a) + 54.4 eV (b) - 13.6 eV
 (c) + 27.2 eV (d) Cannot be predicted
45. Faraday's laws of electrolysis are related to the [IIT 1983]
 (a) Atomic number of cation
 (b) Atomic number of anion
 (c) Equivalent weight of the electrolyte
 (d) Speed of the cation
46. The electric charge for electrode decomposition of one gram equivalent of a substance is [IIT 1984; KCET 1992]
 (a) One ampere per second
 (b) 96500 coulombs per second
 (c) One ampere for one hour
 (d) Charge on one mole of electrons
47. The number of electrons passing per second through a cross-section of copper wire carrying 10^{-6} amperes of current per second is found to be [EAMCET 1985]
 (a) 1.6×10^{-19} (b) 6×10^{-35}
 (c) 6×10^{-16} (d) 6×10^{12}
48. The electrolytic cells, one containing acidified ferrous chloride and another acidified ferric chloride are connected in series. The ratio of iron deposited at cathodes in the two cells when electricity is passed through the cells will be [CPMT 1989]
 (a) 3 : 1 (b) 2 : 1
 (c) 1 : 1 (d) 3 : 2
49. When 96500 coulomb of electricity is passed through a copper sulphate solution, the amount of copper deposited will be [MP PMT 1996]
 (a) 0.25 mol (b) 0.50 mol
 (c) 1.00 mol (d) 2.00 mol
50. During electrolysis of fused aluminium chloride 0.9 gm of aluminium was deposited on the cathode. The volume of chlorine liberated at the anode will be
 (a) 2.24 litres (b) 11.2 litres
 (c) 1.12 litres (d) 5.6 litres
51. Faraday has the dimensions of [MP PET 1995]
 (a) Coulombs
 (b) Coulomb equivalent
 (c) Coulomb per equivalent
 (d) Coulomb per degree Kelvin

52. The required charge for one equivalent weight of silver deposited on cathode is [Roorkee 1995] [AMU 1983; AFMC 1989; MP PET 2001]
- (a) $9.65 \times 10^7 C$ (b) $9.65 \times 10^4 C$ (c) $9.65 \times 10^3 C$ (d) $9.65 \times 10^5 C$
53. 96500 coulombs of electric current liberates from $CuSO_4$ solution [MP PET 1995]
- (a) 63.5 gm Cu (b) 31.75 gm Cu (c) 96500 gm Cu (d) 100 gm Cu
54. A current of strength 2.5 amp was passed through $CuSO_4$ solution for 6 minutes 26 seconds. The amount of copper deposited is (Atomic weight of Cu = 63.5) (1 faraday = 96500 coulombs) [EAMCET 1989; MP PET 1994]
- (a) 0.3175 g (b) 3.175 g (c) 0.635 g (d) 6.35 g
55. A certain quantity of electricity is passed through an aqueous solution of $AgNO_3$ and cupric salt solution connected in series. The amount of Ag deposited is 1.08 gm, the amount of copper deposited is (atomic weight of Cu = 63.5; Ag = 108)
- (a) 0.6454 g (b) 6.354 g (c) 0.3177 g (d) 3.177 g
56. The number of electrons required to deposit 1 gm atom of aluminium (at. wt. = 27) from a solution of aluminium chloride will be (where N is Avogadro's number) [AIIMS 1992]
- (a) 1 N (b) 2 N (c) 3 N (d) 4 N
57. Three faradays of electricity are passed through molten Al_2O_3 , aqueous solution of $CuSO_4$ and molten NaCl taken in different electrolytic cells. The amount of Al, Cu and Na deposited at the cathodes will be in the ratio of [BHU 1990]
- (a) 1 mole : 2 mole : 3 mole (b) 3 mole : 2 mole : 1 mole (c) 1 mole : 1.5 mole : 3 mole (d) 1.5 mole : 2 mole : 3 mole
58. An electrolytic cell contains a solution of Ag_2SO_4 and have platinum electrodes. A current is passed until 1.6 gm of O_2 has been liberated at anode. The amount of silver deposited at cathode would be [CPMT 1971]
- (a) 107.88 gm (b) 1.6 gm (c) 0.8 gm (d) 21.60 gm
59. The aqueous solution of which of the following decomposes on passing electric current [EAMCET 1973]
- (a) Cane sugar (b) Urea (c) Methanol (d) Potassium iodide
60. The number of Faradays needed to reduce 4 gram equivalents of Cu^{++} to Cu metal will be [BHU 1981]
- (a) 1 (b) 2 (c) 1/2 (d) 4
61. When electricity is passed through the solution of $AlCl_3$, 13.5 gm of Al are deposited. The number of Faraday must be [NCERT 1974; MP PET 1992; MP PET 1994]
- (a) 0.50 (b) 1.00 (c) 1.50 (d) 2.00
62. The value of one Faraday is
- (a) 95500 C mol⁻¹ (b) 96550 C mol⁻¹ (c) 96500 C mol⁻¹ (d) 98500 C mol⁻¹
63. The quantity of electricity needed to liberate 0.5 gram equivalent of an element is [CPMT 1988; MP PET 1997]
- (a) 48250 Faradays (b) 48250 Coulombs (c) 193000 Faradays (d) 193000 Coulombs
64. The number of coulombs required for the deposition of 107.870 g of silver is [MP PET/PMT 1998]
- (a) 96,500 (b) 48,250 (c) 1,93,000 (d) 10,000
65. When one of ampere current flows for 1 sec through a conductor, this quantity of electricity is known as [MP PET 1993]
- (a) Faraday (b) Coulomb (c) E.M.F. (d) Ohm
66. The mass deposited at an electrode is directly proportional to [CPMT 1974; AFMC 1987; MP PET 2000]
- (a) Atomic weight (b) Equivalent weight (c) Molecular weight (d) Atomic number
67. From the solution of which of the following one faraday of electricity will liberate one gram atom of metal [MH CET 1999; MP PET 1993, 2000; AFMC 2000]
- (a) NaCl (b) BaCl₂ (c) CuSO₄ (d) AlCl₃
68. On electrolysis, 1 mole of aluminium will be deposited from its molten salt by [MH CET 2000]
- (a) 3 moles of electrons (b) 4 moles of electrons (c) 2 moles of electrons (d) 1 mole of electrons
69. The atomic weight of Fe is 56. The weight of Fe deposited from $FeCl_3$ solution by passing 0.6 Faraday of electricity is [MH CET 2000]
- (a) 5.6 g (b) 11.2 g (c) 22.4 g (d) 33.6 g
70. 2.5 F of electricity are passed through a $CuSO_4$ solution. The number of gm equivalent of Cu deposited on anode is [CPMT 1973; DPMT 1982; MP PET 2001]
- (a) Zero (b) 1.25 (c) 2.5 (d) 5.0
71. The equivalent weight of a certain trivalent element is 20. Molecular weight of its oxide is [KCET 2003]
- (a) 152 (b) 56 (c) 168 (d) 68
72. Silver is removed electrically from 200 ml of a 0.1 N solution of $AgNO_3$ by a current of 0.1 ampere. How long will it take to remove half of the silver from the solution [AMU 1999]
- (a) 16 sec (b) 96.5 sec (c) 100 sec (d) 10 sec
73. In order to separate oxygen from one mole of H_2O the required quantity of coulomb would be [RPET 1999]
- (a) 1.93×10^5 (b) 9.6×10^4 (c) 1.8 (d) 3.2
74. A current of 0.25 A is passed through $CuSO_4$ solution placed in voltameter for 45 minutes. The amount of Cu deposited on cathode is (At weight of Cu = 63.6) [BHU 2001]

- (a) 0.20 g (b) 0.22 g
(c) 0.25 g (d) 0.30 g [CPMT 1982; Pb.CET 2003]
75. Faraday constant [KCET (Med.) 2001]
(a) Is a numerical constant
(b) Depends on equivalent
(c) Depends upon the current passed
(d) Depends on the number of electrons
76. If 0.5 amp current is passed through acidified silver nitrate solution for 10 minutes. The mass of silver deposited on cathode, is (eq. wt. of silver nitrate = 108) [AFMC 2001]
(a) 0.235 g (b) 0.336 g
(c) 0.536 g (d) 0.636 g
77. The unit for the electric current is [KCET (Med.) 2001]
(a) Ohm (b) Volt
(c) Ampere (d) Coulomb
78. The quantity of electricity required to liberate 112 cm^3 of hydrogen at STP from acidified water is [KCET (Med.) 2001]
(a) 0.1 Faraday (b) 1 Faraday
(c) 965 Coulomb (d) 96500 Coulomb
79. Which solution will show highest resistance during the passage of current [BHU 2001]
(a) 0.05 N NaCl (b) 2 N NaCl
(c) 0.1 N NaCl (d) 1 N NaCl
80. 4 g of copper was dissolved in concentrated nitric acid. The copper nitrate solution on strong heating gave 5 g of its oxide. The equivalent weight of copper is [KCET 2004]
(a) 23 (b) 32
(c) 12 (d) 20
81. The amount of silver deposited by passing 241.25 coulomb of current through silver nitrate solution is [MHCET 2003]
(a) 2.7 g (b) 2.7 mg
(c) 0.27 g (d) 0.54 g
82. When 1F of electricity is passed through acidulated water, O_2 evolved is [MHCET 2004]
(a) 11.2 dm^3 (b) 5.6 dm^3
(c) 22.4 dm^3 (d) 1.0 dm^3
83. Charge required to liberate 11.5 g sodium is [AIIMS 1992; DCE 2002]
(a) 0.5 F (b) 0.1 F
(c) 1.5 F (d) 96500 coulombs
84. In the electrolysis of water, one Faraday of electrical energy would evolve [DCE 2004]
(a) One mole of oxygen (b) One g atom of oxygen
(c) 8 g of oxygen (d) 22.4 litres of oxygen
85. In a galvanic cell, the electrons flow from [KCET 2004]
(a) Anode to cathode through the solution
(b) Cathode to anode through the solution
(c) Anode to cathode through the external circuit
(d) Cathode to anode through the external circuit
86. An electric current is passed through silver nitrate solution using silver electrodes. 10.79 g of silver was found to be deposited on the cathode if the same amount of electricity is passed through copper sulphate solution using copper electrodes, the weight of copper deposited on the cathode is [Kerala PMT 2004]
(a) 6.4 g (b) 2.3 g
(c) 12.8 g (d) 1.6 g
(e) 3.2 g
87. The law of electrolysis were proposed by
(a) Kohlraush (b) Faraday
(c) Nernst (d) Berthelot
88. How many atoms of calcium will be deposited from a solution of CaCl_2 by a current 0.25 mA following for 60 seconds
(a) 4.68×10^{18} (b) 4.68×10^{15}
(c) 4.68×10^{12} (d) 4.68×10^9
89. The number of coulombs required to reduce 12.3 g of nitrobenzene to aniline [UPSEAT 2003]
(a) 115800 C (b) 5790 C
(c) 28950 C (d) 57900 C
90. During the process of electrolytic refining of copper, some metals present as impurity settle as 'anode mud'. These are [AIEEE 2005]
(a) Sn and Ag (b) Pb and Zn
(c) Ag and Au (d) Fe and Ni
91. A galvanic cell is set up from a zinc bar weighing 50g and 1.0 litre, 1.0M, CuSO_4 solution. How long would the cell run, assuming it delivers a steady current of 1.0 ampere [Roorkee 2000]
(a) 48 hrs (b) 41 hrs
(c) 21 hrs (d) 1 hr
92. On passing electric current through molten aluminium chloride, 11.2 litre of Cl_2 is liberated at NTP at anode. The quantity of aluminium deposited at cathode is (at. wt. of Al = 27)
(a) 9 g (b) 18 g
(c) 27 g (d) 36 g
93. An electric current is passed through silver voltameter connected to a water voltameter. The cathode of the silver voltameter weighed 0.108 g more at the end of the electrolysis. The volume of oxygen evolved at STP is [Kerala (Med.) 2003]
(a) 56 cm^3 (b) 550 cm^3
(c) 5.6 cm^3 (d) 11.2 cm^3
(e) 22.4 cm^3
94. During electrolysis of aqueous NaOH, 4 g of O_2 gas is liberated at NTP at anode, H_2 gas liberated at cathode is [CBSE PMT 1998]
(a) 2.8 litres (b) 5.6 litres
(c) 11.2 litres (d) 22.4 litres

Conductor and conductance

1. Which one of the following statements is correct [MP PET 1997]
(a) The oxidation number of oxygen in KO_2 is zero
(b) The specific conductance of an electrolyte solution decreases with increase in dilution
(c) Sn^{2+} oxidises Fe^{3+}
(d) $\text{Zn} / \text{ZnSO}_4$ is a reference electrode
2. In infinite dilutions, the equivalent conductances of Ba^{2+} and Cl^- are 127 and $76 \text{ ohm}^{-1}\text{cm}^{-1} \text{ eqvt}^{-1}$. The equivalent conductivity of BaCl_2 at indefinite dilution is [CBSE 2000]
(a) 101.5 (b) 139.5

- (c) 203.5 (d) 279.5
3. The factor which is not affecting the conductivity of any solution is
(a) Dilution (b) Nature of electrolyte
(c) Temperature (d) None of these
4. Specific conductance of 0.1 M nitric acid is $6.3 \times 10^{-2} \text{ ohm}^{-1} \text{ cm}^{-1}$. The molar conductance of solution is
[Kerala (Med.) 2003]
(a) $630 \text{ ohm}^{-1} \text{ cm}^2 \text{ mole}^{-1}$ (b) $315 \text{ ohm}^{-1} \text{ cm}^2 \text{ mole}^{-1}$
(c) $100 \text{ ohm}^{-1} \text{ cm}^2 \text{ mole}^{-1}$ (d) $6300 \text{ ohm}^{-1} \text{ cm}^2 \text{ mole}^{-1}$
(e) $63.0 \text{ ohm}^{-1} \text{ cm}^2 \text{ mole}^{-1}$
5. The conductivity of strong electrolyte is [CPMT 2003]
(a) Increase on dilution slightly
(b) Decrease on dilution
(c) Does not change with dilution
(d) Depend upon density of electrolytes itself
6. If X is the specific resistance of the solution and M is the molarity of the solution, the molar conductivity of the solution is given by [Kurukshetra CEE 2002]
(a) $\frac{1000X}{M}$ (b) $\frac{1000}{MX}$
(c) $\frac{1000M}{X}$ (d) $\frac{MX}{1000}$
7. Conductivity (unit Siemen's) is directly proportional to area of the vessel and the concentration of the solution in it and is inversely proportional to the length of the vessel then the unit of the constant of proportionality is [AIEEE 2002]
(a) Sm mol^{-1} (b) $\text{Sm}^2 \text{ mol}^{-1}$
(c) $\text{S}^{-2} \text{ m}^2 \text{ mol}$ (d) $\text{S}^2 \text{ m}^2 \text{ mol}^{-2}$
8. If one end of a piece of a metal is heated, the other end becomes hot after some time. This is due to [CBSE PMT 1995]
(a) Energised electrons moving to the other part of the metal
(b) Resistance of the metal
(c) Mobility of atoms in the metal
(d) Minor perturbation in the energy of atoms
9. Conductivity of a solution is directly proportional to [KCET 1984]
(a) Dilution (b) Number of ions
(c) Current density (d) Volume of the solution
10. The increase in equivalent conductance of an electrolyte solution with dilution is due to the increase in [MP PMT 1996]
(a) Ionic attraction
(b) Molecular attraction
(c) Degree of association of the electrolyte
(d) Degree of ionisation of the electrolyte
11. Which of the following conducts electricity [AFMC 1995]
(a) Fused NaCl (b) CO_2
(c) Br_2 (d) Si
12. Which of the following shows electrical conduction [CBSE PMT 1999; AIIMS 1999]
(a) Potassium (b) Graphite
(c) Diamond (d) Sodium
13. The unit of equivalent conductivity is [CPMT 1999; BCECE 2005]
(a) ohm cm
(b) $\text{ohm}^{-1} \text{ cm}^2 (\text{gm equivalent})^{-1}$
(c) $\text{ohm cm}^2 (\text{gm equivalent})$
(d) S cm^{-2}
14. It has been observed that gaseous hydrogen chloride is a very poor conductor of electricity but a solution of hydrogen chloride gas in water is a good conductor of electricity. This is due to the fact that [NCERT 1976]
(a) Water is good conductor of electricity
(b) Hydrogen chloride gas in water solution ionizes
(c) A gas is non-conductor but a liquid conducts electricity
(d) Gas does not obey Ohm's law whereas solution does
15. Electrolytic conduction differs from metallic conduction in that in the case of electrolytic conduction [KCET 1987; Bihar CEE 1992]
(a) The resistance increases with increasing temperature
(b) The resistance decreases with increasing temperature
(c) The flow of current does not generate heat
(d) The resistance is independent of the length of the conductor
16. The electrolytic conductance is a direct measure of [KCET 1990; CPMT 2003]
(a) Resistance (b) Potential
(c) Concentration (d) Dissociation
17. Conductivity of a strong electrolyte [KCET 1993]
(a) Increases on dilution
(b) Does not change considerably on dilution
(c) Decreases on dilution
(d) Depends on density
18. Which of the following statements is not applicable to electrolytic conductors [AIIMS 1991]
(a) New products show up at the electrodes
(b) Ions are responsible for carrying the current
(c) Show a positive temperature coefficient for conductance
(d) A single stream of electrons flows from cathode to anode
19. Which one is not a conductor of electricity [RPET 1999]
(a) NaCl (aqueous) (b) NaCl (solid)
(c) NaCl (molten) (d) Ag metal
20. Solid sodium chloride is bad conductor of electricity because
(a) It contains only molecules
(b) It does not possess ions
(c) The ions present in it are not free to move
(d) It does not contain free molecules
21. Which of the following is a poor conductor of electricity [EAMCET 1992]
(a) CH_3COONa (b) $\text{C}_2\text{H}_5\text{OH}$
(c) NaCl (d) KOH
22. The molar conductivity is maximum for the solution of concentration [DCE 2002]
(a) 0.001 M (b) 0.005 M
(c) 0.002 M (d) 0.004 M
23. The unit of molar conductivity is [DCE 2002]
(a) $\Omega^{-1} \text{ cm}^{-2} \text{ mol}^{-1}$ (b) $\Omega \text{ cm}^{-2} \text{ mol}^{-1}$
(c) $\Omega^{-1} \text{ cm}^2 \text{ mol}^{-1}$ (d) $\Omega \text{ cm}^2 \text{ mol}$
24. The highest electrical conductivity of the following aqueous solutions is of [AIEEE 2005]
(a) 0.1 M acetic acid (b) 0.1 M chloroacetic acid
(c) 0.1 M fluoroacetic acid (d) 0.1 M difluoroacetic acid
25. Given $l/a = 0.5 \text{ cm}^{-1}$, $R = 50 \text{ ohm}$, $N = 1.0$. The equivalent conductance of the electrolytic cell is [Orissa JEE 2005]
(a) $10 \text{ ohm}^{-1} \text{ cm}^2 \text{ gmeq}^{-1}$ (b) $20 \text{ ohm}^{-1} \text{ cm}^2 \text{ gmeq}^{-1}$
(c) $300 \text{ ohm}^{-1} \text{ cm}^2 \text{ gmeq}^{-1}$ (d) $100 \text{ ohm}^{-1} \text{ cm}^2 \text{ gmeq}^{-1}$

26. If equivalent conductance of 1M benzoic acid is $12.8 \text{ ohm}^{-1} \text{ cm}^2$ and if the conductance of benzoate ion and H^+ ion are 42 and $288.42 \text{ ohm}^{-1} \text{ cm}^2$ respectively, its degree of dissociation is
(a) 39% (b) 3.9%
(c) 0.35% (d) 0.039%
27. The unit ohm^{-1} is used for [J & K 2005]
(a) Molar conductivity (b) Equivalent conductivity
(c) Specific conductivity (d) Conductivity
- Cell constant and Electrochemical Cells**
1. When electric current is passed through a cell having an electrolyte, the positive ions move towards the cathode and the negative ions towards the anode. If the cathode is pulled out of the solution [AIIMS 1980]10.
(a) The positive and negative ions will move towards the anode
(b) The positive ions will start moving towards the anode, the negative ions will stop moving
(c) The negative ions will continue to move towards the anode and the positive ions will stop moving
(d) The positive and negative ions will start moving randomly
2. If the half cell reaction $\text{A} + \text{e}^- \rightarrow \text{A}^-$ has a large negative reduction potential, it follows that [MNR 1992; UPSEAT 2000, 02]
(a) A is readily reduced (b) A is readily oxidised
(c) A^- is readily reduced (d) A^- is readily oxidised
3. Mark the false statement [MP PET 1997]
(a) A salt bridge is used to eliminate liquid junction potential
(b) The Gibbs free energy change, ΔG is related with electromotive force (E), as $\Delta G = -nFE$
(c) Nernst equation for single electrode potential is
$$E = E^\circ - \frac{RT}{nF} \ln a_{\text{M}^{n+}}$$

(d) The efficiency of a hydrogen oxygen fuel cell is 23%
4. The specific conductance of a 0.1 N KCl solution at 23°C is $0.012 \text{ ohm}^{-1} \text{ cm}^{-1}$. The resistance of cell containing the solution at the same temperature was found to be 55 ohm. The cell constant will be [CBSE PMT 1999, 2000; KCET 2001]
(a) 0.142 cm^{-1} (b) 0.66 cm^{-1}
(c) 0.918 cm^{-1} (d) 1.12 cm^{-1}
5. Which of the following reactions occurs at the cathode of a common dry cell [NCERT 1978]
(a) $\text{Mn} \rightarrow \text{Mn}^{2+} + 2\text{e}^-$
(b) $2\text{MnO}_2 + \text{Zn}^{2+} + 2\text{e}^- \rightarrow \text{ZnMn}_2\text{O}_4$
(c) $2\text{ZnO}_2 + \text{Mn}^{2+} + 2\text{e}^- \rightarrow \text{MnZn}_2\text{O}_4$
(d) $\text{Zn} \rightarrow \text{Zn}^{2+} + 2\text{e}^-$
6. In Cu – Zn cell [BHU 1981]
(a) Reduction occurs at the copper cathode
(b) Oxidation occurs at the copper cathode
(c) Reduction occurs at the anode
(d) Chemical energy is converted to light energy
7. Which of the following reaction is used to make a fuel cell [AIIMS 2003]
(a) $\text{Cd(s)} + 2\text{Ni(OH)}_3\text{(s)} \rightarrow \text{CdO(s)} + 2\text{Ni(OH)} + \text{H}_2\text{O(l)}$
(b) $\text{Pb(s)} + \text{PbO}_2\text{(s)} + 2\text{H}_2\text{SO}_4\text{(aq)} \rightarrow 2\text{PbSO}_4\text{(s)} + 2\text{H}_2\text{O(l)}$
(c) $2\text{H}_2\text{(g)} + \text{O}_2\text{(g)} \rightarrow 2\text{H}_2\text{O(l)}$
(d) $2\text{Fe(s)} + \text{O}_2\text{(g)} + 4\text{H}^+\text{(aq)} \rightarrow 2\text{Fe}^{2+}\text{(aq)} + 2\text{H}_2\text{O(l)}$
8. When lead storage battery is charged [MP PET 2003]
(a) PbO_2 is involved
(b) H_2SO_4 is regenerated
(c) PbSO_4 is deposited on lead electrode
(d) Lead is deposited on lead electrode
9. When lead storage battery is charged [MP PET 1993; MP PMT 2000]
(a) Lead dioxide dissolves
(b) Sulphuric acid is regenerated
(c) The lead electrode becomes coated with lead sulphate
(d) The amount of sulphuric acid decreases
- The electrolytic decomposition of dilute sulphonic acid with platinum electrode in cathodic reaction is [MNR 1988; UPSEAT 1999, 2002]
(a) Oxidation
(b) Reduction
(c) Oxidation and reduction both
(d) Neutralisation
11. Which colourless gas evolves, when NH_4Cl reacts with zinc in a dry cell battery [Orissa JEE 2003]
(a) NH_4 (b) N_2
(c) H_2 (d) Cl_2
12. Which of the substances Na, Hg, S, Pt and graphite can be used as electrodes in electrolytic cells having aqueous solutions
(a) Na, Pt and graphite (b) Na and Hg
(c) Pt and graphite only (d) Na and S only
13. In electrolysis of dilute H_2SO_4 using platinum electrodes [DPMT 1983; IIT 1983; Kurukshetra CET 2002; AFMC 2005]
(a) H_2 is evolved at cathode
(b) NH_3 is produced at anode
(c) Cl_2 is obtained at cathode
(d) O_2 is produced
14. For cell reaction, $\text{Zn} + \text{Cu}^{2+} \rightarrow \text{Zn}^{2+} + \text{Cu}$, cell representation is
(a) $\text{Zn} | \text{Zn} || \text{Cu} | \text{Cu}$ (b) $\text{Cu} | \text{Cu} || \text{Zn} | \text{Zn}$
(c) $\text{Cu} | \text{Zn} || \text{Zn} | \text{Cu}$ (d) $\text{Cu} | \text{Zn} || \text{Zn} | \text{Cu}$
15. Which one is not called a anode reaction from the following
(a) $\text{Cl}^- \rightarrow \frac{1}{2} \text{Cl}_2 + \text{e}^-$ (b) $\text{Cu} \rightarrow \text{Cu}^{++} + 2\text{e}^-$
(c) $\text{Hg}^+ \rightarrow \text{Hg}^{++} + \text{e}^-$ (d) $\text{Zn}^{2+} + 2\text{e}^- \rightarrow \text{Zn}$
16. A cell from the following which converts electrical energy into chemical energy
(a) Dry cell (b) Electrochemical cell
(c) Electrolytic cell (d) None of these
17. In the cell $\text{Zn} | \text{Zn}^{2+} || \text{Cu}^{2+} | \text{Cu}$, the negative electrode is [MP PMT 1995]
(a) Cu (b) Cu^{2+}
(c) Zn (d) Zn^{2+}
18. Which of the following statements is correct? Galvanic cell converts [KCET 1991]
(a) Chemical energy into electrical energy
(b) Electrical energy into chemical energy
(c) Metal from its elemental state to the combined state

- (d) Electrolyte into individual ions
19. Hydrogen-oxygen fuel cells are used in space-craft to supply [MP PMT 1993; MP PET 1999] [Pb. PMT 1999; KCET 1999]
 (a) Power for heat and light
 (b) Power for pressure
 (c) Oxygen
 (d) Water
20. The standard cell potential of $Zn|Zn^{2+}(aq)||Cu^{2+}(aq)|Cu$ cell is 1.10 V. The maximum work obtained by this cell will be
 (a) 106.15 kJ (b) -212.30 kJ
 (c) -318.45 kJ (d) -424.60 kJ
21. The relationship between standard reduction potential of cell and equilibrium constant is shown by [MP PET 2002]
 (a) $E_{cell}^0 = \frac{n}{0.059} \log K_c$ (b) $E_{cell}^0 = \frac{0.059}{n} \log K_c$
 (c) $E_{cell}^0 = 0.059 n \log K_c$ (d) $E_{cell}^0 = \frac{\log K_c}{n}$
22. Consider the Galvanic cell $Zn^{\ominus} | ZnSO_4 || CuSO_4 | Cu^{\oplus}$ the reaction at cathode is [AMU 2000]
 (a) $Zn^{2+} + 2e^- \rightarrow Zn$
 (b) $Cu^{2+} + 2e^- \rightarrow Cu$
 (c) $Cu^{2+} + Zn \rightarrow Cu + Zn^{2+}$
 (d) $Zn^{2+} + Cu \rightarrow Zn + Cu^{2+}$
23. The cell reaction $Cu + 2Ag^+ \rightarrow Cu^{+2} + Ag$ is best represented by [AMU 2000]
 (a) $Cu_{(s)} | Cu^{+2}(aq) || Ag^+(aq) | Ag_{(s)}$
 (b) $Pt | Cu^{+2} || Ag^+(aq) | Ag_{(s)}$
 (c) $Cu^{+2} | Cu || Pt | Ag$
 (d) None of the above representations
24. $Zn_{(s)} | Zn^{2+}(aq) || Cu^{2+}(aq) | Cu_{(s)}$ is [Kerala (Engg.) 2002]
 (anode) (cathode)
 (a) Weston cell (b) Daniel cell
 (c) Calomel cell (d) Faraday cell
 (e) Standard cell
25. The specific conductance of a solution is $0.2 \text{ ohm}^{-1} \text{ cm}^{-1}$ and conductivity is 0.04 ohm^{-1} . The cell constant would be
 (a) 1 cm^{-1} (b) 0 cm^{-1}
 (c) 5 cm^{-1} (d) 0.2 cm^{-1}
26. If the conductance and specific conductance of a solution is one then its cell constant would be [RPET 1999]
 (a) 1 (b) Zero
 (c) 0.5 (d) 4
27. Saturated solution of KNO_3 is used to make 'salt-bridge' because
 (a) Velocity of K^+ is greater than that of NO_3^-
 (b) Velocity of NO_3^- is greater than that of K^+
 (c) Velocities of both K^+ and NO_3^- are nearly the same
 (d) KNO_3 is highly soluble in water
28. In balancing the half reaction $S_2O_3^{2-} \rightarrow S_{(s)}$ the number of electrons that must be added is [DPMT 2000]
 (a) 4 on the left (b) 3 on the right
 (c) 2 on the left (d) 2 on the right
29. Which one of the following statement is true for an electrochemical cell [Pb. PMT 1999; KCET 1999]
 (a) H_2 is cathode and Cu is anode
 (b) H_2 is anode and Cu is cathode
 (c) Reduction occurs at H_2 electrode
 (d) Oxidation occurs at Cu electrode
30. In the reaction [MP PET 2002]
 $Cu(s) + 2Ag^+(aq) \rightarrow Cu^{2+}(aq) + 2Ag(s)$
 The reduction half-cell reaction is [AIIMS 1997]
 (a) $Cu + 2e^- \rightarrow Cu^{2-}$ (b) $Cu - 2e^- \rightarrow Cu^{2+}$
 (c) $Ag^+ + e^- \rightarrow Ag$ (d) $Ag - e^- \rightarrow Ag^+$
31. Which of the following statements about galvanic cell is incorrect [JIPMER 1997]
 (a) Anode is positive
 (b) Oxidation occurs at the electrode with lower reduction potential
 (c) Cathode is positive
 (d) Reduction occurs at cathode
32. The molar conductances of $NaCl$, HCl and CH_3COONa at infinite dilution are 126.45, 426.16 and $91 \text{ ohm}^{-1} \text{ cm}^2 \text{ mol}^{-1}$ respectively. The molar conductance of CH_3COOH at infinite dilution is [CBSE PMT 1997]
 (a) $201.28 \text{ ohm}^{-1} \text{ cm}^2 \text{ mol}^{-1}$
 (b) $390.71 \text{ ohm}^{-1} \text{ cm}^2 \text{ mol}^{-1}$
 (c) $698.28 \text{ ohm}^{-1} \text{ cm}^2 \text{ mol}^{-1}$
 (d) $540.48 \text{ ohm}^{-1} \text{ cm}^2 \text{ mol}^{-1}$
33. The electrodes of a conductivity cell are 3 cm apart and have a cross-sectional area of 4 cm^2 . The cell constant of the cell (in cm^{-1}) is
 (a) 4×3 (b) $4/3$
 (c) $3/4$ (d) $9/4$
34. The anode half-reaction occurring during the discharge of a lead storage battery is
 (a) $Pb(s) + SO_2 + O_2 \rightarrow PbSO_4(s)$
 (b) $Pb(s) + SO_4^{2-}(aq) \rightleftharpoons PbSO_4(s) + 2e^-$
 (c) $PbO_2(s) + 4H^+(aq) + 2e^- + SO_4^{2-}(aq) \rightleftharpoons PbSO_4(s) + 2H_2O$ [RPET 1999]
 (d) $Pb^{2+}(aq) + SO_4^{2-}(aq) \rightarrow PbSO_4(s)$
35. The unit of cell constant is [MP PET 1996]
 (a) $\text{ohm}^{-1} \text{ cm}^{-1}$ (b) ohm cm
 (c) cm (d) cm^{-1}
36. In dry cell the reaction which takes place at the zinc anode is [MP PET 1996]
 (a) $Zn^{2+} + 2e^- \rightarrow Zn(s)$
 (b) $Zn(s) \rightarrow Zn^{2+} + 2e^-$
 (c) $Mn^{2+} + 2e^- \rightarrow Mn(s)$
 (d) $Mn(s) \rightarrow Mn^{+} + e^- + 1.5V$
37. The chemical reaction taking place at the anode of a cell is [MP PET 1996]
 (a) Ionisation (b) Reduction

- (c) Oxidation (d) Hydrolysis
38. Which of the following reactions occurs at the cathode during the charging of a lead storage battery [Manipal MEE 1995; MP PET 2002]
- (a) $Pb^{2+} + 2e^- \rightarrow Pb$
 (b) $Pb^{2+} + SO_4^{2-} \rightarrow PbSO_4$
 (c) $Pb \rightarrow Pb^{2+} + 2e^-$
 (d) $PbSO_4 + 2H_2O \rightarrow 2PbO_2 + 4SO_4^{2-} + 2e^-$
39. A depolarizer used in dry cell batteries is [NCERT 1981]
- (a) Ammonium chloride (b) Manganese dioxide
 (c) Potassium hydroxide (d) Sodium phosphate
40. When a lead storage battery is discharged [IIT 1987; MP PMT 2004]
- (a) SO_2 is evolved
 (b) Lead sulphate is consumed
 (c) Lead is formed
 (d) Sulphuric acid is consumed
41. In electroplating, the article to be electroplated serves as [AMU 1982, 83]
- (a) Cathode (b) Electrolyte
 (c) Anode (d) Conductor
42. The position of some metals in the electrochemical series in decreasing electropositive character is given as $Mg > Al > Zn > Cu > Ag$. What will happen, if a copper spoon is used to stir a solution of aluminium nitrate [NCERT 1977]
- (a) The spoon will get coated with Al
 (b) An alloy of Cu and Al is formed
 (c) The solution becomes blue
 (d) There is no reaction
43. In a electrochemical cell [AFMC 1989]
- (a) Potential energy changes into kinetic energy
 (b) Kinetic energy changes into potential energy
 (c) Chemical energy changes into electrical energy
 (d) Electrical energy changes into chemical energy
44. In galvanic cell, the salt bridge is used to [MP PMT 2002]
- (a) Complete the circuit
 (b) Reduce the electric resistance in the cell
 (c) Separate cathode from anode
 (d) Carry salts for the chemical reaction
45. If a strip of Cu metal is placed in a solution of ferrous sulphate [NCERT 1974; CPMT 1977; MP PET 2000]
- (a) Copper will precipitate out
 (b) Iron will precipitate out
 (c) Copper will dissolve
 (d) No reaction will take place
46. Which of the following is not used to construct salt bridge [MP PET 2003]
- (a) CH_3COOK (b) KCl
 (c) NH_4NO_3 (d) KNO_3
47. The reference electrode is made by using [MP PMT 2002]
- (a) $ZnCl_2$ (b) $CuSO_4$
 (c) $HgCl_2$ (d) Hg_2Cl_2
48. In a hydrogen – oxygen fuel cell, combustion of hydrogen occurs to
- (a) Produce high purity water
 (b) Create potential difference between the two electrodes
 (c) Generate heat
 (d) Remove adsorbed oxygen from electrode surfaces
49. $\lambda_{ClCH_2COONa} = 224 \text{ ohm}^{-1} \text{cm}^2 \text{gmeq}^{-1}$,
 $\lambda_{NaCl} = 38.2 \text{ ohm}^{-1} \text{cm}^2 \text{gmeq}^{-1}$,
 $\lambda_{HCl} = 203 \text{ ohm}^{-1} \text{cm}^2 \text{gmeq}^{-1}$,
 What is the value of λ_{ClCH_2COOH} [JEE Orissa 2004]
- (a) $288.5 \text{ ohm}^{-1} \text{cm}^2 \text{gmeq}^{-1}$
 (b) $289.5 \text{ ohm}^{-1} \text{cm}^2 \text{gmeq}^{-1}$
 (c) $388.5 \text{ ohm}^{-1} \text{cm}^2 \text{gmeq}^{-1}$
 (d) $59.5 \text{ ohm}^{-1} \text{cm}^2 \text{gmeq}^{-1}$
50. Which of the following statement is true for the electrochemical Daniel cell [AIIMS 2004]
- (a) Electrons flow from copper electrode to zinc electrode
 (b) Current flows from zinc electrode to copper electrode
 (c) Cations move toward copper electrode which is cathode
 (d) Cations move toward zinc electrode
51. Which of the following statement is true for an electrochemical cell
- (a) H_2 is cathode and Cu is anode
 (b) H_2 is anode and Cu is cathode
 (c) Reduction occurs at H_2 electrode
 (d) Oxidation occurs at Cu electrode
52. Which of the following statements are true for an fuel cells [DPMT 2004]
- (a) They run till the reactants are active
 (b) They are free from pollution
 (c) They are more efficient
 (d) All of the above
53. For gold plating, the electrolyte used is [Pb.CET 2004]
- (a) $AuCl_3$ (b) $HAuCl_4$
 (c) $k[Au(CN)_2]$ (d) None of these
54. The acid used in lead storage battery is [Pb.CET 2003]
- (a) H_2SO_4 (b) H_3PO_4
 (c) HCl (d) HNO_3
55. At $25^\circ C$ specific conductivity of a normal solution of KCl is 0.002765 mho . The resistance of cell is 400 ohms . The cell constant is [Pb.PMT 2004]
- (a) 0.815 (b) 1.016
 (c) 1.106 (d) 2.016
56. Which of the following is used widely in the manufacture of lead storage battery [BHU 2004]
- (a) Arsenic (b) Lithium
 (c) Bismuth (d) Antimony
57. The chemical reaction, $2AgCl(s) + H_2(g) \rightarrow 2HCl(aq) + 2Ag(s)$ taking place in a galvanic cell is represented by the notation [AIIMS 2005]
- (a) $Pt | H_2(g), 1 \text{ bar} | 1M KCl(aq) | AgCl(s) | Ag(s)$
 (b) $Pt | H_2(g), 1 \text{ bar} | 1M HCl(aq) || 1M Ag^+(aq) | Ag(s)$

- (c) $Pt(s) | H_2(g), 1\text{bar} | 1M\ HCl(aq) | AgCl(s) | Ag(s)$
(d) $Pt(s) | H_2(g), 1\text{bar} | 1M\ HCl(aq) | Ag(s) | AgCl(s)$
58. If the Zn^{2+} / Zn electrode is diluted to 100 times then the change in e.m.f. [DPMT 2005]
(a) Increase of 59 mV
(b) Decrease of 59 mV
(c) Increase of 29.5 mV
(d) Decrease of 29.5 mV
59. If hydrogen electrode dipped in 2 solution of $pH = 3$ and $pH = 6$ and salt bridge is connected the e.m.f. of resulting cell is [DPMT 2005]
(a) 0.177 V (b) 0.3 V
(c) 0.052 V (d) 0.104 V
60. The tendency of an electrode to lose electrons is known as [J & K 2005]
(a) Electrode potential (b) Reduction potential
(c) Oxidation potential (d) e.m.f.
61. When electric current is supplied through an ionic hydride of fused state, then [Kerala CET 2005]
(a) Hydrogen is obtained at anode
(b) Hydrogen is obtained at cathode
(c) No change
(d) Hydride ion moves towards cathode
(e) hydride ion present in solution
- Electrode potential, E_{Cell} , Nernt equation and ECS**
1. The hydrogen electrode is dipped in a solution of $pH = 3$ at $25^\circ C$. The potential of the cell would be (the value of $2.303RT/F$ is 0.059 V) [KCET 1993, 2005]
(a) 0.177 V (b) - 0.177 V
(c) 0.087 V (d) 0.059 V
2. The standard electrode potentials of Zn^{2+} / Zn and Ag^+ / Ag are -0.763 V and $+0.799\text{ V}$ respectively. The standard potential of the cell is [KCET 1993]
(a) 1.56 V (b) 0.036 V
(c) - 1.562 V (d) 0.799 V
3. The standard reduction potentials at 298 K for the following half reactions are given against each
 $Zn^{2+}(aq) + 2e \rightleftharpoons Zn(s); \quad -0.762$
 $Cr^{3+}(aq) + 3e \rightleftharpoons Cr(s); \quad -0.740$
 $2H^+(aq) + 2e \rightleftharpoons H_2(g); \quad 0.00$
 $Fe^{3+}(aq) + e \rightleftharpoons Fe^{2+}(aq); \quad 0.770$
Which is the strongest reducing agent [IIT 1981; MP PET/PMT 1988; MP PMT 1989; MH CET 2001]
(a) $Zn(s)$ (b) $Cr(s)$
(c) $H_2(g)$ (d) $Fe^{2+}(aq)$
4. When Zn piece is kept in $CuSO_4$ solution, the copper get precipitated due to standard potential of zinc is
(a) > copper (b) < copper
(c) > sulphate (d) < sulphate
5. Which of the following metal does not react with the solution of copper sulphate [CPMT 1999]
(a) Mg (b) Fe
(c) Zn (d) Ag
6. A solution containing one mole per litre of each $Cu(NO_3)_2$, $AgNO_3$, $Hg_2(NO_3)_2$ and $Mg(NO_3)_2$, is being electrolysed by using inert electrodes. The values of standard electrode potentials in volts (reduction potentials) are $Ag / Ag^+ = +0.80$, $2Hg / Hg_2^{2+} = +0.79$, $Cu / Cu^{2+} = +0.34$, $Mg / Mg^{2+} = -2.37$ with increasing voltage, the sequence of deposition of metals on the cathode will be [IIT 1984; AMU 1999; Kerala PMT 2004]
(a) Ag, Hg, Cu, Mg (b) Mg, Cu, Hg, Ag
(c) Ag, Hg, Cu (d) Cu, Hg, Ag
7. The standard reduction electrode potentials of four elements are
 $A = -0.250\text{ V}$ $B = -0.136\text{ V}$
 $C = -0.126\text{ V}$ $D = -0.402\text{ V}$
The element that displaces A from its compounds is
(a) B (b) C
(c) D (d) None of these
8. The standard oxidation potential of zinc and silver in water at 298 K are
 $Zn(s) \rightarrow Zn^{2+} + 2e^-; E = 0.76\text{ V}$
 $Ag(s) \rightarrow Ag^{2+} + 2e^-; E = -0.80\text{ V}$
Which of the following reactions actually take place [NCERT 1983, 84; KCET 2003]
(a) $Zn(s) + 2Ag^+(aq) \rightarrow Zn^{2+}(aq) + 2Ag(s)$
(b) $Zn^{2+}(aq) + 2Ag(s) \rightarrow 2Ag^+(aq) + Zn(s)$
(c) $Zn(s) + Ag(s) \rightarrow Zn^{2+}(aq) + Ag^+(aq)$
(d) $Zn^{2+}(aq) + Ag^+(aq) \rightarrow Zn(s) + Ag(s)$
9. Beryllium is placed above magnesium in the second group. Beryllium dust, therefore when added to $MgCl_2$ solution will [CPMT 1977]
(a) Have no effect
(b) Precipitate Mg metal
(c) Precipitate MgO
(d) Lead to dissolution of Be metal
10. The name of equation showing relation between electrode potential (E) standard electrode potential (E°) and concentration of ions in solution is
(a) Kohlrausch's equation (b) Nernst's equation
(c) Ohm's equation (d) Faraday's equation
11. The correct representation of Nernst's equation is
(a) $E_{M^{n+}/M} = E^\circ_{M^{n+}/M} + \frac{0.0591}{n} \log(M^{n+})$
(b) $E_{M^{n+}/M} = E^\circ_{M^{n+}/M} - \frac{0.0591}{n} \log(M^{n+})$

- (c) $E_{M^{n+}/M} = E_{M^{n+}/M}^{\circ} + \frac{n}{0.0591} \log(M^{n+})$
 (d) None of the above
12. Standard electrode potential of NHE at 298 K is
 (a) 0.05 V (b) 0.1 V
 (c) 0.00 V (d) 0.11 V
13. When a copper wire is placed in a solution of $AgNO_3$, the solution acquires blue colour. This is due to the formation of
 [Roorkee 1989]
 (a) Cu^{2+} ions
 (b) Cu^{+} ions
 (c) Soluble complex of copper with $AgNO_3$
 (d) Cu^{-} ion by the reduction of Cu
14. Consider the reaction $M_{(aq)}^{n+} + ne^{-} \rightarrow M_{(s)}$. The standard reduction potential values of the elements M_1, M_2 and M_3 are $-0.34V, -3.05V$ and $-1.66V$ respectively. The order of their reducing power will be
 [NCERT 1990]
 (a) $M_1 > M_2 > M_3$ (b) $M_3 > M_2 > M_1$
 (c) $M_1 > M_3 > M_2$ (d) $M_2 > M_3 > M_1$
15. $E^{\circ} = \frac{RT}{nF} \ln K_{eq}$. This is called
 [CPMT 1988; MP PET 2000]
 (a) Gibb's equation
 (b) Gibb's-Helmholtz equation
 (c) Nernst's equation
 (d) Vander Waal's equation
16. Four alkali metals A, B, C and D are having respectively standard electrode potential as $-3.05, -1.66, -0.40$ and 0.80 . Which one will be the most reactive
 [MP PMT/PET 1988; CPMT 1983; MNR 1993; UPSEAT 2002]
 (a) A (b) B
 (c) C (d) D
17. Which one of the following metals cannot evolve H_2 from acids or H_2O or from its compounds
 [MP PET/PMT 1988; CPMT 1996; AFMC 1998, 99; Pb. PET 1999; BVP 2003]
 (a) Hg (b) Al
 (c) Pb (d) Fe
18. Which one of the following reaction is not possible
 [MP PMT 1991]
 (a) $Fe + H_2SO_4 \rightarrow FeSO_4 + H_2$
 (b) $Cu + 2AgNO_3 \rightarrow Cu(NO_3)_2 + 2Ag$
 (c) $2KBr + I_2 \rightarrow 2KI + Br_2$
 (d) $CuO + H_2 \rightarrow Cu + H_2O$
19. When a rod of metal A is dipped in an aqueous solution of metal B (concentration of B^{2+} ion being 1M) at $25^{\circ}C$, the standard electrode potentials are $A^{2+}/A = -0.76$ volts, $B^{2+}/B = +0.34$ volts [KCET 1992]
 (a) A will gradually dissolve
 (b) B will deposit on A
 (c) No reaction will occur
 (d) Water will decompose into H_2 and O_2
20. The reaction $Zn^{2+} + 2e^{-} \rightarrow Zn$ has a standard potential of $-0.76V$. This means
 [KCET 1992]
 (a) Zn can't replace hydrogen from acids
 (b) Zn is a reducing agent
 (c) Zn is an oxidising agent
 (d) Zn^{2+} is a reducing agent
21. $2H^{+}(aq) + 2e^{-} \rightarrow H_2(g)$. The standard electrode potential for the above reaction is (in volts)
 [CPMT 1988]
 (a) 0 (b) +1
 (c) -1 (d) None of these
22. K, Ca and Li metals may be arranged in the decreasing order of their standard electrode potentials as
 [CPMT 1990]
 (a) K, Ca, Li (b) Ca, K, Li
 (c) Li, Ca, K (d) Ca, Li, K
23. The correct order of chemical reactivity with water according to electrochemical series
 [MP PMT 1991]
 (a) $K > Mg > Zn > Cu$ (b) $Mg > Zn > Cu > K$
 (c) $K > Zn > Mg > Cu$ (d) $Cu > Zn > Mg > K$
24. EMF of cell $Ni | Ni^{2+}(1.0M) || Au^{3+}(1.0M) | Au$ (Where E° for $Ni^{2+} | Ni$ is $-0.25V$; E° for $Au^{3+} | Au$ is $1.50V$) is
 [MP PET 1993; MP PMT 2000]
 (a) $+1.25V$ (b) $-1.75V$
 (c) $+1.75V$ (d) $+4.0V$
25. Oxidation and reduction take place in a cell, then its electromotive force will be
 [RPET 1999]
 (a) Positive (b) Negative
 (c) Zero (d) Stable
26. For a spontaneous reaction the ΔG , equilibrium constant (K) and E_{Cell}° will be respectively
 [AIEEE 2005]
 (a) $-ve, >1, +ve$ (b) $+ve, >1, -ve$
 (c) $-ve, <1, -ve$ (d) $-ve, >1, -ve$
27. The reference electrode is made from which of the following
 [MP PET/PMT 1988]
 (a) $ZnCl_2$ (b) $CuSO_4$
 (c) Hg_2Cl_2 (d) $HgCl_2$
28. The charge over anode in a galvanic cell is
 (a) Negative
 (b) Positive
 (c) No charge
 (d) Sometimes negative and sometimes positive
29. The standard electrode potential for the two electrode A^{+}/A and B^{+}/B are respectively $0.5V$ and $0.75V$. The emf of the given cell $A | A^{+}(a=1) || B^{+}(a=1) | B$ will be
 (a) $1.25V$ (b) $-1.25V$
 (c) $-0.25V$ (d) $0.25V$
30. The standard reduction potential for Li^{+}/Li ; Zn^{2+}/Zn ; H^{+}/H_2 and Ag^{+}/Ag is $-3.05, -0.762, 0.00$ and $+0.80V$. Which of the following has highest reducing capacity
 (a) Ag (b) H_2
 (c) Zn (d) Li

31. If an iron rod is dipped in CuSO_4 solution [MADT Bihar 1984]
- Blue colour of the solution turns green
 - Brown layer is deposited on iron rod
 - No change occurs in the colour of the solution
 - Blue colour of the solution vanishes
 - None of the above
32. E° values of Mg^{2+}/Mg is -2.37V , of Zn^{2+}/Zn is -0.76V and Fe^{2+}/Fe is -0.44V . Which of the following statements is correct [EAMCET 1989]
- Zn will reduce Fe^{2+}
 - Zn will reduce Mg^{2+}
 - Mg oxidises Fe
 - Zn oxidises Fe
33. The standard reduction potential for Fe^{2+}/Fe and Sn^{2+}/Sn electrodes are -0.44 and -0.14 volt respectively. For the given cell reaction $\text{Fe}^{2+} + \text{Sn} \rightarrow \text{Fe} + \text{Sn}^{2+}$, the standard EMF is [IIT Screening 1990; MP PMT 2003]
- $+0.30\text{V}$
 - -0.58V
 - $+0.58\text{V}$
 - -0.30V
34. Electrode potential of Zn^{2+}/Zn is -0.76V and that of Cu^{2+}/Cu is $+0.34\text{V}$. The EMF of the cell constructed between these two electrodes is [EAMCET 1992; BHU 2001; CBSE PMT 2001; KCET 1990; MHCET 1999, 2003; Pb. CET 2002; AFMC 2001; Pb. PMT 2004]
- 1.10V
 - 0.42V
 - -1.1V
 - -0.42V
35. EMF of a cell whose half cells are given below is
 $\text{Mg}^{2+} + 2\text{e}^- \rightarrow \text{Mg(s)}; E = -2.37\text{V}$
 $\text{Cu}^{2+} + 2\text{e}^- \rightarrow \text{Cu(s)}; E = +0.33\text{V}$ [EAMCET 1987; MP PET 1994; Pb. PMT 2000]
- -2.03V
 - 1.36V
 - 2.7V
 - 2.03V
36. A cell constructed by coupling a standard copper electrode and a standard magnesium electrode has emf of 2.7 volts. If the standard reduction potential of copper electrode is $+0.34$ volt that of magnesium electrode is [KCET 1989]
- $+3.04$ volts
 - -3.04 volts
 - $+2.36$ volts
 - -2.36 volts
37. When $E^\circ_{\text{Ag}^+/\text{Ag}} = 0.8$ volt and $E^\circ_{\text{Zn}^{2+}/\text{Zn}} = -0.76$ volt, which of the following is correct [MP PMT 1994]
- Ag^+ can be reduced by H_2
 - Ag can oxidise H_2 into H^+
 - Zn^{2+} can be reduced by H_2
 - Ag can reduce Zn^{2+} ion
38. Adding powdered lead and iron to a solution that is 1.0M in both Pb^{2+} and Fe^{2+} ions, would result a reaction, in which [CPMT 1987]
- More iron and Pb^{2+} ions are formed
 - More lead and Fe^{2+} ions are formed
 - Concentration of both Pb^{2+} and Fe^{2+} ions increases
 - There is no net change
39. Given standard electrode potentials
- $$\text{Fe}^{++} + 2\text{e}^- \rightarrow \text{Fe}; E^\circ = -0.440\text{V}$$
- $$\text{Fe}^{+++} + 3\text{e}^- \rightarrow \text{Fe}; E^\circ = -0.036\text{V}$$
- The standard electrode potential (E°) for $\text{Fe}^{+++} + \text{e}^- \rightarrow \text{Fe}^{++}$ is [AIIMS 1982]
- -0.476V
 - -0.404V
 - $+0.404\text{V}$
 - $+0.771\text{V}$
40. Reduction potential of four elements $\text{P}, \text{Q}, \text{R}, \text{S}$ is $-2.90, +0.34, +1.20$ and -0.76 . Reactivity decreases in the order [MP PET 1989; UPSEAT 2001]
- $\text{P} > \text{Q} > \text{R} > \text{S}$
 - $\text{Q} > \text{P} > \text{R} > \text{S}$
 - $\text{R} > \text{Q} > \text{S} > \text{P}$
 - $\text{P} > \text{S} > \text{Q} > \text{R}$
41. Which of the following metal can deposit copper from copper sulphate solution [CPMT 1983; MP PMT 1989]
- Mercury
 - Iron
 - Gold
 - Platinum
42. Standard electrode potential of Ag^+/Ag and Cu^+/Cu is $+0.80\text{V}$ and $+0.34\text{V}$ respectively. these electrodes are joint together by salt bridge if [AMU 2002]
- Copper electrode is work like cathode, then E°_{cell} is $+0.45\text{V}$
 - Silver electrode is work like anode then E°_{cell} is -0.34V
 - Copper electrode is work like anode then E°_{cell} is $+0.46\text{V}$
 - Silver electrode is work like cathode then E°_{cell} is -0.34V
 - Silver electrode is work like anode then E°_{cell} will be $+1.14\text{V}$
43. The reaction is spontaneous if the cell potential is [MP PET 1999]
- Positive
 - Negative
 - Zero
 - Infinite
44. Which substance eliminates bromine from KBr solution [IIT 1981]
- I_2
 - Cl_2
 - HI
 - SO_2
45. A standard hydrogen electrode has zero electrode potential because [IIT 1997]
- Hydrogen is easiest to oxidise
 - The electrode potential is assumed to be zero
 - Hydrogen atom has only one electron
 - Hydrogen is the lightest element
46. In the electrochemical cell
 $\text{H}_2(\text{g}) | 1\text{atm} | \text{H}^+(1\text{M}) || \text{Cu}^{2+}(1\text{M}) | \text{Cu}(\text{s})$
 Which one of the following statements is true [EAMCET 1997]
- H_2 is cathode; Cu is anode
 - Oxidation occurs at Cu electrode
 - Reduction occurs at H_2 electrode
 - H_2 is anode; Cu is cathode
47. Expression representing the cell potential (E_{cell})
- $E_{\text{cath}} + E_{\text{an}}$
 - $E_{\text{an}} - E_{\text{cath}}$
 - $E_{\text{cath}} - E_{\text{an}}$
 - $E_{\text{c}} - E_{\text{a}}$
48. Iron displaces copper from its salt solution, because [MP PMT 1996]
- Atomic number of iron is less than that of copper

- (b) The standard reduction potential of iron is less than that of copper
(c) The standard reduction potential of iron is more than that of copper
(d) The iron salt is more soluble in water than the copper salt
49. (i) Copper metal dissolves in 1M silver nitrate solution and crystals of silver metal get deposited.
(ii) Silver metal does not react with 1 M zinc nitrate solution
(iii) Zinc metal dissolves in 1M copper sulphate solution and copper metal gets deposited
- Hence the order of decreasing strength of the three metals as reducing agents will be
- (a) $Cu > Ag > Zn$ (b) $Ag > Cu > Zn$
(c) $Zn > Cu > Ag$ (d) $Cu > Zn > Ag$
50. Standard electrode potentials of Zn and Fe are known to be (i) $-0.76 V$ and (ii) $-0.44 V$ respectively. How does it explain that galvanization prevents rusting of iron while zinc slowly dissolves away
- (a) Since (i) is less than (ii), zinc becomes the cathode and iron the anode
(b) Since (i) is less than (ii), zinc becomes the anode and iron the cathode
(c) Since (i) is more than (ii), zinc becomes the anode and iron the cathode
(d) Since (i) is more than (ii), zinc becomes the cathode and iron the anode
51. Amongst the following electrodes the one with zero electrode potential is [MP PMT 1997]
(a) Calomel electrode
(b) Standard hydrogen electrode
(c) Glass electrode
(d) Gas electrode
52. Which of the following is correct expression for electrode potential of a cell [MP PMT 1997]
- (a) $E = E^{\circ} - \frac{RT}{nF} \ln \frac{[\text{product}]}{[\text{reactant}]}$
(b) $E = E^{\circ} + \frac{RT}{F} \ln \frac{[\text{product}]}{[\text{reactant}]}$
(c) $E = E^{\circ} - \frac{RT}{nF} \ln \frac{[\text{reactant}]}{[\text{product}]}$
(d) $E = -\frac{RT}{F} \ln \frac{[\text{product}]}{[\text{reactant}]}$
53. Calculate standard free energy change for the reaction $\frac{1}{2}Cu(s) + \frac{1}{2}Cl_2(g) \rightleftharpoons \frac{1}{2}Cu^{2+} + Cl^{-}$ taking place at $25^{\circ}C$ in a cell whose standard e.m.f. is 1.02 volts [MP PMT 1997]
(a) $-98430 J$ (b) $98430 J$
(c) $96500 J$ (d) $-49215 J$
54. In which cell the free energy of a chemical reaction is directly converted into electricity? [MP PET/PMT 1998]
(a) Leclanche cell (b) Concentration cell
(c) Fuel cell (d) Lead storage battery
55. Nernst equation is related with
(a) The electrode potential and concentration of ions in the solution
(b) Equilibrium constant and concentration of ions
(c) Free energy change and E.M.F. of the cell
(d) None of these
56. The standard reduction potentials of 4 elements are given below. Which of the following will be the most suitable reducing agent
 $I = -3.04 V$, $II = -1.90 V$, $III = 0 V$, $IV = 1.90 V$ [CPMT 1999]
(a) I (b) II
(c) III (d) IV
57. Electrode potential data are given below :
 $Fe^{3+}(aq) + e^{-} \rightarrow Fe^{2+}(aq); E^{\circ} = +0.77 V$
 $Al^{3+}(aq) + 3e^{-} \rightarrow Al(s); E^{\circ} = -1.66 V$
 $Br_2(aq) + 2e^{-} \rightarrow 2Br^{-}(aq); E^{\circ} = +1.08 V$
- Based on the data given above, reducing power of Fe^{2+} , Al and Br^{-} will increase in the order [Pb. PMT 1998]
(a) $Br^{-} < Fe^{2+} < Al$ (b) $Fe^{2+} < Al < Br^{-}$
(c) $Al < Br^{-} < Fe^{2+}$ (d) $Al < Fe^{2+} < Br^{-}$
58. The standard electrode potential (E°) for OCl^{-}/Cl^{-} and $Cl^{-}/\frac{1}{2}Cl_2$ respectively are $0.94 V$ and $-1.36 V$. The E° value for $OCl^{-}/\frac{1}{2}Cl_2$ will be [KCET 1996]
(a) $-0.42 V$ (b) $-2.20 V$
(c) $0.52 V$ (d) $1.04 V$
59. If the reduction potential is more, then [CPMT 1996]
(a) It is easily oxidised
(b) It is easily reduced
(c) It acts as oxidising agent
(d) It has redox nature
60. One of the following is false for Hg [BHU 1998]
(a) It can evolve hydrogen from H_2S
(b) It is a metal
(c) It has high specific heat
(d) It is less reactive than hydrogen
61. E° for the cell $Zn|Zn^{2+}(aq)||Cu^{2+}(aq)|Cu$ is $1.10 V$ at $25^{\circ}C$, the equilibrium constant for the reaction $Zn + Cu^{2+}(aq) \rightleftharpoons Cu + Zn^{2+}(aq)$ is of the order of [CBSE PMT 1997]
(a) 10^{-28} (b) 10^{-37}
(c) 10^{+18} (d) 10^{+17}
62. Standard reduction potentials at $25^{\circ}C$ of $Li^{+}|Li$, $Ba^{2+}|Ba$, $Na^{+}|Na$ and $Mg^{2+}|Mg$ are -3.05 , -2.90 , -2.71 and -2.37 volt respectively. Which one of the following is the strongest oxidising agent [CBSE PMT 1994; JIPMER 2002]
(a) Na^{+} (b) Li^{+}
(c) Ba^{2+} (d) Mg^{2+}
63. Which of the following displaces Br_2 from an aqueous solution containing bromide ions [CBSE PMT 1994; JIPMER (Med.) 2002]
(a) Cl_2 (b) Cl^{-}
(c) I_2 (d) I_3^{-}
64. For the cell reaction
 $Cu^{2+}(C_1aq) + Zn(s) = Zn^{2+}(C_2aq) + Cu(s)$

of an electrochemical cell, the change in free energy at a given temperature is a function of [CBSE PMT 1998]

- (a) $\ln (C_1)$ (b) $\ln (C_2)$
(c) $\ln (C_1 + C_2)$ (d) $\ln (C_2 / C_1)$

65. The e.m.f. of the cell in which the following reaction $Zn(s) + Ni^{2+}(a=1.0) \rightleftharpoons Zn^{2+}(a=10) + Ni(s)$ occurs, is found to be 0.5105 V at 298 K. The standard e.m.f. of the cell is

[Roorkee Qualifying 1998]

- (a) 0.5400 (b) 0.4810 V
(c) 0.5696 V (d) -0.5105 V

66. For the redox reaction

E_{cell}° is 1.10 volt. E_{cell} for the cell will be $\left(2.303 \frac{RT}{F} = 0.0591\right)$

[AIEEE 2003]

- (a) 2.14 volt (b) 1.80 volt
(c) 1.07 volt (d) 0.82 volt

67. The emf of a Daniel cell at 298 K is E_1 $Zn | ZnSO_4(0.01 M) || CuSO_4(1.0 M) | Cu$ when the concentration of $ZnSO_4$

is 1.0 M and that of $CuSO_4$ is 0.01 M the emf changed to E_2 . What is the relationship between E_1 and E_2

[CBSE PMT 2003]

- (a) $E_2 = 0 \neq E_1$ (b) $E_1 > E_2$
(c) $E_1 < E_2$ (d) $E_1 = E_2$

68. The oxidation potentials of following half-cell reactions are given

whose cell-reaction is $Fe^{2+}(aq) + Zn \rightarrow Zn^{2+}(aq) + Fe$

[MP PMT 2003]

- (a) -1.20 V (b) +0.32 V
(c) -0.32 V (d) +1.20 V

69. The E° for half cells Fe/Fe^{2+} and Cu/Cu^{2+} are -0.44 V and +0.32 V respectively. Then [MP PMT 2003]

- (a) Cu^{2+} oxidises Fe (b) Cu^{2+} oxidises Fe^{2+}
(c) Cu oxidises Fe^{2+} (d) Cu reduces Fe^{2+}

70. What is E° for electrode represented by $Pt, O_2(1 atm) / 2H^+(1M)$ [JIPMER 1997]

- (a) Unpredictable (b) Zero
(c) 0.018 V (d) 0.118 V

71. The cell potential of a cell in operation is

- (a) Zero (b) Positive
(c) Negative (d) None of the above

72. Which of the following is displaced by Fe [Roorkee 1995]

- (a) Ag (b) Hg
(c) Zn (d) Na

73. The standard electrode potential of the half cells are given below

The emf of the cell $Fe^{2+} + Zn \rightarrow Zn^{2+} + Fe$ is

[CPMT 2003]

- (a) 1.54 V (b) -1.54 V

- (c) -0.19 V (d) +0.19 V

74. $Zn^{2+} + 2e^- \rightarrow Zn(s); E^{\circ} = -0.76,$

Strongest reducing agent is

[BHU 2003]

- (a) Fe^{2+} (b) Zn
(c) Cr (d) H_2

75. Standard reduction electrode potentials of three metals A, B and C are respectively +0.5 V, -3.0 V and -1.2 V. The reducing powers of these metals are [IIT 1998; AIEEE 2003]

- (a) $B > C > A$ (b) $A > B > C$
(c) $C > B > A$ (d) $A > C > B$

76. For a cell reaction involving a two-electron change, the standard emf of the cell is found to be 0.295 V at 25°C. The equilibrium constant of the reaction at 25°C will be

[Roorkee 1999; AIEEE 2003; CBSE PMT 2004]

- (a) 1×10^{-10} (b) 29.5×10^{-2}
(c) 10 (d) 1×10^{10}

77. For the electrochemical cell,

[IIT-JEE (Screening) 2000]

- (a) $M + X \rightarrow M^+ + X^-$ is the spontaneous reaction
(b) $M^+ + X^- \rightarrow M + X$ is the spontaneous reaction
(c) $E_{cell} = 0.77 V$
(d) $E_{cell} = -0.77 V$

78. The standard potential at 25°C for the following half reactions are given against them

When zinc dust is added to the solution of $MgCl_2$

[UPSEAT 2001]

- (a) $ZnCl_2$ is formed
(b) Zinc dissolves in the solution
(c) No reaction takes place
(d) Mg is precipitated

79. $KMnO_4$ acts as an oxidising agent in the neutral medium and gets reduced to MnO_2 . The equivalent weight of $KMnO_4$ in neutral medium [AMU 2001]

- (a) mol. wt/2 (b) mol. wt/3
(c) mol. wt/4 (d) mol. wt/7

80. Which of the following condition will increase the voltage of the cell, represented by the equation

- (a) Increase in the concentration of Ag^+ ion
(b) Increase in the concentration of Cu^+ ion
(c) Increase in the dimension of silver electrode
(d) Increase in the dimension of copper electrode

81. Which will increase the voltage of the cell

- (a) Increase in the concentration of Ag^+ ions
(b) Increase in the concentration of Sn^{2+} ions
(c) Increase in size of the silver rod
(d) None of these
82. The mass of the proton is 1840 times that of electron, its potential difference is V . The kinetic energy of proton is [DCE 2001]
(a) 1840 KeV (b) 1 KeV
(c) $\frac{1}{1840}$ KeV (d) 920 KeV
83. What will be the emf for the given cell
 $Pt | H_2(P_1) | H^+(aq) || H_2(P_2) | Pt$ [AIEEE 2002]
(a) $\frac{RT}{f} \log \frac{P_1}{P_2}$ (b) $\frac{RT}{2f} \log \frac{P_1}{P_2}$
(c) $\frac{RT}{f} \log \frac{P_2}{P_1}$ (d) None of these
84. What is the potential of a cell containing two hydrogen electrodes the negative one in contact with $10^{-8} M H^+$ and positive one in contact with $0.025 M H^+$ [MP PMT 2000]
(a) 0.18 V (b) 0.28 V
(c) 0.38 V (d) 0.48 V
85. Will $Fe(s)$ be oxidised to Fe^{2+} by the reaction with $1 M HCl$ (E° for $Fe/Fe^{2+} = +0.44 V$) [Pb. PMT 2000]
(a) Yes (b) No
(c) May be (d) Can't say
86. EMF of a cell in terms of reduction potential of its left and right electrodes is [AIEEE 2002]
(a) $E = E_{left} - E_{right}$ (b) $E = E_{left} + E_{right}$
(c) $E = E_{right} - E_{left}$ (d) $E = -(E_{right} + E_{left})$
87. Arrange the following in the order of their decreasing electrode potential Mg, K, Ba, Ca [JIPMER 2002]
(a) K, Ba, Ca, Mg (b) Ca, Mg, K, Ba
(c) Ba, Ca, K, Mg (d) Mg, Ca, Ba, K
88. Which of the following has highest electrode potential [Pb. PMT 2000]
(a) Li (b) Cu
(c) Au (d) Al
89. The cell reaction of a cell is
 $Mg(s) + Cu^{2+}(aq) \rightarrow Cu(s) + Mg^{2+}(aq)$
If the standard reduction potentials of Mg and Cu are -2.37 and $+0.34 V$ respectively. The emf of the cell is [EAMCET 1995; JIPMER (Med.) 2001; AFMC 2002; CBSE PMT 2002]
(a) 2.03 V (b) $-2.03 V$
(c) $+2.71 V$ (d) $-2.71 V$
90. The element which can displace three other halogens from their compound is [EAMCET 1998]
(a) Cl (b) F
(c) Br (d) I
91. Which of the following has been universally accepted as a reference electrode at all temperatures and has been assigned a value of zero volt [AIIMS 1998]
(a) Graphite electrode
(b) Copper electrode
(c) Platinum electrode
(d) Standard hydrogen electrode
92. Aluminium is more reactive than Fe . But Al is less easily corroded than iron because [DCE 1999]
(a) Al is noble metal
(b) Iron forms both mono and divalent ions
(c) Oxygen forms a protective oxide layer
(d) Fe undergoes reaction easily with H_2O
93. Zinc displaces copper from the solution of its salt because [MP PET 1995]
(a) Atomic number of zinc is more than that of copper
(b) Zinc salt is more soluble in water than the copper salt
(c) Gibbs free energy of zinc is less than that of copper
(d) Zinc is placed higher than copper in electro-chemical series
94. An electrochemical cell is set up as follows
 $Pt(H_2, 1 atm) / 0.1 M HCl$
 $|| 0.1 M \text{ acetic acid } / (H_2, 1 atm) Pt$
E.M.F. of this cell will not be zero because [CBSE PMT 1995]
(a) The pH of $0.1 M HCl$ and $0.1 M$ acetic acid is not the same
(b) Acids used in two compartments are different
(c) E.M.F. of a cell depends on the molarities of acids used
(d) The temperature is constant
95. Cu^+ ion is not stable in aqueous solution because of disproportionation reaction. E° value for disproportionation of Cu^+ is
(Given $E^\circ_{Cu^{2+}/Cu^+} = 0.15$, $E^\circ_{Cu^{2+}/Cu} = 0.34 V$) [IIT 1995]
(a) $-0.49 V$ (b) $0.49 V$
(c) $-0.38 V$ (d) $0.38 V$
96. E° of a cell $aA + bB \rightarrow cC + dD$ is [CPMT 1997]
(a) $-\frac{RT}{nF} \log \frac{[C]^c [D]^d}{[A]^a [B]^b}$ (b) $-RT \log \frac{[a]^A [b]^B}{[c]^C [d]^D}$
(c) $-\frac{RT}{nF} \log \frac{[C]^c [d]^D}{[A]^a [B]^b}$ (d) $-\frac{RT}{nF} \log \frac{[C]^c [d]^D}{[a]^A [b]^B}$
97. In the experiment set up for the measurement of EMF of a half cell using a reference electrode and a salt bridge, when the salt bridge is removed, the voltage [NCERT 1984; CPMT 1985]
(a) Does not change
(b) Decreases to half the value
(c) Increase to maximum
(d) Drops to zero
98. Electrode potentials of five elements A, B, C, D and E are respectively -1.36 , -0.32 , 0 , -1.26 and -0.42 . The reactivity order of these elements are in the order of [MP PMT 1995]
(a) A, D, E, B and C (b) C, B, E, D and A
(c) B, D, E, A and C (d) C, A, E, D and B
99. What is wrongly stated about electrochemical series

[DCE 1999]

- (a) It is the representation of element in order of increasing or decreasing standard electrode reductional potential
 (b) It does not compare the relative reactivity of metals
 (c) It compares relative strengths of oxidising agents
 (d) H_2 is centrally placed element

100. Which of the following statements is true for fuel cells

[KCET (Med.) 1999; AFMC 2000]

- (a) They are more efficient
 (b) They are free from pollution
 (c) They run till reactants are active
 (d) All of these

101. What is the potential of a half-cell consisting of zinc electrode in 0.01M $ZnSO_4$ solution at $25^\circ C$ ($E^\circ = 0.763 V$)

[AIIMS 2000; BHU 2000]

- (a) 0.8221 V (b) 8.221 V
 (c) 0.5282 V (d) 9.232 V

102. The *emf* of a galvanic cell, with electrode potentials of silver = +0.80 V and that of copper = +0.34 V, is

[AIIMS 1999]

- (a) -1.1 V (b) +1.1 V
 (c) +0.46 V (d) +0.76 V

103. Copper cannot replace..... from solution [DPMT 2002]

- (a) Fe (b) Au
 (c) Hg (d) Ag

104. The strongest reducing agent of the alkali metal is

[CBSE PMT 2000]

- (a) Li (b) Na
 (c) K (d) Cs

105. Which of the following is the most electropositive element

[Pb. PMT 2000]

- (a) Carbon (b) Calcium
 (c) Chlorine (d) Potassium

106. The metal that forms a self protecting film of oxide to prevent corrosion, is

[BHU 1999]

- (a) Cu (b) Al
 (c) Na (d) Au

107. In a cell that utilises the reaction $Zn_{(s)} + 2H^+(aq) \rightarrow$

$Zn^{2+}(aq) + H_{2(g)}$ addition of H_2SO_4 to cathode compartment, will

[AIEEE 2004]

- (a) Increase the E and shift equilibrium to the right
 (b) Lower the E and shift equilibrium to the right
 (c) Lower the E and shift equilibrium to the left
 (d) Increase the E and shift equilibrium to the left

108. For the electrochemical cell, $M | M^+ || X^- | X$, $E^\circ(M^+ | M) = 0.44 V$ $E^\circ(X | X^-) = 0.33 V$ From this data, one can deduce that

[Pb.CET 2004]

- (a) $E^\circ_{cell} = -0.77 V$
 (b) $M^+ + X^- \rightarrow M + X$ is the spontaneous reaction
 (c) $M + X \rightarrow M^+ + X^-$ is the spontaneous reaction
 (d) $E^\circ_{cell} = .77 V$

109. The standard *emf* of a cell, involving one electron change is found to be 0.591 V at $25^\circ C$. The equilibrium constant of the reaction is ($F = 96,500 C mol^{-1}$; $R = 8.314 JK^{-1}mol^{-1}$) [AIEEE 2004]

- (a) 1.0×10^{10} (b) 1.0×10^5
 (c) 1.0×10^1 (d) 1.0×10^{30}

110. Standard electrode potential of cell $H_2 | H^+ || Ag^+ | Ag$ is

[AIEEE 2004]

- (a) 0.8 V (b) -0.8 V
 (c) -1.2 V (d) 1.2 V

111. A galvanic cell with electrode potential of 'A' = +2.23 V and 'B' = -1.43 V. The value of E°_{cell} is [Pb.CET 2003]

- (a) 3.66 V (b) 0.80 V
 (c) -0.80 V (d) -3.66 V

112. The *emf* of a cell whose half cells are given below is $Mg^{2+} + 2e^- \rightarrow Mg(s)$ $E^\circ = -2.37 V$ 

[Pb.CET 2001]

- (a) +1.36 V (b) +2.71 V
 (c) +2.17 V (d) -3.01 V

113. For the cell reaction, $2Ce^{4+} + Co \rightarrow 2Ce^{3+} + Co^{2+}$ E°_{cell} is 1.89 V. If $E^\circ_{Ce^{4+}/Ce^{3+}}$

[Pb.CET 2000]

- (a) -1.64 V (b) +1.64 V
 (c) -2.08 V (d) +2.17 V

114. If the ΔG of a cell reaction $AgCl + e^- \rightarrow Ag + Cl^-$ is -21.20 KJ; the standard *emf*, of cell is

[MP PMT 2004]

- (a) 0.229 V (b) 0.220 V
 (c) -0.220 V (d) -0.110 V

115. The *emf* of the cell $Ag | Ag^+(0.1M) || Ag^+(1M) | Ag$ at 298 K is

[DCE 2003]

- (a) 0.0059 V (b) 0.059 V
 (c) 5.9 V (d) 0.59 V

116. The *emf* of the cell $Zn | Zn^{2+}(0.01M) || Fe^{2+}(0.001M) | Fe$ at 298 K is 0.2905 then the value of equilibrium for the cell reaction is [IIT-JEE Scr

- (a) $\frac{0.32}{e^{0.0295}}$ (b) $\frac{0.32}{10^{0.0295}}$
 (c) $\frac{0.26}{10^{0.0295}}$ (d) $\frac{0.32}{10^{0.0591}}$

117. Aluminium displaces hydrogen from dilute HCl whereas silver does not. The *emf* of a cell prepared by combining Al/Al^{3+} and Ag/Ag^+ is 2.46 V. The reduction potential of silver electrode is +0.80 V. The reduction potential of aluminium electrode is

[KCET 2004]

- (a) +1.66 V (b) -3.26 V
 (c) 3.26 V (d) -1.66 V

118. Consider the following E° values :

- Under standard conditions the potential for the reaction $\text{Sn}_{(s)} + 2\text{Fe}^{3+}(\text{aq}) \rightarrow 2\text{Fe}^{2+}(\text{aq}) + \text{Sn}^{2+}(\text{aq})$ is [AIEEE 2004]
- (a) 0.91 V (b) 1.40 V
(c) 1.68 V (d) 0.63 V
119. $\text{Cr}_2\text{O}_7^{2-} + \text{I}^- \rightarrow \text{I}_2 + \text{Cr}^{3+}$
 $E^\circ_{\text{cell}} = 0.79 \text{ V}$
 $E^\circ_{\text{Cr}_2\text{O}_7^{2-}} = 1.33 \text{ V}$, $E^\circ_{\text{I}_2}$ is [BVP 2004]
- (a) -0.10 V (b) +0.18 V
(c) -0.54 V (d) 0.54 V
120. $\text{Zn}(\text{s}) + \text{Cl}_2(1 \text{ atm}) \rightarrow \text{Zn}^{2+} + 2\text{Cl}^-$. E°_{cell} of the cell is 2.12 V. To increase E [BVP 2004]
- (a) $[\text{Zn}^{2+}]$ should be increased
(b) $[\text{Zn}^{2+}]$ should be decreased
(c) $[\text{Cl}^-]$ should be decreased
(d) P_{Cl_2} should be decreased
121. The $E^\circ_{\text{M}^{3+}/\text{M}^{2+}}$ values for Cr, Mn, Fe and Co are -0.41, +1.57, +0.77 and +1.97 V respectively. For which one of these metals the change in oxidation state from +2 to +3 is easiest [AIEEE 2004]
- (a) Fe (b) Mn
(c) Cr (d) Co
122. The rusting of iron takes place as follows
 $2\text{H} + 2\text{e}^- + \frac{1}{2}\text{O}_2 \longrightarrow \text{H}_2\text{O}(\text{l})$;
 $E^\circ = +1.23 \text{ V}$
 $\text{Fe} + 2\text{e}^- \longrightarrow \text{Fe}(\text{s})$; $E^\circ = -0.44 \text{ V}$
Calculate ΔG° for the net process [IIT 2005]
- (a) -322 kJ mol⁻¹ (b) -161 kJ mol⁻¹
(c) -152 kJ mol⁻¹ (d) -76 kJ mol⁻¹
123. When an acid cell is charged, then [AFMC 2005]
- (a) Voltage of cell increases
(b) Electrolyte of cell dilutes
(c) Resistance of cell increases
(d) None of these
124. The standard electrode potential is measured by [KCET 2005]
- (a) Electrometer (b) Voltmeter
(c) Pyrometer (d) Galvanometer
125. Aluminium displaces hydrogen from acids but copper does not. A galvanic cell prepared by combining Cu/Cu^{2+} and Al/Al^{3+} has an e.m.f. of 2.0 V at 298 K. If the potential of copper electrode is +0.34 V, that of aluminium is [CPMT 2001; KCET 2001]
- (a) +1.66 V (b) -1.66 V
(c) +2.34 V (d) -2.3 V
126. If the standard electrode potential of Cu^{2+}/Cu electrode is 0.34 V, what is the electrode potential of 0.01M concentration of Cu^{2+} ($T = 298 \text{ K}$) [EAMCET 2003]
- (a) 0.399 V (b) 0.281 V
(c) 0.222 V (d) 0.176 V
127. Calculate the electrode potential at 298°K for $\text{Zn}|\text{Zn}^{++}$ electrode in which the activity of zinc ions is 0.001 M and $E^\circ_{\text{Zn}/\text{Zn}^{++}}$ is -0.74 volts [AMU 2002]
- (a) 0.38 volts (b) 0.83 volts
(c) 0.40 volts (d) 0.45 volts
128. Which of the following expression is correct [Orissa JEE 2005]
- (a) $\Delta G^\circ = -nFE^\circ_{\text{cell}}$ (b) $\Delta G^\circ = +nFE^\circ_{\text{cell}}$
(c) $\Delta G^\circ = -2.303RT nFE^\circ_{\text{cell}}$ (d) $\Delta G^\circ = -nF \log K_C$
129. For the feasibility of a redox reaction in a cell, the e.m.f. should be [J & K 2002]
- (a) Positive (b) Fixed
(c) Zero (d) Negative

Corrosion

1. Corrosion is basically a [Kerala (Med.) 2002]
- (a) Altered reaction in presence of H_2O
(b) Electrochemical phenomenon
(c) Interaction
(d) Union between light metal and heavy metal
2. Rusting of iron is catalysed by which of the following [MNR 1990; UPSEAT 2001]
- (a) Fe (b) O_2
(c) Zn (d) H^+
3. Which of the following is a highly corrosive salt [AFMC 2005]
- (a) FeCl_2 (b) PbCl_2
(c) Hg_2Cl_2 (d) HgCl_2
4. Corrosion of iron is essentially an electrochemical phenomenon where the cell reactions are [KCET 2005]
- (a) Fe is oxidised to Fe^{2+} and dissolved oxygen in water is reduced to OH^-
(b) Fe is oxidised to Fe^{3+} and H_2O is reduced to O_2^{2-}
(c) Fe is oxidised to Fe^{2+} and H_2O is reduced to O_2^-
(d) Fe is oxidised to Fe^{2+} and H_2O is reduced to O_2

Critical Thinking

Objective Questions

1. The limiting molar conductivities $\wedge^\circ$ for NaCl, KBr and KCl are 126, 152 and 150 $\text{S cm}^2\text{mol}^{-1}$ respectively. The $\wedge^\circ$ for NaBr is
- (a) 278 $\text{S cm}^2\text{mol}^{-1}$ (b) 176 $\text{S cm}^2\text{mol}^{-1}$
(c) 128 $\text{S cm}^2\text{mol}^{-1}$ (d) 302 $\text{S cm}^2\text{mol}^{-1}$
2. On the basis of the electrochemical theory of aqueous corrosion, the reaction occurring at the cathode is [MP PET 1994; UPSEAT 2001]
- (a) $\text{O}_{2(\text{g})} + 4\text{H}^+_{(\text{aq})} + 4\text{e}^- \rightarrow 2\text{H}_2\text{O}_{(\text{l})}$
(b) $\text{Fe}_{(\text{s})} \rightarrow \text{Fe}^{2+}_{(\text{aq})} + 2\text{e}^-$
(c) $\text{Fe}^{2+}_{(\text{aq})} \rightarrow \text{Fe}^{3+}_{(\text{aq})} + \text{e}^-$

3. The reaction $\frac{1}{2}H_{2(g)} + AgCl(s) \rightarrow H^+(aq) + Cl^-(aq) + Ag(s)$ occurs in the galvanic cell

[IIT 1985; AMU 2002; KCET 2003]

- (a) $Ag / AgCl(s)KCl(soln) || AgNO_3(soln) / Ag$
 (b) $Pt / H_2(g)HCl(soln) || AgNO_3(soln) / Ag$
 (c) $Pt / H_2(g)HCl(soln) || AgCl(s) / Ag$
 (d) $Pt / H_2(g)KCl(soln) || AgCl(s) / Ag$

4. The standard reduction potential E° for the half reactions are as

The EMF for cell reaction $Fe^{2+} + Zn \rightarrow Zn^{2+} + Fe$ is

[IIT 1988; CBSE PMT 1993, 96; BHU 1995, 2000; CPMT 2000; KCET 2000; AIIMS 2001; Orissa JEE 2002]

- (a) $-0.35 V$ (b) $+0.35 V$
 (c) $+1.17 V$ (d) $-1.17 V$

5. The number of electrons to balance the following equation $NO_3^- + 4H^+ + e^- \rightarrow 2H_2O + NO$ is [IIT Screening 1991]

- (a) 5 (b) 4
 (c) 3 (d) 2

6. The standard EMF for the given cell reaction $Zn + Cu^{2+} = Cu + Zn^{2+}$ is $1.10 V$ at $25^\circ C$. The EMF for the cell reaction, when $0.1 M Cu^{2+}$ and $0.1 M Zn^{2+}$ solutions are used, at $25^\circ C$ is

[MNR 1994; AMU 1999; UPSEAT 2002]

- (a) $1.10 V$ (b) $0.110 V$
 (c) $-1.10 V$ (d) $-0.110 V$

7. A gas X at $1 atm$ is bubbled through a solution containing a mixture of $1 M Y^-$ and $1 M Z^-$ at $25^\circ C$. If the reduction potential of $Z > Y > X$, then [IIT 1999]

- (a) Y will oxidize X and not Z
 (b) Y will oxidize Z and not X
 (c) Y will oxidize both X and Z
 (d) Y will reduce both X and Z

8. The oxidation potential of a hydrogen electrode at $pH = 10$ and $pH_1 = 1$ [JIPMER 2000]

- (a) $0.059 V$ (b) $0.59 V$
 (c) $0.00 V$ (d) $0.51 V$

9. The decomposition of hydrogen peroxide is an example of

[Roorkee 2000]

- (a) Exothermic reaction (b) Endothermic reaction
 (c) Negative catalysis (d) Auto-oxidation

10. Aluminium oxide may be electrolysed at $1000^\circ C$ to furnish aluminium metal (At. Mass = $27 amu$; $1 Faraday = 96,500 Coulombs$). The cathode reaction is

To prepare $5.12 kg$ of aluminium metal by this method would require [AIEEE 2005]

- (a) $5.49 \times 10^7 C$ of electricity
 (b) $1.83 \times 10^7 C$ of electricity
 (c) $5.49 \times 10^4 C$ of electricity
 (d) $5.49 \times 10^1 C$ of electricity

11.

Electrolyte :	KCl	KNO_3	HCl	$NaOAc$	$NaCl$
$\Lambda^\infty (Scm^2 mol^{-1}) :$	149.9	145.0	426.2	91.0	126.5

Calculate Λ_{HOAc}^∞ using appropriate molar conductances of the electrolytes listed above at infinite dilution in H_2O at $25^\circ C$ [AIEEE 2005]

- (a) 517.2 (b) 552.7
 (c) 390.7 (d) 217.5

12.

The mass of carbon anode consumed (giving only carbondioxide) in the production of $270 kg$ of aluminium metal from bauxite by the Hall process is [CBSE PMT 2005]

- (a) $180 kg$ (b) $270 kg$
 (c) $540 kg$ (d) $90 kg$

13.

$4.5 g$ of aluminium (at mass $27 amu$) is deposited at cathode from Al^{3+} solution by a certain quantity of electric charge. The volume of hydrogen produced at STP from H^+ ions in solution by the same quantity of electric charge will be [CBSE PMT 2005]

- (a) $22.4 L$ (b) $44.8 L$
 (c) $5.6 L$ (d) $11.2 L$

14.

What amount of Cl_2 gas liberated at anode, if $1 amp.$ current is passed for $30 min.$ from $NaCl$ solution. [BHU 2005]

- (a) $0.66 moles$ (b) $0.33 moles$
 (c) $0.66 g$ (d) $0.33 g$

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

1. Assertion : Sodium ions are discharged in preference to hydrogen ions at a mercury cathode.
 Reason : The nature of the cathode can effect the order of discharge of ions.
 2. Assertion : In electrolysis, the quantity of electricity needed for depositing 1 mole of silver is different from that required for 1 mole of copper.
 Reason : The molecular weights of silver and copper are different
 3. Assertion : Equivalent conductance of all electrolytes decreases with the increases in concentration.
 Reason : Lesser number of ions are available per gram equivalent at higher concentration.
 4. Assertion : Copper reacts with hydrochloric acid and liberates hydrogen from the solution of dilute hydrochloric acid.
 Reason : Hydrogen is below copper in the electrochemical series.

5. Assertion : Copper liberates hydrogen from a solution of dil. HCl .
Reason : Hydrogen is below copper in the reactivity series.
6. Assertion : Zn metal is formed when a Cu plate is dipped in $ZnSO_4$ solution.
Reason : Cu being placed above Zn in electrochemical series.
7. Assertion : Electrical conductivity of copper increases with increase in temperature.
Reason : The electrical conductivity of metals is due to the motion of electrons.
8. Assertion : A small amount of acid or alkali is added before electrolysis of water.
Reason : Pure water is weak electrolyte.
9. Assertion : Copper reacts with HCl and liberates hydrogen.
Reason : Hydrogen is present above Cu in the reactivity series.
10. Assertion : K and Cs are used in photoelectric cells.
Reason : K and Cs emit electrons on exposure to light.
11. Assertion : A large dry cell has high *e.m.f.*
Reason : The *e.m.f.* of a dry cell is proportional to its size.
12. Assertion : The resistivity for a substance is its resistance when its is one meter long and its area of cross section is one square meter.
Reason : The *S.I.* units of resistivity are ohm metre (Ωm) and ohm centimeter (Ωcm).
13. Assertion : When acidified zinc sulphate solution is electrolysed between zinc electrodes, it is zinc that is deposited at the cathode and hydrogen evolution does not take place.
Reason : The electrode potential of zinc is more negative than hydrogen as the overvoltage for the hydrogen as the evolution on zinc is quite large.
14. Assertion : If $\lambda_{Na^+}^0 + \lambda_{Cl^-}^0$ are molar limiting conductivity of the sodium and chloride ions respectively, then the limiting molar conducting for sodium chloride is given by the equation:
$$\wedge_{NaCl}^0 = \lambda_{Na^+}^0 + \lambda_{Cl^-}^0$$

Reason : This is according to Kohlrausch law of independent migration of ions.
15. Assertion : One coulomb of electric charge deposits weight equal to the electrochemical equivalent of the substance.
Reason : One Faraday deposits one mole of the substance.
16. Assertion : Auric chloride ($AuCl_3$) solution cannot be stored in a vessel made of copper, iron, nickel, chromium, zinc or tin.
Reason : Gold is a very precious metal.
17. Assertion : For a cell reaction $Zn(s) + Cu^{2+}(aq) \rightarrow Zn^{2+}(aq) + Cu(s)$; at the equilibrium, voltmeter gives zero reading.
Reason : At the equilibrium, there is no change in the concentration of Cu^{2+} and Zn^{2+} ions.
18. Assertion : A negative value of standard reduction potential means that reduction take place on this electrode with reference to standard hydrogen electrode.
Reason : The standard electrode potential of a half cell has a fixed value.
19. Assertion : Weston is a standard cell.
Reason : Its *e.m.f.* does not change with temperature.
20. Assertion : Galvanic cells containing hydrogen, methane, methanol etc. as fuels are called fuel cells.
Reason : They are designed to convert the energy of combustion of fuels directly into electrical energy.
21. Assertion : Zinc displaces copper from copper sulphate solution.
Reason : The E^0 of zinc is $-0.76 V$ and that of copper is $+0.34 V$.
22. Assertion : Identification of cathode and anode is done by the use of a thermometer.
Reason : Higher is the value of reduction potential, greater would be its reducing power.
23. Assertion : An electrochemical cell can be set up only if the redox reaction is spontaneous.
Reason : A reaction is spontaneous if free energy change is negative.
24. Assertion : Galvanised iron does not rust.
Reason : Zinc has a more negative electrode potential than iron. [AIIMS 2005]
25. Assertion : In an electrochemical cell anode and cathode are respectively negative and positive electrodes.
Reason : At anode oxidation takes place and at cathode reduction takes place.
26. Assertion : $Ni / Ni^{2+} (1.0M) || Au^{3+} (1.0M) | Au$, for this cell emf is $1.75 V$ if $E_{Au^{3+}/Au}^0 = 1.50$ and $E_{Ni^{2+}/Ni}^0 = 0.25 V$.
Reason : Emf of the cell $= E_{cathode}^0 - E_{anode}^0$.
27. Assertion : Salts like KCl, KNO_3 i.e., inert electrolytes are used in salt bridge.
Reason : An inert electrolyte can easily be filled in the U-tube.
28. Assertion : Emf and potential difference are same for cell.
Reason : Both gives the difference in electrode potential under any condition.

AS Answers and Solutions

Electrolytes and Electrolysis

1. (b) Sugar solution does not form ion; hence does not conduct electricity in solution.
3. (c) Strong electrolytes are almost completely ionised in polar solvent.
7. (b) The reduction potential of Mg is less than that of water ($E^0 = -0.83V$). Hence their ions in the aqueous solution cannot be reduced instead water will be reduced

$$2H_2O + 2e^- \rightarrow H_2 + 2OH^-$$
8. (b) HCl is an electrolyte.
9. (b) Water is reduced at the cathode and oxidized at the anode instead of Na^+ and SO_4^{2-} .
 Cathode: $2H_2O + 2e^- \rightarrow H_2 + 2OH^-$
 Anode: $H_2O \rightarrow 2H^+ + \frac{1}{2}O_2 + 2e^-$
10. (a) In electrolysis process oxidation occurs at anode and reduction occurs at cathode.
11. (a) Because in it covalent bonding is present.
12. (c) According to Faraday's law.
13. (d) Impure metal made anode while pure metal made cathode.
14. (d) In electrolytic cell, cathode acts as source of electrons.
15. (c) $AgNO_3$ is an electrolyte.
17. (a) At cathode: $2H^+ + 2e^- \rightarrow H_2$,
 At anode: $2OH^- \rightarrow H_2O + \frac{1}{2}O_2 + 2e^-$
18. (c) In between dilute H_2SO_4 and platinum electrode O_2 gas evolve at anode.
19. (c) When polar solvent added in to solid electrolyte than it is ionised.
20. (a) In fused $NaCl$ chloride ions are oxidized at anode and it is called oxidation.
21. (a) $w = zit, Q = it$.
22. (b) $2H^+ + 2e^- \rightarrow H_{2(g)}$ at cathode.
23. (b) $Na^+ + e^- \rightarrow Na$, means oxidation number is decreased so the reaction is reduction.
24. (d) Degree of dissociation of weak electrolyte increases on increasing temperature.
25. (b) Since discharge potential of water is greater than that of sodium so water is reduced at cathode instead of Na^+
 Cathode: $H_2O + e^- \rightarrow \frac{1}{2}H_2 + OH^-$
 Anode: $Cl^- \rightarrow \frac{1}{2}Cl_2 + e^-$
26. (b) Because it does not have ions.
27. (b) $NaCl \rightleftharpoons Na^+ + Cl^-$.
28. (a) Cathode: $2H_2O + 2e^- \rightarrow H_2 + 2OH^-$
 Anode: $H_2O \rightarrow 2H^+ + \frac{1}{2}O_2 + 2e^-$
29. (c) Electrolysis use for electroplating and electrorefining.

32. (d) The degree of ionization depend upon the nature of the solute the size of the solute molecules and the concentration of the solution.
33. (c) $C_{12}H_{22}O_{11}$ is a non-electrolyte.
34. (b) On electrolysis molten ionic hydride liberate H_2 at the anode.
35. (b) During electrolysis cation discharged at cathode and anion discharged at anode.
36. (a) Calcium is produced when molten anhydrous calcium chloride is electrolysed.
37. (d) All metals conduct heat and electricity.
38. (c) $2Al + dil. H_2SO_4 \rightarrow Al_2SO_4 + H_2 \uparrow$.
39. (d) Generally fused potassium chloride flow the electric conductivity.
41. (a) The substances whose aqueous solutions allow the passage of electric current and are chemically decomposed, are termed electrolytes. Electrolytic substances are classified as strong or weak according to how readily they dissociate into conducting ions. Acetic acid is a weak electrolyte. Glucose, ethanol and urea are non-electrolytes.

Faraday's law of electrolysis

1. (c) $Ag^+ + e^- \rightarrow Ag$; $E_{Ag} = \frac{\text{Atomic Mass}}{1} = 108$
 Number of faraday $= \frac{W_{Ag}}{E_{Ag}} = \frac{108}{108} = 1$.
2. (a) $W_{Ag} = \frac{E_{Ag} \times Q}{96500} = \frac{108 \times 9.65}{96500}$
 $= 1.08 \times 10^{-2} gm = 10.8 mg$
3. (b) $Fe^{2+} + 2e^- \rightarrow Fe$; $E_{Fe} = \frac{56}{2} = 28$
 $W_{Fe} = E_{Fe} \times \text{Number of faraday} = 28 \times 3 = 84 gm$.
4. (c) $W_{Ag} = \frac{E_{Ag} \times Q}{96500} = \frac{107.87 \times 965}{96500} = 1.0787 gm$.
5. (c) $Al^{3+} + 3e^- \rightarrow Al$
 $E_{Al} = \frac{27}{3} = 9$
 $W_{Al} = E_{Al} \times \text{No. of faradays} = 9 \times 5 = 45 gm$.
6. (c) Cu voltameter or Cu or Ag coulometer are used to detect the amount deposited on an electrode during passage of known charge through solution.
8. (b) $\frac{\text{Weight of } Cu}{\text{Weight of } H_2} = \frac{\text{Eq. weight of } Cu}{\text{Eq. weight of } H}$
 $\frac{\text{Weight of } Cu}{0.50} = \frac{63.6/2}{1}$
 Weight of $Cu = 15.9 gm$.
9. (c) $Cu^{2+} + 2e^- \rightarrow Cu$
 2 Faradays will deposit $= 1g$ atom of $Cu = 63.5g$.
12. (a) At cathode; $Al^{3+} + 3e^- \rightarrow Al$
 $E_{Al} = \frac{27}{3} = 9$
 $W_{Al} = E_{Al} \times \text{No. of faradays} = 9 \times 0.1 = 0.9 gm$.
14. (b) $W = zit$; $W = \frac{32.69 \times 5 \times 60 \times 40}{96500} = 4.065 gm$.
15. (b) $m = Z \times 4 \times 120$; $M = Z \times 6 \times 40$

$$\frac{M}{m} = \frac{6 \times 40}{4 \times 120} = \frac{1}{2}; \quad M = m/2.$$

16. (c) $W_{\text{metal}} = \frac{E \times I \times t}{96500} = \frac{E \times 3 \times 50 \times 60}{96500}$
 $E = \frac{96500 \times w}{3 \times 50 \times 60} = \frac{96500 \times 1.8}{3 \times 50 \times 60} = 19.3.$

The charged obtained is $3 \times 96500 \text{ C}$.

18. (a) Wt. of Ag deposited = Eq. wt. of Ag = 108 gm
 Wt. of Ni deposited = Eq. wt. of Ni = 29.5 gm
 Wt. of Cr deposited = Eq. wt. of Cr = 17.3 gm.

19. (d) One Faraday = 1 gm of equivalent of Cu.

20. (c) $W = Zit$; $Z = \frac{E}{96500}$.

21. (d) During electrolysis of $CuSO_4$, Cu^{2+} gets discharged at cathode and OH^- at anode. Thus solution becomes acidic due to excess of H^+ and SO_4^{2-} or H_2SO_4 .

23. (b) 1 mole of electrons = 1 faraday
 $Mg^{++} + 2e^- \rightarrow Mg$; 2 moles of electrons = 2 faraday.

24. (d) $Cu^{++} + 2e^- \rightarrow Cu$
 $E_{Cu} = \frac{63.54}{2} = 31.77$
 Amount of electricity required to deposit .6354 gm of Cu
 $= \frac{96500 \times 0.6354}{31.77} = 1930 \text{ Coulombs}.$

25. (a) The amount deposited is directly proportional to current intensity, electrochemical equivalent of ions and the time for electrolysis and is independent of the temperature.

27. (a) $W = ZQ$; $W = Zit$.

28. (d) $Ca^{++} + 2e^- \rightarrow Ca$
 $E_{Ca} = \frac{40}{2} = 20$
 $W_{Ca} = E_{Ca} \times \text{No. of faradays} = 20 \times 0.04 = 0.8 \text{ gm}.$

29. (c) $E_{\text{metal}} = \frac{\text{Weight of metal} \times 96500}{\text{Number of coulombs}}$
 $= \frac{22.2 \times 96500}{2 \times 5 \times 60 \times 60} = 59.5$
 Oxidation number of the metal = $\frac{177}{59.5} = +3$

30. (a) Quantity of electricity passed = $\frac{25}{1000} \times 60 = 1.5$
 $2F = 2 \times 96500 \text{ C}$ deposit $Ca = 1 \text{ mole}$
 $\therefore 1.5 \text{ C}$ will deposit $Ca = \frac{1}{2 \times 96500} \times 1.5 \text{ mole}$
 $= \frac{1}{2 \times 96500} \times 1.5 \times 6.023 \times 10^{23} \text{ atom} = 4.68 \times 10^{18}.$

31. (b) Equivalent of Cl deposited
 = No. of Faraday passed = 0.5
 Wt. of Cl = $0.5 \times \text{Eq. wt.} = 0.5 \times 35.5 = 17.75 \text{ gm}.$

32. (b) At Andoe At Anode $Cl^- \rightarrow \frac{1}{2} Cl_2 + e^-$
 $E_{Cl_2} = \frac{35.5 \times 2}{2} = 35.5$

$$W_{Cl_2} = \frac{E_{Cl_2} \times I \times t}{96500} = \frac{35.5 \times 2 \times 30 \times 60}{96500} = 1.32 \text{ gm}.$$

34. (b) It is Faraday's law.

35. (b) Equivalent wt. of O_2 = Equivalent wt. of Cu

36. (d) $O_2\% = 20\%$

$$\text{Metal}\% = 80\% = \frac{80}{20} \times 8 = 32 \text{ g of metal}.$$

37. (b) $V = \frac{827 \times 10^3}{4 \times 96500} = 2.14 \text{ V}.$

38. (b) $Ag^+ \xrightarrow{+e^-} Ag$, 96500 C will liberate silver = 108 gm.
 9650 C will liberate silver = 10.8 gm.

39. (a) One mole of monovalent metal ion means charge of N electron i.e. 96500 C or 1 Faraday.

42. (a) 1 Faraday involves charge of 1 mole electrons.

43. (a) $\text{Coulomb} = \text{ampere (A)} \times \text{second (S)}.$

44. (b) $E = -\frac{13.6}{n^2}$ for He^+ $n = 1$
 $E = -\frac{13.6}{1^2} = -13.6 \text{ eV}.$

45. (c) $w \propto E$ if i and t are constant.

47. (d) Charge (Coulombs) pass per second = 10^{-6}
 number of electrons passed per second

$$= \frac{10^{-6}}{1.602 \times 10^{-19}} = 6.24 \times 10^{12}.$$

48. (d) At cathode;
 $Fe^{2+} + 2e^- \rightarrow Fe$; $Fe^{3+} + 3e^- \rightarrow Fe$
 $(E_{Fe})_1 = \frac{\text{Atomic weight}}{2}$; $(E_{Fe})_2 = \frac{\text{Atomic weight}}{3}$
 Ratio of weight of Fe liberated
 $= \frac{\text{Atomic weight}}{3} : \frac{\text{Atomic weight}}{2} = 3 : 2.$

49. (b) 31.75 g copper gets deposited at cathode on passing 96500 coulomb charge. We know that 31.75 gm of Cu is equal to 0.5 mole of Cu deposited at cathode on passing 1F of current.

52. (b) For deposition of one equivalent silver required charged is 96500 C.

53. (b) $Cu^{++} + 2e^- \rightarrow Cu$; $E_{Cu} = \frac{63.55}{2} = 31.75 \text{ gm Cu}.$

54. (a) $Q = 2.5 \times 386 = 96500 \text{ C}$
 $2F(2 \times 96500 \text{ C})$ deposited $Cu = 63.5 \text{ g}$
 $\therefore$ Hence 965 C will deposited; $Cu = 0.3175 \text{ gm}.$

55. (c) $\frac{\text{Wt. of Cu}}{\text{Wt. of Ag}} = \frac{\text{Eq. wt. of Cu}}{\text{Eq. wt. of Ag}}; \frac{\text{Wt. of Cu}}{1.08} = \frac{63.5/2}{108}$
 Wt. of Cu = 0.3177 gm.

56. (c) 1 g atom of Al = 3 equivalent of Al = 3 faraday charge
 3 mole electrons = 3 N electron.

57. (c) At cathode : $Al^{3+} + 3e^- \rightarrow Al$
 $E_{Al} = \frac{\text{Atomic mass}}{3}$

$$E_{Cu} = \frac{\text{Atomic mass}}{2}$$

$$E_{Na} = \frac{\text{Atomic mass}}{1}$$

For the passage of 3 faraday;

mole atoms of Al deposited = 1

$$\text{mole atoms of } Cu \text{ deposited} = \frac{1 \times 3}{2} = 1.5$$

mole atoms of Na deposited = $1 \times 3 = 3$.

58. (d) At cathode: $Ag^+ + e^- \rightarrow Ag$

$$E_{Ag} = \frac{108}{1} = 108; E_{O_2} = \frac{\frac{1}{2} \times 32}{2} = 8$$

$$\frac{W_{Ag}}{E_{Ag}} = \frac{W_{O_2}}{E_{O_2}}; W_{Ag} = \frac{1.6 \times 108}{8} = 21.6 \text{ gm.}$$

59. (d) KI is an electrolyte.

60. (d) Number of gm equivalent = Number of faraday pass
 $4 \text{ gm} = 4 \text{ faraday.}$

61. (c) Eq. of $Al = \frac{13.5}{27/3} = 1.5$.

Thus 1.5 Faraday is needed.

63. (b) Electricity required

$$= \text{No. of } gm \text{ equivalent} \times 96500 \text{ coulombs}$$

$$= 0.5 \times 96500 = 48250 \text{ C.}$$

64. (a) Equivalent weight of silver = 107.870 g .

1 Faraday = 96500 $coulomb$.

67. (a) Equivalent weight and atomic weight of Na metal are the same, so 1 g atom of Na is deposited by one Faraday of current.

68. (a) $Al \rightarrow Al^{3+} + 3e^-$.

70. (c) $\therefore$ 1F obtained from 1 g equivalent

$\therefore$ 2.5 F obtained from 2.5 g equivalent.

75. (c) Faraday constant depends upon the current passed.

80. (b) In 5 gm CuO , 4 gm Cu and 1 gm O be present.

Element	Wt.	At. Wt.	Wt. / At. Wt. $\neq x$	Ratio
Cu	4 gm	63.5	$4/63.5 = .0625$	$\frac{.0625}{.0625} = 1$
O	1 gm	16	$1/16 = .0625$	$\frac{.0625}{.0625} = 1$

Empirical formula = CuO of oxide

In this oxide, oxidation no. of $Cu = +2$

$$\text{Equivalent weight} = \frac{\text{Molecular weight}}{\text{Oxidation no.}} = \frac{63.5}{2} \approx 31.75$$

but Equivalent weight should be an integral no. = 32

81. (c) Given, Current = 241.25 $coulomb$

$$1 \text{ coulomb current will deposit} = 1.118 \times 10^{-3} \text{ gm } Ag.$$

$$\therefore 241.25 \text{ current will deposit} = 1.118 \times 10^{-3} \times 241.25 = 0.27 \text{ gm silver.}$$

82. (b) Reaction for electrolysis of water is

$\therefore n = 4$ so 4 Faraday charge will liberate

1 mole = 22.4 dm^3 oxygen

$$\therefore 1 \text{ Faraday charge will liberate } \frac{22.4}{4} = 5.6 \text{ dm}^3 O_2.$$

83. (a) $Na^+ + e^- \rightarrow Na$

Charge (in F) = moles of e^- used = moles of Na deposited

$$= \frac{11.5}{23} \text{ gm} = 0.5 \text{ Faraday.}$$

84. (c) Hydrolysis of water: $2H_2O \rightleftharpoons 4H^+ + 4e^- + O_2$

4 F charge will produce = 1 mole $O_2 = 32 \text{ gm } O_2$

$$1 \text{ F charge will produce} = \frac{32}{4} = 8 \text{ gm } O_2.$$

85. (c) In a galvanic cell, the electrons flow from anode to cathode through the external circuit. At anode ($-ve$ pole) oxidation and at cathode ($+$ pole) reduction takes place.

86. (e) Number of equivalents of silver formed = Number of equivalents of copper formed.

In $AgNO_3$, Ag is in $+1$ oxidation state.

In $CuSO_4$, Cu is in $+2$ oxidation state.

$$\text{Equivalent weight of } Ag = \frac{108}{1} = 108$$

$$\text{Equivalent weight of } Cu = \frac{63.6}{2} = 31.8$$

$$\frac{M_1}{M_2} = \frac{E_1}{E_2}; \frac{10.79}{M_{Cu}} = \frac{108}{31.8}$$

$$M_{Cu} = \frac{10.79 \times 31.8}{108} = 3.2 \text{ gm.}$$

87. (b) Laws of electrolysis were proposed by Faraday.

88. (a) Given, Current (i) = 25 mA = 0.025 A

Time (t) = 60 sec

$$Q = i t = 60 \times 0.025 = 1.5 \text{ coulombs}$$

$$\text{No. of electrons} = \frac{1.5 \times 6.023 \times 10^{23}}{96500}$$

$$e^- = 9.36 \times 10^{18}$$

$2e^-$ are required to deposit one Ca atom

$$9.36 \times 10^{18} e^- \text{ will be used to deposit} = \frac{9.36 \times 10^{18}}{2} = 4.68 \times 10^{18}.$$

89. (d) $C_6H_5NO_2 + 6H^+ + 6e^- \rightarrow C_6H_5NH_2 + 2H_2O$

1 mole = 123 gm nitrogen requires 6 mole electron e^-

= $6 \times 96500 \text{ coulomb charge}$

$$\therefore 12.3 \text{ gm nitrobenzene will require} = \frac{6 \times 96500 \times 12.3}{123}$$

$$= 6 \times 9650 = 57900 \text{ C.}$$

90. (c) Au and Ag settle down below the anode as anode mud during the process of electrolytic refining of copper.

Conductor and Conductance

2. (b) $\lambda^\infty BaCl_2 = \frac{1}{2} \lambda^\infty Ba^{2+} + \lambda^\infty Cl^-$

$$= \frac{127}{2} + 76 = 139.5 \text{ ohm}^{-1} \text{ cm}^{-1} \text{ eq}^{-1}.$$

3. (d) Dilution, temperature and nature of electrolyte affect the conductivity of solution.

5. (a) Generally strong electrolyte on dilution shows conductivity characters.

6. (b) Molar conductivity = $\frac{1000}{MX}$.
7. (b) $C = \frac{K[A]A}{l}$, $K = \frac{C \times l}{[A]A} = \frac{Sm}{mol\ m^{-3}\ m^2} = Sm^2\ mol^{-1}$.
9. (b) Conductivity of a solution is directly proportional to the number of ions.
11. (a) $NaCl \rightleftharpoons Na^+ + Cl^-$. So it conduct electricity.
12. (b) Graphite is a good conductor of electricity.
15. (b) Electrolytic conduction resistance decreases with increasing temperature.
16. (d) Because conductance is increase when the dissociation is more.
17. (b) Strong electrolyte ionize completely at all dilutions and the number of ions does not increase on dilution. A small increase in $\wedge_m$ volume with dilution is due to the weakening of electrostatic attraction between the ions on dilution.
18. (d) In electrolytic conductors, a single stream of electrons flow from cathode to anode.
19. (b) In solid state $NaCl$ does not dissociate into ions so it does not conduct electricity.
20. (c) The ions are not free to move in solid state and held up in lattice due to strong coulombic forces of attraction.
21. (b) C_2H_5OH being non electrolyte so does not ionize.
22. (a) Since molar conductance $\propto \frac{1}{\text{Molarity}}$.
23. (c) Molar conductivity = $\frac{1}{\rho M}$
So its unit will be $\Omega^{-1}cm^2mol^{-1}$.
25. (a) $l/a = 0.5\ cm^{-1}$, $R = 50\ ohm$
 $p = \frac{Ra}{l} = \frac{50}{0.5} = 100$
 $\Lambda = k \times \frac{1000}{N} = \frac{1}{p} \times \frac{1000}{N} = \frac{1}{100} \times \frac{1000}{1}$
 $10\ ohm^{-1}cm^2\ gmeq^{-1}$
26. (b) $\Lambda_{m(C_6H_5COOH)}^o = \Lambda_{(C_6H_5COO^-)}^o + \Lambda_{(H^+)}^o$
 $= 42 + 288.42 = 330.42$
 $\alpha = \frac{\Lambda_m^c}{\Lambda_m^o} = \frac{12.8}{330.42} = 3.9\%$
27. (d) Conductance = $\frac{1}{\text{resistance}} = \frac{1}{ohm} = ohm^{-1}$ or *mho*
6. (a) Because the reduction potential of Cu is highest.
7. (c) Overall reaction - $2H_{2(g)} + O_{2(g)} \rightarrow 2H_2O(l)$.
9. (b) During charging of a lead storage battery, the reaction at the anode and cathode are
Anode: $PbSO_4 + 2e^- \rightarrow Pb + SO_4^{2-}$
Cathode: $PbSO_4 + 2H_2O \rightarrow PbO_2 + 4H^+ + SO_4^{2-} + 2e^-$
In both the reactions H_2SO_4 is regenerated.
11. (c) $2NH_4Cl + Zn \rightarrow 2NH_3 + ZnCl_2 + H_2 \uparrow$.
13. (a) When platinum electrodes are dipped in dilute solution H_2SO_4 than H_2 is evolved at cathode.
14. (a) Electrode on which oxidation occurs is written on *L.H.S.* and the other on the *R.H.S.* as represented by
 $Zn | Zn^{2+} || Cu^{2+} | Cu$.
Reduction
 $Zn^{2+} + 2e^- \rightarrow Zn$. It shows reduction reaction.
15. (d) $Zn^{2+} + 2e^- \rightarrow Zn$. It shows reduction reaction.
16. (c) In the electrolytic cell electrical energy change into chemical energy.
17. (c) In the cell $Zn | Zn^{2+} || Cu^{2+} | Cu$ the negative electrode (anode) is Zn . In electrochemical cell representation anode is always written on left side while cathode on right side.
18. (a) Galvanic cell converts the chemical energy into electrical energy.
19. (b) Fuel-cells are used to provide power and drinking water to astronauts in space programme.
21. (b) $E_{cell}^o = \frac{2.303 RT}{nF} \log K = \frac{0.0591}{n} \log K_c$ at 298K.
22. (b) $Cu^{2+} + 2e^- \rightarrow Cu$
Reduction
24. (b) The cell in which Cu and Zn rods are dipped in its solutions called Daniel cell.
25. (c) $K = C \times \text{Cell constant} = \frac{K}{C} = \frac{0.2}{0.04} = 5\ cm^{-1}$.
26. (a) $\frac{K}{C} = \text{Cell Constant}$.
27. (c) Velocities of both K^+ and NO_3^- are nearly the same in KNO_3 so it is used to make salt-bridge.
28. (a) In this reaction 4 electrons are needed for the reaction volume.
29. (b) In electrochemical cell H_2 release at anode and Cu is deposit at the cathode.
31. (a) Anode has negative polarity.
32. (b) $\wedge_m^o(CH_3COOH) =$
 $\wedge^o(CH_3COONa) + \wedge^o(HCl) - \wedge^o(NaCl)$
 $= 91 + 426.16 - 126.45 = 390.71\ ohm^{-1}cm^2mol^{-1}$.
36. (b) At anode: $Zn_{(s)} \rightarrow Zn^{2+} + 2e^-$.
38. (d) $PbSO_4 + 2H_2O \rightarrow 2PbO_2 + 4SO_4^{2-} + 2e^-$.
39. (b) MnO_2 is used in dry batteries cell.
40. (d) $Pb + PbO_2 + 2H_2SO_4 \xrightleftharpoons[\text{Recharge}]{\text{Discharge}} 2PbSO_4 + 2H_2O$.
Sulphuric acid is consumed on discharging.
42. (d) The metal placed below in electrochemical series does not react with that metal salt solution which metal is placed above in series.
43. (c) In the electrochemical cell chemical energy changes into electrical energy.
44. (a) In galvanic cell, the salt bridge used to complete the circuit.

Cell constant and Electrochemical cells

1. (d) In the absence of electric field the ions in the solution move randomly due to thermal energy.
2. (d) Since E_{A/A^-}^o has large negative value, the tendency of A to be reduced to A^- is very small. In other words tendency of A^- to be oxidized to A is very large.
3. (d) Practically only 60-70% efficiency has been attained.
4. (b) $K = \frac{1}{R} \times \text{Cell constant}$
Cell constant = $K \times R$; $0.012 \times 55 = 0.66\ cm^{-1}$.
5. (b) In common dry cell.
Anode: $Zn \rightarrow Zn^{++} + 2e^-$
Cathode: $2MnO_2 + Zn^{++} + 2e^- \rightarrow ZnMn_2O_4$.

45. (d) $Cu + FeSO_4 \rightarrow$ No reaction Because Cu has $E^\circ = 0.34$ volt and Fe has $E^\circ = -0.44$ volt.
47. (d) Calomel electrode as reference electrode is made by using Hg_2Cl_2 .
48. (b) In hydrogen-oxygen fuel cell following reactions take place to create potential difference between two electrodes.
- $$2H_{2(g)} + 4OH^-(aq) \rightarrow 4H_2O(l) + 4e^-$$
- $$O_{2(g)} + 2H_2O(l) + 4e^- \rightarrow 4OH^-(aq)$$
-
- Overall reaction = $2H_{2(g)} + O_{2(g)} \rightarrow 2H_2O(l)$
the net reaction is the same as burning (Combustion) of hydrogen to form water.
49. (c) $ClCH_2COONa + HCl \rightarrow ClCH_2COOH + NaCl$
 $\lambda_{ClCH_2COONa} + \lambda_{HCl} = \lambda_{ClCH_2COOH} + \lambda_{NaCl}$
 $224 + 203 = \lambda_{ClCH_2COOH} + 38.2$
 $\lambda_{ClCH_2COOH} = 427 - 38.2 = 388.8 \text{ ohm}^{-1}\text{cm}^2\text{gmeq}^{-1}$.
50. (c) In daniel cell copper rod acts as cathode so there cations move towards copper electrode and reduction take place on copper rod.
51. (b) Elements with lower reduction potential act as anode. His placed above Cu in electrochemical series so it has lesser reduction potential and thus act as anode and Cu act as cathode.
52. (d) Fuel cells are more efficient as they are free from pollution and hence they run till the reactants are active. They have longer life than lead storage cells.
53. (c) For gold plating, the used electrolyte is $K[Au(CN)_2]$.
54. (a) Dil. H_2SO_4 is used in lead in lead storage battery as electrolyte.
55. (c) Cell constant = $\frac{\text{Specific conductivity}}{\text{Observed conductance}}$
 $= \frac{0.002765}{1/R} = 0.002765 \times 400 = 1.106$.
57. (b) $2AgCl_{(s)} + H_{2(g)} \rightarrow 2HCl_{(aq)} + 2Ag_{(s)}$
The activities of solids and liquids are taken as unity and at low concentrations, the activity of a solute is approximated to its molarity.
The cell reaction will be
 $Pt_{(s)} | H_{2(g)} 1 \text{ bar} | H_{(aq)} 1 M | AgCl_{(s)} 1 M | Ag_{(s)}$
58. (a) $E_{cell} = \frac{0.059}{n} \log \frac{1}{C} = -\frac{0.059}{2} \log \frac{1}{100}$
 $= -\frac{0.059}{2} (-2) = 0.059 \text{ V} = 59 \text{ mV} \text{ (increase)}$
59. (a) $E_{cell} = -0.059 \log \frac{10^{-6}}{10^{-3}} = -0.059 \log 10^{-3}$
 $= -0.059 \times (-3) = 0.177 \text{ V}$.
60. (c) The magnitude of the electrode potential of a metal is a measure of its relative tendency to lose or gain electrons. i.e., it is a measure of the relative tendency to undergo oxidation (loss of electrons) or reduction (gain of electrons).
 $M \rightarrow M^{n+} + ne^-$ (oxidation potential)
 $M^{n+} + ne^- \rightarrow M$ (reduction potential)
61. (a) On electrolysis of fused ionic hydride (LiH), hydrogen obtained at anode.
 $MH + H_2O \rightarrow MOH + H_2 \uparrow$

$$E_H = \frac{-2.303RT}{F} \log \frac{1}{[H^+]}$$

$$= -0.059 pH = -0.059 \times 3 = -0.177 \text{ V}$$

2. (a) $E^\circ_{cell} = E^\circ_{cathode} - E^\circ_{anode} = 0.799 - (-0.763) = 1.562 \text{ V}$
3. (a) More negative is the reduction potential, higher will be the reducing property, i.e. the power to give up electrons.
4. (b) Standard potential of Zinc < Copper.
6. (c) A cation having highest reduction potential will be reduced first and so on. However, Mg^{2+} in aqueous solution will not be reduced $\left(E^\circ_{Mg^{2+}/Mg} < E_{H_2O/1/2H_2+OH^-} \right)$. Instead water would be reduced in preference.
7. (c) A is displaced from D because D has a $E^\circ = -0.402 \text{ V}$.
8. (a) $Zn_{(s)} + 2Ag^+_{(aq)} \rightarrow Zn^{2+}_{(aq)} + 2Ag_{(s)}$
 $\xrightarrow[\text{Oxidation}]{\text{Reduction}}$
 In this reaction zinc acts as an anode and Ag acts as a cathode.
9. (a) No doubt Be is placed above Mg in the second group of periodic table but it is below Mg in electrochemical series.
10. (b) Nernst's equation shows relation between E and E° .
11. (a) $E = E^\circ - \frac{RT}{nF} \ln \frac{1}{[M^{n+}]} ; E = E^\circ + \frac{RT}{nF} \ln [M^{n+}]$
 $E = E^\circ + \frac{2.303RT}{nF} \log [M^{n+}]$
 Substituting the value of R , T (298K) and F we get
 $E = E^\circ + \frac{0.0591}{n} \log (M^{n+})$.
12. (c) At 298 K standard electrode potential of NHE electrode is 0.00 V.
13. (a) Since, Ag^+ ions are reduced to Ag and
 $E^\circ_{Ag^+/Ag} > E^\circ_{Cu^{++}/Cu}$ Cu is oxidized to Cu^{++} .
14. (d) The reducing power decreases as the reduction potential increases (becomes less negative).
15. (c) Actually the equation is derived from Nernst equation assuming equilibrium condition in a cell reaction, when $E = 0$.
16. (a) More negative is the standard reduction potential, greater is the tendency to lose electrons and hence greater reactivity.
17. (a) Hg has greater reduction potential than that of H^+ and hence cannot displace hydrogen from acid.
18. (c) Brown layer is deposited on iron rod because Cu has greater reduction potential than that of Fe^{2+} .
19. (b) Since $E^\circ_{A^{2+}/A} < E^\circ_{B^{2+}/B}$, A has greater tendency to be oxidized.
 $A + B^{2+} \rightarrow A^{2+} + B$.
20. (b) Since $E^\circ_{Zn^{++}/Zn}$ is negative, so Zn has greater tendency to be oxidized than hydrogen. Hence it can act as reducing agent.
21. (a) Standard electrode potential of Hydrogen is zero.
22. (b) According to electrochemical series.
23. (a) The standard reduction potential of K^+ , Mg^{2+} , Zn^{+2} , Cu^{2+} increase in this order.
24. (c) $E_{cell} = E^\circ_{Au^{3+}/Au} - E^\circ_{Ni^{2+}/Ni} = 1.50 - (-0.25) = 1.75 \text{ V}$.
25. (a) Electromotive force is +ve if oxidation and reduction both take place in a cell.
28. (a) In galvanic cell anode is always made up of negative electrode.

Electrode potential, E_{cell} , Nernst equation and ECS

1. (b) Reduction potential of hydrogen electrode,

29. (d) $A|A^+(a=1)||B^+(a=1)|B$
 $EMF = E_{\text{cathode}} - E_{\text{anode}} = 0.75 - (0.5); EMF = 0.25 V.$
30. (d) $E^\circ = -3.05 \text{ Li}^+ / \text{Li}$ is most negative (minimum) and hence Li has maximum tendency to lose electrons or it is the strongest reducing agent.
31. (b) Brown layer is deposited on iron rod because Cu has greater than reduction potential than that of Fe^{2+} .
32. (a) $E_{\text{Zn}^{2+}/\text{Zn}}^\circ < E_{\text{Fe}^{2+}/\text{Fe}}^\circ$, so Zn will reduce Fe^{2+} . Zn cannot reduce Mg^{2+} because $E_{\text{Zn}^{2+}/\text{Zn}}^\circ > E_{\text{Mg}^{2+}/\text{Mg}}^\circ$
 On similar reason Mg and Zn cannot oxidize Fe .
33. (d) For the cell reaction, Fe acts as cathode and Sn as anode. Hence,
 $E_{\text{cell}}^\circ = E_{\text{cathode}}^\circ - E_{\text{anode}}^\circ = -0.44 - (-0.14) = -0.30 V$
 The negative EMF suggests that the reaction goes spontaneously in reversed direction.
34. (a) $E_{\text{cell}}^\circ = E_{\text{cathode}}^\circ - E_{\text{anode}}^\circ = 0.34 - (-0.76) = 1.10 V.$
35. (c) $E_{\text{cell}}^\circ = E_{\text{cathode}}^\circ - E_{\text{anode}}^\circ$; $E_{\text{cell}}^\circ = 0.34 - (-2.37)$
 $E_{\text{cell}}^\circ = 2.71 V.$
36. (d) Mg lies above Cu in electrochemical series and hence Cu electrode acts as cathode
 $E_{\text{cell}}^\circ = E_{\text{Cu}^{2+}/\text{Cu}}^\circ - E_{\text{Mg}^{2+}/\text{Mg}}^\circ$
 $2.70 V = 0.34 - E_{\text{Mg}^{2+}/\text{Mg}}^\circ$; $E_{\text{Mg}^{2+}/\text{Mg}}^\circ = -2.36 V.$
37. (a) Because H_2 has greater reduction potential so it reduced the Ag^+ .
39. (d) $\Delta G^\circ = -nE^\circ F$
 $\text{Fe}^{2+} + 2e^- \rightarrow \text{Fe} \quad \dots(i)$
 $\Delta G^\circ = -2 \times F \times (-0.440 V) = 0.880 F$
 $\text{Fe}^{3+} + 3e^- \rightarrow \text{Fe} \quad \dots(ii)$
 $\Delta G^\circ = -3 \times F \times (-0.036) = 0.108 F$
 On subtracting equation (i) from (ii)
 $\text{Fe}^{3+} + e^- \rightarrow \text{Fe}^{2+}$
 $\Delta G^\circ = 0.108 F - 0.880 F = -0.772 F$
 $E^\circ \quad \text{for} \quad \text{the} \quad \text{reaction} \quad = -\frac{\Delta G^\circ}{nF}$
 $= -\frac{(-0.772 F)}{1 \times F} = +0.772 V.$
40. (d) Reducing power *i.e.* the tendency to lose electrons increases as the reduction potential decreases.
41. (b) Cu^{++} will be reduced and Fe will be oxidized.
 $\text{Cu}^{++} + \text{Fe} \rightarrow \text{Cu} + \text{Fe}^{++}.$
42. (c) Cell reaction is
 $\text{Cu}_{(s)} + 2\text{Ag}^+ \rightarrow \text{Cu}^{2+} + 2\text{Ag}$
 Two half cell reaction is
 $\text{Cu} \rightarrow \text{Cu}^{2+} + 2e^- \quad \text{Oxidation (anode)}$
 $\text{Ag}^+ + e^- \rightarrow \text{Ag} \quad \text{Reduction (cathode)}$
 $E_{\text{cell}} = E_{\text{ox}} - E_{\text{red}} = 0.80 - 0.34 = +0.46 V$
43. (a) $EMF = [\text{s.r.p. of cathode} - \text{s.r.p. of anode}]$

Where s.r.p. = Standard reduction potential

If EMF is positive then the reaction is spontaneous

For *e.g.* in Galvanic cell

(a) $EMF = 1.1 \text{ volt}$

(b) Cathode is made of copper

(c) Anode is made of Zinc

$EMF = 0.34 - (-0.76) = 1.1 \text{ volt}.$

46. (d) H_2 is anode because oxidation takes place.
 Cu is cathode because reduction takes place.
47. (c) $E_{\text{cell}}^\circ = E_{\text{cathode}}^\circ - E_{\text{anode}}^\circ.$
51. (b) Standard hydrogen electrode have zero electrode potential.
53. (a) $\Delta G = -nFE^\circ$
 $\Delta G = -1 \times 96500 \times 1.02$; $\Delta G = -98430.$
54. (c) Fuel cell converts the chemical energy into electrical energy.
55. (a) $E = E^\circ - \frac{2.303 RT}{nF} \log \frac{[M]}{[M^{n+}]}.$
56. (a) Less is the reduction potential stronger is the reducing agent.
57. (a) Reducing power, *i.e.* the tendency to lose electrons increases as the reduction potential decreases.
58. (a) $\text{OCl}^- \rightarrow \text{Cl}^-, E^\circ = 0.94 V$
 $\text{Cl}^- \rightarrow \frac{1}{2} \text{Cl}_2 + e^-, E^\circ = -1.36 V$
 adding the two equations, we get
 $\text{OCl}^- \rightarrow \frac{1}{2} \text{Cl}_2, E^\circ = 0.94 - 1.36 = -0.42 V.$
60. (a) It cannot evolved H_2 from H_2S
 $\text{Hg} + \text{H}_2\text{S} \rightarrow \text{No reaction}.$
61. (b) $E_{\text{cell}}^\circ = \frac{0.059}{n} \log K$
 $\log K = \frac{1.10 \times 2}{0.059} = 37.2881$ or $K = 10^{-37}.$
62. (d) The oxidizing character *i.e.* acceptance of electrons increases with the reduction potential.
63. (a) According to electrochemical series.
64. (d) $E_{\text{cell}} = E_{\text{cell}}^\circ - \frac{RT}{nF} \ln \frac{C_2}{C_1}$ and $\Delta G = -nFE_{\text{cell}}$
 hence ΔG is the function of $\ln \left(\frac{C_2}{C_1} \right).$
66. (c) $E = E^\circ - \frac{0.059}{n} \log \frac{[\text{Zn}^{++}]}{[\text{Cu}^{++}]} = 1.10 - \frac{0.059}{2} \log \frac{1}{0.1}$
 $= 1.10 - 0.0295 \log 10 = 1.07 \text{ volt}.$
67. (b) $E_1 = E_o - \frac{0.0591}{2} \log \frac{0.01}{1} = E_o + \frac{0.0591}{2} \times 2$
 $E_2 = E_o - \frac{0.0591}{2} \log \frac{100}{0.01} = E_o - \frac{0.0591}{2} \times 4$
 $\therefore E_1 > E_2.$
68. (b) $\text{Fe}^{+2} + \text{Zn} \xrightarrow[\text{Reduction}]{\text{Oxidation}} \text{Zn}^{+2} + \text{Fe}$
 $EMF = E_{\text{cathode}} - E_{\text{anode}} = 0.44 - (0.76) = +0.32 V.$
69. (a) Fe is more electropositive than copper. Hence Cu^{2+} can oxidise Fe .
70. (b) $E^\circ = 0$ because hydrogen have zero potential.
71. (b) Cell potential of the cell is positive.
72. (a,b) Because these comes after the Fe in electrochemical series.

73. (c) $\text{Fe}^{2+} + \text{Zn} \rightarrow \text{Zn}^{2+} + \text{Fe}$
- $\xrightarrow{\text{Oxidation}}$
 $\xleftarrow{\text{Reduction}}$
- $EMF = E_{\text{cathode}} - E_{\text{anode}} = -7.81 - (-7.62)$
 $EMF = -0.19 \text{ V}$.
74. (c) $\text{Cr}^{3+} > \text{Zn}^{2+} > \text{H} > \text{Fe}^{3+}$.
 Reducing nature decreasing order.
75. (a) More is reduction potential, more is the power to get itself reduced or lesser is reducing power or greater is oxidising power.
76. (d) $\Delta G = -nFE^0$
 $\Delta G = -2.303RT \log K$; $nFE^0 = 2.303RT \log K$
 $\log K = \frac{nFE^0}{2.303RT} = \frac{2 \times 96500 \times 0.295}{2.303 \times 8.314 \times 298}$
 $\log K = 9.97 = K = 1 \times 10^{10}$.
77. (b) For the given cell $M | M^+ || X^- | X$, the cell reaction is derived as follows:
 RHS: reduction $X + e^- \rightarrow X^-$ (i)
 LHS: Oxidation $M \rightarrow M^+ + e^-$ (ii)
 Add (i) and (ii) $M + X \rightarrow M^+ + X^-$
 The cell potential = -0.11 V
 Since $E_{\text{cell}} = -$ ve, the cell reaction derived above is not spontaneous. In fact, the reverse reaction will occur spontaneously.
78. (c) $\text{Zn} + \text{MgCl}_2 \rightarrow \text{ZnCl}_2 + \text{Mg}$ No reaction
- $\xrightarrow{\text{Oxidation}}$
 $\xleftarrow{\text{Reduction}}$
- This type of reaction does not occur because
 $\text{Mg}^{2+} E^0 = -2.37 \text{ V}$ while $\text{Zn}^{2+} E^0 = -0.76 \text{ V}$.
79. (b) In neutral medium Mn^{+7} oxidation state change into +4 oxidation state, hence equivalent weight of $\text{KMnO}_4 = \frac{M}{3}$.
80. (a) Increase in the concentration of Ag^+ ion increase the voltage of the cell.
81. (a) $E_{\text{cell}} = E_{\text{cell}}^0 + \frac{0.059}{2} \log \frac{(\text{Ag}^+)}{(\text{Sn}^{2+})}$.
82. (b) The K.E. of proton is 1 KeV.
83. (b) Anodic reaction : $\text{H}_2(\text{P}_1) \rightarrow 2\text{H}^+$
 Cathodic reaction : $2\text{H}^+ \rightarrow \text{H}_2(\text{P}_2)$
 $E_{\text{cathode}} = -\frac{RT}{2F} \ln \frac{P_2}{[\text{H}^+]^2}$; $E_{\text{anode}} = -\frac{RT}{2F} \ln \frac{[\text{H}^+]^2}{P_1}$
 $E_{\text{inf}} = E_{\text{anode}} + E_{\text{cathode}}$
 $= -\frac{RT}{2F} \ln \frac{(\text{H}^+)^2}{P_1} - \frac{RT}{2F} \ln \frac{P_2}{(\text{H}^+)^2}$
 $= -\frac{RT}{2F} \ln \frac{P_2}{P_1} = \frac{RT}{2F} \ln \frac{P_1}{P_2}$.
84. (c) $\frac{1}{2} \text{H}_2 \rightarrow \text{H}^+(10^{-8} \text{ M}) + e^-$ (oxidation)
 $\text{H}^+(0.025 \text{ M}) + e^- \rightarrow \frac{1}{2} \text{H}_2$ (reduction)
 Cell reaction is :
- $\text{H}^+(0.025 \text{ M}) \rightarrow \text{H}^+(10^{-8} \text{ M})$; $E_{\text{cell}} = 0.38 \text{ V}$.
85. (a) E^0 for $\text{Fe} / \text{Fe}^{2+} = 0.44 \text{ V}$.
86. (c) (Reduction potential of cathode) – (reduction potential of anode).
87. (a) The correct decreasing electrode potential order is : $\text{K}, \text{Ba}, \text{Ca}, \text{Mg}$.
89. (c) $E_{\text{cell}}^0 = E_{\text{cathode}}^0 - E_{\text{anode}}^0$
 $= 0.34 - (-2.37) = +2.71 \text{ V}$.
90. (b) Because fluorine is most powerful reducing agent than other halogens.
92. (c) Aluminium forms a protective oxide layer but iron does not.
93. (d) The reduction potential of Zn is very higher than Cu .
94. (a) The pH of 0.1 M HCl and 0.1 M acetic acid is not the same, because HCl is a strong acid so its pH is less and CH_3COOH is a weak acid, so its pH is more.
95. (d) The required reaction ($\text{Cu}^{++} + \text{Cu} \rightarrow 2\text{Cu}^+$) can be obtained by using the following reactions.
 $\text{Cu}^{++} + e^- \rightarrow \text{Cu}^+$; $E_{\text{Cu}^{++}/\text{Cu}^+}^0 = 0.15 \text{ V}$ (i)
 $\text{Cu}^{++} + 2e^- \rightarrow \text{Cu}$; $E_{\text{Cu}^{++}/\text{Cu}}^0 = 0.34 \text{ V}$ (ii)
 Multiplying eq. (i) by 2 we get
 $2\text{Cu}^{++} + 2e^- \rightarrow 2\text{Cu}^+$ (iii)
 $\Delta G_1 = -nFE = -2 \times F \times 0.15$
 $\text{Cu}^{++} + 2e^- \rightarrow \text{Cu}$ (iv)
 $\Delta G_2 = -nFE = -2 \times F \times 0.34$
 Subtract the eq. (iv) from (iii)
 $\text{Cu}^{++} + \text{Cu} \rightarrow 2\text{Cu}^+$
 $\Delta G_3 = -nFE = -1 \times F \times E^0$
 Also $\Delta G_3 = \Delta G_1 - \Delta G_2$
 $-1FE^0 = (-2F \times 0.15) - (-2F \times 0.34)$
 $E^0 = -0.38$
 This is the value for the reaction
 $\text{Cu}^{++} + \text{Cu} \rightarrow 2\text{Cu}^+$
 But the given reaction is just reverse of it
 $\therefore E_{\text{cell}}$ for given reaction = + 0.38 V.
97. (d) It connect two solutions and complete the circuit.
98. (a) Greater the oxidation potential, greater is the reactivity.
99. (b) Electrochemical series compare the relative reactivity of metals.
100. (d) Fuel cells are more efficient, free from pollution and they run till reactants are active.
102. (c) $E^0 = E_{\text{Ag}^{2+}/\text{Ag}}^0 + E_{\text{Cu}/\text{Cu}^{2+}}^0 = -0.34 + 0.80 = +0.46 \text{ V}$.
103. (a) Fe is placed above Cu in electrochemical series.
104. (a) Lithium is the strongest reducing agent of the alkali metals.
105. (d) Potassium is more electropositive element, because it is the only alkali metal among the given elements.
106. (b) Aluminium forms a self protecting film of oxide to prevent corrosion.
107. (a) $\text{Zn}_{(\text{s})} + 2\text{H}^+_{(\text{aq})} \rightleftharpoons \text{Zn}^{2+}_{(\text{aq})} + \text{H}_{2(\text{g})}$
 $E_{\text{Cell}} = E_{\text{Cell}}^0 - \frac{0.059}{2} \log \frac{[\text{Zn}^{2+}]}{[\text{H}^+]^2}$
 When H_2SO_4 is added then $[\text{H}^+]$ will increase therefore E_{Cell} will also increase and equilibrium will shift towards right.
108. (b) For $\text{M}^+ + \text{X}^- \rightarrow \text{M} + \text{X}$
 $E_{\text{Cell}}^0 = E_{\text{Cathode}}^0 + E_{\text{Anode}}^0 = 0.44 - 0.33 = +0.11 \text{ V}$

Since $E_{\text{Cell}}^0 = (+) 0.11 \text{ V}$ is positive hence this reaction should be spontaneous.

109. (a) $E_{\text{Cell}} = E_{\text{Cell}}^0 - \frac{0.0591}{n} \log K_c$

At 298 K $E_{\text{Cell}} = 0$ $0 = 0.591 - \frac{0.0591}{n} \log K_c$

$\log K_c = \frac{0.591 \times 1}{0.0591} = 10$; $K_c = \text{Antilog} 10 = 1 \times 10^{10}$.

110. (a) $\frac{1}{2} \text{H}_2 | \text{H}^+ || \text{Ag}^+ | \text{Ag}$

$E_{\text{Cell}}^0 = E_{\text{Cathode}}^0 - E_{\text{Anode}}^0 = E_{\text{Ag}^+/\text{Ag}}^0 - E_{\text{H}^+/\frac{1}{2}\text{H}_2}^0$

$(0.80) - (0.0) = 0.80 \text{ V}$.

111. (a) $E_A = 2.23 \text{ V} > E_B = 1.43 \text{ V}$

So A will act as cathode in galvanic cell. Hence

$E_{\text{Cell}}^0 = E_{\text{Cathode}} - E_{\text{Anode}} = E_A - E_B$

$= (2.23) - (-1.43) = 3.66 \text{ V}$.

112. (b) $E_{\text{Cu}}^0 > E_{\text{Mg}}^0$ hence Cu acts as cathode and Mg acts as anode.

$E_{\text{Cell}}^0 = E_{\text{Cu}}^0 - E_{\text{Mg}}^0 = (0.34) - (-2.37) = +2.71 \text{ V}$.

113. (b) In this cell Co is oxidised and it acts as anode and Ce acts as cathode.

$E_{\text{Cell}}^0 = E_{\text{Cathode}}^0 - E_{\text{Anode}}^0 = 1.89 = E_{\text{Ce}}^0 - (-0.28)$

$E_{\text{Cell}}^0 = 1.89 - 0.28 = 1.61 \text{ Volts}$.

114. (b) Given: $\Delta G = -21.20 \text{ kJ} = 21200 \text{ J}$

$\therefore \Delta G = -nFE$

$E = \frac{21200}{1 \times 96500} = 0.2196 \text{ V} = 0.22 \text{ V}$.

115. (b) $\text{Ag} | \text{Ag}^+(1\text{M}) || \text{Ag}^+(1\text{M}) | \text{Ag}$

$E_{\text{Cell}} = \frac{2.303RT}{nF} \log \frac{c_1}{c_2} = \frac{0.059}{1} \log \frac{1}{0.1}$

$= 0.059 \log 10 = 0.059 \text{ Volt}$.

116. (b) For this cell, reaction is: $\text{Zn} + \text{Fe}^{2+} \rightarrow \text{Zn}^{2+} + \text{Fe}$

$E = E^0 - \frac{0.0591}{n} \log \frac{c_1}{c_2}$; $E^0 = E + \frac{0.0591}{n} \log \frac{c_1}{c_2}$

$= 0.2905 + \frac{0.0591}{2} \log \frac{10^{-2}}{10^{-3}} = 0.32 \text{ V}$.

$E^0 = \frac{0.0591}{2} \log K_c$; $\log K_c = \frac{0.32 \times 2}{0.0591} = \frac{0.32}{0.0295}$

$\therefore K_c = \frac{0.32}{10^{0.295}}$.

117. (d) Al displaces H from HCl but silver cannot it means Al is situated above the Ag in ECS, hence Al will act as anode and Ag will act as cathode.

$E_{\text{Cell}}^0 = E_{\text{Cathode}}^0 - E_{\text{Anode}}^0 = E_{\text{Ag}^+/\text{Ag}}^0 - E_{\text{Al}^{3+}/\text{Al}}^0$

$2.46 = 0.8 - E_{\text{Al}^{3+}/\text{Al}}^0$; $E_{\text{Al}^{3+}/\text{Al}}^0 = 0.8 - 2.46 = -1.66 \text{ V}$.

118. (a) For $\text{Sn}_{(\text{s})} + 2\text{Fe}_{(\text{aq})}^{3+} \rightarrow 2\text{Fe}_{(\text{aq})}^{2+} + \text{Sn}_{(\text{aq})}^{2+}$

$E_{\text{Cell}}^0 = E_{\text{Sn}/\text{Sn}^{2+}}^0 + E_{\text{Fe}^{3+}/\text{Fe}^{2+}}^0 = (0.14) + (0.77)$

$E_{\text{Cell}} = 0.91 \text{ Volts}$.

119. (d) I^- get oxidised to I_2 hence will form anode and $\text{Cr}_2\text{O}_7^{2-}$ get reduced to Cr^{3+} hence will form cathode.

$E_{\text{Cell}}^0 = E_{\text{Cathode}}^0 - E_{\text{Anode}}^0$; $E_{\text{Cell}}^0 = E_{\text{Cr}_2\text{O}_7^{2-}}^0 - E_{\text{I}_2}^0$

$0.79 = 1.33 - E_{\text{I}_2}^0$; $E_{\text{I}_2}^0 = 1.33 - 0.79$; $E_{\text{I}_2}^0 = 0.54 \text{ V}$.

120. (b) According to nernst's equation

$E_{\text{Cell}} = E_{\text{Cell}}^0 - \frac{nRT}{F} \log \frac{c_1}{c_2}$

$c_1 = [\text{Zn}^{2+}]$ and $c_2 = [\text{Cl}^-]$

Hence to increase E , c_1 should be decreased and c_2 should be increased is $[\text{Zn}^{2+}]$ should be decreased and Cl^- should be increased.

121. (c)

Reduction $E_0 M^{3+} / M^{2+}$	Cell reaction		$E_0 M^{2+} / M^{3+}$ (Oxidation)
-0.41 V	Cr^{2+}	Cr^{3+}	+0.41 V
+1.57 V	Mn^{2+}	Mn^{3+}	-1.57 V
+0.77 V	Fe^{2+}	Fe^{3+}	-0.77 V
+1.97 V	Co^{2+}	Co^{3+}	-1.97 V

As Cr has maximum oxidation potential value, therefore its oxidation should be easiest.

122. (a) $\text{Fe}(\text{s}) \longrightarrow \text{Fe} + 2\text{e}^-$; ΔG_1^0

Applying, $\Delta G_1^0 + \Delta G_2^0 = \Delta G_3^0$

$\Delta G_3^0 = (-2F \times 0.44) + (-2F \times 1.23)$

$\Delta G_3^0 = -(2 \times 96500 \times 0.44 + 2 \times 96500 \times 1.23)$

$\Delta G_3^0 = -322310 \text{ J}$

$\therefore \Delta G_3^0 = -322 \text{ kJ}$

128. (a) $\Delta G^0 = -2.303RT \log K_{\text{eq}}$ or $\Delta G^0 = -nFE_{\text{cell}}^0$

129. (a) Any redox reaction would occur spontaneously if the free energy change (ΔG) is negative.

$\Delta G^0 = nFE^0$

Where n is the number of electrons involved, F is the value of Faraday and E^0 is the cell emf. ΔG^0 can be negative if E^0 is positive.

Corrosion

2. (d) Rusting of iron is catalysed by $[\text{H}^+]$.

3. (d) HgCl_2 has corrosive action. It is highly poisonous. It sublimes on heating. It is, therefore, known as corrosive sublimate.

4. (a) $\text{Fe} \rightarrow \text{Fe}^{2+} + 2\text{e}^-$ (anode reaction)

The overall reaction is

$Fe(OH)_2$ may be dehydrated to iron oxide FeO , or further oxidised to $Fe(OH)_3$ and then dehydrated to iron rust, Fe_2O_3 .

Critical Thinking Questions

- (c) $(126 \text{ scm}^2) \wedge_{NaCl}^0 = \wedge_{Na^+}^0 + \wedge_{Cl^-}^0$ (1)

$(152 \text{ scm}^2) \wedge_{KBr}^0 = \wedge_{K^+}^0 + \wedge_{Br^-}^0$ (2)

$(150 \text{ scm}^2) \wedge_{KCl}^0 = \wedge_{K^+}^0 + \wedge_{Cl^-}^0$ (3)

By equation (1)+(2) - (3)

$\therefore \wedge_{NaBr}^0 = \wedge_{Na^+}^0 + \wedge_{Br^-}^0$

$= 126 + 152 - 150 = 128 \text{ Scm}^2 \text{ mol}^{-1}$
- (a) At cathode : $2H^+_{(aq)} + 2e^- \rightarrow 2H$

$$2H + \frac{1}{2}O_2 \rightarrow H_2O$$

$$2H^+ + \frac{1}{2}O_2 + 2e^- \rightarrow H_2O$$
- (c) H_2 undergoes oxidation and $AgCl(Ag^+)$ undergoes reduction.
- (b) In this reaction $Fe^{2+} + Zn \rightarrow Zn + Fe$

$$\begin{array}{c} \text{Oxidation} \\ \begin{array}{c} 0 \quad 2+ \quad 0 \\ \text{Fe} \quad \text{Zn} \end{array} \\ \text{Reduction} \end{array}$$

$EMF = E_{\text{cathode}} - E_{\text{anode}} = -0.41 - (-0.76)$

$EMF = +0.35 \text{ V}$
- (c) $NO_3^- + 4H^+ + 4e^- \rightarrow 2H_2O + NO$. In this equation all the atoms are balanced. For balancing added $3e^-$ to L.H.S. we have, $NO_3^- + 4H^+ + 3e^- \rightarrow 2H_2O + NO$.
- (a) $E_{\text{cell}} = E_{\text{cell}}^0 - \frac{0.059}{2} \log \frac{(Zn^{++})}{(Cu^{++})}$

$= 1.10 - \frac{0.059}{2} \log \frac{0.1}{0.1} = 1.10 \text{ V}$
- (a) The tendency to gain electron is in the order $Z > Y > X$

Thus $Y + e \rightarrow Y^-$; $X \rightarrow X^+ + e$.
- (b) $E_{OP} = E_{OP}^0 - \frac{0.059}{1} \log \frac{[H^+]}{P_{H_2}}$

$\therefore [H^+] = 10^{-10}$; $P_{H_2} = 1 \text{ atm}$; $E_{OP} = 0.59 \text{ V}$.
- (a,c,d) Decomposition of H_2O_2 is an example of exothermic reaction, negative catalysis and auto-oxidation.
- (a) 27 gm of Al is obtained by passing a current of $3 \times 96500 \text{ C}$.

$\therefore 1 \text{ gm}$ of Al is obtained by passing a current of $3 \times \frac{96500}{27} \text{ C}$.

$\therefore 5.12 \times 10^4 \text{ gm}$ of Al is obtained by passing a current of $3 \times \frac{96500}{27} \times 5.12 \times 1000$

$= 1.83 \times 10^6 \text{ C} \times 3 = 5.49 \times 10^6 \text{ C}$.
- (c) $\Lambda_{HOAC}^\infty = \Lambda_{NaOAC}^\infty + \Lambda_{HCl}^\infty - \Lambda_{NaCl}^\infty$

$= 91.0 + 426.2 - 126.5 = 390.7$

- (d) $\frac{\omega_1}{E_1} = \frac{\omega_2}{E_2}$; $\frac{\omega_1}{3} = \frac{270}{93}$; $\omega_1 = 90 \text{ kg}$.
- (c) $Eq \text{ of } Al = eq \text{ of } H_2$

$\frac{4.5}{27} = eq \text{ of } H_2$; $\frac{4.5}{9} = eq \text{ of } H_2$

$\frac{4.5}{3}$

$2H^+ + 2e^- \rightarrow H_2$

$eq. \text{ of } H_2 = \text{Number of moles} \times n \text{ factor } 0.5 = n_{H_2} \times 2$

$V_{H_2} = \frac{0.5}{2} \times 22.4$; $V_{H_2} = 5.6 \text{ L}$
- (c) The reaction taking place at anode is

$2Cl \rightarrow Cl_2 + 2e^-$

$1 \text{ mole} \quad 2 \times 96500 \text{ coulomb}$

$Q = i \cdot t = 1 \times 30 \times 60 = 1800 \text{ coulomb}$.

The amount of chlorine liberated by passing 1800 coulomb of electric charge $= \frac{1 \times 1800 \times 71}{2 \times 96500} = 0.66 \text{ g}$.

Assertion & Reason

- (a) The nature of the cathode can affect the order of discharge of ions.
- (b) 1 mole of silver = 1g equivalent of silver
1 mole of copper = 2g equivalent of copper
We know from Faraday's law of electrolysis that "The weight of ion deposited on an electrode is directly proportional to the quantity of electricity passed".
- (d) Copper is present below hydrogen therefore hydrogen from HCl cannot be liberated by treating with copper. Hence assertion is false while reason is true.
- (d) Copper cannot liberate hydrogen from a dil. HCl solutions because it is situated below hydrogen in the reactivity series. Here both assertion and reason are false.
- (d) The formation of Zn is not possible by placing Cu plate in $ZnSO_4$ solution because Zn is placed above Cu in electrochemical series. Therefore, both assertion and reason are false.
- (e) Electrical conductivity of copper decreases with increase in temperature because the metallic conductivity is due to the motion of electrons. On increasing temperature the motion of electron increases which hinder in conductance of current. Hence, here assertion is false but the reason is true.
- (a) Dry air is heavier than wet air because the density of dry air is more than water.
- (e) Copper is present below hydrogen therefore hydrogen from HCl cannot be liberated by treating with copper. Hence, assertion is false while reason is true.
- (a) K and Cs emit electrons on exposure to light hence, both are used in photoelectric cells. Here, assertion and reason are true and reason is a correct explanation.
- (b) We know, $R \propto \frac{l}{A}$ or $R = \rho \left(\frac{l}{A} \right)$, where proportionality constant ρ is called resistivity. If $l = 1m$ and $A = 1m^2$, then $R = \rho$ i.e. Resistance = Resistivity.
- (a) According to Kohlrausch law, "Limiting molar conductivity of an electrolyte can be represented as the sum of the individual contributions of the anion and cation of the electrolyte".
- (c) One Faraday deposit one gram equivalent of the substance.
- (b) Gold has higher reduction potential than the given metals. Hence $AuCl_3$ will react with these metals.

As the time passes, the concentration of Zn^{2+} keeps on increasing while the concentration of Cu^{2+} keeps on decreasing. At the same time voltage of the cell keeps on decreasing. When there is no change in concentration of Cu^{2+} and Zn^{2+} ions, voltmeter gives zero reading and this state is known as equilibrium.

18. (e) A negative value of standard reduction potential means that oxidation takes place on this electrode with reference to SHE.

19. (a) A standard cell is one whose *e.m.f.* almost does not change with temperature.

22. (d) Identification of cathode and anode is done by the use of ammeter/voltmeter. Higher is the value of reduction potentials greater would be its oxidising power.

23. (b) If redox reaction is spontaneous, ΔG is $-ve$ and hence E^0 is positive. $-\Delta G^0 = nFE^0_{\text{cell}}$

24. (a) Zinc metal which has a more negative electrode potential than iron will provide electrons in preference of the iron, and therefore corrode first. Only when all the zinc has been oxidised does the iron start to rust.

25. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

Anode (oxidation) for eq. $Zn \longrightarrow Zn^{2+} + 2e^-$, so

Excess of electrons and hence negatively charged while cathode is positively charged.

26. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

$$E^0_{Au^{3+}/Au} - E^0_{Ni/Ni^{2+}} = 1.50 - (-0.25) = 1.75 \text{ V}$$

27. (c) Assertion is true but reason is false. Ions of inert electrolytes are not involved in any electrochemical change until they react chemically with the electrolytes in the two half-cells.

28. (d) Both assertion and reason are false. Potential difference is the difference between the electrode potential of the two electrodes of the cell when cell is under operation while emf is the potential difference generated by a cell when there is zero electron flow.

Electrochemistry

SET Self Evaluation Test -12

1. The mass of copper deposited from a solution of CuSO_4 by passage of 5 A current for 965 second is (Mol. wt. of Copper = 63.5) [AIIMS 2001]
- (a) 15.875 g (b) 1.5875 g
(c) 4825 g (d) 96500 g
2. The current in a given wire is 1.8 A. The number of coulombs that flow in 1.36 minutes will be [AIIMS 2001]
- (a) 100 C (b) 147 C
(c) 247 C (d) 347 C
3. A solution of a salt of a metal was electrolysed for 150 minutes with a current of 0.15 amperes. The weight of metal deposited was 0.783 gm. The equivalent weight of the metal is [AFMC 2001]
- (a) 55.97 gm (b) 65.97 gm
(c) 75.97 gm (d) 85.97 gm
4. The resistance of 0.01N NaCl solution at 25°C is 200 Ω . Cell constant of conductivity cell is 1 cm. The equivalent conductance is
- (a) $5 \times 10^2 \Omega^{-1} \text{cm}^2 \text{eq}^{-1}$ (b) $6 \times 10^3 \Omega^{-1} \text{cm}^2 \text{eq}^{-1}$
(c) $7 \times 10^4 \Omega^{-1} \text{cm}^2 \text{eq}^{-1}$ (d) $8 \times 10^5 \Omega^{-1} \text{cm}^2 \text{eq}^{-1}$
5. Which of the following reaction is possible at anode [AIEEE 2002]
- (a) $2\text{Cr}^{3+} + 7\text{H}_2\text{O} \rightarrow \text{Cr}_2\text{O}_7^{2-} + 14\text{H}^+$
(b) $\text{F}_2 \rightarrow 2\text{F}^-$
(c) $\frac{1}{2}\text{O}_2 + 2\text{H}^+ \rightarrow \text{H}_2\text{O}$
(d) None of these
6. What is the standard cell potential for the cell
 $\text{Zn} / \text{Zn}^{2+} (1\text{M}) \parallel \text{Cu}^{2+} (1\text{M}) / \text{Cu}$
 E° for $\text{Zn} / \text{Zn}^{2+} (1\text{M}) = -0.76 \text{ V}$ & $\text{Cu}^{2+} / \text{Cu} = +0.34 \text{ V}$ [AIIMS 1980]
- (a) $-0.76 + (-0.34) = -0.42 \text{ V}$
(b) $-0.34 + 0.76 = +0.42 \text{ V}$
(c) $0.34 - (-0.76) = 1.10 \text{ V}$
(d) $-0.76 - (+0.34) = -1.10 \text{ V}$
7. Normal aluminium electrode coupled with normal hydrogen electrode gives an emf of 1.66 volts. So the standard electrode potential of aluminium is [KCET 1987]
- (a) -1.66 V (b) $+1.66 \text{ V}$
(c) -0.83 V (d) $+0.83 \text{ V}$
8. Which one among the following is the strongest reducing agent
- $\text{Fe}^{2+} + 2\text{e}^- \rightarrow \text{Fe} (-0.44 \text{ V})$
 $\text{Ni}^{2+} + 2\text{e}^- \rightarrow \text{Ni} (-0.25 \text{ V})$
 $\text{Sn}^{2+} + 2\text{e}^- \rightarrow \text{Sn} (-0.14 \text{ V})$
 $\text{Fe}^{3+} + \text{e}^- \rightarrow \text{Fe}^{2+} (-0.77 \text{ V})$ [BHU 1998]
- (a) Fe (b) Fe^{2+}
(c) Ni (d) Sn
9. The [CBSE PMT 1999] cell reaction of the galvanic cell
 $\text{Cu}_{(\text{s})} \mid \text{Cu}^{2+}_{(\text{aq})} \parallel \text{Hg}^{2+}_{(\text{aq})} \mid \text{Hg}_{(\text{l})}$ is [EAMCET 2003]
- (a) $\text{Hg} + \text{Cu}^{2+} \rightarrow \text{Hg}^{2+} + \text{Cu}$
(b) $\text{Hg} + \text{Cu}^{2+} \rightarrow \text{Cu}^+ + \text{Hg}^+$
(c) $\text{Cu} + \text{Hg} \rightarrow \text{CuHg}$
(d) $\text{Cu} + \text{Hg}^{2+} \rightarrow \text{Cu}^{2+} + \text{Hg}$
10. The specific conductivity of N/10 KCl solution at 20°C is $0.0212 \text{ ohm}^{-1} \text{cm}^{-1}$ and the resistance of cell containing this solution at 20°C is 55 ohm. The cell constant is [AIIMS 1999]
- (a) 1.166 cm^{-1}
(b) 2.173 cm^{-1}
(c) 3.324 cm^{-1}
(d) 4.616 cm^{-1}
11. The oxide which is not reduced by hydrogen is [JIPMER 1999]
- (a) Ag_2O (b) K_2O
(c) Fe_2O_3 (d) P_4O_{10}

1. (b) Current (I) = 5A and time (t) = 965 sec.
We know that equivalent weight of copper

$$= \frac{\text{Molecular weight}}{\text{Valency}} = \frac{63.5}{2}$$
 and quantity of electricity passed in coulomb = current $\times$ time = $5 \times 965 = 4825 C$. Since 96500 coulombs will deposit $\frac{63.5}{2} g$ of copper therefore 4825 coulombs will deposit

$$= \frac{63.5 \times 4825}{96500 \times 2} = 1.5875 g.$$
2. (b) $Q = I \times t$; $1.8 \times 1.36 \times 60 = 147 C$.
3. (a) Time (t) = 150 min = 9000 sec
Current (I) = 0.15 A
Weight of metal (w) = 0.783 g.
We know $Q = I \times t = 0.15 \times 9000 = 1350 C$. Since 1350 C of electricity will deposited 0.783 g of metal, so, 96500 C of electricity will deposited $\frac{0.783 \times 96500}{1350} = 55.97 g$.
4. (a) $\lambda = k \times V = \frac{1}{R} \times \frac{l}{a} \times V = \frac{1}{200} \times 1 \times 10,000$

$$= 5 \times 10^2 \Omega^{-1} cm^2 eq.^{-1}$$
5. (a) Oxidation always occurs at anode.
6. (c) $E^o = E_{\text{cathode}} - E_{\text{anode}}$

$$E^o = 0.34 - (-0.76); E^o = 1.10 \text{ volt}.$$
7. (a) $E_{\text{cell}}^o = 1.66 = E_{H^+/H_2}^o - E_{Al^{3+}/Al}^o$

$$= 0 - E_{Al^{3+}/Al}^o \text{ or } E_{Al^{3+}/Al}^o = -1.66 V.$$
8. (a) The reduction potential of Fe is very high, so it is a strongest reducing agent.
9. (b) $Cu_{(s)} | Cu_{(Ag)}^{2+} || Hg_{(Ag)}^{2+} | Hg_{(l)}$
 anode oxidation cathode reduction
- $$\begin{array}{c}
 \text{Reduction} \\
 \text{Cu} + Hg^{2+} \rightarrow Cu^{2+} + Hg \\
 \text{Oxidation}
 \end{array}$$
10. (a) $K = \frac{1}{R} \times \text{cell constant}$

$$= K \times R = 0.0212 \times 55 = 1.166 \text{ cm}^{-1}.$$
11. (b) On the basis of electrochemical series K_2O is not reduced by hydrogen.

Chapter 13 Redox Reactions

Chemical reactions involve transfer of electrons from one chemical substance to another. These electron – transfer reactions are termed as oxidation-reduction or redox-reactions.

Molecular and Ionic equations

(1) **Molecular equations** : When the reactants and products involved in a chemical change are written in molecular forms in the chemical equation, it is termed as molecular equation.

In above example the reactants and products have been written in molecular forms, thus the equation is termed as **molecular equation**.

(2) **Ionic equations** : When the reactants and products involved in a chemical change are ionic compounds, these will be present in the form of ions in the solution. The chemical change is written in ionic forms in chemical equation, it is termed as ionic equation. *Example*,

In above example the reactants and products have been written in ionic forms, thus the equation is termed as **ionic equation**.

(3) **Spectator ions** : In ionic equations, the ions which do not undergo any change and equal in number in both reactants and products are termed as spectator ions and are not included in the final balanced equations. *Example*,

In above example, the Cl^- ions are the **spectator ions** and hence are not included in the final ionic balanced equation.

Oxidation-reduction and Redox reactions

(1) **Oxidation** : Oxidation is a process which involves; addition of oxygen, removal of hydrogen, addition of non-metal, removal of metal, Increase in +ve valency, loss of electrons and increase in oxidation number.

(vi) **Loss of electrons** (also known as de-electronation)

(vii) **Increase in oxidation number**

(2) **Reduction** : Reduction is just reverse of oxidation. Reduction is a process which involves; removal of oxygen, addition of hydrogen, removal of non-metal, addition of metal, decrease in +ve valency, gain of electrons and decrease in oxidation number.

(iii) **Removal of non-metal**

(v) **Decrease in +ve valency**(vi) **Gain of electrons** (also known as electronation)(vii) **Decrease in oxidation number**(3) **Redox-reactions**

(i) An overall reaction in which oxidation and reduction takes place simultaneously is called **redox** or **oxidation-reduction reaction**. These reactions involve transfer of electrons from one atom to another. Thus every redox reaction is made up of two **half reactions**. One half reaction represents the oxidation and the other half reaction represents the reduction.

(ii) **Types of redox reaction**

(a) **Direct redox reaction** : The reactions in which oxidation and reduction takes place in the same vessel are called direct redox reactions.

(b) **Indirect redox reaction** : The reactions in which oxidation and reduction takes place in different vessels are called indirect redox reactions. Indirect redox reactions are the basis of electro-chemical cells.

(c) **Intermolecular redox reactions** : In which one substance is oxidised while the other is reduced.

Here, Al is oxidised to Al_2O_3 while Fe_2O_3 is reduced to Fe .

(d) **Intramolecular redox reactions** : In which one element of a compound is oxidised while the other is reduced.

Here, Cl^{+5} in $KClO_3$ is reduced to Cl^{-1} in KCl while O^{2-} in $KClO_3$ is oxidised to O_2^0 .

Oxidising and Reducing agents

(i) **Definition** : The substance (atom, ion or molecule) that gains electrons and is thereby reduced to a low valency state is called an **oxidising agent**, while the substance that loses electrons and is thereby oxidised to a higher valency state is called a **reducing agent**.

Or

An **oxidising agent** is a substance, the oxidation number of whose atom or atoms decreases while a **reducing agent** is a substance the oxidation number of whose atom increases.

(2) **Important oxidising agents**

(i) Molecules made up of electronegative elements.

Example : O_2 , O_3 and X_2 (halogens).

(ii) Compounds containing an element which is in the highest oxidation state.

Example : $KMnO_4$, $K_2Cr_2O_7$, $Na_2Cr_2O_7$, CrO_3 , H_2SO_4 , HNO_3 , $NaNO_3$, $FeCl_3$, $HgCl_2$, $KClO_4$, SO_3 , CO_2 , H_2O_2 etc.(iii) Oxides of elements, MgO , CuO , CrO_3 , CO_2 , P_4O_{10} , etc.

(iv) Fluorine is the strongest oxidising agent.

(3) **Important reducing agents**(i) All metals e.g. Na , Zn , Fe , Al , etc.(ii) A few non-metals e.g. C , H , S etc.(iii) Hydrides : HCl , HBr , HI , H_2S etc.

(iv) A few compounds containing an element in the lower oxidation state (ous).

Example : $FeCl_2$, $FeSO_4$, $SnCl_2$, Hg_2Cl_2 , Cu_2O etc.(v) Metallic hydrides e.g. NaH , LiH etc.

(vi) Organic compounds like $HCOOH$ and $(COOH)_2$ and their salts, aldehydes, alkanes etc.

(vii) Lithium is the strongest reducing agent in solution.

(viii) Cesium is the strongest reducing agent in absence of water.

Other reducing agents are $Na_2S_2O_3$ and KI .

(ix) Hypo prefix indicates that central atom of compound has the minimum oxidation state so it will act as a reducing agent.

Example : H_3PO_2 (hypophosphorous acid).(4) **Substances which act as oxidising as well as reducing agents**Examples : H_2O , SO_2 , H_2SO_3 , HNO , $NaNO$, $NaSO_3$, O_2 etc.(5) **Tips for the identification of oxidising and reducing agents**

(i) If an element is in its highest possible oxidation state in a compound, the compound can function as an oxidising agent.

Example : $KMnO_4$, $K_2Cr_2O_7$, HNO_3 , H_2SO_4 , $HClO_4$ etc.

(ii) If an element is in its lowest possible oxidation state in a compound, the compound can function only as a reducing agent.

Example : H_2S , $H_2C_2O_4$, $FeSO_4$, $Na_2S_2O_3$, $SnCl_2$ etc.

(iii) If an element is in its intermediate oxidation state in a compound, the compound can function both as an oxidising agent as well as reducing agent.

Example : H_2O_2 , H_2SO_3 , HNO_2 , SO_2 etc.

(iv) If a highly electronegative element is in its highest oxidation state in a compound, that compound can function as a powerful oxidising agent.

Example : $KClO_4$, $KClO_3$, $KBrO_3$, KIO_3 etc.

(v) If an electronegative element is in its lowest possible oxidation state in a compound or in free state, it can function as a powerful reducing agent.

Example : I^- , Br^- , N^{3-} etc.(6) **Equivalent weight of oxidising and reducing agents**

Equivalent weight of a substance (oxidant or reductant) is equal to molecular weight divided by number of electrons lost or gained by one molecule of the substance in a redox reaction.

$$\text{Eq. wt. of O. A.} = \frac{\text{Molecular weight}}{\text{No. of electrons gained by one molecule}}$$

$$= \frac{\text{Molecular weight}}{\text{Change in O. N. per mole}}$$

$$\text{Eq. wt. of R. A.} = \frac{\text{Molecular weight}}{\text{No. of electrons lost by one molecule}} = \frac{\text{Molecular weight}}{\text{Change in O. N. per mole}}$$

Table : 13.1 Equivalent weight of few oxidising/reducing agents

Agents	O. N.	Product	O. N.	Change in O. N. per atom	Total Change in O. N. per mole	Eq. wt.
$\text{Cr}_2\text{O}_7^{2-}$	+ 6	Cr^{3+}	+ 3	3	$3 \times 2 = 6$	Mol. wt./6
$\text{C}_2\text{O}_4^{2-}$	+ 3	CO_2	+ 4	1	$1 \times 2 = 2$	Mol. wt./2
$\text{S}_2\text{O}_3^{2-}$	+ 2	$\text{S}_4\text{O}_6^{2-}$	+ 2.5	0.5	$0.5 \times 2 = 1$	Mol. wt./1
H_2O_2	- 1	H_2O	- 2	1	$1 \times 2 = 2$	Mol. wt./2
H_2O_2	- 1	O_2	0	1	$1 \times 2 = 2$	Mol. wt./2
MnO_4^- (Acidic medium)	+ 7	Mn^{2+}	+ 2	5	$5 \times 1 = 5$	Mol. wt./5
MnO_4^- (Neutral medium)	+ 7	MnO_2	+ 4	3	$3 \times 1 = 3$	Mol. wt./3
MnO_4^- (Alkaline medium)	+ 7	MnO_4^{2-}	+ 6	1	$1 \times 1 = 1$	Mol. wt./1

Oxidation number or Oxidation state

(1) **Definition** : Charge on an atom produced by donating or accepting electrons is called **oxidation number** or **oxidation state**. It is the number of effective charges on an atom.

(2) **Valency and oxidation number** : Valency and oxidation number concepts are different. In some cases (mainly in the case of electrovalent compounds), valency and oxidation number are the same but in other cases they may have different values. Points of difference between the two have been tabulated below

Oxidation number	Valency
O.N. is the charge (real or imaginary) present on the atom of the element when it is in combination. It may have plus or minus sign.	It is the combining capacity of the element. No plus or minus sign is attached to it.
O.N. of an element may have different values. It depends on the nature of compound in which it is present.	Valency of an element is usually fixed.
O.N. of the element may be a whole number or fractional.	Valency is always a whole number.
O.N. of the element may be zero.	Valency of the element is never zero except of noble gases.

(3) Oxidation number and Nomenclature

(i) When an element forms two monoatomic cations (representing different oxidation states), the two ions are distinguished by using the ending-ous and ic. The suffix -ous is used for the cation with lower oxidation state and the suffix -ic is used for the cation with higher oxidation state.

For example : Cu (oxidation number +1) cuprous

Cu (oxidation number +2) cupric

(ii) **Albert Stock** proposed a new system known as **Stock system**. In this system, Roman numeral written in parentheses immediately after the name of the element indicates the oxidation states. For example,

Cu_2O	Copper (I) oxide	SnO	Tin (II) oxide
FeCl_2	Iron (II) chloride	Mn_2O_7	Manganese (VII) oxide
$\text{K}_2\text{Cr}_2\text{O}_7$	Potassium dichromate (VI)	Na_2CrO_4	Sodium chromate (VI)

V_2O_5	Vanadium (V) oxide	CuO	Copper (II) oxide
SnO_2	Tin (IV) oxide	FeCl_3	Iron (III) chloride

(4) Rules for the determination of oxidation number of an atom :

The following rules are followed in ascertaining the oxidation number of an atom,

(i) If there is a covalent bond between two same atoms then oxidation numbers of these two atoms will be zero. Bonded electrons are symmetrically distributed between two atoms. Bonded atoms do not acquire any charge. So oxidation numbers of these two atoms are zero.

For example, Oxidation number of Cl in Cl_2 , O in O_2 and N in N_2 is zero.

(ii) If covalent bond is between two different atoms then electrons are counted towards more electronegative atom. Thus oxidation number of more electronegative atom is negative and oxidation number of less electronegative atom is positive. Total number of charges on any element depends on number of bonds.

The oxidation number of less electronegative element (A) is +1 and +2 respectively.

(iii) If there is a coordinate bond between two atoms then oxidation number of donor atom will be +2 and of acceptor atom will be -2.

(iv) The oxidation number of all the atoms of different elements in their respective elementary states is taken to be zero. For example, in N_2 , Cl_2 , H_2 , P_4 , S_8 , O_2 , Br_2 , Na , Fe , Ag etc. the oxidation number of each atom is zero.

(v) The oxidation number of a monoatomic ion is the same as the charge on it. For example, oxidation numbers of Na^+ , Mg^{2+} and Al^{3+} ions are +1, +2 and +3 respectively while those of Cl^- , S^{2-} and N^{3-} ions are -1, -2 and -3 respectively.

(vi) The oxidation number of hydrogen is +1 when combined with non-metals and is -1 when combined with active metals called metal hydrides such as LiH , KH , MgH , CaH etc.

(vii) The oxidation number of oxygen is -2 in most of its compounds, except in peroxides like H_2O_2 , BaO_2 etc. where it is -1. Another interesting exception is found in the compound OF_2 (oxygen difluoride) where the oxidation number of oxygen is +2. This is due to the fact that fluorine being the most electronegative element known has always an oxidation number of -1.

(viii) In compounds formed by union of metals with non-metals, the metal atoms will have positive oxidation numbers and the non-metals will have negative oxidation numbers.

For example,

(a) The oxidation number of alkali metals (Li , Na , K etc.) is always +1 and those of alkaline earth metals (Be , Mg , Ca etc) is +2.

(b) The oxidation number of halogens (F , Cl , Br , I) is always -1 in metal halides such as KF , $AlCl_3$, $MgBr_2$, CdI_2 etc.

(ix) In compounds formed by the union of different elements, the more electronegative atom will have negative oxidation number whereas the less electronegative atom will have positive oxidation number.

For example,

(a) N is given an oxidation number of -3 when it is bonded to less electronegative atom as in NH_3 and NH_4^+ , but is given an oxidation number of +3 when it is bonded to more electronegative atoms as in NCl_3 .

(b) Since fluorine is the most electronegative element known so its oxidation number is always -1 in its compounds i.e. oxides, interhalogen compounds etc.

(c) In interhalogen compounds of Cl , Br , and I ; the more electronegative of the two halogens gets the oxidation number of -1. For example, in $BrCl_3$, the oxidation number of Cl is -1 while that of Br is +3.

(x) For neutral molecule, the sum of the oxidation numbers of all the atoms is equal to zero. For example, in NH_3 the sum of the oxidation numbers of nitrogen atom and 3 hydrogen atoms is equal to zero. For a complex ion, the sum of the oxidation numbers of all the atoms is equal to charge on the ion. For example, in SO_4^{2-} ion, the sum of the oxidation numbers of sulphur atom and 4 oxygen atoms must be equal to -2.

(xi) It may be noted that oxidation number is also frequently called as oxidation state. For example, in H_2O , the oxidation state of hydrogen is +1 and the oxidation state of oxygen is -2. This means that oxidation number gives the oxidation state of an element in a compound.

(xii) In the case of representative elements, the highest oxidation number of an element is the same as its group number while highest negative oxidation number is equal to $(8 - \text{Group number})$ with negative sign with a few exceptions. The most common oxidation states of the representative elements are shown in the following table,

Group	Outer shell configuration	Common oxidation numbers (states) except zero in free state
-------	---------------------------	---

Table : 13.2 Oxidation number of some elements in compounds, ions or chemical species

Element	Oxidation Number	Compounds, ions or chemical species
Sulphur (S)	-2	H_2S , ZnS , $NaHS$, $(SrS)_2$, BaS , CS_2
	0	S_8 , S_2 , S , SCN
	+1	S_2F_2 , S_2Cl_2
	+4	SO_2 , H_2SO_3 , $(SO_3)^-$, $SOCl_2$, $NaHSO_3$, $Ca[HSO_3]_2$, $[HSO_3]^-$, SF_4

I A	ns^1	+1
II A	ns^2	+2
III A	$ns^2 np^1$	+3, +1
IV A	$ns^2 np^2$	+4, +3, +2, +1, -1, -2, -3, -4
V A	$ns^2 np^3$	+5, +3, +1, -1, -3
VI A	$ns^2 np^4$	+6, +4, +2, -2
VII A	$ns^2 np^5$	+7, +5, +3, +1, -1

(xiii) Transition metals exhibit a large number of oxidation states due to involvement of $(n-1)$ d electron besides ns electron.

(xiv) Oxidation number of a metal in carbonyl complex is always zero.

Example: Ni has zero oxidation state in $[Ni(CO)_4]$.

(xv) Those compounds which have only C , H and O the oxidation number of carbon can be calculated by following formula,

$$\text{Oxidation number of 'C'} = \frac{(n_O \times 2 - n_H)}{n_C}$$

Where, n_O is the number of oxygen atom, n_H is the number of hydrogen atom, n_C is the number of carbon atom.

For example, (a) CH_3OH ; $n_H = 4$, $n_C = 1$, $n_O = 1$

$$\text{Oxidation number of 'C'} = \frac{(1 \times 2 - 4)}{1} = -2$$

(b) $HCOOH$; $n_H = 2$, $n_O = 2$, $n_C = 1$

$$\text{Oxidation number of carbon} = \frac{(2 \times 2 - 2)}{1} = +2$$

(5) **Procedure for calculation of oxidation number** : By applying the above rules, we can calculate the oxidation numbers of elements in the molecules/ions by the following steps.

(i) Write down the formula of the given molecule/ion leaving some space between the atoms.

(ii) Write oxidation number on the top of each atom. In case of the atom whose oxidation number has to be calculated write x .

(iii) Beneath the formula, write down the total oxidation numbers of each element. For this purpose, multiply the oxidation numbers of each atom with the number of atoms of that kind in the molecule/ion. Write the product in a bracket.

(iv) Equate the sum of the oxidation numbers to zero for neutral molecule and equal to charge on the ion.

(v) Solve for the value of x .

	+ 6	H_2SO_4 , $(SO_4)^{2-}$, $[HSO_4]^-$, $BaSO_4$, $KHSO_4$, SO_3 , SF_6 , $H_2S_2O_8$, $(S_2O_8)^{2-}$
Nitrogen (N)	- 3	NH_3 , (NH_3) , AlN , Mg_3N_2 , $(N_3)^-$, Ca_3N_2 , CN^-
	- 2	NH_2 , (NH_2)
	- 1	NH_2OH
	-1/3	NaN_3 , N_3H
	0	N_2
	+ 1	N_2O
	+ 2	NO
	+ 3	HNO_2 , $(NO_2)^-$, $NaNO_2$, N_2O_3 , NF_3
	+ 4	NO_2
	+ 5	HNO_3 , $(NO_3)^-$, KNO_3 , N_2O_5
Chlorine (Cl)	- 1	HCl , $NaCl$, $CaCl_2$, $AlCl_3$, ICl_3 , ICl , $SOCl_2$, CrO_2Cl_2 , KCl , K_2PtCl_6 , $HAuCl_4$, CCl_4
	0	Cl_2 , Cl_2
	+ 1	$HOCl$, $NaOCl$, $(OCl)^-$, Cl_2O
	+ 3	$KClO_3$, $(ClO_3)^-$, $HClO_3$
	+ 4	ClO_2
	+ 5	$(ClO_2)^-$, $KClO_4$, $NaClO_4$, $HClO_4$
	+ 7	$HClO_4$, Cl_2O_7 , $KClO_4$, $(ClO_4)^-$
Hydrogen (H)	- 1	NaH , CaH_2 , $LiAlH_4$, LiH
	+ 1	NH_3 , PH_3 , HF
Phosphorus (P)	- 3	PH_3 , (PH_3) , Ca_3P_2
	0	P_4
	+ 1	H_3PO_2 , KH_2PO_2 , $BaH_2P_2O_7$
	+ 3	P_4 , PBr_3 , PCl_3 , P_2O_3 , H_3PO_3
	+ 5	$(PO_4)^{3-}$, $H_2PO_4^-$, $Ca_3(PO_4)_2$, H_3PO_4 , P_2O_5 , PCl_5 , $(PO_3)^-$, $Mg_3P_2O_7$, ATP
Oxygen (O)	- 2	H_2O , PbO_2 , $(CO_3)^{2-}$, $(PO_4)^{3-}$, SO_3 , $(C_2O_4)^{2-}$, $HOCl$, $(OH)^-$, $(O)^-$
	- 1	Na_2O_2 , BaO_2 , H_2O_2 , $(O_2)^-$, Peroxides
	- 1/2	KO_2
	0	O_2 , O_2 , O_2
	+ 1	OF_2
	+ 2	OF_2
Carbon (C)	- 4	CH_4
	- 3	C_2H_2
	- 2	CH_2Cl_2 , C_2H_4
	- 1	CaC_2 , C_2H_2
	0	Diamond, Graphite, $C_2H_2O_2$, $C_2H_4O_2$, $HCHO$, CH_2Cl_2
	+ 2	CO , $CHCl_3$, HCN
	+ 3	H_2CO_3 , $(C_2O_3)^-$
	+ 4	CO_2 , H_2CO_3 , $(HCO_3)^-$, CCl_4 , Na_2CO_3 , $CaCO_3$, CS_2 , CF_4 , $(CO_3)^{2-}$

Chromium (<i>Cr</i>)	+ 3	$Cr_2(SO_4)_3$, $CrCl_3$, Cr_2O_3 , $[Cr(H_2O)_6]^{3+}$
	+ 6	$K_2Cr_2O_7$, $(CrO_4)^{2-}$, $K_2Cr_2O_8$, $(CrO_5)^{-}$, $KCrO_4Cl$, CrO_2Cl_2 , $Na_2Cr_2O_7$, CrO_3
Manganese (<i>Mn</i>)	+ 2	MnO , $MnSO_4$, $MnCl_2$, $Mn(OH)_2$
	+ 8/3	Mn_3O_4
	+ 3	$Mn(OH)_3$
	+ 4	MnO_2 , $KMnO_4$
	+ 6	$KMnO_4$, $(MnO_4)^{-}$
	+ 7	$KMnO_4$, $(MnO)_2$, $HMnO_4$
Silicon (<i>Si</i>)	- 4	SiH_4 , $MgSi$
	+ 4	SiO_2 , K_2SiO_3 , $SiCl_4$
Iron (<i>Fe</i>)	$+\frac{8}{3}$	Fe_3O_4
	+ 2	$FeSO_4$, $(NH_4)_2SO_4$ (Ferrous ammonium sulphate), $K_2Fe(CN)_6$, $FeCl_2$
	+ 3	$K_3[Fe(CN)_6]$, $FeCl_3$
Iodine (<i>I</i>)	+ 7	$H_4IO_6^-$, KIO_4
Osmium (<i>Os</i>)	+ 8	OsO_4
Xenon (<i>Xe</i>)	+ 6	XeO_4 , XeF_6

(6) **Exceptional cases of evaluation of oxidation numbers** : The rules described earlier are usually helpful in determination of the oxidation number of a specific atom in simple molecules but these rules fail in following cases. In these cases, the oxidation numbers are evaluated using the concepts of chemical bonding involved.

Type 1. In molecules containing peroxide linkage in addition to element-oxygen bonds. For example,

(i) **Oxidation number of S in H_2SO_5**

(Permonosulphuric acid or Caro's acid)

By usual method; H_2SO_5

$$2 \times 1 + x + 5 \times (-2) = 0 \quad \text{or} \quad x = +8$$

But this cannot be true as maximum oxidation number for S cannot exceed + 6. Since S has only 6 electrons in its valence shell. This exceptional value is due to the fact that two oxygen atoms in H_2SO_5 shows peroxide linkage as shown below,

Therefore the evaluation of o.n. of sulphur here should be made as follows,

$$\begin{array}{ccccccc}
 2 \times (+1) & + & x & + & 3 \times (-2) & + & 2 \times (-1) \\
 \text{(for H)} & & \text{(for S)} & & \text{(for O)} & & \text{(for O-O)} \\
 \text{or } 2 & + & x & - & 6 & - & 2 = 0 \quad \text{or} \quad x = +6.
 \end{array}$$

(ii) **Oxidation number of S in $H_2S_2O_8$**

(Peroxydisulphuric acid or Marshall's acid)

By usual method ; $H_2S_2O_8$

$$1 \times 2 + 2x + 8(-2) = 0$$

$$2x = +16 - 2 = 14 \quad \text{or} \quad x = +7$$

Similarly Caro's acid, Marshall's acid also has a peroxide linkage so that in which S shows +6 oxidation state.

Therefore the evaluation of oxidation state of sulphur should be made as follow,

$$\begin{array}{ccccccc}
 2 \times (+1) & + & 2 \times (x) & + & 6 \times (-2) & + & 2 \times (-1) = 0 \\
 \text{(for H)} & & \text{(for S)} & & \text{(for O)} & & \text{(for O-O)} \\
 \text{or } 2 & + & 2x & - & 12 & - & 2 = 0 \quad \text{or} \quad x = +6.
 \end{array}$$

(iii) **Oxidation number of Cr in CrO_5**

(Blue perchromate)

By usual method CrO_5 ; $x - 10 = 0$ or $x = +10$

This cannot be true as maximum O. N. of Cr cannot be more than + 6. Since Cr has only five electrons in 3d orbitals and one electron in 4s orbital. This exceptional value is due to the fact that four oxygen atoms in CrO_5 are in peroxide linkage.

The chemical structure of CrO_5 is

Therefore, the evaluation of o.n. of Cr should be made as follows

$$\begin{array}{ccccccc}
 x & + & 1 \times (-2) & + & 4 \times (-1) = 0 \\
 \text{(for Cr)} & & \text{(for O)} & & \text{(for O-O)}
 \end{array}$$

$$\text{or } x - 2 - 4 = 0 \quad \text{or } x = +6.$$

Type II. In molecules containing covalent and coordinate bonds, following rules are used for evaluating the oxidation numbers of atoms.

(i) For each covalent bond between dissimilar atoms the less electronegative element is assigned the oxidation number of +1 while the atom of the more electronegative element is assigned the oxidation number of -1.

(ii) In case of a coordinate-covalent bond between similar or dissimilar atoms but the donor atom is less electronegative than the acceptor atom, an oxidation number of +2 is assigned to the donor atom and an oxidation number of -2 is assigned to the acceptor atom.

Conversely, if the donor atom is more electronegative than the acceptor atom, the contribution of the coordinate bond is neglected. *Examples,*

(a) *Oxidation number of C in $HC \equiv N$ and $HN \equiv C$*

The evaluation of oxidation number of C cannot be made directly by usual rules since no standard rule exists for oxidation numbers of N and C.

In such cases, evaluation of oxidation number should be made using indirect concept or by the original concepts of chemical bonding.

(b) *Oxidation number of carbon in $H-N \equiv C$*

The contribution of coordinate bond is neglected since the bond is directed from a more electronegative N atom (donor) to a less electronegative carbon atom (acceptor).

Therefore the oxidation number of N in $HN \equiv C$ remains -3 as it has three covalent bonds.

$$1 \times (+1) + 1 \times (-3) + x = 0$$

(for H) (for N) (for C)

$$\text{or } 1 + x - 3 = 0 \quad \text{or } x = +2.$$

(c) *Oxidation number of carbon in $HC \equiv N$*

In $HC \equiv N$, N is more electronegative than carbon, each bond gives an oxidation number of -1 to N. There are three covalent bonds, the oxidation number of N in $HC \equiv N$ is taken as -3

$$\text{Now } HC \equiv N \therefore +1 + x - 3 = 0 \Rightarrow x = +2$$

Type III. In a molecule containing two or more atoms of same or different elements in different oxidation states.

(i) *Oxidation number of S in $Na_2S_2O_3$*

By usual method $Na_2S_2O_3$

$$\therefore 2 \times (+1) + 2 \times x + 3(-2) = 0 \quad \text{or } 2 + 2x - 6 = 0$$

$$\text{or } x = 2.$$

But this is unacceptable as the two sulphur atoms in $Na_2S_2O_3$ cannot have the same oxidation number because on treatment with dil. H_2SO_4 , one sulphur atom is precipitated while the other is oxidised to SO_2 .

In this case, the oxidation number of sulphur is evaluated from concepts of chemical bonding. The chemical structure of $Na_2S_2O_3$ is

Due to the presence of a co-ordinate bond between two sulphur atoms, the acceptor sulphur atom has oxidation number of -2 whereas the other S atom gets oxidation number of +2.

$$2 \times (+1) + 3 \times (-2) + x \times 1 + 1 \times (-2) = 0$$

(for Na) (for O) (for S) (for coordinated S)

$$\text{or } +2 - 6 + x - 2 = 0 \quad \text{or } x = +6$$

Thus two sulphur atoms in $Na_2S_2O_3$ have oxidation number of -2 and +6.

(ii) *Oxidation number of chlorine in $CaOCl$*

(bleaching powder)

In bleaching powder, $Ca(OCl)Cl$, the two Cl atoms are in different oxidation states i.e., one Cl having oxidation number of -1 and the other as OCl having oxidation number of +1.

(iii) *Oxidation number of N in NH_4NO_3*

By usual method NH_4NO_3 ; $2x + 4 \times (+1) + 3 \times (-1) = 0$

$$2x + 4 - 3 = 0 \quad \text{or } 2x = +1 \quad (\text{wrong})$$

No doubt NH_4NO_3 has two nitrogen atoms but one N has negative oxidation number (attached to H) and the other has positive oxidation number (attached to O). Hence the evaluation should be made separately for NH_4^+ and NO_3^-

$$NH_4^+ \quad x + 4 \times (+1) = +1 \quad \text{or } x = -3$$

$$NO_3^- \quad x + 3(-2) = -1 \quad \text{or } x = +5.$$

(iv) *Oxidation number of Fe in Fe_3O_4*

In Fe_3O_4 , Fe atoms are in two different oxidation states. Fe_3O_4 can be considered as an equimolar mixture of FeO [iron (II) oxide] and Fe_2O_3 [iron (III) oxide]. Thus in one molecule of Fe_3O_4 , two Fe atoms are in +3 oxidation state and one Fe atom is in +2 oxidation state.

(v) *Oxidation number of S in sodium tetrathionate ($Na_2S_4O_6$)*

Its structure can be represented as follows,

The two S-atoms which are linked to each other have oxidation number zero. The oxidation number of other S-atoms can be calculated as follows

Let oxidation number of S = x.

$$\therefore 2 \times x + 2 \times 0 + 6 \times (-2) = -2$$

(for S) (for S-S) (for O)

$$x = +5.$$

Balancing of oxidation-reduction reactions

Though there are a number of methods for balancing oxidation - reduction reactions, two methods are very important. These are,

(1) Oxidation number method

(2) Ion - electron method

(1) **Oxidation number method** : The method for balancing redox reactions by oxidation number change method was developed by **Johnson**. In a balanced redox reaction, total increase in oxidation number must be equal to the total decrease in oxidation number. This equivalence provides the basis for balancing redox reactions. This method is applicable to both

molecular and ionic equations. The general procedure involves the following steps,

(i) Write the skeleton equation (if not given, frame it) representing the chemical change.

(ii) Assign oxidation numbers to the atoms in the equation and find out which atoms are undergoing oxidation and reduction. Write separate equations for the atoms undergoing oxidation and reduction.

(iii) Find the change in oxidation number in each equation. Make the change equal in both the equations by multiplying with suitable integers. Add both the equations.

(iv) Complete the balancing by inspection. First balance those substances which have undergone change in oxidation number and then other atoms except hydrogen and oxygen. Finally balance hydrogen and oxygen by putting H_2O molecules wherever needed.

The final balanced equation should be checked to ensure that there are as many atoms of each element on the right as there are on the left.

(v) In ionic equations the net charges on both sides of the equation must be exactly the same. Use H^+ ion/ions in acidic reactions and OH^- ion/ions in basic reactions to balance the charge and number of hydrogen and oxygen atoms.

The following example illustrate the above rules,

Step: I $Cu + HNO_3 \rightarrow Cu(NO_3)_2 + NO_2 + H_2O$
(*Skeleton equation*)

Step: II Writing the oxidation number of all the atoms.

Step: III Change in oxidation number has occurred in copper and nitrogen.

Cu Increase in oxidation number of copper = 2 units per molecule

HNO_3 Decrease in oxidation number of nitrogen = 1 unit per molecule

Step: IV To make increase and decrease equal, equation (ii) is multiplied by 2.

Step: V Balancing nitrate ions, hydrogen and oxygen, the following equation is obtained.

This is the balanced equation.

(2) **Ion-electron method** (half reaction method)

Jette and **LaMev** developed the method for balancing redox-reactions by ion electron method in 1927. It involves the following steps

(i) Write down the redox reaction in ionic form.

(ii) Split the redox reaction into two half reactions, one for oxidation and other for reduction.

(iii) Balance each half reaction for the number of atoms of each element. For this purpose,

(a) Balance the atoms other than H and O for each half reaction using simple multiples.

(b) Add water molecules to the side deficient in oxygen and H to the side deficient in hydrogen. This is done in acidic or neutral solutions.

(c) In alkaline solution, for each excess of oxygen, add one water molecule to the same side and $2OH^-$ ions to the other side. If hydrogen is still unbalanced, add one OH^- ion for each excess hydrogen on the same side and one water molecule to the other side.

(iv) Add electrons to the side deficient in electrons as to equalise the charge on both sides.

(v) Multiply one or both the half reactions by a suitable number so that number of electrons become equal in both the equations.

(vi) Add the two balanced half reactions and cancel any term common to both sides.

The following example illustrate the above rules

Step: I $I_2 + OH^- \rightarrow IO_3^- + I^- + H_2O$ (*Ionic equation*)

Step: II Splitting into two half reactions,

Step: III Adding OH^- ions, $I_2 + 12OH^- \rightarrow 2IO_3^- + 6H_2O$

Step: IV Adding electrons to the sides deficient in electrons, (S)

Step: V Balancing electrons in both the half reactions.

Step: VI Adding both the half reactions.

Autoxidation

(1) Turpentine and numerous other olefinic compounds, phosphorus and certain metals like Zn and Pb can absorb oxygen from the air in presence of water. The water is oxidised to hydrogen peroxide. This phenomenon of formation of H_2O_2 by the oxidation of H_2O is known as **autoxidation**. The substance such as turpentine or phosphorus or lead which can activate the oxygen is called **activator**. The activator is supposed to first combine with oxygen to form an addition compound, which acts as an **autoxidator** and reacts with water or some other acceptor so as to oxidise the latter. For example;

(2) The turpentine or other unsaturated compounds which act as activators are supposed to take up oxygen molecule at the double bond position to form unstable peroxide called **moloxide**, which then gives up the oxygen to water molecule or any other acceptor.

The evolution of iodine from KI solution in presence of turpentine can be confirmed with starch solution which turns blue.

(3) The concept of autoxidation help to explain the phenomenon of induced oxidation. Na_2SO_3 solution is oxidised by air but Na_3AsO_3

solution is not oxidised by air. If a mixture of both is taken, it is observed both are oxidised. This is induced oxidation.

Moloxide

Disproportionation

One and the same substance may act simultaneously as an oxidising agent and as a reducing agent with the result that a part of it gets oxidised to a higher state and rest of it is reduced to lower state of oxidation. Such a reaction, in which a substance undergoes simultaneous oxidation and reduction is called **disproportionation** and the substance is said to **disproportionate**.

Following are the some examples of *disproportionation*,

Tips & Tricks

✍ If an element is in its highest possible oxidation state in a compound, it can act as an oxidising agent. for example, KMnO_4 , $\text{K}_2\text{Cr}_2\text{O}_7$, HNO_3 , H_2SO_4 , HClO_4 etc.

✍ If an element is in its lowest oxidation state in a compound, it can act as a reducing agent. For example, H_2S , $\text{H}_2\text{C}_2\text{O}_4$, FeSO_4 , Na_2SO_3 , SO_2 , SnCl_2 , many metals etc.

✍ The strength of oxyacids of chlorine decrease in the order. $\text{HClO}_4 > \text{HClO}_3 > \text{HClO}_2 > \text{HClO}$

✍ If highly electronegative element is in its highest oxidation state in a compound that compound can act as powerful oxidant. For example, KClO_4 , KClO_3 , KBrO_3 , KIO_3 etc.

✍ If an element is in intermediate oxidation state in a compound, it

can act as both oxidising & reducing agent. For example, H_2O_2 , H_2SO_3 , HNO_2 , SO_2 etc.

Ordinary Thinking

Objective Questions

Oxidation, Reduction

- H_2O_2 reduces MnO_4^- ion to [KCET (Med.) 2000]
 - Mn^+
 - Mn^{2+}
 - Mn^{3+}
 - Mn^-
- When a sulphur atom becomes a sulphide ion [AMU 1999]
 - There is no change in the composition of atom
 - It gains two electrons
 - The mass number changes
 - None of these
- The ultimate products of oxidation of most of hydrogen and carbon in food stuffs are [DCE 2001]
 - H_2O alone
 - CO_2 alone
 - H_2O and CO_2
 - None of these
- When P reacts with caustic soda, the products are PH_3 and NaH_2PO_2 . This reaction is an example of [IIT 1980; Kurukshetra CEE 1993; CPMT 1997]
 - Oxidation
 - Reduction
 - Oxidation and reduction (Redox)
 - Neutralization
- Which one of the following does not get oxidised by bromine water [MP PET/PM]
 - Fe^{+2} to Fe^{+3}
 - Cu^+ to Cu^{+2}
 - Mn^{+2} to MnO_4^-
 - Sn^{+2} to Sn^{+4}
- In the reaction $\text{H}_2\text{S} + \text{NO}_2 \rightarrow \text{H}_2\text{O} + \text{NO} + \text{S}$, H_2S is
 - Oxidised
 - Reduced
 - Precipitated
 - None of these
- The conversion of PbO_2 to $\text{Pb}(\text{NO}_3)_2$ is
 - Oxidation
 - Reduction
 - Neither oxidation nor reduction
 - Both oxidation and reduction
- In the course of a chemical reaction an oxidant [MP PMT 1986]
 - Loses electrons
 - Gains electrons
 - Both loses and gains electron
 - Electron change takes place
- $2\text{CuI} \rightarrow \text{Cu} + \text{CuI}_2$, the reaction is [RPMT 1997]
 - Redox
 - Neutralisation
 - Oxidation
 - Reduction

10. H_2S reacts with halogens, the halogens [JIPMER 2000]
 (a) Form sulphur halides (b) Are oxidised
 (c) Are reduced (d) None of these
11. H_2O_2 reduces $K_4Fe(CN)_6$ [MP PMT 1985]
 (a) In neutral solution (b) In acidic solution
 (c) In non-polar solvent (d) In alkaline solution
12. Max. number of moles of electrons taken up by one mole of NO_3^- when it is reduced to [DPMT 2002]
 (a) NH_3 (b) NH_2OH
 (c) NO (d) NO_2
13. In the reaction $3Mg + N_2 \rightarrow Mg_3N_2$ [MP PMT 1999]
 (a) Magnesium is reduced (b) Magnesium is oxidized
 (c) Nitrogen is oxidized (d) None of these
14. When sodium metal is dissolved in liquid ammonia, blue colour solution is formed. The blue colour is due to [NCERT 1981]
 (a) Solvated Na^+ ions (b) Solvated electrons
 (c) Solvated NH_2^- ions (d) Solvated protons
15. Following reaction describes the rusting of iron
 $4Fe + 3O_2 \rightarrow 4Fe^{3+} + 6O^{2-}$
 Which one of the following statement is incorrect [NCERT 1981; MNR 1991; AIIMS 1998]
 (a) This is an example of a redox reaction
 (b) Metallic iron is reduced to Fe^{3+}
 (c) Fe^{3+} is an oxidising agent
 (d) Metallic iron is a reducing agent
16. $SnCl_2$ gives a precipitate with a solution of $HgCl_2$. In this process $HgCl_2$ is [CPMT 1983]
 (a) Reduced
 (b) Oxidised
 (c) Converted into a complex compound containing both Sn and Hg
 (d) Converted into a chloro complex of Hg
17. Oxidation involves [NCERT 1971, 81; CPMT 1980, 82, 83; MP PMT 1983]
 (a) Loss of electrons
 (b) Gain of electrons
 (c) Increase in the valency of negative part
 (d) Decrease in the valency of positive part
18. Incorrect statement regarding rusting is [MP PET 2000]
 (a) Metallic iron is oxidised to Fe^{3+} ions
 (b) Metallic iron is reduced to Fe^{2+} ions
 (c) Oxygen gas is reduced to oxide ion
 (d) Yellowish – brown product is formed
19. When copper turnings are added to silver nitrate solution, a blue coloured solution is formed after some time. It is because, copper [CPMT 1974, 79; DPMT 2000]
 (a) Displaces silver from the solution
 (b) Forms a blue coloured complex with $AgNO_3$
 (c) Is oxidised to Cu^{2+}
 (d) Is reduced to Cu^{2+}
20. Solution of sodium metal in liquid ammonia is strongly reducing due to the presence of the following in the solution [NCERT 1977; KCET (Med.) 2000]
 (a) Sodium atoms (b) Solvated electrons
 (c) Sodium hydride (d) Sodium amide
21. When Sn^{2+} changes to Sn^{4+} in a reaction [CPMT 1981]
 (a) It loses two electrons (b) It gains two electrons
 (c) It loses two protons (d) It gains two protons
22. Oxidation of thiosulphate ($S_2O_3^{2-}$) ion by iodine gives [NCERT 1976]
 (a) SO_3^{2-} (b) SO_4^{2-}
 (c) $S_4O_6^{2-}$ (d) $S_2O_6^{2-}$
23. $Zn^{2+}(aq) + 2e^- \rightarrow Zn(s)$. This is [CPMT 1985]
 (a) Oxidation (b) Reduction
 (c) Redox reaction (d) None of these
24. One gas bleaches the colour of flowers by reduction while the other by oxidation [EAMCET 1980]
 (a) CO and Cl_2 (b) SO_2 and Cl_2
 (c) H_2S and Br_2 (d) NH_3 and SO_2
25. Reduction involves NCERT 1972
 (a) Loss of electrons
 (b) Gain of electrons
 (c) Increase in the valency of positive part
 (d) Decrease in the valency of negative part
26. In a reaction between zinc and iodine, in which zinc iodide is formed, what is being oxidised [NCERT 1975]
 (a) Zinc ions (b) Iodide ions
 (c) Zinc atom (d) Iodine
27. Which one of the following reactions does not involve either oxidation or reduction [EAMCET 1982]
 (a) $VO_2^+ \rightarrow V_2O_3$ (b) $Na \rightarrow Na^+$
 (c) $CrO_4^{2-} \rightarrow Cr_2O_7^{2-}$ (d) $Zn^{2+} \rightarrow Zn$
28. In the following reaction,
 $3Br_2 + 6CO_3^{2-} + 3H_2O = 5Br^- + BrO_3^- + 6HCO_3^-$
 (a) Bromine is oxidised and carbonate is reduced
 (b) Bromine is reduced and water is oxidised
 (c) Bromine is neither reduced nor oxidised
 (d) Bromine is both reduced and oxidised [MP PMT 1994, 95]
29. In the following reaction,
 $4P + 3KOH + 3H_2O \rightarrow 3KH_2PO_2 + PH_3$ [Pb. PMT 2002]
 (a) P is oxidized as well as reduced
 (b) P is reduced only
 (c) P is oxidised only
 (d) None of these
30. In the following reaction
 $Cr_2O_7^{2-} + 14H^+ + 6I^- \rightarrow 2Cr^{3+} + 3H_2O + 3I_2$
 Which element is reduced [CPMT 1976]
 (a) Cr (b) H
 (c) I (d) I
31. The conversion of sugar $C_{12}H_{22}O_{11} \rightarrow CO_2$ is
 (a) Oxidation
 (b) Reduction
 (c) Neither oxidation nor reduction
 (d) Both oxidation and reduction
32. Which halide is not oxidised by MnO_2 [MNR 1985; JIPMER 2000]
 (a) F (b) Cl

- (c) Br (d) I
33. When Fe^{2+} changes to Fe^{3+} in a reaction
(a) It loses an electron (b) It gains an electron
(c) It loses a proton (d) It gains a proton
34. In acid solution, the reaction $MnO_4^- \rightarrow Mn^{2+}$ involves [MP PMT 1989]
(a) Oxidation by 3 electrons
(b) Reduction by 3 electrons
(c) Oxidation by 5 electrons
(d) Reduction by 5 electrons
35. When iron or zinc is added to $CuSO_4$ solution, copper is precipitated. It is due to [CPMT 1974, 79]
(a) Oxidation of Cu^{+2} (b) Reduction of Cu^{+2}
(c) Hydrolysis of $CuSO_4$ (d) Ionization of $CuSO_4$
36. In the reaction, $4Fe + 3O_2 \rightarrow 4Fe^{3+} + 6O^{2-}$ which of the following statement is incorrect [UPSEAT 2001, 02]
(a) A Redox reaction
(b) Metallic iron is a reducing agent
(c) Fe^{3+} is an oxidising agent
(d) Metallic iron is reduced to Fe^{3+}
37. Which of the following is redox reaction [CBSE PMT 1997]
(a) H_2SO_4 with $NaOH$
(b) In atmosphere, O_3 from O_2 by lightning
(c) Evaporation of H_2O
(d) Nitrogen oxides form nitrogen and oxygen by lightning
- (c) $HClO_2$ (d) $HOCl$
6. Identify the correct statement about H_2O_2 [AIIMS 1996]
(a) It acts as reducing agent only
(b) It acts as both oxidising and reducing agent
(c) It is neither an oxidiser nor reducer
(d) It acts as oxidising agent only
7. Several blocks of magnesium are fixed to the bottom of a ship to [AIEEE 2003]
(a) Keep away the sharks
(b) Make the ship lighter
(c) Prevent action of water and salt
(d) Prevent puncturing by under-sea rocks
8. Which of the following behaves as both oxidising and reducing agents [AFMC 1995]
(a) H_2SO_4 (b) SO_2
(c) H_2S (d) HNO_3
9. The reaction $H_2S + H_2O_2 \rightarrow 2H_2O + S$ shows [JIPMER 2001]
(a) Oxidizing action of H_2O_2
(b) Reducing action of H_2O_2
(c) Alkaline nature of H_2O_2
(d) Acidic nature of H_2O_2
10. Which of the following is not a reducing agent [EAMCET 1987]
(a) $NaNO_2$ (b) $NaNO_3$
(c) HI (d) $SnCl_2$
11. Which of the following cannot work as oxidising agent [CPMT 1996]
(a) O_2 (b) $KMnO_4$
(c) I_2 (d) None of these
12. H_2O_2 is used as [CPMT 1994]
(a) An oxidant only
(b) A reductant only
(c) An acid only
(d) An oxidant, a reductant and an acid
13. In $C + H_2O \rightarrow CO + H_2$, H_2O acts as [AFMC 1988]
(a) Oxidising agent (b) Reducing agent
(c) (a) and (b) both (d) None of these
14. Strongest reducing agent is [CPMT 1977; BHU 1984, 96; MP PET 1990; AMU 1999]
(a) F^- (b) Cl^-
(c) Br^- (d) I^-
15. A solution of sulphur dioxide in water reacts with H_2S precipitating sulphur. Here sulphur dioxide acts as [NCERT 1980]
(a) As oxidising agent (b) A reducing agent
(c) An acid (d) A catalyst
16. Which of these substances is a good reducing agent [NCERT 1979; CPMT 1988]
(a) $NaOCl$ (b) HI
(c) $FeCl_3$ (d) KBr
17. The strongest reducing agent is [MNR 1982]
(a) HNO_2 (b) H_2S

Oxidizing and Reducing agent

1. Equation $H_2S + H_2O_2 \rightarrow S + 2H_2O$ represents [UPSEAT 2001]
(a) Acidic nature of H_2O_2
(b) Basic nature of H_2O_2
(c) Oxidising nature of H_2O_2
(d) Reducing nature of H_2O_2
2. In the reaction
 $C_2O_4^{2-} + MnO_4^- + H^+ \rightarrow Mn^{2+} + CO_2 + H_2O$
the reductant is [EAMCET 1991]
(a) $C_2O_4^{2-}$ (b) MnO_4^-
(c) Mn^{2+} (d) H^+
3. A reducing agent is a substance which can [CPMT 1971, 74, 76, 78, 80; NCERT 1976]
(a) Accept electron (b) Donate electrons
(c) Accept protons (d) Donate protons
4. Which of the following is the most powerful oxidizing agent [MNR 1990; CPMT 2003]
(a) F_2 (b) Cl_2
(c) Br_2 (d) I_2
5. Of the four oxyacids of chlorine the strongest oxidising agent in dilute aqueous solution is [MP PET 2000]
(a) $HClO_4$ (b) $HClO_3$

[JEE Orissa 2004]

- (c) H_2SO_3 (d) $SnCl_2$
18. Which one is an oxidising agent [DPMT 1996]
 (a) $FeSO_4$
 (b) HNO_3
 (c) $FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$
 (d) H_2SO_4
19. In which of the following reactions H_2O_2 is a reducing agent [CPMT 1981; NCERT 1981; BHU 1999]
 (a) $2FeCl_2 + 2HCl + H_2O_2 \rightarrow 2FeCl_3 + 2H_2O$
 (b) $Cl_2 + H_2O_2 \rightarrow 2HCl + O_2$
 (c) $2HI + H_2O_2 \rightarrow 2H_2O + I_2$
 (d) $H_2SO_3 + H_2O_2 \rightarrow H_2SO_4 + H_2O$
20. When $NaCl$ is dissolved in water the sodium ion becomes [NCERT 1976]
 (a) Oxidised (b) Reduced
 (c) Hydrolysed (d) Hydrated
21. Strongest reducing agent is [MNR 1984, 89]
 (a) K (b) Mg
 (c) Al (d) Br
 (e) Na
22. Which substance is serving as a reducing agent in the following reaction
 $14H^+ + Cr_2O_7^{2-} + 3Ni \rightarrow 2Cr^{3+} + 7H_2O + 3Ni^{2+}$
 [CBSE PMT 1994; AFMC 2000; DPMT 2001]
 (a) H_2O (b) Ni
 (c) H^+ (d) $Cr_2O_7^{2-}$
23. Which of the following acid possesses oxidising, reducing and complex forming properties [MNR 1985]
 (a) HNO_3 (b) H_2SO_4
 (c) HCl (d) HNO_2
24. Which one is oxidising substance [CPMT 1997]
 (a) $C_2H_2O_2$ (b) CO
 (c) H_2S (d) CO_2
25. The compound that can work both as oxidising and reducing agent is [CPMT 1986; MP PET 2000]
 (a) $KMnO_4$ (b) H_2O_2
 (c) BaO_2 (d) $K_2Cr_2O_7$
26. Which one is oxidising agent in the reaction below
 $2CrO_4^{2-} + 2H^+ \rightarrow Cr_2O_7^{2-} + H_2O$ [CPMT 1997]
 (a) H^+ (b) $Cr_2O_4^-$
 (c) Cr^{++} (d) None of these
27. Which is the best description of the behaviour of bromine in the reaction given below
 $H_2O + Br_2 \rightarrow HOBr + HBr$ [CBSE PMT 2004]
 (a) Oxidised only
 (b) Reduced only
 (c) Proton acceptor only
 (d) Both oxidised and reduced
28. What is the oxidising agent in chlorine water
 (a) HCl (b) $HClO_2$
 (c) $HOCl$ (d) None of these
29. In the reaction
 $Ag_2O + H_2O_2 \rightarrow 2Ag + H_2O + O_2$, the H_2O_2 acts as [BHU 2004]
 (a) Reducing agent (b) Oxidising agent
 (c) Bleaching agent (d) None of the above
30. In the reaction
 $HAsO_2 + Sn^{2+} \rightarrow As + Sn^{4+} + H_2O$ oxidising agent is [BVP 2004]
 (a) Sn^{2+} (b) Sn^{4+}
 (c) As (d) $HAsO_2$
31. Which of the following substances acts as an oxidising as well as a reducing agent [UPSEAT 2004; DCE 2004]
 (a) Na_2O (b) $SnCl_2$
 (c) Na_2O_2 (d) $NaNO_2$
32. In the reaction
 $P + NaOH \rightarrow PH_3 + NaH_2PO_2$ [MP PET 2004]
 (a) P is oxidised only
 (b) P is reduced only
 (c) P is oxidized as well as reduced
 (d) Na is reduced

Oxidation number and Oxidation state

1. The oxidation number of C in CO_2 is [MP PET 2001]
 (a) -2 (b) $+2$
 (c) -4 (d) $+4$
2. The oxidation number of As is [RPMT 1997]
 (a) $+2$ and $+3$ (b) $+3$ and $+5$
 (c) $+3$ and $+4$ (d) None of these
3. The oxidation number of Ba in barium peroxide is [Pb. PMT 2002]
 (a) $+6$ (b) $+2$
 (c) 1 (d) $+4$
4. HNO_2 acts both as reductant and oxidant, while HNO_3 acts only as oxidant. It is due to their [AIIMS 2000]
 (a) Solubility ability
 (b) Maximum oxidation number
 (c) Minimum oxidation number
 (d) Minimum number of valence electrons
5. Chlorine is in $+1$ oxidation state in [MP PMT 1981; NCERT 1974; CPMT 1971, 78]
 (a) HCl (b) $HClO_4$
 (c) ICl (d) Cl_2O
6. The valency of Cr in the complex $[Cr(H_2O)_4Cl_2]^+$ [MP PMT 2000]
 (a) 1 (b) 3
 (c) 5 (d) 6
7. In the conversion $Br_2 \rightarrow BrO_3^-$, the oxidation state of bromine changes from [EAMCET 1990; AMU 1999; RPMT 2002]
 (a) -1 to -1 (b) 0 to -1
 (c) 0 to $+5$ (d) 0 to -5

8. In the chemical reaction $Cl_2 + H_2S \rightarrow 2HCl + S$, the oxidation number of sulphur changes from [MP PMT 1999]
 (a) 0 to 2 (b) 2 to 0
 (c) -2 to 0 (d) -2 to -1
9. Oxidation number of cobalt in $K[Co(CO)_4]$ is [KCET 1996]
 (a) +1 (b) +3
 (c) -1 (d) -3
10. When $K_2Cr_2O_7$ is converted to K_2CrO_4 , the change in the oxidation state of chromium is [NCERT 1981]
 (a) 0 (b) 6
 (c) 4 (d) 3
11. The oxidation number of chlorine in $HOCl$
 (a) -1 (b) 0
 (c) +1 (d) +2
12. Oxidation number of S in S^{2-} is [CPMT 1979]
 (a) -2 (b) 0
 (c) -6 (d) +2
13. Oxidation number of N in $(NH_4)_2SO_4$ is [CPMT 1996]
 (a) -1/3 (b) -1
 (c) +1 (d) -3
14. In which compound, oxidation state of nitrogen is 1 [MP PMT 1989]
 (a) NO (b) N_2O
 (c) NH_2OH (d) N_2H_4
15. Oxidation number of nickel in $Ni(CO)_4$ [AIIMS 1984; MNR 1985; CPMT 1997; MP PET/PMT 1998; AMU 2000; 01]
 (a) 0 (b) +4
 (c) -4 (d) +2
16. The oxidation number of sulphur in H_2SO_4 is [CPMT 1979Pb. CET 2002]
 (a) -2 (b) +2
 (c) +4 (d) +6
17. Oxidation state of chlorine in perchloric acid is [EAMCET 1989]
 (a) -1 (b) 0
 (c) -7 (d) +7
18. Oxidation number of N in HNO_3 is [BHU 1997]
 (a) -3.5 (b) +3.5
 (c) -3, +5 (d) +5
19. The oxidation number of Mn in MnO_4^{-1} is
 (a) +7 (b) -5
 (c) +6 (d) +5
20. Sn^{++} loses two electrons in a reaction. What will be the oxidation number of tin after the reaction
 (a) +2 (b) Zero
 (c) +4 (d) -2
21. The oxidation state of Mn in K_2MnO_4 [CPMT 1982, 83, 84; DPMT 1982; NCERT 1973; AMU 2000]
 (a) +2 (b) +7
 (c) -2 (d) +6
22. Oxidation number of oxygen in O_2 molecule is [CPMT 1984]
 (a) +1 (b) 0
 (c) +2 (d) -2
23. Maximum oxidation state of Cr is [RPMT 2002]
 (a) 3 (b) 4
 (c) 6 (d) 7
24. In which of the following compound transition metal has zero oxidation state [CBSE PMT 1999; BHU 2000]
 (a) CrO_5 (b) $NH_2.NH_2$
 (c) $NOClO_4$ (d) $[Fe(CO)_5]$
25. Carbon is in the lowest oxidation state in [NCERT 1979; MH CET 1999]
 (a) CH_4 (b) CCl_4
 (c) CF_4 (d) CO_2
26. Oxidation number of carbon in $H_2C_2O_4$ is [CPMT 1982]
 (a) +4 (b) +3
 (c) +2 (d) -2
27. The oxidation number of Pt in $[Pt(C_2H_4)Cl_3]^-$ is [MNR 1993]
 (a) +1 (b) +2
 (c) +3 (d) +4
28. The oxidation number of carbon in CH_2Cl_2 is [CPMT 1976; Pb. PET 1999; AFMC 2004]
 (a) 0 (b) +2
 (c) -2 (d) +4
29. The oxidation states of phosphorus vary from [CPMT 1976]
 (a) -3 to +5 (b) -1 to +1
 (c) -3 to +3 (d) -5 to +1
30. The process in which oxidation number increases is known as [CPMT 1976]
 (a) Oxidation (b) Reduction
 (c) Auto-oxidation (d) None of the above
31. The oxidation number of S in $H_2S_2O_8$ is [MP PET 2002]
 (a) +2 (b) +4
 (c) +6 (d) +7
32. The oxidation state of nitrogen in N_3H is [NCERT 1977, 81]
 (a) $+\frac{1}{3}$ (b) +3
 (c) -1 (d) $-\frac{1}{3}$
33. Which of the following statements is correct [AFMC 1997]
 (a) Hydrogen has oxidation number -1 and +1
 (b) Hydrogen has same electronegativity as halogens
 (c) Hydrogen will not be liberated at anode
 (d) Hydrogen has same ionization potential as alkali metals
34. The oxidation state of Cr in $[Cr(NH_3)_4Cl_2]^+$ is [AIEEE 2005]
 (a) +3 (b) +2
 (c) +1 (d) 0
35. Sulphur has highest oxidation state in [EAMCET 1991]
 (a) SO_2 (b) H_2SO_4
 (c) $Na_2S_2O_3$ (d) $Na_2S_4O_6$
36. The oxidation number of Fe and S in iron pyrites are

- (a) 4, -2 (b) 2, -1 (c) 3, -1.5 (d) 3, -1 [RPMT 1997]
37. The oxidation number of nitrogen in NO_3^- is [CPMT 1982]
(a) -1 (b) +2 (c) +3 (d) +5
38. Oxidation state of elemental carbon is [MNR 1983]
(a) 0 (b) 1 (c) 2 (d) 3
39. The sum of the oxidation numbers of all the carbons in $\text{C}_6\text{H}_5\text{CHO}$ is [EAMCET 1986]
(a) +2 (b) 0 (c) +4 (d) -4
40. Which one of the following has the highest oxidation number of iodine [CPMT 1982]
(a) KI_3 (b) KI (c) IF_5 (d) KIO_4
41. The oxidation number of N in N_2H_5^+ [Pb. PMT 2001]
(a) -3 (b) -2 (c) -1 (d) +2
42. In which of the following compounds the oxidation number of carbon is maximum
(a) HCHO (b) CHCl_3 (c) CH_3OH (d) $\text{C}_{12}\text{H}_{22}\text{O}_{11}$
43. The oxidation state of chlorine in KClO_4 is [CPMT 1985]
(a) -1 (b) +1 (c) +7 (d) -7
44. The oxidation state of I in H_4IO_6^- is [CBSE PMT 1994]
(a) +7 (b) +5 (c) +1 (d) -1
45. An element which never has a positive oxidation number in any of its compounds [AIIMS 1981]
(a) Boron (b) Oxygen (c) Chlorine (d) Fluorine
46. In an oxidation process, oxidation number [CPMT 1976]
(a) Decreases (b) Increases (c) Does not change (d) First increases then decreases
47. If HNO_3 changes into N_2O , the oxidation number is changed by [BHU 1987; AFMC 2001]
(a) +2 (b) -1 (c) 0 (d) +4
48. The characteristic oxidation number of atoms in free metals is [NCERT 1975]
(a) Minus one (b) Any number (c) One (d) Zero
49. In which one of the following changes there are transfer of five electrons [NCERT 1982]
(a) $\text{MnO}_4^- \rightarrow \text{Mn}^{2+}$ (b) $\text{CrO}_4^{2-} \rightarrow \text{Cr}^{3+}$ (c) $\text{MnO}_4^{2-} \rightarrow \text{MnO}_2$ (d) $\text{Cr}_2\text{O}_7^{2-} \rightarrow 2\text{Cr}^{3+}$
50. Oxidation number of C in $\text{C}_6\text{H}_{12}\text{O}_6$ is [KCET 1992]
(a) +6 (b) -6 (c) 0 (d) +4
51. In which of the following compounds iron has lowest oxidation state [MNR 1984]
(a) $\text{FeSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$ (b) $\text{K}_4\text{Fe}(\text{CN})_6$ (c) $\text{Fe}(\text{CO})_5$ (d) Fe_2O (e) K_2FeO_4
52. The oxidation number of hydrogen in MH_2 is [CPMT 1976]
(a) +1 (b) -1 (c) +2 (d) -2
53. Oxidation number of iodine varies from [CPMT 1982]
(a) -1 to +1 (b) -1 to +7 (c) +3 to +5 (d) -1 to +5
54. When SO_2 is passed through acidic solution of potassium dichromate, then chromium sulphate is formed. Change in valency of chromium is [CPMT 1979]
(a) +4 to +2 (b) +5 to +3 (c) +6 to +3 (d) +7 to +2
55. The oxidation states of the most electronegative element in the products of the reaction of BaO_2 with dilute H_2SO_4 are [IIT 1991; CBSE PMT 1992; BHU 2000]
(a) 0 and -1 (b) -1 and -2 (c) -2 and 0 (d) -2 and +1
56. The highest oxidation state of Mn is shown by [MNR 1983; RPMT 1999]
(a) K_2MnO_4 (b) KMnO_4 (c) MnO_2 (d) Mn_2O_2 (e) MnO
57. The oxidation number of carbon in CH_2O is [IIT 1982; EAMCET 1985; MNR 1990; UPSEAT 2001; CPMT 1997, 2004]
(a) -2 (b) +2 (c) 0 (d) +4
58. Oxidation state of oxygen in hydrogen peroxide is [DPMT 1984; 91; CPMT 1988; MNR 1994; UPSEAT 2001; RPMT 2002; JEE Orissa 2004]
(a) -1 (b) +1 (c) 0 (d) -2
59. The oxidation number of Cr in $\text{K}_2\text{Cr}_2\text{O}_7$ is [CPMT 1981, 85, 90, 93, 99; KCET 1992; BHU 1988, 98; AFMC 1991, 99; EAMCET 1986; MP PMT 1996, 99, 2002; MP PET/PMT 1998; Bihar CEE 1995; RPET 2000]
(a) +6 (b) -7 (c) +2 (d) -2
60. In which of the following compounds transition metal is in oxidation state zero [NCERT 1982]
(a) $[\text{Co}(\text{NH}_3)_6]\text{Cl}_2$ (b) $[\text{Fe}(\text{H}_2\text{O})_6]\text{SO}_4$ (c) $[\text{Ni}(\text{CO})_4]$ (d) $[\text{Fe}(\text{H}_2\text{O})_3](\text{OH})_2$
61. Oxidation number of osmium (Os) in OsO_4 is [AIIMS 1999]
(a) +4 (b) +6 (c) +7 (d) +8
62. The atomic number of an element which shows the oxidation state of +3 is [CPMT 1989, 94]
(a) 13 (b) 32 (c) 33 (d) 17
63. The oxidation number of iron in the compound $\text{K}_4[\text{Fe}(\text{CN})_6]$ is [NCERT 1976; MNR 1986; AIIMS 2000]
(a) +6 (b) +4 (c) +3 (d) +2

64. The brown ring complex compound is formulated as $[Fe(H_2O)_5NO]SO_4$. The oxidation state of iron is
[EAMCET 1987; IIT 1987; MP PMT 1994; AIIMS 1997; DCE 2000]
(a) 1 (b) 2
(c) 3 (d) 0
65. Oxidation state of oxygen in F_2O is
[BHU 1982; UPSEAT 2001; MH CET 2002]
(a) +1 (b) +2
(c) -1 (d) -2
66. Phosphorus has the oxidation state of +3 in
[NCERT 1982; RPMT 1999]
(a) Orthophosphoric acid (b) Phosphorus acid
(c) Metaphosphoric acid (d) Pyrophosphoric acid
67. Oxidation number of P in $Mg_2P_2O_7$ is
[CPMT 1989; MP PMT 1995]
(a) +3 (b) +2
(c) +5 (d) -3
68. The oxidation state of nitrogen is highest in
[MP PMT 2001; BHU 2002]
(a) N_3H (b) NH_2OH
(c) N_2H_4 (d) NH_3
69. Oxidation number of P in KH_2PO_2 is
[CPMT 1987; MH CET 1999]
(a) +1 (b) +3
(c) +5 (d) -4
70. The most common oxidation state of an element is -2. The number of electrons present in its outermost shell is
[BHU 1983; NCERT 1974; CPMT 1977]
(a) 4 (b) 2
(c) 6 (d) 8
71. Sulphur has lowest oxidation number in
[EAMCET 1993]
(a) H_2SO_3 (b) SO_2
(c) H_2SO_4 (d) H_2S
72. The oxidation number and covalency of sulphur in the sulphur molecule (S_8) are respectively
[NCERT 1977]
(a) 0 and 2 (b) 6 and 8
(c) 0 and 8 (d) 6 and 2
73. In ferrous ammonium sulphate oxidation number of Fe is
[CPMT 1988]
(a) +3 (b) +2
(c) +1 (d) -2
74. The oxidation number of nitrogen in NH_2OH is
[NCERT 1981]
(a) +1 (b) -1
(c) -3 (d) -2
75. The oxidation number of phosphorus in $Ba(H_2PO_2)_2$ is
[Kurukshetra CEE 1998; DCE 2004]
(a) -1 (b) +1
(c) +2 (d) +3
76. A compound is in its low oxidation state. Then it will be
[DCE 2001]
(a) Highly acidic
(b) Highly basic
(c) Highest oxidising property
(d) Half acidic, half basic
77. The oxidation number and the electronic configuration of sulphur in H_2SO_4 is
[KCET 2002]
(a) +4; $1s^2 2s^2 2p^6 3s^2$
(b) +2; $1s^2 2s^2 2p^6 3s^2 3p^2$
(c) +3; $1s^2 2s^2 2p^6 3s^2 3p^1$
(d) +6; $1s^2 2s^2 2p^6$
78. The oxidation number of Mn in $KMnO_4$ is
[CPMT 1982, 83; EAMCET 1992, 93; RPET 1999]
(a) +7 (b) -7
(c) +1 (d) -1
79. Oxidation number of As atoms in H_3AsO_4 is
[DPMT 2001]
(a) -3 (b) +4
(c) +6 (d) +5
80. In XeO_3 and XeF_6 the oxidation state of Xe is
[MP PET 2003]
(a) +4 (b) +6
(c) +1 (d) +3
81. Oxidation number of carbon in $CH_3 - Cl$ is
[MP PET 2000]
(a) -3 (b) -2
(c) -1 (d) 0
82. The oxidation state of Cr in $Cr_2O_7^{2-}$ is
[BHU 2000; CPMT 2000]
(a) 4 (b) -6
(c) 6 (d) -2
83. Oxidation state of 'S' in H_2SO_3
[RPET 2003]
(a) +3 (b) +6
(c) +4 (d) +2
84. Oxidation numbers of two Cl atoms in bleaching powder, $CaOCl_2$ are
(a) -1, -1 (b) +1, -1
(c) +1, +1 (d) 0, -1
85. Select the compound in which chlorine is assigned the oxidation number +5
[NCERT 1984, 94]
(a) $HClO_4$ (b) $HClO_2$
(c) $HClO_3$ (d) HCl
86. When $KMnO_4$ is reduced with oxalic acid in acidic solution, the oxidation number of Mn changes from
[MNR 1987; MP PET 2000; CBSE PMT 2000; UPSEAT 2000, 02; BHU 2003; AMU 2002]
(a) 7 to 4 (b) 6 to 4
(c) 7 to 2 (d) 4 to 2
87. Oxygen has oxidation states of +2 in the
[NCERT 1973; DPMT 1983; MP PET 2000]
(a) H_2O_2 (b) CO_2
(c) H_2O (d) OF_2
88. The element exhibiting most stable +2 oxidation state among the following is
[IIT 1995]
(a) Ag (b) Fe
(c) Sn (d) Pb
89. Oxidation number of sulphur in $S_2O_3^{2-}$ is
[CPMT 1979]
(a) -2 (b) +2
(c) +6 (d) 0
90. Carbon has zero oxidation number in
[Kurukshetra CEE 2002]

- (a) CO (b) CH_4
(c) CH_2Cl_2 (d) CH_3Cl
91. Oxidation state of oxygen atom in potassium superoxide is [MNR 1988; NCERT 1980]
(a) 0 (b) -1
(c) $-\frac{1}{2}$ (d) -2
92. Oxidation number of S in S_2Cl_2 is
(a) +1 (b) -1
(c) +6 (d) 0
93. What is the oxidation number of sulphur in $Na_2S_4O_6$ [AIIMS 1998; DCE 1999]
(a) $\frac{2}{3}$ (b) $\frac{3}{2}$
(c) $\frac{3}{5}$ (d) $\frac{5}{2}$
94. When $CuSO_4$ reacts with KI , the oxidation number of Cu changes by [BHU 1997]
(a) 0 (b) -1
(c) 1 (d) 2
95. The oxidation number of N in NH_4Cl is
(a) +5 (b) +3
(c) -5 (d) -3
96. In which reaction there is a change in valency [NCERT 1971; CPMT 1971]
(a) $2NO_2 \rightarrow N_2O_4$
(b) $2NO_2 + H_2O \rightarrow HNO_2 + HNO_3$
(c) $NH_4OH \rightarrow NH_4^+ + OH^-$
(d) $CaCO_3 \rightarrow CaO + CO_2$
97. Oxidation state of Fe in Fe_3O_4 is [CBSE PMT 1999; AIIMS 2002]
(a) $\frac{3}{2}$ (b) $\frac{4}{5}$
(c) $\frac{5}{4}$ (d) $\frac{8}{3}$
98. Nitrogen show different oxidation states in the range [Kerala (Med.) 2003]
(a) 0 to +5 (b) -3 to +5
(c) -5 to +3 (d) -3 to +3
99. Oxidation number of Mn in K_2MnO_4 and $MnSO_4$ are respectively [CPMT 1997]
(a) +7, +2 (b) +6, +2
(c) +5, +2 (d) +2, +6
100. Identify the element which can have highest oxidation numbers [AIIMS 1996]
(a) N (b) O
(c) Cl (d) C
101. What is the oxidation number of Co in $[Co(NH_3)_4ClNO_2]$ [BHU 1999]
(a) +2 (b) +3
(c) +4 (d) +5
102. The oxidation number of nickel in $K_4[Ni(CN)_4]$ is [JIPMER 1999]
(a) -2 (b) -1
(c) +2 (d) 0
103. The oxidation number of fluorine in F_2O is [CPMT 1982; BHU 1982; EAMCET 1986]
(a) -1 (b) +1
(c) +2 (d) -2
104. Oxidation number of Fe in $K_3[Fe(CN)_6]$ is [AMU 1988]
(a) +2 (b) +3
(c) +1 (d) +4
105. Oxidation number of N in NH_3 is [CPMT 1979; Pb CET 2004]
(a) -3 (b) +3
(c) 0 (d) +5
106. What is the net charge on ferrous ion [AFMC 2004]
(a) +2 (b) +3
(c) +4 (d) +5
107. Which of the following elements never show positive oxidation number [CPMT 2004]
(a) O (b) Fe
(c) Ga (d) F
108. The oxidation state shown by silicon when it combines with strongly electropositive metals is [MH CET 2004]
(a) -2 (b) -4
(c) +4 (d) -2
109. The oxidation number of sulphur in H_2S is [Pb. CET 2002]
(a) -2 (b) +3
(c) +2 (d) -3
110. Oxidation number of nitrogen in $NaNO_2$ is [Pb. CET 2000]
(a) +2 (b) +3
(c) +4 (d) -3
111. Oxidation number of S in SO_4^{2-} [BCECE 2005]
(a) +6 (b) +3
(c) +2 (d) -2
112. The oxidation state of chromium in the final product formed by the reaction between KI and acidified potassium dichromate solution is [AIEEE 2005]
(a) +4 (b) +6
(c) +2 (d) +3
113. The oxidation state of I in IPO_4 is [Orissa JEE 2005]
(a) +1 (b) +3
(c) +5 (d) +7

Redox reaction and Method for balancing Redox reaction

1. The value of x in the partial redox equation $MnO_4^- + 8H^+ + xe \rightleftharpoons Mn^{2+} + 4H_2O$ is
(a) 5 (b) 3
(c) 1 (d) 0
2. $C_2H_6(g) + nO_2 \rightarrow CO_2(g) + H_2O(l)$
In this equation, the ratio of the coefficients of CO_2 and H_2O is [KCET 1992]
(a) 1 : 1 (b) 2 : 3
(c) 3 : 2 (d) 1 : 3
3. The number of electrons involved in the reduction of $Cr_2O_7^{2-}$ in acidic solution to Cr^{3+} is [EAMCET 1983]
(a) 0 (b) 2
(c) 3 (d) 5
4. When $KMnO_4$ acts as an oxidising agent and ultimately forms $[MnO_4]^{2-}$, MnO_2 , Mn_2O_3 , Mn^{+2} then the number of electrons transferred in each case respectively is [AIEEE 2002]

- (a) 4, 3, 1, 5 (b) 1, 5, 3, 7
(c) 1, 3, 4, 5 (d) 3, 5, 7, 1
5. Starch paper is used to test for the presence of [NCERT 1979]
(a) Iodine (b) Oxidising agent
(c) Iodide ion (d) Reducing agent
6. How many moles of $K_2Cr_2O_7$ can be reduced by 1 mole of Sn^{2+} [MP PMT 2003]
(a) $1/3$ (b) $1/6$
(c) $2/3$ (d) 1
7. $2MnO_4^- + 5H_2O_2 + 6H^+ \rightarrow 2Z + 5O_2 + 8H_2O$. In this reaction Z is [RPMT 2002]
(a) Mn^{+2} (b) Mn^{+4}
(c) MnO_2 (d) Mn
8. What is 'A' in the following reaction
 $2Fe^{3+}_{(aq)} + Sn^{2+}_{(aq)} \rightarrow 2Fe^{2+}_{(aq)} + A$ [MP PET 2003]
(a) $Sn^{3+}_{(aq)}$ (b) $Sn^{4+}_{(aq)}$
(c) $Sn^{2+}_{(aq)}$ (d) Sn
9. For the redox reaction
 $MnO_4^- + C_2O_4^{2-} + H^+ \rightarrow Mn^{2+} + CO_2 + H_2O$
the correct coefficients of the reactants for the balanced reaction are [IIT 1988, 92; BHU 1995; CPMT 1997; RPMT 1999; DCE 2000; MP PET 2003]
- | MnO_4^- | $C_2O_4^{2-}$ | H^+ |
|-----------|---------------|-------|
| (a) 2 | 5 | 16 |
| (b) 16 | 5 | 2 |
| (c) 5 | 16 | 2 |
| (d) 2 | 16 | 5 |
10. Which of the following is a redox reaction [AIEEE 2002]
(a) $NaCl + KNO_3 \rightarrow NaNO_3 + KCl$
(b) $CaC_2O_4 + 2HCl \rightarrow CaCl_2 + H_2C_2O_4$
(c) $Mg(OH)_2 + 2NH_4Cl \rightarrow MgCl_2 + 2NH_4OH$
(d) $Zn + 2AgCN \rightarrow 2Ag + Zn(CN)_2$
11. Which of the following reaction is a redox reaction [MP PMT 2003]
(a) $P_2O_5 + 2H_2O \rightarrow H_4P_2O_7$
(b) $2AgNO_3 + BaCl_2 \rightarrow 2AgCl + Ba(NO_3)_2$
(c) $BaCl_2 + H_2SO_4 \rightarrow BaSO_4 + 2HCl$
(d) $Cu + 2AgNO_3 \rightarrow 2Ag + Cu(NO_3)_2$
12. Which of the following reactions involves oxidation-reduction [NCERT 1972; AFMC 2000; Pb. CET 2004; CPMT 2004]
(a) $NaBr + HCl \rightarrow NaCl + HBr$
(b) $HBr + AgNO_3 \rightarrow AgBr + HNO_3$
(c) $H_2 + Br_2 \rightarrow 2HBr$
(d) $2NaOH + H_2SO_4 \rightarrow Na_2SO_4 + 2H_2O$
13. Which of the following is the strongest oxidising agent [Pb. CET 2000]
(a) $BrO_3^- / Br^{2+}, E^0 = +1.50$
(b) $Fe^{3+} / Fe^{2+}, E^0 = +0.76$
(c) $MnO_4^- / Mn^{2+}, E^0 = +1.52$
(d) $Cr_2O_7^{2-} / Cr^{3+}, E^0 = +1.33$
14. In the balanced chemical reaction,
 $IO_3^- + aI^- + bH^+ \rightarrow cH_2O + dI_2$
a, b, c and d respectively correspond to [AIIMS 2005]
(a) 5, 6, 3, 3 (b) 5, 3, 6, 3
(c) 3, 5, 3, 6 (d) 5, 6, 5, 5
15. The number of moles of $KMnO_4$ reduced by one mole of KI in alkaline medium is: [CBSE PMT 2005]
(a) One fifth (b) five
(c) One (d) Two

Auto oxidation and Disproportionation

1. In the equation $H_2S + 2HNO_3 \rightarrow 2H_2O + 2NO_2 + S$
The equivalent weight of hydrogen sulphide is [BVP 2003]
(a) 16 (b) 68
(c) 34 (d) 17
2. 1.2 g of metal displace 1.12 litre hydrogen at normal temperature and pressure, equivalent weight of metal would be [DPMT 2001]
(a) 24 (b) 12
(c) $1.2 \div 11.2$ (d) 1.2×11.2
3. Which one of the following nitrates will leave behind a metal on strong heating [AIEEE 2003]
(a) Ferric nitrate (b) Copper nitrate
(c) Manganese nitrate (d) Silver nitrate
4. To prevent rancidification of food material, which of the following is added [CPMT 1996]
(a) Reducing agent (b) Anti-oxidant
(c) Oxidising agent (d) None of these
5. Prevention of corrosion of iron by zinc coating is called [MP PMT 1993; CPMT 2002]
(a) Galvanization (b) Cathodic protection
(c) Electrolysis (d) Photo-electrolysis
6. The metal used in galvanizing of iron is [MP PET 1985, 96]
(a) Pb (b) Zn
(c) Al (d) Sn
7. In which of the following reactions there is no change in valency [NCERT 1974; CPMT 1997]
(a) $4KClO_3 \rightarrow 3KClO_4 + KCl$
(b) $SO_2 + 2H_2S \rightarrow 2H_2O + 3S$
(c) $BaO_2 + H_2SO_4 \rightarrow BaSO_4 + H_2O_2$
(d) $2BaO + O_2 \rightarrow 2BaO_2$
8. The equivalent weight of phosphoric acid (H_3PO_4) in the reaction
 $NaOH + H_3PO_4 \rightarrow NaH_2PO_4 + H_2O$ is [AIIMS 1999]
(a) 25 (b) 49
(c) 59 (d) 98
9. What is the equivalent mass of IO_4^- when it is converted into I_2 in acid medium [Kerala PMT 2004]

- (a) $M/6$ (b) $M/7$
(c) $M/5$ (d) $M/4$
(e) None of these
10. For decolourization of 1 mole of $KMnO_4$, the moles of H_2O_2 required is [AIIMS 2004]
(a) $1/2$ (b) $3/2$
(c) $5/2$ (d) $7/2$
11. In the reaction $I_2 + 2S_2O_3^{2-} \rightarrow 2I^- + S_4O_6^{2-}$ equivalent weight of iodine will be equal to [MP PET 2004]
(a) $1/2$ of molecular weight
(b) Molecular weight
(c) $1/4$ of molecular weight
(d) None
12. The equivalent weight of KIO_3 in the reaction $2Cr(OH)_3 + 4OH + KIO_3 \rightarrow 2CrO_4^{2-} + 5H_2O + KI$ is [MP PMT 2004]
(a) Mole wt. (b) $\frac{\text{Mol.wt.}}{6}$
(c) $\frac{\text{Mol.wt.}}{2}$ (d) $\frac{\text{Mol.wt.}}{3}$
13. The product of oxidation of I^- with MnO_4^- in alkaline medium is [IIT-JEE Screening 2004]
(a) IO_3^- (b) I_2
(c) IO^- (d) IO_4^-
14. In alkaline medium ClO_2 oxidize H_2O_2 in O_2 and reduced itself in Cl^- then how many mole of H_2O_2 will oxidize by one mole of ClO_2 [Kerala CET 2005]
(a) 1.0 (b) 1.5
(c) 2.5 (d) 3.5
(e) 5.0

Critical Thinking

Objective Questions

1. In which of the following acid, which acid has oxidation reduction and complex formation properties [UPSEAT 2001]
(a) HNO_3 (b) H_2SO_4
(c) HCl (d) HNO_2
2. The compound which could not act both as oxidising as well as reducing agent is [IIT Screening 1991]
(a) SO_2 (b) MnO_2
(c) Al_2O_3 (d) CrO
3. H_2S acts only as a reducing agent while SO_2 can act both as a reducing and oxidizing agent because [AMU 1999]
(a) S in H_2S has -2 oxidation state
(b) S in SO_2 has oxidation state $+4$
(c) Hydrogen in H_2S more +ve than oxygen
(d) Oxygen is more -ve in SO_2
4. Of all the three common mineral acids, only sulphuric acid is found to be suitable for making the solution acidic because [Kurukshetra CEE 2002]
(a) It does not react with $KMnO_4$ or the reducing agent
(b) Hydrochloric acid reacts with $KMnO_4$
(c) Nitric acid is an oxidising agent which reacts with reducing agent
(d) All of the above are correct
5. For H_3PO_3 and H_3PO_4 the correct choice is [IIT Screening 2003]
(a) H_3PO_3 is dibasic and reducing
(b) H_3PO_3 is dibasic and non-reducing
(c) H_3PO_4 is tribasic and reducing
(d) H_3PO_3 is tribasic and non-reducing
6. Match List I with List II and select the correct answer using the codes given below the lists
- | List I (Compound) | List II (Oxidation state of N) |
|-------------------|--------------------------------|
| (A) NO_2 | (1) $+5$ |
| (B) HNO | (2) -3 |
| (C) NH_3 | (3) $+4$ |
| (D) N_2O_5 | (4) $+1$ |
- Codes :
(a) A B C D
2 3 4 1
(b) A B C D
3 1 2 4
(c) A B C D
3 4 2 1
(d) A B C D
2 3 1 4
7. M^{+3} ion loses $3e^-$. Its oxidation number will be [CPMT 2002]
(a) 0 (b) $+3$
(c) $+6$ (d) -3
8. In the reaction $Zn + 2H^+ + 2Cl^- \rightarrow Zn^{2+} + 2Cl^- + H_2$, the spectator ion is [AIIMS 2001]
(a) Cl^- (b) Zn^{2+}
(c) H^+ (d) All of these
9. The oxidation number of sulphur in $H_2S_2O_7$ and iron in $K_4Fe(CN)_6$ is respectively [AIIMS 2000]
(a) $+6$ and $+2$ (b) $+2$ and $+2$
(c) $+8$ and $+2$ (d) $+6$ and $+4$
10. Oxidation number of oxygen in potassium super oxide (KO_2) is [UPSEAT 1999,
(a) -2 (b) -1
(c) $-1/2$ (d) $-1/4$
11. One mole of N_2H_4 loses 10 mol of electrons to form a new compound Y. Assuming that all nitrogen appear in the new compound, what is the oxidation state of N in Y? (There is no change in the oxidation state of hydrogen) [IIT 1981; Pb. PMT 1998]
(a) $+3$ (b) -3
(c) -1 (d) $+5$

12. Amongst the following identify the species with an atom in + 6 oxidation state [IIT Screening 2000]
- (a) MnO_4^- (b) $Cr(CN)_6^{3-}$
(c) NiF_6^{2-} (d) CrO_2Cl_2
13. In which of the following compounds, is the oxidation number of iodine is fractional [BVP 2003]
- (a) IF_3 (b) IF_2
(c) I_3^- (d) IF_7
14. The compound $YBa_2Cu_3O_7$ which shows superconductivity has copper in oxidation state Assume that the rare earth element Yttrium is in its usual +3 oxidation state [IIT 1994]
- (a) $3/7$ (b) $7/3$
(c) 3 (d) 7
15. The oxidation number of sulphur in S_8, S_2F_2, H_2S respectively, are [IIT 1999]
- (a) 0, +1 and - 2 (b) + 2, +1 and - 2
(c) 0, + 1 and + 2 (d) - 2, + 1 and - 2
16. Which one of the following reactions is not an example of redox reaction [Kurukshetra CEE 1998]
- (a) $Cl_2 + 2H_2O + SO_2 \rightarrow 4H^+ + SO_4^{2-} + 2Cl^-$
(b) $Cu^{++} + Zn \rightarrow Zn^{++} + Cu$
(c) $2H_2 + O_2 \rightarrow 2H_2O$
(d) $HCl + H_2O \rightarrow H_3O^+ + Cl^-$
17. For the reactions, $C + O_2 \rightarrow CO_2; \Delta H = -393J$
 $2Zn + O_2 \rightarrow 2ZnO; \Delta H = -412J$ [AIEEE 2002]
- (a) Carbon can oxidise Zn
(b) Oxidation of carbon is not feasible
(c) Oxidation of Zn is not feasible
(d) Zn can oxidise carbon
18. In the reaction $B_2H_6 + 2KOH + 2X \rightarrow 2Y + 6H_2$, X and Y are respectively [EAMCET 2003]
- (a) H_2, H_3BO_3 (b) HCl, KBO_3
(c) H_2O, KBO_3 (d) H_2O, KBO_2
19. In a balanced equation $H_2SO_4 + xHI \rightarrow H_2S + yI_2 + zH_2O$, the values of x, y, z are [EAMCET 2003]
- (a) $x = 3, y = 5, z = 2$
(b) $x = 4, y = 8, z = 5$
(c) $x = 8, y = 4, z = 4$
(d) $x = 5, y = 3, z = 4$
20. Which of the following can act as an acid and as a base [AMU 1999]
- (a) $HClO_3^-$ (b) $H_2PO_4^-$
(c) HS^- (d) All of these
21. MnO_4^{2-} (1 mole) in neutral aqueous medium is disproportionate to [AIIMS 2003]
- (a) $2/3$ mole of MnO_4^- and $1/3$ mole of MnO_2
(b) $1/3$ mole of MnO_4^- and $2/3$ mole of MnO_2
(c) $1/3$ mole of Mn_2O_7 and $1/3$ mole of MnO_2
(d) $2/3$ mole of Mn_2O_7 and $1/3$ mole of MnO_2
22. The conductivity of a saturated solution of $BaSO_4$ is $3.06 \times 10^{-6} \text{ ohm}^{-1} \text{ cm}^{-1}$ and its equivalent conductance is $1.53 \text{ ohm}^{-1} \text{ cm}^{-1} \text{ equivalent}^{-1}$. The K_{sp} of the $BaSO_4$ will be [KCET 1996]
- (a) 4×10^{-12} (b) 2.5×10^{-9}
(c) 2.5×10^{-13} (d) 4×10^{-6}
23. When MnO_2 is fused with KOH , a coloured compound is formed, the product and its colour is [IIT Screening 2003]
- (a) K_2MnO_4 , purple green
(b) $KMnO_4$, purple
(c) Mn_2O_3 , brown
(d) Mn_3O_4 black

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : SO_2 and Cl_2 both are bleaching agents.
Reason : Both are reducing agents. [AIIMS 1995]
2. Assertion : Fluorine exists only in -1 oxidation state.
Reason : Fluorine has $2s^2 2p^5$ configuration. [AIIMS 2001]
3. Assertion : Stannous chloride is a powerful oxidising agent which oxidises mercuric chloride to mercury.
Reason : Stannous chloride gives grey precipitate with mercuric chloride, but stannic chloride does not do so. [AIIMS 2002]
4. Assertion : $HClO_4$ is a stronger acid than $HClO_3$.
Reason : Oxidation state of Cl in $HClO_4$ is +VII and in $HClO_3$ +V. [AIIMS 2004]
5. Assertion : In a reaction $Zn(s) + CuSO_4(aq) \rightarrow ZnSO_4(aq) + Cu(s)$, Zn is a reductant but itself get oxidized.

- Reason : In a redox reaction, oxidant is reduced by accepting electrons and reductant is oxidized by losing electrons.
6. Assertion : Oxidation number of carbon in CH_2O is zero.
- Reason : CH_2O formaldehyde, is a covalent compound.
7. Assertion : The oxidation numbers are artificial, they are useful as a 'book-keeping' device of electrons in reactions.
- Reason : The oxidation numbers do not usually represent real charges on atoms, they are simply conventions that indicate what the maximum charge could possibly be on an atom in a molecule.
8. Assertion : H_2SO_4 cannot act as reducing agent.
- Reason : Sulphur cannot increase its oxidation number beyond + 6.
9. Assertion : Equivalent weight of NH_3 in the reaction $N_2 \rightarrow NH_3$ is 17/3 while that of N_2 is 28/6.
- Reason : Equivalent weight

$$= \frac{\text{Molecular weight}}{\text{number of } e^- \text{ lost or gained}}$$

Answers and Solutions

Oxidation, Reduction

It shows oxidation and reduction (Redox) properties.

9. (a) $2\overset{+1}{\text{CuI}} \rightarrow \overset{0}{\text{Cu}} + \overset{+2}{\text{CuI}_2}$. Oxidation and Reduction both occur so the reaction is redox.

10. (c) $\text{H}_2\text{S} + \text{X}_2(\text{Cl}, \text{Br}, \text{I} = \text{X}) \rightarrow 2\text{HX} + \text{S}$. Here the halogen are reduced.

11. (b) When H_2O_2 reduces with $\text{K}_4[\text{Fe}(\text{CN})_6]$. It is present in acidic solution.

13. (b) In the given reaction oxidation state of Mg is changing from 0 to +2 while in nitrogen it is changing from 0 to -3. So oxidation of Mg and reduction of nitrogen takes place.

14. (b) When sodium metal is dissolved in liquid ammonia to form coloured solution. Dilute solutions are bright blue in colour due to the presence of solvated electrons.

15. (b) The metallic iron is oxidised to Fe^{+3} .

In this reaction HgCl_2 is reduced in Hg .

17. (a) It is the process in which electrons are lost (de-electronation).

18. (b) $4\text{Fe} + 3\text{O}_2 \rightarrow 4\text{Fe}^{3+} + 6\text{O}^{2-}$

19. (c) Cu is above of Ag in electrochemical series and thus $\text{Cu} + 2\text{Ag}^+ \rightarrow \text{Cu}^{2+} + 2\text{Ag}$ reaction occurs.

21. (a) $\text{Sn}^{2+} \rightarrow \text{Sn}^{4+} + 2e^-$. In this reaction Sn^{2+} change in Sn^{4+} it is called an oxidation reaction.

22. (c) $2\text{S}_2\text{O}_3^{2-} + \text{I}_2 \rightarrow \text{S}_4\text{O}_6^{2-} + 2\text{I}^-$.

23. (b) $\overset{2+}{\text{Zn}}_{(\text{aq})} + 2e^- \rightarrow \overset{0}{\text{Zn}}_{(\text{s})}$ reduction.

24. (b) SO_2 bleaches by reduction while chlorine bleaches colour of flowers by oxidation.

25. (b) It is the process in which electrons are gained (electronation).

In this reaction Zn atom oxidised to Zn^{2+} ion and iodine reduced to I^- .

27. (c) $\overset{*}{\text{CrO}_4^{2-}} \quad \overset{*}{\text{Cr}_2\text{O}_7^{2-}}$
 $x + [(-2) \times 4] = -2 \quad 2x + (-2) \times 7 = -2$
 $x = 8 - 2 = +6 \quad 2x = 14 - 2 = 12,$

$$x = \frac{12}{2} = +6$$

In this reaction oxidation and reduction are not involved because there is no change in oxidation number.

28. (d) $3\overset{0}{\text{Br}_2} + 6\overset{-1}{\text{CO}_3^{2-}} + 3\text{H}_2\text{O} \rightarrow 5\overset{-1}{\text{Br}^-} + \overset{+5}{\text{BrO}_3^-} + 6\text{HCO}_3^-$. In this reaction bromine is oxidised as well as reduced.

29. (a) P is oxidized as well as reduced (as in option a).

31. (a) In this reaction oxidation occur.

32. (a) Fluorine has highest E° - value and more reactive than MnO_2 .

33. (a) $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + e^-$ oxidation.

34. (d) $\text{MnO}_4^- \rightarrow \text{Mn}^{2+}$. In this reaction $5e^-$ are needed for the reduction of Mn^{2+} as:

In this reaction Cu^{2+} change in Cu^0 , hence it is called as reduction reaction.

36. (d) $4\overset{0}{\text{Fe}} + 3\text{O}_2 \rightarrow 4\overset{3+}{\text{Fe}} + 6\text{O}^{2-}$, in this reaction metallic iron is oxidised to Fe^{3+} .

37. (d) $2\overset{0}{\text{N}_2} + \overset{0}{\text{O}_2} \rightarrow 2\overset{+2-2}{\text{NO}}$

Here O.N. of N increases from 0 in N_2 to +2 in NO , 2- and that of decreased from 0 in O_2 to -2 in O , therefore, it is a redox reaction.

Oxidizing and Reducing agent

The oxidation of S shows oxidising nature of H_2O_2 .

2. (a) $\text{C}_2\text{O}_4^{2-} + \text{MnO}_4^- + \text{H}^+ \rightarrow \text{Mn}^{2+} + \text{CO}_2 + \text{H}_2\text{O}$.

In this reaction $\text{C}_2\text{O}_4^{2-}$ act as a reducing agent.

3. (b) A substance which is capable of reducing other substances and is capable of donating electrons during reduction is called a reducing agent or reductant.

4. (a) Fluorine is a most powerful oxidizing agent because it consist of $E^\circ = +2.5 \text{ volt}$.

5. (d) HClO is the strongest oxidising agent. The correct order of oxidising power is $\overset{+1}{\text{HClO}} > \overset{+3}{\text{HClO}_2} > \overset{+5}{\text{HClO}_3} > \overset{+7}{\text{HClO}_4}$.

6. (b) It acts both oxidizing and reducing agent.

7. (c) Prevent action of water and salt.

9. (a) In this reaction H_2O_2 acts as an oxidizing agent.
10. (b) $NaNO_2$, $SnCl_2$ and HI have reducing and oxidizing properties but $NaNO_3$ has only oxidizing property.
11. (c) Because I_2 is a reducing agent.
13. (a) In this reaction H_2O acts as an oxidising agent.
14. (d) I^- acts as a more reducing agent than other ions.
15. (a) When sulphur dioxide reacts with H_2S here SO_2 acts as an oxidising agent and H_2S acts as a reducing agent.
16. (b) HI (Hydrogen iodide) is a good reducing agent than other compounds.
17. (b) Hydrogen sulphide (H_2S) acts as a strong reducing agent as it decomposes by evolving hydrogen.
19. (b) $\overset{0}{Cl}_2 + H_2O_2 \rightarrow 2\overset{-1}{HCl} + \overset{-1}{O}_2$. In this reaction chlorine is reduced from zero to -1 oxidation state.
20. (d) $NaCl + H_2O \rightarrow NaOH + HCl$
Sodium ion is hydrated in water.
21. (a) Potassium has a higher negative value of reduction potential hence it shows more reducing properties.
22. (b) The oxidation number of Ni changes from 0 to $+1$.
23. (d) HNO_2 (Nitrous acid) acts as an oxidising, reducing agent and has complex formation properties.
24. (d) CO_2 is an oxidizing agent.
25. (b) Hydrogen peroxide (H_2O_2) acts as both an oxidising and a reducing agent.
27. (d) $H_2O + Br_2 \longrightarrow HOBr + HBr$
 $\begin{matrix} & & +1 & -1 \\ & & \uparrow & \downarrow \\ 0 & & & \end{matrix}$

In the above reaction the oxidation number of Br_2 increases from zero (in Br_2) to $+1$ (in $HOBr$) and decreases from zero (Br_2) to -1 (in HBr). Thus Br_2 is oxidised as well as reduced & hence it is a redox reaction.

28. (c) $Cl_2 + H_2O \longrightarrow HCl + HOCl$

$HOCl$ can furnish nascent oxygen.

Reduction (oxidising agent)

29. (a) $Ag_2O + H_2O_2 \longrightarrow 2Ag + H_2O + O_2$
 $\begin{matrix} & & & & & & \\ & & \downarrow & & \uparrow & & \\ & & \text{Oxidation (reducing agent)} & & \text{Reduction (oxidising agent)} & & \end{matrix}$

30. (d) Oxidizing agent itself, undergoes reduction during a redox reaction

Hence, here $HAsO_2$ is acting as an oxidizing agent.

31. (d) $NaNO_2$ (Sodium nitrite) acts both as an oxidising as well as a reducing agent because in it N atom is in $+3$ oxidation state (intermediate oxidation state)

Reducing property

Oxidation number and Oxidation state

1. (d) $\overset{*}{CO_2}$
 $x + 2(-2) = 0$; $x - 4 = 0$; $x = +4$.
3. (b) $+2$ it is a second group element.
4. (b) In $\overset{*}{HNO_2}$ oxidation number of $N = +3$
In $\overset{*}{HNO_3}$ oxidation number of $N = +5$.
5. (d) In case of Cl_2O chlorine shows $+1$ oxidation state.
6. (b) $\overset{*}{[Cr(H_2O)_4Cl_2]^+}$
 $x + 0 + 2(-1) = +1$; $x - 2 = +1$
 $x = +3$ for Cr in complex.
7. (c) $\overset{0}{Br_2} \rightarrow \overset{+5}{BrO_3^-}$, in this reaction oxidation state changes from 0 to $+5$.
8. (c) Oxidation state of sulphur in H_2S is -2 , while it is zero in 'S' i.e. in this reaction oxidation of sulphur and reduction of chlorine takes place.
9. (c) $\overset{*}{K[Co(CO)_4]}$
 $1 + x + 0 = 0$; $x = -1$.
10. (a) $\overset{+6}{K_2Cr_2O_7} \rightarrow \overset{+6}{K_2CrO_4}$. In this reaction no change in oxidation state of chromium.
11. (c) In hypochlorous acid chlorine atom has $+1$ oxidation number.
12. (a) $S \rightarrow S^{2-}$ O.N. of $S = -2$.
13. (d) $(NH_4)_2SO_4 \rightleftharpoons 2NH_4^+ + SO_4^{--}$
 $\overset{*}{NH_4^+}$
 $x + 4 = +1$; $x = 1 - 4 = -3$.
14. (b) In N_2O nitrogen has $+1$ oxidation state.
15. (a) If any central metal atom combined with a carbonyl group then the central metal atom shows always zero oxidation state.
16. (d) $\overset{*}{H_2SO_4}$
 $2 + x - 2 \times 4 = 0$, $x = 8 - 2 = +6$.
17. (d) $\overset{*}{HClO_4}$
 $1 + x - 2 \times 4 = 0$; $1 + x - 8 = 0$
 $x = 8 - 1 = +7$ oxidation state.
18. (d) $\overset{*}{HNO_3}$; $1 + x - 6 = 0$; $x = +5$.
19. (a) Mn shows $+7$ oxidation state in MnO_4^{-1} .

$$x + (-2 \times 4) = -1$$

$$x - 8 = -1$$

$$x = -1 + 8 = +7.$$

$$2 + x - 2 \times 4 = 0$$

$$x = 8 - 2 = +6.$$

22. (b) Each molecule always show zero oxidation state.

23. (c) Maximum oxi. state for Cr is + 6.

24. (d) In $[Fe(CO)_5]$, transition metal Fe has zero oxidation state.

25. (a) In (b, c, d) carbon show + 4 oxidation state while in (a) carbon show - 4 oxidation state.

$$2 + 2x - 2 \times 4 = 0; \quad 2x = 8 - 2 = 6$$

$$x = \frac{6}{2} = +3.$$

27. (b) In complex $[Pt(C_2H_4)Cl_3]^-$ Pt have + 2 oxidation state.

$$x + 2 - 2 = 0; \quad x = 0.$$

29. (a) Phosphorus shows - 3 to + 5 oxidation state.

31. (c) The chemical structure of $H_2S_2O_8$ is as follows:-

So the oxidation number of S should be :

$$2 \times (+1) + 2 \times X + 6 \times (-2) + 2 \times (-1) = 0 \quad \text{or} \quad X = +6.$$

(for H) (for S) (for O) (for O-O)

32. (d) In hydrazoic acid (N_3H) nitrogen shows $-\frac{1}{3}$ oxidation state.

$$3x + 1 = 0, \quad 3x = -1, \quad x = -\frac{1}{3}.$$

33. (a) Hydrogen have oxidation no. + 1 and - 1.

$$x + 4 \times (0) - 2 = 1 \Rightarrow x + 0 - 2 = 1$$

$$\Rightarrow x = 1 + 2 = +3.$$

$$x - 4 = 0 \quad 4 + 2x = 0$$

$$x = +4 \quad 2x = -4$$

$$x = \frac{-4}{2} = -2.$$

$$x - 2 \times 3 = -1; \quad x = 6 - 1 = +5.$$

38. (a) Every element always shows zero oxidation state.

39. (d) In benzaldehyde all carbon atoms show - 4 oxidation state.

$$1 + x - 2 \times 4 = 0; \quad x = 8 - 1 = +7.$$

$$2x + 5 = +1; \quad 2x = 1 - 5$$

$$2x = -4; \quad x = -2.$$

42. (b) Oxidation number of C in

$$2 + 2x - 2 \times 7 = 0$$

$$2x - 14 + 2 = 0.$$

$$4 + x - 12 = -1; \quad x = -1 + 8 = +7.$$

45. (d) Fluorine always shows - 1 oxidation state.

46. (b) In oxidation process oxidation state always increases.

$$1 + x - 6 = 0 \quad 2x - 2 = 0$$

$$x = +5 \quad 2x = 2$$

$$x = \frac{2}{2} = +1.$$

48. (d) All free metals always shows zero oxidation state.

50. (c) C has oxidation number = 0.

51. (c) Iron has zero oxidation state in carbonyl complexes.

52. (b) In all alkali and alkaline earth metal hydride hydrogen always shows - 1 oxidation state.

53. (b) Iodine shows - 1 to + 7 oxidation state.

In this reaction chromium change from + 6 to +3 oxidation state.

55. (b) In H_2O_2 oxygen shows = - 1 (peroxide) oxidation state and in $BaSO_4$ oxygen shows = - 2 oxidation state.

56. (b) Mn shows highest oxidation state in $KMnO_4$.
57. (c) CH_2O
 $x + 2 - 2 = 0$
 $x = 0$.
58. (a) In all peroxide oxygen shows -1 oxidation state.
59. (a) $K_2Cr_2O_7$
 $2 + 2x - 2 \times 7 = 0$; $2x - 14 + 2 = 0$
 $2x = 12$; $x = \frac{12}{2} = +6$.
60. (c) Nickel shows zero oxidation state in carbonyl complex.
61. (d) OsO_4
 $x + 4(-2) = 0$
 $x - 8 = 0$
 $x = +8$.
62. (a) Al shows $+3$ oxidation state.
63. (d) $K_4[Fe(CN)_6]$
 $1 \times 4 + x + (-1 \times 6) = 0$, $4 + x - 6 = 0$
 $x = +2$.
 In this complex compound Iron show $+2$ oxidation state.
64. (b) In this complex iron is a central metal atom showing $+2$ oxidation state.
65. (b) Oxygen shows $+2$ oxidation state in F_2O . As F most electronegative element, it always has an O. No. -1
66. (b) H_3PO_3
 $3 + x - 2 \times 3 = 0$; $x = 6 - 3 = +3$.
67. (c) $Mg_2P_2O_7$
 $4 + 2x - 2 \times 7 = 0$; $2x = 14 - 4 = 10$
 $2x = 10$; $x = \frac{10}{2} = +5$.
68. (a) $3 \times x + 1(1) = 0$
 $3x + 1 = 0$
 $3x = -1$, $\Rightarrow x = -\frac{1}{3}$ in N_3H
 $x + 2(+1) + 1(-2) + 1(1) = 0$
 $x = -1$ in NH_2OH
 $x \times 2 + 4(1) = 0$ $x = -\frac{4}{2} = -2$ in N_2H_4
 $x + 3(1) = 0$ $x = -3$ in NH_3
 Hence, highest in N_3H .
69. (a) In KH_2PO_2
 $1 + 2 + x + (-2 \times 2) = 0$
 $3 + x - 4 = 0$; $x = +1$.
70. (c) Oxygen has 6 electrons in the outer most shell and shows common oxidation state -2 .
71. (d) $H_2SO_3 = +4$; $SO_2 = +4$
 $H_2SO_4 = +6$; $H_2S = -2$.
72. (a) The oxidation number of sulphur in the sulphur molecule (S_8) is 0 and 2.
73. (b) In ferrous ammonium sulphate Fe shows $+2$ oxidation state.
74. (b) NH_2OH
 $x + 2(+1) - 2 + 1 = 0$
 $x + 2 - 2 + 1 = 0$; $x = -1$.
75. (b) $Ba(H_2PO_2)_2$; $BaH_4P_2O_4$
 $2 + 4 + 2x - 8 = 0$; $2x = 2$
 $x = \frac{2}{2} = +1$.
77. (d) H_2SO_4
 $2 \times (+1) + x + 4 \times (-2) = 0$
 $+2 + x - 8 = 0$; $x = 8 - 2 = +6$
 Electronic configuration of sulphur in H_2SO_4 is
 $1s^2, 2s^2, 2p^6$.
78. (a) $KMnO_4$
 $1 + x - 2 \times 4 = 0$; $x = 8 - 1 = +7$.
79. (d) H_3AsO_4
 $+3 + x - 2 \times 4 = 0$; $x = 8 - 3 = +5$.
80. (b) The oxidation state of Xe in both XeO_3 and XeF_6 is $+6$
 XeO_3 XeF_6
 $x - 2 \times 3 = 0$ $x - 6 = 0$
 $x = +6$ $x = +6$.
81. (b) CH_3-Cl
 $x + 3(+1) + (-1) \times 1 = 0$
 $x + 3 - 1 = 0$; $x + 2 = 0$
 $x = -2$.
82. (c) $Cr_2O_7^{2-}$
 $2x - 2 \times 7 = -2$; $2x = 14 - 2 = 12$
 $x = \frac{12}{2} = +6$.
83. (c) H_2SO_3
 $+2 + x - 2 \times 3 = 0$; $x = 6 - 2 = +4$.
84. (b) Two Cl atom shows $+1$ and -1 oxidation state.
85. (c) $HClO_3$
 $1 + x - 2 \times 3 = 0$; $x = 6 - 1 = +5$.
86. (c) $5 \begin{array}{c} COOH \\ | \\ COOH \end{array} + 2KMnO_4 + 3H_2SO_4 \rightarrow$

In this reaction oxidation state of Mn change from +7 to +2.

87. (d) Oxygen have +2 oxidation state in OF_2 .
89. (b) $S_2O_3^{2-}$
 $2x + 3(-2) = -2$; $x = +2$.
90. (c) $x + 2 \times (+1) + 2(-1) = 0$
 $x + 2 - 2 = 0$; $x = 0$ in CH_2Cl_2 .
91. (c) In potassium superoxide (KO_2) oxygen shows, $-\frac{1}{2}$ oxidation state.
92. (a) S_2Cl_2
 $2x + 2(-1) = 0$; $2x - 2 = 0$
 $x = +1$.
93. (d) $Na_2S_4O_6$
 $2 + 4x - 12 = 0$
 $4x = 10$ $x = \frac{10}{4}$ $x = \frac{5}{2}$.
94. (c) $CuSO_4 + 2KI \rightleftharpoons K_2SO_4 + CuI_2$
 $2CuI_2 \longrightarrow Cu_2I_2 + I_2$
95. (d) $NH_4Cl \rightleftharpoons NH_4^+ + Cl^-$
 NH_4^+
 $x + 4 = +1$; $x = 1 - 4 = -3$.
96. (b) $2NO_2 + H_2O \rightarrow HNO_2 + HNO_3$. In this reaction oxidation state changes.
97. (d) Fe_3O_4
 $3x + (-8) = 0$; $3x - 8 = 0$
 $3x = 8$; $x = \frac{8}{3}$.
99. (b) K_2MnO_4 $MnSO_4$
 $2 + x - 8 = 0$ $x + 6 - 8 = 0$
 $x = +6$ $x = +2$.
100. (c) Chlorine have oxidation state -1 to +7.
101. (a) $[Co(NH_3)_4ClNO_2]$
 $x + 4(0) + 1(-1) + 1(-1) = 0$
 $x + 0 - 1 - 1 = 0$
 $x - 2 = 0$; $x = +2$.
102. (d) $K_4[Ni(CN)_4]$
 $4 \times (+1) + x + 4 \times (-1) = 0$
 $+4 + x - 4 = 0 \Rightarrow x = 0$.
103. (a) Fluorine always shows -1 oxidation state in oxides.
104. (b) $K_3[Fe(CN)_6]$
 $1 \times 3 + x + (-1 \times 6) = 0$
 $3 + x - 6 = 0$; $x = +3$.

105. (a) NH_3
 $x + 3(+1) = 0$, $x = -3$.
106. (a) ${}_{26}Fe \longrightarrow [Ar]3d^6 4s^2$
 $Fe^{++} \longrightarrow [Ar]3d^6 4s^0$
 $Fe^{+++} \longrightarrow [Ar]3d^5 4s^0$
 In +2 state Fe is called Ferrous & in +3 state as ferric.
107. (d) Fluorine is the most electronegative element in the periodic table so it never shows positive oxidation state.
108. (b) Silicon forms silicides with strongly electropositive metals (like Na, Mg, K etc.) In these compounds. It has oxidation number = -4.
109. (a) H_2S [O.N. of $H = +1$]
 $(+1) \times 2 + x = 0$
 $2 + x = 0$; $x = -2$
110. (b) Let the oxidation number of N in $NaNO_2$ be x
 $+1 + x + (-2) \times 2 = 0$
 $1 + x - 4 = 0$; $x = +3$
111. (a) $x = 8 - 2 = +6$
112. (d) $K_2Cr_2O_7 + 6KI + 7H_2SO_4 \rightarrow 4K_2SO_4 + Cr_2(SO_4)_3 + 7H_2O + 3I_2$
 $Cr_2(SO_4)_3 \rightarrow 2Cr^{+3} + 3SO_4^{2-}$
113. (b) Let the oxidation number of I in $IPO_4 = x$
 Oxidation number of $PO_4 = -3$
 $x + (-3) = 0 \Rightarrow x = +3$

Redox reaction and Method for balancing Redox reaction

1. (a) $MnO_4^- + 8H^+ + 5e^- \rightleftharpoons Mn^{++} + 4H_2O$.
2. (b) The balanced equation is $2C_2H_6 + 7O_2 \rightarrow 4CO_2 + 6H_2O$.
 Ratio of the coefficients of CO_2 and H_2O is 4 : 6 or 2 : 3.
3. (c) $Cr_2O_7^{2-} + 3e^- \rightarrow Cr^{3+}$
 Reduction
 In this reaction three electrons are required for the reduction of $Cr_2O_7^{2-}$ into Cr^{3+} .
4. (c) Number of e^- transferred in each case is 1, 3, 4, 5.
5. (a) Starch paper are used for iodine test
 as: $I^- + \text{oxidant} \longrightarrow I_2$
 $I_2 + \text{starch} \longrightarrow \text{blue colour}$
6. (a) $Cr_2O_7^{2-} + 14H^+ + 6e^- \rightarrow 2Cr^{3+} + 7H_2O$

It is clear from this equation that 3 moles of Sn^{2+} reduce one mole of $Cr_2O_7^{2-}$, hence 1 mol. of Sn^{2+} will reduce $\frac{1}{3}$ moles of $Cr_2O_7^{2-}$.

Thus the coefficient of MnO_4^- , $C_2O_4^{2-}$ and H^+ in the above balanced equation respectively are 2, 5, 16.

13. (c) Higher is the reduction potential stronger is the oxidising agent. Hence in the given options, MnO_4^- is strongest oxidising agent.

Step 1 : $I^- \rightarrow I_2$ (oxidation)

On comparing, $a = 5$, $b = 6$, $c = 3$, $d = 3$

15. (d) In alkaline medium

Auto oxidation and Disproportionation

$$\text{Equivalent wt.} = \frac{\text{Mol. wt.}}{2} = \frac{34}{2} = 17.$$

4. (b) To prevent rancidification of food material we add anti-oxidant which are called oxidation inhibitor.

In galvanizing action Zn is coated over iron.

8. (d) Molecular weight of H_3PO_4 is 98 and change in its valency = 1 equivalent wt. of H_3PO_4

$$= \frac{\text{Molecular weight}}{\text{Change in valency}} = \frac{98}{1} = 98.$$

9. (b) Equivalent mass

$$= \frac{\text{Molecular weight}}{\text{Change in oxidation number per mole}}$$

Suppose molecular weight is M

Oxidation number of I_2 in IO_4^- is

Acidic medium i.e., $I \times (-8) + 1e^- = +7$

So eq. wt. = $M/7$.

12. (d) $\frac{\text{Molecular weight}}{3}$ Because in KIO_3 effective oxidation number is 3.

Critical Thinking Questions

1. (d) HNO_2 shows both oxidation and reduction properties.

2. (c) Al_2O_3 could not act as an oxidising and reducing agent.

3. (a, b) In H_2S sulphur shows -2 oxidation state and in SO_2 shows $+4$ oxidation state. Hence SO_2 shows both oxidising and reducing properties.

4. (d) All the given statements are true.

5. (a) $H - O - \overset{\overset{H}{|}}{\underset{\underset{O}{|}}{P}} - OH$, hence it is dibasic. It acts as reducing agent also.

6. (c) (a) NO_2 ; $x - 4 = 0$; $x = +4$

(b) HNO ; $1 + x - 2 = 0$; $x = +1$

(c) NH_3 ; $x + 3 = 0$; $x = -3$

(d) N_2O_5 ; $2x - 10 = 0$; $2x = 10$; $x = \frac{10}{2}$; $x = 5$.

7. (c) $2 \times \text{No. of } e^- \text{ losses} = \text{Oxi. no.}$

$$2 \times 3e^- = +6.$$

8. (a) The ion which is not affected during the course of reaction is known as spectator ion.

9. (a) $H_2S_2O_7$

$$2 \times (+1) + 2 \times x + 7 \times (-2) = 0$$

$$+2 + 2x - 14 = 0$$

$$2x = 14 - 2 = 12$$

$$x = \frac{12}{2} = +6 \text{ for } S$$

$$4 \times (+1)x + 6 \times (-1) = 0$$

$$4 + x - 6 = 0$$

$$x = 6 - 4 = +2 \text{ for } Fe.$$

10. (c) KO_2 , $+1 + 2x = 0$, $x = -\frac{1}{2}$.

11. (a) $N_2^{2-} \rightarrow 2N^{a+} + 10e^-$
 $\therefore 2a - [2 \times (-2)] = 10$
 $\therefore a = +3$.

12. (d) CrO_2Cl_2 , $x - 4 - 2 = 0$, $x = +6$.

13. (c) $3x = -1$, $x = -1/3$.

14. (b) $Ba_2Cu_3O_7$
 $3 + 2 \times 2 + 3x - (2 \times 7) = 0$
 $3 + 4 + 3x - 14 = 0$
 $3x = 7$

$$x = \frac{7}{3}.$$

15. (a) S_8 = 0

16. (d) In reaction $HCl + H_2O \rightarrow H_3O^+ + Cl^-$, only reduction has taken place not oxidation.

17. (d) Zn can oxidise carbon because heat of combustion of $Zn < C$.

18. (d) $B_2H_6 + 2KOH + 2H_2O \rightarrow 2KBO_2 + 6H_2$.

19. (c) The values of x, y, z are 8, 4, 4 respectively hence the reaction is

20. (d) Acid Base

21. (a) MnO_4^{2-} in neutral aqueous medium is disproportionate to $\frac{2}{3}$ mole of MnO_4^- and $\frac{1}{3}$ mole of MnO_2 .

22. (d) $\lambda_m = \frac{1000 K}{S} = \frac{1000 \times 3.06 \times 10^{-6}}{S} = 1.53$

$$S = 2 \times 10^{-3} \frac{\text{mol}}{\text{litre}}$$

$$K_{sp}(BaSO_4) = S^2 = (2 \times 10^{-3})^2 = 4 \times 10^{-6}.$$

23. (a) $2MnO_2 + 4KOH + O_2 \xrightarrow{\Delta} 2K_2MnO_4 + 2H_2O$.
purple green

Assertion & Reason

1. (c) It is true that SO_2 and Cl_2 both are bleaching agents. But Cl_2 is an oxidising agent while SO_2 is a reducing agent. Therefore, in this questions assertion is true while reason is false.
2. (b) It is correct that fluorine exists only in -1 oxidation state because it has $1s^2 2p^5$ electronic configuration and thus shows only -1 oxidation state in order to complete its octet. Hence, both assertion and reason are true and reason is not a correct explanation of assertion.
3. (e) Here, assertion is false, because stannous chloiride is a strong reducing agent not strong oxidising agent. Stannous chlorides gives Grey precipitate with mercuric chloride. Hence, reason is true.

4. (b) Both assertion and reason are true but reason is not the correct explanation of assertion. Greater the number of negative atoms present in the oxy-acid make the acid stronger. In general, the strengths of acids that have general formula $(HO)_m ZO_n$ can be related to the value of n . As the value of n increases, acidic character also increases. The negative atoms draw electrons away from the Z-atom and make it more positive. The Z-atom, therefore, becomes more effective in with drawing electron density away from the oxygen atom that bonded to hydrogen. in turn, the electrons of $H-O$ bond are drawn more strongly away from the H -atom. The net effect makes it easier from the proton release and increases the acid strength.
5. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

6. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
Oxidation number can be calculated using some rules. H is assigned $+1$ oxidation state and O has oxidation number -2
 $\therefore$ O. No. of C in CH_2O :
O. no. of $C + 2(+1) + (-2) = 0$
 $\therefore$ O. No. of $C = 0$
7. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
8. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

Maximum oxidation state of S is $+6$, it cannot exceed it. Therefore it can't be further oxidised as S^{-2} can't be reduced further.

9. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

$\therefore$ equivalent weight of

$$NH_3 = \frac{14 + 3}{3} = \frac{17}{3} \text{ (M. wt. of } NH_3 \text{)}$$

$$\text{while for } N_2 = \frac{14 \times 2}{6} = \frac{28}{6}$$

Redox Reactions

Self Evaluation Test -13

- When a piece of wire of copper is dipped in $AgNO_3$ solution, the colour of the solution turns blue due to
[MP PMT 1992; JIPMER 2002]
(a) Formation of soluble complex
(b) Oxidation of copper
(c) Oxidation of silver
(d) Reduction of copper
- HBr and HI can reduce H_2SO_4 , HCl can reduce $KMnO_4$ and HF can reduce
[IIT 1981]
(a) H_2SO_4 (b) $KMnO_4$
(c) $K_2Cr_2O_7$ (d) None of the above
- Consider the following statements :
In the chemical reaction
 $MnO_2 + 4HCl \rightarrow MnCl_2 + 2H_2O + Cl_2$
(1) Manganese ion is oxidised
(2) Manganese ion is reduced
(3) Chloride ion is oxidised
(4) Chloride ion is reduced
Which of these statements are correct [NDA 1999]
(a) 1 and 3 (b) 1 and 4
(c) 2 and 3 (d) 2 and 4
- The oxide which cannot act as a reducing agent is
[CBSE PMT 1995; AIIMS 2000; JIPMER 2002; Kurukshetra CEE 2002]
(a) SO_2 (b) NO_2
(c) CO_2 (d) ClO_2
- In the reaction between ozone and hydrogen peroxide, H_2O_2 acts as
[RPET 2000]
(a) Oxidising agent
(b) Reducing agent
(c) Bleaching agent
(d) Both oxidising and bleaching agent
- The oxidation state of each oxygen atom in Na_2O_2 is
[NCERT 1971]
(a) -2 each (b) -2 and zero
(c) -1 each (d) None of the above
- The oxidation state of sulphur in SO_4^{2-} is
[Bihar MEE 1996]
(a) 4 (b) 2
(c) 6 (d) -6
- The charge on cobalt in $[Co(CN)_6]^{3-}$ is
[CPMT 1985, 93]
(a) -6 (b) -3
(c) +3 (d) +6
- Oxidation number of S in Na_2SO_4 is
[CPMT 1989]
(a) -2 (b) +2
(c) -6 (d) +6
- A metal ion M^{3+} after loss of three electrons in a reaction will have an oxidation number equal to
[CPMT 1980, 83, 84, 94, 99]
(a) Zero (b) +2
(c) +3 (d) +6
- Oxidation number of oxygen in ozone (O_3) is
[MP PET 2000; MP PMT 2001]
(a) +3 (b) -3
(c) -2 (d) 0
- The oxidation states of sulphur in the anions SO_3^{2-} , $S_2O_4^{2-}$ and $S_2O_6^{2-}$ follow the order
[CBSE PMT 2003]
(a) $S_2O_6^{2-} < S_2O_4^{2-} < SO_3^{2-}$ (b) $S_2O_4^{2-} < SO_3^{2-} < S_2O_6^{2-}$
(c) $SO_3^{2-} < S_2O_4^{2-} < S_2O_6^{2-}$ (d) $S_2O_4^{2-} < S_2O_6^{2-} < SO_3^{2-}$
- The oxidation number of hydrogen in LiH is
(a) +1 (b) -1
(c) 2 (d) 0
- Which of the following is not a redox reaction
[RPMT 1999]
(a) $2Rb + 2H_2O \rightarrow 2RbOH + H_2$
(b) $2CuI_2 \rightarrow 2CuI + I_2$
(c) $2H_2O_2 \rightarrow 2H_2O + O_2$
(d) $4KCN + Fe(CN)_2 \rightarrow K_4Fe(CN)_6$
- Which of the following equations is a balanced one
[EAMCET 1980]
(a) $5BiO_3^- + 22H^+ + Mn^{2+} \rightarrow 5Bi^{3+} + 7H_2O + MnO_4^-$
(b) $5BiO_3^- + 14H^+ + 2Mn^{2+} \rightarrow 5Bi^{3+} + 7H_2O + 2MnO_4^-$
(c) $2BiO_3^- + 4H^+ + Mn^{2+} \rightarrow 2Bi^{3+} + 2H_2O + MnO_4^-$
(d) $6BiO_3^- + 12H^+ + 3Mn^{2+} \rightarrow 6Bi^{3+} + 6H_2O + 3MnO_4^-$
- In the equation
 $4M + 8CN^- + 2H_2O + O_2 \rightarrow 4[M(CN)_2]^- + 4OH^-$
Identify the metal M
[AFMC 1998]
(a) Copper (b) Iron
(c) Gold (d) Zinc
- In alkaline condition $KMnO_4$ reacts as
 $2KMnO_4 + 2KOH \rightarrow 2K_2MnO_4 + H_2O + O_2$. The equivalent weight of $KMnO_4$ would be (Atomic mass of K = 39, Mn = 55, O = 16)
[MP PMT 2002]
(a) 158.0 (b) 79.0
(c) 52.7 (d) 31.6
- In acidic medium, equivalent weight of $K_2Cr_2O_7$ (mol. wt. = M) is
[AFMC 1988]
(a) $M/3$ (b) $M/4$
(c) $M/6$ (d) $M/2$

1. (b) $2Ag^+ + Cu \rightarrow Cu^{++} + 2Ag^-$; $E_{Ag^+/Ag}^o > E_{Cu^{++}/Cu}^o$.
2. (d) F^- can be oxidised to F_2 only by electrolysis.
3. (c) Because the oxidation state of chlorine is -4 to 0 while Manganese ion is reduced because its oxidation state $+4$ to $+2$.
4. (c) CO_2 is an acidic oxide.
5. (b) H_2O_2 acts as a reducing agent in the reaction between O_3 and H_2O_2 .
6. (c) In Na_2O_2 oxygen shows -1 oxidation state.
7. (c) SO_4^{2-}

$$x - 2 \times 4 = -2$$

$$x = 8 - 2 = +6.$$
8. (c) In $[Co(CN)_6]^{3-}$ complex Co shows $+3$ oxidation state.
9. (d) Na_2SO_4

$$2 + x - 2 \times 4 = 0$$

$$x = +6.$$
10. (d) $M^{3+} \rightarrow M^{6+} + 3e^-$. Thus the oxidation number of metal = $+6$.
13. (b) LiH .
14. (d) In the reaction $4KCN + Fe(CN)_2 \rightarrow K_4Fe(CN)_6$, change in oxidation state is not taking place.
15. (b) $5BiO_3^- + 14H^+ + 2Mn^{2+} \rightarrow 5Bi^{3+} + 7H_2O + 2MnO_4^-$ is the balanced reaction.
16. (c) $4Au + 8CN^- + 2H_2O + O_2 \rightarrow 4[Au(CN)_2]^- + 4OH^-$.
17. (a) $e^- + Mn^{7+} \rightarrow Mn^{6+} \therefore E = \frac{M}{1}$.
18. (c) $Cr_2O_7^{2-} + 14H^+ + 6e^- \rightarrow 2Cr^{3+} + 7H_2O$
 Equivalent weight of $K_2Cr_2O_7$

$$= \frac{\text{Molecular Mass}}{6} = \frac{294.2}{6} = \frac{M}{6}.$$

11. (d) Molecule and free atoms show zero oxidation state O_3 is a molecule shows zero oxidation state.
12. (b) $S_2O_4^{2-} < SO_3^{2-} < S_2O_6^{2-}$
 Oxi. state of sulphur in $S_2O_4^{2-} = +3$
 Oxi. state of sulphur in $SO_3^{2-} = +4$
 Oxi state of sulphur in $S_2O_6^{2-} = +5.$

Chapter 14 Surface Chemistry

“The branch of physical chemistry, which deals the nature of surfaces and also with the chemical and physical processes which takes place on the surfaces, is called surface chemistry”.

In surface chemistry, we study the phenomenon of adsorption, catalysis and colloidal properties.

Adsorption

(1) **Definition** : The phenomenon of attracting and retaining the molecules of a substance on the surface of a liquid or solid resulting in to higher concentration of the molecules on the surface is called **adsorption**.

(2) **Causes of adsorption** : Unbalanced forces of attraction or free valencies which is present at the solid or liquid surface, have the property to attract and retain the molecules of a gas or a dissolved substance on to their surfaces with which they come in contact.

Example : Ammonia gas placed in contact with charcoal gets adsorbed on the charcoal whereas ammonia gas placed in contact with water gets absorbed into water,

Table : 14.1 Some basic terms used in adsorption

Interface : Any surface is a plane which separates any two phases in contact with each other. The plane which separates any two phase is generally called an interface between the two phases.	Adsorbate and Adsorbent : The substance which gets adsorbed on any surface is called adsorbate for example, if a gas gets adsorbed on to the surface of a solid, then the gas is termed as the adsorbate. The substance on the surface of which adsorption takes place is called adsorbent .
Desorption : The removal of the adsorbed substance from a surface is called desorption .	Absorption : When the molecules of a substance are uniformly distributed throughout the body of a solid or liquid. This phenomenon is called absorption .
Sorption : The phenomenon in which adsorption and absorption occur simultaneously is called sorption . Mc. Bain introduced a general term sorption describing both the processes, however adsorption is instantaneous <i>i.e.</i> a fast process while absorption is a slow process.	Occlusion : When adsorption of gases occur on the surface of metals this is called occlusion .

(3) Difference between adsorption and absorption

Adsorption	Absorption
It is a surface phenomenon.	It concerns with the whole mass of the absorbent.
In it, the substance is only retained on the surface and does not go into the bulk or interior of the solid or liquid.	It implies that a substance is uniformly distributed, through the body of the solid or liquid.
In it the concentration of the adsorbed molecules is always greater at the free phase.	In it the concentration is low.
It is rapid in the beginning and slows down near the equilibrium.	It occurs at the uniform rate.
Examples : (i) Water vapours adsorbed by silica gel. (ii) NH_3 is adsorbed by charcoal.	Examples : (i) Water vapours absorbed by anhydrous $CaCl_2$ (ii) NH_3 is absorbed in water forming NH_4OH

(4) **Surface forces** : Only the surface atoms of an adsorbent play an active role in adsorption. These atoms possess unbalanced forces of various types such as, Vander Waal's forces and chemical bond forces.

Thus, **the residual force-field on a free surface which is responsible for adsorption is produced**. For example, when a solid substance is broken into two pieces, two new surfaces are formed and therefore, the number of unbalanced forces becomes more. As a result the tendency for adsorption become large.

(5) **Reversible and Irreversible adsorption** : The adsorption is reversible, if the adsorbate can be easily removed from the surface of the adsorbent by physical methods. If the adsorbate can not be easily removed from the surface of the adsorbent is called irreversible adsorption.

Example for reversible adsorption: A gas adsorbed on a solid surface can be completely removed in vacuum.

Example for irreversible adsorption: Adsorption of O_2 on tungsten adsorbent.

(6) Characteristics of adsorption

(i) Adsorption refers to the existence of a higher concentration of any particular component at the surface of a liquid or a solid phase.

(ii) Adsorption is accompanied by decrease in the ΔG (free energy change) of the system when $\Delta G = 0$, **adsorption equilibrium is said to be established**.

(iii) Adsorption is invariably accompanied by evolution of heat, *i.e.* it is an exothermic process. In other words, **ΔH of adsorption is always negative.**

(iv) When a gas is adsorbed, the freedom of movement of its molecules becomes restricted. On account of its decrease in the entropy of the gas after adsorption, *i.e.* **ΔS is negative.**

(v) For a process to be spontaneous, the thermodynamic requirement is that **ΔG must be negative**, *i.e.* there is decrease in free energy. On the basis of **Gibb's Helmholtz equation**, $\Delta G = \Delta H - T\Delta S$, ΔG can be negative if ΔH has sufficiently high negative value and $T\Delta S$ has positive value.

Classification of adsorption

Adsorption can be classified into two categories as described below,

(1) **Depending upon the concentration** : In adsorption the concentration of one substance is different at the surface of the other substance as compared to adjoining bulk or interior phase.

(i) **Positive adsorption** : If the concentration of adsorbate is more on the surface as compared to its concentration in the bulk phase then it is called **positive adsorption**.

Example : When a *concentrated* solution of KCl is shaken with blood charcoal, it shows positive adsorption.

(ii) **Negative adsorption** : If the concentration of the adsorbate is less than its concentration in the bulk then it is called **negative adsorption**.

Example : When a *dilute* solution of KCl is shaken with blood charcoal, it shows negative adsorption.

(2) **Depending upon the nature of force existing between adsorbate molecule and adsorbent**

(i) **Physical adsorption** : If the forces of attraction existing between adsorbate and adsorbent are Vander Waal's forces, the adsorption is called physical adsorption. This type of adsorption is also known as **physisorption or Vander Waal's adsorption**. It can be easily reversed by heating or decreasing the pressure.

(ii) **Chemical adsorption** : If the forces of attraction existing between adsorbate particles and adsorbent are almost of the same strength as chemical bonds, the adsorption is called chemical adsorption. This type of adsorption is also called as **chemisorption or Langmuir adsorption**. This type of adsorption cannot be easily reversed.

Comparison between physisorption and chemisorption

Physisorption (Vander Waal's adsorption)	Chemisorption (Langmuir adsorption)
Low heat of adsorption usually in range of 20-40 kJ/mol	High heat of adsorption in the range of 50-400 kJ/mol
Force of attraction are Vander Waal's forces .	Forces of attraction are chemical bond forces .
It is reversible	It is irreversible
It usually takes place at low temperature and decreases with increasing temperature.	It takes place at high temperature .
It is related to the case of liquefaction of the gas.	It is not related.
It forms multimolecular layers .	It forms monomolecular layers .
It does not require any activation energy.	It requires high activation energy .
High pressure is favourable. Decrease of pressure causes desorption	High pressure is favourable. Decrease of pressure does not cause desorption.
It is not very specific.	It is highly specific.

Factors which affect the extent of adsorption : The following are the factors which affect the adsorption,

(1) **Nature of the adsorbate (gas) and adsorbent (solid)**

(i) In general, easily liquefiable gases *e.g.*, CO , NH_3 , Cl_2 and SO_2 etc. are adsorbed to a greater extent than the elemental gases *e.g.* H_2 , O_2 , N_2 , He etc. (while chemisorption is specific in nature.)

(ii) Porous and finely powdered solid *e.g.* charcoal, fuller's earth, adsorb more as compared to the hard non-porous materials. Due to this property powdered charcoal is used in gas masks.

(2) **Surface area of the solid adsorbent**

(i) The extent of adsorption depends directly upon the surface area of the adsorbent, *i.e.* **larger the surface area of the adsorbent, greater is the extent of adsorption.**

(ii) Surface area of a powdered solid adsorbent depends upon its particle size. Smaller the particle size, greater is its surface area.

(3) **Effect of pressure on the adsorbate gas**

(i) An increase in the pressure of the adsorbate gas increases the extent of adsorption.

(ii) **At low temperature**, the extent of adsorption increases rapidly with pressure.

(iii) **Small range of pressure**, the extent of adsorption is found to be directly proportional to the pressure.

(iv) **At high pressure** (closer to the saturation vapour pressure of the gas), the adsorption tends to achieve a limiting value.

(4) **Effect of temperature**

(i) As adsorption is accompanied by evolution of heat, so according to the **Le-Chatelier's principle**, the magnitude of adsorption should decrease with rise in temperature.

(ii) The relationship between the extent of adsorption and temperature at any constant pressure is called **adsorption isobar**.

(iii) A physical adsorption isobar shows a decrease in x/m (where ' m ' is the mass of the adsorbent and ' x ' that of adsorbate) as the temperature rises.

(iv) The isobar of chemisorption shows an increase in the beginning and then decrease as the temperature rises.

Adsorption isotherms

A mathematical equation, which describes the relationship between pressure (p) of the gaseous adsorbate and the extent of adsorption at any fixed temperature, is called **adsorption isotherms**.

The extent of adsorption is expressed as mass of the adsorbate adsorbed on one unit mass of the adsorbent.

Thus, if x g of an adsorbate is adsorbed on m g of the adsorbent, then

$$\text{Extent of adsorption} = \frac{x}{m}$$

Various adsorption isotherms are commonly employed in describing the adsorption data.

(1) **Freundlich adsorption isotherm**

(i) Freundlich adsorption isotherm is obeyed by the adsorptions where the adsorbate forms a **monomolecular layer** on the surface of the adsorbent.

$$\frac{x}{m} = kp^{\frac{1}{n}} \quad (\text{Freundlich adsorption isotherm}) \text{ or}$$

$$\log \frac{x}{m} = \log k + \frac{1}{n} \log p$$

where x is the weight of the gas adsorbed by m gm of the adsorbent at a pressure p , thus x/m represents the amount of gas adsorbed by the adsorbents per gm (unit mass), k and n are constant at a particular temperature and for a particular adsorbent and adsorbate (gas), n is always greater than one, indicating **that the amount of the gas adsorbed does not increase as rapidly as the pressure.**

(i) At **low pressure**, the extent of adsorption varies linearly with pressure. $\frac{x}{m} \propto p^1$

(iii) At **high pressure**, it becomes independent of pressure. $\frac{x}{m} \propto p^0$

(iv) At **moderate pressure** $\frac{x}{m}$ depends upon pressure raised to

powers $\frac{x}{m} \propto p^{\frac{1}{n}}$

Freundlich adsorption isotherm: plot of x/m against p

Plot of $\log x/m$ against $\log p$ for the adsorption of a gas on a solid

(2) The Langmuir - adsorption isotherms

(i) One of the drawbacks of Freundlich adsorption isotherm is that it fails at high pressure of the gas. **Irving Langmuir in 1916** derived a simple adsorption isotherm, on theoretical considerations based on **kinetic theory of gases**. This is named as **Langmuir adsorption isotherm**.

(a) Adsorption takes place on the surface of the solid only till the whole of the surface is completely covered with a unimolecular layer of the adsorbed gas.

(b) Adsorption consists of two opposing processes, namely **Condensation** of the gas molecules on the solid surface and **Evaporation** (desorption) of the gas molecules from the surface back into the gaseous phase.

(c) The rate of condensation depends upon the uncovered (bare) surface of the adsorbent available for condensation. Naturally, at start when whole of the surface is uncovered the rate of condensation is very high and as the surface is covered more and more, the rate of condensation progressively decreases. On the contrary, the rate of evaporation depends upon the covered surface and hence increases as more and more of the surface is covered ultimately an equilibrium will be set up at a stage when the rate of condensation becomes equal to the rate of evaporation (adsorption equilibrium).

(d) The rate of condensation also depends upon the pressure of the gas since according to the kinetic theory of gases, **the number of molecules striking per unit area is proportional to the pressure.**

Mathematically, $\frac{x}{m} = \frac{ap}{1+bp}$, where a and b are constants and

their value depends upon the nature of gas (adsorbate), nature of the solid adsorbent and the temperature. Their values can be determined from the experimental data.

Limitation of Langmuir theory

(a) Langmuir's theory of unimolecular adsorption is valid only at **low pressures and high temperatures.**

(b) When the pressure is increased or temperature is lowered, additional layers are formed. This has led to the modern concept of **multilayer adsorption.**

Adsorption from solutions

(1) The process of adsorption can take place from solutions also.

(2) In any solution, there are two (or more) components ; **solute** and **solvent**. The solute may be present in the molecular or ionic form.

(3) The extent of adsorption from solution depends upon the concentration of the solute in the solution, and can be expressed by the **Freundlich isotherm**.

(4) The Freundlich adsorption isotherm for the adsorption from solution is, $\frac{x}{m} = kc^{\frac{1}{n}}$ where, x is the mass of the solute adsorbed, m is the mass of the solid adsorbent, c is the equilibrium concentration of the solute in the solution, n is a constant having value greater than one,

k is the proportionality constant, (The value of k depends upon the nature of solid, its particle size, temperature, and the nature of solute and solvent etc.)

(5) The plot of x/m against c is similar to that Freundlich adsorption isotherm. The above equations may be written in the following form, $\log \frac{x}{m} = \log k + \frac{1}{n} \log c$ where c , is the equilibrium concentration of the solute in the solution.

Application of adsorption

The phenomenon of adsorption finds a number of applications. Important applications are given as follows.

(1) **Production of high vacuum**

(2) **In Gas masks** : This apparatus is used to adsorb poisonous gases (e.g. Cl_2 , CO , oxide of sulphur etc.) and thus purify the air for breathing.

(3) **For desiccation or dehumidification** : These substances can be used to reduce/remove water vapours or moisture present in the air. Silica gel and alumina are used for dehumidification in electronic equipment.

(4) **Removal of colouring matter from solution** : (i) Animal charcoal removes colours of solutions by adsorbing coloured impurities. (ii) Animal charcoal is used as decolouriser in the manufacture of cane sugar.

(5) **Heterogeneous catalysis** : Mostly heterogeneous catalytic reactions proceed through the adsorption of gaseous reactants on solid catalyst. For example,

(i) Finely powdered nickel is used for the hydrogenation of oils.

(ii) Finely divided vanadium pentoxide (V_2O_5) is used in the contact process for the manufacture of sulphuric acid.

(6) **Separation of inert gases** : Due to the difference in degree of adsorption of gases by charcoal, a mixture of inert gases can be separated by adsorption on coconut charcoal at different low temperatures.

(7) **Softening of hard water**

(i) The hard water is made to pass through a column packed with zeolite (sodium aluminium silicate)

(ii) Ca , Mg ions which are responsible for hardness, get adsorbed on zeolite, exchanging sodium ions.

(iii) The exhausted zeolite is regenerated with 10% of sodium chloride solution.

(8) **De-ionisation of water**

(i) Water can be de-ionised by removing all dissolved salts with the help of cation and anion-exchanger resin.

(ii) Cation-exchanger is an organic synthetic resin such as polystyrene-containing a macroanion ($R-SO_3^-$ etc.) which has adsorbed H ions.

(iii) A resin containing a basic group (R_3N^+ etc.) which has adsorbed OH^- ions acts as anion exchanger.

(9) **In curing diseases** : A number of drugs are adsorbed on the germs and kill them or these are adsorbed on the tissues and heat them.

(10) **Cleaning agents** : Soap and detergents get adsorbed on the interface and thus reduce the surface tension between dirt and cloth, subsequently the dirt is removed from the cloth.

(11) Froth floatation process

A low grade sulphide ore is concentrated by separating it from silica and other earthy matter by this method.

(12) In adsorption indicators

Surface of certain precipitates such as silver halide, have the property of adsorbing some dyes like eosin, fluorescein etc.

(13) Chromatographic analysis

The phenomenon of adsorption has given an excellent technique of analysis known as chromatographic analysis.

(14) **In dyeing** : Many dyes get adsorbed on the cloth either directly or by the use of mordants.

Catalysis

"Catalyst is a substance which speeds up and speeds down a chemical reaction without itself being used up."

Berzelius (1836) introduced the term **catalysis** and **catalyst**.

Ostwald (1895) redefined a catalyst as, "A substance which changes the reaction rate without affecting the overall energetics of the reaction is termed as a catalyst and the phenomenon is known as catalysis."

Types of catalysis

Catalytic reactions can be broadly divided into the following types,

(1) **Homogeneous catalysis** : When the reactants and the catalyst are in the same phase (*i.e.* solid, liquid or gas). The catalysis is said to be **homogeneous**. The following are some of the examples of homogeneous catalysis.

(i) In the lead chamber process

(ii) In the hydrolysis of ester

(iii) In the hydrolysis of sugar

(2) **Heterogeneous catalysis** : The catalytic process in which the reactants and the catalyst are in different phases is known as **heterogeneous catalysis**. Some of the examples of heterogeneous catalysis are given below.

(i) In contact process for H_2SO_4

(ii) In Haber's process for NH_3

(iii) In Ostwald's process for HNO_3

(3) **Positive catalysis** : When the rate of the reaction is accelerated by the foreign substance, it is said to be a **positive catalyst** and phenomenon as **positive catalysis**. Some examples of positive catalysis are given below.

(i) Decomposition of $KClO_3$

(ii) Oxidation of SO_2

(iii) Deacon's process

(4) **Negative catalysis** : There are certain substance which, when added to the reaction mixture, retard the reaction rate instead of increasing it. These are called **negative catalyst** or **inhibitors** and the phenomenon is known as **negative catalysis**. Some examples are as follows.

(i) Oxidation of sodium sulphite

(ii) Oxidation of benzaldehyde

(iii) Tetra ethyl lead (TEL) is added to petrol to retard the ignition of petrol vapours on compression in an internal combustion engine and thus minimise the **knocking effect**.

(5) **Auto-catalysis** : In certain reactions, one of the product acts as a catalyst. In the initial stages the reaction is slow but as soon as the products come into existence the reaction rate increases. This type of phenomenon is known as **auto-catalysis**. Some examples are as follows,

(i) The rate of oxidation of oxalic acid by acidified potassium permanganate increases as the reaction progresses. This acceleration is due to the presence of Mn^{2+} ions which are formed during reaction. Thus Mn^{2+} ions act as auto-catalyst.

(ii) When nitric acid is poured on copper, the reaction is very slow in the beginning, gradually the reaction becomes faster due to the formation of nitrous acid during the reaction which acts as an auto-catalyst.

(6) **Induced catalysis** : When one reaction influences the rate of other reaction, which does not occur under ordinary conditions, the phenomenon is known as **induced catalysis**. Some examples are as follows,

(i) Sodium arsenite solution is not oxidised by air. If, however, air is passed through a mixture of the solution of sodium arsenite and sodium sulphite, both of them undergo simultaneous oxidation. The oxidation of sodium sulphite, thus, induces the oxidation of sodium arsenite.

(ii) The reduction of mercuric chloride ($HgCl_2$) with oxalic acid is very slow, but potassium permanganate is reduced readily with oxalic acid. If, however, oxalic acid is added to a mixture of potassium permanganate and $HgCl_2$ both are reduced simultaneously. The reduction of potassium permanganate, thus, induces the reduction of mercuric chloride.

(7) **Acid-base catalysis** : According to the **Arrhenius** and **Ostwald** H or H ion act as a catalyst.

(i) For example, Hydrolysis of an ester,

(ii) Inversion of cane sugar,

(iii) Conversion of acetone into diacetone alcohol,

Characteristics of catalysis

The following are the characteristics which are common to most of catalytic reactions.

(1) A catalyst remains unchanged in mass and chemical composition at the end of the reaction.

(2) **A small quantity of the catalyst is generally sufficient to catalyses almost unlimited reactions**

(i) For example, in the decomposition of hydrogen peroxide, one gram of colloidal platinum can catalyses 10^8 litres of hydrogen peroxide.

(ii) In Friedel craft's reaction, anhydrous aluminium chloride is required in relatively large amount to the extent of 30% of the mass of benzene,

(3) **The catalyst can not initiate the reaction:** The function of the catalyst is to alter the speed of the reaction rather than to start it.

(4) **The catalyst is generally specific in nature:** A substance, which acts as a catalyst for a particular reaction, fails to catalyse the other reaction, different catalysts for the same reactant may for different products.

Examples :

(5) **The catalyst can not change the position of equilibrium :** The catalyst catalyse both forward and backward reactions to the same extent in a reversible reaction and thus have no effect on the equilibrium constant.

(6) **Catalytic promoters :** Substances which themselves are not catalysts, but when mixed in small quantities with the catalysts increase their efficiency are called as **promoters** or **activators**.

(i) For example, in Haber's process for the synthesis of ammonia, traces of molybdenum increases the activity of finely divided iron which acts as a catalyst.

(ii) In the manufacture of methyl alcohol from water gas ($CO + H_2$), chromic oxide (Cr_2O_3) is used as a promoter with the catalyst zinc oxide (ZnO).

(7) **Catalytic poisons :** Substances which destroy the activity of the catalyst by their presence are known as **catalytic poisons**.

(i) For example, the presence of traces of arsenious oxide (As_2O_3)

in the reacting gases reduces the activity of platinized asbestos which is used as catalyst in contact process for the manufacture of sulphuric acid.

(ii) The activity of iron catalyst is destroyed by the presence of H_2S or CO in the synthesis of ammonia by Haber's process.

(iii) The platinum catalyst used in the oxidation of hydrogen is poisoned by CO .

(8) **Change of temperature alters the rate of catalytic reaction as it does for the same reaction in absence of catalyst :** By increasing the temperature, there is an increase in the catalytic power of a catalyst but after a certain temperature its power begins to decrease. A catalyst has thus, a particular temperature at which its catalytic activity is maximum. This temperature is termed as **optimum temperature**.

(9) **A positive catalyst lowers the activation energy**

(i) According to the collision theory, a reaction occurs on account of effective collisions between the reacting molecules.

(ii) For effective collision, it is necessary that the molecules must possess a minimum amount of energy known as activation energy (E).

(iii) After the collision molecules form an activated complex which dissociate to yield the product molecules.

(iv) The catalyst provides a new pathway involving lower amount of activation energy. Thus,

larger number of effective collisions occur in the presence of a catalyst in comparison to effective collisions at the same temperature in absence of a catalyst. Hence the presence of a catalyst makes the reaction to go faster.

(v) Figure shows that activation energy E_a , in absence of a catalyst is higher than the activation energy E'_a in presence of a catalyst.

(vi) E_R and E_P represent the average energies of reactants and products. The difference gives the value of ΔG , i.e., $\Delta G = E_R - E_P$

Theories of catalysis

There are two theories of catalysis which is described as follows.

(1) Intermediate compound theory

(i) This theory was proposed by **Clement and Desormes** in 1806. According to this theory, the desired reaction is brought about by a path involving the formation of an unstable intermediate compound, followed by its decomposition into the desired end products with the regeneration of the catalyst.

(ii) The intermediate compound may be formed in either of two ways

(a) When the intermediate compound is reactive and reacts with the other reactants.

(b) When the intermediate is unstable and decomposes to give the final product.

Where, A , B and C are the reactant molecules and X is the molecule of the catalyst. The first type of reaction sums up to, $AB + C \rightarrow CB + A$

While the second to, $A + B \rightarrow AB$ in many cases, the intermediate compounds postulated to be formed are known compounds and often their presence is detected.

(2) Adsorption theory

(i) This theory is applicable to reactions between gases in the presence of a solid catalyst. Some typical examples are as follows.

(ii) The contact process for the oxidation of SO_2 to SO_3 with atmospheric oxygen in the presence of platinum as the catalyst.

(iii) The Haber's process for the synthesis of ammonia with iron as the catalyst.

(iv) Adsorption results in the loosening of the chemical bonds in the reactant molecules, so that their rupture becomes easier. This is confirmed by the observed lower activation energies for heterogeneous catalytic reactions in the presence of the catalysts as compared to that for the same reaction in the absence of the catalyst.

Enzyme catalysis

(1) Enzymes are complex nitrogenous substances these are actually protein molecules of higher molecular mass.

(2) Enzymes catalyse numerous reactions, especially those connected with natural processes.

(3) Numerous reactions occur in the bodies of animals and plants to maintain the life process. These reactions are catalysed by enzymes. The enzymes are thus, termed as **bio-chemical catalysts** and the phenomenon is known as **bio-chemical catalysis**.

(4) **Nitrogenase** an enzyme present in bacteria on the root nodules of leguminous plants such as peas and beans, catalyses the conversion of atmospheric N_2 to NH_3 .

(5) In the human body, the enzyme carbonic anhydrase catalyses the reaction of CO_2 with H_2O ,

The forward reaction occurs when the blood takes up CO_2 in the tissues, and the reverse reaction occurs when the blood releases CO_2 in lungs.

(6) In manufacturing of ethyl alcohol

Activity and Selectivity

(1) **Activity** : Activity is the ability of catalysts to accelerate chemical reaction, the degree of acceleration can be as high as 10^{10} times in certain reactions. For example reaction between H_2 and O_2 to form H_2O in presence of platinum as catalyst takes place with explosive violence.

In absence of catalyst, H_2 and O_2 can be stored indefinitely without any reaction.

(2) **Selectivity** : Is the ability of catalysts to direct reaction to yield particular products (excluding other).

Example :

Zeolite (Shape selective catalysis)

(1) Zeolite are aluminosilicates of the general formula, $M_{x/n}[AlO_2]_x.(SiO_2)_y.mH_2O$, where, M may be simple cation like Na^+ , K^+ or Ca^{2+} , n is the charge on the simple cation, m is the number of molecules of water of crystallization.

(2) Some well known zeolites are as follows,

(3) The characteristic feature of zeolites is the openness of the structure, which permits cavities of different sizes.

(4) The open structure is provided by silica in which aluminium occupies $x/(x+y)$ fraction of the tetrahedral sites.

(5) The negative charge of the aluminosilicate framework is neutralized by the replaceable cations.

(6) The void space forms more than 50% of the total volume, which is occupied by water molecules.

(7) The reaction- selectivity of zeolites depends upon the size of cavities (cages), pores (apertures) and the distribution of pores in the structure. The pore size in zeolites generally varies from 260 pm to 740 pm.

(8) Zeolite have high porosity due to the presence of one, two, or three dimensional networks of interconnected channels and cavities of molecular dimensions.

(9) There is a new class of highly siliceous zeolites with an optimal pore diameter of 550pm. ZSM-5 is one such zeolite having the formula. $[H_x(AlO_2)_x.(SiO_2)_{96-x}].16H_2O$

(10) The zeolite catalyst ZSM-5 converts alcohols to gasoline (petrol) by dehydrating the alcohol and producing a mixture of wide variety of hydrocarbons.

Colloidal state

(1) The foundation of colloidal chemistry was laid down by an English scientist, **Thomas Graham**, in 1861. The credit for the various advances in this field goes to eminent scientists like **Tyndall**, **Hardy**, **Zsigmondy**, **N.R. Dhar**, **S.S. Bhatnagar** and others.

(2) **Thomas Graham** classified the soluble substances into two categories depending upon the rate of diffusion through animal and vegetable membranes or **parchment paper**.

(i) **Crystalloids** : They have higher rate of diffusion and diffused from parchment paper.

Examples : All organic acids, bases and salts and organic compounds such as sugar, urea etc.

(ii) **Colloids** (Greek word, *kolla*, meaning glue-like) : They have slower rate of diffusion and can not diffused from parchment paper.

Examples : Starch, gelatin, gums, silicic acid and hemoglobin etc.

(3) The above classification was discarded *i.e.*, the terms colloid does not apply to a particular class of substances but is a state of matter like solid, liquid and gas. Any substance can be brought into colloidal state.

(4) The colloidal state depends on the particle size. If is regarded as intermediate state between true solution and suspension.

Table : 14.2 Features of the three types of solutions

Property	Suspension	Colloid solution	True solution
Nature	Heterogeneous	Heterogeneous	Homogeneous
Particle size	> 100 nm	1 nm – 100 nm	< 1 nm
Separation by (i) Ordinary filtration (ii) Ultra- filtration	Possible Possible	Not possible Possible	Not possible Not possible
Settling of particles	Settle under gravity	Settle only on centrifugation	Do not settle
Appearance	Opaque	Generally transparent	Transparent
Tyndall effect	Shows	Shows	Does not show
Diffusion of particles	Does not diffuse	Diffuses slowly	Diffuses rapidly
Brownian movement	May show	Shows	Negligible

Fig. 14.1 Three types solutions

Phases of colloids and Their classification

(i) **Phases of colloids** : We know that a colloidal solution is of heterogeneous nature. It consists of two phases which are as follows

(i) **Internal phase or Dispersed phase** (Discontinuous phase) : It is the component present in small proportion and is just like a solute in a solution. For example in the colloidal solution of silver in water (silver acts as a dispersed phase)

(ii) **External phase or Dispersion medium** (continuous phase) : It is generally component present in excess and is just like a solvent in a solution. For example, in the colloidal solution of silver in water. Water act as a dispersion medium.

(2) **Classification of colloids** : The colloids are classified on the basis of the following criteria

(i) **Classification based on the physical state of the dispersed phase and dispersion medium** : Depending upon the physical state of dispersed phase and dispersion medium whether these are solids, liquids or gases, eight types of colloidal systems are possible.

Table : 14.3 Different types of colloidal systems

Dispersed phase	Dispersion Medium	Colloidal System	Examples
Liquid	Gas	Aerosol of liquids	Fogs, clouds, mists, fine insecticide sprays
Solid	Gas	Aerosol of solids	Smoke, volcanic dust, haze
Gas	Liquid	Foam or froth	Soap lather, Lemonade froth, foam, whipped cream, soda water
Liquid	Liquid	Emulsions	Milk, emulsified oils, medicines
Solid	Liquid	Sols	Most paints, starch in water, proteins, gold sol, arsenic sulphide sol, ink
Gas	Solid	Solid foam	Pumice stone, styrene rubber, foam rubber
Liquid	Solid	Gels	Cheese, butter, boot polish, jelly, curd
Solid	Solid	Solid sols (coloured glass)	Ruby glass, some gem stones and alloys

(ii) **Classification based on Nature of interaction between dispersed phase and dispersion medium**: Depending upon the nature of interactions between dispersed phase and the dispersion medium, the colloidal solutions can be classified into two types as (a) Lyophilic and (b) Lyophobic sols.

(a) **Lyophilic colloids** (water loving) : "The colloidal solutions in which the particles of the dispersed phase have a great affinity for the dispersion medium, are called **lyophilic colloids**."

(b) **Lyophobic colloids** (water hating) : "The colloidal solutions in which there is no affinity between particles of the dispersed phase and the dispersion medium are called **lyophobic colloids**."

Distinction between lyophilic and lyophobic sols

Property	Lyophilic sols (suspensoid)	Lyophobic sols (Emulsoid)
Surface tension	Lower than that of the medium	Same as that of the medium
Viscosity	Much higher than that of the medium	Same as that of the medium
Reversibility	Reversible	Irreversible
Stability	More stable	Less stable
Visibility	Particles can't be detected even under ultramicroscope	Particles can be detected under ultramicroscope.
Migration	Particles may migrate in either direction or do not migrate in an electric field because do not carry any charge.	Particles migrate either towards cathode or anode in an electric field because they carry charge.
Action of electrolyte	Addition of smaller quantity of electrolyte has little effect	Coagulation takes place
Hydration	Extensive hydration takes place	No hydration
Examples	Gum, gelatin, starch, proteins, rubber etc.	Metals like Ag and Au, hydroxides like $Al(OH)_3$, $Fe(OH)_3$ metal sulphides like As_2S_3 etc.

(iii) **Classification based on types of particle of dispersed phase** : Depending upon the type of the particles of the dispersed phase, the colloids are classified as follows.

(a) **Multimolecular colloids**

- When on dissolution, atoms or smaller molecules of substances (having diameter less than 1 nm) aggregate together to form particles of colloidal dimensions, the particles thus formed are called **multimolecular colloids**.

- In these sols the dispersed phase consists of aggregates of atoms or molecules with molecular size less than 1 nm .

- For example, sols of gold atoms and sulphur (S_8) molecules. In these colloids, the particles are held together by **Vander Waal's forces**. They have usually **lyophilic character**.

(b) **Macromolecular colloids**

- These are the substances having big size molecules (called macromolecules) which on dissolution form size in the colloidal range. Such substances are called **macromolecular colloids**.

- These macromolecules forming the dispersed phase are generally **polymers** having very high molecular masses.

- Naturally occurring macromolecules are starch, cellulose, proteins, enzymes, gelatin etc. Artificial macromolecules are synthetic polymers such as nylon, polythene, plastics, polystyrene etc.

- They have usually **lyophobic character**.

(c) **Associated colloids**

- These are the substances which on dissolved in a medium behave as normal electrolytes at low concentration but behave, as colloidal particles at higher concentration due to the formation of aggregated particles. The aggregates particles thus formed are called **micelles**.

- Their molecules contain both **lyophilic** and **lyophobic** groups.

Micelles

- Micelles are the cluster or aggregated particles formed by association of colloid in solution.

- The common examples of micelles are **soaps** and **detergents**.

- The formation of micelles takes place above a particular temperature called **Kraft temperature** (T_k) and above a particular concentration called **critical micellization concentration** (CMC).

- They are capable of forming ions.

- Micelles may contain as many as 100 molecules or more.

- For example sodium stearate ($C_{17}H_{35}COONa$) is a typical example of such type of molecules.

- When sodium stearate is dissolved in water, it gives Na^+ and $C_{17}H_{35}COO^-$ ions.

The stearate ions associate to form **ionic micelles** of colloidal size.

- It has long hydrocarbon part of $C_{17}H_{35}$ radical. Which is **lyophobic** and COO^- part which is **lyophilic**.

- In the figure, the chain corresponds to stearate ion, ($C_{17}H_{35}COO^-$). When the concentration of the solution is below from its CMC ($10^{-3}\text{ mol L}^{-1}$), it behaves as normal electrolyte. But above this concentration it is aggregated to behave as micelles.

Fig. 14.2 Aggregation of several ions to form ionic micelle

- The main function of a soap is to reduce oily and greasy dirt to colloidal particles (an emulsion). Soap therefore, are known as **emulsifying agents**.

- Some other examples of micelles are sodium palmitate ($C_{15}H_{31}COONa$), Sodium lauryl sulphate [$CH_3(CH_2)_{11}SO_3O^-Na^+$], Cetyl trimethyl ammonium bromide $CH_3(CH_2)_{15}(CH_2)_3N^+Br^-$ etc.

General methods of preparation of colloids

Lyophilic and lyophobic colloidal solutions (or sols) are generally prepared by different types of methods. Some of the common methods are as follows.

(1) **Preparation of Lyophilic colloids**

(i) The lyophilic colloids have strong affinity between particles of dispersed phase and dispersion medium.

(ii) Simply mixing the dispersed phase and dispersion medium under ordinary conditions readily forms these colloidal solutions.

(iii) For example, the substance like gelatin, gum, starch, egg, albumin etc. pass readily into water to give colloidal solution.

(iv) They are reversible in nature become these can be precipitated and directly converted into colloidal state.

(2) **Preparation of Lyophobic colloids** : Lyophobic colloids can be prepared by mainly two types of methods.

(i) **Condensation method** : In these method, smaller particles of dispersed phase are condensed suitably to be of colloidal size. This is done by the following methods.

(a) **By oxidation** : A colloidal solution of sulphur can be obtained by bubbling oxygen (or any other oxidising agent like HNO_3, Br_2 etc.) through a solution of hydrogen sulphide in water.

(b) **By reduction** : A number of metals such as silver, gold and platinum, have been obtained in colloidal state by treating the aqueous solution of their salts, with a suitable reducing agent such as formaldehyde, phenyl hydrazine, hydrogen peroxide, stannous chloride etc.

The gold sol, thus prepared, has a purple colour and is called purple of cassius.

(c) **By hydrolysis** : Many salt solutions are rapidly hydrolysed by boiling dilute solutions of their salts. For example, ferric hydroxide and aluminium hydroxide sols are obtained by boiling solutions of the corresponding chlorides.

Similarly silicic acid sol is obtained by the hydrolysis of sodium silicate.

(d) **By double decomposition** : A sol of arsenic sulphide is obtained by passing hydrogen sulphide through a cold solution of arsenious oxide in water.

(e) **By excessive cooling** : A colloidal solution of ice in an organic solvent like ether or chloroform can be prepared by freezing a solution of

water in the solvent. The molecules of water which can no longer be held in solution, separately combine to form particles of colloidal size.

(f) *By exchange of solvent* : Colloidal solution of certain substances such as sulphur, phosphorus, which are soluble in alcohol but insoluble in water can be prepared by pouring their alcoholic solution in excess of water. For example, alcoholic solution of sulphur on pouring into water gives milky colloidal solution of sulphur.

(g) *By change of physical state* : Sols of substances like mercury and sulphur are prepared by passing their vapour's through a cold water containing a suitable stabilizer such as ammonium salt or citrate.

(ii) **Dispersion methods** : In these methods, larger particles of a substance (suspensions) are broken into smaller particles. The following methods are employed.

(a) *Mechanical dispersion*

- In this method, the substance is first ground to coarse particles.

- It is then mixed with the dispersion medium to get a suspension.

- The suspension is then grinded in colloidal mill.

- It consists of two metallic discs nearly touching each other and rotating in opposite directions at a very high speed about 7000 revolution per minute.

- The space between the discs of the mill is so adjusted that coarse suspension is subjected to great shearing force giving rise to particles of colloidal size.

- Colloidal solutions of black ink, paints, varnishes, dyes etc. are obtained by this method.

(b) *By electrical dispersion or Bredig's arc method*

- This method is used to prepare sols of platinum, silver, copper or gold.

- The metal whose sol is to be prepared is made as two electrodes which immersed in dispersion medium such as water etc.

- The dispersion medium is kept cooled by ice.

- An electric arc is struck between the electrodes.

- The tremendous heat generate by this method and give colloidal solution.

- The colloidal solution prepared is stabilised by adding a small amount of KOH to it.

(c) *By peptisation*

- The process of converting a freshly prepared precipitate into colloidal form by the addition of suitable electrolyte is called **peptisation**.

- The electrolyte is used for this purpose is called **peptizing agent** or **stabilizing agent**.

- Cause of peptisation is the adsorption of the ions of the electrolyte by the particles of the precipitate.

- Important peptizing agents are sugar, gum, gelatin and electrolytes.

Fig. 14.3 Colloidal mill

Fig. 14.4 Bredig's arc method

- Freshly prepared ferric hydroxide can be converted into colloidal state by shaking it with water containing Fe^{3+} or OH^- ions, viz.

$FeCl_3$ or NH_4OH respectively.

Fig. 14.5 Preparation of colloidal sol by peptisation

- A stable sol of stannic oxide is obtained by adding a small amount of dilute HCl to stannic oxide precipitates.

- Similarly, a colloidal solution of $Al(OH)_3$ and $AgCl$ are obtained by treating the corresponding freshly prepared precipitate with very dilute solution of HCl and $AgNO_3$ or KCl respectively.

Purification of colloidal solution

The following methods are commonly used for the purification of colloidal solutions.

(1) **Dialysis**

(i) The process of separating the particles of colloid from those of crystalloid, by means of diffusion through a suitable membrane is called dialysis.

(ii) Its principle is based upon the fact that colloidal particles can not pass through a parchment or cellophane membrane while the ions of the electrolyte can pass through it.

(iii) The impurities slowly diffused out of the bag leaving behind pure colloidal solution

(iv) The distilled water is changed frequently to avoid accumulation of the crystalloids otherwise they may start diffusing back into the bag.

(v) Dialysis can be used for removing HCl from the ferric hydroxide sol.

(2) **Electrodialysis**

(i) The ordinary process of dialysis is slow.

(ii) To increase the process of purification, the dialysis is carried out by applying electric field. This process is called **electrodialysis**.

(iii) The important application of electrodialysis process in the artificial kidney machine used for the purification of blood of the patients whose kidneys have failed to work. The artificial kidney machine works on the principle of **dialysis**.

(3) **Ultra – filtration**

(i) Sol particles directly pass through ordinary filter paper because their pores are larger (more than 1μ or $1000m\mu$) than the size of sol particles (less than $200m\mu$).

(ii) If the pores of the ordinary filter paper are made smaller by soaking the filter paper in a solution of gelatin or colloidal ion and subsequently hardened by soaking in formaldehyde, the treated filter paper may retain colloidal particles and allow the true solution particles to escape. Such filter paper is known as **ultra – filter** and the process of separating colloids by using ultra – filters is known as **ultra – filtration**.

(4) **Ultra – centrifugation**

(i) The sol particles are prevented from setting out under the action of gravity by kinetic impacts of the molecules of the medium.

(ii) The setting force can be enhanced by using high speed centrifugal machines having 15,000 or more revolutions per minute. Such machines are known as **ultra-centrifuges**.

Properties of colloidal solutions

The main characteristic properties of colloidal solutions are as follows.

(1) Physical properties

(i) **Heterogeneous nature** : Colloidal sols are heterogeneous in nature. They consist of two phases; the dispersed phase and the dispersion medium.

(ii) **Stable nature** : The colloidal solutions are quite stable. Their particles are in a state of motion and do not settle down at the bottom of the container.

(iii) **Filterability** : Colloidal particles are readily passed through the ordinary filter papers. However they can be retained by special filters known as ultrafilters (parchment paper).

(2) Colligative properties

(i) Due to formation of associated molecules, observed values of colligative properties like relative decrease in vapour pressure, elevation in boiling point, depression in freezing point, osmotic pressure are smaller than expected.

(ii) For a given colloidal sol the number of particles will be very small as compared to the true solution.

(3) Mechanical properties

(i) Brownian movement

(a) **Robert Brown**, a botanist discovered in 1827 that the **pollen grains** suspended in water do not remain at rest but move about continuously and randomly in all directions.

(b) Later on, it was observed that the colloidal particles are moving at random in a **zig – zag** motion. This type of motion is called **Brownian movement**.

(c) The molecules of the dispersion medium are constantly colliding with the particles of the dispersed phase. It was stated by **Wiener** in 1863 that *the impacts of the dispersion medium particles are unequal, thus causing a zig-zag motion of the dispersed phase particles*.

(d) The Brownian movement explains the force of gravity acting on colloidal particles. This helps in providing stability to colloidal sols by not allowing them to settle down.

(ii) **Diffusion** : The sol particles diffuse from higher concentration to lower concentration region. However, due to bigger size, they diffuse at a lesser speed.

(iii) **Sedimentation** : The colloidal particles settle down under the influence of gravity at a very slow rate. This phenomenon is used for determining the molecular mass of the macromolecules.

(4) Optical properties : Tyndall effect

(i) When light passes through a sol, its path becomes visible because of scattering of light by particles. It is called **Tyndall effect**. This phenomenon was studied for the first time by **Tyndall**. The illuminated path of the beam is called **Tyndall cone**.

(ii) The intensity of the scattered light depends on the difference between the refractive indices of the dispersed phase and the dispersion medium.

(iii) In lyophobic colloids, the difference is appreciable and, therefore, the Tyndall effect is well - defined. But in lyophilic sols, the difference is very small and the Tyndall effect is very weak.

(iv) The Tyndall effect confirms the **heterogeneous nature of the colloidal solution**.

(v) The Tyndall effect has also been observed by an instrument called **ultra – microscope**.

Some example of Tyndall effect are as follows

(a) *Tail of comets is seen as a **Tyndall cone** due to the scattering of light by the tiny solid particles left by the comet in its path.*

(b) *Due to scattering the sky looks blue.*

(c) *The blue colour of water in the sea is due to scattering of blue light by water molecules.*

(d) *Visibility of projector path and circus light.*

(e) *Visibility of sharp ray of sunlight passing through a slit in dark room.*

(5) Electrical properties

(i) Electrophoresis

(a) The phenomenon of movement of colloidal particles under an applied electric field is called **electrophoresis**.

(b) If the particles accumulate near the negative electrode, the charge on the particles is **positive**.

(c) On the other hand, if the sol particles accumulate near the positive electrode, the charge on the particles is **negative**.

(d) The apparatus consists of a U-tube with two **Pt**-electrodes in each limb.

(e) When electrophoresis of a sol is carried out without stirring, the bottom layer gradually becomes more concentrated while the top layer which contains pure and concentrated colloidal solution may be decanted. This is called **electro decantation** and is used for the purification as well as for concentrating the sol.

(f) The reverse of electrophoresis is called **Sedimentation potential or Dorn effect**. The sedimentation potential is setup when a particle is forced to move in a resting liquid. This phenomenon was discovered by **Dorn** and is also called **Dorn effect**.

(ii) Electrical double layer theory

(a) The electrical properties of colloids can also be explained by electrical double layer theory. According to this theory **a double layer of ions appear at the surface of solid**.

(b) The ion preferentially adsorbed is held in fixed part and imparts charge to colloidal particles.

(c) The second part consists of a diffuse mobile layer of ions. This second layer consists of both the type of charges. The net charge on the second layer is exactly equal to that on the fixed part.

(d) The existence of opposite sign on fixed and diffuse parts of double layer leads to appearance of a difference of potential, known as **zeta potential or electrokinetic potential**. Now when electric field is employed the particles move (electrophoresis)

(iii) Electro-osmosis

(a) In it the movement of the dispersed particles are prevented from moving by **semipermeable membrane**.

(b) Electro-osmosis is a phenomenon in which dispersion medium is allowed to move under the influence of an electrical field, whereas colloidal particles are not allowed to move.

(c) The existence of electro-osmosis has suggested that when liquid forced through a porous material or a capillary tube, a potential difference is setup between the two sides called as streaming potential. So the reverse of electro-osmosis is called **streaming potential**.

Origin of the charge on colloidal particles

The origin of the charge on the sol particles in most cases is due to the preferential adsorption of either positive or negative ions on their surface. The sol particles acquire electrical charge in any one or more of the following ways.

(1) **Due to the dissociation of the surface molecules** : Some colloidal particles develop electrical charge due to the dissociation / ionisation of the surface molecules. The charge on the colloidal particles is balanced by the oppositely charged ions in the sol. For example, an aqueous solution of soap (sodium palmitate) which dissociates into ions as,

The cations (Na) pass into the solution while the anions ($C_{15}H_{31}COO^-$) have a tendency to form aggregates due to weak attractive forces present in the hydrocarbon chains.

(2) **Due to frictional electrification**

(i) It is believed that the frictional electrification due to the rubbing of the dispersed phase particles with that of dispersion medium results in some charge on the colloidal particles.

(ii) The dispersion medium must also get some charge, because of the friction. Since it does not carry any charge, the theory does not seem to be correct.

(3) **Due to selective adsorption of ions**

(i) The particles constituting the dispersed phase adsorb only those ions preferentially which are common with their own lattice ions.

(ii) For example, when a small quantity of silver nitrate ($AgNO_3$) solution is added to a large quantity of potassium iodide (KI) solution, the colloidal particles of silver iodide adsorb I^- from the solution to become **negatively charged**, (at this stage KI is in excess, and I^- being common to AgI)

But, when a small quantity of potassium iodide (KI) solution is added to a large quantity of silver nitrate solution ($AgNO_3$); the colloidal silver iodide particles adsorb Ag^+ from the solution to become **positively charged**, (at this stage $AgNO_3$ is in excess and Ag^+ is common to AgI),

Fig. 14.6

(iii) Depending upon the nature of charge on the particles of the dispersed phase, the colloidal solutions are classified into positively charged and negatively charged colloids. Some typical examples are as follows

(a) **Negatively charged colloids**

- Metal sulphides : As_2S_3, CdS
- Metal dispersions : Ag, Au, Pt
- Acid dyes : Eosin, congo red
- Sols of starch, gums, gold, gelatin etc.

(b) **Positively charged colloids**

- Metal hydroxides : $Al(OH)_3, Fe(OH)_3$
- Metal oxide : TiO_2
- Basic dyes : Methylene blue
- Haemoglobin
- Sulphur sol

Stability of sols

Sols are thermodynamically unstable and the dispersed phase (colloidal particles) tend to separate out on long standing due to the **Vander Waal's attractive forces**. However sols tend to exhibit some stability due to

(1) **Stronger repulsive forces between the similarly charged particles**

(2) **Particle-solvent interactions** : Due to strong particle-solvent (dispersion medium) interactions, the colloidal particles get strongly solvated.

Coagulation or Flocculation or Precipitation

*"The phenomenon of the precipitation of a colloidal solution by the addition of the excess of an electrolyte is called **coagulation or flocculation**."*

The coagulation of the **lyophobic sols** can be carried out by following methods.

(1) **By electrophoresis** : In electrophoresis the colloidal particles move towards oppositely charged electrode. When these come in contact with the electrode for long these are discharged and precipitated.

(2) **By mixing two oppositely charged sols** : When oppositely charged sols are mixed in almost equal proportions, their charges are neutralised. Both sols may be partially or completely precipitated as the mixing of ferric hydroxide (+ve sol) and arsenious sulphide (-ve sol) bring them in precipitated form. This type of coagulation is called **mutual coagulation or metrical coagulation**.

(3) **By boiling** : When a sol is boiled, the adsorbed layer is disturbed due to increased collisions with the molecules of dispersion medium. This reduces the charge on the particles and ultimately they settle down to form a precipitate.

(4) **By persistent dialysis** : On prolonged dialysis, the traces of the electrolyte present in the sol are removed almost completely and the colloids become unstable.

(5) **By addition of electrolytes** : The particles of the dispersed phase *i.e.*, colloids bear some charge. When an electrolyte is added to sol, the colloidal particles take up ions carrying opposite charge from the electrolyte. As a result, their charge gets neutralised and this causes the uncharged, particles to come closer and to get coagulated or precipitated. For example, if $BaCl_2$ solution is added to As_2S_3 sol the Ba^{2+} ions are attracted by the negatively charged sol particles and their charge gets neutralised. This lead to coagulation.

(6) **Hardy schulze rule** : The coagulation capacity of different electrolytes is different. It depends upon the valency of the active ion are called flocculating ion, which is the ion carrying charge opposite to the charge on the colloidal particles. "According to Hardy Schulze rule, greater the valency of the active ion or flocculating ion, greater will be its coagulating power" thus, Hardy Schulze law state:

(i) *The ions carrying the charge opposite to that of sol particles are effective in causing coagulation of the sol.*

(ii) *Coagulating power of an electrolyte is directly proportional to the valency of the active ions (ions causing coagulation).*

For example to coagulate **negative sol** of As_2S_3 , the **coagulation power** of different cations has been found to **decrease** in the order as, $Al^{3+} > Mg^{2+} > Na^+$

Similarly, to coagulate a **positive sol** such as $Fe(OH)_3$, the **coagulating power** of different anions has been found to **decrease** in the order : $[Fe(CN)_6]^{4-} > PO_4^{3-} > SO_4^{2-} > Cl^-$

(7) **Coagulation or flocculation value**

*"The minimum concentration of an electrolyte which is required to cause the coagulation or flocculation of a sol is known as **flocculation value**."*

or

"The number of millimoles of an electrolyte required to bring about the coagulation of one litre of a colloidal solution is called its **flocculation value**."

$$\text{Coagulation value or flocculating value} \propto \frac{1}{\text{Coagulating power}}$$

(8) Coagulation of lyophilic sols

(i) There are two factors which are responsible for the stability of lyophilic sols.

(ii) These factors are the charge and solvation of the colloidal particles.

(iii) When these two factors are removed, a lyophilic sol can be coagulated.

(iv) This is done (i) by adding electrolyte (ii) and by adding suitable solvent.

(v) When solvent such as alcohol and acetone are added to hydrophilic sols the dehydration of dispersed phase occurs. Under this condition a small quantity of electrolyte can bring about coagulation.

Protection of colloids and Gold number

- Lyophilic sols are more stable than lyophobic sols.
- Lyophobic sols can be easily coagulated by the addition of small quantity of an electrolyte.

- When a lyophilic sol is added to any lyophobic sol, it becomes less sensitive towards electrolytes. Thus, lyophilic colloids can prevent the coagulation of any lyophobic sol.

"The phenomenon of preventing the coagulation of a lyophobic sol due to the addition of some lyophilic colloid is called **sol protection** or **protection of colloids**."

- The protecting power of different protective (lyophilic) colloids is different. The efficiency of any protective colloid is expressed in terms of **gold number**.

Gold number : **Zsigmondy** introduced a term called **gold number** to describe the protective power of different colloids. This is defined as, "weight of the dried protective agent in milligrams, which when added to 10 ml of a standard gold sol (0.0053 to 0.0058%) is just sufficient to prevent a colour change from red to blue on the addition of 1 ml of 10 % sodium chloride solution, is equal to the gold number of that protective colloid."

Thus, smaller is the gold number, higher is the protective action of the protective agent.

$$\text{Protective power} \propto \frac{1}{\text{Gold number}}$$

Table : 14.4 Gold numbers of some hydrophilic substances

Hydrophilic substance	Gold number	Hydrophilic substance	Gold number
Gelatin	0.005 - 0.01	Sodium oleate	0.4 - 1.0
Sodium caseinate	0.01	Gum tragacanth	2
Hamoglobin	0.03 - 0.07	Potato starch	25
Gum arabic	0.15 - 0.25		

Congo rubin number : **Ostwald** introduced congo rubin number to account for protective nature of colloids. It is defined as "the amount of protective colloid in milligrams which prevents colour change in 100 ml of 0.01 % congo rubin dye to which 0.16 g equivalent of KCl is added."

Mechanism of sol protection

(i) The actual mechanism of sol protection is very complex. However it may be due to the adsorption of the protective colloid on the lyophobic sol particles, followed by its solvation. Thus it stabilises the sol via **solvation effects**.

Fig. 14.7 Protection of colloids

(ii) Solvation effects contribute much towards the stability of lyophilic systems. For example, gelatin has a sufficiently strong affinity for water. It is only because of the solvation effects that even the addition of electrolytes in small amounts does not cause any flocculation of hydrophilic sols. However at higher concentration, precipitation occurs. This phenomenon is called **salting out**.

(iii) The salting out efficiency of an electrolyte depends upon the tendency of its constituents ions to get hydrated i.e, the tendency to squeeze out water initially tied up with the colloidal particle.

(iv) The cations and the anions can be arranged in the decreasing order of the salting out power, such an arrangement is called **lyotropic series**.

Ammonium sulphate, due to its very high solubility in water, is oftenly used for precipitating proteins from aqueous solutions.

(v) The precipitation of lyophilic colloids can also be affected by the addition of organic solvents of non-electrolytes. For example, the addition of acetone or alcohol to aqueous gelatin solution causes precipitation of gelatin. Addition of petroleum ether to a solution of rubber in benzene causes the precipitation of rubber.

Emulsion

"The colloidal systems in which fine droplets of one liquid are dispersed in another liquid are called **emulsions** the two liquids otherwise being mutually immiscible." or

"Emulsion are the colloidal solutions in which both the dispersed phase and the dispersion medium are liquids."

A good example of an emulsion is milk in which fat globules are dispersed in water. The size of the emulsified globules is generally of the order of 10^{-6} m. Emulsion resemble lyophobic sols in some properties.

(1) **Types of Emulsion** : Depending upon the nature of the dispersed phase, the emulsions are classified as;

(i) **Oil-in-water emulsions (O/W)** : The emulsion in which oil is present as the dispersed phase and water as the dispersion medium (**continuous phase**) is called an oil-in-water emulsion. Milk is an example of the oil-in-water type of emulsion. In milk liquid fat globules are dispersed in water. Other examples are, vanishing cream etc.

(ii) **Water-in-oil emulsion (W/O)** : The emulsion in which water forms the dispersed phase, and the oil acts as the dispersion medium is called a water-in-oil emulsion. These emulsion are also termed **oil emulsions**. **Butter** and **cold cream** are typical examples of this types of emulsions. Other examples are cod liver oil etc.

(2) Properties of emulsion

(i) Emulsions show all the characteristic properties of colloidal solution such as Brownian movement, Tyndall effect, electrophoresis etc.

(ii) These are coagulated by the addition of electrolytes containing polyvalent metal ions indicating the negative charge on the globules.

(iii) The size of the dispersed particles in emulsions is larger than those in the sols. It ranges from 1000 Å to 10,000 Å. However, the size is smaller than the particles in suspensions.

(iv) Emulsions can be converted into two separate liquids by heating, centrifuging, freezing etc. This process is also known as **demulsification**.

(3) Applications of emulsions

(i) Concentration of ores in metallurgy

(ii) In medicine (Emulsion water-in-oil type)

(iii) Cleansing action of soaps.

(iv) Milk, which is an important constituent of our diet an emulsion of fat in water.

(v) Digestion of fats in intestine is through **emulsification**.

Gels

(1) "A gel is a colloidal system in which a liquid is dispersed in a solid."

(2) The lyophilic sols may be coagulated to give a semisolid jelly like mass, which encloses all the liquid present in the sol. The process of gel formation is called **gelation** and the colloidal system formed called **gel**.

(3) Some gels are known to liquify on shaking and reset on being allowed to stand. This reversible **sol-gel transformation** is called **thixotropy**.

(4) The common examples of gel are gum arabic, gelatin, processed cheese, silicic acid, ferric hydroxide etc.

(5) Gels may shrink by losing some liquid help them. This is known as **syneresis or weeping**.

(6) Gels may be classified into two types

(i) **Elastic gels** : These are the gels which possess the property of elasticity. They readily change their shape on applying force and return to original shape when the applied force is removed. Common examples are gelatin, agar-agar, starch etc.

(ii) **Non-elastic gels** : These are the gels which are rigid and do not have the property of elasticity. For example, silica gel.

Application of colloids

(1) **Purification of water by alum** (coagulation) : Alum which yield Al^{3+} ions, is added to water to coagulate the negatively charged clay particles.

(2) **In rubber and tanning industry** (coagulation and mutual coagulation) : Several industrial processes such as rubber plating, chrome tanning, dyeing, lubrication etc are of colloidal nature

(i) In rubber plating, the negatively charged particles of rubber (latex) are made to deposit on the wires or handle of various tools by means of electrophoresis. The article on which rubber is to be deposited is made anode.

(ii) In tanning the positively charged colloidal particles of hides and leather are coagulated by impregnating, them in negatively charged tanning materials (present in the barks of trees). Among the tanning agent chromium salts are most commonly used for the coagulation of the hide material and the process is called **chrome tanning**.

(3) **Artificial rains** : It is possible to cause artificial rain by throwing the electrified sand or silver iodide from an aeroplane and thus coagulating the mist hanging in air.

(4) **Smoke precipitation** (Coagulation) : Smoke is a **negative** sol consisting of carbon particles dispersed in air. Thus, these particles are removed by passing through a chamber provided with highly positively charged metallic knob.

(5) **Formation of deltas** (coagulation) : River water consists of negatively charged clay particles of colloidal dimension. When the river falls into the sea, the clay particles are coagulated by the positive Na^+ , K^+ , Mg^{2+} ions etc. present in sea water and new lands called deltas are formed.

(6) **Clot formation** : Blood consists of negatively charged colloidal particles (albuminoid substance). The colloidal nature of blood explains why bleeding stops by applying a ferric chloride solution to the wound. Actually ferric chloride solution causes coagulation of blood to form a clot which stops further bleeding.

(7) **Colloidal medicine** : Argyrol and protargyrol are colloidal solution of silver and are used as eye lotions colloidal sulphur is used as disinfectant colloidal gold, calcium and iron are used as tonics.

(8) **Coating of Photographic plates** : These are thin glass plates coated with gelatin containing a fine suspension of silver bromide. The particles of silver bromide are colloidal in nature.

Tips & Tricks

- ✍ Chemisorption and physisorption both are exothermic.
- ✍ Charcoal adsorbs many gases. It even adsorbs polluting gases present in air in small concentration.
- ✍ The langmuir adsorption isotherm is restricted to the formation of unimolecular layer of gas molecules on the surface of solids. However, it was suggested that there is possibility of multimolecular layer of gas molecules on the surface of the solids rather than single layer on this basis Brunauer, Emmett and Teller proposed a new theory known as B.E.T. theory.
- ✍ All Bronsted acids and bases act as acid base catalysts.
- ✍ The principle of electrophoresis is employed for the separation of proteins from nucleic acids removing sludge from sewage waste etc.
- ✍ Hydrophilic sols show greater stability than hydrophobic sols.
- ✍ Colloidal solution of graphite is called aquadug.
- ✍ The phase in which the emulsifier is more soluble becomes outer phase of the emulsion that is called Ben croft rule.

Ordinary Thinking

Objective Questions

Adsorption and Adsorption isotherm

- Chemisorption
 - Involves the weak attractive interactions between adsorbent and adsorbate
 - Is irreversible in nature
 - Decreases with increase of temperature
 - Involves multilayer formation of adsorbent on adsorbate
- Chemisorption
 - Increases with temperature
 - Decreases with temperature
 - Remains unaffected by change of temperature
 - Either increases or decreases with temperature
- Which among the following statement is false
[KCET (Med.) 2002]
 - The adsorption may be monolayered or multilayered
 - Particle size of adsorbent will not affect the amount of adsorption
 - Increase of pressure increases amount of adsorption
 - Increase of temperature may decrease the amount of adsorption
- Wood charcoal is used to decolourise sugar because it
[CPMT 2002]
 - Adsorbs coloured material
 - Absorbs decolourised material
 - Reduces coloured material
 - None of these
- If the adsorbate is held on a surface by weak Vander Waal's forces, the adsorption process is called
[Kerala (Med.) 2002]
 - Physical adsorption
 - Chemical adsorption
 - Heat of adsorption
 - Enthalpy of adsorption
- When the temperature is raised, the viscosity of liquid decreases, this is because
[Kerala (Med.) 2002]
 - Decreased volume of the solution
 - Increase in temperature increases the average kinetic energy of molecules, which overcome the attractive force between them
 - Decreased covalent and hydrogen bond forces
 - Increased attraction between molecules
- A solid acts as an adsorbent because it has
 - A definite shape
 - Small pores in it
 - Unsaturated valencies
 - A high lattice energy
- Point out the wrong statement :
Physical adsorption is characterised by
 - Attraction due to weak Vander Waal's forces
 - Irreversible nature of adsorption
 - Multimolecular adsorption layers
 - Decrease in adsorption with increase in temperature
- When the temperature is lowered and pressure is raised, the adsorption of a gas on a solid
[MP PMT 1997]
 - Decreases
 - Increases
 - Remains unaffected
 - Decreases first then increases
- In physical adsorption, the gas molecules are held on solid surface by [MP PET 1996; AIIMS 1998]
 - Chemical forces
 - Electrostatic forces
 - Gravitational forces
 - Vander Waal's forces
- Adsorption is multilayer in the case of [MP PET 1999]
 - Physical adsorption
 - Chemisorption
 - Both
 - None of both
- Physical adsorption
 - Involves the weak attractive interaction between the adsorbent and adsorbate
 - Involves the chemical interactions between the adsorbent and adsorbate
 - Is irreversible in nature
 - Increases with increase of temperature
- The charge on As_2S_3 sol is due to the adsorbed
[MP PMT 1985]
 - H^+
 - OH^-
 - O^{2-}
 - S^{2-}
- In the adsorption of acetic acid on activated charcoal, the acetic acid is an [MP PET 1994; MP PMT 2002]
 - Adsorber
 - Absorber
 - Adsorbent
 - Adsorbate
- Sticking of one substance at the surface of another is called
 - Absorption
 - Chemisorption
 - Adsorption
 - Desorption
- The charge on colloidal particles is due to
 - Presence of electrolyte
 - Very small size of particles
 - Adsorption of ions from the solution
 - None of these
- Which one of the following statement is not correct
 - The extent of adsorption depends on the nature of the adsorbent and adsorbate
 - The extent of adsorption depends on the pressure of the gas
 - The extent of adsorption depends on the temperature
 - The extent of adsorption has no upper limit
- For the adsorption of a gas on a solid, the plot of $\log(x/m)$ versus $\log P$ is linear with slope equal to [CBSE PMT 1994]
 - k
 - $\log k$
 - n
 - $1/n$
- According to Langmuir adsorption isotherm, the amount of gas adsorbed at very high pressures [MP PMT 1993]
 - Reaches a constant limiting value
 - Goes on increasing with pressure
 - Goes on decreasing with pressure
 - Increases first and decreases later with pressure
- Which of the following statement is not correct
[MP PET 1993]
 - Physical adsorption is due to Vander Wall's forces
 - Chemical adsorption decreases at high temperature and low pressure
 - Physical adsorption is reversible
 - Adsorption energy for a chemical adsorption is generally greater than that of physical adsorption
- In adsorption of oxalic acid on activated charcoal, the activated charcoal is known as
 - Adsorbent
 - Adsorbate
 - Adsorption
 - Desorption

- (a) Adsorbent (b) Absorbate
(c) Adsorber (d) Absorber
22. Adsorption is phenomenon in which a substance
(a) Goes into the body of the other substance
(b) Remains close to the other substance
(c) Accumulates on the surface of the other substance
(d) None of these
23. Physical adsorption is essentially quite appreciable
(a) At room temperature (b) At higher temperature
(c) At lower temperature (d) None of these
24. Adsorption increases when
(a) Temperature increases
(b) Temperature decreases
(c) Temperature remains constant
(d) None of these
25. In chemical adsorption, how many layers are adsorbed
[MP PMT 1996]
(a) One (b) Two
(c) Multi (d) Zero
26. The adsorption of a gas on a solid surface varies with pressure of the gas in which of the following manner
[CPMT 1999]
(a) Fast $\rightarrow$ slow $\rightarrow$ independent of the pressure
(b) Slow $\rightarrow$ fast $\rightarrow$ independent of the pressure
(c) Independent of the pressure $\rightarrow$ fast $\rightarrow$ slow
(d) Independent of the pressure $\rightarrow$ slow $\rightarrow$ fast
27. Which of the following statements is not applicable to chemisorption
[KCET (Med.) 1999; BHU 2000]
(a) It is slow
(b) It is irreversible
(c) It is highly specific
(d) It is independent of temperature
28. Adsorption is always
[DPMT 2000]
(a) Endothermic (b) Exothermic
(c) Either (a) or (b) (d) None of these
29. The colloidal system consisting of a liquid adsorbent in a solid adsorbate is termed as
(a) Aerosol (b) Sol
(c) Foam (d) Gel
30. Which one of the following substances adsorbs hydrogen gas most strongly
(a) Activated carbon (b) Silica gel
(c) Platinum black (d) Iron powder
31. According to the adsorption theory of catalysis, the speed of the reaction increases because
[CBSE PMT 2003]
(a) Adsorption lowers the activation energy of the reaction
(b) The concentration of reactant molecules at the active centres of the catalyst becomes high due to adsorption
(c) In the process of adsorption, the activation energy of the molecules becomes large
(d) Adsorption produces heat which increases the speed of the reaction
32. In Freundlich adsorption, isotherm adsorption is proportional to pressure P as
[AMU 2002]
(a) P^0 (b) P
(c) P^n (d) $P^{1/n}$
33. Which one of the following characteristics is not correct for physical adsorption
[AIEEE 2003]
(a) Adsorption on solids is reversible
(b) Adsorption increases with increase in temperature
(c) Adsorption is spontaneous
(d) Both enthalpy and entropy of adsorption are negative
34. Which of the following is not a characteristic of chemisorption
(a) ΔH is of the order of 400 kJ
(b) Adsorption is irreversible
(c) Adsorption may be multimolecular layer
(d) Adsorption is specific
35. The viscosity of the solvent depends on
[Kerala (Med.) 2002]
(a) Isothermic nature
(b) Solute - solute interaction
(c) Solute - solvent interaction
(d) Density of the liquid
36. Which of the following kinds of catalysis can be explained by the adsorption theory?
[MP PET/PMT 1998]
(a) Homogeneous catalysis (b) Acid base catalysis
(c) Heterogeneous catalysis (d) Enzyme catalysis
37. Adsorption due to strong chemical forces is called
[KCET (Med.) 2001]
(a) Chemisorption (b) Physisorption
(c) Reversible adsorption (d) Both (b) and (c)
38. In neutralisation of KI by $AgNO_3$ positive charge is due to absorption of
[AMU 2000]
(a) Ag^+ ions (b) Ag
(c) I^- ions (d) Both (b) and (c)
39. Physical adsorption is inversely proportional to the
[AFMC 2000]
(a) Volume (b) Concentration
(c) Temperature (d) All of these
40. 50 ml of 1 M oxalic acid is shaken with 0.5 gm of wood charcoal. The final concentration of the solution after adsorption is 0.5 M. Amount of oxalic acid absorbed per gm of charcoal is
(a) 3.45 gm (b) 3.15 gm
(c) 6.30 gm (d) None
41. Noble gases are adsorbed by
[DCE 2004]
(a) Anhydrous calcium chloride
(b) Ferric hydroxide
(c) Conc. H_2SO_4
(d) Activated coconut charcoal
42. Animal charcoal is used in decolourising colour of liquids because it is a good
[MHCET 2004]
(a) Adsorbate (b) Adsorbent
(c) Oxidising agent (d) Reducing agent
43. What will be the effect of increase in temperature on physical adsorption
[Pb. CET 2000]
(a) It will decrease
(b) It will increase
(c) First increase then decrease
(d) None of these
44. 0.2 gm of fine animal charcoal is mixed with half litre of acetic acid solution and shaken for 30 minutes
[DPMT 2004]
(a) Concentration remains same
(b) Concentration increases
(c) Concentration of the solution decreases
(d) None of these
45. The equation for Freundlich adsorption isotherm is
[MHCET 2004]
(a) $\frac{x}{m} = kp^{1/n}$ (b) $x = mkp^{1/n}$
(c) $x/m = kp^{-n}$ (d) All of these
46. The extent of adsorption of a gas on a solid depends on
[KCET 2005]
(a) Nature of the gas (b) Pressure of the gas
(c) Temperature of the gas (d) All are correct
[KCET 2003]

47. Activated charcoal is used to remove colouring matter from pure substances. It works by [KCET 2005]
- (a) Oxidation (b) Reduction
(c) Bleaching (d) Adsorption

Catalyst and Catalysis

1. Mark the correct statement in a reversible reaction [CPMT 1974; EAMCET 1978, 79; MP PMT 1993]
- (a) The catalyst catalyses the forward reaction
(b) The catalyst catalyses the backward reaction
(c) The catalyst influences the direct and the reverse reaction to the same extent
(d) The catalyst increases the rate of forward reaction and decreases the rate of backward reaction
2. A catalyst is used [CPMT 1989]
- (a) Only for increasing the velocity of the reaction
(b) For altering the velocity of the reaction
(c) Only for decreasing the velocity of the reaction
(d) All (a), (b) and (c) are correct
3. A catalyst is a substance which [NCERT 1981; CPMT 1996]
- (a) Alters the equilibrium in a reaction
(b) Is always in the same phase as the reactants
(c) Participates in the reaction and provides easier pathway for the same
(d) Does not participate in the reaction but speeds it up
4. In Haber's process for the manufacture of ammonia [AMU 1984; CPMT 1974, 90]
- (a) Finely divided iron is used as catalyst
(b) Finely divided molybdenum is used as catalyst
(c) Finely divided nickel is used as catalyst
(d) No catalyst is necessary
5. When $KClO_3$ is heated, it decomposes into $KCl + O_2$. If some MnO_2 is added, the reaction goes much faster because [CPMT 1971, 76, 80, 94]
- (a) MnO_2 decomposes to give O_2
(b) MnO_2 provides heat by reacting
(c) Better contact is provided by MnO_2
(d) MnO_2 acts as a catalyst
6. In the reaction $2SO_2 + O_2 \xrightarrow[As_2O_3]{Pt} 2SO_3$, As_2O_3 acts as a [MP PET 1995]
- (a) Autocatalyst (b) Poison
(c) Promotor (d) Positive catalyst
7. Reactions in Zeolite catalysts depend on [BHU 2000]
- (a) Pores (b) Apertures
(c) Size of cavities (d) All of these
8. What is the role of a catalyst in a catalysed reaction [MP PMT 1996; Pb. PMT 2000; UPSEAT 2001, 02]
- (a) Lowers the activation energy
(b) Increases the activation energy
(c) Affects the free energy change
(d) Affects the enthalpy change
9. The catalyst used in the lead chamber process of sulphuric acid manufacture is [CPMT 1977]
- (a) Platinum (b) Oxide of nitrogen
(c) Nickel (d) Vanadium compounds
10. In the following reaction the catalyst used is

[AMU (Engg.) 1999]

- (a) Al_2O_3 (b) Cr_2O_3
(c) Cr_2O_3 and Al_2O_3 (d) Zn dust
11. Enzymes with two sites are called [AIIMS 2002]
- (a) Apoenzyme (b) Holoenzyme
(c) Allosteric enzyme (d) Conjugate enzyme
12. Which of the following types of metals make the most efficient catalysts [DPMT 1985]
- (a) Alkali metals (b) Transition metals
(c) Alkaline-earth metals (d) Radioactive metals
13. An example of autocatalytic reaction is [NCERT 1983]
- (a) The decomposition of nitroglycerine
(b) Thermal decomposition of $KClO_3$ and MnO_2 mixture
(c) Break down of C^{14}
(d) Hydrogenation of vegetable oil using nickel catalysts
14. In the case of auto catalysis [KCET (Med.) 2002]
- (a) Solvent catalyses
(b) Product catalyses
(c) Reactant catalyses
(d) Heat produced in the reaction catalyses
15. In a reversible reaction, a catalyst will affect the rate of [KCET (Med.) 2002]
- (a) Forward reaction
(b) Reverse reaction
(c) Forward and reverse reaction
(d) Neither (a) nor (b)
16. The role of a catalyst in a reversible reaction is to [KCET (Med.) 2001]
- (a) Increase the rate of forward reaction
(b) Decrease the rate of backward reaction
(c) Alter the equilibrium constant of the reaction
(d) Allow the equilibrium to be achieved quickly
17. The catalyst used in the contact process for manufacturing of sulphuric acid is [MP PMT 1987]
- (a) Copper (b) Iron/aluminium oxide
(c) Vanadium pentoxide (d) Platinized asbestos
18. For the functioning of enzymes which of the following statements is not correct [MP PMT 2000]
- (a) An optimum temperature is needed
(b) An optimum pH is needed
(c) They are substrate specific
(d) They always increase activation energy
19. When a catalyst is added to a system the [JIPMER 2000]
- (a) Value of equilibrium constant is decreased
(b) The rate of forward reaction is increased and that of backward reaction is decreased
(c) Equilibrium concentrations are unchanged
(d) Equilibrium concentrations are increased
20. A catalyst can affect reversible reaction by [CPMT 2002]
- (a) Changing equilibrium
(b) Slowing forward reaction
(c) Attaining equilibrium in both direction
(d) None of these
21.
$$C_{12}H_{22}O_{11} + H_2O \xrightarrow{\text{dil. } H_2SO_4} C_6H_{12}O_6(aq) + C_6H_{12}O_6(aq)$$

Sucrose
Fructose
Glucose

In this reaction, dilute H_2SO_4 is called [AFMC 1997]
- (a) Homogeneous catalysis (b) Homogeneous catalyst
(c) Heterogeneous catalysis (d) Heterogeneous catalyst
22. Which one of the following statement is wrong in case of enzyme catalysis [MP PMT 1985, 2001]
- (a) Enzymes work best at an optimum temperature
(b) Enzymes work at an optimum pH
(c) Enzymes are highly specific for substances

- (d) An enzyme raises activation energy
23. Which of the following catalyses the conversion of glucose into ethanol
[CPMT 1983, 84; CBSE PMT 1989; KCET 1993]
- (a) Zymase (b) Invertase
(c) Maltase (d) Diastase
24. Which of the following is used as a catalyst in the manufacture of toluene from benzene with CH_3Cl
[CPMT 1985]
- (a) Ni (b) Anhydrous AlCl_3
(c) Pd (d) Pt
25. Hydrolysis of ethyl acetate is catalysed by aqueous
[MP PMT 2002]
- (a) Na_2SO_4 (b) K_2SO_4
(c) H_2SO_4 (d) BaSO_4
26. Which of the following statements about a catalyst is true
[AIIMS 1996]
- (a) It lowers the energy of activation
(b) The catalyst altered during the reaction is regenerated
(c) It does not alter the equilibrium
(d) All of these
27. Which of the following statements is true for a catalyst
- (a) It increases the energy of the reactants
(b) It decreases the energy of the products
(c) It decreases the energy of the reactants
(d) It does not change the enthalpy of the reactants
28. Which is not a characteristic of a catalyst
[AFMC 1992]
- (a) It changes the equilibrium constant
(b) It alters the reaction path
(c) It increases the rate of reaction
(d) It increases the average K.E. of the molecules
29. Which one of the following statements is correct in reversible reaction. A catalyst
[MP PET 1994; EAMCET 1987]
- (a) Increases the rate of forward reaction
(b) Decreases the rate of forward reaction
(c) Increases the rate of backward and forward reactions
(d) Alters the equilibrium constant of the reaction
30. A catalyst
[MNR 1987; UPSEAT 2002]
- (a) Increases the free energy change in the reaction
(b) Decreases the free energy change in the reaction
(c) Does not increase or decrease the free energy change in the reaction
(d) Can either increase or decrease the free energy change depending on what catalyst we use
31. Which one of the following changes when catalyst is used in a reaction
- (a) Heat of reaction (b) Product of reaction
(c) Equilibrium constant (d) Activation energy
32. In the reversible reaction a catalyst is the substance which
[CBSE PMT 1992]
- (a) Increases the rate of the forward reaction
(b) Decreases the value of enthalpy change in the reaction
(c) Reduces the time required for reaching the equilibrium state in the reaction
(d) Decreases the rate of the reverse reaction
33. In the titration between oxalic acid and acidified potassium permanganate, the manganous salt formed catalyses the reaction. The manganous salt is
[KCET 1992]
- (a) A promoter (b) A positive catalyst
(c) An autocatalyst (d) None of these
34. Which one of the following statements is incorrect in the case of heterogeneous catalysis
[CPMT 1990]
- (a) The catalyst lowers the energy of activation
(b) The catalyst actually forms a compound with the reactant
(c) The surface of the catalyst plays a very important role
(d) There is no change in the energy of activation
35. Regarding criteria of catalysis which one of the following statements is not true
[CPMT 1990]
- (a) The catalyst is unchanged chemically at the end of the reaction
(b) A small quantity of catalyst is often sufficient to bring about a considerable amount of reaction
(c) In a reversible reaction the catalyst alters the equilibrium position
(d) The catalyst accelerates the reaction
36. Which of the following reaction is catalysed by enzyme maltase
- (a) Starch $\rightarrow$ maltose
(b) Maltose $\rightarrow$ glucose
(c) Lactose $\rightarrow$ maltose
(d) Maltose $\rightarrow$ glucose + fructose
37. The efficiency of an enzyme in catalysing a reaction is due to its capacity
[NCERT 1982]
- (a) To form a strong enzyme-substrate complex
(b) To decrease the bond energies of substrate molecule
(c) To change the shape of the substrate molecule
(d) To lower the activation energy of the reaction
38. A catalyst in a chemical reaction
[BHU 1998]
- (a) Does not initiate a reaction
(b) Increases the activation energy of the reaction
(c) Changes the equilibrium constant of a reaction
(d) Does not change the rate of the reaction
39. Platinized asbestos is used as a catalyst in the manufacture of H_2SO_4 . It is an example of
[CPMT 1975]
- (a) Heterogeneous catalyst (b) Autocatalyst
(c) Homogenous catalyst (d) Induced catalyst
40. Catalyst used in hydrogenation of oils is
[CPMT 1975; MNR 1986; DPMT 1982, 85; BHU 1973, 87; EAMCET 1987; AFMC 1993; CET Pune 1998]
- (a) Pt (b) Mo
(c) Fe (d) Ni
41. Addition of catalyst in a system
[MP PMT 1992]
- (a) Increases equilibrium concentrations
(b) No effect on equilibrium concentrations
(c) Decreases equilibrium concentrations
(d) Increases rate of forward reaction and decreases rate of backward reaction
42. In which of the following processes, platinum is used as a catalyst
[NCERT 1978]
- (a) Oxidation of ammonia to form nitric acid
(b) Hardening of oils
(c) Production of synthetic rubber
(d) Synthesis of methanol
43. Enzymes are
[CPMT 1974, 81]
- (a) Micro-organisms (b) Proteins
(c) Inorganic compounds (d) Moulds
44. Protons accelerate the hydrolysis of esters. This is an example of
[MP PMT 1987]
- (a) A heterogeneous catalysis
(b) An acid-base catalysis
(c) A promoter
(d) A negative catalyst
45. Which of the following processes does not involve a catalyst
[KCET 1991; AIIMS 1996]
- (a) Haber's process (b) Thermite process
(c) Ostwald process (d) Contact process
46. Which of the statement is wrong among the following
[AFMC 1993]
- (a) Haber's process of NH_3 requires iron as catalyst

- (b) Friedel–Craft's reaction uses anhydrous $AlCl_3$
 (c) Hydrogenation of oils uses iron as catalyst
 (d) Oxidation of SO_2 to SO_3 requires V_2O_5
47. A catalyst is a substance which
 (a) Increases the rate of a reaction
 (b) Increases the amount of the products formed in a reaction
 (c) Decreases the temperature required for the reaction
 (d) Alters the speed of the reaction remaining unchanged chemically at the end of the reaction
48. In the Ostwald's process for the manufacture of HNO_3 , the catalyst used is [AMU 1982, 83; MP PET 1999]
 (a) Mo (b) Fe
 (c) Ni (d) Pt
49. A biological catalyst is essentially [NCERT 1978; AFMC 1998]
 (a) An amino acid (b) A carbohydrate
 (c) The nitrogen molecule (d) An enzyme
50. A catalyst added to a reaction mixture
 (a) Increases the equilibrium constant
 (b) Decreases the equilibrium constant
 (c) Does not change the equilibrium constant
 (d) None of these
51. The components of Ziegler Natta catalyst, used in the polymerisation of propylene, are [MP PMT 2003]
 (a) $TiCl_3 + Al(C_2H_5)_3$ (b) $TiCl_4 + Al(C_2H_5)_3$
 (c) $Ti(C_2H_5)_3 + AlCl_3$ (d) $Ti(C_2H_5)_4 + AlCl_3$
52. Which of the following statements regarding catalyst is not true [CPMT 1983, 84; MNR 1993; KCET 1999]
 (a) A catalyst remains unchanged in composition and quantity at the end of the reaction
 (b) A catalyst can initiate a reaction
 (c) A catalyst does not alter the equilibrium in a reversible reaction
 (d) Catalyst are sometimes very specific in respect of reaction
53. The enzyme ptylin used for the digestion of food is present in [CPMT 1981]
 (a) Saliva (b) Blood
 (c) Intestine (d) Adrenal glands
54. Amongst the following chemical reactions, the one representing homogeneous catalysis is [MP PMT 1999]
 (a) $N_2(g) + 3H_2(g) \xrightarrow{Fe} 2NH_3(g)$
 (b) $2SO_2(g) + O_2(g) \xrightarrow{2NO} 2SO_3(g) + 2NO(g)$
 (c) $CO(g) + 3H_2(g) \xrightarrow{Ni} CH_4(g) + H_2O$
 (d) $2SO_2(g) + O_2(g) \xrightarrow{V_2O_5} 2SO_3(g)$
55. Platinised asbestos helps in the formation of SO_3 from SO_2 and O_2 . But, if even a small amount of As_2O_3 is present the platinised asbestos does not help in the formation of SO_3 . As_2O_3 acts here as [MP PMT 1997]
 (a) A positive catalyst (b) A negative catalyst
 (c) An autocatalyst (d) A poison
56. Which of the following statements is wrong
 (a) Catalysts can aid a rapid reaching of the equilibrium position, but do not change the position of the equilibrium
 (b) Homogeneous catalysis generally involves an equilibrium reaction between at least one of the reactants and the catalyst
 (c) Heterogeneous catalysis involves chemisorption on the surface of the catalyst
 (d) Positive catalysts raise the energy of activation of the reaction they catalyse
57. Which one is *false* in the following statement [MP PET 1997]
 (a) A catalyst is specific in its action
 (b) A very small amount of the catalyst alters the rate of a reaction
 (c) The number of free valencies on the surface of the catalyst increases on subdivision
 (d) Ni is used as catalyst in the manufacture of ammonia
58. In the redox reaction
 $2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightleftharpoons 2Mn^{2+} + 10CO_2 + 8H_2O$
 The ion acting as autocatalyst is [MP PMT 1986,94]
 (a) MnO_4^- (b) $C_2O_4^{2-}$
 (c) H^+ (d) Mn^{2+}
59. In a homogeneous catalysis
 (a) The catalyst and the reactants should be gases
 (b) The catalyst and the reactants should form a single phase
 (c) Catalyst and the reactants are all solids
 (d) The catalyst and the reactions are all liquids
60. Which of the following statements is incorrect [CPMT 1985]
 (a) Enzymes are in colloidal state
 (b) Enzymes are catalysts
 (c) Enzymes can catalyse any reaction
 (d) Urease is an enzyme
61. Enzymes are [BHU 1982]
 (a) Substances made by chemists to activate washing powder
 (b) Very active vegetable catalysts
 (c) Catalysts found in organism
 (d) Synthetic catalysts
62. Catalyst used in the oxidation of $SO_2 \rightarrow SO_3$ [AIIMS 1996]
 (a) Nickel (b) $ZnO.Cr_2O_3$
 (c) V_2O_5 (d) Iron
63. Which requires catalyst [AFMC 1987; MP PET 1999]
 (a) $S + O_2 \rightarrow SO_2$ (b) $2SO_2 + O_2 \rightarrow 2SO_3$
 (c) $C + O_2 \rightarrow CO_2$ (d) All
64. The process which is catalysed by one of the products is called [MP PET 1999; AIIMS 1996]
 (a) Acid-base catalysis (b) Autocatalysis
 (c) Negative catalysis (d) None of these
65. Adam's catalyst is [Pb.CET 2001]
 (a) Platinum (b) Iron
 (c) Molybdenum (d) Nickel
66. A catalyst remains unchanged at the end of the reaction regarding [MP PET 1999]
 (a) Mass
 (b) Physical state
 (c) Physical state and chemical composition
 (d) Mass and chemical composition
67. Wilhem Ostwald redefined the action of [Kerala (Med.) 2002]
 (a) Anomers
 (b) Isomers
 (c) Catalyst
 (d) Geometry of monomers
68. In a reversible reaction, a catalyst used
 (a) Increases the speed of the forward reaction
 (b) Decreases the speed of the backward reaction
 (c) Does not alter the final state of equilibrium
 (d) Increases the amount of the products formed

69. Enzyme activity is maximum at [KCET 1989]
(a) 300 K (b) 310 K
(c) 320 K (d) 330 K
70. A catalyst is used to [Pb.CET 2000]
(a) Increase the product
(b) Increase or decrease the rate of reaction
(c) Increase or decrease the products
(d) Decrease the products
71. The transition metal used as a catalyst is [Pb. PMT 2004]
(a) Nickel (b) Platinum
(c) Cobalt (d) All of these
72. Which of the following is true about catalyst [Pb.CET 2000]
(a) It initiates reaction
(b) It changes equilibrium point
(c) It increase average kinetic energy
(d) It accelerates the rate of reaction
73. Which of the following types of metals form the most efficient catalysts [KCET 2005]
(a) Alkali metals
(b) Alkaline earth metals
(c) Transition metals
(d) All of these
74. Formation of ammonia from H_2 and N_2 by Haber's process using Fe is an example of [J & K 2005]
(a) Heterogeneous catalysis (b) Homogeneous catalysis
(c) Enzyme catalysis (d) Non-catalytic process
- (c) Lyophilic sol (d) Associated colloid
6. Which of the following is most effective in coagulating a ferric hydroxide sol [MP PET 1993, 97; MP PMT 2000]
(a) KCl (b) KNO_3
(c) K_2SO_4 (d) $K_3[Fe(CN)_6]$
7. Sky looks blue due to [MNR 1986; MP PET 1992]
(a) Dispersion effect (b) Reflection
(c) Transmission (d) Scattering
8. Which one is an example of gel
(a) Soap (b) Cheese
(c) Milk (d) Fog
9. The random or zig-zag motion of the colloidal particles in the dispersion medium is referred to as [CPMT 1985; JIPMER 1997; MP PET 2000]
(a) Electro-osmosis
(b) Electrophoresis
(c) Brownian movement
(d) Tyndall effect
10. Which of the following electrolytes is least effective in causing flocculation of ferric hydroxide sol [MNR 1991; UPSEAT 1999]
(a) $K_4[Fe(CN)_6]$ (b) K_2CrO_4
(c) KBr (d) K_2SO_4
11. If the dispersed phase is a liquid and the dispersion medium is a solid, the colloid is known as [NCERT 1981; CBSE PMT 1989; KCET 1998]
(a) A sol (b) An emulsion
(c) A gel (d) A foam
12. Zig-zag motion (eratic motion) of particles in colloid was observed by [CPMT 1985]
(a) Tyndall (b) Zsigmondy
(c) Robert brown (d) Thomas Graham
13. On addition of one ml solution of 10% $NaCl$ to 10 ml gold sol in the presence of 0.25 gm of starch, the coagulation is just prevented. Starch has the following gold number [MP PET/PMT 1988]
(a) 0.025 (b) 0.25
(c) 0.5 (d) 250
14. Tyndall effect would be observed in a [CPMT 1973, 79, 90, 91, 94; MP PET 1999; MP PMT 1973, 89; DPMT 1982, 83; AFMC 1999]
(a) Solution (b) Colloidal solution
(c) Precipitate (d) Solvent
15. Ferric hydroxide sol is positively charged colloid. The coagulating power of NO_3^- , SO_4^{2-} and PO_4^{3-} ions would be in the order
(a) $NO_3^- > SO_4^{2-} > PO_4^{3-}$ (b) $SO_4^{2-} > NO_3^- > PO_4^{3-}$
(c) $PO_4^{3-} > SO_4^{2-} > NO_3^-$ (d) $NO_3^- = SO_4^{2-} = PO_4^{3-}$
16. A colloidal solution can be purified by [MP PET 1993; CPMT 1990; MP PMT 2001]
(a) Filtration (b) Peptization
(c) Coagulation (d) Dialysis
17. Gold number is associated with
(a) Only lyophobic colloids
(b) Only lyophilic colloids
(c) Both lyophobic and lyophilic colloids
(d) None of these
18. Which of the following forms a colloidal solution in water [MP PET 1990; CPMT 1988]
(a) $NaCl$ (b) Glucose
(c) Starch (d) Barium nitrate

Colloids, Emulsion, Gel and Their properties with application

1. Gold number is [MP PET/PMT 1988]
(a) The number of mg of lyophilic colloid which should be added to 10 ml of ferric hydroxide sol so as to prevent its coagulation by the addition of 1 ml of 10% sodium chloride solution
(b) The number of mg of lyophilic colloid which should be added to 10 ml of standard gold sol so as to prevent its coagulation by the addition of 1 ml of 10% $NaCl$
(c) The mg of gold salt to be added to a lyophilic colloid to coagulate it
(d) The mg of an electrolyte required to coagulate a colloid
2. Which of the following statement is wrong for lyophobic sol
(a) Dispersed phase is generally in organic material
(b) Can be easily coagulated by small addition of electrolyte
(c) Dispersed phase particles are poorly hydrated and colloid is stabilised due to charge on the colloidal particles
(d) Reversible in nature that is after coagulation can be easily set into colloidal form
3. Which of the following statements is not true for a lyophobic sol
(a) It can be easily solvated
(b) It carries charge
(c) The coagulation of this sol is irreversible in nature
(d) It is less stable in a solvent
4. As_2S_3 sol has a negative charge. Capacity to precipitate it is highest in [CPMT 1982, 89, 93; DPMT 1983; MP PET 1999]
(a) $AlCl_3$ (b) Na_3PO_4
(c) $CaCl_2$ (d) K_2SO_4
5. Starch dispersed in hot water is an example of
(a) Emulsion (b) Hydrophobic sol

19. A negatively charged suspension of clay in water will need for precipitation the minimum amount of [CPMT 1973]
 (a) Aluminium chloride (b) Potassium sulphate
 (c) Sodium hydroxide (d) Hydrochloric acid
20. Difference between colloids and crystalloids is of [CPMT 1979]
 (a) Particle composition (b) Particle size
 (c) Concentration (d) Ionic character
21. The purification of the colloidal particles from crystalloid dimensions through semipermeable membrane is known as [BHU 1979; MP PMT 1999; CBSE 1996; Pb. CET 2002]
 (a) Coagulation (b) Dialysis
 (c) Ultrafiltration (d) Peptisation
22. The stability of lyophilic colloids is due to [CPMT 1971, 81, 83, 93, 96; AFMC 1998; MP PMT 1990, 95; MP PET 1992]
 (a) Charge on their particles
 (b) A layer of dispersion medium on their particles
 (c) The smaller size of their particles
 (d) The large size of their particles
23. Milk is a colloid in which [MP PMT 1985, 2002; MP PET 2001; JIPMER (Med.) 2002]
 (a) A liquid is dispersed in liquid
 (b) A solid is dispersed in liquid
 (c) A gas is dispersed in liquid
 (d) Some sugar is dispersed in water
24. Smoke is an example of [CPMT 1984; BIT 1992]
 (a) Gas dispersed in liquid (b) Gas dispersed in solid
 (c) Solid dispersed in gas (d) Solid dispersed in liquid
25. Gold number is minimum in case of [MP PMT 1985]
 (a) Gelatin (b) Egg albumin
 (c) Gum arabic (d) Starch
26. Movement of colloidal particles under the influence of electrostatic field is [AMU 1985, 88, 02; MP PMT 1987, 89; CPMT 1988, 94; Roorkee 1995; MP PET 1992; AIIMS 2001; UPSEAT 2004]
 (a) Electrophoresis (b) Electrolysis
 (c) Dialysis (d) Ionisation
27. Which of the following substances gives a positively charged sol
 (a) Gold (b) A metal sulphite
 (c) Ferric hydroxide (d) An acidic dye
28. Light scattering in colloidal particles is
 (a) Visible to naked eye
 (b) Not visible by any means
 (c) Visible under ordinary microscope
 (d) Visible under ultra-microscope
29. Flocculation value is expressed in terms of [MP PMT 1986]
 (a) millimole per litre (b) mole per litre
 (c) gram per litre (d) mole per millilitre
30. Which of the following is an emulsifier
 (a) Soap (b) Water
 (c) Oil (d) NaCl
31. Suspensions are [CPMT 1984]
 (a) Visible to naked eye
 (b) Invisible through microscope
 (c) Not visible by any means
 (d) Invisible under electron microscope
32. Gelatin is mostly used in making ice cream in order to [NCERT 1979; MP PET/PMT 1988]
 (a) Prevent making of colloid
 (b) To stabilise the colloid and prevent crystallisation
 (c) To stabilise mixture
 (d) To enrich the aroma
33. In emulsions, the dispersion medium and dispersed phase are
 (a) Both solids (b) Both gases
 (c) Both liquids (d) One is solid and other is liquid
34. Lyophilic sols are more stable than lyophobic sols because [NCERT 1982, 83]
 (a) The colloidal particles have positive charge
 (b) The colloidal particles have no charge
 (c) The colloidal particles are solvated
 (d) There are strong electrostatic repulsions between the negatively charged colloidal particles
35. Which is the correct statement in case of milk [CPMT 1977; MNR 1988; UPSEAT 2000, 01, 02]
 (a) Milk is an emulsion of protein in water
 (b) Milk is an emulsion of fat in water
 (c) Milk is stabilised by protein
 (d) Milk is stabilised by fat
36. Which of the following electrolytes have maximum coagulating power
 (a) CCl_4 (b) $ZnCl_2$
 (c) KCl (d) $NaCl$
37. Which one of the following is not a colloidal solution [MADT Bihar 1983]
 (a) Smoke (b) Ink
 (c) Air (d) Blood
38. Detergent action of soap is due to
 (a) Emulsification properties (b) Hydrolysis
 (c) Ionization (d) High molecular weight
39. When dispersion medium is water, the colloidal system is called
 (a) Sol (b) Aerosol
 (c) Organosol (d) Aquasol
40. When a freshly precipitated substance is converted into a colloidal solution with the help of a third substance, the process is known as
 (a) Coagulation (b) Peptization
 (c) Electrodipersion (d) Dialysis
41. Which of the following will have highest coagulating power for As_2S_3 colloid [CPMT 1988; DPMT 1984; Pb. PMT 2001; Pb. CET 2004]
 (a) PO_4^{3-} (b) SO_4^{2-}
 (c) Na^+ (d) Al^{3+}
42. Which one of the following is a hydrophobic sol [MP PET 1991]
 (a) Starch solution
 (b) Gum solution
 (c) Protein solution
 (d) Arsenic sulphide solution
43. Purification of colloids is done by the process of [CPMT 1988]
 (a) Electrophoresis (b) Electrodipersion
 (c) Peptization (d) Ultra-filtration
44. Which of the following terms is not related with colloids [CPMT 1985, 87, 88]
 (a) Dialysis (b) Ultrafiltration
 (c) Wavelength (d) Brownian movement
45. When dispersed phase is liquid and dispersion medium is gas, then the colloidal system is called [CPMT 1984]
 (a) Smoke (b) Clouds
 (c) Emulsion (d) Jellies
46. Tyndall phenomenon is exhibited by [CPMT 1985]
 (a) NaCl solution (b) Starch solution
 (c) Urea solution (d) $FeCl_3$ solution
47. The colloidal solution of gelatin is known [CPMT 1984]
 (a) Solvent loving sol (b) Reversible sol

- (c) Hydrophilic colloids (d) All of these
48. The zig-zag motion of colloidal particles is due to
(a) Small size of colloidal particles
(b) Large size of colloidal particles
(c) The conversion of potential energy into kinetic energy
(d) Bombardment on colloidal particles by molecules of dispersion medium
49. Which is a natural colloidal [DPMT 1985]
(a) Sodium chloride (b) Urea
(c) Cane sugar (d) Blood
50. Sodium stearate forms in water
(a) True solution (b) A suspension
(c) An emulsion (d) A colloidal solution
51. Blood contains
(a) Positively charged particles
(b) Negatively charged particles
(c) Neutral particles
(d) Negatively as well as positively charged particles
52. Brownian motion is due to [MNR 1987; CPMT 1987; UPSEAT 2001, 02]
(a) Temperature fluctuation within the liquid phase
(b) Attraction and repulsion between charge on the colloidal
(c) Impact of molecules of the dispersion medium on the colloidal particles
(d) Convective currents
53. Milk can be preserved by adding a few drops of [MADT Bihar 1981]
(a) Formic acid solution
(b) Formaldehyde solution
(c) Acetic acid solution
(d) Acetaldehyde solution
54. When a colloidal solution is observed under a microscope we can see
(a) Light scattered by colloidal particles
(b) Size of colloidal particles
(c) Shape of colloidal particles
(d) Relative size of the colloidal particles
55. Property of the colloidal solution is due to
(a) Nature of dispersed phase
(b) Nature of dispersion medium
(c) Physical state of dispersed phase
(d) Temperature of the system
56. Which of the following has minimum value of flocculating power
(a) Pb^{+2} (b) Pb^{+4}
(c) Sr^{+2} (d) Na^{+}
57. According to Graham, colloids are those substances which are
(a) Insoluble in water
(b) In solution do not pass through filter paper
(c) Of definite size of particles
(d) Separated from crystalloids by parchment paper
58. The reason for exhibiting Tyndall effect by the colloidal particle is [CPMT 1980, 86; MP PMT 1989]
(a) Reflection of light (b) Refraction of light
(c) Polarisation of light (d) Scattering of light
59. Which of the following shows the maximum hydrophobic behaviour
(a) Glycerine (b) Stearic acid
(c) Glucose (d) Adenine
60. A liquid aerosol is a colloidal system of [MP PMT 1987]
(a) A liquid dispersed in a solid
(b) A liquid dispersed in a gas
(c) A gas dispersed in a liquid
(d) A solid dispersed in a gas
61. The blue colour of water in the sea is due to [NCERT 1983]
(a) Refraction of blue light by the impurities in sea water
(b) Reflection of blue sky by sea water
(c) Scattering of blue light by water molecules
(d) Absorption of other colours except the blue colour by water molecules
62. Butter is a colloid. It is formed when [MNR 1982; MP PET 1991; MP PMT 1994; CPMT 2002]
(a) Fat is dispersed in solid casein
(b) Fat globules are dispersed in water
(c) Water is dispersed in fat
(d) Casein is suspended in H_2O
63. Colloidal solution cannot be obtained from two such substances which are
(a) Insoluble in each other (b) In same physical state
(c) In different physical state (d) None of these
64. Which of the following reactions leads to the formation of a substance in the colloidal state [MP PMT 1984; MP PET/PMT 1988]
(a) $Cu + HgCl_2 \rightarrow CuCl_2 + Hg$
(b) $2HNO_3 + 3H_2S \rightarrow 3S + 4H_2O + 2NO$
(c) $2Mg + CO_2 \rightarrow 2MgO + C$
(d) $Cu + CuCl_2 \rightarrow Cu_2Cl_2$
(in presence of excess of HCl)
65. Lyophobic colloids are [MP PMT 1986; DPMT 1996]
(a) Reversible colloids (b) Irreversible colloids
(c) Protective colloids (d) Gum proteins
66. Substances whose solutions can readily diffuse through parchment membranes are [CPMT 1984]
(a) Colloids (b) Crystalloids
(c) Electrolytes (d) Non-electrolytes
67. Size of colloidal particles varies from [CPMT 1985] [CPMT 1982, 90, 93, 97; CBSE PMT 1996; MP PMT 1995; AIIMS 2002; KCET 2004]
(a) 10^{-7} to 10^{-9} m (b) 10^{-9} to 10^{-17} m
(c) 10^{-5} to 10^{-7} m (d) 10^{-4} to 10^{-10} m
68. Which of the following pairs of ions would be expected to form precipitate when their dilute solution are mixed [CPMT 1976]
(a) Na^{+}, SO_3^{2-} (b) NH_4^{+}, CO_3^{2-}
(c) Na^{+}, S^{2-} (d) Fe^{+3}, PO_4^{-3}
69. Jelly is a form of [MP PET 1989, 90]
(a) Suspension (b) Colloidal solution
(c) Supersaturated solution (d) True solution
70. Bleeding is stopped by the application of ferric chloride. This is because
(a) Ferric chloride seal the blood cells.
(b) Blood starts flowing in the other direction
(c) Blood is coagulated and blood vessel is sealed
71. The colloidal particles can pass through [NCERT 1982]
(a) Filter paper as well as animal membrane
(b) Animal membrane but not through filter paper
(c) Filter paper but not through animal membrane
(d) Semipermeable membrane
72. The emulsifying agent in milk is
(a) Lactic acid (b) Casein
(c) Lactose (d) Fat
73. Butter is [MP PMT 1990]
(a) A gel (b) An emulsion

- (c) A sol (d) Not a colloid
74. An emulsion is a colloidal dispersion of [BCECE 2005]
(a) A liquid in a gas (b) A liquid in a liquid
(c) A solid in a liquid (d) A gas in a solid
75. The colloidal solution of mercury in water can be easily obtained by
(a) Mechanical precipitation (b) Bredig's arc method
(c) Repeated washing (d) Ultrasonic dispersion
76. The rate of dialysis depends upon
(a) Nature of colloidal substance
(b) Temperature of the solution
(c) Both of these
(d) None of these
77. An emulsifier [MP PET 1995]
(a) Accelerates the dispersion
(b) Homogenises the emulsion
(c) Stabilizes the emulsion
(d) Aids the flocculation of emulsion
78. The difference between a lyophilic and lyophobic colloid is in their
(a) Particle size
(b) Behaviour towards dispersion medium
(c) Filtrability
(d) None of these
79. When a substance comes in colloidal state the surface area of the particles
(a) Increases
(b) Decreases
(c) Remains unchanged
(d) First increases then decreases
80. Which of the impurity can be separated from a solution by electrodialysis
(a) Alcohol (b) Alum
(c) Sugar (d) Parchment paper
81. The reason for the stability of a lyophobic sol is
(a) Brownian movement
(b) Tyndall effect
(c) Electric charge
(d) Brownian movement and electric charge
82. For coagulating As_2S_3 colloidal sol, which of the following will have the lowest coagulation value [MP PMT 1996; DCE 2000]
(a) $NaCl$ (b) KCl
(c) $BaCl_2$ (d) $AlCl_3$
83. Some substances behave as electrolytes in dilute solutions and as colloids in their concentrated solutions. Their colloidal forms are said to form [AMU 2002]
(a) Emulsions (b) Gels
(c) Micelles (d) Sols
84. Which one can act as semipermeable membrane [Pb. PMT 2002]
(a) Phenol layer (b) $Ca_3(PO_4)_2$
(c) $Cu_2Fe(CN)_6$ (d) All of these
85. In which particles can pass through semipermeable membrane
(a) Molecules of solvent (b) Complex ions
(c) Simple ions (d) Molecules of solute
86. Silver iodide is used for producing artificial rain because AgI [NCERT 1984]
(a) Is easy to spray at high altitudes
(b) Is easy to synthesize
(c) Has crystal structure similar to ice
(d) Is insoluble in water
87. Surface water contains [AFMC 2003]
(a) Salt
(b) Salt and organic compound
(c) Organic compounds
(d) Suspended impurities
88. Gelatin is mixed in ice-cream
(a) As a coagulant (b) For taste
(c) For colour (d) As a protective colloid
89. Which of the following is an example of 'water in oil' type emulsion
(a) Butter (b) Milk
(c) Cream (d) Face cream
90. In which of the following Tyndall effect is *not* observed [MP PET/PMT 1998]
(a) Suspensions (b) Emulsions
(c) Sugar solution (d) Gold sol
91. Which of the following is a lyophilic colloid [MP PET/PMT 1998]
(a) Milk (b) Gum
(c) Fog (d) Blood
92. Which characteristic is true in respect of colloidal particle [CPMT 1993; UPSEAT 2000]
(a) They always have two phases
(b) They are only in liquid state
(c) They can't be electrolysed
(d) They are only hydrophilic
93. Gold number is a measure of the [MP PMT 1989; MP PET 1989,90; DCE 1999; BHU 1999; CBSE PMT 1989]
(a) Protective action by a lyophilic colloid on a lyophobic colloid
(b) Protective action by a lyophobic colloid on a lyophilic colloid
(c) Number of *mg* of gold in a standard red gold sol
(d) Stability of gold sol
94. Sulphur sol contains [UPSEAT 2002]
(a) Discrete sulphur atoms
(b) Discrete sulphur molecules
(c) Large aggregates of sulphur molecules
(d) Water dispersed in solid sulphur
95. Pick out the statement which is not relevant in the discussion of colloids [KCET 2003]
(a) Sodium aluminium silicate is used in the softening of hard water
(b) Potash alum is used in shaving rounds and as antiseptic in medicine
(c) Artificial rain is caused by throwing electrified sand on the clouds from an aeroplane
(d) Deltas are formed at a place where the river pours its water into the sea
96. Surface tension of lyophilic sols is [MP PMT 1992]
(a) Lower than H_2O (b) More than H_2O
(c) Equal to H_2O (d) None of these
97. When excess of electrolyte is added to a colloid it [Pb. PMT 2002] [CBSE PMT 1989]
(a) Coagulates (b) Precipitates
(c) Gets diluted (d) Does not change
98. The shape of colloidal particles is
(a) Sphere like (b) Rod like
(c) Disc like (d) Thread like
(e) All of these
99. Colloidal solution of arsenious sulphide is coagulated by [MP PMT 1992]

- (a) Addition of electrolyte
(b) Addition of non-electrolyte
(c) Addition of solid As_2S_3
(d) None of these
100. Different colloidal particles of gold having different colours, obtained from different methods due to [MP PET 1989; UPSEAT 2001, 02; EAMCET 2003]
(a) Variable valency of gold
(b) Different concentration of gold particles
(c) Different types of impurities
(d) Different radius of colloidal particles
101. Which one of the following is lyophilic colloid [MP PET 1989]
(a) Gelatin (b) Sulphur
(c) Gold (d) Carbon
102. Which one of the following properties of colloids is related with scattering of light [MP PMT 1989]
(a) Diffusion (b) Peptization
(c) Tyndall effect (d) Brownian movement
103. Which one of the following is a hydrophilic colloidal sol
(a) Barium hydroxide sol (b) Arsenic sulphide sol
(c) Starch solution (d) Silver chloride sol
104. The coagulation power of an electrolyte for arsenious sulphide decreases in the order [JIPMER 1997]
(a) Na^+, Al^{+3}, Ba^{+2} (b) $PO_4^{-3}, SO_4^{-2}, Cl^-$
(c) Al^{+3}, Ba^{+2}, Na^+ (d) $Cl^-, SO_4^{-2}, PO_4^{-3}$
105. Size of colloidal particle is [BCECE 2005]
(a) 1 nm (b) 1 – 100 nm
(c) > 100 nm (d) > 1000 nm
106. The concentration of electrolyte required to coagulate a given amount of As_2S_3 sol is minimum in the case of [KCET 2003]
(a) Magnesium nitrate
(b) Potassium nitrate
(c) Potassium sulphate
(d) Aluminium nitrate
107. When a strong beam of light is passed through a colloidal solution, the light will [BHU 1996; JIPMER 1997]
(a) Give a rainbow
(b) Be scattered
(c) Be reflected
(d) Absorbed completely
108. A cleared solution which is again converted into colloidal solution, the process is called [DPMT 1996]
(a) Peptisation (b) Electrolytic addition
(c) Electrophoresis (d) None of these
109. In dialysis, colloidal particles are separated from [DPMT 1996]
(a) Solvent
(b) Dispersed phase
(c) Ions of electrolytes
(d) Particles of dispersion medium
110. Colour of colloidal solution is due to [CPMT 1996]
(a) Different size of colloidal particles
(b) Due to formation of complex
(c) Due to formation of hydrated crystal
(d) None of these
111. Which of the following is property of colloid [CPMT 1996]
(a) Scattering of light (b) They show attraction
(c) Dialysis (d) Emulsion
112. The size of particles in suspension, true solution and colloidal solution varies in the order [BHU 1997]
(a) Suspension > Colloidal > True solution
(b) Suspension > (Colloidal + True solution)
(c) True solution > Suspension > Colloidal
(d) None of these
113. Which of the following represents surfactant molecule [JIPMER 1997]
(a) $C_{17}H_{36}$ (b) $C_{17}H_{25}COO^-Na^+$
(c) H_2O (d) None of these
114. In lyophilic sols the attraction of sol particles towards the medium is due to
(a) Covalent bond (b) Vander Waal's force
(c) Hydrogen bond (d) None of these
115. If some gelatin is mixed in colloidal solution of gold, then it does
(a) Coagulation of gold
(b) Peptization of gold
(c) Protection of gold sol
(d) Protection of gelatin
116. Emulsifiers are generally
(a) Soap (b) Synthetic detergents
(c) Lyophilic sols (d) All of these
117. In shaving cream, the dispersion medium is
(a) Liquid (b) Gas
(c) Solid (d) None of these
118. The minimum quantity of sodium chloride which is necessary to precipitate 10 litres of sol in two hours is 0.585 gm. The flocculation value of sodium chloride is
(a) 0.585 (b) 0.0585
(c) 0.1 (d) One
119. Which one is an example of micellar system
(a) Soap + water (b) Protein + water
(c) Rubber + benzene (d) $As_2O_3 + Fe(OH)_3$
120. "Delta" at the rivers are formed due to
(a) Peptization (b) Coagulation
(c) Hydrolysis (d) Precipitation
121. Tyndall effect is more pronounced in
(a) Hydrophilic sols (b) Hydrophobic sols
(c) Starch solution (d) Both (b) and (c)
122. Emulsifier is mixed to
(a) Increase the stability of emulsion
(b) Decrease the stability of emulsion
(c) Change oil into water like emulsion
(d) None of these
123. White of an egg is partly coagulated by heating which can be again obtained back by some pepsin and little HCl . This process is called
(a) Peptization (b) Coagulation
(c) Precipitation (d) None of these
124. When sugar is added to a colloidal solution it brings about
(a) Ionization (b) Coagulation
(c) Peptization (d) None of these
125. Colloidal solutions of metals like gold, silver and platinum are generally prepared by using [DPMT 1984]
(a) Peptization (b) Bredig's arc method
(c) Exchange of solvent (d) Oxidation method
126. Liquid-liquid sols are known as [CPMT 1999]
(a) Aerosols (b) Emulsions
(c) Foam (d) Gel
127. Tyndall effect depends upon the
(a) Charge on the colloidal particles

- (b) Osmotic pressure of colloidal solution
(c) Difference between the refractive indices of dispersed phase and dispersion medium
(d) Size of colloidal particles
128. Which one of the sols acts as protective colloid
[MP PMT 1990; MP PET 1990, 92; RPET 2003]
(a) As_2S_3 (b) Gelatin
(c) Au (d) $Fe(OH)_3$
129. The example of heteropolar sol is
(a) Starch sol in water (b) Rubber sol in water
(c) Protein sol in water (d) Sulphur sol
130. In Bredig's arc method some alkali is added because
(a) It increases electrical conductance
(b) To obtain molecular colloid
(c) To obtain colloidal particles of same size
(d) To stabilise the sol
131. Which one of the following is not a colloid [BIT 1992]
(a) Milk (b) Blood
(c) Solution of urea (d) Ice cream
132. Milk is an example of [BIT 1992; CPMT 1994; MP PET 1996; BHU 1996]
(a) Pure solution (b) Emulsion
(c) Gel (d) Suspension
133. Dialysis is the process of separation of
(a) Suspended particles from colloids
(b) Suspended particles from crystalloids
(c) Colloidal particles from crystalloids
(d) Colloidal particles from gel
134. Minimum concentration of electrolyte which can precipitate any sol is [BIT 1992]
(a) Peptization value (b) Gold number
(c) Avogadro's number (d) Flocculation value
135. Whipped cream is an example of [MNR 1978]
Dispersed medium Dispersed phase
(a) Gas Liquid
(b) Liquid Gas
(c) Liquid Liquid
(d) Liquid Solid
136. Milk is [MP PMT 1995; CPMT 1988; MP PET 1991; MNR 1982]
(a) Dispersed fats in oil (b) Dispersed fats in water
(c) Dispersed water in fats (d) Dispersed water in oil
137. A coagulating agent frequently added to water to remove the suspended and colloidal impurities is
(a) Mohr salt (b) Alum
(c) Bleaching powder (d) Copper sulphate
138. $Fe(OH)_3$ when treated with $FeCl_3$ solution a reddish-brown solution is formed. The process involved is [AFMC 1982]
(a) Dispersion (b) Exchange of solvent
(c) Peptization (d) None of these
139. Alum purifies muddy water by
(a) Dialysis (b) Absorption
(c) Coagulation (d) Forming a true solution
140. Which of the following statements is not true for a lyophilic sol
(a) It can be easily solvated
(b) It carries no charge
(c) Coagulation of this sol is reversible in nature
(d) It is not very stable in a solvent
141. High concentration of gelatin in water on heating gives colloidal solution, which is called
(a) Foam (b) Gel
(c) Gas (d) Air
142. Size of colloidal particle is [CPMT 1988; MP PMT 1991; RPET 2000]
(a) 1 to 10 Å (b) 20 to 50 Å
(c) 10 to 1000 Å (d) 1 to 280 Å
143. Which one is Freundlich's equation
(a) $\frac{x}{m} = \log K + \frac{1}{n} \log P$ (b) $\frac{x}{m} = \exp(-KP)$
(c) $\frac{x}{m} = KP^2$ (d) $\log \frac{x}{m} = \log K + \frac{1}{n} \log C$
144. Ferric chloride is applied to stop bleeding cut because
(a) Fe^{3+} ion coagulates blood, which is a negatively charged sol
(b) Fe^{3+} ion coagulates blood, which is a positively charged sol
(c) Cl^- coagulates blood, which is a positively charged sol
(d) Cl^- ion coagulates blood, which is a negatively charged sol
145. At the critical micelle concentration, the surfactant molecules [CBSE PMT 1998]
(a) Decompose
(b) Dissociate
(c) Associate
(d) Become completely soluble
146. The decomposition of H_2O_2 can be slowed down by the addition of small amount of phosphoric acid which act as [JIPMER 2000]
(a) Promoter (b) Inhibitor
(c) Detainer (d) Stopper
147. Which of the following molecules is most suitable to disperse benzene in water [AIIMS 2005]
(a) 
(b) 
(c) 
(d) 
148. Luminosity observed as a result of scattering of light by particles is observed in [RPET 2000]
(a) Suspension (b) Colloidal solution
(c) True solution (d) None of these
149. Which of the following makes the lyophilic solution unstable [MP PMT 1994]
(a) Dialysis
(b) Addition of electrolyte
(c) Addition of alcohol
(d) Addition of alcohol and electrolyte both
150. A detergent is a [CPMT 1993]
(a) Cleaning agent (b) Drug
(c) Catalyst (d) Vitamin
151. Gold number is related with [MP PET 2000]
(a) Colloids (b) Radioactivity
(c) Gas equation (d) Kinetic energy
152. Small liquid droplets dispersed in another liquid is called [Pb. PMT 2000]
(a) Gel (b) Emulsion
(c) Suspension (d) True solution
153. Which of the following is used for the destruction of colloids [CBSE PMT 2000]
(a) Dialysis (b) Condensation

- (c) By ultrafiltration (d) By adding electrolyte
154. An example of an associated colloid is [CBSE PMT 2000; MP PET 2000]
(a) Milk (b) Soap solution
(c) Rubber latex (d) Vegetable oil
155. The movement of colloidal particles towards the oppositely charged electrodes on passing electricity is known as [AFMC 2000]
(a) Cataphoresis (b) Tyndall effect
(c) Brownian movement (d) None of these
156. Tyndall effect is shown by [Pb. PMT 1999]
(a) Sol (b) Solution
(c) Plasma (d) Precipitation
157. Colloidal solutions of gold prepared by different methods have different colours owing to [JIPMER 1999]
(a) The difference in the size of the colloidal particles
(b) The fact that gold exhibits a variable valency of +1 and +3
(c) Different concentrations of gold
(d) Presence of different types of foreign particles depending upon the method of preparation of the colloid
158. Which of the following colloids are formed when hydrogen sulphide gas is passed through a cold solution of arsenious oxide
(a) As_2S_3 (b) As_2O_3
(c) As_2S (d) As_2H_2
159. The simplest way to check whether a system is colloidal, is [KCET (Med.) 2002]
(a) Tyndall effect (b) Electro dialysis
(c) Brownian movement (d) Finding out particle size
160. Fog is an example of colloidal system [MNR 1985; NCERT 1985; CPMT 1988; MP PMT 1991; MP PET 1996; UPSEAT 1999, 2000]
(a) Liquid dispersed in gas (b) Gas dispersed in gas
(c) Solid dispersed in gas (d) Gas dispersed in liquid
161. In the measurement of gold number, the useful electrolyte is
(a) $AuCl_3$ (b) $NaCl$
(c) $AlCl_3$ (d) $FeCl_3$
162. Blood may be purified by [MP PMT 2000]
(a) Dialysis (b) Electro-osmosis
(c) Coagulation (d) Filtration
163. The stability of lyophilic colloidal sol is due to
(a) Both charge and solvation
(b) Only solvation
(c) Only charge
(d) None of these
164. The impurities present in rain water possess charge
(a) Positive (b) Negative
(c) Zero (d) Positive and negative
165. Sodium lauryl sulphate is [RPET 2003]
(a) Cationic sol (b) Anionic sol
(c) Neutral sol (d) None of these
166. Which of the following statement is false
(a) Every solid substance can be brought into colloidal state
(b) Colloidal particles carry electrical charges
(c) Every solid substance can be made to behave like a lyophilic colloid
(d) Addition of electrolytes causes flocculation of colloidal particles
167. Which is a colloid [CPMT 1984]
(a) Sugar solution (b) Urea solution
(c) Silicic acid (d) $NaCl$ solution
168. Alum helps in purifying water by [AIEEE 2002]
(a) Forming Si complex with clay particles
(b) Sulphate part which combines with the dirt and removes it
(c) Aluminium which coagulates the mud particles
(d) Making mud water soluble
169. Maximum coagulation power is in [MP PET 1989, 90]
(a) Na^+ (b) Ba^{++}
(c) Al^{+++} (d) Sn^{++++}
170. Which of the following is not an emulsion [MP PET 2003]
(a) Butter (b) Ice cream
(c) Milk (d) Cloud
171. Colloidal solution of gold cannot be prepared by
(a) Bredig's arc method (b) Mechanical dispersion
(c) Reduction of gold chloride (d) Exchange of solvents
172. Which of the following ions can cause coagulation of proteins
(a) Ag^+ (b) Na^+
(c) Mg^{++} (d) Ca^{++}
173. Light scattering takes place in [MP PMT 1991; BHU 2000; AFMC 2001; Kerala PET 2002]
(a) Solutions of electrolyte (b) Colloidal solutions
(c) Electrodialysis (d) Electroplating
174. Which of the following can stabilize gold sol from coagulation by $NaCl$ solution [CPMT 2000]
(a) $Fe(OH)_3$ (b) Gelatin
(c) As_2S_3 (d) None of these
175. At isoelectric point
(a) Colloidal sol becomes highly stable
(b) Precipitation of a colloidal sol takes place
(c) Colloidal particles becomes uncharged
(d) Peptization can be carried out
176. Which one is an example of multimolecular colloid system
(a) Soap dispersed in water (b) Protein dispersed in water
(c) Gold dispersed in water (d) Gum dispersed in water
177. Metals like Pt and Pd can adsorb large volume of hydrogen under specific conditions. Such adsorbed hydrogen by the metal is known as
(a) Occluded hydrogen (b) Absorbed hydrogen
(c) Reactive hydrogen (d) Atomic hydrogen
178. A colloidal system in which gas bubbles are dispersed in a liquid is known as [MP PMT 1993]
(a) Foam (b) Sol
(c) Aerosol (d) Emulsion
179. On adding few drops of dilute HCl or $FeCl_3$ to freshly precipitated ferric hydroxide a red coloured colloidal solution is obtained. The phenomenon is known as [NCERT 1981; AFMC 1982; MP PMT 1989, 97]
(a) Peptisation (b) Dialysis
(c) Protective action (d) Dissolution
180. Surface tension of lyophilic sols is [MP PMT 2002]
(a) Lower than that of H_2O (b) More than that of H_2O
(c) Equal to that of H_2O (d) None of these
181. Which of the following is not true of a detergent molecule [JIPMER 2002]
(a) It has a non-polar organic part and a polar group
(b) It is not easily biodegraded
(c) It is a sodium salt of fatty acid
(d) It is a surface active agent
182. Which of the following can act as protective colloids
(a) Hydrophobic sols (b) Hydrophilic sol
(c) Gold sol (d) None of these
183. Which of the following substances is not used for preparing lyophilic sols [MP PET 2002]
(a) Starch (b) Gum

- (c) Gelatin (d) Metal sulphide
184. Hydrophilic sols are
(a) Reversible (b) Irreversible
(c) Unstable (d) None of these
185. Soap essentially forms a colloidal solution in water and removes the greasy matter by
(a) Absorption (b) Emulsification
(c) Coagulation (d) None of these
186. Toilet soap is a mixture of [UPSEAT 2001]
(a) Calcium and sodium salts of fatty acids
(b) Fatty acids and glycerol
(c) Sodium salts of fatty acids
(d) Potassium salt of fatty acids
187. Gold sol is an electronegative sol. The amount of electrolyte required to coagulate a certain amount of gold sol is minimum in the case of [KCET (Med.) 2001]
(a) $CaCl_2$ (b) $NaCl$
(c) $AlCl_3$ (d) Na_2SO_4
188. In the case of small cuts, bleeding is stopped by applying potash alum. Here alum acts as [KCET (Med.) 2001]
(a) Fungicide (b) Disinfectant
(c) Germicide (d) Coagulating agent
189. If gold number of A, B, C and D are 0.005, 0.05, 0.5 and 5 respectively, then which of the following will have the highest protective power [Pb. CET 2001; CPMT 2000]
(a) A (b) B
(c) C (d) D
190. Bredig arc method can not be used to prepare colloidal solution of which of the following [AFMC 2004]
(a) Pt (b) Fe
(c) Ag (d) Au
191. Gold number is maximum for the lyophilic sol is [BVP 2004]
(a) Gelatin (b) Haemoglobin
(c) Sodium oleate (d) Potato starch
192. Which of the following is the best protective colloid [UPSEAT 2004]
(a) Gelatin (Gold No. = 0.005)
(b) Gum arabic (Gold No. = 0.15)
(c) Egg albumin (Gold No. = 0.08)
(d) None of these
193. The gold number of A, B, C and D are 0.04, 0.002, 10 and 25 respectively. Protective power of A, B, C and D are in order [DCE 2003]
(a) $A > B > C > D$ (b) $B > A > C > D$
(c) $D > C > B > A$ (d) $C > A > B > D$
194. A catalyst is a substance which [Pb. CET 2004]
(a) Is always in the same phase as in the reactions
(b) Alters the equilibrium in a reaction
(c) Does not participate in the reaction but alters the rate of reaction
(d) Participates in the reaction and provide an easier pathway for the same
195. Cod liver oil is [MHCET 2004]
(a) An emulsion (b) Solution
(c) Colloidal solution (d) Suspension
196. Paste is [MHCET 2004]
(a) Suspension of solid in a liquid
(b) Mechanical dispersion of a solid in liquid
(c) Colloidal solution of a solid in solid
(d) None of these
197. A precipitate is changed to colloidal solution by the following process [UPSEAT 2004]
(a) Dialysis (b) Ultrafiltration
(c) Peptization (d) Electrophoresis
198. An aerosol is a [UPSEAT 2004]
(a) Dispersion of a solid or liquid in a gas
(b) Dispersion of a solid in a liquid
(c) Dispersion of a liquid in a liquid
(d) Solid solution
199. Lyophilic sols are [IIT 2005]
(a) Irreversible sols
(b) They are prepared from inorganic compound
(c) Coagulated by adding electrolytes
(d) Self-stabilizing
200. The volume of a colloidal particle, V_C as compared to the volume of a solute particle in a true solution V_S , could be [AIEEE 2005]
(a) $\frac{V_C}{V_S} \approx 1$ (b) $\frac{V_C}{V_S} \approx 10^{23}$
(c) $\frac{V_C}{V_S} \approx 10^{-3}$ (d) $\frac{V_C}{V_S} \approx 10^3$
201. The disperse phase in colloidal iron (III) hydroxide and colloidal gold is positively and negatively charged, respectively. Which of the following statements is NOT correct [AIEEE 2005]
(a) Magnesium chloride solution coagulates, the gold sol more readily than the iron (III) hydroxide sol
(b) Sodium sulphate solution causes coagulation in both sols
(c) Mixing the sols has no effect
(d) Coagulation in both sols can be brought about by electrophoresis
202. The surface tension of which of the following liquid is maximum? [CBSE PMT 2004]
(a) H_2O (b) C_6H_6
(c) CH_3OH (d) C_2H_5OH
203. Which one of the following forms micelles in aqueous solution above certain concentration? [CBSE PMT 2005]
(a) Urea
(b) Dodecyl trimethyl ammonium chloride
(c) Pyridinium chloride
(d) Glucose
204. Alum is a water purifier because it [KCET 2005]
(a) Coagulates the impurities
(b) Softens hard water
(c) Gives taste
(d) Destroys the pathogenic bacteria
205. An emulsifier is a substance which [KCET 2005]
(a) Stabilises the emulsion
(b) Homogenises the emulsion
(c) Coagulates the emulsion
(d) Accelerates the dispersion of liquid in liquid
206. Muddy water can be purified through coagulation using [J & K 2005]
(a) Common salt (b) Alums
(c) Sand (d) Lime
207. Fog is a colloidal solution of [J & K 2005]
(a) Solid in gas (b) Liquid in gas
(c) Gas in liquid (d) Gas in solid
208. Lyophilic sols are more stable than lyophobic sols because their particles are [Kerala CET 2005]
(a) Positively charged (b) Negatively charged
(c) All soluble (d) Attract each other
(e) Are heavier
209. Oils and fats are obtained by saponification of potassium stearate. Its formula is $CH_3-(CH_2)_{16}-COO^-K^+$. Lyophobic end of atom is (CH_3) and lyophilic end is COO^-K^+ . potassium stearate is example of [Kerala CET 2005]
(a) Lyophobic colloids (b) Lyophilic colloids
(c) Poly molecular colloids (d) Macromolecular colloids

(e) Combined colloids or Miscells

Critical Thinking

Objective Questions

- Which of the following is contributed towards the extra stability of lyophilic colloids [CPMT 1983]
 - Hydration
 - Charge
 - Colour
 - Tyndall effect
- Which of the following methods is used for sol destruction [CPMT 1988]
 - Condensation
 - Dialysis
 - Diffusion through animal membrane
 - Addition of an electrolyte
- A catalyst is a substance which [IIT 1983]
 - Increases the equilibrium concentration of the product
 - Changes the equilibrium constant of the reaction
 - Shortens the time to reach equilibrium
 - Supplies energy to the reaction
- The decomposition of hydrogen peroxide can be slowed by the addition of a small amount of acetamide. The latter acts as a
 - Detainer
 - Stopper
 - Promoter
 - Inhibitor
- The ability of an ion to bring about coagulation of a given colloid depends upon [CPMT 1980; MP PET/PMT 1988; CBSE PMT 1997; MP PMT 1989; MP PET 1994]
 - Its size
 - The magnitude of its charge only
 - The sign of its charge
 - Both the magnitude and the sign of its charge
- Which one of the following is an incorrect statement for physisorption [MP PET 2002]
 - It is a reversible process
 - It requires less heat of adsorption
 - It requires activation energy
 - It takes place at low temperature
- Which is not colloidal [CPMT 1984; MP PET 1989, 91]
 - Chlorophyll
 - Egg
 - Ruby glass
 - Milk
- Which one of the following is **not** a surfactant [AIIMS 2003]
 - $$\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3 - (\text{CH}_2)_{15} - \text{N}^+ - \text{CH}_3\text{Br}^- \\ | \\ \text{CH}_3 \end{array}$$
 - $\text{CH}_3 - (\text{CH}_2)_{14} - \text{CH}_2 - \text{NH}_2$
 - $\text{CH}_3 - (\text{CH}_2)_{16} - \text{CH}_2\text{OSO}_2^- \text{Na}^+$
 - $\text{OHC} - (\text{CH}_2)_{14} - \text{CH}_2 - \text{COO}^- \text{Na}^+$
- Size of colloidal particles is [CPMT 1984; MP PMT 1990, 92]
 - $0.1\text{ m}\mu$ to $0.001\text{ m}\mu$
 - 10μ to 20μ
 - $0.05\text{ m}\mu$ to $0.1\text{ m}\mu$
 - 25μ to 30μ
- Which of the following electrolytes is most effective in the coagulation of gold solution [KCET 1996]
 - NaNO_3
 - $\text{K}_4[\text{Fe}(\text{CN})_6]$
 - Na_3PO_4
 - MgCl_2
- A catalyst is used in a reaction to [CPMT 1972, 75, 97; DPMT 1982]
 - Change the nature of reaction products
 - Increase the reaction yield
 - Decrease the need for reactants
 - Decrease the time required for the reaction

- Which one of the following is not represented by sols [MP PMT 1992]
 - Absorption
 - Tyndall effect
 - Flocculation
 - Paramagnetism
- Example of intrinsic colloid is
 - Glue
 - Sulphur
 - Fe
 - As_2S_3
- Colloidal solution of arsenious sulphide can be prepared by [AMU 1985]
 - Electrodispersion method
 - Peptization
 - Double decomposition
 - Hydrolysis
- The capacity to bring about coagulation increases with
 - Ionic radii
 - Atomic radii
 - Valency of an ion
 - Size of an ion
- Gold number gives [NCERT 1987; MNR 1987; UPSEAT 2002; Kurukshetra CET 2002; MP PMT 2004]
 - The amount of gold present in the colloid
 - The amount of gold required to break the colloid
 - The amount of gold required to protect the colloid
 - None of these
- Point out the *false* statement [MP PET 1997]
 - Brownian movement and Tyndall effect is shown by colloidal systems
 - Gold number is a measure of the protective power of a lyophilic colloid
 - The colloidal solution of a liquid in liquid is called is gel
 - Hardy-Schulze rule is related with coagulation
- Which of the following does not contain a hydrophobic structure [NCERT 1983]
 - Linseed oil
 - Lanolin
 - Glycogen
 - Rubber
- The function of gum-arabic in the preparation of indian ink is
 - Coagulation
 - Peptization
 - Protective action
 - Absorption
- Identify the gas which is readily adsorbed by activated charcoal [KCET 2004]
 - N_2
 - SO_2
 - H_2
 - O_2
- The density of gold is 19 g/cm^3 . If $1.9 \times 10^{-4}\text{ g}$ of gold is dispersed in one litre of water to give a sol having spherical gold particles of radius 10 nm , then the number of gold particles per mm^3 of the sol will be [Pb.CET 2004]
 - 1.9×10^{12}
 - 6.3×10^{14}
 - 6.3×10^{10}
 - 2.4×10^6
- Which of the following forms cationic miscelles above certain concentration [CBSE PMT 2004]
 - Urea
 - Cetyltrimethylammonium bromide
 - Sodium dodecyl sulphate
 - Sodium acetate

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

1. Assertion : When a finely divided active carbon or clay is stirred into a dilute solution of a dye, the intensity of colour in the solution is decreased.
Reason : The dye is adsorbed on the solid surface.
2. Assertion : The enthalpy of physisorption is greater than chemisorption.
Reason : Molecules of adsorbate and adsorbent are held by van der Waals forces in physisorption and by chemical bonds in chemisorption.
3. Assertion : Silica gel is used for drying air.
Reason : Silica gel adsorbs moisture from air.
4. Assertion : According to Freundlich: $\frac{x}{m} = k \cdot P^{1/n}$.
Reason : The isotherm shows variation of the amount of gas adsorbed by the adsorbent with temperature.
5. Assertion : A reaction cannot become fast by itself unless a catalyst is added.
Reason : A catalyst always increases the speed of a reaction.
6. Assertion : ZSM – 5 is used as a catalyst in petrochemical industries.
Reason : Zeolites are three dimensional network silicates in which some silicon atoms are replaced by aluminium atoms.
7. Assertion : Lyophilic colloids are called as reversible sols.
Reason : Lyophilic sols are liquid loving.
8. Assertion : Colloidal sols scatter light while true solutions do not.
Reason : The particles in the colloidal sol move much slower than that of the true solution.
9. Assertion : Colloidal particles show Brownian movement.
Reason : Brownian movement arises because of the impact of the molecules of the dispersion medium with the colloidal particles.
10. Assertion : For the coagulation of sols carrying positive charge, PO_4^{3-} ions are more efficient than SO_4^{2-} or Cl^- ions.
Reason : This follows Hardy – Schulze rule.
11. Assertion : An emulsion becomes stable if soap is added to it.
Reason : Soap contains hydrophilic and hydrophobic parts.
12. Assertion : Deep electric shock causes death of an animal.
Reason : Electric shock coagulate the blood.
13. Assertion : A catalyst is more effective in finely divided form.
Reason : Finely divided form has more surface area.

[AIIMS 1995]

[AIIMS 1998]

14. Assertion : NH_3 adsorb more readily over activated charcoal than CO_2 .
Reason : NH_3 is non-polar. [AIIMS 2000]
15. Assertion : Sky appears blue colour.
Reason : Colloidal particles of dust scatter blue light. [AIIMS 2000]
16. Assertion : Physical absorption of molecules takes place on surface only.
Reason : In this process, the bonds of the absorbed molecules are broken. [AIIMS 2002]
17. Assertion : The micelle formed by sodium stearate in water has $-COO^-$ groups at the surface.
Reason : Surface tension of water is reduced by the addition of stearate. [AIIMS 2003]
18. Assertion : Aqueous gold colloidal solution is red in colour.
Reason : The colour arises due to scattering of light by colloidal gold particles. [AIIMS 2004]
19. Assertion : Increase in surface area, increase in rate of evaporation.
Reason : Stronger the intermolecular attractive forces, fast is the rate of evaporation at a given temperature.

AS Answers and Solutions

Adsorption and Adsorption isotherm

1. (b) Chemical adsorption is irreversible due to formation of new bonds and compounds.
2. (a) Chemical adsorption increases with temperature.
6. (b) When the temperature is raised, the viscosity of liquid decreases, this is because increase in temperature increases the average kinetic energy of molecules which overcome the attractive force between them.
13. (d) Charge on As_2S_3 sol is due to the adsorbed sulphide ion.
19. (a) According to Langmuir Adsorption isotherm the amount of gas adsorbed at very high pressures reaches a constant limiting volume.
21. (a) According to definition of adsorbent.
24. (b) Adsorption increase when temperature decreases (Adsorption $\propto 1/\text{Temperature}$)
25. (a) In chemical adsorption, one layer is adsorbed.
26. (a) Adsorption of a gas on solid independent of the pressure start fast and after some time becomes slow.
27. (d) Chemisorption first increases and then decreases with temperature.
28. (b) Adsorption is an exothermic process.
32. (d) $\log x / m = \log k + \frac{1}{n} \log p$; this is Freundlich isotherm.

$$\text{Thus } p \propto \frac{1}{n}.$$

36. (c) Heterogeneous catalysis can be explained by the adsorption theory.
37. (a) Adsorption due to strong chemical bond is called chemical adsorption or chemisorption or Langmuir adsorption.
39. (c) Physical adsorption decreases with increase of temperature.
40. (c) $W = \frac{126 \times 1 \times 50}{1000} \Rightarrow 6.3$
(Molecular weight of oxalic acid $\Rightarrow 163$)
 $0.5 \text{ gm} \rightarrow \frac{6.3}{2}$
 $1 \text{ gm} \rightarrow \frac{6.3}{2 \times 0.5} \times 1 \Rightarrow 6.3 \text{ gm}.$
41. (d) Noble gases are adsorbed by coconut charcoal. The adsorption of different noble gases occur at different temperatures, hence charcoal is used to separate these gases. Helium is not adsorbed by charcoal (as it is very difficultly liquifiable gas).
42. (a) Animal charcoal is a good adsorbate. The impurities adsorb on its surface and thus it decolourises colour of liquids.
43. (a) Since adsorption is an exothermic process (taking place with the evolution of heat) therefore in accordance with Lechatelier's principle, the magnitude of physical adsorption will decrease with the increase in temperature. In case of chemisorption the adsorption first increase and then decreases with increase in temperature.
44. (c) Concentration of the solution decreases because acetic acid gets adsorbed on charcoal.
45. (d) $\frac{x}{m} = kp^{1/n}$ or $x = m \cdot kp^{1/n}$ or $x/m = kp^{-n}$

All of these equation represent Freundlich adsorption isotherm.

47. (d) It has been observed that the surface of a solid (or liquid) has the tendency to attract and retain the molecules of other immiscible phase with which it is brought into contact. These molecules remain only at the surface and do not go deeper into the bulk. This tendency of accumulation of molecular species at the surface than in the bulk of a solid (or liquid) is termed adsorption.

Catalyst and Catalysis

3. (d) A catalyst does not take part in the reaction but can speed it up. It can be recovered after the reaction.
4. (a) $N_2 + 3H_2 \xrightarrow[\text{Mo promoter}]{\text{Fe Catalyst}} 2NH_3$
(g) (g) (g)
5. (d) $2KClO_3 \xrightarrow{MnO_2} 2KCl + 3O_2$
6. (b) $2SO_2 + O_2 \xrightarrow[\text{As}_2O_3 (\text{poison})]{\text{Pt (Catalyst)}} 2SO_3$
7. (d) It is a shape-selective catalyst.
8. (a) All substance have average energy and before the reaction occurs energy of the reactant should be higher than the average energy. We also know that catalyst lower the activation energy. Therefore, rate of reaction is increased.
9. (b) $2SO_2 + O_2 \xrightarrow{NO} 2SO_3$
12. (b) Transition metals are most efficient catalysts due to half filled d -orbitals.
16. (d) An increase in rate of reaction in forward direction by a catalyst for a reaction in equilibrium brings in an increase in concentration of products and thus rate of backward reaction also increase to same magnitude and so allow the equilibrium to be achieved quickly.
17. (c) $2SO_2 + O_2 \xrightarrow[\text{(g)}]{V_2O_5} 2SO_3$
(g) (g) (g)
19. (c) Catalyst never change the equilibrium constant.
21. (b) Because reactant and catalyst are present in same physical state.
23. (a) $C_6H_{12}O_6 \xrightarrow[\text{Enzyme}]{\text{Zymase}} 2C_2H_5OH + 2CO_2$
Glucose Ethanol
24. (b) $C_6H_6 + CH_3Cl \xrightarrow[\text{AlCl}_3]{\text{Anhydrous}} C_6H_5CH_3 + HCl$
25. (c) $CH_3COOC_2H_5 + HOH \xrightarrow[\text{Catalyst}]{\text{Conc. } H_2SO_4} CH_3COOH + C_2H_5OH$
27. (d) Catalyst does not depend on the enthalpy of the reactants.
30. (c) Catalyst does not depend on the free energy change in the reaction.
31. (d) Activation energy changes when catalyst is used in a reaction.
32. (c) In the reversible reaction a catalyst is the substance which reduces the time required for reaching the equilibrium state in the reaction.
36. (b) $\text{Maltose} \xrightarrow[\text{enzyme}]{\text{Maltase}} \text{Glucose}$
37. (d) Efficiency of catalysing property is inversely proportional of activation energy.
39. (a) $2SO_2 + O_2 \xrightarrow[\text{Asbestos (s)}]{\text{Platinized}} 2SO_3$; Example of heterogeneous catalyst.
(g) (g) (s)
40. (d) $\text{Oil} + H_2 \xrightarrow{Ni} \text{Ghee}$
41. (b) Catalyst is not effect on equilibrium concentrations.
42. (a) $4NH_3 + 5O_2 \xrightarrow[1100 \text{ K}]{\text{Pt gauze}} 4NO \xrightarrow{O_2} 4NO_2$

53. (a) Ptyline (enzyme) is present in saliva.

58. (d) Mn^{++} is a product in reaction so it is auto catalyst (according to definition).

65. (a) Generally transition elements acts as catalysts. Adam's catalyst is another name of platinum.

69. (b) Enzyme activity is maximum at 310K.

70. (b) Catalyst is a substance which changes the rate of reaction without affecting the overall energetics of the reaction.

71. (d) Ni, Pt and Co all three transition metals are used as a catalysts.

72. (d) Catalyst is a substance which changes the rate of reaction without affecting the overall energetics of the reaction.

73. (c) Many of the d-block (transition) elements and their compounds act as catalyst. Catalytic property is probably due to the utilisation of (n-1)d orbitals or formation of interstitial compounds.

74. (a) The catalytic process in which the reactants and the catalyst are in different phases is known as heterogenous catalysis.

The reactants are in gaseous state while the catalyst is in solid state.

Colloids, Emulsion, Gel and Their properties with application

4. (a) Negatively charged As_2S_3 sol coagulated most effectively by $AlCl_3$. This is because oppositely charged Al^{+++} ions have maximum charge.

6. (d) $K_3[Fe(CN)_6]$ is most effective in coagulating a ferric hydroxide sol.

7. (d) Sky looks blue due to scattering of light by dust particles present in the atmosphere.

10. (c) KBr is least effective in causing flocculation of ferric hydroxide sol due to minimum charge at $(KBr) Br^{-}$

11. (c) Liquid + Solid = Gel (e.g. Butter)
(Dispersed phase) (Dispersion medium) (Colloid)

13. (d) By definition gold number of starch is the amount of starch in mg added to 10 ml standard gold sol which prevents the coagulation of gold on adding 1 ml of 10% NaCl solution. So the amount of starch is 0.25g = 250 mg. Hence gold number is 250.

15. (c) According to Hardy schulze rule the ions having opposite charge to sol particle cause coagulation and greater the valency of oppositely charged ion more is the coagulating power ($PO_4^{3-} > SO_4^{2-} > NO_3^{-}$).

17. (b) Gold number is associated with only lyophilic colloids due to protective nature.

19. (a) Negatively charged sols require minimum amount of electrolyte having higher valence of cation.

22. (b) Lyophilic possesses solvent loving nature and thus a thin layer of dispersed phase is formed round sol particles.

23. (a) Milk is a colloid of liquid (H_2O) dispersed in liquid (fat).

24. (c) Smoke is an example of solid dispersed in gas.

26. (a) Movement of (charged) colloidal particles under the influence of electrostatic field is called electrophoresis due to opposite charge.

27. (c) $Fe(OH)_3$ gives a positively charged sol as it adsorbs Fe^{3+} ions from $FeCl_3$ solution.

29. (a) Flocculation value is expressed in terms of millimole per litre.

32. (b) Gelatin is a protective colloid.

36. (b) $ZnCl_2$ has maximum coagulation power due to more charge on the Zn

37. (c) Air is not a colloidal solution because it is a homogeneous mixture.

43. (d) In Purification separation of colloids from crystalloids is done by the process of ultra-filtration.

45. (b) dispersed phase + dispersion medium
(liquid) (gas)
= colloidal system
(clouds)

46. (b) Tyndall phenomenon is exhibited by starch solution because starch solution is a colloidal solution.

53. (b) Milk can be preserved by adding a few drops of $HCHO$ solution. $HCHO$ is an emulsifier.

55. (c) Properties of the colloidal solution depend upon physical state of dispersed phase and mol. wt.

57. (d) According to Graham, colloids are separated from crystalloids by parchment paper.

60. (b) Liquid aerosol involves liquid dispersed in gas, e.g. cloud, fog, mist etc.

65. (b) Lyophobic colloids are irreversible colloids.

66. (b) Crystalloids are diffuse through parchment membranes.

67. (a) Colloidal particles range between 10^{-7} to 10^{-9} m or 10^{-5} to 10^{-7} cm.

70. (c) Fe^{3+} ion coagulates -ve sol particles of blood and seals the cut.

79. (a) When a substance comes in colloidal state the surface area of the particles increases due to small size than substance.

80. (b) Alum can be separated from a solution by electrodialysis due to alum give Al^{3+} ion in solution.

82. (d) The amount of electrolyte required to coagulate a fixed amount of a solution depends upon the valency of the flocculation ion.

The flocculating power of the various ions follows the following order, larger the valency lesser will be coagulating value.

$Al^{3+} > Mg^{2+} > Na^+$, hence lowest coagulation value is of $AlCl_3$

88. (d) Gelatin is a protective colloid in ice-cream.
90. (c) Tyndall effect is not observed in sugar solution due to homogeneous nature.
92. (a) Dispersion medium and dispersed phase are phase of colloid.
99. (a) As_2S_3 is coagulated by addition of electrolyte due to opposite charge.
104. (c) According to Hardy-Schulze rule.
111. (a) Scattering of light is a property of colloid.
115. (c) Some gelatin is mixed in colloidal solution of gold to form ppt of gold (peptization of gold). Because formation of layer on colloidal particle.
120. (b) "Delta" at the rivers are formed due to coagulation between sea water (+ve charged particles) and river water (-ve charged particles)
121. (b) Tyndall effect expressed by hydrophobic sols.
129. (c) Protein sol in water is a example of heteropolar sol.
130. (d) For stabilise the sol.
131. (c) Solution of urea is not a colloid.
135. (b) Liquid + Gas = Whipped cream
(Dispersion medium) (Dispersed phase) Colloidal solution
137. (b) Alum is a coagulating agent, frequently added to water to remove impurities from water because impurities contain negative charge and alum give positive charge particle for coagulation.
139. (c) Alum purifies muddy water by coagulation due to opposite charge.
142. (c) The particle size is in the order $10\text{\AA} - 1000\text{\AA}$.
144. (a) $FeCl_3$ is a electrolyte give Fe^{3+} and blood contain negatively colloid so stop bleeding due to coagulation.
145. (c) AT (CMC) critical micellization concentration, the surfactant molecules associate to form micelles. For soap CMC is $10^{-3} \text{ mol/litre}$
146. (b) Inhibitors are also known as negative catalyst.
147. (c) Benzene is non polar in nature. As we know that non-polar disperses more to non-polar substances. Therefore, meta-methyl nonylbenzene being nonpolar from both sides will disperse more to benzene. All other substances (a, b and d) have either one side polar or both sides polar.

151. (a) The protective action of different colloids is expressed in terms of Gold number.
156. (a) Tyndall effect may be defined as the scattering of light by the colloidal particles present in a colloidal sol.
158. (a) It is due to adsorption of S^{2-} ions on the surface of the colloidal particles and H^+ ions in the diffused layer.
168. (c) Alum helps in purifying water by Al^{3+} ions which coagulate the negative mud particles.
169. (d) Sn^{+4} contain maximum coagulation power (coagulation power $\propto$ number of charge on ion)
170. (d) It is liquid in gas colloidal solution.

175. (c) Colloidal particles becomes uncharged at isoelectric point.
176. (c) Example of multimolecular colloid system is a gold dispersed in water.
179. (a) The phenomenon of converting of fresh mass into colloidal state by the action of solute or solvent is known as peptization.
180. (a) Surface tension of lyophilic sol is lower than that of the dispersion medium (i.e. H_2O in this case.)
182. (b) Hydrophilic sol can act as protective colloids for hydrophobic solution.
183. (d) Metal sulphide is not used for preparing lyophilic sol.
185. (b) According to definition emulsification.
186. (d) Toilet soap is a mixture of potassium salt of higher fatty acids.
187. (c) Coagulation is governed by Hardy Schulze rule.

189. (a) Protective power $\propto \frac{1}{\text{Gold number}}$

Gold number of A is least, therefore, it has the highest protective power.

190. (b) Bredig's arc method is suitable for the preparation of colloidal solution of metal like gold silver, platinum etc. An arc is struck between the metal electrode under the surface of water containing some stabilizing agent such as a trace of KOH . However, Fe does not react with alkalies that is why it is not obtained by Bredig's arc method.
191. (d) Gold number shows the protective power of a lyophilic solution. Lesser the gold number, greater will be the protecting power of that colloid. Gelatin is one of the best protective colloid. Among the given colloids, potato starch has maximum gold number.

192. (a) Protective power $\propto \frac{1}{\text{Gold number}}$

Thus gelatin is the best protective colloid.

193. (b) Protective power $\propto \frac{1}{\text{Gold number}}$

Hence, the correct order of protective power is $B > A > C > D$.

194. (c) A catalyst does not participate in the reaction but alters the rate of reaction.
195. (a) A colloid of liquid in liquid is called emulsion cod liver oil is such an emulsion.
196. (a) Suspension of solid in a liquid.
197. (c) By the peptization, precipitate is changed to colloidal solution.
198. (a) An aerosol is a dispersion of a solid or liquid in a gas.
199. (d) Lyophilic sols are self stabilizing because these sols are reversible and are highly hydrated in the solution.

200. (d) $\frac{V_c}{V_s} = \frac{10^{-5}}{10^{-7}} \approx 10^3$

204. (a) Alum contains many cations and water has many anionic impurities. On adding alum coagulates the suspended impurities and make water fit for drinking purposes.
205. (a) For the stabilisation of an emulsion a third component called emulsifying agent is usually added. The emulsifier forms an interfacial film between suspended particles and the medium.
206. (b) Alum is added to muddy water so as to destroy the bacteria as well as to coagulate the suspended impurities.
207. (b) Fog is an example of aerosol where the dispersed phase is liquid and dispersion medium is gas.

208. (c) Lyophilic sols, are more stable than Lyophobic sols because after vaporization its remaining residue, convert into colloidal state after the addition of solvent.
209. (e) The substance, whose molecules associate with given solvent to form colloidal particle known as association colloidal. The molecule of soap & detergent are generally smaller than colloidal particle. These molecules associate in concentration solution to form colloidal size particle. These association of soap & detergent known as miscelle.

Critical Thinking Questions

- (a) Lyophilic means liquid loving hence hydration is contributed toward the extra stability of lyophilic colloids.
- (d) Traces of electrolytes are essential for stabilising the sales hence for sales destruction addition of electrolytes are required.
- (c) A catalyst is a substance which alters the rate of reaction and shortens the time to reach equilibrium.
- (d) Inhibitors are also catalysts but they slow down the rate of reaction.
- (d) The ability of an ion to bring about coagulation of a given calloid depend upon both the magnitude and sign of its charge.
- (c) Physiorption is a process in which the particles of adsorbate are held to the surface of adsorbent by physical forces hence does not requires activation energy.
- (a) Egg is a calloid of solid and liquid; Ruby glass is a colloid of solid and solid. Milk is a colloid of liquid and liquid but chlorophyll is a complex of magnesium.
- (b) Surfactant are those which have charge on their tail e.g., cetyltrimethyl ammonium bromide.

Surfactants are those, which dissociate in water to yield positively charged ion.

- (a) The size of colloidal particles is of the order $0.1\text{m}\mu$ to $0.001\text{m}\mu$.
- (b) $K_4[\text{Fe}(\text{CN})_6]$ is most effective in the coagulation of gold-solution.
- (d) A catalyst is used to decrease the time required for the reaction hence it can deacease or increase the rate of reaction.
- (d) Absorption, Tyndall effect and flocculation all are related to sol but paramagnetism is not represented by sol.
- (a) On shaking with the dispersion medium, colloids directly form the colloidal sol. Hence they are called intrinsic colloids. i.e., glue.
- (c) Arsenious sulphide can be prepared by double decomposition

$$\text{As}_2\text{O}_3 + 3\text{H}_2\text{S} \rightarrow \text{As}_2\text{S}_3 + 3\text{H}_2\text{O}$$
- (c) The amount of electrolyte required to coagulate a fixed amount of a sol depends upon the valency of flocculating ion.
- (d) Gold no. is a measure of protective power of a lyophilic colloid.
- (c) The colloidal solution of liquid in liquid is called emulsion not gel.
- (d) Linseed oil, lanolin and Glycogen attract water hence contain a hydrophobic structure but rubber does not attract water and does not contain a hydrophobic structure.
- (c) Gum-arabic has protective power hence the function of it ion in preparation of indian ink is protective action.
- (b) Easily liquefiable gases like SO_2 , NH_3 , CO_2 are adsorbed to a greater extent than the elemental gases like N_2 , O_2 , H_2 .

$$21. \quad (d) \quad \text{Volume of the gold dispersed in one litre water} = \frac{\text{Mass}}{\text{Density}}$$

$$= \frac{1.9 \times 10^{-4} \text{ gm}}{19 \text{ gm cm}^{-3}} = 1 \times 10^{-5} \text{ cm}^{-3}$$

$$\begin{aligned} \text{Radius of gold sol particle} &= 10 \text{ nm} = 10 \times 10^{-9} \text{ m} \\ &= 10 \times 10^{-7} \text{ cm} = 10^{-6} \text{ cm} \end{aligned}$$

$$\text{Volume of the gold sol particle} = \frac{4}{3} \pi r^3$$

$$= \frac{4}{3} \times \frac{22}{7} \times (10^{-6})^3 = 4.19 \times 10^{-18} \text{ cm}^3$$

$$\begin{aligned} \text{No. of gold sol particle in } 1 \times 10^{-5} \text{ cm}^3 &= \frac{1 \times 10^{-5}}{4.19 \times 10^{-18}} \\ &= 2.38 \times 10^{12} \end{aligned}$$

$$\text{No. of gold sol particle in one mm}^3$$

$$= \frac{2.38 \times 10^{12}}{10^6} = 2.38 \times 10^6$$

22. (d) Sodium acetate forms cationic micelles in the molecule of soap and detergent the negative ions aggregate to form a micelle of colloidal size. The negative ion has a long hydrocarbon chain and a polar group ($-\text{COO}^-$) at one end.

Assertion & Reason

- (a) Both assertion and reason are true and reason is the correct explanation of assertion.
The surface of a solid (or liquid) tends to attract and retain other molecules when it is brought in contact with a gas or a solution.
- (e) Assertions is false but reason is true.
The enthalpy of chemisorption is of the order of 200 kJmol^{-1} while for physical adsorption it is of the order of 20 kJmol^{-1} .
- (a) Both assertion and reason are true and reason is the correct explanation of assertion.
- (c) Assertion is true but reason is false.
Freundlich adsorption isotherm gives an empirical relation ship between the quantity of gas adsorbed by unit mass of solid adsorbent and pressure at a particular temperature.
- (d) Both assertion and reason are false.
There are reactions in which one of the products acts as catalyst (autocatalysis) and no catalyst is added.
- (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
ZSM - 5 converts alcohols directly into gasoline (petrol) by dehydrating them so that a mixture of hydrocarbons is formed.
- (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
If the dispersion medium is separated from the dispersed phase, the lyophilic sol can be reconstituted by simply remixing with the dispersion medium. That is why these sols are also called reversible sols.
- (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
The size of colloidal particles is large enough to scatter light while particles of a true solution are too small to scatter light.
- (a) Both assertion and reason are true and reason is the correct explanation of assertion.

The impact of the molecules of the dispersion medium on the colloidal particle are unequal leading to zig-zag motion *i.e.*, Brownian movement.

10. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
According to Hardy – Schulze rule : Coagulating power of an electrolyte is directly proportional to the fourth power of the valency of the ions causing coagulation.
11. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
Soap coats the drops of an emulsion and checks them from coming together and the emulsion is thus stabilised.
12. (a) It is fact that deep electric shock causes death of an animal and the reason for this is that blood is coagulated by electric shock. Therefore, here both assertion and reason are true.
13. (a) A catalyst is more effective in finely divided form because finely divided form has more surface area. Therefore there is an increase in active centres on the surface.
14. (c) NH_3 absorbs more readily over activated charcoal than CO_2 it is correct. The reason is the polar nature of NH_3 due to which it readily absorb. Hence assertion is true but reason is false.
15. (a) The sky appears blue because the colloidal particles of dust, dirt in air scatter blue light to the maximum extent. Here both assertion and reason are correct and reason is the correct explanation of assertion.
16. (d) The assertion that physical absorption of molecules takes place on surface only is false. Actually absorption takes place on the whole body. In physical absorption the bonds of absorption molecules are not broken. Hence, both assertion and reason are false.
17. (b) Here both assertion and reason are correct but reason is not a correct explanation of assertion. Micelle is formed if molecules with polar and nonpolar ends assemble in bulk to give nonpolar interior and polar exterior.
18. (a) Both assertion and reason are true and reason is the correct explanation of assertion. Scattering of light is the main phenomenon of colloidal particles. In which colloidal particles scatter a particular wavelengths light.
19. (c) It is true that if we increase the surface area the rate of evaporation also increase as evaporation is always takes place from the surface. But if the intermolecular attraction is stronger than the rate of evaporation is slower.

Surface Chemistry

SET Self Evaluation Test -14

- In which of the following commercial processes a catalyst is not used
(a) Haber's process
(b) Deacon's process
(c) Solvay process
(d) Lead chamber process
- A catalyst [IIT 1984; AFMC 1995; CBSE PMT 1995]
(a) Increases the average kinetic energy of reacting molecules
(b) Increases the activation energy
(c) Alters the reaction mechanism
(d) Increases the frequency of collisions of reacting species
- The coagulation of 100 ml of a colloidal sol of gold is completely prevented by addition of 0.25 g of a substance 'X' to it before adding 10 ml of 1% NaCl solution. The gold number of 'X' is
(a) 0.25 (b) 25
(c) 250 (d) 2.5
- Which one of the following is not a property of hydrophilic sols
(a) High concentrations of dispersed phase can be easily attained
(b) Coagulation is reversible
(c) Viscosity and surface tension are about the same as for water
(d) The charge of the particle depends on the pH values of the medium; it may be positive, negative or even zero
- Peptising agent is
(a) Always an electrolyte
(b) Always a non-electrolyte
(c) Electrolyte or non-electrolyte
(d) A lyophilic colloid
- The catalyst used in the manufacture of methanol from water gas is
(a) V_2O_5 (b) $Ni + Mo$
(c) $ZnO + Cr_2O_3$ (d) $Pt + W$
- Organic catalysts differ from inorganic catalysts [AFMC 1989]
(a) By acting at very high temperature
(b) By acting at low temperature
(c) Being used up
(d) Being proteinous in nature
- Commercial detergents mainly contain [CPMT 1993]
(a) $RCOONa$
(b) $RONa$
(c) $RONa$ [CPMT 1989]
(d) $ROSO_2Na$
- In which of the following processes shape-selective catalysis is occurring [MP PET 1994]
(a) Conversion of alcohol to gasoline
(b) Synthesis of methanol from CO and H_2
(c) Polymerisation of ethylene
(d) Synthesis of ammonia
- Which one of the following is used for reviving the exhausted permuted [EAMCET 2003]
(a) HCl solution
(b) 10% $CaCl_2$ solution
(c) 10% $MgCl_2$ solution
(d) 10% NaCl solution [AIIMS 1983, 84]
- The ability of a catalyst to accelerate the chemical reaction is known as [CPMT 2000; KCET 2000]
(a) Selectivity
(b) Activity
(c) Negative catalyst
(d) None of these
- $AlCl_3$, in reactions, acts as [MADT Bihar 1983]
(a) Oxidizing agent
(b) Reducing agent
(c) Acid catalyst [MP PET 2002]
(d) None of these
- On addition of one ml of 10% NaCl solution to 10 ml gold sol in the presence of 0.25 gm of starch. The coagulation is just prevented, starch has gold number [MP PET 2004]
(a) 0.025 (b) 0.25
(c) 2.5 (d) None
- Milk is an example of [MP PET 2001; JIPMER 2002; MP PMT 2002,04]
(a) Pure solution
(b) Gel
(c) Emulsion
(d) Suspension

AS Answers and Solutions

(SET -14)

- (c) In Haber's process we use iron as a catalyst, In Deacon's process we use Cu_2Cl_2 as a catalyst and in lead chamber process we use N_2O_5 as a catalyst but in solvay process no catalyst is used.

2. (d) A catalyst can increase the rate of reaction and hence increases the frequency of collision of reacting species.
3. (b) 250 mg of X is present in 100 ml of colloidal sol of gold. By definition, gold no. of X is that amount of it in mg which is present in 10 ml of colloidal gold solution. Hence in 10 ml, the amount of X present is 25 mg which is the gold number of X.
4. (c) Viscosity and surface tension are not same for water in hydrophilic sols.
5. (a) Process of converting precipitate into colloidal particles by adding suitable electrolyte called peptisation and stabilizing agent (electrolytes) as peptizing agent.
6. (c) $[CO + H_2] + H_2 \xrightarrow{ZnO + Cr_2O_3} CH_3OH$
14. (c) Milk is the example of emulsion of fat globules in water.

7. (d) Organic catalyst are proteinous in nature and obtain from living cell.
8. (a) Commercial detergents mainly contain salts of higher fatty acids.
9. (a,c) Shape selective catalyst are zeolites and zeolites are aluminosilicates of general formula $M_{x/n}[(AlO_2)_x.(SiO_2)_y].mH_2O$. Zeolites are used in conversion of alcohol to gasoline and in polymerisation of ethylene.
10. (d) 10% NaCl solution is used for reviving the exhausted permutite.
11. (b) The ability of a catalyst to accelerate the chemical reaction is known as its activity. Degree of acceleration can be as high as 10^{10} times in certain reactions.
12. (c) $AlCl_3$ may be written as $Al^{+3}Cl^-$ and all the tri-positive ions are Lewis acid hence it can act as acid catalyst.
13. (d) $0.25 \times 1000 = 250$

Chapter 15 Chemical Periodicity

Periodic table is an arrangement of elements with similar properties placed together. The **periodic table evolved largely as a result of experimental observations.**

Earlier attempt to classify elements

(1) **Dobereiner's law of triads** (1829) : It was the classification of elements into groups of three elements each with similar properties such that the atomic weight of the middle element was the arithmetic mean of the other two e.g. *Ca, Sr, Ba, Cl, Br, I* etc.

(2) **Telluric screw or Helix** (1862): It was proposed by Chancourtois.

(3) **Newlands law of octaves** (1864) : It was an arrangement of elements in order of increasing atomic weights in which it was observed that every eighth element had properties similar to those of the first just like the eighth note of an octave of music.

(4) **Mendeleev's period law** (1869) : The first significant classification was given by Mendeleeff in the form of periodic table, commonly known as Mendeleeff's periodic table. His periodic table was based on periodic law, "The physical and chemical properties of elements are periodic functions of their atomic weights."

In Mendeleev's periodic table elements are arranged in order of their increasing atomic weights in such a way that elements with similar properties are placed in the same group. It consists of seven horizontal rows called periods. These are numbered from 1 to 7.

Mendeleev's original table consists of **8 vertical columns called groups**. These are numbered as **I, II III..... VIII**. However, 9th vertical column called Zero group was added with the discovery of inert gases. Except for group VIII and zero, each group is further divided into two sub-groups designated as *A* and *B*. Group VIII consists of 9 elements arranged in three sets each containing three elements.

(5) **Modern Periodic Law** : The recent work has established that the **fundamental property of an atom is atomic number** and not atomic weight. Therefore, atomic number is taken as the basis of the classification of the elements. The modern periodic law was given by **Moseley, it may be stated as** : "The properties of elements are periodic functions of their atomic number".

When atomic number is taken as the basis for classification of elements, many anomalies of Mendeleev's table disappear, such as the,

(i) **Position of hydrogen** : Dual behaviour of hydrogen is explained on the fact that it has one electron in its outermost orbit. When it loses its electron it gives *H* and behaves like alkali metals and when it gains an electron it gives *H* and behaves like halogens. Thus, it resembles with both the alkali metals and the halogens.

(ii) **Dissimilar elements placed together** : The lengths of periods are determined by the arrangement of electrons in different orbits. The period ends on the completion of last orbits (last members always being the inert gas). Different periods contain 2, 8, 18 or 32 elements. Now out of the two elements which every long period adds to the group, one resembles the typical elements while the other does not. This gives rise to formation of subgroups. This explains the inclusion of dissimilar elements in the same group but different subgroups.

(iii) **Position of rare earth elements** : The electronic arrangement of rare earths can be written as 2, 8, 18, $(18 + x)$, 9, 2 where *x* varies from 0 to 13, i.e., from Lanthanum to Lutetium. The number of electrons in valency shell, in case of all the elements remain the same although the atomic number increases. Since they possess the same number of valency electrons, the chemical behaviour is also similar. This justifies their positions in the same group and in the same place of the periodic table.

(iv) **Anomalous pairs of elements** : Now the basis of classification is atomic number, therefore, this anomaly disappears as the elements occupy their normal position in the new periodic table.

(v) **Position of isotopes** : Since the isotopes of same element possess same atomic number they should occupy one and the same position in the periodic table.

(vi) **Position of VIII group elements** : In long periods 18 elements are to be distributed among 8 groups; 1 to 7 groups get 2 elements each and zero group accommodates inert elements, the rest three elements are placed at one place in a new group, known as VIII group. This lack of space justifies the induction of VIII group in the periodic table.

(vii) **Transuranic elements** : These elements form a series known as **actinide series**, it begins from actinium and ends at lawrencium (89–103). This series has been placed outside the periodic table. The electronic configuration of these elements can be written as 2, 8, 18, 32, $(18 + x)$, 9, 2, where *x* varies from zero (for actinium) to 14 (for lawrencium). The number of valency electrons remains the same for all these elements although

atomic number increases. Therefore, their chemical behaviour is similar. This justifies their position outside the periodic table at one place.

Classification of element on the basis of electronic configuration

According to Bohr the element have been grouped into four types

(1) **Inert gases** : These atom have been full fill outer most s and p subshell and having the configuration ns^2np^6 (Exception helium having $1s^2$) due to stable configuration these element do not show chemical activity under normal condition and thus termed as inert gases. Under special conditions, the higher members do form some compounds with other elements and hence, the name has been changed to **Noble gases**. Six element He, Ne, Ar, Kr, Xe and Rn belongs to this group.

(2) **Representative or normal elements** : Element in which atom have all shells complete except outermost shell which is incomplete. The number of electrons in the outermost shell varies from 1 to 7 i.e. the configuration of the outermost shell varies from ns^1 to ns^2np^5 . These consist of some metals, all non metals and metalloid. These are the elements which are found in nature in abundance and active in nature. On account of this, these elements are called representative elements. All the three types of valencies are observed in the case of these elements. These elements have one of the following configuration in their outermost shell.

The number of electrons present in the outermost shell signify the group to which these element belong.

(3) **Transition elements** : In the atoms of these elements the outermost shell and the penultimate shell (Next to the outermost) are incomplete. These elements have the general configuration $(n-1)d^{1-9}ns^0 \text{ or } 1 \text{ or } 2$ either in the ground state or in excited state. These elements are present in IV^{th}, V^{th}, VI^{th} and VII^{th} period of periodic table and called transition elements. There are four transition series every series consists 9 elements each.

(4) **Inner transition elements** : Atoms of these elements have three outermost shell incomplete. The general configuration is $(n-2)f^{1-14}(n-1)d^0 \text{ or } 1ns^2$. There are two series of elements.

(i) Lanthanides or rare earths from $Ce(58)$ to $Lu(71)$.

(ii) Actinides from $Th(90)$ to $Lr(103)$

Each series consists of 14 elements i.e. in the lanthanides, $4f$ is gradually filled up while in actinides, $5f$ is gradually filled up.

The properties of these elements are similar to transition elements. The members of actinide series are radioactive and majority of them are not found in nature. The elements from atomic number of 93 onwards are called transuranic elements and have been discovered artificial means.

In this classification the element, Zn, Cd and Hg have not been included in any of the four groups of elements. The elements Lu and Lr of the inner transition group have $(n-2)f$ shell complete consisting 14 electron hence their inclusion in this group is not justified.

Extended or long form of periodic table

Modern periodic table is also called long form of the periodic table or Bohr's table. In this table, the elements are arranged in order of their increasing atomic number. It consists of 4 blocks (s, p, d and f), 18 groups numbered from 1 to 18 and 7 periods numbered from 1 to 7.

Blocks : The periodic table is divided into four main blocks (s, p, d and f) depending upon the subshell to which the valence electron enters into.

- (1) Elements of group 1 and 2 constitute s -Block.
- (2) Elements of group 13, 14, 15, 16, 17, 18 constitute p -Block
- (3) Elements of group 3, 4, 5, 6, 7, 8, 9, 10, 11, 12 constitute d -Block
- (4) The f -Block elements comprise two horizontal rows placed at the bottom of the periodic table to avoid its unnecessary expansion.

Elements of s - and p -blocks are called normal or **representative elements**, those of d -block are called **transition elements** while the f -block elements are called **inner transition elements**.

Groups : The 18 vertical columns are called groups. The elements belonging to a particular group is known as a family and is usually named after the first number. Apart from this some of the groups are given typical names as exemplified beneath,

- (1) Elements of group 1 are called **Alkali-Metals**.
- (2) Elements of group 2 are called **Alkaline Earths**.
- (3) Elements of group 3 are called **Pnicogens**.
- (4) Elements of group 16 are called **Chalcogens**.
- (5) Elements of group 17 are called **Halogens**.
- (6) Elements of group 18 are called **Noble Gases or Aerogens**.

1	2	3	4	5	6	7	8										

All the other groups are named after the first member of each group.

Periods : The horizontal rows are called periods. There are seven periods in the long form of the periodic table,

(1) 1st period (${}_1\text{H} \rightarrow {}_2\text{He}$) contains 2 elements. It is the shortest period.

(2) 2nd period (${}_3\text{Li} \rightarrow {}_{10}\text{Ne}$) and 3rd period (${}_{11}\text{Na} \rightarrow {}_{18}\text{Ar}$) contains 8 elements each. These are short periods.

(3) 4th period (${}_{19}\text{K} \rightarrow {}_{36}\text{Kr}$) and 5th period (${}_{37}\text{Rb} \rightarrow {}_{54}\text{Xe}$) contains 18 elements each. These are long periods.

(4) 6th period (${}_{55}\text{Cs} \rightarrow {}_{86}\text{Ra}$) consists of 32 elements and is the longest period.

(5) 7th period starting with ${}_{87}\text{Fr}$ is incomplete and consists of 19 elements.

Periodicity in properties

"The repetition of similar electronic configuration after a definite period is the cause of periodicity of the properties of elements."

It can be explained with the help of electronic arrangement of elements. According to the modern views, the valency of an element is indicated by the number of electrons present in the outermost orbit. The chemical properties of elements are dependent on valency electrons. Variation in electronic arrangement leads to the variation in properties. After a definite interval, recurrence of similar electronic arrangement takes place when the number of valency electrons is the same. Thus, there is a regular gradation and repetition in the properties of elements.

Periodic properties are directly or indirectly related to their electronic configuration and show a regular gradation on moving from left to right in a period or from top to bottom in a group. Some period or from top to bottom in a group. Some important periodic properties are : **oxidation number, shielding effect, atomic radii, ionization energy, electron affinity, electro-negativity, valency, density, m.pt. and b.pt.**

The screening effect or shielding effect

A valence-electron in a multi-electron atom is attracted by the nucleus, and repelled by the electrons of inner-shells. The combined effect of this attractive and repulsive force acting on the valence-electron experiences less attraction from the nucleus. This is called **shielding** or **screening effect**. The magnitude of the screening effect depends upon the number of inner electrons, i.e., higher the number of inner electrons, greater shall be the value of screening effect. The screening effect constant is represented by the symbol ' σ ' is determined by the **Slater's rules**.

The magnitude of screening constant in the case of *s*- and *p*- block elements increases in a period as well as in a group as the atomic number increases.

Effective nuclear charge

Due to screening effect the valency electron experiences less attraction towards nucleus. This brings decrease in the nuclear charge (Z) actually present on the nucleus. The reduced nuclear charge is termed **effective nuclear charge** and is represented by Z^* . It is related to actual nuclear charge (Z) by the following formula,

$$Z^* = (Z - \sigma) \text{ where } \sigma \text{ is screening constant.}$$

It is observed that **magnitude of effective nuclear charge increases in a period when we move from left to right.**

In a subgroup of normal elements the magnitude of effective nuclear charge remains almost the same.

Covalent, Ionic and Vander waal's radii

The radius of an atom is the distance between the centre of its nucleus and electrons in the last orbit. However, according to quantum mechanics, there is no certainty about the exact position of electrons at any time. Theoretically, an electron, at one time, may be very close to the nucleus while at other time it may be far away from the nucleus. In spite of these limitations we need to have some operational definition of the term atomic radius. There are three operational concepts of atomic radius.

- (1) If the bonding is covalent, the radius is called a **covalent radius**.
- (2) If the bonding is ionic, the radius is called **ionic radius**.
- (3) If the two atoms are not bonded by a chemical bond (as in noble gases) the radius is called **vander Waal's radius**.

(1) **Covalent radius** : It is half of the distance between the nuclei of two like atoms bonded together by a single bond. Thus covalent radius of carbon in a compound having $\text{C} - \text{C}$ single bond can be determined by dividing the bond length by 2, i.e.,

$$r_c = \frac{\text{C}-\text{C}}{2} \quad \therefore \text{C}-\text{C} = 2r_c \quad \text{or} \quad r_c + r_c$$

where, r_c is the single bond covalent radii (SBCR) of carbon. However, if atoms forming the covalent bond are different i.e., one is more electronegative than the other then the atomic radius is determined by the relation

$$A - B = r_A + r_B - 0.009(\chi_A - \chi_B)$$

where χ_A and χ_B are electronegativities of the atoms *A* and *B* respectively. This relation was given by **Stevenson** in 1941.

In a given period, atomic radius generally decreases from left to right and thus in any period, alkali metal is the largest and halogen is the smallest atom. For example, in second period elements the covalent radii decrease from *Li* to *F*.

1.23 0.89 0.80 0.77 0.74 0.74 0.72 1.6

The decrease in size along a period is due to the effect of successive increasing nuclear charge without addition of a new shell, *i.e.*, in each element of a given period a new electron is added in the same principal quantum number. For example, in the second period the nuclear charge increases from +3 in *Li* to +9 in *F*. The increased nuclear charge attracts the electrons more strongly to the nucleus and thus decreases the size of the atom. In case of noble gases, the atomic radii are only the vander Waal's radii which are naturally higher than the covalent radii of other elements.

In a given group, Atomic radius generally increases as one moves from top to bottom, *eg.*, in group 1 atomic size increases steadily from lithium to cesium, *i.e.* $r_{Cs} > r_{Rb} > r_K > r_{Na} > r_{Li}$

The increase in size on descending a group is due to addition of extra shell which outweighs the effect of increased nuclear charge. Remember that He and Fr are smallest and largest atom respectively.

(2) **Ionic radius** : It is the effective distance from the nucleus of an ion upto which it has its influence on its electron cloud.

A cation is always much smaller than the corresponding atom. Further, more the number of electrons removed smaller will be the size of the resulting positive ion. For example, $r_{Fe} > r_{Fe^{2+}} > r_{Fe^{3+}}$. This is

1.26 0.76 0.64

due to following two factors

(i) A cation formed by the loss of electrons may result in the complete disappearance of the outer shell and since the remaining inner shells do not extend so far in space, the cation is much smaller than the metal atom. For example,

Sodium atom (*Na*) → Sodium ion (*Na*)

(2, 8, 1) (2, 8)

(ii) Whenever a cation is formed, the ratio of nuclear charge to the number of electrons (*Z/e* ratio) is increased with the result the effective nuclear charge is increased and the electrons are pulled towards the nucleus. Consequently, the cation becomes smaller. An anion is always larger than the corresponding atom. For example, Atomic radius of *I* = 1.23 ; Ionic radii of *I* = 2.16

This is again due to following two factors : (a) Since in the formation of an anion, one or more electrons are added, the electron cloud expands and the ionic size increases. (b) In the formation of anion, the effective nuclear charge decreases with the result the electrons get away from the nucleus and thus the anion becomes larger than the corresponding atom.

In any particular group, the ions of elements increase in size on moving from top to bottom.

In case of *isoelectronic ions* (ions having same number of electrons but different nuclear charge); the greater the nuclear charge, the greater is the attraction for electrons and smaller is ionic radius. Hence size of such ions decreases. Which is as follows

Size of ions (in decreasing order)

(3) **Vander Waal's radius** : It is one-half of the distance between the nuclei of two adjacent atoms belonging to two neighbouring molecules of an element in the solid state.

The covalent radius is always smaller than the corresponding vander Waal's radius. This is because of the fact that in the formation of a chemical bond, the two atoms have to come closer to each other. This also explains *why covalent bonds are much stronger than the vander Waal's forces*. It is important to note that since the noble gases ordinarily do not form any covalent bond, in crystals of noble gases, no chemical forces are operating between the atoms. Hence the vander Waal's forces are the only attractive forces in these cases. In other words, *the vander Waal's radii constitute the atomic radii of noble gases* and since vander Waal's radii are larger than covalent radii, *atomic radii of noble gases are largest in their respective periods* (anomaly).

Ionisation potential or ionisation energy

The electrons in an atom are attracted by the nucleus. When an electron is to be removed then work is done against this nuclear attraction. In other words energy is required to remove an electron from an atom. To understand the details of chemical behaviour of an element we must have an indication of the energy with which an atom binds its electrons. This is obtained by the measurement of ionisation potential or ionisation energy. It may be defined as **the energy required to remove an electron from the outermost orbit of an isolated gaseous atom in its ground state**. It is expressed in electron volts (eV) or kilo calories per gram atom. In an atom, the energy required to remove first electron from a gaseous atom is called first ionisation energy. The energy required to remove one electron from a unipositive ion to form a bipositive ion is called second ionisation energy. Second ionisation energy is higher than the first. The reason is that in unipositive ion left after the removal of one electron from the atom, the electrons are more firmly bound to the nucleus than in the atom. Hence more energy is needed to remove the second electron.

Similarly, third ionisation energy is even more than second ionisation energy.

(I) Variation of ionisation energy in periodic table

(i) *Ionisation energy decreases in a group as the atomic number increases*. It is based on the fact that as we move down a group, the size of atom increases, and the outer electrons become farther away from the nucleus thus reducing the force of attraction and hence ionisation energy decreases.

<i>Li</i>	<i>Na</i>	<i>K</i>	<i>Rb</i>	<i>Cs</i>
5.4 eV	1. eV	4.3 eV	4.2 eV	3.9 eV

(ii) *Ionisation energy increases along a period with increase in atomic number*. This is due to the size of atom since it decreases along a period and outer electrons are most strongly attracted by the nucleus and hence more energy is required to remove the electron.

<i>Li</i>	<i>Be</i>	<i>B</i>	<i>C</i>	<i>N</i>	<i>O</i>	<i>F</i>	<i>Ne</i>
5.4 eV	9.3 eV	8.3 eV	11.3 eV	14.6 eV	13.6 eV	17.0 eV	21.6 eV

(iii) The ionisation energies of inert gases are greater than that of their immediate neighbour. It is due to their complete octet *ns²np⁶* configuration which is highly stable. Therefore, it is very difficult to remove an electron from the outermost orbit of an inert gas.

(2) Factors affecting the value of ionisation energy

(i) **Size of atom** : With an increase in atomic size, the ionisation potential is reduced, since the distance of the outermost electron from the nucleus increases and hence the force of attraction decreases.

(ii) **The charge on the nucleus** : With an increase in the nuclear charge, there is an increase in force of attraction of nucleus for electrons making the removal of the electrons more difficult. Thus an increase in nuclear charge increases the ionisation potential.

(iii) **The shielding or screening effect of inner shells** : The valence electrons in a multi-electron atom are pulled by the nucleus but are repelled by the electrons of the inner shells. The valence electrons, therefore, do not experience the total pull of the nucleus. Instead the total pull of the nucleus is reduced by the electrons in inner shells. This effect of reducing the force of attraction of nucleus by the inner shells is called *screening effect*. This effect is exhibited maximum by *sp* (the most stable) shell. Therefore, the ionisation energy of *K* is much less than *Cu*, however, both have one electron in their fourth shell.

$$K^{19} = 1s^2, 2s^2p^6, 3s^2p^6, 4s^1$$

$$Cu^{29} = 1s^2, 2s^2p^6, 3s^2p^6d^{10}, 4s^1$$

The ionisation energy of *K* is 4.33 eV while that of *Cu* is 7.72 eV. This is due to a large screening effect of s^2p^6 , penultimate orbit in *K* while $s^2p^6d^{10}$, penultimate orbit in *Cu* which exhibit little screening effect.

(iv) **Type of electrons involved** : Ionisation energy also depends upon the type, i.e., *s*, *p*, *d* or *f*, electrons which are to be removed, *s*-electrons are closer to the nucleus and are more tightly held as compared to *p*, *d* or *f* electrons. Hence, ionisation energy decreases in the order of $s > p > d > f$ orbitals.

(v) **Completely filled or half filled sub-shells** : According to Hund's rule, completely filled or half filled orbitals are more stable. Therefore, it is comparatively difficult to remove the electrons from these shells. The ionisation energy of *Be* (9.3 eV) is more than *B* (8.3 eV) because *Be* has *2s* configuration of the outermost orbit which is fully filled. Similarly, nitrogen (14.6 eV) has more ionisation energy than oxygen (13.6 eV) because nitrogen has outermost shell configuration as *2sp* in which *p* shell is half filled and is more stable. Similarly, ionisation energy of *Mg* is more than *Al* and that of *P* is more than *S*.

(3) Relative ionisation energies

- IE_1 and IE_2 of the 2nd period elements

$$IE_1 : Li < B < Be < C < O < N < F < Ne$$

$$IE_2 : Be < C < B < N < F < O < Ne < Li$$

- IE_1 and IE_2 of the 3rd period elements

$$IE_1 : Na < Al < Mg < Si < S < P < Cl < Ar$$

$$IE_2 : Mg < Si < Al < P < S < Cl < Ar < Na$$

- IE_1 of elements with very high values

$$Cl < H < O < Kr < N < Ar < F < Ne < He$$

(4) Importance of ionisation energy

(i) Lower is the ionisation potential of an element, more would be its reducing power and also reactivity.

(ii) It gives rough estimate about the basic character of the elements.

(iii) The relative values of ionisation potential and electron affinity of two elements are related to the nature of bond formed during their combination.

(iv) The ionisation potentials provide an indication about the number of valence electron (*s*) in an atom; the abnormally high value indicates that the electron removed is other than the valence electron.

For example, IE_1 , IE_2 and IE_3 values are 5.39, 75.62 and 122.42 eV. Since the values shows sudden jump, it indicates that the number of valence electron in its atom is one. Similarly, values of IE_1 , IE_2 and IE_3 as 9.32, 18.21 and 153.85 eV indicate that the number of valence electrons in its atom is two.

Electron affinity

Those atoms whose nuclear forces are not completely screened by electronic shells, offer attraction for electrons. Such atoms capture electrons if these are available within their effective fields to neutralise the electrostatic forces of the nucleus. Energy is always liberated whenever there is a force of attraction offered by an atom or ion, and this energy is called electron affinity. This may be defined as, "the energy released when an extra electron is added to a neutral gaseous atom".

When first electron is added in a neutral atom then some energy is released that is called first electron affinity but in case of second electron affinity energy will be absorbed due to electronic repulsion. Example as

Thus, higher the energy released in the process of taking up an extra electron, the higher will be the electron affinity. Higher the value of electron affinity of an atom, the more is its tendency to change into anion. It is very difficult to determine the electron affinity experimentally. The values have been calculated on the basis of thermodynamic concepts. It is expressed in electron volts. The values of inert gases are assumed to be zero because they have stable *ns²p⁶* configuration and unable to accept any electron. The values for alkali metals are between zero and one.

The electron affinities of *Be*, *Mg* and zero since they have complete *ns* configuration which can not accommodate extra electron. Similarly, the values for *N* and *P* are very low because they also have completely half-filled *p* orbitals (*ns²p³*) and are more stable.

(I) Factors affecting the value of electron affinity

(i) **Atomic size** : The value of electron affinity decreases with the increase in the size of atom since the nuclear attraction decreases down a group as the atomic number increases. Its value increases as we move along a period since the size of atoms decreases along a period. The lower value of *F* than *Cl* is due to the very small size of *F* in which negative charge is highly concentrated and repels the incoming electron thereby reducing the force of attraction of the nucleus towards the adding electron and hence decreasing the electron affinity. Thus, chlorine has a highest value of electron affinity.

(ii) **Nuclear charge** : The value of electron affinity increases with increasing nuclear charge. Thus, its value increases with increase in nuclear charge along a period.

(iii) **Screening or shielding effect** : The value of electron affinity increases with the decrease in shielding effect of inner electrons. Besides, the value of electron affinity also depends to some extent upon the type of orbital in which electron is added. The value is greater when electron enters '*s*' orbital and decreases successively for *p*, *d* and *f* orbitals.

(2) **Importance of electron affinity** : Certain properties of the elements are predicted on the basis of values of electron affinity.

(i) The elements having high value high values of electron affinity are capable of accepting electron easily. They form anions and electrovalent compounds. These elements are electronegative in nature.

(ii) The elements having high values of electron affinity act as strong oxidising agents, for example, F, Cl, Br, O, S , etc.

On the basis of the general trend of ionisation potential and electron affinity, the following properties can be predicted,

(a) Metallic nature decreases in a period while nonmetallic nature increases. Metallic nature increases in a group while non-metallic nature decreases. The arrow ($\downarrow$) represents a group and ($\rightarrow$) represents a period.

(b) Reducing nature decreases in a period while oxidising nature increases. The reducing nature increases in a group while oxidising nature decreases.

(c) Stability of metal increases while activity of the metal decreases in a period and in a group stability decreases while activity increases.

This trend is observed especially in IA, IIA and IIIA elements.

(d) The basic nature of the oxides decreases in a period while acidic nature increases. In a group, basic nature increases while acidic nature decreases.

Electronegativity

The tendency of an atom in a compound to attract a pair of bonded electrons towards itself is known as electronegativity of the atom. It is important to note that electron affinity and electronegativity both measure the electrons attracting power but the former refers to an isolated gaseous atom while the latter to an atom in a compound. Thus electron affinity is attraction for a single electron while electronegativity is for a pair of bonded electrons. Further electron affinity is energy while electronegativity is a tendency.

(1) Factors affecting the value of electronegativity

(i) The size of the atom.

(ii) Electronic configuration. Small atoms attract electrons more than the larger one and are therefore more electronegative. Secondly, atoms with nearly filled shell of electrons, will tend to have higher electronegativity than those sparsely occupied ones.

(2) Variation of electronegativity in the periodic table

(i) In a period, electronegativity increases from left to right. This is due to decrease in size and increase in nuclear charge. Thus the alkali metals possess the lowest value, while the halogens have the highest. Inert gases have zero electronegativity.

(ii) In a group, electronegativity decreases from top to bottom. This is due to increase in atomic size.

If an element exhibits various oxidation state, the atom in the higher oxidation state will be more negative due to greater attraction for the electron, e.g., Sn II (1.30) and Sn IV (1.90).

(3) Electronegativity may be expressed on the following three scales

(i) **Mulliken's scale** : Mulliken regarded electronegativity as the average value of ionization potential and electron affinity of an atom.

$$\text{Electronegativity} = \frac{\text{Ionization potential} + \text{Electron affinity}}{2}$$

(ii) **Allred-Rochow scale** : Allred and Rochow defined electronegativity as the electrostatic force exerted by the nucleus on the valence electrons. Thus $\chi = \frac{0.359 Z}{r^2} + 0.744$ where Z is the effective nuclear charge and r is the covalent radius of the atom in Å.

(iii) **Pauling scale** : Pauling scale of electronegativity is the most widely used. It is based on excess bond energies. He determined electronegativity difference between the two atoms and then by assigning arbitrary values to few elements (e.g. 4.00 to fluorine, 2.5 to carbon and 2.1 to hydrogen), he calculated the electronegativity of the other elements.

$\chi_A - \chi_B = 0.208 \sqrt{\Delta E}$ where χ_A and χ_B are electronegativities of the atoms A and B respectively, the factor 0.208 arises from the conversion of kcal to electron volt (1 eV = 23.0 kcal/mole),

$$\text{while } \Delta E = \text{Actual bond energy} - \sqrt{(E_{A-A} \times E_{B-B})}$$

Pauling and Mulliken values of electronegativities are related as below χ (Pauling) = 0.34χ (Mulliken) - 0.2

(4) **Importance of electronegativity** : The following predictions can be made from value of electronegativity,

(i) Nature of the bond between two atoms can be predicted from the electronegativity difference of the two atoms.

(a) The difference $\chi_A - \chi_B = 0$, i.e., $\chi_A = \chi_B$ the bond is purely covalent.

(b) The difference $\chi_A - \chi_B$ is small, i.e., $\chi_A > \chi_B$, the bond is polar covalent.

(c) The difference $X_A - X_B$ is 1.7, the bond is 50% covalent and 50% ionic.

(d) The difference $X_A - X_B$ is very high, the bond is more ionic and less covalent. The molecule will be represented in such case as $BA(B^+A^-)$. Percentage ionic character may be calculated as,

$$\text{Percentage of ionic character} = 16(X_A - X_B) + 3.5(X_A - X_B)^2$$

where X_A and X_B represents electronegativity of bonded atoms A and B .

This relation was given by A.L. Allred (1961).

(ii) Greater the value of difference $(X_A - X_B)$ more stable will be the bond.

	$H - F$	$H - Cl$	$H - Br$	$H - I$
$(X_A - X_B)$	1.9	0.9	0.7	0.4
	Stability decreases $\rightarrow$			

Stability of compounds in which $X_A - X_B$ is very small are unstable in nature, $SiH_4(0.3)$, $NCl_3(0.0)$, $PH_3(0)$, $AsH_3(0.1)$ are unstable.

(iii) $(X_O - X_A)$ difference predicts the nature of the oxides formed by the element A . X_O is the electronegativity of oxygen.

$X_O - X_A$ is large, the oxide shows basic nature, (e.g., Na_2O).

$X_O - X_A$ is small, the oxide shows acidic nature, (e.g., SO_2).

(iv) Ionic compounds having percentage ionic character less than 20% were found coloured, e.g.,

$AgCl$	$AgBr$	AgI	Ag_2S
22%	18%	11%	8%
White	Light yellow	Dark yellow	Black

Lesser the percentage ionic character, darker will be the colour.

Some other periodic properties

(1) **Atomic volume** : It is defined as the volume occupied by one gram atom of an element. Mathematically,

$$\text{Atomic volume} = \frac{\text{Gram atomic weight}}{\text{Density in solid state}}$$

Units of atomic volume are c.c./mole. Atomic volume signifies the volume occupied by one mole (Avogadro number) of atoms of the given element in solid state. Lower atomic volume generally leads to higher density, increased hardness and brittleness, higher melting and boiling points, less malleability and ductility.

(i) While descending a group, the atomic volume generally increases which is due to increase in the number of shells though the valence electrons in a given group remains constant.

(ii) While going left to right across a period the atomic volume first decreases to a minimum and then increases. Francium has the highest atomic volume and boron has lowest atomic volume.

(2) **Density** : The density of the elements in solid state varies periodically with their atomic numbers. At first, the density increases gradually in a period and becomes maximum somewhere for the central members and then starts decreasing afterwards gradually.

(3) **Melting and boiling points** : The melting points of the elements exhibit some periodicity with rise of atomic number. It is observed that elements with low values of atomic volumes have high melting points while elements with high values of atomic volumes have low melting points. In general, melting points of elements in any periodic at first increase and become maximum somewhere in the centre and thereafter begins to decrease.

Tungsten has the maximum melting point ($3410^\circ C$) amongst metals and carbon has the maximum melting point ($3727^\circ C$) amongst non-metals. Helium has the minimum melting point ($-270^\circ C$). The metals, Cs , Ga and Hg are known in liquid state at $30^\circ C$.

The boiling points of the elements also show similar trends, however, the regularities are not so striking as noted in the case of melting points.

(4) **Oxidation state (Oxidation number, O.N.)** : *Oxidation number of an element in a compound is the total number of electrons it appears to have gained or lost (negative and positive oxidation states respectively) during the formation of that particular compound.*

Note : For detail see chapter redox reaction.

(5) **Magnetic properties** : Magnetic properties of matter depend on the properties of the individual atoms. A substance (atom, ion or compound) capable of being attracted into a magnetic field is known as **paramagnetic**. The paramagnetic substances have a net magnetic moment which in turn is due to the presence of unpaired electron(s) in atoms, ions or molecules. Since most of the transition metal ions have unpaired *d*-electrons, they show paramagnetic behaviour. The exceptions are Sc^{3+} , Ti^{4+} , Zn^{2+} , Cu^{+} , etc. which do not contain any unpaired electron and hence are diamagnetic.

On the other hand, a substance which is repelled by a magnetic field is known as **diamagnetic**. Such substances do not have any net magnetic moment because they do not have any unpaired electron. Electrons determine the magnetic properties of matter in two ways,

- Each electron can be treated as a small sphere of negative charge spinning on its axis. The spinning of charge produces magnetic moment.
- An electron travelling in closed path around a nucleus will also produce magnetic moment just as does electric current travelling in a loop of wire.

The observed magnetic moment is therefore the sum of the two moments: the spin moment and the orbital moment. It is expressed in units called Bohr Magnetons (BM). In terms of *n* (number of unpaired electron), magnetic moment is given by the formula, $\mu = \sqrt{n(n+2)}$

Greater the number of unpaired electrons in a substance, the greater is the magnetic moment of the substance. The value of magnetic moment has been used to calculate the number of unpaired electrons in an ion. In some cases, even the structure of the molecule or complex is indicated by its magnetic moment.

Paramagnetism is generally measured by a simple device known as Guoy's balance which involves weighing the species in presence of a magnetic field.

Ferromagnetism is a special property observed in some substances in the solid state. Such substances are strongly attracted to magnetic field and may retain the magnetic properties for some time even after the removal of the field. The most common example is of Fe followed by Co and Ni.

(6) Hydration and hydration energy

(i) Hydration energy is the enthalpy change that accompanies the dissolving of 1 mol of gaseous ions in water.

(ii) Size of ions and its charge determines extent of hydration. Greater the charge smaller the size of the ion, greater the attraction for the lone pair of O of H_2O , hence greater the extent of hydration energy.

- Size of the hydration ion increases.
- Ionic mobility decreases i.e. heavier (hydrated) ions moves slower.

(7) Acid-base-character of oxides

(i) On moving across a period, the basic character of the oxides gradually changes first into amphoteric and finally into acidic character.

(ii) On moving down a group, reverse behaviour is observed i.e., from more acidic to more basic.

(iii) Stability of oxides decreases across a period.

(8) Hydrides

(i) Hydrogen combines with a number of other elements including metals and non-metals to form compounds called hydrides.

(ii) Covalent nature of hydrides increases across a period and decreases down the group.

(iii) Ionic hydride are better reducing agents than covalent hydride and reducing nature of hydride decreases across a period and increases down the group.

(iv) Covalent and ionic hydrides are classified as follows,

Diagonal relationship

Certain elements of 2nd period show similarity with their diagonal elements in the 3rd period as shown below :

	Group 1	Group 2	Group 13	Group 14
2 nd perio	Li	Be	B	C
3 rd period	Na	Mg	Al	Si

Thus, Li resembles Mg, Be resembles Al and B resembles Si. This is called diagonal relationship and is due to the reason that these pairs of element have almost identical ionic radii and polarizing power (i.e. charge/size ratio). Element of second period are known as bridge elements.

Anomalous behaviour of the first elements of a group: The first element of a group differs considerably from its congeners (i.e. the rest of the element of its group). This is due to (i) small size (ii) high electronegativity and (iii) non availability of *d*-orbitals for bonding. Anomalous behaviour is observed among the second row elements (i.e. Li to F).

Tips & Tricks

The IUPAC nomenclature of elements > 100

In IUPAC system, the names are derived by using roots for the three digits in the atomic number of the element and adding the ending : ium. The roots for the numbers are

Number	0	1	2	3	4	5	6	7	8	9
Root	nil	un	bi	tri	quad	pent	hex	hept	oct	enn

Atomic

Number	Name	Symbol
101	un-nil-unium	Unu
102	un-nil-bium	Unb
103	un-nil-trium	Unt
104	un-nil-quadium	Unq
105	un-nil-pentium	Unp
106	un-nil-hexium	Unh
107	un-nil-septium	Uns
108	un-nil-octium	Uno
109	un-nil-ennium	Une
110	un-un-nilium	Uun
111	un-un-unium	Uuu
112	un-un-bium	Uub
113	un-un-trium	Uut
114	un-un-quadium	Uuq
115	un-un-pentium	Uup
116	un-un-hexium	Uuh
117	un-un-septium	Uus
118	un-un-octium	Uuo
119	un-un-ennium	Uue

✍ Elements of second period are known as Bridge elements. Their properties resemble with the properties of diagonal elements of third period.

✍ For isoelectronic ions the size depends on the nuclear charge. Greater is the nuclear charge smaller is the size.

✍ The increase in magnitude of radii is more in the beginning of a group because the difference in energy between energy shells is more.

✍ The ionisation potentials provide an indication about the number of valence electrons (s) in an atom e.g., Na has $IE_1 \gg IE_2$ (because it has one valence electron) while Mg has $IE_1 \gg IE_2 > IE_3$ because it has two valence electrons and attains noble gas configuration after losing 2 electrons.

✍ The highest I.E. in a period is shown by noble gas.

✍ The electronegativity of a series of transition metals is almost similar. The electronegativity of all lanthanide's are identical (≈ 1).

✍ The most electronegative elements is Fluorine (value is 4.0 on the Pauling scale). The least electronegative elements is Cs and Fr with a value of 0.700.

✍ The electron affinity of exactly half-filled configuration is approximately zero and exactly zero for fully filled configuration.

✍ The electron affinities of gaseous anions are always negative.

✍ Some of the polar crystals when heated produce electric current. This phenomena is termed as piezoelectric effect.

✍ All the elements of f block (4f series – Lanthanides and 5f series – Actinides) are placed in 3rd group (IIIB) and form a separate block at the bottom of the periodic table.

Ordinary Thinking

Objective Questions

Extended or long form of periodic table

- Which of the following statement is not correct for the element having electronic configuration $1s^2, 2s^2 2p^6, 3s^1$
 - It is a monovalent electropositive
 - It forms basic oxide
 - It is a non-metal
 - It has low electron affinity
- Which of these does not reflect the periodicity of the elements [UPSEAT 2001; B]
 - Bonding behaviour
 - Electronegativity
 - Ionization energy
 - Neutron/proton ratio
- If an atom has electronic configuration $1s^2 2s^2 2p^6 3s^2 3p^6 3d^3 4s^2$, it will be placed in [CBSE PMT 2002]
 - Second group
 - Third group
 - Fifth group
 - Sixth group
- All the s-block elements of the periodic table are placed in the groups ... [Orissa JEE 2002]
 - IA and IIA
 - IIIA and IVA
 - B sub groups
 - VA to VIIA
- The electronic configuration of halogen is [MP PET/PMT 1998; Pb. PMT 2001]
 - $ns^2 np^6$
 - $ns^2 np^3$
 - $ns^2 np^5$
 - ns^2
- Hydrogen by donating one electron forms H^+ . In this property, it resembles with
 - Transitional metals
 - Alkaline earth metals
 - Alkali metals
 - Halogens
- The tenth elements in the periodic table resembles with the [CPMT 1988]
 - First period
 - Second period
 - Fourth group
 - Ninth group
- The element with quantum numbers $n = 2, l = 1, m = 1, s = -1/2$ has the following position in the periodic table
 - Group VII-A, period II
 - Group 0, period II
 - Group VII-A, period III
 - Group 0, period III
- Who developed the long form of periodic table [MP PET 1997]
 - Lothar Meyer
 - Niels Bohr
 - Mendeleef
 - Moseley
- The electronic configuration of an element is $1s^2, 2s^2 2p^6, 3s^2 3p^3$. What is the atomic number of the element which is just below the above element in the periodic table [CBSE PMT

- (a) 33 (b) 34
(c) 31 (d) 49
11. In the periodic table, the element with atomic number 16 will be placed in the group [MP PET/PMT 1998]
(a) Third (b) Fourth
(c) Fifth (d) Sixth
12. The first element of rare-earth metals is [AFMC 1992]
(a) Cerium (b) Actinium
(c) Uranium (d) Lanthanum
13. The *d*-block elements consists mostly of [MP PMT 1994]
(a) Monovalent metals
(b) All non-metals
(c) Elements which generally form stoichiometric metal oxide
(d) Many metals with catalytic properties
14. "The 6 properties of the elements are periodic function of their atomic numbers." The statement was given by [MNR 1995]
(a) N. Bohr (b) J.W. Dobereiner
(c) D.I. Mendeleef (d) H.G.J. Moseley
15. The long form of periodic table has [CPMT 1986; KCET 1998]
(a) Eight horizontal rows and seven vertical columns
(b) Seven horizontal rows and eighteen vertical columns
(c) Seven horizontal rows and seven vertical columns
(d) Eight horizontal rows and eight vertical columns
16. The telluric helix was given by [AFMC 1990]
(a) De Chan Courtois (b) Newlands
(c) L. Meyer (d) Mendeleef
17. Which one of the following belongs to representative group of elements in the periodic table [Kurukshetra CEE 1991]
(a) Lanthanum (b) Argon
(c) Chromium (d) Aluminium
18. An element of atomic number 29 belongs to [CPMT 1991; Kurukshetra CEE 1991; MP PET 2001]
(a) *s*-block (b) *p*-block
(c) *d*-block (d) *f*-block
19. The element californium belongs to the family [MNR 1987]
(a) Actinide series (b) Alkali metal family
(c) Alkaline earth family (d) Lanthanide series
20. On moving from left to right across a period in the table the metallic character [CPMT 1986]
(a) Increases
(b) Decreases
(c) Remains constant
(d) First increases and then decreases
21. An element with atomic number 20 will be placed in which period of the periodic table [MNR 1986; UPSEAT 1999]
(a) 4 (b) 3
(c) 2 (d) 1
22. The electronic structure $(n-1)d^{1-10}ns^{0-2}$ is characteristic of [CET Pune 1998]
(a) Transition elements (b) Lanthanides
(c) Actinides (d) Rare gases
23. The elements with atomic number 10, 18, 36, 54 and 86 are all [CPMT 1976]
(a) Light metals (b) Inert gases
(c) Halogens (d) Rare-earths
24. Elements of atomic number 6 is placed in [CPMT 1978]
(a) IV group (b) IV period
(c) VI group (d) III group
25. Which of the following elements is a lanthanide (Rare-earth element) [Manipal MEE 1995]
(a) Cadmium (b) Californium
(c) Cerium (d) Cesium
26. Mendeleef's periodic law is based on
(a) Atomic weight (b) Atomic number
(c) Number of neutrons (d) None of the above
27. The heaviest atom amongst the following is [CPMT 1976; NCERT 1976]
(a) *U* (b) *Ra*
(c) *Pb* (d) *Hg*
28. Which of the following pairs has both members from the same group of the periodic table [CPMT 1985; MP PET/PMT 1998]
(a) *Mg* – *Ba* (b) *Mg* – *Na*
(c) *Mg* – *Cu* (d) *Mg* – *K*
29. Which of the following pairs has both members from the same period of the periodic table [CPMT 1985; UPSEAT 2001; BHU 2003]
(a) *Na* – *Ca* (b) *Na* – *Cl*
(c) *Ca* – *Cl* (d) *Cl* – *Br*
30. Diagonal relationship is shown by [DPMT 1984]
(a) Elements of first period
(b) Elements of second period
(c) Elements of third period
(d) (b) and (c) both
31. The elements having the electronic configuration, [*Kr*] $4d^{10}f^{14}, 5s^2p^6d^2, 6s^2$ belongs to [CPMT 1982]
(a) *s*-block (b) *p*-block
(c) *d*-block (d) *f*-block
32. Chemical property of *Li* and *Mg* similar because [RPMT 2002]
(a) These belong to same group
(b) Both ionisation potential is same
(c) Shows diagonal relationship
(d) Both electron affinity is same
33. According to the periodic law of elements, the variation in properties of elements is related to their [AIEEE 2003]
(a) Atomic masses
(b) Nuclear masses
(c) Atomic numbers
(d) Nuclear neutron-proton number
34. The element with atomic number 36 belongs to block in the periodic table [KCET 2003]
(a) *p* (b) *s*
(c) *f* (d) *d*
35. Which group of the periodic table contains only metals [UPSEAT 2003]
(a) IIA (b) IB
(c) IA (d) None of these
36. The elements in which *s* and *p*-orbitals are present
(a) Common elements
(b) Inert gases
(c) Halogens
(d) Transitional elements
37. Aluminium is diagonally related to (in periodic table) [MP PET 1993]
(a) *Li* (b) *C*
(c) *B* (d) *Be*

38. An element has the electronic configuration $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^5, 4s^1$. It is a
 (a) *s*-block element (b) *p*-block element
 (c) *d*-block element (d) Inert gas
39. Which of the following show diagonal relationship
 [KCET 2003; MP PMT 2003]
 (a) *B* and *Si* (b) *B* and *Al*
 (c) *B* and *Ga* (d) *B* and *C*
40. Which of the following dinegative anion is quite common
 [CPMT 2000]
 (a) S^{2-} (b) Se^{2-}
 (c) Te^{2-} (d) O^{2-}
41. An element has electronic configuration $1s^2 2s^2 2p^6 3s^2 3p^4$. Predict their period, group and block
 [CPMT 2000]
 (a) Period = 3, block = *p*, group = 16
 (b) Period = 5, block = *s*, group = 1
 (c) Period = 3, block = *p*, group = 10
 (d) Period = 4, block = *d*, group = 12
42. If the atomic number of an element is 33, it will be placed in the periodic table in the
 [RPET 1999; UPSEAT 2001, 02]
 (a) First *gp* (b) Third *gp*
 (c) Fifth *gp* (d) Seventh *gp*
43. Which of the following is the atomic number of a metal
 [AIIMS 2000]
 (a) 32 (b) 34
 (c) 36 (d) 38
44. Which of the following statement is not correct regarding hydrogen atom
 [AIIMS 2000]
 (a) It resembles halogens in some properties
 (b) It resembles alkali metals in some properties
 (c) It can be placed in 7th group of periodic table
 (d) It can not be placed in first group of periodic table
45. Lithium shows similarities to magnesium in its chemical behaviour because
 [AFMC 2000]
 (a) Similar size, same electronegativity and lower polarizing power
 (b) Similar size, greater electronegativity and similar polarizing power
 (c) Similar size, same electronegativity and similar high polarizing power
 (d) None of these
46. On going left to right in a period, in transition metals, their atomic volumes
 [MP PMT 2003]
 (a) Decrease (b) Increase
 (c) Remain same (d) None of these of correct
47. Electronic configuration of chalcogens in their outermost orbit is
 (a) $s^2 p^3$ (b) $s^2 p^4$
 (c) $s^2 p^5$ (d) $s^2 p^6$
48. Which configuration represents a noble gas
 [DPMPT 2000]
 (a) $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^2$
 (b) $1s^2 2s^2 2p^6 3s^2 3p^6$
 (c) $1s^2 2s^2 2p^6 3p^6$
 (d) $1s^2 2s^2 2p^6 3s^2$
49. Which of the following pair has elements containing same number of electrons in the outermost orbit
 [Kurukshetra CEE 1998; AFMC 2000]
 (a) *N*, *O* (b) *Na*, *Ca*
- (c) *As*, *Bi* (d) *Pb*, *Sb*
50. Dobereiner triads is
 (a) *Na*, *K*, *Rb* (b) *Mg*, *S*, *As*
 (c) *Cl*, *Br*, *I* (d) *P*, *S*, *As* [RPMT 1997]
51. As per the modern periodic law, the physical and chemical properties of elements are periodic functions of their
 [RPMT 1997; EAMCET 1998]
 (a) Atomic volume
 (b) Electronic configuration
 (c) Atomic weight
 (d) Atomic size
52. Elements after atomic number 103 have been discovered till now. If an element with atomic number 106 were ever discovered which of the following electronic configuration will it possess [AIIMS 1982]
 (a) $[Rn]5f^{14} 6d^4 7s^2$ (b) $[Rn]5f^{14} 6d^5 7s^1$
 (c) $[Rn]5f^{14} 6d^6 7s^0$ (d) $[Rn]5f^{14} 6d^1 7s^2 7p^3$
53. The element *X*, *Y*, *Z* and *T* have the indicated electronic configurations. Starting with the innermost shell, which is the most metallic element [CPMT 1979, 93]
 (a) *X* = 2, 8, 4 (b) *Y* = 2, 8, 8
 (c) *Z* = 2, 8, 8, 1 (d) *T* = 2, 8, 8, 7
54. Which pair of atomic numbers represents *s*-block elements
 [EAMCET 1990; RPMT 1997; MP PET 2003]
 (a) 7, 15 (b) 6, 12
 (c) 9, 17 (d) 3, 12
55. Which pair of elements has same chemical properties
 [EAMCET 1987]
 (a) 13, 22 (b) 3, 11
 (c) 4, 24 (d) 2, 4
56. Mosley's name is most closely associated with the discovery of
 (a) Positron (b) Deutrons
 (c) Atomic number (d) Atomic weight
57. In the periodic table going down in fluorine group
 [CPMT 1981]
 (a) Reactivity will increase
 (b) Electronegativity will increase
 (c) Ionic radius will increase
 (d) Ionization potential will increase
58. Beryllium resembles much with [CPMT 1988]
 (a) *Zn* (b) *Al*
 (c) *Li* (d) *Ra*
59. The last member in each period of the periodic table is [DPMPT 2001]
 (a) An inert gas element (b) A transition element
 (c) A halogen (d) An alkali metal
60. Which one of the following combination represents a metallic element [EAMCET 1979]
 (a) 2, 8, 7 (b) 2, 8, 8
 (c) 2, 8, 4 (d) 2, 8, 2
61. The electronic configuration of an atom *A* is $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 3p^3$. The chemistry of *A* is therefore likely to be similar to that of [MP PMT 1995]
 (a) Chlorine (b) Nitrogen
 (c) Oxygen (d) Boron
62. The element having the electronic configuration $1s^2, 2s^2 2p^6, 3s^2 3p^1$ is
 (a) A transition element
 (b) A representative element
 (c) An inert gas

- (d) An inner-transition element
63. The element with configuration $1s^2, 2s^2 p^6, 3s^2$ would be [CPMT 1986; MP PMT 1993]
 (a) A metal (b) A non-metal
 (c) An inert gas (d) A metalloid
64. The long form of periodic table is based on [CPMT 1997]
 (a) Shape of the atom
 (b) Mass of the atom
 (c) Atomic number of the atom
 (d) Electronegativity
65. Chloride of an element *A* gives neutral solution in water. In the periodic table, the element *A* belongs to [AIIMS 1992; UPSEAT 2001]
 (a) First group (b) Third group
 (c) Fifth group (d) First transition series
66. The fundamental basis of the present-day Periodic Table is that elements are [JIPMER 1999]
 (a) Arranged in the order of increasing atomic weights
 (b) Grouped according to chemical properties
 (c) Arranged in the order of increasing number of neutrons in the atomic nucleus
 (d) Arranged in the order of increasing number of protons in the nucleus
67. All the elements in a group in the periodic table have the same [NCERT 1974; MP PET 1996; MP PMT 1996]
 (a) Atomic number
 (b) Electronic configuration
 (c) Atomic weight
 (d) Number of electrons in the outermost shell or number of electrons for bonding
68. The most predominantly ionic compounds will be obtained from the combination of elements belonging to
 (a) 1 and 7 groups (b) 2 and 6 groups
 (c) 3 and 5 groups (d) 0 and 7 groups
69. An atom with atomic number 21 belongs to the category of [Kurukshetra CEE 1991]
 (a) *s*-block elements (b) *p*-block elements
 (c) *d*-block elements (d) *f*-block elements
70. Which metal has 2 electrons in the outermost orbit
 (a) *Na* (b) *Cu*
 (c) *Au* (d) *Be*
71. In the modern periodic table, elements are arranged in [MP PMT 1990; MP PET 1995; CPMT 1971, 73, 78, 80]
 (a) Increasing mass
 (b) Increasing volume
 (c) Increasing atomic number
 (d) Alphabetically
72. Alkali metals in each period have [MP PMT 1995]
 (a) Smallest size
 (b) Lowest ionization potential
 (c) Highest ionization potential
 (d) Highest electronegativity
73. The elements on the right side of the periodic table are [CPMT 1976]
 (a) Metals (b) Metalloids
 (c) Non-metals (d) Transition elements
74. The screening effect of *d*-electrons is [RPMT 2000]
 (a) Equal to that of *p*-electrons
 (b) More than that of *p*-electrons
 (c) Same as *f*-electrons
 (d) Less than *p*-electrons
75. Chemical behaviour of an atom is determined by
 (a) Atomic number (b) Mass number
 (c) Binding energy (d) Number of isotopes
76. Which of the following is an inert element
 (a) *Na* (b) *Fe*
 (c) *Li* (d) *He*
77. The lightest metal is [CPMT 1976; NCERT 1976; AFMC 1988]
 (a) *Li* (b) *Mg*
 (c) *Ca* (d) *Na*
78. Choose the typical element
 (a) *K* (b) *Na*
 (c) *Sc* (d) *He*
79. Of the following pairs, the one containing example of metalloid elements in the periodic table is
 (a) Sodium and potassium
 (b) Fluorine and chlorine
 (c) Calcium and magnesium
 (d) Boron and silicon
80. The number of elements in each of the long periods in the periodic table is
 (a) 2 (b) 8
 (c) 18 (d) 32
81. In the periodic table, all the non-metals are placed under [EAMCET 1988]
 (a) *s*-block (b) *p*-block
 (c) *d*-block (d) *f*-block
82. Elements with outer electronic configuration $ns^2 np^6$ are [MP PET/PMT 1998]
 (a) Alkaline earth metals (b) Transition elements
 (c) Chalcogenes (d) Noble gases
83. Highest density is of [RPET 2000]
 (a) *Ir* (b) *Os*
 (c) *Pb* (d) *Hg*
84. Lithium shows diagonal relationship with [MP PET 1995, 96; EAMCET 1990]
 (a) *Al* (b) *Mg*
 (c) *Be* (d) *B*
85. $1s^2 2s^2 2p^6 3s^2$ is the electronic configuration of the metal [RPET 2000]
 (a) *Na* (b) *Mg*
 (c) *Fe* (d) *Al*
86. Element having atomic number 17 is placed in [MP PET 1995]
 (a) *I*-group (b) *V*-group
 (c) *VIII*-group (d) *VII*-group
87. The most important active step in the development of periodic table was taken by [CPMT 1976]
 (a) Mendeleef (b) Dalton
 (c) Avogadro (d) Cavendish
88. Who is called the father of chemistry [CPMT 1972]
 (a) Faraday (b) Priestley
 (c) Rutherford (d) Lavoisier
89. The total number of rare-earth elements is [CPMT 1993]
 (a) 8 (b) 32
 (c) 14 (d) 10
90. Which is a metalloid [Bihar MEE 1997]
 (a) *Pb* (b) *Sb*

- (c) *Bi* (d) *Zn*
(e) *Mg*
91. The element or elements whose position is anomalous in the periodic table is
(a) Halogens (b) *Fe, Co* and *Ni*
(c) Inert gases (d) Hydrogen
92. An element M has an atomic mass 19 and atomic number 9. Its ion is represented by
(a) M^+ (b) M^-
(c) M^{2+} (d) M^{2-}
93. The number of elements in the 5th period of the periodic table are
(a) 8 (b) 10
(c) 18 (d) 32
94. The element with atomic number 55 belongs to
(a) *s*-block (b) *p*-block
(c) *d*-block (d) *f*-block [MP PMT 1995]
95. Coloured salts are formed by
(a) Alkali metals (b) Lanthanides
(c) Actinides (d) Transition metals
(e) None of these [Bihar MEE 1996]
96. Which one of the following is an *s* - block element
(a) Aluminium (b) Chromium
(c) Niobium (d) Potassium [MP PMT 1999]
97. In the modern periodic table, the place of the element with atomic number 31 is in
(a) *s* - block (b) *d* block
(c) *p*-block (d) *f*- block [MP PMT 1999]
98. Last element of group-IV is found to be
(a) Strong metallic
(b) Weak metallic
(c) Strong non-metallic
(d) Weak non-metallic [DPMT 1996]
99. Elements of *d* group are called
(a) Transition elements (b) Transuranic elements
(c) Metals (d) Metalloids [DPMT 1996]
100. Which of the following is a normal element
(a) *Ce* (b) *He*
(c) *Li* (d) *Ar*
101. Which of the following is metalloid
(a) *Pb* (b) *Zn*
(c) *As* (d) None of these [BHU 1996; AMU 2000]
102. Under normal condition which of the following electronic configuration is able to form dipositive ion
(a) $[Ar]4s^1$ (b) $[Ne]2s^23p^6$
(c) $[Ne]3s^2$ (d) None of these [RPET 2000]
103. The statement that is true for the long form of the periodic table is [IIT 1980]
(a) It reflects the sequence of filling the electrons in the order of sub-energy levels *s*, *p*, *d* and *f*
(b) It helps to predict the stable valency states of the elements
(c) It reflects trends in physical and chemical properties of the elements
(d) It helps to predict the relative ionicity of the bonds between any two elements
104. To which block is related an element having electronic configuration $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^1$ in the periodic table [MP PMT 1995]
(a) *s* - block (b) *p* - block
(c) *d* - block (d) *f* - block
105. *Ce* - 58 is a member of
(a) *s*-block elements (b) *p*-block elements
(c) *d*-block elements (d) *f*-block elements
106. Atomic number of elements represent
(a) Number of protons in the nucleus
(b) Number of neutrons in the nucleus
(c) Number of protons and neutrons in nucleus
(d) The valency of an element
107. As we go from left to right in period two of the periodic table, gram atomic volume of the elements
(a) Will change indefinitely
(b) Increases at a constant rate
(c) First increases then decrease
(d) Decreases
108. The electronic configuration of the element which is just above the element with atomic number 43 in the same periodic group is [MNR 1992; UPSE]
(a) $1s^2 2s^2 2p^6 3s^2 3p^6 3d^5 4s^2$
(b) $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^2 4p^5$
(c) $1s^2 2s^2 2p^6 3s^2 3p^6 3d^6 4s^1$
(d) $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^1 4p^6$
109. The elements indicating following atomic numbers belong to same group
(a) 11 and 37 (b) 19 and 15
(c) 39 and 88 (d) None of these [RPMT 1997]
110. Elements in which 4*f* orbitals are progressively filled are called as [MP PET 1999]
(a) Transition elements (b) Lanthanides
(c) Actinides (d) Inert gases
111. Hydrogen can be put in halogen group because
(a) It has deuterium and tritium as isotopes
(b) It forms hydrides like chlorides
(c) It contains one electron only
(d) It is light [RPMT 2000]
112. In the main group elements (i) as we proceed down the same group in the periodic table and (ii) as we proceed from left to right in the same period, the atomic radius
(a) (i) Increase continuously; (ii) Decreases continuously
(b) (i) Decreases continuously; (ii) Increases continuously
(c) (i) Increases continuously; (ii) Decreases upto the group IV and then increases upto the end of the period.
(d) (i) Decreases continuously; (ii) Decreases upto the group IV and then increases upto the end of the period.
- Cause of diagonal relationship is
(a) Similar electronic configuration of the elements
(b) Similar *e/r* ratio of the elements
(c) Same number of valency electrons in the elements
(d) Same atomic weights of the elements
114. From which of the following the hydration energy of Mg^{2+} is larger [MP PET 2000]

- (a) Na^+ (b) Al^{3+}
(c) Be^{2+} (d) Cr^{3+}
115. Group comprising of all metals is [RPET 2000]
(a) IIIA (b) IVA
(c) VIIA (d) IIA
116. Whose name is not associated with the development of Periodic Table [DCE 1999]
(a) Prout's (b) Newlands
(c) Rutherford (d) Lother Meyer
117. Element of atomic number 23 is placed in the periodic table in [MP PMT 1996]
(a) s -block (b) p -block
(c) d -block (d) f -block
118. In which of the following groups all the three members are of the alkaline earth metals family
(a) Al, Sr, Ti (b) Li, Na, K
(c) Mg, Ba, Ca (d) Rb, Cs, Fr
119. Astatine is a [RPET 2000]
(a) Halogen
(b) Rare earth element
(c) Alkaline earth metal
(d) None of these
120. The nitride ion in lithium nitride is composed of [CBSE PMT 2001]
(a) $7P + 7e$ (b) $10P + 7e$
(c) $7P + 10e$ (d) $10P + 10e$
121. Which set has the same number of unpaired electrons in their ground state [JIPMER 2000]
(a) Cl^-, Fe^{3+}, Cr^{3+} (b) Na^+, Mg^{2+}, Al
(c) Na, P, Cl (d) N, P, V
122. Which of the following doesn't decompose on heating [AMU 2002]
(a) $MgCO_3$ (b) Na_2CO_3
(c) Li_2CO_3 (d) $Ca(HCO_3)_2$
123. Which of the following has smallest bond angle [AMU 2002]
(a) H_2O (b) NH_3
(c) CH_4 (d) CO_2
124. The metal having highest melting point is [AMU 2002]
(a) Chromium (b) Tungsten
(c) Diamond (d) Silver
125. The elements with atomic numbers 9, 17, 35, 53, 85 are all [KCET 2004]
(a) Noble gases (b) Halogens
(c) Heavy metals (d) Light metals
126. The atomic number of an element is derived from [Kerala PMT 2004]
(a) Number of electrons (b) Number of protons
(c) Number of neutrons (d) Number of isotopes
(e) Number of nucleons
127. Beryllium shows diagonal relationship with [Pb.CET 2003]
(a) Mg (b) Na
(c) B (d) Al
128. Which of the properties remains unchanged on descending a group in the periodic table [MP PMT 1997; RPMT 2002]
(a) Atomic size (b) Density
(c) Valence electrons (d) Metallic character
129. Which of the following element does not occur in liquid form [RPMT 2002]
(a) Hg (b) Li
(c) Ga (d) Br
130. The cause of periodicity of properties is
(a) Increasing atomic radius
(b) Increasing atomic weights
(c) Number of electrons in the valency orbit
(d) The re-occurrence of similar outer electronic configuration
131. The chemistry of lithium is very similar to that of magnesium even though they are placed in different groups [NCERT 1982]
(a) Both are found together in nature
(b) Both have nearly the same size
(c) Both have similar electronic configuration
(d) The ratio of their charge to size is nearly the same

Atomic and Ionic radii

1. The ratio between radii of He^+ ion and H atom is [MP PET 1996]
(a) $\frac{1}{2}$ (b) 1
(c) $\frac{3}{2}$ (d) 2
2. The smallest among the following ions is [JIPMER 1999]
(a) Na^+ (b) Mg^{+2}
(c) Ba^{2+} (d) Al^{3+}
3. Which is smallest in size [RPMT 1997]
(a) O^{2-} (b) C^{4-}
(c) F^- (d) N^{3-}
4. Which of the following has largest size [MP PMT 1995, 2003; JIPMER (Med.) 2002]
(a) Al (b) Al^+
(c) Al^{+2} (d) Al^{+3}
5. Of the following, the one with largest size is [EAMCET 1997; BHU 1999]
(a) Cl^- (b) Ar
(c) K^+ (d) Ca^{2+}
6. Which cation has smallest radius [RPET 2000]
(a) K^+ (b) Na^+
(c) Li^+ (d) Be^{2+}
7. The radii of F, F^-, O and O^{2-} are in the order of

- [AIIMS 1999; CPMT 1999]
- (a) $O^{2-} > F^- > O > F$ (b) $O^{2-} > F^- > F > O$
 (c) $F^- > O^{2-} > F > O$ (d) $O^{2-} > O > F^- > F$
8. Which of the following has the smallest size [CBSE PMT 1996]
- (a) Na^+ (b) Mg^{+2}
 (c) Cl^- (d) F^-
9. Which of the following is largest [CBSE PMT 1996]
- (a) Cl^- (b) S^{2-}
 (c) Na^+ (d) F^-
10. Which of the following property displays progressive increase down a group in the Bohr's periodic table
- (a) Electronegativity (b) Electron affinity
 (c) Ionization potential (d) Size of the atom
11. Atomic radii of fluorine and neon in angstrom units are respectively given by [IIT 1987]
- (a) 0.762, 1.60 (b) 1.60, 1.60
 (c) 0.72, 0.72 (d) None of these values
12. Which ion has greatest radius in the following [CPMT 1976; NCERT 1977]
- (a) H^- (b) F^-
 (c) Br^- (d) I^-
13. Which has the maximum atomic radius [CPMT 1975; AIIMS 1982; DPMT 1982]
- (a) Al (b) Si
 (c) P (d) Mg
14. Which one of the following ions has the highest value of ionic radius [AIEEE 2004]
- (a) O^{2-} (b) B^{3+}
 (c) Li^+ (d) F^-
15. On going down a main sub-group in the periodic table (example Li to Cs in IA or Be to Ra in IIA), the expected trend of changes in atomic radius is a [CPMT 1981; NCERT 1979]
- (a) Continuous increase
 (b) Continuous decrease
 (c) Periodic one, an increase followed by a decrease
 (d) A decrease followed by increase
16. Which one of the following is the smallest in size [IIT 1989]
- (a) N^{3-} (b) O^{2-}
 (c) F^- (d) Na^+
17. Which one is the correct order of the size of the iodine species [Pb. CET 1986; CBSE PMT 1997; Kurukshetra CEE 1998; RPMT 1999; DCE 1999; MP PET 2000; MP PMT 2001; BCECE 2005]
- (a) $I > I^+ > I^-$ (b) $I > I^- > I^+$
 (c) $I^+ > I^- > I$ (d) $I^- > I > I^+$
18. Which one has larger radius [CPMT 1997; KCET 2005]
- (a) Na^+ (b) F
 (c) F^- (d) Na
19. In third row of periodic table the atomic radii from Na to Cl [MP PMT 1986]
- (a) Continuously decreases
 (b) Continuously increases
 (c) Remains constant
 (d) Increases but not continuously
20. The size of the following species increases in the order [IIT-JEE 1990; AFMC 1995]
- (a) $Mg^{2+} < Na^+ < F^- < Al$
 (b) $F^- < Al < Na^+ > Mg^{2+}$
 (c) $Al < Mg < F^- < Na^+$
 (d) $Na^+ < Al < F^- < Mg^{2+}$
21. In K^+F^- ionic radius of F^- is more while atomic radius of K^+ is [CPMT 1997]
- (a) Less than F^- (b) More than F^-
 (c) Equal of F^- (d) None of these
22. Which one of the following species possesses maximum size [EAMCET 1993; MP PET 2001]
- (a) Na^+ (b) F^-
 (c) Ne (d) O^{2-}
23. The ionic radii of N^{3-} , O^{2-} , F^- and Na^+ follow the order [MP PET/PMT 1999]
- (a) $N^{3-} > O^{2-} > F^- > Na^+$
 (b) $N^{3-} > Na^+ > O^{2-} > F^-$
 (c) $Na^+ > O^{2-} > N^{3-} > F^-$
 (d) $O^{2-} > F^- > Na^+ > N^{3-}$
24. On moving down a group of regular elements, both atomic and ionic radii increases with increasing [BMEE 1995]
- (a) Atomic number (b) Atomic weight
 (c) Atomic mass (d) None of these
25. Which one of the following indicates the correct order of atomic size [EAMCET 1999]
- (a) $Be > F > C > Ne$ (b) $Be < C < F < Ne$
 (c) $Be > C > F > Ne$ (d) $F < Ne < Be < C$
26. Which has the smallest size [MP PET 1999]
- (a) Na^+ (b) Mg^{2+}
 (c) Al^{3+} (d) P^{5+}
27. A sodium cation has a different number of electrons from
- (a) O^{2-} (b) F^-
 (c) Li^- (d) Al^{3+}
28. Which of the following statement concerning lanthanides elements is false [CBSE PMT 1994]
- (a) Lanthanides are separated from one another by ion exchange method
 (b) Ionic radii of trivalent lanthanides steadily increases with increase in the atomic number
 (c) All lanthanides are highly dense metals
 (d) More characteristic oxidation state of lanthanide elements is +3
29. The lanthanide contraction is responsible for the fact that [CBSE PMT 1997]
- (a) Zr and Y have about the same radius
 (b) Zr and Nb have similar oxidation state
 (c) Zr and Hf have about the same radius
 (d) Zr and Zn have the same oxidation state
30. Elements of which group form anions most readily [CBSE PMT 1992]
- (a) Oxygen family (b) Nitrogen group
 (c) Halogens (d) Alkali metals
31. The unit representing atomic radii and ionic radii is
- (a) nm (b) cm
 (c) $\text{\AA}$ (d) m
32. The atomic radii in periodic table among elements from right to left [MP PET 1999]
- (a) Decreases

- (b) Increases
(c) Remain constant
(d) First decreases and then increases
33. Of the following the ion with the smallest ionic radius is [MP PET 1996]
(a) K^+ (b) Ca^{2+}
(c) Ti^{3+} (d) Ti^{4+}
34. Which of the following does not represent the correct order of the property indicated [CBSE PMT 1997]
(a) $Sc^{3+} > Cr^{3+} > Fe^{3+} > Mn^{3+}$ ionic radii
(b) $Sc < Ti < Cr < Mn$ Density
(c) $Mn^{2+} > Ni^{2+} < Co^{2+} < Fe^{2+}$ ionic radii
(d) $FeO < CaO > MnO > CuO$ Basic nature
35. The order of magnitude of ionic radii of ions Na^+ , Mg^{2+} , Al^{3+} and Si^{4+} is [MP PMT 1996]
(a) $Na^+ < Mg^{2+} < Al^{3+} < Si^{4+}$
(b) $Mg^{2+} > Na^+ > Al^{3+} > Si^{4+}$
(c) $Al^{3+} > Na^+ > Si^{4+} > Mg^{2+}$
(d) $Na^+ > Mg^{2+} > Al^{3+} > Si^{4+}$
36. The order of the magnitude of ionic radii of ions N^{3-} , O^{2-} and F^- is [MP PMT 1996]
(a) $N^{3-} > O^{2-} > F^-$ (b) $N^{3-} < O^{2-} < F^-$
(c) $N^{3-} > O^{2-} > F^-$ (d) $N^{3-} < O^{2-} > F^-$
37. Which statement is correct
(a) For potassium, the atomic radius < ionic radius; but for bromine, the atomic radius > ionic radius
(b) For potassium and bromine both, the atomic radii > ionic radii
(c) For potassium and bromine both, the atomic radii < ionic radii
(d) For potassium, the atomic radius > ionic radius but for bromine, the atomic radius < ionic radius
38. Which of the following ion is the smallest ion [AIIMS 2001]
(a) O_2^+ (b) O_2^-
(c) O_2 (d) O_2^{2-}
39. The correct order of radii is [IIT-JEE (Screening) 2000]
(a) $N < Be < B$ (b) $F^- < O^{2-} < N^{3-}$
(c) $Na < Li < K$ (d) $Fe^{3+} < Fe^{2+} < Fe^{4+}$
40. Which one of the following should be most stable [MP PET 2000]
(a) H_2^+ (b) H^+
(c) H (d) H^-
41. Which of the following is the correct order of ionic radii [BHU 2002]
(a) $F > Li > Na > K$ (b) $F > K > Na > Li$
(c) $Na > K > F > Li$ (d) $Li > Na > K > F$
42. Smallest among these species is [KCET 2002]
(a) Lithium ion (b) Hydrogen
(c) Lithium (d) Helium
43. Which of the following ionic radius would be maximum [MP PET 1997]
(a) C^{4-} (b) N^{3-}
(c) O^{2-} (d) Mg^{2+}
44. Which is helpful in the formation of ionic bond
(a) Only small cation
(b) Only small anion
(c) Small cation and small anion both
(d) Low positive charge, large cation and small anion
45. Which of the following has largest ionic radius [AFMC 1999; BHU 2003]
(a) Cs^+ (b) Li^+
(c) Na^+ (d) K^+
46. Point out the wrong statement :
On moving horizontally from left to right across a period in the periodic table
(a) Metallic character decreases
(b) Electronegativity increases
(c) Gram atomic volume first decreases and then increases
(d) Size of the atoms increases for normal elements
47. Which of the following statements is correct [MP PET 1997]
(a) X^- ion is larger in size than X atom
(b) X^+ ion is larger in size than X atom
(c) X^+ ion is larger in size than X^- ion
(d) X^+ and X^- ions are equal in size
48. The atomic radius of elements of which of the following series would be nearly the same [MP PET 1997]
(a) Na, K, Rb, Cs (b) Li, Be, B, C
(c) Fe, Co, Ni, Cu (d) F, Cl, Br, I
49. The decreasing order of size of isoelectronic series K^+ , Ca^{2+} , Cl^- and S^{2-} is [Roorkee 1995]
(a) $K^+ > Ca^{2+} > S^{2-} > Cl^-$
(b) $K^+ > Ca^{2+} > Cl^- > S^{2-}$
(c) $Ca^{2+} > K^+ > Cl^- > S^{2-}$
(d) $S^{2-} > Cl^- > K^+ > Ca^{2+}$
50. Which of the following sets of elements have the strongest tendency to form anions [MP PET 1993]
(a) N, O, F (b) P, S, Cl
(c) As, Se, Br (d) Sb, Te, I
51. Radius of the isoelectronic species [MP PET 1994]
(a) Increases with the increase of nuclear charge
(b) Decreases with the increase of nuclear charge
(c) Is the same for all
(d) First increases and then decreases
52. In which of the following pairs the difference between the covalent radii of the two metals is maximum [MP PET 1994]
(a) K, Ca (b) Mn, Fe
(c) Co, Ni (d) Cr, Mn
53. An atom of an element has electronic configuration 2, 8, 1. Which of the following statement is correct [MP PMT 1994]
(a) The element's valency is 7
(b) The element exists as a diatomic molecule
(c) The element is of non-metallic nature
(d) The element forms a basic oxide
54. Which of the following ions has the smallest radius [KCET 1992]
(a) Be^{2+} (b) Li^+
(c) O^{2-} (d) F^-

55. Point out the *wrong* statement :
In a given period of the periodic table the *s*-block element has, in general, a lower value of [MP PMT 1997]
(a) Ionisation energy (b) Electronegativity
(c) Atomic radius (d) Electron affinity
56. Arrange the following in increasing order of their atomic radius :
Na, K, Mg, Rb [AFMC 1995, 97; CPMT 1999]
(a) $Mg < K < Na < Rb$ (b) $Mg < Na < K < Rb$
(c) $Mg < Na < Rb < K$ (d) $Na < K < Rb < Mg$
57. In the isoelectronic species the ionic radii (Å) of N^{3-} , O^{2-} and F^{-} are respectively given by [Pb. CET 1989]
(a) 1.36, 1.40, 1.71 (b) 1.36, 1.71, 1.40
(c) 1.71, 1.40, 1.36 (d) 1.71, 1.36, 1.40
58. Al^{3+} has a lower ionic radius than Mg^{2+} because [EAMCET 1992]
(a) *Mg* atom has less number of neutrons than *Al*
(b) Al^{3+} has a higher nuclear charge than Mg^{2+}
(c) Their electronegativities are different
(d) *Al* has a lower ionisation potential than *Mg* atom
59. When a neutral atom is converted into cation, there is [EAMCET 1986]
(a) Decrease in the atomic number
(b) An increase in the atomic number
(c) A decrease in size
(d) An increase in size
60. A trend common to both groups I and VII elements in the periodic table as atomic number increases is [NCERT 1981; EAMCET 1980]
(a) Oxidising power increases
(b) Atomic radius increases
(c) Maximum valency increases
(d) Reactivity with water increases
61. Increasing order of atomic radii is [RPET 2003]
(a) $Mg^{2+} < Na^{+} < Ne < F^{-} < O^{2-}$
(b) $Na^{+} < Mg^{2+} < Ne < F^{-} < O^{2-}$
(c) $O^{2-} < F^{-} < Ne < Na^{+} < Mg^{2+}$
(d) $Ne < O^{2-} < F^{-} < Na^{+} < Mg^{2+}$
62. Chloride ion and potassium ion are isoelectronic. Then [KCET 2002]
(a) Potassium ion is relatively bigger
(b) Depends on the other cation and anion
(c) Their size are same
(d) Chloride ion is bigger than potassium ion
63. Which of the following has the largest ionic radius [Pb. PMT 2002; BHU 2003]
(a) Na^{+} (b) Ni^{+}
(c) Cs^{+} (d) Mg^{+2}
64. The ionic radii of Li^{+} , Na^{+} , K^{+} are in which of the following order [MP PMT 2002]
(a) $K^{+} > Na^{+} > Li^{+}$ (b) $K^{+} > Na^{+} < Li^{+}$
(c) $K^{+} < Na^{+} < Li^{+}$ (d) $Li^{+} > Na^{+} < K^{+}$
65. Which of the following has smallest size [JIPMER (Med.) 2002]
(a) Mg^{2+} (b) Na^{+}
(c) Al^{3+} (d) Si^{4+}
66. Which one of the following is expected to have largest size [UPSEAT 2004]
(a) F^{-} (b) O^{2-}
(c) Al^{+3} (d) N^{-3}
67. The trivalent ion having largest size in lanthanide series is [Pb. PMT 2004]
(a) *Ti* (b) *Zr*
(c) *Hf* (d) *La*
68. Which of the following alkali metal ions has lowest ionic mobility in aqueous solutions [DPMT 2004]
(a) Rb^{+} (b) Cs^{+}
(c) Li^{+} (d) Na^{+}
69. Ionic radii are [CBSE PMT 2003, 04]
(a) Directly proportional to effective nuclear charge
(b) Directly proportional to square of effective nuclear charge
(c) Inversely proportional to effective nuclear charge
(d) Inversely proportional to square of effective nuclear charge.
70. The correct sequence of increasing covalent character is represented by [CBSE PMT 2005]
(a) $LiCl < NaCl < BeCl_2$ (b) $BeCl_2 < NaCl < LiCl$
(c) $NaCl < LiCl < BeCl$ (d) $BeCl_2 < LiCl < NaCl$
71. Correct energy value order is [Orissa JEE 2004]
(a) $ns np nd(n-1)f$ (b) $ns np(n-1)d (n-2)f$
(c) $ns np(n-1)d (n-1)f$ (d) $ns(n-1)d n(n-1)f$
72. The ionic conductance of following cation in a given concentration are in the order [Orissa JEE 2004]
(a) $Li^{+} < Na^{+} > K^{+} < Rb^{+}$
(b) $Li^{+} > Na^{+} > K^{+} > Rb^{+}$
(c) $Li^{+} < Na^{+} > K^{+} > Rb^{+}$
(d) $Li^{+} = Na^{+} < K^{+} < Rb^{+}$

Ionisation energy

1. The incorrect statement among the following is [IIT-JEE 1997]
(a) The first ionisation potential of *Al* is less than the first ionisation potential of *Mg*
(b) The second ionisation potential of *Mg* is greater than the second ionisation potential of *Na*
(c) The first ionisation potential of *Na* is less than the first ionisation potential of *Mg*
(d) The third ionisation potential of *Mg* is greater than the third ionisation potential of *Al*
2. The second ionisation potential of an element *M* is the energy required to [JIPMER 1997]
(a) Remove one mole of electron from one mole of gaseous anion
(b) Remove one mole of electron from one mole of gaseous cation of the element
(c) Remove one mole of electron from one mole of monovalent gaseous cation of the element
(d) Remove 2 moles of electrons from one mole of gaseous atoms
3. The ionization energy of an element is
(a) The same as the electron affinity of the element
(b) Equal in magnitude but of opposite sign to the electron affinity of the element
(c) The energy released when an electron is added to an atom of the element

- (d) The energy required to remove the outermost electron of an atom of the element
4. The first ionisation energies of alkaline earth metals are higher than those of the alkali metals. This is because [MP PET 1996]
- (a) There is increase in the nuclear charge of the alkaline earth metals
(b) There is a decrease in the nuclear charge of the alkaline earth metals
(c) There is no change in the nuclear charge
(d) None of the above
5. The statement that is not correct for the periodic classification of elements is [IIT-JEE 1992]
- (a) The properties of elements are the periodic functions of their atomic numbers
(b) Non-metallic elements are lesser in number than metallic elements
(c) The first ionisation energies along a period do not vary in a regular manner with increase in atomic number
(d) For transition elements the d -sub-shells are filled with electrons monotonically with increase in atomic number
6. Choose the correct statement
- (a) Ionization energy and electron affinity increases across a period
(b) Ionization energy increases but electron affinity decreases along a period
(c) Ionization energy decreases but electron affinity increases
(d) Both decreases along a period
7. In halogens, with the increase of atomic number which habit is found
- (a) Habit to loose electrons decreases
(b) Ionic radii decreases
(c) Ionization potential decreases
(d) In MX_2 (M = metal and X = halogen), covalent properties decreases
8. Ionization potential is lowest for [CPMT 1989; MP PET 2001]
- (a) Halogens (b) Inert gases
(c) Alkaline earth metals (d) Alkali metals
9. Which of the following explanation is best for not placing hydrogen in either the group of alkali metals or halogens [NCERT 1978]
- (a) The ionization energy of hydrogen is too high for group of alkali metals, but too low of halogen group
(b) Hydrogen can form compounds with all other elements
(c) Hydrogen is much lighter element than the alkali metals or the halogens
(d) None of the above
10. The ionization energy of nitrogen is more than that of oxygen because [MP PET 1993]
- (a) Nitrogen has half filled p -orbitals
(b) Nitrogen is left to the oxygen in the same period of the periodic table
(c) Nitrogen contains less number of electrons
(d) Nitrogen is less electronegative
11. The energy required to remove an electron of a gaseous atom from its ground state is called [CPMT 1989, 94]
- (a) Potential energy (b) Ionization energy
(c) Electrode potential (d) Activation energy
12. The first ionization energy of boron is less than that of beryllium because
- (a) Boron has higher nuclear charge
(b) Atomic size of boron is more than that of beryllium
(c) Boron has only one electron in p -sub-shell
(d) Atomic size of boron is less than that of beryllium
13. $A \rightarrow A^+ + e$, E_1 and $A^+ \rightarrow A^{2+} + e$, E_2 . The energy required to pull out the two electrons are E_1 and E_2 respectively. The correct relationship between two energy would be
- (a) $E_1 < E_2$ (b) $E_1 = E_2$
(c) $E_1 > E_2$ (d) $E_1 \neq E_2$
14. Which of the following element has maximum, first ionisation potential [AIIMS 2001]
- (a) V (b) Ti
(c) Cr (d) Mn
15. Highest energy will be absorbed to eject out the electron in the configuration [RPMT 2000]
- (a) $1s^2 2s^2 2p^1$ (b) $1s^2 2s^2 2p^3$
(c) $1s^2 2s^2 2p^2$ (d) $1s^2 2s^2 2p^4$
16. In which of the following process highest energy is absorbed [RPET 2000]
- (a) $Cu \rightarrow Cu^+$ (b) $Br \rightarrow Br^-$
(c) $I \rightarrow I^-$ (d) $Li \rightarrow Li^+$
17. The first ionization potential of Na , Mg , Al and Si are in the order [IIT 1988; MP]
- (a) $Na < Mg > Al < Si$ (b) $Na > Mg > Al > Si$
(c) $Na < Mg < Al > Si$ (d) $Na > Mg > Al < Si$
18. How many ionisation energies can carbon have
- (a) 1 (b) 2
(c) 4 (d) 6
19. Which of the following gaseous atoms has highest value of IE [JIPMER 1997; CPMT 1997; AIIMS 2000]
- (a) P (b) Si
(c) Mg (d) Al
20. Hydrogen has high ionization energy than alkali metals, due to its [AIIMS 1999]
- (a) Large size (b) Small size
(c) Ionic bond (d) Covalent bond
21. The first ionization potentials (eV) of Be and B respectively are [CBSE PMT]
- (a) 8.29eV, 9.32eV (b) 9.32eV, 9.32eV
(c) 8.29eV, 8.29eV (d) 9.32eV, 8.29eV
22. Which ionisation potential (IP) in the following equations involves the greatest amount of energy [Pune CET 1998]
- (a) $Na \rightarrow Na^+ + e^-$ (b) $K^+ \rightarrow K^{2+} + e^-$
(c) $C^{2+} \rightarrow C^{3+} + e^-$ (d) $Ca^+ \rightarrow Ca^{2+} + e^-$
23. Which of the following has maximum ionization potential [MH CET 1999]
- (a) K (b) Na
(c) Al (d) Mg
24. The first four ionization energy values of an element are 191, 578, 872 and 5962 kcal. The number of valence electrons in the element is
- (a) 1 (b) 2
(c) 3 (d) 4
25. Which of the following has least ionization potential [CPMT 1982, 93]
- (a) Li (b) Cs
(c) Cl (d) I
26. Which of the following element has the lowest ionization potential [CPMT 1976;]
- (a) Fe (b) H
(c) Li (d) He
27. As one moves along a given row in the periodic table, ionization energy [CPMT 1976, 89; NCERT 1978; EAMCET 1985]
- (a) Remains same

- (b) Increases from left to right
(c) First increases, then decreases
(d) Decreases from left to right
28. Ionization energy is highest for [AFMC 2001; BVP 2003]
(a) Noble gases
(b) Platinum metals
(c) Transition elements
(d) Inner-transition elements
29. Which one of the following elements has the highest ionisation energy [IIT-JEE 1990]
(a) $[Ne]3s^2 3p^1$ (b) $[Ne]3s^2 3p^2$
(c) $[Ne]3s^2 3p^3$ (d) $[Ar]3d^{10} 4s^2 4p^2$
30. Which of the following elements has the lowest ionisation potential [EAMCET 1993]
(a) N (b) O
(c) F (d) Ne
31. Which of the following has lowest first ionisation potential [CPMT 1993]
(a) B (b) C
(c) N (d) O
32. If first orbit energy of He^+ is -54.4 eV , then the second orbit energy will be [Roorkee 1995]
(a) -54.4 eV (b) -13.6 eV
(c) -27.2 eV (d) $+27.2 \text{ eV}$
33. The screening effect of inner electrons of the nucleus causes [MP PMT 1994]
(a) A decrease in the ionisation potential
(b) An increase in the ionisation potential
(c) No effect on the ionisation potential
(d) An increase in the attraction of the nucleus to the electrons
34. Which of the following has highest first ionization energy [MP PET 1994]
(a) Sulphur (b) Oxygen
(c) Nitrogen (d) Phosphorus
35. The second ionization potential is [Bihar CEE 1995; CET Pune 1998]
(a) Less than the first ionization potential
(b) Equal to the first ionization potential
(c) Greater than the first ionization potential
(d) None of these
36. When the first ionization energies are plotted against atomic number the peaks are occupied [CET Pune 1998]
(a) Alkali metals (b) Halogens
(c) Rare gases (d) Transition elements
37. Among the following which has the highest first ionization energy
(a) K (b) Na
(c) B (d) Kr
38. The first ionisation potential will be maximum for [CPMT 2000]
(a) Lithium (b) Hydrogen
(c) Uranium (d) Iron
39. Arrange S, P, As in order of increasing ionisation energy [JIPMER (Med.) 2002]
(a) $S < P < As$ (b) $P < S < As$
(c) $As < S < P$ (d) $As < P < S$
40. With reference to concept of ionisation potential, which one of the following sets are correct [Kurukshetra CEE 1991]
(a) $U > K > Cs$ (b) $B > U > K$
(c) $Cs > U > B$ (d) $Cs < U < K$
41. Which among the following species has the highest ionisation potential [KCET 2001]
(a) B (b) Li
(c) Ne (d) F
42. The set representing the correct order of first ionisation potential is [IIT-JEE (Mains) 2002]
(a) $K > Na > Li$ (b) $Be > Mg > Ca$
(c) $B > C > N$ (d) $Ge > Si > C$
43. Among the following options, the sequence of increasing first ionisation potential will be [AIIMS 2000; MP PMT 2002]
(a) $B < C < N$ (b) $B > C > N$
(c) $C < B < N$ (d) $N > C > B$
44. The decreasing order of the ionisation potential in the following elements is [MP PMT 2001]
(a) $Ne > Cl > P > S > Al > Mg$
(b) $Ne > Cl > P > S > Mg > Al$
(c) $Ne > Cl > S > P > Mg > Al$
(d) $Ne > Cl > S > P > Al > Mg$
45. Which is the correct order of the first ionization potential of N, O and C [AMU 2000]
(a) $C > N > O$ (b) $C < N > O$
(c) $O > N > O$ (d) $C > N - O$
46. Which of the following order is wrong [CBSE 2002]
(a) $NH_3 < PH_3 < AsH_3$ -acidic nature
(b) $Li^+ < Na^+ < K^+ < Cs^+$ -ionic radius
(c) $Al_2O_3 < MgO < Na_2O < K_2O$ -basic
(d) $Li < Be < B < C$ -1st ionisation potential
47. Which of the following has the least ionization potential [MP PET 2002]
(a) Lithium (Li) (b) Helium (He)
(c) Nitrogen (N) (d) Zinc (Zn)
48. The first ionisation energy of lithium will be [EAMCET 1990]
(a) Greater than Be (b) Less than Be
(c) Equal to that of Na (d) Equal to that of F
49. Spectrum of Li^{2+} is similar to that of [AIIMS 2002]
(a) H (b) He
(c) Be (d) Ne
50. Highest ionisation energy stands for [DPMT 2000]
(a) He (b) C
(c) N (d) H
51. Which of the following electrons should have the highest value of ionisation energy (for the same value of the principal quantum number)
(a) s (b) p
(c) d (d) f
52. The correct sequence of elements in decreasing order of first ionisation energy is [MP PET 1997]
(a) $Na > Mg > Al$ (b) $Mg > Na > Al$
(c) $Al > Mg > Na$ (d) $Mg > Al > Na$
53. Correct order of polarising power is [MP PMT 2003; BHU 2003]
(a) $Cs^+ < K^+ < Mg^{2+} < Al^{3+}$
(b) $K^+ < Cs^+ < Mg^{2+} < Al^{3+}$
(c) $Cs^+ < K^+ < Al^{3+} < Mg^{2+}$

- (d) $K^+ < Cs^+ < Al^{3+} < Mg^{2+}$
54. Correct increasing order of first ionisation potential is [UPSEAT 2003]
 (a) $Na < Mg > Al < Si$ (b) $Na < Mg < Al < Si$
 (c) $Na > Mg > Al > Si$ (d) $Na < Mg < Al > Si$
55. The ionisation potential of hydrogen from ground state to the first excited state is [DCE 2001]
 (a) -13.6 eV (b) 13.6 eV
 (c) -3.4 eV (d) 3.4 eV
56. In view of their low ionisation energies the alkali metals are [MP PMT 2002]
 (a) Weak oxidising agents
 (b) Strong reducing agents
 (c) Strong oxidising agents
 (d) Weak reducing agents
57. Of the following iso-electronic ions, the one which has the lowest ionisation potential is [AMU 1999]
 (a) Na^+ (b) Mg^{++}
 (c) F^- (d) O^{--}
58. Ionisation energy in group I-A varies in the decreasing order as [Orissa JEE 2005]
 (a) $Li > Na > K > Cs$ (b) $Na > Li > K > Cs$
 (c) $Li > Cs > K > Na$ (d) $K > Cs > Na > Li$
59. Which of the following relation is correct with respect to first (I) and second (II) ionization potentials of sodium and magnesium [CPMT 1999]
 (a) $I_{Mg} = II_{Na}$ (b) $I_{Na} > I_{Mg}$
 (c) $II_{Mg} > II_{Na}$ (d) $II_{Na} > II_{Mg}$
60. The order of the magnitude of first ionisation potentials of Be , B , N and O is [MP PMT 1996]
 (a) $N > O > Be > B$ (b) $N > Be > O > B$
 (c) $Be > B > N > O$ (d) $B > Be > O > N$
61. Which of the following transitions involves maximum amount of energy [AIIMS 1992]
 (a) $M^-(g) \rightarrow M(g)$ (b) $M(g) \rightarrow M^+(g)$
 (c) $M^+(g) \rightarrow M^{2+}(g)$ (d) $M^{2+}(g) \rightarrow M^{3+}(g)$
62. Which of the following species has lowest ionization potential [KCET 1996]
 (a) O (b) O_2
 (c) O_2^+ (d) O_2^-
63. Which of the following has minimum ionization energy [JIPMER 1999]
 (a) Ge (b) Se
 (c) As (d) Br
64. First I.P. of Mg is than Al [CPMT 1997]
 (a) Less (b) More
 (c) Equal (d) None of these
65. The element with highest value of ionization potential is
 (a) Potassium (b) Helium
 (c) Hydrogen (d) Xenon
66. Which has the highest second ionisation potential [AIIMS 1991]
 (a) Nitrogen (b) Carbon
 (c) Oxygen (d) Fluorine
67. In ionisation of hydrogen, the energy required is [CPMT 1996]
 (a) 13.6 eV (b) $> 13.6 \text{ eV}$
 (c) $< 13.6 \text{ eV}$ (d) 1.5 eV
68. Which of the following elements will have the lowest first ionisation energy [KCET 1992]
 (a) Mg (b) Rb
 (c) Li (d) Ca
69. In the long form of periodic table, the element having lowest ionisation potentials are present in [EAMCET 1992]
 (a) I group (b) IV group
 (c) VII group (d) Zero group
70. The process requiring the absorption of energy is [Roorkee 1990]
 (a) $F \rightarrow F^-$ (b) $Cl \rightarrow Cl^-$
 (c) $O \rightarrow O^{2-}$ (d) $H \rightarrow H^-$
71. In a period from Li to F , ionization potential [CPMT 1982]
 (a) Increases (b) Decreases
 (c) Remains same (d) None of the above
72. Ionization energy increases in the order
 (a) Be, B, C, N (b) B, Be, C, N
 (c) C, N, Be, B (d) N, C, Be, B
73. A neutral atom will have the lowest ionization potential when its electronic configuration is [NCERT 1978; CBSE PMT 1991]
 (a) $1s^1$ (b) $1s^2, 2s^2 p^6$
 (c) $1s^2, 2s^2 p^2$ (d) $1s^2, 2s^2 p^6, 3s^1$
74. Which has maximum first ionization potential [IIT 1982; EAMCET 1997; KCET (Med.) 1999; KCET 2000]
 (a) C (b) N
 (c) B (d) O
75. Which one of the following elements has the highest ionisation energy
 (a) Na (b) Mg
 (c) C (d) F
76. Order of first ionization potentials of elements Li , Be , B , Na is [Kerala CET 2005]
 (a) $Li > Be > B > Na$ (b) $Be > B > Li > Na$
 (c) $Na > Li > B > Be$ (d) $Be > Li > B > Na$
 (e) $B > Be > Li > Na$
77. The ionization energy of nitrogen is larger than that of oxygen because of [RPMT 1997; DCE 1999]
 (a) Greater attraction of electrons by the nucleus
 (b) The size of nitrogen atom being smaller
 (c) The half-filled p -orbitals possess extra stability
 (d) Greater penetration effect
78. If the IP of Na is 5.48 eV , the ionisation potential of K will be [EAMCET 1998]
 (a) Same as that of Na (b) 5.68 eV
 (c) 4.34 eV (d) 10.88 eV
79. Mg and Li are similar in their properties due to [AFMC 2004]
 (a) Same e/m ratio (b) Same electron affinity
 (c) Same group (d) Same ionic potential
80. The formation of the oxide ion $O_{(g)}^{2-}$ requires first an exothermic and then an endothermic step as shown below

$$O_{(g)} + e^- = O_{(g)}^- \Delta H^0 = -142 \text{ kJmol}^{-1}$$

$$O_{(g)}^- + e^- = O_{(g)}^{2-} \Delta H^0 = 844 \text{ kJmol}^{-1}$$
 This is because [AIEEE 2004]
 (a) O^- ion will tend to resist the addition of another electron
 (b) Oxygen has high electron affinity

- (c) Oxygen is more electronegative
(d) O^- ion has comparatively larger size than oxygen atom
81. Which is correct about ionisation potential [MHCET 2003]
(a) It is independent of atomic radii
(b) It increases with increase in atomic radii
(c) It remains constant with increase in atomic radii
(d) It decreases with increase in atomic radii
82. Fluorine is the best oxidising agent because it has [CPMT 2004]
(a) Highest electron affinity
(b) Highest E_{red}^0
(c) Highest E_{oxid}^0
(d) Lowest electron affinity
83. Which among the following elements have lowest value of IE_1 [CPMT 2004]
(a) *Pb* (b) *Sn*
(c) *Si* (d) *C*
84. In a given shell, the order of screening effect is [Kerala PMT 2004]
(a) $s > p > d > f$ (b) $f > d > p > s$
(c) $p < d < s < f$ (d) $d > f < s > p$
(e) $f > p > s > d$
85. Which of the following has the highest first ionisation energy [BHU 2004]
(a) *Li* (b) *Be*
(c) *B* (d) *C*
86. Which one of the following sets of ions represents the collection of isoelectronic species [AIEEE 2004]
(a) $K^+, Cl^-, Mg^{2+}, Sc^{3+}$ (b) $Na^+, Ca^{2+}, Sc^{3+}, F^-$
(c) $K^+, Ca^{2+}, Sc^{3+}, Cl^-$ (d) $Na^+, Mg^{2+}, Al^{3+}, Cl$
87. The correct order of reactivity of halogens is [MHCET 2003]
(a) $F > Cl > Br > I$ (b) $F < Cl > Br < I$
(c) $F < Cl < Br < I$ (d) $F < Cl < Br > I$
88. The first ionisation potential is maximum for [CPMT 2004]
(a) *B* (b) *N*
(c) *O* (d) *Be*
89. The correct order of ionisation energy for comparing carbon, nitrogen and oxygen atoms is [UPSEAT 2004]
(a) $C > N > O$ (b) $C > N < O$
(c) $C < N > O$ (d) $C < N < O$
- (c) $O > C > B > N$ (d) $O > B > C > N$
4. Which one has maximum electron affinity [Roorkee 1995]
(a) *N* (b) *Be*
(c) *B* (d) *Cl*
5. The electron affinity for the inert gases is [Kurukshetra CEE 1998; MP PMT 2002]
(a) Zero (b) High
(c) Negative (d) Positive
6. The electron affinities of halogens are $F = 322$, $Cl = 349$, $Br = 324$, $I = 295 kJ mol^{-1}$. The higher value for *Cl* as compared to that of *F* is due to [MP PMT 1997]
(a) Weaker electron-electron repulsion in *Cl*
(b) Higher atomic radius of *F*
(c) Smaller electronegativity of *F*
(d) More vacant *p*-subshell in *Cl*
7. Which one of the following is an incorrect statement [MP PMT 2001]
(a) The ionisation potential of nitrogen is greater than that of oxygen
(b) The electron affinity of fluorine is greater than that of chlorine
(c) The ionisation potential of beryllium is greater than that of boron
(d) The electronegativity of fluorine is greater than that of chlorine
8. Electron affinity is the [MP PMT 1993]
(a) Energy absorbed when an electron is added to an isolated atom in the gaseous state
(b) Energy released when an electron is added to an isolated atom in the gaseous state
(c) Energy required to take out an electron from an isolated gaseous atom
(d) Power of an atom to attract an electron to itself
9. The electron affinity values for the halogens show the following trend [Kerala PET 2002]
(a) $F < Cl > Br > I$ (b) $F < Cl < Br < I$
(c) $F > Cl > Br > I$ (d) $F < Cl > Br < I$
10. Which element has maximum electron affinity
(a) *Na* (b) *S*
(c) *Mg* (d) *Al*
11. Which of the following has the least electron affinity in $kJ mol^{-1}$ [AFMC 2000]
(a) Oxygen (b) Carbon
(c) Nitrogen (d) Boron
12. Fluorine has low electron affinity than chlorine because of [CPMT 1997]
(a) Smaller radius of fluorine, high density
(b) Smaller radius of chlorine, high density
(c) Bigger radius of fluorine, less density
(d) Smaller radius of chlorine, less density
13. For electron affinity of halogens which of the following is correct [AIIMS 2004]
(a) $Br > F$ (b) $F > Cl$
(c) $Br < Cl$ (d) $F > I$
14. Ionic compounds are formed most easily with [DPMT 2005]
(a) Low electron affinity, high ionisation energy
(b) High electron affinity, low ionisation energy
(c) Low electron affinity, low ionisation energy
(d) High electron affinity, high ionisation energy
15. In comparison with alkali metals, the electron affinity of halogens is
(a) Very high (b) Very low

Electron affinity

1. Electron affinity depends on [MP PMT 2002]
(a) Atomic size
(b) Nuclear charge
(c) Atomic number
(d) Atomic size and nuclear charge both
2. Increasing order of electron affinity is [RPET 2003]
(a) $N < O < Cl < Al$ (b) $O < N < Al < Cl$
(c) $Al < N < O < Cl$ (d) $Cl < N < O < Al$
3. The correct order of electron affinity of *B*, *C*, *N*, *O* is [MP PET 1997; J & K 2005]
(a) $O > C > N > B$ (b) $B > N > C > O$

- (c) Nearly same (d) Exactly same
16. The electron affinity of [CPMT 1994]
 (a) Carbon is greater than oxygen
 (b) Sulphur is less than oxygen
 (c) Iodine is greater than bromine
 (d) Bromine is less than chlorine
17. The amount of energy which is released due to addition of extra electron to the outermost orbit of gaseous atom is called [BHU 1996]
 (a) Electron capacity (b) Electron affinity
 (c) Ionisation potential (d) Electronegativity
18. Which of the following species has the highest electron affinity [KCET 1996]
 (a) F (b) O
 (c) O^- (d) Na^+
19. The electron affinity values (in $kJ\ mol^{-1}$) of three halogens X, Y and Z are respectively $-349, -333$ and -325 . Then X, Y and Z are respectively [EAMCET 2003]
 (a) F_2, Cl_2 and Br_2 (b) Cl_2, F_2 and Br_2
 (c) Cl_2, Br_2 and F_2 (d) Br_2, Cl_2 and F_2
20. Nitrogen has lower electron affinity than its preceding element carbon because
 (a) Electron affinity decreases along a period
 (b) Electron affinity generally increases along a period
 (c) Nitrogen atom has half filled p -orbital
 (d) Nitrogen is a p -block element
21. Electron affinity is the lowest for
 (a) Nitrogen (b) Carbon
 (c) Oxygen (d) Sulphur
22. Which one of the elements has the maximum electron affinity [CPMT 1986; AFMC 1992, 95; Bihar MEE 1996; BHU 1997; CBSE PMT 1996, 99; MP PET 1995, 2001; AMU 2000]
 (a) F (b) Cl
 (c) Br (d) I
23. Which among the following factors is the most important in making fluorine the strongest oxidizing halogen [AIEEE 2004]
 (a) Hydration enthalpy
 (b) Ionization enthalpy
 (c) Electron affinity
 (d) Bond dissociation energy
24. Which of the following pairs show reverse properties on moving along a period from left to right and from top to down in a group [DCE 2003]
 (a) Nuclear charge and electron affinity
 (b) Ionisation energy and electron affinity
 (c) Atomic radius and electron affinity
 (d) None of these
25. Which of the following properties show gradual decrease with increase in atomic number across a period in the periodic table [Pb. CET 2003]
 (a) Electron affinity (b) Ionization potential
 (c) Electronegativity (d) Size of atom
26. Order of electron affinity of F, Cl, Br and I is [AFMC 1999; Orissa JEE 2004,05]
 (a) $F < Cl > Br > I$ (b) $F > Cl > Br > I$
 (c) $F < Cl < Br < I$ (d) $F > Cl < Br > I$
27. Which one of the following arrangements represents the correct order of electron gain enthalpy (with negative sign) of the given atomic species. [CBSE PMT 2005]
 (a) $Cl < F < S < O$ (b) $O < S < F < Cl$
 (c) $S < O < Cl < F$ (d) $F < Cl < O < S$

Electronegativity

1. Between HF, HCl, HBr and HI, HF has the highest ionic character because
 (a) F has the highest electron affinity
 (b) In HF , electronegativity difference is highest
 (c) F^- ion has the highest value of ionic radius
 (d) Atomic orbitals of H and F have almost similar energy
2. On going from right to left in a period in the periodic table the electronegativity of the elements [MP PET/PMT 1998; MP PMT 2002]
 (a) Increases
 (b) Decreases
 (c) Remain unchanged
 (d) Decreases first then increases
3. On Pauling scale which of the following does not have electronegativity ≥ 3.0 [MP PET 1994]
 (a) Oxygen (b) Nitrogen
 (c) Chlorine (d) Bromine
4. Which one of the following represents the electronic configuration of the most electropositive element [AIIMS 1982; CPMT 1994; MP PMT 2000]
 (a) $[He]2s^1$ (b) $[Xe]6s^1$
 (c) $[He]2s^2$ (d) $[Xe]6s^2$
5. An atom with high electronegativity has [Kerala (Med.) 2003]
 (a) Large size
 (b) High ionisation potential
 (c) Low electron affinity
 (d) Low ionisation potential
6. Two elements whose electronegativities are 1.2 and 3.0 the bond formed between them would be [MP PET 2002]
 (a) Ionic (b) Covalent
 (c) Coordinate (d) Metallic
7. The solubilities of carbonates decreases down the magnesium group due to a decrease in [AIEEE 2003]
 (a) Lattice energies of solids
 (b) Hydration energies of cations
 (c) Inter-ionic attraction
 (d) Entropy of solution formation
8. Which element has the highest electronegativity
 or
 Which of the following is the most electronegative [CPMT 1981; Roorkee 1995; MP PMT 2003; EAMCET 1980; CPMT 1989; MNR 1994; MP PMT 1999]
 (a) F (b) He
 (c) Ne (d) Na
9. Which element has the highest electronegativity [MP PET/PMT 1998]
 (a) C (b) Mg
 (c) O (d) S
10. Keeping in view the periodic law and the periodic table suggest which of the following elements should have the maximum electronegative character [MNR 1985]
 (a) P (b) As
 (c) Bi (d) Sb
11. The outermost electronic configuration of the most electronegative element is [MP PET 1996; RPMT 1997; MP PET 2004]

- (a) ns^2np^3 (b) ns^2np^4
(c) ns^2np^5 (d) ns^2np^6
12. Going from fluorine to chlorine, bromine and iodine, the electronegativity [MP PMT 2000]
(a) Increases
(b) Decreases
(c) First decreases then increases
(d) Changes randomly
13. Of the following elements, which one has highest electro-negativity [CPMT 1988; CBSE PMT 1991; BHU 1996; Kurukshetra CET 2002; Pb. PMT 2004]
(a) *I* (b) *Br*
(c) *Cl* (d) *F*
14. Which of the following is most electronegative [CPMT 1999]
(a) Carbon (b) Silicon
(c) Lead (d) Tin
15. The property of attracting electrons by the halogen atom in a molecule is called [CPMT 1996]
(a) Ionisation potential (b) Electron affinity
(c) Electronegativity (d) Electronic attraction
16. In third row of periodic table from *Na* to *Cl* [MP PET 1986]
(a) Electronegativity increases
(b) Electronegativity decreases
(c) Ionization energy decreases
(d) Atomic volume increases
17. Which of the following is the most electropositive element [AIIMS 1998]
(a) Aluminium (b) Magnesium
(c) Phosphorus (d) Sulphur
18. Which of the following sets of atoms is arranged in order of increasing electronegativity
(a) *S, Si, P* (b) *S, P, Si*
(c) *Si, P, S* (d) *Si, S, P*
19. Which of the following property displays progressive increase with the rise in atomic number across a period in the periodic table
(a) Electronegativity (b) Electron affinity
(c) Ionization potential (d) Size of the atom
20. With respect to chlorine, hydrogen will be [NCERT 1978; MP PMT 2003]
(a) Electropositive (b) Electronegative
(c) Neutral (d) None of the above
21. The correct order of electropositive nature of *Li*, *Na* and *K* is
(a) *Li > Na > K* (b) *Li > K > Na*
(c) *Na > K > Li* (d) *K > Na > Li*
22. Electronegativity is a measure of the capacity of an atom to [CPMT 1989]
(a) Attract electrons (b) Attract protons
(c) Repel electrons (d) Repel protons
23. With increasing atomic number in a certain period [MP PMT 1987]
(a) The chemical reactivity decreases
(b) The chemical reactivity increases
(c) The electropositive character increases
(d) The electronegative character increases
24. Which of the following have maximum electronegativity [CPMT 1982]
(a) *Al* (b) *S*
(c) *Si* (d) *P*
25. Which element has the lowest electronegativity [CPMT 1976]
(a) *Li* (b) *F*
- (c) *Fe* (d) *Cl*
26. The attraction that an atom exerts on a pair of electrons that are being shared between that atom and another atom to which it is bonded by a covalent bond is referred to as its [Manipal MEE 1995]
(a) Electron affinity (b) Electronegativity
(c) Ionisation energy (d) Valence
27. The electronegativity of the following elements increases in the order [IIT 1987]
(a) *C, N, O, F* (b) *N, Si, C, P*
(c) *Si, P, C, N* (d) *P, Si, N, C*
28. Choose the correct statement
(a) Electronegativity increases down a group
(b) Electronegativity decreases down a group
(c) Electronegativity decreases from left to right along a period
(d) Electronegativity changes along a group but remains constant along a period
29. In *C, N, O* and *F* the electronegativity [DPMT 2001]
(a) Decreases from carbon to fluorine
(b) Increases from carbon to fluorine
(c) Increases from carbon to oxygen and then decreases
(d) Decreases from carbon to oxygen and then increases
30. Which is the correct order of electronegativities [EAMCET 1990]
(a) *F > N < O > C* (b) *F > N > O > C*
(c) *F < N < O < C* (d) *F > N > O < C*
31. In the following, the element with the highest electropositivity is [MP PET/PMT 1991]
(a) Copper (b) Caesium
(c) Barium (d) Chromium
32. Which one of the following has the highest electronegativity [UPSEAT 2004]
(a) *Br* (b) *Cl*
(c) *P* (d) *Si*
33. Which or these have no unit [AFMC 2004]
(a) Electronegativity (b) Electron affinity
(c) Ionisation energy (d) Excitation potential
34. The polarising ability of which one of the following is highest [DCE 2003]
(a) Small highly +ve ion (b) Large +ve ion
(c) Small highly -ve ion (d) Large -ve ion
35. Among Al_2O_3 , SiO_2 , P_2O_3 and SO_2 the correct order of acid strength is [AIEEE 2004]
(a) $Al_2O_3 < SiO_2 < SO_2 < P_2O_3$
(b) $SiO_2 < SO_2 < Al_2O_3 < P_2O_3$
(c) $SO_2 < P_2O_3 < SiO_2 < Al_2O_3$
(d) $Al_2O_3 < SiO_2 < P_2O_3 < SO_2$

Valency and oxidation state

1. Which one of the following oxides is neutral [IIT-JEE 1996]
(a) *CO* (b) *SnO₂*
(c) *ZnO* (d) *SiO₂*
2. All element in 3rd period have [JIPMER 1997]
(a) An atomic number 3
(b) 3 complete sub-shells
(c) Valence electrons shell

- (d) 3 electrons less than the octet
3. Which shows variable valency [RPMT 1997]
 (a) *s*-block elements (b) *p*-block elements
 (c) *d*-block elements (d) Radioactive elements
4. Most reducing agent is [UPSEAT 1999]
 (a) *K* (b) *Mg*
 (c) *Al* (d) *Ba*
5. Acidity of pentoxides in VA group [CPMT 1982]
 (a) Decreases (b) Increases
 (c) Remains same (d) None
6. If the valency shell electronic structure for an element is ns^2np^5 , this element will belong to the group of [CBSE PMT 1992]
 (a) Alkali metals (b) Inert metals
 (c) Noble gases (d) Halogens
7. The order in which the following oxides are arranged according to decreasing basic nature is [CPMT 1985]
 (a) Na_2O, MgO, Al_2O_3, CuO
 (b) MgO, Al_2O_3, CuO, Na_2O
 (c) Al_2O_3, MgO, CuO, Na_2O
 (d) CuO, Na_2O, MgO, Al_2O_3
8. Strongest reducing agent is [RPMT 1997]
 (a) Cl_2 (b) Cl^-
 (c) Br^- (d) I^-
9. Metallic nature and basic nature of the oxides as we move along a period
 (a) Increases
 (b) Decreases
 (c) First increases then decreases
 (d) Remains constant
10. The correct order of increasing order of oxidising power is [DCE 2000]
 (a) $F_2 < Cl_2 < Br_2 < I_2$ (b) $F_2 < Br_2 < Cl_2 < I_2$
 (c) $Cl_2 < Br_2 < F_2 < I_2$ (d) $I_2 < Br_2 < Cl_2 < F_2$
11. The most basic among these hydroxides, is [MP PMT 2003]
 (a) $Be(OH)_2$ (b) $Mg(OH)_2$
 (c) $Ca(OH)_2$ (d) $Ba(OH)_2$
12. In any period the valency of an element with respect to oxygen [Kerala (Med.) 2003]
 (a) Increases one by one from IA to VIIA
 (b) Decreases one by one from IA to VIIA
 (c) Increases one by one from IA to IVA and then decreases from VA to VIIA one by one
 (d) Decreases one by one from IA to IVA and then increases from VA to VIIA one by one
13. Which will show maximum non-metallic character [UPSEAT 2003]
 (a) *B* (b) *Be*
 (c) *Mg* (d) *Al*
14. Which of the following halogen acids is least acidic [RPET 2003]
 (a) *HI* (b) *HCl*
 (c) *HF* (d) *HBr*
15. Pentavalency in phosphorus is more stable when compared to that of nitrogen even though they belong to same group is due to [KCET 2002]
 (a) Reactivity of phosphorus
 (b) Inert nature of nitrogen
 (c) Dissimilar electronic configuration
 (d) Larger size of phosphorus atom
16. In the ground state of cobalt atom ($Z = 27$) there are unpaired electrons and thus the atom is.....
 (a) 2, diamagnetic (b) 2, paramagnetic
 (c) 3, diamagnetic (d) 3, paramagnetic
17. Variable valency in general, is exhibited by [CPMT 1974, 84, 89; DPMT 1981, 82; MP PET 2001]
 (a) Transition elements (b) Gaseous elements
 (c) Non-metals (d) *s*-block elements
18. An element of atomic weight 40 has 2, 8, 8, 2 as the electronic configuration. Which one of the following statements regarding this element is not correct
 (a) It belongs to II group of the periodic table
 (b) It has 20 neutrons
 (c) The formula of its oxide is MO_2
 (d) It belongs to 4th period of the periodic table
19. Which of the following oxides is most basic [MP PET 1994]
 (a) Na_2O (b) Al_2O_3
 (c) SiO_2 (d) SO_2
20. In the periodic table, the metallic character of elements [MP PET 1993]
 (a) Decreases from left to right across a period and on descending a group
 (b) Decreases from left to right across a period and increases on descending a group
 (c) Increases from left to right across a period and on descending a group
 (d) Increases from left to right across a period and decreases on descending a group
21. The halogen that most easily reduced is [MP PMT 2000]
 (a) F_2 (b) Cl_2
 (c) Br_2 (d) I_2
22. Which of the following is the correct order of gradually decreasing basic nature of the oxides [MP PMT 1997]
 (a) $Al_2O_3, MgO, Cl_2O_7, SO_3$
 (b) $MgO, Al_2O_3, SO_3, Cl_2O_7$
 (c) $Cl_2O_7, SO_3, Al_2O_3, MgO$
 (d) $SO_3, Cl_2O_7, MgO, Al_2O_3$
23. The correct order of reactivity of halogen is [BHU 2000]
 (a) Fluorine > bromine > chlorine > iodine
 (b) Fluorine > chlorine > bromine > iodine
 (c) Iodine > bromine > chlorine > fluorine
 (d) Bromine > chlorine > fluorine > iodine
24. Elements A and B with their respective electronic configurations $3d^{10}4s^1$ and $4d^{10}5s^1$ in their outermost shell are
 (a) Both non-metals
 (b) Both coinage metals
 (c) A is a non-metal and B is coinage metal
 (d) A is a coinage metal and B is non-metal
25. Which is the best reducing agent [MP PET 2000]
 (a) F^- (b) Cl^-
 (c) Br^- (d) I^-
26. Which of the following group of elements eliminates electron easily
 (a) *N, P, As* (b) *O, S, Se*
 (c) *Li, Na, K* (d) *Cl, Br, I*
27. The maximum valency of an element with atomic number 7 is [AFMC 2002]
 (a) 2 (b) 5
 (c) 4 (d) 3

28. Which of the following metals exhibits more than one oxidation state [MP PET 1999]
 (a) *Na* (b) *Mg*
 (c) *Fe* (d) *Al*
29. Out of the following elements which one do you expect to be most reactive chemically [CPMT 1983]
 (a) *Mg* (b) *Ca*
 (c) *Sr* (d) *Ba*
30. Thallium shows different oxidation states because [AIIMS 1982]
 (a) It is a transition element
 (b) Of inert pair effect
 (c) Of its amphoteric character
 (d) Of its higher reactivity
31. Oxidising action increases in halogen in the following order [DPMT 1990]
 (a) $Cl < Br < I < F$ (b) $Cl < I < Br < F$
 (c) $I < F < Cl < Br$ (d) $I < Br < Cl < F$
32. Fluorine, chlorine, bromine and iodine are placed in the same group (17) of the periodic table, because [KCET (Med.) 1999]
 (a) They are non-metals
 (b) They are electronegative
 (c) Their atoms are generally univalent
 (d) They have 7 electrons in the outermost shell of their atom
33. Which of the following sequence correctly represents the decreasing acid nature of oxides [AMU 2000]
 (a) $Li_2O > BeO > B_2O_3 > CO_2 > N_2O_3$
 (b) $N_2O_3 > CO_2 > B_2O_3 > BeO > Li_2O$
 (c) $CO_2 > N_2O_3 > B_2O_3 > BeO > Li_2O$
 (d) $B_2O_3 > CO_2 > N_2O_3 > Li_2O > BeO$
34. Which of the following aqueous acid is most acidic [AMU 2000]
 (a) *HCl* (b) *HF*
 (c) *HI* (d) *HBr*
35. The correct order of the increasing ionic character is [MP PET 2000]
 (a) $BeCl_2 < MgCl_2 < CaCl_2 < BaCl_2$
 (b) $BeCl_2 < MgCl_2 < BaCl_2 > CaCl_2$
 (c) $BeCl_2 < BaCl_2 < MgCl_2 < CaCl_2$
 (d) $BaCl_2 < CaCl_2 < MgCl_2 < BeCl_2$
36. Which of the following elements is found in native state [RPET 1999]
 (a) *Al* (b) *Au*
 (c) *Cu* (d) *Na*
37. The basis of keeping the elements in the group of a periodic table is [RPET 1999]
 (a) Ionisation potential
 (b) Electronegativity
 (c) Electron affinity
 (d) Number of electrons in the valence shell
38. Which of the following electronic configurations in the outermost shell is characteristic of alkali metals [Bihar CEE 1992]
 (a) $(n-1)s^2 p^6, ns^2 p^1$ (b) $(n-1)s^2 p^6 d^{10}, ns^1$
 (c) $(n-1)s^2 p^6, ns^1$ (d) $ns^2 p^6 d^1$
39. On moving down the group gradually increase
 (a) Oxidising property (b) Electronegativity
 (c) Acidic property (d) Metallic property
40. An ion which has 18 electrons in the outermost shell is
 (a) K^+ (b) Ca^{2+}
 (c) Na^+ (d) Cu^+
41. Increasing order of acid strength of halogen acid is [DCE 2000]
 (a) $HF < HCl < HBr < HI$
 (b) $HCl < HBr < HI < HF$
 (c) $HF < HI < HBr < HCl$
 (d) None of these
42. Which is the weakest base [KCET 1993]
 (a) *NaOH* (b) *KOH*
 (c) $Ca(OH)_2$ (d) $Zn(OH)_2$
43. Which of the following elements shows maximum number of different oxidation states in its compounds [CBSE PMT 1998]
 (a) *Eu* (b) *La*
 (c) *Gd* (d) *Am*
44. The valency shell of calcium contains [JIPMER 2000]
 (a) 8 electrons (b) 6 electrons
 (c) 4 electrons (d) 2 electrons
45. 3 and 6 electrons are present in the outermost orbit of *A* and *B* respectively. The chemical formula of its compound will be
 (a) A_3B_2 (b) A_2B_3
 (c) A_2B (d) AB
46. Which of the following halogens doesn't exhibit positive oxidation state in its compounds [MH CET 1999]
 (a) *Cl* (b) *Br*
 (c) *I* (d) *F*
47. The most basic element is [MP PET 2000; JIPMER 2000]
 (a) Fluorine (b) Iodine
 (c) Chlorine (d) Bromine
48. Which of the following set has the strongest tendency to form anions [AFMC 1999]
 (a) *Ga, In* and *Te* (b) *Na, Mg* and *Al*
 (c) *N, O* and *F* (d) *V, Cr* and *Mn*
49. An element *X* which occurs in the first short period has an outer electronic structure $s^2 p^1$. What are the formula and acid-base character of its oxides [DCE 1999]
 (a) XO_3 , basic (b) X_2O_3 , basic
 (c) X_2O_3 , amphoteric (d) XO_2 , acidic
50. Which of the following gas does not have an octet or eight electrons in the outer shell [CBSE PMT 2001]
 (a) *Ne* (b) *Ar*
 (c) *Rn* (d) *He*
51. Beryllium and aluminium exhibit many properties which are similar. But, the two elements differ in [AIEEE 2004]
 (a) Forming covalent halides
 (b) Forming polymeric hydrides
 (c) Exhibiting maximum covalency in compounds
 (d) Exhibiting amphoteric nature in their oxides

Critical Thinking

Objective Questions

- Which of the following statement is correct with respect to the property of elements with an increase in atomic number in the carbon family (group 14) [BHU 2004]
 - Atomic size decrease
 - Ionization energy increase
 - Metallic character decrease
 - Stability of +2 oxidation state increase
- The pair of amphoteric hydroxides is [AIIMS 2005]
 - $Al(OH)_3$, $LiOH$
 - $Be(OH)_2$, $Mg(OH)_2$
 - $B(OH)_3$, $Be(OH)_2$
 - $Be(OH)_2$, $Zn(OH)_2$
- Which of the following oxides is amphoteric in character [AIEEE 2005]
 - CaO
 - CO
 - SiO_2
 - SnO_2
- Which has highest melting point [RPMT 1997]
 - $LiCl$
 - $BeCl_2$
 - BCl_3
 - CCl_4
- Arrange S , O and Se in ascending order of electron affinity [Roorkee 1990]
 - $Se < S < O$
 - $Se < O < S$
 - $S < O < Se$
 - $S < Se < O$
- Which of the following is not the correct increasing order of ionisation energy [RPMT 2000]
 - $Cl^- < Ar < K^+$
 - $Au < Ag < Cu$
 - $Cs < Rb < K$
 - $K < Ca < Sc$
- In which of the following arrangements the order is NOT according to the property indicated against it [AIEEE 2005]
 - $Al^{3+} < Mg^{2+} < Na^+ < F^-$: Increasing ionic size
 - $B < C < N < O$: Increasing first ionization enthalpy
 - $I < Br < F < Cl$: Increasing electron gain enthalpy (with negative sign)
 - $Li < Na < K < Rb$: Increasing metallic radius
- Which element has the greatest tendency to loose electrons [NCERT 1980]
 - F
 - S
 - Fe
 - Be
- Strongest acid is [RPMT 1997]
 - Al_2O_3
 - MgO
 - Na_2O
 - CaO
- Which one of the following arrangements represents the correct order of electron gain enthalpy (with negative sign) of the given atomic species [CBSE PMT 2005]
 - $Cl < F < S < O$
 - $O < S < F < Cl$
 - $S < O < Cl < F$
 - $F < Cl < O < S$
- Increasing order of electronegativity is [RPET 2003]
 - $Bi < P < S < Cl$
 - $P < Bi < S < Cl$
 - $S < Bi < P < Cl$
 - $Cl < S < Bi < P$
- What will be the order of 1st ionisation energy [BHU 2005]
 - $Li > Na > K$
 - $K > Li > Na$
 - $Na > Li > K$
 - $Li > K > Na$
- Which of the following configurations represents atoms of the elements having the highest second ionization energy [Pb. PMT 1998]
 - $1s^2 2s^2 2p^4$
 - $1s^2 2s^2 2p^6$
 - $1s^2 2s^2 2p^6 3s^1$
 - $1s^2 2s^2 2p^6 3s^2$
- The first ionization potentials in electron volts of nitrogen and oxygen atoms are respectively given by [IIT 1987]
 - 14.6, 13.6
 - 13.6, 14.6
 - 13.6, 13.6
 - 14.6, 14.6
- The elements which occupy the peaks of ionisation energy curve, are [CBSE 2000]
 - Na , K , Rb , Cs
 - Na , Mg , Cl , I
 - Cl , Br , I , F
 - He , Ne , Ar , Kr
- Which is the correct order of ionic sizes (At. No. : $Ce = 58$, $Sn = 50$, $Yb = 70$ and $Lu = 71$) [AIEEE 2002]
 - $Ce > Sn > Yb > Lu$
 - $Sn > Ce > Lu > Yb$
 - $Lu > Yb > Sn > Ce$
 - $Sn > Yb > Ce > Lu$
- A sudden large jump between the values of second and third ionisation energies of an element would be associated with the electronic configuration [CBSE PMT 1992; AFMC 1998; CPMT 1999]
 - $1s^2, 2s^2 2p^6, 3s^1$
 - $1s^2, 2s^2 2p^6, 3s^2 p^1$
 - $1s^2, 2s^2 2p^6, 3s^2 p^2$
 - $1s^2, 2s^2 2p^6, 3s^2$
- Which element having following electronic configurations has minimum ionization potential [NCERT 1978; KCET 1991; CBSE PMT 1991; Pb. PET 1999; BHU 2000]
 - $1s^1$
 - $1s^2, 2s^2 2p^6$
 - $1s^2, 2s^2 2p^6, 3s^1$
 - $1s^2, 2s^2 2p^2$
- Arrange F , Cl , O , N in the decreasing order of electronegativity
 - $O > F > N > Cl$
 - $F > N > Cl > O$
 - $Cl > F > N > O$
 - $F > O > N > Cl$
- Ionic radii of [IIT-JEE 1999]
 - $Ti^{4+} < Mn^{7+}$
 - $^{35}Cl^- < ^{37}Cl^-$
 - $K^+ > Cl^-$
 - $P^{3+} > P^{5+}$
- Which of the following have high electron affinity [BHU 2000, 05]
 - F
 - Cl
 - N
 - O
- In which block 106th element belongs [DCE 2000]
 - s -block
 - p -block
 - d -block
 - f -block

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Positive ions will be wider than parent atoms [AIIMS 1999]
Reason : Nuclear charge pulls them closer
2. Assertion : Dinegative anion of oxygen (O^{2-}) is quite common but dinegative anion of sulphur (S^{2-}) is less common
Reason : Covalency of oxygen is two [AIIMS 2002]
3. Assertion : The atomic radii of calcium is smaller than sodium.
Reason : Calcium has a lower nuclear charge than sodium [AIIMS 1999]
4. Assertion : The first ionization energy of Be is greater than that of B
Reason : $2p$ orbital is lower in energy than $2s$ of [IIT-JEE Screening 2000]
5. Assertion : LiCl is predominantly a covalent compound
Reason : Electronegativity difference between Li and Cl is too small [IIT-JEE 1998]
6. Assertion : F atom has a less negative electron affinity than Cl atom
Reason : Additional electrons are repelled more effectively by $3p$ electrons in Cl atom than by $2p$ electrons in F atom [IIT-JEE 1998]
7. Assertion : Noble gases have maximum electron affinity. [AIIMS 1995]
Reason : High electron affinity shows that the electron is loosely bonded to the atom.
8. Assertion : The first ionisation energy of Be is greater than boron [AIIMS 2002]
Reason : $2p$ orbitals have lower energy than $2s$ orbitals.
9. Assertion : Atomic number of the element ununbium is 112.
Reason : Name for digits 1 and 2 is un- and bi- respectively in latin words.
10. Assertion : Chemistry of Actinoids is more complicated than Lanthanoids.
Reason : Actinoid elements are radioactive.
11. Assertion : Ionization enthalpy is always negative.
Reason : Energy is always released when electrons are removed.
12. Assertion : Shielding effect increases as we go down the group.
Reason : More is the number of electrons in the penultimate shell, more is shielding.
13. Assertion : Ionization potential across the period is $Na < Al < Mg < Si$.
Reason : Ionization potential decreases with decrease in atomic size.
14. Assertion : More is the electron affinity greater is the reducing character.
Reason : Reducing character depends on number of electrons gained.
15. Assertion : Ground state configuration of Cr is $3d^4, 4s$.

- Reason : A set of half filled orbitals containing one electron each with their spin parallel provides extra stability to the system.
16. Assertion : I.E. of N is more than that of O as well as C.
Reason : This is due to difference in reactivity towards oxygen.
 17. Assertion : NO ion is isoelectronic with CN ion.
Reason : Isoelectronic ions have same number of electrons.
 18. Assertion : Outermost electronic configuration of most electropositive elements is $ns np$.
Reason : $ns np$ is stable due to half filled subshell.
Assertion : First ionization energy for nitrogen is lower than oxygen.
Reason : Across a period effective nuclear charge decreases. [AIIMS 2005]

 Answers and Solutions

Extended or long form of periodic table

- (d) n/p ratio is a cause of radioactivity.
- (c) Halogens has 7 electrons in his valance shell (ns^2np^5).
- (c) As alkali metals have tendency to loose e^- .
- (b) Each period consists of a series of elements whose atom have the same principal quantum no. (n) of the outer most shell i.e. In second period $n = 2$, this shell has four orbitals (one $2s$ and three $2p$) which can have eight electrons, hence second period contains 8 elements from atomic no. 3 to 10.
- (b) Neils Bohr developed the long form of periodic table on the basis of Mosley's principle.
- (a) $33 - 1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^2 4p^3$

- (d) $16 - 1s^2 2s^2 2p^6 3s^2 3p^4$ there are $6e^-$ in outer most shell therefore its group is VI-A.
- (d) Many metals with catalytic properties because
 - They provide surface area for reaction to occur
 - They decreases the ionisation energy.
 - They have vacant d -orbitals.
- (d) Aluminium. As it belongs to p -block element.
- (c) $Cu_{29} - [Ar] 3d^{10} 4s^1$.
- (a) $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2$ principal quantum no. is 4 so it belongs to 4th period.
- (b) Inert gases, these have $ns^2 np^6$ configuration.
- (a) $1s^2 2s^2 2p^2$ - there are $4e^-$ in valence shell therefore it goes to IV- group.
- (a) $U > Ra > Pb > Hg$
- (a) $Mg - Ba$. Both belongs to II-A group.
- (b) $Na - Cl$. Both belongs to III period.
- (d) Elements of second and third period

Diagonal relationship

- (c) d -Block because the last electron enters d -subshell.
- (a) Kr has atomic no. 36 which is a noble gas and all noble gases are included in the p -block.
- (c) d -block. As the last e^- enters in d -subshell.
- (d) Due to its vacant p -orbital.
- (a) By obserbing principal quantum number (n), Orbital (s, p, d, f) and equating no. of e^- 's we are able to find the period, block and group of element in periodic table.
- (c) $33: 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^2, 3d^{10}, 4p^3$
In its valence shell $5e^-$ are present so it is fifth (A) group element.
- (d) 38 is the atomic no. of strontium (Sr) which is s -block element and all the elements of s -block are metals.
- (d) Hydrogen resembles alkali metals in some properties so it can be placed in the first group of periodic table.
- (b) Chalcogens are oxygen family.
- (c) Both belongs to VA group.
- (c) According to Doberner law of triads the atomic mass of the central element was nearly the arithmetic mean of atomic masses of other two elements.

$$\begin{array}{ccccccc}
 Cl & & Br & & I & & \text{Arithmetic mean} \\
 35 & & 75 & & 120 & & \frac{120 + 35}{2} = 77.5
 \end{array}$$

- (c) $Z = 2, 8, 8, 1$. $\therefore$ it would donate e^- more easily.
- (d) Last electron goes to s -subshell.
- (b) Because they belong to same group.
- (c) Ionic radius will increase as number of shells increases
- (b) Al Due to diagonal relationship.
- (d) $2, 8, 2$. $\therefore$ it would donate e^- more easily.
- (b) A representative element as last e^- enters p -orbital.

63. (a) The configuration represents on alkaline earth metals.
65. (a) First group
e.g. $\text{NaCl} + \text{H}_2\text{O} \rightleftharpoons \text{NaOH} + \text{HCl}$
68. (a) Ionic bond is formed when there is large difference of electro-negativities between the atoms.
69. (c) *d*-block - $[\text{Ar}]3d^1 4s^2$
70. (d) *Be* : $1s^2 2s^2$
71. (c) Increasing atomic number. Mosley found that atomic no. was better fundamental property than atomic weight.
72. (b) Lowest ionisation energy due to largest size.
73. (c) Elements on the right side of the periodic table are *p*-block. Mostly non-metals.
74. (c) Screening effect of *d* and *f* block elements is nearly same.
77. (a) *Li* because of its smallest size.
78. (b) In third group *Na* is a typical element.
85. (b) On equating no. of e^- 's atomic no. is 12 which is for *Mg*.
86. (d) $17 - 1s^2 2s^2 2p^6 3s^2 3p^5$.
89. (c) Lanthanide's are called rare earth metals.
91. (d) It show similarities with both alkali metals as well as halogens.
92. (b) M^- After gaining an e^- the metal attains stable configuration.
95. (d) Due to presence of vacant *d*-orbitals and they show *d-d* transition.
96. (d) Potassium, $K - [\text{Ar}]4s^1$.
97. (c) *p*-block; ${}_{31}\text{Ga} \rightarrow [\text{Ar}]3d^{10} 4s^2 p^1$.
102. (c) *Mg* has only two electrons in the 3*s*-orbital and hence its I.E. is lowest, i.e. it has the maximum tendency to form di-positive ions.
103. (a,b,c,d) It reflects trends in physical and chemical properties of the elements.
104. (c) As last e^- goes to *d*-subshell.
107. (d) First decreases to a minimum and then increases
108. (a) ${}_{25}\text{Mn} - 3d^5 4s^2$.
111. (b) Hydrogen, forms hydrides like halides, e.g. *HCl*.
114. (a) Hydration energy increases along the period.
115. (d) In IIA group all elements are metal while in IIIA, IVA and VIIA groups non-metallic elements are also present.
118. (c) *Mg, Ba, Ca* have ns^2 configuration.
119. (a) Elements of group halogen are : *F, Cl, Br, I* and *At*.
121. (d) *N* and *P* have 3 unpaired electrons in 2*p* and 3*p* respectively; *V* has 3 unpaired electrons in 3*d*.
124. (b) Tungsten (*W*) having highest m.p.
125. (b) These atomic no. gives the configuration $ns^2 np^5$ which are of halogen group or VII⁺ group.
126. (b) The atomic no. of an element is derived from the no. of proton because during chemical reaction no. of electron undergoes for change
127. (d) Due to identical ionic radii and polarising power

$$\left[\frac{\text{Charge}}{\text{Size}} \text{ ratio of pairs of these elements} \right]$$

Atomic and ionic radii

1. (b) Value of *Z* for hydrogen = 1
Value of *Z* for helium = 2
Value of *n* for both is = 1
- $$r_H = \frac{0.52 \times 1^2}{1} \quad r_{\text{He}^+} = \frac{0.52 \times 1^2}{1}$$
- $$\frac{r_H}{r_{\text{He}^+}} = 1 : 1 \quad \text{or} \quad r_{\text{He}^+} : r_H = 1 : 1$$
2. (d) The size of an species decreases with increasing nuclear charge because the attraction for the electrons increases. Thus Al^{3+} is smaller in size.
3. (c) As the nuclear charge per electron is maximum in F^- . Therefore it is smallest in size.
4. (a) During the formation of cation the size decreases.
6. (d) Highest the nuclear charge smallest the atomic size as well as radius also.
7. (a) Atomic radius decreases on going from left to right in a period. Thus size of $\text{O} > \text{F}$. As O^{2-} and F^- are isoelectronic, therefore, size of $\text{O}^{2-} > \text{F}^-$.
8. (b) As the nuclear charge per e^- is maximum in Mg^{+2} , it has smallest size among Na^+ , Mg^{+2} , Cl^- and F^- .
9. (b) S^{2-} and Cl^- both are isoelectronic but nuclear charge of Cl^- is more than S^{2-} . So it has largest size.
10. (d) In completely filled shell inter atomic repulsion is more so have greater size.
12. (d) I^- as it has the biggest size.
13. (d) *Mg*, as we move across the period atomic radius decreases.
14. (a) O^{2-} has the highest value of ionic radii as this can be explained on the basis of $Z/e \left\{ \frac{\text{Nucleus charge}}{\text{No. of electron}} \right\}$
- Whereas Z/e ratio increases, the size decreases and when Z/e ratio decreases the size increases.
15. (a) Continuous increase as no. of shells increases down the group.
16. (d) $\text{Na}^+ < \text{F}^- < \text{O}^{2-} < \text{N}^{3-}$
All are isoelectronic, effective nuclear charge is highest for Na^+ so it has smallest size.
17. (d) $\text{I}^- > \text{I} > \text{I}^+$
54 53 52 atomic number
19. (a) Continuously decreases as the effective nuclear charge increases.
20. (a) $\text{Mg}^{2+} < \text{Na}^+ < \text{F}^- < \text{Al}$
 F^- has bigger size than Mg^{2+} and Na^+ due to small nuclear charge.
21. (b) More than F^- as K^+ has more no of shells in atomic state.
22. (d) All are isoelectronic but O^{2-} has lowest charge among them. So it is largest in size.
23. (a) As effective nuclear charge on Na^+ is maximum. It has smallest size.

25. (c) $Be > C > F > Ne$. Atomic size decreases across a period.
26. (d) As the nuclear charge per electron is maximum in P^{5+} . Therefore its size is smallest.
27. (c) $Na^+ - 10$ electron ; $Li^- - 4$ electron
28. (b) Ionic radius of trivalent lanthanide's almost remains constant with increase in the atomic number.
30. (c) Halogens are most electronegative elements.
33. (d) On moving from left to right in a period value of radius decreases.
34. (a) $Sc^{3+} > Cr^{3+} > Fe^{3+} > Mn^{3+}$ the correct order is $Cr^{+3} > Mn^{+3} > Fe^{+3} > Sc^{+3}$
35. (d) $Na^+ > Mg^{2+} > Al^{3+} > Si^{4+}$. All are isoelectronic but nuclear charge per electron is greatest for Si^{4+} . So it has smallest size and nuclear charge per electron for Na^+ is smallest. So it has largest size.
36. (a) $N^{3-} > O^{2-} > F^-$. All are isoelectronic but nuclear charge per electron is highest for F^- , so it has smallest size.
38. (a) Cation has small size than parent atom and anion has greater size than parent atom.
39. (b) Ionic radii decreases significantly from left to right in a period among representative elements.
40. (d) H^- is most stable due to its full filled 1s-orbital.
43. (a) C^{4-} has largest radius due to least nuclear charge per electron.
44. (d) For ionic bond formation low I.E., high electron affinity and high lattice energy is needed.
45. (a) Ionic radii increases in a group.
46. (d) Size of elements decreases across a period.
47. (a) X^- ion larger in size than X atoms. Because of low effective nuclear charge on X^- , X has a bigger size.
48. (c) Fe, Co, Ni, Cu . Due to shielding of d -electrons, the effect of increased nuclear charge due to increase in atomic no. neutralised. Consequently atomic radius remains almost unchanged after chromium.
49. (d) $S^{2-} > Cl^- > K^+ > Ca^{2+}$
52. (a) Covalent radii decreases on going from left to right in periods. However among the transition elements the size do not changes much because the electrons add to the penultimate d -subshells i.e. $(n-1)d$ - subshell.
59. (c) During the conversion of neutral atom to cation size decreases because after removal one e^- or more
(i) Nuclear charge per electron increases.
(ii) Outermost shell is completely removed.
60. (b) Atomic radius increases as no. of shells increases.
62. (d) Chloride ion and potassium ion are isoelectronic, isoelectronic ions are those ions having same number of electrons.
 $K = 2, 8, 8, 1$ $K^+ = 2, 8, 8$
 $Cl = 2, 8, 7$ $Cl^- = 2, 8, 8$
63. (c) CS^+ has the largest ionic radius in the periodic table.
64. (a) Ionic radii increases down the group.
65. (d) Si^{4+} is smallest in size due to their greater +ve charge.
66. (d) Due to having three electrons atomic size increases.
 $F^- = 9 + 1 = 10$ electrons ; $O^{2-} = 8 + 2 = 10$ electrons
 $Al + 3 = 13 - 3 = 10$ electrons ; $N^{3-} = 7 + 3 = 10 e^-$.
Because electrostatic force between nucleus and e^- cloud is least in nitrogen.
67. (d) The trivalent ion having largest size in lanthanide series is lanthanum. This is due to lanthanide contraction.
68. (c) As we know that hydration power decreases on moving down the group hence among alkali metals Li has excessive hydration & hence it has low mobility in aqueous solution.
69. (c) Ionic radius in the n orbit is given by $r_n = \frac{n^2 a}{Z}$ or $r_n \propto \frac{1}{Z}$
where n is principal equation no., a_0 bohr's radius of hydrogen atom and Z is the effective nuclear energy.
70. (c) Order of polarising power $Be^{++} > Li^+ > Na^+$
Hence order of covalent character $BeCl_2 > LiCl > NaCl$
71. (b) Higher the (nA) value higher is the energy associated with orbitals.
72. (a) With the increase in size of cation the size of the hydrated ion decreases hence ionic conductance increases.

Ionisation energy

1. (b) I.E.(II) of Na is higher than that of Mg because in case of Na , the second e^- has to be removed from the noble gas core while in case of Mg removal of second e^- gives a noble gas core.
 Mg has high first ionisation potential than Na because of its stable ns^2 configuration.
7. (c) Ionization potential decreases. Since, atomic size increases.
8. (d) Alkali metals, lower the no. of valence e^- , lower is the value of ionization potential.
9. (a) The ionization energy of hydrogen is too high for group of alkali metals, but too low for halogen group.
13. (a) $E_1 < E_2$ because second I.E. is greater than first I.E.
15. (b) Due to high stability of half-filled orbitals.
16. (a) In Cu it has completely filled d -orbital so highest energy is absorbed when it converts in Cu^+ ion.
18. (c) The energy required to remove an electron from outermost orbit of an isolated gaseous atom is called I.E. Now carbon has $4e^-$ in outermost shell. Thus it has 4 ionization energies.
19. (a) Since, stable half filled configuration.
21. (d) First I.P. of $Be > B$ because of stable ns^2 configuration.
22. (b) $K^+ \rightarrow K^{2+} + e^-$. Since e^- is to be removed from stable configuration.
24. (c) Since the IV, I.E. is very high. Thus electron is to be removed from stable configuration.
25. (b) Li and Cs belong to 1st group but Cs has larger size, hence low nuclear attraction force, thus low ionization energy.
26. (c) Li belongs to 1st group. There is $1e^-$ in outermost shell. Thus low I.E.

27. (b) Increases from left to right. Since, the size decreases.
28. (a) As the e^- is to be removed from stable configuration.
29. (c) Since e^- is to be removed from exactly half filled p -orbital.
31. (a) Ionisation potential increases across the period.
32. (b) $E = \frac{E_0}{n^2} = \frac{-54.4}{4} = -13.6 \text{ eV}$
34. (c) Due to stable half-filled orbitals.
35. (c) Greater than the first ionization energy because after removal one e^- , effective nuclear charge increases.
36. (c) Rare gases as the e^- is to be removed from stable electron configuration.
37. (d) Since it is a noble gas.
38. (b) The first I.P. is maximum for hydrogen due to its small size.
41. (c) Due to his fullfilled configuration.
42. (b) 1st I.P. decreases down the group.
43. (a) 1st I.P. increases from left to right in a period.
45. (b) First I.P. for C is 11.3, for N is 14.5 and for O is 13.6
47. (a) Li has least 1st I.P. about 5.4.
48. (b) I.E. increases across the period.
50. (a) He has highest ionisation energy due to its full fill 1s-orbital.
51. (a) s-electrons are strongly bonded to the nucleus. So large amount of energy is required to remove an e^- .
52. (d) $Mg > Al > Na$. This is due to the presence of fully filled s-orbital in Mg.
55. (c) The 1st I.P. for hydrogen is 13.6 volts
56. (b) Alkali metals are strong reducing agents
58. (a) Due to the large size of group 1A elements, the outermost electron is far from the nucleus and can easily be removed. their ionisation energies or ionisation potentials are relatively low.
- | | Li | Na | K | Rb | Cs |
|---------------------------|-----|-----|-----|-----|-----|
| Ionisation potential (eV) | 5.4 | 5.1 | 4.3 | 4.2 | 3.9 |
60. (a) $N > O > Be > B$ 1st ionisation energy of $N > O$ because of half filled p -orbital.
61. (d) $M^{2+} \rightarrow M^{3+}$ After the removal of $2e^-$ the nuclear charge per e^- increases, due to which high energy is required to remove $3e^-$.
63. (a) I.E. increases from left to right in a period.
64. (b) More because of stable configuration of Mg.
65. (b) He and Xe belongs to same group but He has higher ionisation energy because of small size.
66. (c) In second transition electron is to be removed from half filled orbital.
68. (b) As it belongs to 1A group and has maximum size.
69. (a) Since, they have larger size as compared to other.
70. (c) The second I.E. is greater than first I.E. similarly second E.A. is greater than first E.A. the energy is to be supplied to force the second e^- into the anion.
71. (a) Increases as the atomic size decreases and hence effective nuclear charge increases.
72. (b) B, Be, C, N as I.E. increases across the period.
73. (d) Ionization potential is least for alkali metals and it decreases down the group.
74. (b) It has maximum ionization energy due to half filled orbitals.
75. (d) It has maximum no. of e^- in outermost shell. So it has maximum I.E.
76. (b) Ionization potential increases as we go from left to right in a period, while it decreases as we come down a group.
- | Be | B | Li | Na |
|-----|-----|-----|-----|
| 9.3 | 8.3 | 5.4 | 5.1 |
77. (c) Half filled p -orbitals possess extra stability.
78. (c) Ionization potential decreases down the group.
79. (d) Li^+ and Mg^{+2} ions have similar polarising power or ionic potential and therefore have similar properties. This type of relationship of the first element of a group with the second element of the next group is known as diagonal relationship.
80. (a) The addition of second electron in an atom or ion is always endothermic.
81. (d) We know that ionisation potential gradually decreases of moving down the group while atomic size increases as we move down the group. Hence larger the atomic size, smaller is ionisation potential.
82. (b) Fluorine has highest E° red {Equal to +2.9 V} due to which it can easily accept an electron & hence it is the best oxidising agent.
83. (b) The ionisation energy of tin {Sn} is less than that of lead (Pb). It is due to the poor shielding of d- and f-electron in Pb due to which it feels greater attraction from nucleus.
84. (a) The order of screening effect in a given shell are in order $s > p > d > f$.
85. (d) The ionisation energy of Li, Be, B and C is 520, 899, 801, 1086 kJ/mol respectively hence, carbon has highest IE_1 .
86. (c) Isoelectronic species are those which have same no. of electrons.
- $K^+ = 19 - 1 = 18$; $Ca^{+2} = 20 - 2 = 18$
- $Sc^{+3} = 21 - 3 = 18$; $Cl^- = 17 + 1 = 18$
87. (a) We know that atomic no. of fluorine (F), chlorine (Cl), Bromine (Br) and Iodine (I) are 9, 17, 35 and 53 respectively. Therefore correct reactivity of halogens is $F > Cl > Br > I$
88. (b) Ionisation potential generally increases when we move in a period from left to right but IE_1 of N_2 is greater than that of O_2 . It is due to the more stable (half-filled orbitals) configurations of N .
89. (c) Nitrogen has more ionisation potential than carbon & oxygen because, if outermost orbit is half filled so it is more stable & order is $C < N > O$

Electron affinity

3. (c) $O > C > B > N$ Value of electron affinity increases on 140.9 122.3 83 0 going from left to right in periods but the value of electron affinity of V⁺ A elements is less than that of IV⁺ A element, this is due to half filled p -orbitals presence.
4. (d) Halogens have maximum electron affinity due to their smaller size.
5. (a) Zero, because of the stable electronic configuration the noble gases do not show any force of attraction towards the incoming electron.
8. (b) Energy released when an electron is added to an isolated atom in gaseous state.
9. (a) Electron affinity value of Cl is greater than F and then decreases down the group.
10. (b) Electron affinity increases across the period.
13. (c) Electron affinity of chlorine is maximum.
14. (b) The formation of ionic bond depends upon easy formation of cation and anion. therefore the ionisation energy value of the metal atom should be low, so that it can easily form cation. on

the other hand, the electron affinity value of the non-metal atom should be high so that it can easily form anion.

15. (a) Because it can easily accept an e^- .
18. (a) Halogens have the highest e^- affinity.
19. (b) In IB group all elements are metals.
22. (b) Fluorine although have highest electronegativity due to its very small size, effective inter electronic repulsions are observed which brings down its electron affinity.
23. (d) The bond dissociation energy of $F-F$ bond is very low. The weak $F-F$ bond makes fluorine the strongest oxidising halogen.
24. (c) Atomic radius increase from top to bottom in a group while decrease from left to right in a period on the other hand electron affinity shows severe trends i.e. decrease from top to bottom in a group and increase from left to right in a period.
25. (d) It is a fact.
26. (a) Electron affinity of Cl is greater than fluorine so the order are as $F < Cl > Br > I$
27. (b) Halogens have very high electron affinity. It may be rated that the electron affinity of fluorine is unexpectedly low ($< Cl$). This may perhaps be due to small size of F atom. The value of electron gain enthalpies for Cl, F, S and O are respectively 349, 333, 200 & 142 kJ/mol hence correct order is $Cl > F > S > O$

Electronegativity

2. (b) Decrease as atomic size increases.
4. (b) Electropositive nature increases down the group and decreases across the period.
5. (b) An atom with high electronegativity has high I.P.
6. (a) If electronegativity difference is greater than 1.7 bond is ionic, if less than 1.7, the bond is covalent.
7. (b) Due to decrease in hydration energy of cation and lattice energy remains almost unchanged.
8. (a) F , because of its smallest size.
9. (c) Because of small size and high nuclear charge.
10. (a) Electronegativity decreases down the group.
11. (c) Halogens are most electronegative.
12. (b) Electronegativity decreases down the group.
13. (d) Because of smallest size.
14. (a) Electronegativity decreases down the group.
16. (a) Electronegativity increases since the size decreases.
17. (b) Electropositive character decreases across the period as metallic character decreases.
18. (c) Si, P, S . As across the period electronegativity increases.
19. (a) Both electronegativity and electron affinity increases. This is because decrease in the size and increase in the nuclear charge. But electronegativity increases continuously.
20. (a) Electropositive nature increases down the group.
21. (d) Electropositive nature increases down the group.
23. (d) The electronegative character increases as the size decreases.
24. (b) Electronegativity increases across a period.
25. (a) $Li_3 - 1s^2 2s^1$ donates $1e^-$ easily.
28. (b) Electronegativity decreases down the group as atomic radius increases.
30. (a) Electronegativity increases across the period because size decreases.
31. (b) Alkali metals are most electropositive and moreover, electropositive character increases down the group.
32. (b) Electronegativity increases when moves towards period & decrease when moves toward group.

33. (a) Electronegativity is the property of a bonded atom. The relative tendency on an atom to attract the shared pair of electron toward itself is called electronegativity.
34. (a) Due to Raving small in size and electron deficient in nature it has highest polarising ability we can use Fajan's rule to understand it further.
35. (d) With decrease in size from Al to S the basic nature of oxide decrease and acidic nature increases.
- $Al_2O_3 < SiO_2 < P_2O_3 < SO_2$
- Al_2O_3 is amphoteric, SiO_2 is slightly acidic whereas P_2O_3 and SO_2 are the anhydrides of acids H_3PO_3 and H_2SO_3 .

Valency and Oxidation state

1. (a) Examples of neutral oxides are CO, H_2O, N_2O . These oxides are neutral towards litmus paper.
5. (a) Basic or metallic character of pentaoxides in VA group increases down the group. Hence acidity decreases.
7. (a) Na_2O, MgO, Al_2O_3, CuO . More the metallic character higher the e^- donating tendency. Therefore lower the I.E. more the basic nature of oxide.
8. (d) As it can donate e^- easily due to low comparative attraction by the nucleus to the valence e^- .
9. (b) Because of the non-metallic character increases.
10. (d) Oxidizing power increases in a group.
14. (c) HF is least acidic due to the small size of fluorine.
16. (d) $Co - [Ar]3d^7 4s^2$, it has 3 unpaired e^- so it is a paramagnetic.
17. (a) Transition elements due to presence of vacant d -orbitals.
18. (c) Its valency is 2. So it will form MO type compound.
19. (a) Oxides of alkali metals are most basic.
21. (a) Fluorine is the most easily reduced in halogens.
22. (b) Across the period non-metallic character increases. Hence basic nature of oxide decreases.
23. (b) Fluorine is more reactive than chlorine, bromine and iodine.
24. (b) Both are coinage metals
- $3d^{10} 4s^1 - Cu ; 4d^{10} 5s^1 - Ag$
26. (c) Li, Na, K , contains only one e^- in outer most orbit.
27. (b) Valency is according to valence shell configuration which here is $1s^2, 2s^2, 2p^3$, i.e. 5
28. (c) Fe belongs to first transition series.
29. (d) Reactivity of alkaline earth metals increases down the group.
31. (d) Tendency to gain e^- and oxidising power are related. Among halogens F is the directly most powerful oxidising agent.
32. (d) Electronic configuration of outermost shell of group-17 or halogens are $ns^2 np^5$.
33. (b) On passing from left to right in a period acidic character of the normal oxides of the element goes on increasing with increase in electronegativity.
36. (b) Gold is found in native state.
37. (d) The elements which having same number of electrons in the valence shell are placed in the same group of periodic table.
38. (c) Alkali metals have the configuration $(n-1)s^2 p^6, ns^1$
41. (a) As going down the group size increases, an liberation of H^+ ion becomes easy. So the order of acidity is :
- $HI > HBr > HCl > HF$
44. (d) Valence shell configuration for IIA group elements is : ns^2

45. (b) A_2B_3
 $A \xrightarrow{-3e^-} A^{+3}; B \xrightarrow{+2e^-} B^{-2}$
47. (b) Lower the value of I.P. of an element, the greater will be the basic character of the element.
48. (c) N, O and F have strong tendency to attract the shared pair of electrons i.e. by gaining electrons to form anions.
49. (c) B_2O_3, Al_2O_3 are amphoteric oxides.
50. (d) He has the atomic number 2 so it does not have octet.
51. (c) Beryllium has the valency of +2 while aluminum exhibits its valency as +3
19. (d) Electronegativity increases on going from left to right in a period. Thus electronegativity of $F > O > N \simeq Cl$.
20. (d) Nuclear charge per electron is greater in P^{5+} . Therefore, its size is smaller.
21. (b) The electron affinities of some of the elements of second period (i.e., N, O, F etc.) are however, lower than the corresponding elements (i.e., P, S, Cl etc.) of the third period. This is due to the reason that the elements of second period have the smallest atomic size amongst the elements in their respective groups. As a result, there are considerable electron-electron repulsion within the atom itself and hence the additional electron is not accepted with the same ease as is the case with the remaining elements in the same group.
22. (c) Element belongs to d -block is unnilhexium $(Unh)_{106}$.

Critical Thinking Questions

1. (d) As we go down the group inertness of ns^2 pair increase hence tendency to exhibit +2 oxidation state increases and that of +4 oxidation state decreases.
2. (d) Both $Be(OH)_2$ and $Zn(OH)_2$ are amphoteric in nature.
3. (d) CaO is basic; CO_2 is acidic; SiO_2 is weakly acidic. SnO_2 is amphoteric.
4. (b) In $BeCl_2$ has the highest melting point due to ionic bond.
5. (a) Correct order of electron affinity is $Se < S < O$. In a group electron affinity decreases with increase in atomic number.
6. (b) The correct increasing order of I.E. is,
 $Cu < Ag < Au$.
7. (b) $B < C < N < O$; When we move from B to O in a periodic table the first ionisation enthalpy increase due to the attraction of nucleus towards the outer most of electron.
8. (c) Both Fe and Be are metal but Be has stable configuration so it is difficult to release e^- from it. So it has less metallic character than Fe .
9. (a) The basic nature of oxide decreases across the period as metallic character decreases. Therefore acidic nature of oxide increases.
10. (b) Halogens have very high electron affinities. It may be noted that the electron affinity of fluorine is unexpectedly low ($< Cl$). This may perhaps be due to the small size of the F atom. The values of electron gain enthalpies for Cl, F, S and O are respectively 349, 333, 200 and 142 kJ/mole hence correct order is $Cl > F > S > O$.
11. (a) Increasing order of electronegativity is $Bi < P < S < Cl$.
12. (a) In a group, the ionisation potential decreases from top to bottom. In the alkali group, the ionisation potential decreases from Li to Cs .
- | | Li | Na | K | Rb | Cs |
|------|------|------|-----|------|------|
| eV | 5.3 | 5.1 | 4.3 | 4.2 | 3.9 |
13. (c) Because for removing second electron, it has to be taken out from stable configuration that needs a large amount of energy.
14. (a) First I.E. of $N >$ First I.E. of O .
15. (d) All the noble gases occupy the peaks of I.E. curve.
16. (b) Correct order of ionic size is $Sn > Ce > Lu > Yb$.
17. (d) $1s^2 2s^2 p^6 3s^2$ - In III transition e^- is to be removed from stable configuration.
18. (c) $1s^2 2s^2 2p^6 3s^1$. It belongs to IA group which has least ionization potential and it decreases down the group

Assertion and Reason

1. (d) Positive ions will be smaller than parent atoms.
3. (c) Calcium has a higher nuclear charge than sodium.
4. (c) $2s$ orbital has lower energy than $2p$.
5. (c) Cl is more electronegative than Li . Although the difference is not much. Therefore the electron pair moves equally to both and thus forming a covalent compound.
6. (c) The lower value of electron affinity of F is due to electron-electron repulsion in $2p$ orbitals of F -atom is stronger.
7. (d) All noble gases have stable configuration. Therefore, they can not take any electron means that they have no affinity for electrons. High electron affinity shows that electron is strongly bonded to the atom. Here both assertion and reason are false.
8. (a) The first ionization energy of Be is greater than Boron because it is difficult to remove electron from Be in comparison to boron. It is also true that the $2p$ orbitals have lower energy than $2s$ -orbitals. Both assertion and reason are true and reason is correct explanation.
9. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
10. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
 Actinoids are more complicated due to the possibility of large number oxidation states.
11. (d) Both assertion and reason are false.
 Ionization enthalpies are always positive. Energy is always absorbed when electrons are removed from an atom.
12. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
 The phenomenon is which the Penultimate Shell $(n-1)$ electrons act as screen or shield in between nucleus and valence shell electrons thereby reducing the effective nuclear charge is known as shielding effect.
13. (c) Assertion is true but reason is false.
 Ionisation potential decreases with increase in atomic size and also for a given a shell, I.E. is in given order.
 $s > p > d > f$
14. (e) Assertion is false but reason is true.
 More is the electron affinity, greater is the Oxidising character.
15. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
 I.E. of N is more than that of ${}_8O$ as well as ${}_6C$.

16. (c) Assertion is true but reason is false.
 N is half-filled ($1s^2 2s^2 2p^3$) and therefore more stable and hence energy required to lose electron is greater.
17. (e) Assertion is false but reason is true.
 $NO^- = 7 + 8 + 1 = 16 e^-$ whereas
 $CN^- = 6 + 7 + 1 = 14 e^-$. So both are not isoelectronic.
18. (e) Assertion is false but reason is true.
Outermost electronic configuration of most electropositive elements is ns^1
19. (b) First ionization energy for nitrogen is lower than oxygen due to decrease nuclear charge in nitrogen comparison than oxygen.

Chemical Periodicity

Self Evaluation Test -15

- If the difference in electronegativities of two elements is very large, then
 - The bond is 50% ionic
 - The bond is 100% covalent
 - The bond is more covalent than ionic
 - The bond is more ionic than covalent
- Which of the following elements will have the lowest electron affinity
 - Nitrogen
 - Flourine
 - Chlorine
 - Phosphorus
- The correct order of second ionization potential of carbon, nitrogen, oxygen and fluorine is
[IIT-JEE 1981; CBSE PMT 1991; MADT Bihar 1995; MP PMT 2003]
 - $C > N > O > F$
 - $O > N > F > C$
 - $O > F > N > C$
 - $F > O > N > C$
- Which of the following species has the highest ionisation potential[EAMCET 1998]
 - Li^+
 - Mg^+
 - Al^+
 - Ne
- Which of the following elements are analogous to the lanthanides[AIIMS 1998]
 - Actinides
 - Borides
 - Carbides
 - Hydrides
- Which of the order for ionisation energy is correct
[CPMT 1999; CBSE PMT 2001]
 - $Be > B > C > N > O$
 - $B < Be < C < O < N$
 - $B < Be < C < N < O$
 - $B < Be < N < C < O$
- Modern periodic table is based on the atomic number of the elements. The experiment which proved the significance of the atomic number was
[CBSE PMT 1989]
 - Millikan's oil drop experiment
 - Moseley's work on X -ray spectra
 - Bragg's work on X -ray diffraction
 - Discovery of X -rays by Rontgen
- Which one of the elements is most metallic
[MP PMT 2002]
 - P
 - As
 - Sb
 - Bi
- For a p -block element, its $3d$, $3s$, $3p$ and $4s$ orbitals are completely filled and the differentiating electron goes to the $4p$ orbital. The element should have its atomic number in the range
 - 13 - 18
 - 21 - 26
 - 31 - 36
 - 49 - 54
- The most common lanthanide is [AFMC 1995]
 - Lanthanum
 - Cerium
 - Samarium
 - Plutonium
- In a period, elements are arranged in strict sequence of [CPMT 1989]
 - Decreasing charges in the nucleus
 - Increasing charges in the nucleus
 - Constant charges in the nucleus
 - Equal charges in the nucleus
- Some of the polar crystal when heated produce electric current. This phenomena is termed as [AMU 2001]
 - Ferroelectric effect
 - Pyroelectric effect
 - Antiferroelectric effect
 - Piezoelectric effect
- Which of the following pairs has elements containing same number of electrons in the outermost orbit [CPMT 1985]
 - $N - O$
 - $Na - Cl$
 - $Ca - Cl$
 - $Cl - Br$
- Coinage metals are present in [DCE 2000]
 - s -block
 - d -block
 - p -block
 - f -block
- In which of the following metal carbonate which metal carbonate is decomposed on heating [UPSEAT 1999]
 - $MgCO_3$
 - Na_2CO_3
 - K_2CO_3
 - Pb_2CO_3
- Which one of the following is the correct decreasing order of boiling point [AMU 2000]
 - $H_2O > H_2S > H_2Se > H_2Te$
 - $H_2Te > H_2Se > H_2S > H_2O$
 - $H_2O > H_2Te > H_2Se > H_2S$
 - $H_2Te > H_2O > H_2Se > H_2O$

1. (d) If the difference in electronegativities of two elements is very high then the bond is more ionic than covalent.
2. (d) Phosphorus have the lowest electron affinity due to half filled p orbital, but in nitrogen electron affinity is greater than phosphorus because of large nuclear attraction in comparison with phosphorus.
3. (c) The ionization potential increases across the period but the second ionization potential of oxygen is highest among them because after the removal of $1e^-$ the $2e^-$ is to be removed from half filled orbital which is difficult.
4. (d) As, now the e^- is to be removed from stable configuration. Li has the highest ionisation potential due to its stability.
5. (a) Actinides are homologous of Lanthanides.
6. (b) Ionisation energy increases across the period but due to stable half filled configuration of VA group, its I.E. is more than VI-A group.
7. (b) Moseley's work on X-ray spectra was proved the significance of the atomic number.
15. (a) $MgCO_3 \rightarrow MgO + CO_2$
16. (c) Correct decreasing order of boiling point is,
 $H_2O > H_2Te > H_2Se > H_2S$.

8. (d) The metallic property of an element increases from top to bottom in group.
 $P < As < Sb < Bi$
9. (c) $31 - 36 \Rightarrow Ga \text{ to } Kr$.
10. (b) The most common lanthanide is cerium.
11. (b) Increasing charges in the nucleus as atomic number increases across a period.
12. (d) This phenomena is called piezoelectric effect.
13. (d) $Cl - Br$. Both belong to VII-A group having $7e^-$ in valence shell.
14. (b) Copper, Silver and Gold are coinage metals

Chapter 16

General Principles of Extraction of Metals

All the materials found in the earth are composed of elements. There are about 112 elements known which constitute the entire matter on the earth. Therefore, the elements are regarded as the building blocks of the universe. These are distributed in all the three main parts of the earth; atmosphere and lithosphere. Among these, lithosphere constitutes the main source of most of the elements. The elements have been broadly divided into metals and non-metals on the basis of their physical and chemical properties.

Occurrence of Metals

Element which have low chemical reactivity generally occur **native** or **free** or **metallic** state. e.g. *Au, Pt*, noble gas etc. Element which are chemically reactive, generally occur in the **combined state**. e.g. halogens, chalcogens etc. The natural materials in which the metals occur in the earth are called **minerals**. The mineral from which the metal is conveniently and economically extracted is called an **ore**. *All the ores are minerals but all minerals cannot be ores*. Ores may be divided into four groups,

(i) **Metallic core (siderophile)** of the earth crust contains (*Mn, Fe, Co, Ni, Cu, Ru, Rb, Pd, Ag, Re, Os, Ir, Pt, Au*). *Entire composition of metals in earth crust may be given as,*

Al (8.3%); *Ca* (3.6%); *Na* (2.8%); *K* (2.6%); *Mg* (2.1%); *Ti* (0.4%); *Mn* (0.1%); *Fe* (5.1%) other metals (0.1%).

(i) **Native ores** : These ores contain metals in free state, e.g., silver, gold, platinum, mercury, copper, etc. These are found usually associated with rock or alluvial materials like clay, sand, etc. sometimes lumps of pure metals are also found. These are termed **nuggets**. Iron is found in free state as meteorites which also have 20 to 30% nickel.

(ii) **Sulphurised and arsenical ores** : These ores consist of sulphides and arsenides in simple and complex forms of metals. Important ores of this group are

Metal	Name of the ore	Composition
<i>Pb</i>	Galena	<i>PbS</i>
<i>Zn</i>	Zinc blende	<i>ZnS</i>
<i>Hg</i>	Cinnabar	<i>HgS</i>
<i>Ag</i>	Argentite or silver glance Pyrargyrite or ruby silver	<i>Ag₂S</i> <i>3Ag₂S.Sb₂S₃</i>
<i>Fe</i>	Iron pyrites	<i>FeS₂</i>
<i>Ni</i>	Kupfer nickel	<i>NiAs</i>

<i>Cu</i>	Copper pyrites	<i>CuFeS₂</i>
	Chalcocite or Copper glance	<i>Cu₂S</i>

(iii) **Oxidised ores** : In these ores, metals are present as their oxides or oxysalts such as carbonates, nitrates, sulphates, phosphates, silicates, etc.

Important ores of this group are listed below,

Oxides

Haematite	<i>Fe₂O₃</i>	}
Magnetite	<i>Fe₃O₄</i>	
Limonite	<i>Fe₂O₃.3H₂O</i>	
Bauxite	<i>Al₂O₃.2H₂O</i>	}
Corundum	<i>Al₂O₃</i>	
Diaspore	<i>Al₂O₃.H₂O</i>	
Chromite	<i>FeO.Cr₂O₃</i>	}
Chromeoehre	<i>Cr₂O₃</i>	
Tinstone (Cassiterite)	<i>SnO₂</i>	
Chrysoberyl	<i>BeO.Al₂O₃</i>	}
Cuprite (Ruby copper)	<i>Cu₂O</i>	
Pyrolusite	<i>MnO₂</i>	
Zincite	<i>ZnO</i>	}
Rutile	<i>TiO₂</i>	
Ilmenite	<i>FeO.TiO₂</i>	

Carbonates

Magnesite	<i>MgCO₃</i>	}
Lime stone	<i>CaCO₃</i>	
Dolomite	<i>CaCO₃.MgCO₃</i>	
Calamine	<i>ZnCO₃</i>	}
Malachite	<i>CuCO₃.Cu(OH)₂</i>	
Azurite	<i>Cu(OH)₂.2CuCO₃</i>	
Cerussite	<i>PbCO₃</i>	}
Siderite	<i>FeCO₃</i>	

Nitrates

Chile saltpetre	<i>NaNO₃</i>
Salt petre	<i>KNO₃</i>

Sulphates

Epsom salt	$MgSO_4 \cdot 7H_2O$
Barytes	$BaSO_4$
Gypsum	$CaSO_4 \cdot 2H_2O$
Glauber's salt	$Na_2SO_4 \cdot 10H_2O$
Anglesite	$PbSO_4$
Kainite	$KCl \cdot MgSO_4 \cdot 3H_2O$
Schonite	$K_2SO_4 \cdot MgSO_4 \cdot 6H_2O$
Polyhalite	$K_2SO_4 \cdot MgSO_4 \cdot CaSO_4 \cdot 2H_2O$

Phosphates and Silicates

Lepidolite (an ore of lithium)	$(Li, Na, K), Al(SiO_3), (F, OH)$
Petalite (an ore of lithium)	$LiAl(SiO_3)_2$
Triphylite (an ore of lithium)	$(Li, Na), PO_4, (Fe, Mn), (PO_4)_3$
Beryl (an ore of beryllium)	$3BeO \cdot Al_2O_3 \cdot 6SiO_2$
Willemite	Zn_2SiO_4
China clay	$Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$
Chlor-apatite	$3Ca_3(PO_4)_2 \cdot CaCl_2$
Mica	$K_2O \cdot 3Al_2O_3 \cdot 6SiO_2 \cdot 2H_2O$
Fluor-apatite	$3Ca_3(PO_4)_2 \cdot CaF_2$
Felspar	$KAlSi_3O_8$
Talc	$Mg_3(Si_2O_5)_2 \cdot Mg(OH)_2$
Asbestos	$CaMg_3(Si_2O_5)_2$

(iv) **Halide ores** : Metallic halides are very few in nature. Chlorides are most common. For example,

Common salt $NaCl$; Horn silver $AgCl$

Carnallite $KCl \cdot MgCl_2 \cdot 6H_2O$

The important fluoride ores are

Fluorspar CaF_2 ; Cryolite Na_3AlF_6

Metals in Biology

Metals are also found in living organisms, e.g.,

- (1) Magnesium is found in chlorophyll.
- (2) Potassium is present in plant roots.
- (3) Manganese, Iron and copper are present in chloroplast.
- (4) Zinc is present in eyes of cats and cows.
- (5) Iron is present in haemoglobin.
- (6) Calcium is present in bones.
- (7) Vanadium is present in cucumbers.
- (8) Chromium is present in prawn.

Extraction of Metals: Metallurgy

The extraction of a pure metal from its ore is called **metallurgy**. In order to extract the metal from ores, several physical and chemical methods are used. The method used depending upon chemical properties and nature of the ore from which it is to be extracted. It involves four main steps,

- (1) Crushing and grinding of the ore.
- (2) Concentration or dressing of the ore.
- (3) Reduction to free metal.
- (4) Purification or refining of the metal.

(1) **Crushing and grinding of the ore** : Those ores occur in nature as huge lumps. They are broken to small pieces with the help of *crushers* or *grinders*. These pieces are then reduced to fine powder with the help of a *ball mill* or *stamp mill*. This process is called **pulverisation**.

(2) **Concentration or dressing of the ore** : The ore are usually obtained from the ground and therefore contained large amount of unwanted impurities, e.g., earthing particles, rocky matter, sand, limestone etc. These impurities are known collectively as **gangue** or **matrix**. It is essential to separate the large bulk of these impurities from the ore to avoid bulk handling and in subsequent fuel costs. The removal of these impurities from the ores is known as **concentration**. The concentration is done by physical as well as chemical methods.

Physical Methods (i) **Gravity Separation or levigation**: This process of concentration is based on the difference in the specific gravity of the ore and gangue. The sieved ore is either subjected to dry centrifugal separation or is placed in big shallow tanks in which a strong current of water blows. Heavy ore particles settle down to the bottom of the tanks while lighter gangue particles are carried away by the current of water. The process removes most of the soluble and insoluble impurities. For this purpose wilfley table and hydraulic classifier are widely used. The method is particularly suitable for heavy oxide and carbonate ores like *Cassiterite* (SnO) and haematite.

Fig. 16.1. The Wilfley table

(ii) **Froth floatation process** : In some cases for example, sulphides ores of copper, zinc and lead concentration is brought by this method. In this method advantage is taken of the preferential wetting of the ore by an oil. The finely ground ore is taken in a tank containing water and 1% of **pine oil** or **terpentine oil**. A strong current of air is blown through the suspension, producing a heavy froth or foam on the surface. The metal sulphide is wetted by the oil but the gangues are not and the sulphide-oil mixture is carried to the surface by films of oil. The froth is skimmed off, the gangue settles down on the bottom or remains underneath the froth. By this floatation method it is possible to concentrate over 90% of a sulphide ore to 1/10 of its original bulk.

Fig. 16.2. Froth floatation process

(ii) **Activators and Depressants** : During the floatation process of some ores, these substances are added which activate or depress the floatation property of the minerals and thus help in the separation of minerals present in the ore. For instance, galena (PbS) is usually associated with sphalerite (ZnS) and pyrites (FeS). Concentration of galena is carried out by passing potassium ethyl xanthate (**Collector**) along with sodium cyanide and alkali (**depressants**) where by the floatation property of ZnS and FeS is depressed. Mainly PbS passes into the froth when air current is blown in, which is collected. After PbS is removed with the froth, same $CuSO_4$ (**activator**) is added and air is blown. The floatation property of ZnS is increased which is now removed with the froth. The slurry is acidified and process is repeated when FeS passed into the froth and is collected.

Fig. 16.3 Electromagnetic separation

(iii) **Electromagnetic separation** : If the mineral and not gangue is attracted by a magnet, it can be concentrated by magnetic separation. For example **chromite** ore, $FeCr_2O_4$ being magnetic can be separated from non-magnetic silicons impurities by this method. Sometimes two minerals occur together, in which one happens to be magnetic. By magnetic separation method the nonmagnetic minerals is separated from the magnetic mineral. For example **tin-stone or cassiterite**, SnO (non-magnetic) containing **wolfram**, $FeWO_4$ (magnetic) is separated by this method. In this method a thin layer of finely ground ore is spread over a rubber belt carried over a pulley in a magnetic field. The gangue particles or the particles of non-magnetic mineral fall off as the belt becomes vertical, and the magnetic particles collect.

Chemical methods (i) **Calcination** : In this process the concentrated ore is heated in a suitable furnace generally in reveratory furnace much below its **melting point** in absence of air. As a result of which the ore dries up and moisture and volatile impurities are driven off and carbonates are converted into oxides and the ore becomes porous. For example,

(ii) **Roasting** : The process of heating the ores strongly in presence of air with or without certain substances, below its melting point is termed as roasting. It differs from calcination in the respect that heating is done in presence of air and at a higher temperature. In this process the **impurities of sulphur and arsenic** etc. are volatilized away as oxides and the ore is converted into oxide. For example zinc oxide is formed by the oxidation of zinc blende,

(iii) **Leaching** : It involves the treatment of the ore with a suitable reagent as to make it soluble while impurities remain insoluble. The ore is recovered from the solution by suitable chemical method. For example, the chief ore of aluminium, bauxite ($AlO_2 \cdot 2H_2O$) contains varying amounts of ferric oxides, titanium oxide and silica. Since alumina is amphoteric, it can be separated from the other two oxides. Finely powdered bauxite is digested with caustic soda solution at 150–170°C under pressure for some hours. Alumina dissolves forming soluble sodium aluminate.

The impurities remain unaffected and separated as insoluble red mud which is filtered off. The filtrate is diluted and some freshly precipitated aluminium hydroxide is added when $Al(OH)_3$ is precipitated as follows,

The precipitated hydroxide is filtered off and calcified to get highly pure aluminium oxide (alumina).

Gold and silver are also extracted from their native ores by Leaching (Mac-Arthur forest cyanide process).

(3) **Reduction to free metal** : Some of the methods commonly used to get free metal from the concentrated ore are given below,

(i) **Smelting** : The process of extracting a metal in the state of fusion is called **smelting**. In this process the ore is mixed with carbon, obtained after the above reactions and heated in suitable furnace. A suitable **flux** is added during the operation to convert the non-fusible gangue to fusible slag. The metallic oxide is reduced by carbon and the metal may be obtained in the molten state or as vapours which are condensed. Metals like tin, zinc or lead are obtained by this process.

Flux and slag : Flux is a substance that is added during smelting to convert infusible silicons or earthy impurities into fusible material known as slag. **Impurities + Flux = Slag**. The slag is immiscible with the metal and has a low melting point and density. The slag floats on the metal and protects it from oxidation. It is removed from the furnace through the slag hole. If the impurities in the ore are acidic (SiO) in nature, a basic flux e.g., CaO , MgO , FeO etc. are added; and if the impurities are basic (CaO , FeO , etc.) then on acidic flux (SiO) is used. The gangue or matrix present in the ore is refractory or non-fusible in nature but it reacts with the flux forming fusible slag which does not mix with the molten metal and forms the upper layer. Slag are usually silicates.

(ii) **Reduction by Aluminium** (Gold-schmidt aluminio thermic process) : The process of reduction is used in the case of those oxides which can not be easily reduced by carbon. In this process, metallic oxides ore are mixed with aluminium powder commonly called as thermite and placed in a steel crucible lined inside with a refractory material and ignited by magnesium ribbon. By the use of this process a number of metals such as chromium and manganese are obtained on a commercial scale in highly pure state.

Large amount of heat energy is released during reduction, which fuses both the alumina and the metal.

(iii) **Self reduction process** : This process is also called autoreduction process or air reduction process. The sulphide ores of less electropositive metals like **Hg**, **Pb**, **Cu** etc., are heated in air as to convert part of the ore into oxide or sulphate which then reacts with the remaining sulphide ore to give the metal and sulphur dioxide. No external reducing agent is used in this process.

(iv) **Electrolytic reduction process** : This process is used in the extraction of the alkali and alkaline earth metals, zinc and aluminium. The material from which a metal to be obtained is first smelted by heating and then electrolysed. Sometimes, some other salt is mixed to lower the melting point of the substance taken. For example,

At anode (Oxidation) : $Cl^- \xrightarrow{-e^-} Cl ; Cl + Cl \rightarrow Cl_2$,

At cathode (Reduction) : $Na^+ + e^- \rightarrow Na$

(v) **Precipitation or metal displacement method** (Hydrometallurgy) : This method is used for extraction of metals such as **cadmium, copper, gold and silver**. A metal having higher electrode potential is added into the solution of a metal of lower electrode potential with the result that the latter is displaced or precipitated.

(vi) **Amalgamation process** : This method is used for the extraction of noble metals like **gold, silver**, etc., from the native ores. the finely powdered ore is brought in contact with mercury which combines with the particles of the metal present in the ore and form amalgam. The metal recovered from the amalgam by subjecting it to distillation, where the mercury distills over leaving behind the metal.

(4) **Purification or refining of metals** : Metals obtained as above are usually impure and need purification. Some of the methods used in the refining of metals are given below,

(i) **By piling** : The molten metals is stirred with green wood poles. Wood at the high temperature of the molten metals form hydrocarbons like methane which being about the reduction of any oxide present in the metal e.g.,

copper oxide present in the blister copper. In the case of the tin the impurities are oxidised and float on the molten metal as scum which is removed.

(ii) **By cupellation** : In this method the impure metal is heated in a blast of air when impurities are oxidised and blown away. For example, when impure silver is heated in air, lead present in it is oxidised to litharge (PbO) and blown away leaving a shining of silver.

(iii) **By liquation** : This process is used for refining easily fusible metals like lead and tin. The impure metal is heated on the slopy hearth of a reverberatory furnace. The metal melts and flows down leaving the impurities.

(iv) **By distillation** : Some metals have very low melting point and soon vaporize on behind heating, while the associated impurities remains in the solid state. **Zinc, mercury and arsenic** are purified by this method. Vacuum distillation gives very pure product and is used in the refining of the metals of IA and IIA Groups.

(v) **By fractional distillation** : This process is applied for the separation of **cadmium** from **zinc**. In the metallurgy of zinc, the metal is invariably associated with cadmium. The impure zinc is mixed with powdered coke and heated when the first portion of the condensate contain cadmium while zinc is obtained in the subsequent portions.

(vi) **By thermal dissociation** : In this process the metal is first converted into some compound which is then decomposed into pure metal by heating. For example, impure **nickel** is heated with carbon monoxide at $60^\circ C$ to form nickel carbonyl $Ni(CO)_4$, which is then decomposed at higher temperature, $150-180^\circ C$ to give very pure nickel. Sometimes iron is also purified by this method.

(vii) **By Electrolytic refining** : Most of the metals such as **copper, silver, gold, zinc, nickel, and chromium** are refined electrolytically. The impure metal is made the anode and a thin sheet of the pure metal the cathode in a suitable electrolytic bath. On passing current the metal from the anode passes in the solution and pure metal from the electrolyte is deposited on the cathode. The electrolyte used in the bath is usually a complex salt of the metal to enable the smooth deposition of pure metal on the cathode.

(viii) **Special methods**

(a) **Mond's process** : Nickel is purified by this method. Impure nickel is treated with carbon monoxide at $60-80^\circ C$ when volatile compound, nickel carbonyl, is formed. **Nickel carbonyl** decomposes at $180^\circ C$ to form pure nickel and carbon monoxide which can again be used.

(b) **Van Arkel process** : This methods is generally applied for obtaining ultrapure metals. The impure metal is converted into a volatile compound while the impurities are not affected. The volatile compound is then decomposed electrically to get the pure metal. **Ti, Zr, Hf, Si** etc., have been refined by this method.

(c) **Zone refining or fractional crystallisation** : Elements such as **Si, Ge, Ga**, etc., which are used as semiconductors are refined by this method. Highly pure metals are obtained. The method is based on the difference in solubility of impurities in molten and solid state of the metals. A movable heater is fitted around a rod of the metal. The heater is slowly moved across the rod. The metal melts at the point of heating and as the heater moves on from one end of the rod to the other end, the pure metal crystallises while the impurities pass on the adjacent melted zone.

Fig. 16.4. Zone refining of metals

Table 16.1 Summary of the Extraction of Metals

Metal	Main Occurrence	Main method of Extraction
Sodium	Common Salt, $NaCl$	Electrolysis of fused $NaCl$ with $CaCl_2$
Magnesium	Carnallite, $KCl.MgCl_2.6H_2O$ Magnesite $MgCO_3$	Electrolysis of fused $MgCl_2$ with KCl
Calcium	Lime stone, $CaCO_3$ Gypsum, $CaSO_4.2H_2O$	Electrolysis of fused $CaCl_2$ and CaF_2
Aluminium	Bauxite, $Al_2O_3.2H_2O$	Electrolysis of Al_2O_3 in molten Na_3AlF_6 (cryolite)
Copper	Copper pyrites, $CuFeS_2$ Cuprite, Cu_2O	Partial oxidation of sulphide ore $(2Cu_2O + Cu_2S \longrightarrow 6Cu + SO_2)$
Silver	Argentite, Ag_2S Native silver	Hydrometallurgy $Ag_2S + 4NaCN \longrightarrow 2NaAg(CN)_2 + Na_2S$ $2NaAg(CN)_2 + Zn \longrightarrow Na_2Zn(CN)_4 + 2Ag$
Zinc	Zinc Blende, ZnS Calamine, $ZnCO_3$	Reduction of ZnO with carbon or electrolysis of $ZnSO_4$ $ZnO + C \longrightarrow Zn + CO$
Lead	Galena, PbS	Reduction of PbO with carbon $PbO + C \longrightarrow Pb + CO$
Tin	Cassiterite, SnO_2	Reduction of SnO_2 with carbon $SnO_2 + 2C \longrightarrow Sn + 2CO$

Iron	Haematite, Fe_2O_3 Magnetite, Fe_3O_4	Reduction of oxide with carbon monoxide $Fe_2O_3 + 3CO \longrightarrow 2Fe + 3CO_2$
Chromium	Chromite, $FeO.Cr_2O_3$	Reduction of Cr_2O_3 with Al $Cr_2O_3 + 2Al \rightarrow 2Cr + Al_2O_3$
Nickel	Millerite, NiS	Reduction of NiO with CO $NiO + 5CO \longrightarrow Ni(CO)_4 + CO_2$; $Ni(CO)_4 \longrightarrow Ni + 4CO$
Mercury	Cinnabar, HgS	Direct reduction of HgS by heat alone $HgS + O_2 \longrightarrow Hg + SO_2$

Main types of metallurgical processes

Different metallurgical processes can be broadly divided into three main types

(1) **Pyrometallurgy** : Extraction is done using heat energy. The metals like $Cu, Fe, Zn, Pb, Sn, Ni, Cr, Hg$ etc. Which are found in the nature in the form of oxides, carbonates, sulphides are extracted by this process.

(2) **Hydrometallurgy** : Extraction of metals involving aqueous solution is known as hydrometallurgy. Silver, gold etc are extracted by this process.

(3) **Electrometallurgy** : Extraction of highly reactive metals such as Na, K, Ca, Mg, Al etc. by carrying electrolysis of one of the suitable compound in fused or molten state.

Furnaces

In the extraction of metal different types of furnaces are used. Each furnace has its own characteristics. Some principal furnaces have been described below,

(1) **Blast furnace** : It is a special type of tall cylindrical furnace, about 100 feet high with a diameter of 15-28 feet. It is made of steel sheets lined inside with fire-proof bricks. The charge is added through a cup and cone arrangement at the top. At the upper part of the furnace there is a hole for the escape of the waste gases of the furnace. There are two outlets in the hearth of the furnace, one for tapping the molten metal and the other above it for the slag. The waste gases are heated and a hot air blast under pressure is blown into the furnace by means of bellows or fans through water cooled nozzles or tuyeres. The temperature of the furnace varies from $250^\circ C$ to $1500^\circ C$. Thus the charge descends slowly into zone of increasing temperatures. The blast furnace is used for the extraction of metal like **copper and iron**.

Fig. 16.5 Blast Furnace

(2) **Reverberatory Furnace** : In this furnace fuel burns in a separate part and does not mix with the charge. The furnace may be divided into 3 parts,

(i) **Fire Grate** : It is on one side where the fuel burns.

(ii) **Flue or Chimney** : It is on the other side of the fire grate. The waste gases escape through it.

(iii) **Hearth** : It is the middle part of the furnace where the charge is heated with the flames and hot gases.

The material to be heated is placed on the hearth or bed of the furnace and is heated by the hot gases or flames produced by the burning of fuel. The waste gases escape out of the chimney. Since the fuel does not come in contact with the charge, the furnace is very suitable for calcination and roasting and is employed for both oxidising and reducing purposes. For oxidation, the material is heated by the current of hot air while for reduction the material is mixed with coke and heated. The furnace find wide application in the extractive metallurgy.

Fig. 16.6. Modern reverberatory furnace

(3) **Electric Furnace** : The fuel burnt furnaces described in this chapter produce temperature in the range of $1000-1500^\circ C$. Although these furnaces have the great utility in the extraction of metals yet these are unsuitable where higher temperatures are needed. One commonly used electric furnace is **Heroult's furnace** shown in fig. It consists of a steel shell lined inside with dolomite or magnesite. It is provided with movable water jacketed electrodes suspended from the roof or from the sides. Heat is generated by striking an arc between the electrodes, thereby, a temperature of over $3000^\circ C$ may be reached. The charge melts and the impurities e.g., Si, Mn, P and S etc. present in the ore combine with the basic lining to form slag, which is free from sulphur or gas bubbles. **Steel** of very fine quality is prepared by this method. Electric furnaces are largely used where,

(i) Cheap power supply is available. (ii) High temperature are required. (iii) Pure product are required.

As such they find wide applicability in a number of industries such as metallurgy, ceramics plastics chemical and also in the research laboratories. These furnaces are easily operated and involve the problem of the storage of fuel and disposal of fuel waste.

(4) **Muffle Furnace** : In this furnace the material to be heated does not come in the contact with the fuel or flames. A muffle is a chamber made of refractory material and is surrounded by flames and hot gases on all sides. The products of combustion are removed through a door provided in the furnace. Muffle furnace is used for the extraction of **zinc**, preparation of red lead, Pb_2O_3 and for testing the purity of precious metals like **silver** and **gold**. In an electric muffle furnace the chamber is surrounded by resistance coils.

Fig. 16.7. Muffle furnace

(5) **Bessemer Converter** : A Bessemer converter is a pear-shaped 10 or more feet high, open at the top, lined with a refractory material such as silica or magnesia which also acts as a flux. The converter is mounted on trunnions, so that it can be tilted to collect the products formed. There is an arrangement of introducing a hot blast of air from a number of small openings in the bottom of the furnace. The converter is used mostly for manufacturing of **copper of steel from pig iron**. Passing a current of hot air into the molten metal taken in the converter, the impurities are oxidised and escaped as gases or from slag. The Bessemer process is rapid one and does not take more than 15 minutes in the production of one bath.

(6) **Regenerative Furnace** : These are furnaces in which the heat of the gases escaping out from the chimney is utilized. Most of the furnaces particularly blast furnaces are fitted up with regenerated system which means an economy of the fuel. A flowing column of air is heated by the hot flue gases, it is then brought back to the fire and returned to the furnace. This furnace is largely used in the production of **steel**.

Refractory materials

The materials which can withstand very high temperatures without melting or becoming soft are known as refractory materials. These are not

affected by slags formed during the extraction of metals. These are used in the form of bricks for the internal linings of furnaces. Refractory materials used are of three types,

- (1) **Acid refractories** : Silica, quartz, silicious sand stones, etc., are the examples.
- (2) **Basic refractories** : Lime, dolomite, magnesite, etc., are the examples.
- (3) **Neutral refractories** : Graphite, chromite, bone ash, etc., are the examples.

Silica (92% SiO_2 , 2.7% Al_2O_3) and quartz, can tolerate temperatures upto about $1750^\circ C$, bauxite upto $1800^\circ C$, alumina upto $2000^\circ C$ and magnesite, chromite, etc., upto $2200^\circ C$. Some carbides such as silicon carbide is used as refractory for special purposes.

Alloys

A metallic product containing two or more metals or sometimes one of the ingredients a non-metal provided that the mixture is homogenous and possesses metallic properties, is known as an alloy. Alloys are usually prepared by melting two or more metals together in the proportions and then allowing the melting to solidify. If one of the metals is mercury the alloy is known as **amalgam**.

Alloys are prepared with a view to impart some desirable properties which the individual metals do not possess. These are,

- (1) **Change in the chemical reactivity** : Sodium acts vigorously with water, but $Na-Hg$ amalgam reacts slowly to suit the requirement of a number of chemical reactions.
- (2) **Hardness** : Silver, gold and soft metals but become hard when alloyed with copper.
- (3) **Melting Points** : Melting points of an alloy may be higher or lower than any of its components. Wood-metal, which is an alloy of Bi , Pb , Sn and Cd fuses at $60.5^\circ C$, while none of these metals fuses at this low temperature.
- (4) **Change of colour** : Aluminium bronze is an alloy of aluminium and copper. It is of golden, yellow colour and is used in making decoration articles, jewellery and coins while the colour of aluminium is white and that of copper is red.
- (5) **Corrosion resistance** : Iron gets corroded soon whereas stainless Steel, an alloy of iron and chromium, resists corrosion.
- (6) **Casting** : An alloy of lead and antimony is known as **type metal** is used for casting type required in printing works.

Table 16.2 Alloys of Al

Alloy	Percentage		Important Properties	Uses
Aluminium bronze	Al Cu	95% 5%	Light, strong alloy with golden lustre, resistant to corrosion	Coins, utensils, jewellery picture frames etc.
Magnalium	Al Mg	95% 5%	Light, tough and strong	Light instruments, balance beam, pressure cookers etc.
Duralumin	Al Cu Mg Mn	95% 4% 0.5% 0.5%	Light, tough, ductile, resistant to corrosive action	Making aeroplanes automobile parts pressure cookers etc.

Table 16.3 Alloys of Ag

Alloy	Percentage composition	Uses
Coinage silver	Ag = 90, Cu = 10	For making silver coins.
Silver solder	Ag = 63, Cu = 30, Zn = 7	For soldering and joining metals
Dental alloy	Ag = 33, Hg = 52, Sn = 12.5, Cu = 2.0, Zn = 0.5	For filling teeth

Silver palladium	$Ag = 40, Pd = 60$	Potentiometers and winding of some special instruments.
------------------	--------------------	---

Table 16.4 Alloys of Pb and Sn

Alloy	Percentage Composition	Uses
Solder	$Pb = 50, Sn = 50$	For soldering.
Pewter	$Pb = 20, Sn = 80$	In making cups, mugs and other utensils.
Type metal	$Pb = 70, Sb = 20$ and $Sn = 10$	For making printing type.
Rose metal	$Pb = 22, Sn = 28, Bi = 50$	For making electric fuses.
Britannia metals	$Sn = 90, Sb = 8, Cu = 2$	For making table wares.

Table 16.5 Alloys of Copper

Alloy	Percentage Composition	Uses
Brass	$Cu = 80, Zn = 20$	For making utensils, condenser tubes, wires parts of machinery etc.
Bronze or Copper bronze	$Cu = 80, Zn = 10, Sn = 10$	For making cooking utensils, statues, coins etc.
Aluminium bronze	$Al = 95, Cu = 5$	Coins, picture frames, cheap jewellery
Gun metal	$Cu = 90, Sn = 10$	For making gun barrels.
Bell metal	$Cu = 90, Sn = 20$	For making bells, gongs etc.
Constantan	$Cu = 60, Ni = 40$	For electrical apparatus
German silver	$Cu = 60, Zn = 20, Ni = 20$	For making silver wire, resistance wires etc.
Monel metal	$Cu = 30, Ni = 67, Fe$ and $Mn = 3$	For making acid pumps and acid containers.
Phosphor bronze	$Cu = 95, Sn = 4.8, P = 0.2$	For making springs, electrical equipment
Gold-copper alloy	$Au = 90, Cu = 10$	For making gold coins, jewellery, watch cases, spectacle rims etc.

Table 16.6 Alloys of Iron

Name	Percentage	Properties	Uses
Stainless steel	$Fe = 73\%, Cr = 18\%, Ni = 8\%$ and carbon	Resists corrosion	For making utensils, cutlery and ornamental pieces.
Manganese steel	$Fe = 86\%, Mn = 13\%$ and carbon	Very hard, resistant to wear and tear.	For Making rock drills, safes etc.
Tungsten steel	$Fe = 94\%, W = 5\%$ and carbon	Retains hardness even at high temperatures	For making high speed cutting tools.
Invar	$Fe = 64\%, Ni = 36\%$	Practically no coefficient of expansion.	For making watches, meter scales, pendulum rods etc.
Nickel steel	$Fe = 98-96\%, Ni = 2-4\%$	Resistant to corrosion, hard and elastic.	For making wire cables, gears, drive shafts etc.
Permalloy	$Fe = 21\%, Ni = 78\%$ and carbon	Strongly magnetised by electric current, loses magnetism when current is cut off.	For making electromagnets, ocean cables etc.
Chrome steel	$Fe = 98-96\%, Cr = 2-4\%$	High tensile strength	For making axles, ball bearings and cutting tools such as files.
Alnico	$Fe = 60\%, Al = 12\%, Ni = 20\%, Co = 8\%$	Highly magnetic	For making permanent magnets.

Tips & Tricks

- ✍ Pitch blende is the source of *Ra*, *U* and *Th*.
- ✍ Nitrate is least likely to be found in mineral.
- ✍ Oxygen is the most abundant element (45.2%)
- ✍ Aluminium is the most abundant metal (8.3%)
- ✍ Silicon is the second most common element in the universe (27.2%)
- ✍ First five elements comprise almost 92% by weight
- ✍ First ten elements make up over 99.5% of the earth crust.
- ✍ Other very abundant elements are nitrogen (78% of the atmosphere) and hydrogen which occurs as water in the ocean.
- ✍ Diamond consists only of carbon.
- ✍ Removal of unwanted earthy and silicious impurity from the ore is called ore dressing or concentration.
- ✍ *Refractory materials* : These are the substances which can withstand very high temperature without melting or becoming soft.
- ✍ Noble metals like *Au*, *Ag* etc. are obtained by cyanide or amalgamation process.
- ✍ Active metals like *Li*, *Na*, *K* (alkali metals), *Cs*, *Mg*, *Sr*, *Ba* (alkaline earth metals) etc. are obtained by the electrolysis of their chloride, oxides or hydroxide.
- ✍ Heavy metals like *Cu*, *Zn*, *Fe*, *Pb*, *Sn* etc. are obtained by roasting and smelting process.
- ✍ Gravity separation is employed for the concentration of oxide ores.
- ✍ Slag is used in road making as well as in the manufacture of cement and fertilizers.

Ordinary Thinking

Objective Questions

Occurrence

1. The most abundant element on earth crust is
[MP PMT 1972, 80, 84; DPMT 1986]
(a) Hydrogen (b) Oxygen
(c) Silicon (d) Carbon
2. Naturally occurring substances from which a metal can be profitably (or economically) extracted are called
[CPMT 1982; MP PET 1996]
(a) Minerals (b) Ores
(c) Gangue (d) Salts
3. Titanium containing mineral found in our country is
[NCERT 1984; RPET 1999]
(a) Bauxite (b) Dolomite
(c) Chalcopyrites (d) Elmanite
4. Silicon is main constituent of
[DPMT 1985]
(a) Alloys (b) Rocks
(c) Animals (d) Vegetables
5. Ore pitch blende is main source of
[DPMT 1985; RPET 1999]

- (a) *Ra* (b) *Ce*
(c) *Th* (d) *Mg*
6. Which of ore is metalloid [MP PMT 1987]
(a) *As* (b) *Na*
(c) *Au* (d) *Fe*
7. A mineral is called an ore if [MP PMT 1990]
(a) Metal present in mineral is precious
(b) Metal can be extracted from it
(c) Metal can be extracted profitably from it
(d) Metal cannot be extracted from it
8. The highest quantity present in the atmosphere is of [NCERT 1971, 79; CPMT 1972]
(a) Oxygen (b) Hydrogen
(c) Nitrogen (d) Ozone
9. Which of the following statement is correct
(a) Bauxite is an ore of aluminium
(b) Magnetite is an ore of manganese
(c) Haematite is an ore of mercury
(d) Pyrites is an ore of phosphorus
10. Carnallite is a mineral of [CBSE PMT 1988; DPMT 1983; AMU 1999]
(a) *Ca* (b) *Na*
(c) *Mg* (d) *Zn*
11. The salt which is least likely to be found in minerals is [DPMT 1984]
(a) Chloride (b) Sulphate
(c) Sulphide (d) Nitrate
12. Metal which can be extracted from all the three dolomite, magnesite and carnallite is [MP PET 1985]
(a) *Na* (b) *K*
(c) *Mg* (d) *Ca*
13. Cinnabar is an ore of [DPMT 1982, 84; CBSE PMT 1991; MNR 1986; CPMT 1973, 76, 78, 79, 86, 89, 94; UPSEAT 1999]
(a) *Hg* (b) *Cu*
(c) *Pb* (d) *Zn*
14. Metallurgy is the process of [MP PET 2001]
(a) Concentrating the ore
(b) Roasting the ore
(c) Extracting the metal from the ore
(d) Adding carbon to the ore in blast furnace
15. What is believed to be the second most common element in the universe [MP PET 2000]
(a) Helium (b) Hydrogen
(c) Nitrogen (d) Silicon
16. Which of the following substances consists of only one element [MP PET 1999, 2000]
(a) Marble (b) Sand
(c) Diamond (d) Glass
17. Which of the following minerals is not an ore of aluminium
(a) Bauxite (b) Gypsum
(c) Cryolite (d) Corundum
18. An example of halide ore is [MP PMT 1993]
(a) Galena (b) Bauxite
(c) Cinnabar (d) Cryolite
19. Which of the following is not an ore [IIT 1982]
(a) Bauxite (b) Malachite
(c) Zinc blende (d) Pig iron
20. "Chile saltpetre" is an ore of [CPMT 1982]
(a) Iodine (b) Sodium

- (c) Bromine (d) Magnesium
21. Which of the following metal is not found in free state
(a) *Na* (b) *Au*
(c) *Ag* (d) *Pb*
22. Which of the following ore is used for industrial extraction of aluminium in India [MP PET 1989]
(a) Corundum (b) Keolin
(c) Cryolite (d) Bauxite
23. Bauxite is an oxide ore of [BHU 1979; AFMC 1980; Kurukshetra CEE 1998; RPET 1999; CPMT 1976, 2001, 02]
(a) Barium (b) Boron
(c) Bismuth (d) Aluminium
24. Cryolite is [AMU 1983]
(a) Magnesium silicate
(b) Sodium borofluoride
(c) Sodium aluminium fluoride
(d) Magnesium silicate
25. Composition of bauxite is
(a) Al_2O_3 (b) $Al_2O_3 \cdot H_2O$
(c) $Al_2O_3 \cdot 2H_2O$ (d) $Al_2O_3 \cdot 3H_2O$
26. Main ore of aluminium is [CPMT 1989, 91, 2001; RPMT 1997; RPET 1999]
[CPMT 2002, MP PMT 1999]
(a) Bauxite (b) Corundum
(c) Cryolite (d) Magnetite
27. Corundum is [CPMT 1975, 76; DPMT 1983]
(a) SrO_2 (b) Al_2O_3
(c) $CaCl_2$ (d) Cu_2Cl_2
28. Which is not a mineral of aluminium [BHU 1974, 79; MNR 1984; DPMT 2002]
(a) Anhydrite (b) Bauxite
(c) Corundum (d) Diaspore
29. Which of the following mineral does not contain *Al* [IIT (Screening) 1992]
(a) Cryolite (b) Mica
(c) Feldspar (d) Fluorspar
30. An important oxide ore of iron is [MP PET/PMT 1998; MP PET 1990; MP PMT 1994, 96]
(a) Haematite (b) Siderite
(c) Pyrites (d) Malachite
31. Which ore is used for the manufacture of iron [CPMT 1973, 79; RPET 2000]
(a) Cryolite (b) Bauxite
(c) Haematite (d) Chalcopyrites
32. Formula of magnetite is [CPMT 1991]
(a) Fe_2O_3 (b) FeS_2
(c) $FeCO_3$ (d) Fe_3O_4
33. Which of the following is ferrous alloy [DPMT 1982, 84; CPMT 1989]
(a) Invar (b) Solder
(c) Magnalium (d) Type metal
34. Which of the following ores does not represent the ore of iron [CPMT 1989; AIIMS 2002]
(a) Haematite (b) Magnetite
(c) Cassiterite (d) Limonite
35. The formula of haematite is [MNR 1994]
(a) Fe_3O_4 (b) Fe_2O_3
(c) $FeCO_3$ (d) FeS_2
36. Which metal is not silvery white
(a) *Ni* (b) *Cu*
(c) *Na* (d) *Sn*
37. Azurite is an ore of
(a) *Ag* (b) *Cu*
(c) *Pt* (d) *Au*
38. Copper can be extracted from [NCERT 1973; IIT 1978; J & K 2005]
(a) Kupfernickel (b) Dolomite
(c) Galena (d) Malachite
39. Which of the following ore is called malachite [CPMT 1989, 93]
(a) Cu_2S (b) $CuCO_3 \cdot Cu(OH)_2$
(c) Cu_2O (d) $CuCO_3$
40. Argentite is a mineral of [CPMT 1978; MP PMT/PET 1988]
(a) Copper (b) Silver
(c) Platinum (d) Gold
41. Which one of the following is an ore of silver [CPMT 1983; MP PET 1989; CBSE PMT 1993]
(a) Argentite (b) Stibnite
(c) Haematite (d) Bauxite
42. Calamine is [BHU 1980, 85; CPMT 1990; MNR 1995; UPSEAT 1999]
(a) $ZnSO_4$ (b) ZnO
(c) $Zn(NO_3)_2$ (d) $ZnCO_3$
43. Important ore of zinc is [CPMT 1973, 78, 80]
(a) Calamine (b) Cryolite
(c) Gibbsite (d) Malachite
44. Which of the following statement is incorrect [CPMT 1985]
(a) Silver glance mainly contains silver sulphide
(b) Gold is found in native state
(c) Zinc blende mainly contain zinc chloride
(d) Copper pyrites also contain Fe_2S_3
45. Commercially important ore of lead from which it is extracted is [DPMT 1982, 90]
(a) Siderite (b) Haematite
(c) Galena (d) None of these
46. Which of the following is not an ore of lead [MP PMT 1993]
(a) Galena (b) Anglesite
(c) Calamine (d) Cerrusite
47. Galena is
(a) PbO (b) $PbCO_3$
(c) PbS (d) $PbCl_2$
48. An example of an oxide ore is [MP PET 1996]
(a) Bauxite (b) Malachite
(c) Zinc blende (d) Felspar
49. Cryolite is an ore of [MP PMT 1996; BHU 2002; DPMT 1996]
(a) Iron (b) Silver
(c) Zinc (d) Aluminium
50. Cassiterite is an ore of [CBSE PMT 1999; DPMT 1996]
(a) *Mn* (b) *Ni*
(c) *Sb* (d) *Sn*

51. Which one of the following is the most abundant element in the universe [NDA 1999]
(a) Nitrogen (b) Hydrogen
(c) Oxygen (d) Silicon
52. Among the following statements, the incorrect one is [IIT 1997]
(a) Calamine and siderite are carbonates
(b) Argentite and cuprite are oxides
(c) Zinc blende and pyrites are sulphides
(d) Malachite and azurite are ores of copper
53. Which one of the following ores is a chloride [EAMCET 1997; CPMT 2001]
(a) Horn silver (b) Zincite
(c) Bauxite (d) Felspar
54. Aluminium is most abundant in earth crust yet it is obtained from bauxite because [CPMT 1997]
(a) Bauxite is available in larger quantity
(b) Of easy extraction of aluminium from it
(c) Bauxite contains maximum aluminium
(d) Bauxite is less impure
55. An ore of potassium is [JIPMER 2001]
(a) Bauxite (b) Solomite
(c) Carnallite (d) Cryolite
56. The molecular formula of cryolite is [AFMC 1999; MP PET 2002]
(a) Fe_3O_4 (b) Na_3AlF_6
(c) $Na_2Al_2O_3$ (d) All of these
57. All ores are minerals, while all minerals are not ores because [Orissa JEE 2002]
(a) The metal can't be extracted economically from all the minerals
(b) Minerals are complex compounds
(c) The minerals are obtained from mines
(d) All of these are correct
58. Corundum is an ore of [Kerala (Med.) 2002]
(a) Copper (b) Boron
(c) Aluminium (d) Sodium
59. Which one of the following is correct [MP PET/PMT 2002]
(a) A mineral cannot be an ore
(b) An ore cannot be a mineral
(c) All minerals are ores
(d) All ores are minerals
60. Which ore contains both iron and copper? [IIT-JEE (Screening) 2005]
(a) Cuprite (b) Chalcocite
(c) Chalcopyrite (d) Malachite
61. Formula of Felspar is [MHCET 2004]
(a) $K_2O \cdot Al_2O_3 \cdot 6SiO_2$
(b) $K_2O_3 \cdot Al_2O_3 \cdot 6Si_2O_2 \cdot 2H_2O$
(c) $Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$
(d) $3MgO \cdot 4SiO_2 \cdot H_2O$
62. Chile saltpetre is [MP PET 2004]
(a) $NaNO_3$ (b) KNO_3
(c) Na_2SO_4 (d) $Na_2S_2O_3$
63. Which of the following is not an ore of magnesium [CPMT 2004; DCE 2004]
(a) Magnesite (b) Dolomite
(c) Gypsum (d) Carnalite
64. Which of the following is not a mineral of iron? [Kerala PMT 2004]
(a) Magnetite (b) Siderite
(c) Smithsonite (d) Limonite
(e) Haematite
65. The ore carnalite is represented by structure: [EAMCET 1987; MP PET 1986, 04; AFMC 2000 Pb. PMT 2004]
(a) $Na_2Al_2O_3$ (b) Na_3AlF_6
(c) $KCl \cdot MgCl_2 \cdot 6H_2O$ (d) Fe_3O_4
66. Which of the following metal is sometimes found native in nature [CPMT 1973, 7]
(a) Al (b) Cu
(c) Fe (d) Mg
67. The most abundant metal in the earth crust is [BHU 1979, 81; MP PMT 1997; CPMT 1988, 2001; CBSE PMT 2000]
(a) Na (b) Mg
(c) Al (d) Fe
68. Indicate the mineral from which copper is manufactured [NCERT 1973]
(a) Galena (b) Cuprite
(c) Sphalerite (d) Chalcopyrite
69. The principal ores of silver are argentite, horn silver and pyrargyrite. Their formula respectively are
(a) Ag_2S , $AgCl$ and $AgSbS_2$
(b) $AgCl$, $AgSbS_2$ and Ag_2S
(c) $AgSbS_2$, Ag_2S and $AgCl$
(d) $AgCl$, Ag_2S and $AgSbS_2$
70. The most important ore of tin is [AFMC 2005]
(a) Cassiterite (b) Cryolite
(c) Cerussite (d) None of these
71. Important ore of Mg is [BCECE 2005]
(a) Gypsum (b) Carnalite
(c) Magnetite (d) Carnolite
72. Which of the following is a carbonate ore [AIIMS 2005]
(a) Pyrolusite (b) Malachite
(c) Diaspore (d) Cassiterite

Concentration

1. Sulphide ores are generally concentrated by [CPMT 1980, 82; EAMCET 1980; MNR 1981; DPMT 1982; KCET 1993]
(a) Froth floatation process (b) Magnetic separation
(c) Gravity separation (d) By hand picking
2. Froth floatation process is used for the concentration of [NCERT 1984; CPMT 1982, 87; MP PMT 1989; BHU 1997; EAMCET 1983; AMU 1984; DPMT 1989; AFMC 2000; MNR 1981; KCET 2000; MP PET 2001; Pb. PMT 2002]
(a) Oxide ores (b) Sulphide ores
(c) Chloride ores (d) Amalgams
3. A process used for the concentration of ore is [MP PMT 1990; MP PET 2003]
(a) Froth floatation (b) Roasting
(c) Electrolysis (d) Bessemerization
4. Magnetic separation is used for increasing concentration of the following [MP PET 1990]
(a) Horn silver (b) Calcite
(c) Haematite (d) Magnesite
5. The substance added in water in the froth floatation process is [EAMCET 1980]

- (a) Soap powder (b) Pine oil
(c) Coconut oil (d) None of the above
6. For which one of the metal, froth floatation method is used for concentration [MP PMT 2001]
(a) Horn silver (b) Bauxite
(c) Cinnabar (d) Haematite
7. Cyanide process is used in the extraction of [DCE 2002, 03]
(a) Au (b) Ag
(c) both (a) and (b) (d) Cu
8. Cassiterite is concentrated by [EAMCET 1998]
(a) Levigation
(b) Electromagnetic separation
(c) Floatation
(d) Liquifaction
9. Froth floatation process for the concentration of ores is an illustration of the practical application of [NCERT 1984]
(a) Adsorption (b) Absorption
(c) Coagulation (d) Sedimentation
10. Iron ore is concentrated by [MP PMT 1991]
(a) Froth floatation (b) Electrolysis
(c) Roasting (d) Magnetic treatment
11. An ore of tin containing $FeCrO_4$ is concentrated by [SCRA 1991]
(a) Magnetic separation (b) Froth floatation
(c) Electrostatic method (d) Gravity separation
12. One of the following metals forms a volatile compound and this property is taken advantage for its extraction. This metal is [NCERT 1984]
(a) Iron (b) Nickel
(c) Cobalt (d) Tungsten
13. Bauxite ore is concentrated by [MP PET 1994; KCET 1999; UPSEAT 2001]
(a) Froth floatation
(b) Electromagnetic separation
(c) Chemical separation
(d) Hydraulic separation
14. In extraction of copper, we use [CPMT 1980; MP PMT 1986]
(a) Cu_2S (b) Pyrites
(c) Silver argentocyanide (d) $CuFeS_2$
15. Which metal is most difficult to be extracted from its oxide
(a) Cs (b) Ag
(c) Zn (d) Mg
16. Copper pyrites are concentrated by [MNR 1995; UPSEAT 1999; AMU 1999; MP PMT 2003]
(a) Electromagnetic method (b) Gravity method
(c) Froth floatation process (d) All the above methods
17. In the metallurgy of zinc, flux is not used because
(a) Zinc ore has no impurities
(b) Zinc is volatile hence easily separated
(c) Zinc reacts with flux
(d) Flux is volatile
18. Ores like magnetite or tungstates in tin ores are concentrated by
(a) Froth floatation (b) Magnetic separation
(c) Gravity separation (d) Electrostatic separation
19. Froth-floatation method is successful in separating impurities from ores because [Kerala CET 2005]
(a) The pure ore is lighter than water containing additives like pine oil, cresylic acid etc.
(b) The pure ore is soluble in water containing additives like pine oil, cresylic acid etc.
(c) The impurities are soluble in water containing additives like pine oil, cresylic acid etc.
(d) The pure ore is not as easily wetted by water as by pine oil, cresylic acid etc
20. An ore like zinc blende is concentrated by [MP PMT 1997]
(a) Froth floatation (b) Magnetic separation
(c) Leaching (d) Washing with water
21. The method of concentrating the ore which makes use of the difference in density between ore and impurities is called [Pune CET 1998]
(a) Levigation (b) Leaching
(c) Magnetic separation (d) Liquifaction
22. Which of the following ore is best concentrated by froth-floatation method [AIEEE 2004]
(a) Galena (b) Cassiterite
(c) Magnetite (d) Malachite

Roasting & Calcination

1. Refractory materials are generally used in furnaces because [MNR 1980; MP PMT 1986]
(a) They possess great structural strength
(b) They can withstand high temperature
(c) They are chemically inert
(d) They do not require replacement
2. Main function of roasting is [MP PET/PMT 1988]
(a) To remove volatile substances
(b) Oxidation
(c) Reduction
(d) Slag formation
3. Roasting is generally done in case of the following [MP PMT 1985]
(a) Oxide ores (b) Silicate ores
(c) Sulphide ores (d) Carbonate ores
4. Heating of pyrites in air for oxidation of sulphur is called [CPMT 1973, 75, 78, 79, 94; DPMT 1982, 84, 86; MP PMT 2000, 01, 02]
(a) Roasting (b) Calcination
(c) Smelting (d) Slagging
5. Which is not basic flux [CPMT 1986]
(a) $CaCO_3$ (b) Lime
(c) SiO_2 (d) CaO
6. A substance which reacts with gangue to form fusible material is called [MP PMT 1990; Kurukshetra CEE 1998]
(a) Flux (b) Catalyst
(c) Ore (d) Slag
7. When lime stone is heated strongly, it gives off CO_2 . In metallurgy this process is known as [MP PET/PMT 1988]
(a) Calcination (b) Roasting
(c) Smelting (d) Ore dressing
8. Electric furnaces are lined with magnesia because
(a) It is not affected by acids
(b) It gives oxygen on heating
(c) It melts at very high temperature

- (d) It has no effect of electricity
9. Purpose of smelting of an ore is [MP PMT 1990, 2001; Kurukshetra CEE 1998; RPMT 2000]
- (a) To oxidise it
(b) To reduce it
(c) To remove vaporisable impurities
(d) To obtain an alloy
10. Smelting is done in [DPMT 1979]
- (a) Blast furnace (b) Muffle furnace
(c) Open-hearth furnace (d) Electric furnace
11. In order to bring initial chemical change in the ore, the process of heating of ore below its melting point is known as
- (a) Reduction (b) Smelting
(c) Calcination (d) Roasting
12. Matte contains mainly [KCET 2000]
- (a) Cu_2S and FeS (b) CuS and Fe_2S_3
(c) Fe (d) Cu_2S
13. The substance which is mixed with the ore for removal of impurities is termed as [MP PMT 1985, 87, 90; CPMT 1996; JIPMER 2002]
- (a) Slag (b) Gangue
(c) Flux (d) Catalyst
14. The cheap and having high melting point compound used in furnace is [CPMT 1975]
- (a) PbO (b) CaO
(c) HgO (d) ZnO
15. Which of the following substance can be used for drying gases [EAMCET 1997; MP PET 1999]
- (a) $CaCO_3$ (b) Na_2CO_3
(c) $NaHCO_3$ (d) CaO
16. Which one of the furnaces among the following can produce the highest temperature
- (a) Muffle furnace (b) Blast furnace
(c) Reverberatory furnace (d) Electric furnace
17. The process of heating the ore strongly in excess of air so that the volatile impurities are removed and the ore is changed to oxide is known as [AMU 1985; NCERT 1990]
- (a) Calcination (b) Roasting
(c) Froth floatation (d) Leaching
18. The role of calcination in metallurgical operations is [AMU 1984]
- (a) To remove moisture
(b) To decompose carbonate
(c) To drive off organic matter
(d) To achieve all the above
19. Calcination is the process of heating the ore [CPMT 1982]
- (a) In a blast furnace (b) In absence of air
(c) In presence of air (d) None of these
20. Smelting is termed to the process in which [MP PMT 1987]
- (a) The ore is heated in the absence of air
(b) Ore is cold
(c) The ore is heated in the presence of air
(d) Ore is melted
21. The metallurgical process in which a metal is obtained in a fused state is called [IIT 1978; MP PET 1997]
- (a) Smelting (b) Roasting
(c) Calcination (d) Froth floatation
22. Which of the following processes involves smelting [NCERT 1983]
- (a) $ZnCO_3 \rightarrow ZnO + CO_2$
(b) $Fe_2O_3 + 3C \rightarrow 2Fe + 3CO$
(c) $2PbS + 3O_2 \rightarrow 2PbO + 2SO_2$
(d) $Al_2O_3 \cdot 2H_2O \rightarrow Al_2O_3 + 2H_2O$
23. Reverberatory furnace is employed in the metallurgical process mainly for [MP PMT 1994]
- (a) Reduction of oxide ores
(b) Smelting of sulphide ores
(c) Conversion of chloride to sulphate
(d) Getting magnetic materials
24. In metallurgy, flux is a substance used to convert [EAMCET 1988]
- (a) Infusible impurities to fusible material
(b) Soluble impurities to insoluble impurities
(c) Fusible impurities to infusible impurities
(d) Mineral into silicate
25. In the manufacture of iron lime stone added to the blast furnace, the calcium ion ends in the form of [MP PMT 1989; CPMT 1989; KCET 1993; IIT 1982; MADT Bihar 1995]
- (a) Slag (b) Gangue
(c) Calcium metal (d) $CaCO_3$
26. Flux added in the extraction of iron is
- (a) Silica (b) Felspar
(c) Limestone (d) Flint
27. The smelting of iron in the blast furnace involves all the following process except
- (a) Oxidation (b) Reduction
(c) Decomposition (d) Sublimation
28. In the manufacture of iron from haematite, the function of lime stone is as [CPMT 1988; MP PET 1991, 93, 95]
- (a) A reducing agent (b) Flux
(c) Slag (d) Gangue
29. The slag obtained during the extraction of copper from copper pyrites is composed mainly of [MNR 1993; MP PMT 1997; UPSEAT 2000, 01; IIT-JEE Screening 2001]
- (a) $CaSiO_3$ (b) $FeSiO_3$
(c) $CuSiO_3$ (d) SiO_2
30. Complex is formed in the extraction of [MP PET 1989]
- (a) Na (b) Cu
(c) Ag (d) Fe
31. Which of the following metal is extracted by amalgamation process
- (a) Tin (b) Silver
(c) Copper (d) Zinc
32. The reaction $2ZnS + 3O_2 \rightarrow 2ZnO + 2SO_2$ in the metallurgical process of zinc is called [MP PET 1994]
- (a) Calcination (b) Cupellation
(c) Smelting (d) Roasting
33. Calcination is used in metallurgy for removal of [AFMC 1995]
- (a) Water and sulphide (b) Water and CO_2
(c) CO_2 and H_2S (d) H_2O and H_2S
34. Which of the following is slag [CPMT 1994]
- (a) CaO (b) $CaSO_4$

- (c) CaSiO_3 (d) SiO_2
35. The impurities associated with minerals used in metallurgy are collectively called [MP PMT 1995; RPMT 1999]
 (a) Slag (b) Flux
 (c) Gangue (d) Ore
36. When a metal is to be extracted from its ore, if the gangue associated with the ore is silica, then [MP PET 1996]
 (a) An acidic flux is needed
 (b) A basic flux is needed
 (c) Both acidic and basic flux are needed
 (d) Neither of them is needed
37. Which statement is correct
 (a) Gangues are carefully chosen to combine with the slag present in the ore to produce easily fusible flux to carry away the impurities
 (b) Slags are carefully chosen to combine with the flux present in the ore to produce easily fusible gangue to carry away the impurities
 (c) Gangues are carefully chosen to combine with the flux present in the ore to produce easily fusible slag to carry away the impurities
 (d) Fluxes are carefully chosen to combine with the gangue present in the ore to produce easily fusible slag to carry away the impurities
38. Roasting of copper pyrites ores is for the following purposes
 (a) To burn off sulphur, arsenic, antimony etc. as oxides and convert all the iron and copper to their oxides
 (b) To burn off arsenic, antimony etc. as oxides and burn off sulphur so that enough of it remains to combine with all the copper
 (c) To burn off sulphur partially to leave enough to combine with arsenic, antimony etc. and to convert all the iron and copper to oxides
 (d) To melt arsenic and antimony sulphides etc. and remove them by liquation and to burn off sulphur partially to leave enough to combine with copper and iron
39. In the modern blast furnaces, the charge consists of a mixture of
 (a) Calcined iron oxides + lime + anthracite coal
 (b) Calcined iron oxides + limestone + coke
 (c) Hydrated iron oxides + dolomite + coke
 (d) Iron pyrites + lime + bituminous coal
40. Roasting involves
 (a) Only volatilisation of volatile impurities
 (b) Only volatilisation of volatile impurities and decomposition of the ore
 (c) Volatilisation of volatile impurities and decomposition and oxidation of the ore
 (d) Oxidation and reduction of the ore and slag formation
41. Which of the following ores is subjected to roasting during metallurgical operations for getting the metal oxide
 (a) Horn silver (b) Zinc blende
 (c) Malachite (d) Limonite
42. A metal obtained directly by roasting of its sulphide ore is [Pune CET 1998]
 (a) Cu (b) Pb
 (c) Hg (d) Zn
43. In blast furnace, the highest temperature is in [KCET 1998]
 (a) Reduction zone (b) Slag zone
 (c) Fusion zone (d) Combustion zone
44. The process of roasting of an ore is carried out in the [BHU 1999]
 (a) Absence of air (b) Presence of air
 (c) Limited supply of air (d) None of these
45. Flux is used to remove [AIIMS 1999]
 (a) Acidic impurities (b) Basic impurities
 (c) All impurities from ores (d) Both (a) and (b)
46. During extraction of Fe ; slag obtained is [CPMT 2000]
 (a) FeO (b) FeSiO_3
 (c) MgSiO_3 (d) CaSiO_3
47. The final step for the extraction of copper from copper pyrite in Bessemer converter involves the reaction [CPMT 2000]
 (a) $4\text{Cu}_2\text{O} + \text{FeS} \rightarrow 8\text{Cu} + \text{FeSO}_4$
 (b) $\text{Cu}_2\text{S} + 2\text{Cu}_2\text{O} \rightarrow 6\text{Cu} + \text{SO}_2$
 (c) $2\text{Cu}_2\text{O} + \text{FeS} \rightarrow 4\text{Cu} + \text{Fe} + \text{SO}_2$
 (d) $\text{Cu}_2\text{S} + 2\text{FeO} \rightarrow 2\text{Cu} + 2\text{FeCO} + \text{SO}_2$
48. Flux is used to remove [KCET (Med.) 2000; PCET 2004]
 (a) Silica
 (b) Metal oxide
 (c) All impurities from ores
 (d) Silica and undesirable metal oxide
49. Roasting is done in [AFMC 2001]
 (a) Blast furnace (b) Open hearth furnace
 (c) Electric furnace (d) None of these
50. Which of the following fluxes is used to remove acidic impurities in metallurgical process [KCET (Med.) 2001]
 (a) Silica (b) Lime stone
 (c) Sodium chloride (d) Sodium carbonate
51. Refractory metals are used in construction of furnaces because
 (a) They can withstand high temperature
 (b) They are chemically inert
 (c) Their melting point is high
 (d) None of these
52. CN^- solution used in extraction of which metal [RPMT 2002]
 (a) Ag (b) Ti
 (c) Zn (d) Sn
53. In a line kiln, to get higher yield of CO_2 , the measure that can be taken is [KCET 2003]
 (a) To remove CaO
 (b) To add more CaCO_3
 (c) To maintain high temperature
 (d) To pump out CO_2
54. Which metal is used as a reducing agent in smelting [MP PET 2003]
 (a) C (b) Al
 (c) Zn (d) None of these
55. Inner layer of blast furnace is made of [MP PMT 1990]
 (a) Graphite bricks (b) Silica bricks
 (c) Fire-clay bricks (d) Basic bricks
56. Blast furnace is employed in the smelting of oxide ore with coke and flux in the metallurgy of
 (a) Iron (b) Copper
 (c) Lead (d) All the above
57. How is limestone used in Fe extraction [Orissa JEE 2004]
 (a) Oxidation of Fe ore (b) Reduction of Fe ore
 (c) Formation of slag (d) Purification of Fe formed
58. Heating mixture of Cu_2O and Cu_2S will give

[AIEEE 2005]

- (a) $Cu + SO_2$ (b) $Cu + SO_3$
(c) $CuO + CuS$ (d) Cu_2SO_3

59. Heating of ore in presence of air to remove sulphur impurities is called [AFMC 2005]

- (a) Calcination (b) Roasting
(c) Smelting (d) None of these

60. The important step in the extraction of metal from carbonate ore is

- (a) Calcination (b) Roasting
(c) Electro-reduction (d) Cupellation

Reduction to free Metal

1. Electrometallurgical process is used to extract

[MNR 1985, 89; UPSEAT 2000; MP PMT 2001]

- (a) Fe (b) Pb
(c) Na (d) Ag

2. General method for the extraction of metal from oxide ore is

[CPMT 1983; MP PET 2002]

- (a) Carbon reduction (b) Reduction by aluminium
(c) Reduction by hydrogen (d) Electrolytic reduction

3. Function of the flux added during smelting is

- (a) To make ore porous
(b) To remove gangue
(c) To make reduction easier
(d) To precipitate slag

4. Alumino-thermic process is used for the extraction of metals, whose oxides are

- (a) Fusible
(b) Not easily reduced by carbon
(c) Not easily reduced by hydrogen
(d) Strongly basic

5. In blast furnace iron oxide is reduced by

[MP PMT 1989; KCET 2005]

- (a) Silica (b) CO
(c) Carbon (d) Lime stone

6. Furnaces are lined with calcium oxide because

- (a) It gives off oxygen on heating
(b) It gives strong light on heating
(c) It is refractory and basic
(d) It is not affected by acids

7. The substance used in the thermite process of reducing metal ores is [MP PET 1993; CPMT 2000, 01]

- (a) Aluminium (b) Thorium
(c) Heated Pt gauge (d) Carbon

8. The electrolytic method of reduction is employed for the preparation of metals that

[MP PMT 1991; NCERT 1984; CPMT 1988; KCET 2002]

- (a) Are weakly electropositive
(b) Are moderately electropositive
(c) Are strongly electropositive
(d) Form oxides

9. Which of the following metals cannot be extracted by carbon reduction process [AMU 1982]

- (a) Pb (b) Al
(c) Hg (d) Zn

10. Carbon reduction process is used for the extraction of

- (a) Hg (b) Zn
(c) Cr (d) Fe

11. Among the following groups of oxides, the group containing oxides that cannot be reduced by carbon to give the respective metals is [NCERT 1984]

- (a) Cu_2O, K_2O (b) Fe_2O_3, ZnO
(c) CaO, K_2O (d) PbO, Fe_3O_4

12. Which one of the following metals is extracted by thermal reduction process? [EAMCET 1986]

- (a) Copper (b) Iron
(c) Aluminium (d) Magnesium

13. Chemical reduction is not suitable for converting

[MP PET 1994]

- (a) Bauxite into aluminium (b) Cuprite into copper
(c) Haematite into iron (d) Zinc oxide into zinc

14. In alumino-thermite process, aluminium is used as

[IIT 1983; DPMT 1980; MP PMT 1987;

MP PET/PMT 1988; NCERT 1983; UPSEAT 2003]

- (a) Oxidising agent (b) Flux
(c) Reducing agent (d) Solder

15. Which metal is extracted by electrolytic reduction method

[CPMT 1984; MP PET 1997]

- (a) Cu (b) Al
(c) Fe (d) Ag

16. Alumina

- (a) Is a good conductor of electricity
(b) Is a bad conductor of electricity
(c) Melts at $200^\circ C$
(d) Is an electrovalent compound

17. Aluminium is prepared in large quantities by

[KCET 1991, 92]

- (a) Heating cryolite in a limited quantity of air
(b) Reducing aluminium oxide with coke
(c) Reducing aluminium oxide with sodium
(d) Electrolysing aluminium oxide dissolved in fused electrolyte

18. Alumina is

- (a) $Al(OH)_3$ (b) $AlCl_3$
(c) AlN (d) Al_2O_3

19. Which one of the following is used in the extraction of aluminium by electrolytic process [CPMT 1978]

- (a) Al_2O_3 (b) $Al(OH)_3$
(c) $AlCl_3$ (d) $Al_2(SO_4)_3$

20. Which technique is used in the manufacture of aluminium from bauxite [NCERT 1983]

- (a) Reduction with magnesium
(b) Reduction with coke
(c) Electrolytic reduction
(d) Reduction with iron

21. Which of the following processes does not involve a catalyst

[KCET 1991]

- (a) Haber's process (b) Thermite process
(c) Ostwald process (d) Contact process

22. Thermite process is used to extract metals

[KCET 1989]

- (a) When their oxides can't be reduced by carbon
(b) When their carbonates do not yield oxides by thermal decomposition
(c) When their sulphides can't be converted into oxides by roasting
(d) When their melting points are very high

23. Iron is obtained on a large scale from Fe_2O_3 by

[CPMT 1973, 78, 79; Orissa JEE 2005]

- (a) Reduction with Al
(b) Reduction with CO

- (c) Reduction with H_2
(d) Reduction with sodium
24. After partial roasting, the sulphide of copper is reduced by [MP PMT 1993]
(a) Reduction by carbon (b) Electrolysis
(c) Self-reduction (d) Cyanide process
25. High purity copper metal is obtained by [MP PMT 1991]
(a) Carbon reduction (b) Hydrogen reduction
(c) Electrolytic reduction (d) Thermite reduction
26. In the metallurgical extraction of zinc from ZnO the reducing agent used is [MP PET 1994]
(a) Carbon monoxide (b) Sulphur dioxide
(c) Carbon dioxide (d) Nitric oxide
27. In order to refine "blister copper" it is melted in a furnace and is stirred with green logs of wood. The purpose is [MP PET 1996]
(a) To expel the dissolved gases in blister copper
(b) To bring the impurities to surface and oxidize them
(c) To increase the carbon content of copper
(d) To reduce the metallic oxide impurities with hydrocarbon gases liberated from the wood
28. Aluminium is produced on a large scale by electrolysis of alumina, dissolved in fused cryolite and a little fluorspar. These two electrolytes, *cryolite* and *fluorspar* are respectively
(a) Na_3AlF_6 and CaF_2
(b) AlF_3 and KF
(c) Al_2C_6 and KCl
(d) $KCl.MgCl_2.6H_2O$ and MgF_2
29. Electrometallurgy is used for
(a) Transition metals
(b) Most reactive metals
(c) Noble metals
(d) Soft metals
30. The metal extracted by electrolysis of its fused salt is [MP PET/PMT 1998]
(a) Iron (b) Lead
(c) Sodium (d) Copper
31. Alumino-thermic process is used for metallurgy of [CPMT 1996]
(a) Pb (b) Ag
(c) Al (d) None of these
32. Which metal can't be obtained from electrolysis [CPMT 1997; RPET 1999]
(a) Cu (b) Mg
(c) Cr (d) Ni
33. To obtain chromium from chromic oxide (Cr_2O_3), the method used is [JIPMER 2001]
(a) Alumino-thermic process
(b) Electrolytic reduction
(c) Carbon reduction
(d) Carbon monoxide reduction
34. The substance used in the thermite process of reducing metal ores is [CPMT 2000; KCET 2001; UPSEAT 2001]
(a) Aluminium (b) Thorium
(c) Heated platinum gauze
(d) Carbon
35. Heating with carbon in absence of air is known as [DCE 2002]
(a) Reduction (b) Carbon-reduction
(c) Smelting (d) Roasting

Refining of crude metal

1. In electrolytic refining of metals, electrolysis of an aqueous solution of its complex salt is done with impure metal as anode and an strip of pure metal as cathode. This method cannot be used for the refining of the metal [MP PMT 1989]
(a) Silver (b) Copper
(c) Aluminium (d) Zinc
2. Which method of purification is represented by the equation

$$\underset{\text{Impure}}{Ti} + 2I_2 \xrightarrow{500\text{ K}} TiI_4 \xrightarrow{1675\text{ K}} \underset{\text{Pure}}{Ti} + 2I_2$$
 [AIIMS 1983]
(a) Cupellation (b) Poling
(c) Van Arkel (d) Zone refining
3. Cupellation process is used in the metallurgy of [CPMT 1983; MP PET 1994; MP PMT 2000, 02]
(a) Copper (b) Silver
(c) Aluminium (d) Iron
4. Metals are [MADT Bihar 1983]
(a) Electropositive (b) Electronegative
(c) Acceptor of electrons (d) None of these
5. The cyanide process is used for obtaining [DPMT 1982; CPMT 1976, 84, 90; MNR 1995; MP PET/PMT 1998; AIEEE 2002]
(a) Na (b) Ag
(c) Cu (d) Zn
6. In electrolytic refining, the impure metal is made is used to make
(a) Cathode (b) Anode
(c) Electrolytic bath (d) None of these
7. Of the following, which cannot be obtained by electrolysis of the aqueous solution of their salts [IIT 1990]
(a) Ag (b) Mg and Al
(c) Cu (d) Cr
8. Van Arkel method of purification of metals involves converting the metal to a [BHU 1990]
(a) Volatile stable compound
(b) Volatile unstable compound
(c) Non volatile stable compound
(d) None of the above
9. Zone refining is a method to obtain [KCET 1993]
(a) Very high temperature (b) Ultra pure Al
(c) Ultra pure metals (d) Ultra pure oxides
10. Which one of the following is manufactured by the electrolysis of fused sodium chloride [CPMT 1979, 83, 91]
(a) $NaOH$ (b) $NaClO$
(c) Na (d) $NaClO_3$
11. A metal which is refined by poling is [RPET 2000]

- (a) Sodium (b) Blister copper
(c) Zinc (d) Silver
12. Silver obtained from argentiferrous lead containing lead impurity is purified by [CPMT 1981; MP PMT 1990; EAMCET 1998]
(a) Distillation (b) Froth floatation
(c) Cupellation (d) Treatment of KCN
13. If the impurity in a metal has a greater affinity for oxygen and is more easily oxidised than the metal, then the purification of metal may be carried out by [MP PMT 1997]
(a) Poling (b) Zone refining
(c) Electrolytic refining (d) Cupellation
14. Electric refining is used for refining of [DPMT 1996]
(a) Lead (b) Copper
(c) Iron (d) Sodium
15. Zone refining is used for the purification of [Pune CET 1998]
(a) Cu (b) Au
(c) Ge (d) Ag
16. Mond's process is used for preparing [MNR 1983]
(a) Ni (b) H_2SO_4
(c) NH_3 (d) HNO_3
(e) $NaHCO_3$
17. Gold is extracted by hydrometallurgical process based on its property [KCET 2005]
(a) Of being electropositive
(b) Of being less reactive
(c) To form complexes which are water soluble
(d) To form salts which are water soluble
7. Zone refining is a technique used primarily for which one of the following process
(a) Alloying (b) Tempering
(c) Sintering (d) Purification
8. Method used for obtaining highly pure silicon used as a semiconductor material is [CBSE PMT 1994]
(a) Oxidation (b) Electrochemical
(c) Crystallization (d) Zone refining
9. Which is correct [MADT Bihar 1995]
(a) Galena : Mg_2CO_3
(b) Cassiterite : $CaCO_3 \cdot MgCO_3$
(c) Dolomite : SnO_2
(d) Magnesite : $MgCO_3$
10. 'Lapis-Lazuli' is a blue coloured precious stone. It is mineral of the class [NCERT 1980; AIIMS 1980; BHU 1978, 80]
(a) Sodium-alumino silicate (b) Zinc cobaltate
(c) Basic copper carbonate (d) Prussian blue

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

Critical Thinking

Objective Questions

1. Black Jack is an ore of [PCET 2004]
(a) Cr (b) Sn
(c) Zn (d) Ni
2. Froth floatation process is used for concentration of [MNR 1987; IIT 1989; UPSEAT 2000, 02]
(a) Chalcopyrite (b) Bauxite
(c) Haematite (d) Calamine
3. The process of ore dressing is carried out to [MP PMT 1994]
(a) Remove the siliceous materials
(b) Add flux to the mineral
(c) Convert the ore to oxide
(d) Remove the poisonous impurities
4. Wolframite ore is separated from tinstone ore by the process of
(a) Roasting (b) Electromagnetic
(c) Smelting (d) Calcination
5. Which process of reduction of mineral to the metal is suited for the extraction of copper from its ores with low copper content
(a) Metal displacement (b) Auto reduction
(c) Chemical reduction (d) Electrolytic reduction
6. Pb and Sn are extracted from their chief ore by [IIT-JEE Screening 2004]
(a) Carbon reduction and self reduction.
(b) Self reduction and carbon reduction.
(c) Electrolysis and self reduction.
(d) Self reduction and electrolysis.
1. Assertion : $Al(OH)_3$ is amphoteric in nature
Reason : $Al-O$ and $O-H$ bonds can be broken with equal ease in $Al(OH)_3$ [IIT 1998]
2. Assertion : Iron is found in the free state in nature [AIIMS 2001]
Reason : Iron is highly reactive element
3. Assertion : Zinc is used and copper is not used in the recovery of Ag from the complex $[Ag(CN)_2]^-$.
Reason : Zinc is a powerful reducing agent than copper.
4. Assertion : Coke and flux are used in smelting.
Reason : The phenomenon in which ore is mixed with suitable flux and coke is heated to fusion is known as smelting.
5. Assertion : Leaching is a process of reduction.
Reason : Leaching involves treatment of the ore with a suitable reagent so as to make it soluble while impurities remains insoluble. [BHU 2004]
6. Assertion : Ethyl xanthate is used as a collector in froth floatation process.
Reason : Collectors depress the floatation property of one of the components of the ore and thus help in the separation of different minerals present in the same ore.
7. Assertion : Levigation is used for the separation of oxide ores from impurities.
Reason : Ore particles are removed by washing in a current of water.

8. Assertion : In Hall and Heroult's process, Al is extracted by electrolysis of a fused mixture of alumina, cryolite and fluorspar.
Reason : Addition of cryolite and fluorspar lowers the fusion temperature and increases the conductivity of the electrolyte.
9. Assertion : $AgNO_3$ is called lunar caustic.
Reason : In contact with organic matter (skin, cloth paper, etc.) $AgNO_3$ is reduced to metallic silver.
10. Assertion : Wolframite impurities are separated from cassiterite by electromagnetic separation.
Reason : Cassiterite being magnetic is attracted by the magnet and forms a separate heap.
11. Assertion : Lead, tin and bismuth are purified by liquation method.
Reason : Lead, tin and bismuth have low m.p. as compared to impurities.
12. Assertion : Gold is recovered from its solution containing aurocyanide complex by adding zinc dust.
Reason : Zinc is more electropositive than gold.

AS Answers and Solutions

Occurrence

1. (b)

Element	% abundance by weight
<i>O</i>	46.6
<i>Si</i>	27.7
<i>Al</i>	8.3
<i>Fe</i>	5.1
<i>Ca</i>	3.6
6. (a) $As \rightarrow$ Metalloid $Na, Au, Fe \rightarrow$ Metals
8. (c) $N_2 = 78\%$; $O_2 = 21\%$
9. (a) Bauxite $Al_2O_3 \cdot 2H_2O$
10. (c) Carnallite $KCl \cdot MgCl_2 \cdot 6H_2O$
12. (c) Dolomite $MgCO_3 \cdot CaCO_3$
 Magnesite $MgCO_3$
 Carnallite $KCl \cdot MgCl_2 \cdot 6H_2O$
16. (c) Diamond made up of carbon only.
17. (b)

$\left. \begin{array}{l} \text{Bauxite } (Al_2O_3) \\ \text{Cryolite } (Na_3AlF_6) \\ \text{Corundum } (Al_2O_3) \end{array} \right\}$	Minerals of Al
Gypsum $(CaSO_4 \cdot 2H_2O)$	
18. (d) Cryolite $(Na_3AlF_6) \rightarrow$ Halide ore
 $\left. \begin{array}{l} \text{Galena } (PbS) \\ \text{Cinnabar } (HgS) \end{array} \right\}$ Sulphide ore
 Bauxite $Al_2O_3 \cdot 2H_2O \rightarrow$ Oxide ore
19. (d) Pig iron $\rightarrow$ It is the most impure form of iron and contains highest proportion of carbon (2.5 – 4%)
 Malachite $\rightarrow Cu(OH)_2 \cdot CuCO_3$
 Zinc blende $\rightarrow ZnS$
 Bauxite $\rightarrow Al_2O_3 \cdot 2H_2O$
20. (b) Chile salt petre $\rightarrow NaNO_3$
21. (a) Na is alkali metal highly reactive. Hence present in combined state.
24. (c) Na_3AlF_6 Sodium hexafluoro aluminate (III)
28. (a) Bauxite $(Al_2O_3 \cdot 2H_2O)$
 Corundum (Al_2O_3)
 Diaspore $(Al_2O_3 \cdot H_2O)$
29. (d) Fluorspar (CaF_2) , Cryolite (Na_3AlF_6) ,
 Feldspar $(KAlSi_3O_8)$, Mica $(K_2O \cdot 3Al_2O_3 \cdot 6SiO_2 \cdot 2H_2O)$
30. (a) Haematite Fe_2O_3
33. (a) Invar $Fe = 64\%$ and $Ni = 36\%$
34. (c) Cassiterite (SnO_2) , Magnetite (Fe_3O_4) ,
 Haematite (Fe_2O_3) , Limonite $(Fe_2O_3 \cdot 3H_2O)$.
36. (b) Copper is a reddish brown metal
37. (b) Azurite $Cu(OH)_2 \cdot 2CuCO_3$
38. (d) Malachite $(Cu(OH)_2 \cdot CuCO_3)$
40. (b) Argentite or silver glance (Ag_2S)
44. (c) Zinc blende is ZnS not $ZnCl_2$
46. (c) Galena (PbS) , Anglesite $(PbSO_4)$,
 Calamine $(ZnCO_3)$, Cerrussite $(PbCO_3)$
52. (b) Cuprite (Cu_2O) and Argentite (Ag_2S)
53. (a) Horn silver $(AgCl)$
55. (c) Carnallite is $KCl \cdot MgCl_2 \cdot 6H_2O$
56. (b) Cryolite is an ore of Al containing Na_3AlF_6 .
58. (c) Corundum (Al_2O_3) is an ore of Al .
59. (d) All minerals are not suitable for the extraction of metals commercially. Thus all ores are minerals, but all minerals are not ores.
60. (c) Among cuprite $[Cu_2O]$, Chalcocite $[Cu_2S]$, Chalcopyrite $[CuFeS_2]$ & Malachite $[Cu(OH)_2 \cdot CuCO_3]$, only Chalcopyrite is an ore which contains both Fe and Cu
61. (a) Felspar is $K_2O \cdot Al_2O_3 \cdot 6SiO_2$
62. (a) Chile salt petre is $NaNO_3$ While KNO_3 is Indian salt petre. Na_2SO_4 is Glauber salt and $Na_2S_2O_3$ is known as Hypo.
63. (c) Gypsum $(CaSO_4 \cdot 2H_2O)$ is an ore of calcium.
 Dolomite $(CaCO_3 \cdot MgCO_3)$, Magnesite $(MgCO_3)$ and Carnallite $(KCl \cdot MgCl_2 \cdot 6H_2O)$ are the ores of Magnesium.
64. (c) Magnetite (Fe_3O_4) , Siderite $(FeCO_3)$, Limonite $(Fe_2O_3 \cdot 3H_2O)$ and Haematite (Fe_2O_3) are ores of Iron. Only Smithsonite is not an ore of Iron.

65. (c) Carnallite is an important ore of magnesium. It is $KCl.MgCl_2.6H_2O$
67. (c) Al is most abundant metal in the earth crust
68. (d) Chalcopyrite ($CuFeS_2$)
70. (a) Cassiterite - SnO_2
Cryolite - Na_3AlF_6
Cerussite - $PbCO_3$
71. (b) Carnallite is the ore of K and Mg its formula is $KCl.MgCl_2.6H_2O$
72. (b) Pyrolusite - MnO_2
Malachite - $CuCO_3.Cu(OH)_2$
Diaspore - $Al_2O_3.H_2O$
Cassiterite - SnO_2

Concentration

1. (a) Froth floatation method is based on the fact that the surface of sulphide ores is preferentially wetted by oil while that of gangue is wetted by water.
4. (c) Haematite (Fe_2O_3)
Iron ores are concentrated by this method
5. (b) Pine oil is foaming agent. Now another substance collector such as potassium ethyl xanthate or amyl xanthate are added.
6. (c) Cinnabar (HgS) the ore of mercury is concentrated by froth floatation process.
7. (c) Cyanide process is used in the extraction of both Silver and Gold because these form complex salts with CN^- ion due to presence of lone pair of electron on nitrogen atom.
8. (b) Cassiterite SnO_2 or tinstone - an ore of tin being non-magnetic can be separated from magnetic impurities like Fe and Mn from this method.
13. (c) Chemical separation or Leaching.
In this powdered ore is treated with a suitable reagent which can dissolve the ore but not the impurities.
14. (d) Copper pyrite $CuFeS_2$ (Chalcopyrite)
16. (c) Sulphides ores are always concentrated by froth floatation process
20. (a) Froth floatation because it is sulphide ore (ZnS)
22. (a) Here only Galena is PbS (a sulphide ore).
Cassiterite is SnO_2 (oxide ore). Magnetite is Fe_3O_4 (Oxide ore) and Malachite is $Cu(OH)_2.CuCO_3$ (Carbonate ore). The froth floatation process is used to concentrate sulphide ores, based on preferential wetting properties with frothing agent and water.
2. (a) To remove volatile substances.
 $S_8 + 8O_2 \rightarrow 8SO_2 \uparrow$; $P_4 + 5O_2 \rightarrow P_4O_{10} \uparrow$
 $4As + 3O_2 \rightarrow 2As_2O_3 \uparrow$
3. (c) In this process sulphides ores are converted into oxide ores
 $2ZnS + 3O_2 \rightarrow 2ZnO + 2SO_2 \uparrow$
5. (c) SiO_2 $CaCO_3$, lime, CaO
Acidic flux Basic flux
6. (a) (Impurity) Gangue + flux $\rightarrow$ Slag
Infusible Fusible
7. (a) $CaCO_3 \rightarrow CaO + CO_2$
Heating the ore in absence of air is calcination.
9. (b) Smelting is a process of reducing metal oxide to metal by means of coke or CO .
 $Fe_2O_3 + 3C \rightarrow 2Fe + 3CO$
 $Fe_2O_3 + 3CO \rightarrow 2Fe + 3CO_2$
13. (c) Flux is added during smelting it combines with infusible gangue present in the ore to form a fusible mass known as slag. Flux + Gangue $\rightarrow$ Slag
15. (d) $CaO \rightarrow$ It is hygroscopic in nature
22. (b) Reduction with carbon is called smelting
 $Fe_2O_3 + 3C \rightarrow 2Fe + 3CO$
25. (a) $SiO_2 + CaO \rightarrow CaSiO_3$
Impurity Flux Slag
26. (c) Impurities of SiO_2 is present in the iron ore so basic flux $CaCO_3$ is added. $CaO + SiO_2 \rightarrow CaSiO_3$
Flux Impurity Slag
28. (b) $CaCO_3 \rightarrow CaO + CO_2$; $CaO + SiO_2 \rightarrow CaSiO_3$
Flux Impurity of haematite Slag
29. (b) $FeO + SiO_2 \rightarrow FeSiO_3$
Impurity Flux Slag
30. (c) Hydrometallurgy
 $Ag_2S + 4NaCN \rightarrow 2Na[Ag(CN)_2] + Na_2S$
 $2Na[Ag(CN)_2] + Zn \rightarrow Na_2[Zn(CN)_4] + 2Ag$
31. (b) $Cu_2Cl_2 + Ag_2S \rightarrow Cu_2S + 2AgCl$
 $2AgCl + Hg \rightarrow Hg_2Cl_2 + 2Ag$
 $AgCl + Hg \rightarrow Ag + HgCl$
32. (d) Roasting (Sulphide ore is heated in excess of air)
33. (b) $ZnCO_3 \rightarrow ZnO + CO_2$
In calcination ore is heated in absence of air in a reverberatory furnace to remove moisture and CO_2
36. (b) $SiO_2 + CaO \rightarrow CaSiO_3$
Acidic impurity Basic flux Slag
39. (b) $CaCO_3 + \text{Coke} + \text{Calcined}$
1 : 4 : 8
41. (b) Zinc blende (ZnS); $2ZnS + 3O_2 \xrightarrow{\Delta} 2ZnO + 2SO_2$
42. (c) When conc. HgS ore is roasted
 $HgS + O_2 \xrightarrow{773-873K} Hg + SO_2$

Roasting & Calcination

1. (b) These are the substances which can withstand very high temperature without melting or becoming soft.

At this temperature, mercury vaporises and the vapours are condensed to the liquid metal. Mercury so obtained is about 99.7% pure.

43. (d) Combustion zone 1800 K
Fusion zone 1600 K
Slag zone 1300 K
Tredution zone 800 K
44. (b) In roasting process, the ore (usually sulphide) alone or mixed with other materials is heated in excess of air.
45. (d) Flux is used to fuse non-fusible impurities presents in ore.
46. (d) During extraction of *Fe* calcium silicate (CaSiO_3) slag is obtained.
47. (b) In Bessemer converter copper sulphide is partially oxidised to cuprous oxide which further reacts with remaining copper sulphide to form copper and sulphur dioxide.
 $\text{Cu}_2\text{S} + 2\text{Cu}_2\text{O} \rightarrow 6\text{Cu} + \text{SO}_2$
48. (d) Flux is used to remove silica and undesirable metal oxide.
49. (a) Roasting is the process of heating the ore strongly in the presence of excess of air. It is generally carried in a reverberatory or blast furnace.
50. (b) Lime stone which is a flux used to remove acidic impurities in metallurgical process.
52. (a) CN^- solution used in extraction of *Ag* metal in the cyanide process.
57. (c) Lime stone (CaCO_3) is used for formation of slag in *Fe* extraction
- $$\underset{\text{Limestone}}{\text{CaCO}_3} \longrightarrow \text{CaO} + \text{CO}_2 \uparrow$$
- $$\underset{\substack{\text{Gangue} \\ \text{or} \\ \text{impurity}}}{\text{CaO}} + \underset{\text{slag}}{\text{SiO}_2} \longrightarrow \text{CaSiO}_3$$
58. (a) $\text{Cu}_2\text{S} + 2\text{Cu}_2\text{O} \rightarrow 6\text{Cu} + \text{SO}_2$ (Auto-reduction).
This reaction occurs in reverberatory furnace to get metallic copper.
59. (b) Roasting involves heating of the ore either alone or with some other material usually in presence of air below its fusion temperature. In roasting, definite chemical changes like oxidation, chlorination etc., take place
 $\text{S} + \text{O}_2 \rightarrow \text{SO}_2$
60. (a) Calcination $\text{ZnCO}_3 \rightarrow \text{ZnO} + \text{CO}_2$

Reduction to free metal

1. (c) Because *Na* is very reactive and can not be extracted by means of the reduction by *C*, *CO* etc. So extracted by electrolysis.
2. (a) Carbon reduction, $\text{Fe}_2\text{O}_3 + 3\text{C} \rightarrow 2\text{Fe} + 3\text{CO}$
3. (b) Flux + Gangue $\rightarrow$ Slag

4. (b) Alumino thermite process involves reduction of oxides such as Fe_2O_3 , Mn_2O_3 , Cr_2O_3 etc. to metals with aluminum.
 $\text{Cr}_2\text{O}_3 + 2\text{Al} \rightarrow \text{Al}_2\text{O}_3 + 2\text{Cr} \quad \Delta H = -ve$
5. (b) $\text{Fe}_2\text{O}_3 + 3\text{CO} \rightarrow 2\text{Fe} + 3\text{CO}_2$
7. (a) A mixture of *Al* powder and metallic oxide (Cr_2O_3 , Mn_2O_3 etc) is called thermite.
9. (b) *Al* is highly electropositive. It can be obtained by electrolytic reduction.
10. (d) $\text{Fe}_2\text{O}_3 + 3\text{C} \rightarrow 3\text{CO} + 2\text{Fe}$
13. (a) Bauxite into aluminium because *Al* is a strong reducing agent it has strong affinity with oxygen than carbon
20. (c) Electrolytic reduction Hall and Heroult process.
23. (b) $\text{Fe}_2\text{O}_3 + 3\text{CO} \rightarrow 3\text{CO}_2 + 2\text{Fe}$
24. (c) Self reduction :- Reduction of oxide ore of a metal by its own sulphide $2\text{Cu}_2\text{O} + \text{Cu}_2\text{S} \rightarrow 6\text{Cu} + \text{SO}_2$
26. (a) $\text{ZnO} + \text{CO} \rightarrow \text{CO}_2 + \text{Zn}$
27. (d) $2\text{Cu}_2\text{S} + 3\text{O}_2 \rightarrow 2\text{Cu}_2\text{O} + 2\text{SO}_2$
 $3\text{Cu}_2\text{O} + \underset{\substack{\text{(From green} \\ \text{logs of wood)}}}{\text{CH}_4} \rightarrow 6\text{Cu} + 2\text{H}_2\text{O} + \text{CO}$
30. (c) Sodium $\rightarrow$ Highly reactive metal
33. (a) $\text{Cr}_2\text{O}_3 + 2\text{Al} \rightarrow \text{Al}_2\text{O}_3 + 2\text{Cr}$
34. (a) In thermite process a mixture of aluminium powder and ferric oxide in the rate of 1 : 3 is used.
35. (b) Heating with carbon in absence of air is known as carbon reduction.
This is used in Iron metallurgy.
 $\text{Fe}_2\text{O}_3 + \text{C} \xrightarrow{\text{(in blast furnace)}} \text{Fe}$

Refining of crude metal

2. (c) Van Arkel method *Ti* and *Zn* are refined by this method. It is used for obtaining ultra pure metals.
3. (b) Cupellation method is used when the impure metals contain impurity of another metal which forms volatile oxide.
4. (a) Metals are electropositive elements because they have tendency to loose e^- and forms +ve ions
 $\text{Na} \rightarrow \text{Na}^+ + e^-$
6. (b) Impure metal as anode and pure metal as cathode.
7. (b) *Mg* and *Al* can not be obtained by the electrolysis of aqueous solution of their salts because instead of metal H_2 gas is liberated at cathode.
8. (a) $\text{Ti} + 2\text{I}_2 \xrightarrow{500\text{ K}} \underset{\substack{\text{Volatile} \\ \text{Stable compound}}}{\text{TiI}_4} \xrightarrow{1700\text{ K}} \underset{\text{Pure metal}}{\text{Ti}} + 2\text{I}_2$
9. (c) Zone refining is employed for preparing extremely pure metals.
It is based on the principle that when a molten solution of the impure metal is allowed to cool the pure metal crystallises out while the impurities remain in the melt. Ex : Semiconductors like *Si*, *Ge* and *Ga* are purified by this method.
10. (c) $2\text{NaCl} \rightarrow 2\text{Na}^+ + 2\text{Cl}^-$
(fused)

Anode: $2Cl^- \rightarrow 2e^- + Cl_2$ (oxidation)

Cathode: $2Na^+ + 2e^- \rightarrow 2Na$ – (reduction)

11. (b) Poling is used for purification of metal which contain their own oxide as impurity

e.g. Cu_2O in Cu ; SnO_2 in Sn

12. (c) Cupellation : If metal possess the impurity of another metal which forms volatile oxide. Then cupellation method is used.

16. (a) Mond's process

17. (c) Hydrometallurgy is the process of dissolving the metal or its ore by the action of a suitable chemical reagent followed by recovery of the metal either by electrolysis or by the use of a suitable precipitating agent.

Critical Thinking Questions

- (c) Black Jack (ZnS), also called zinc blend, is an ore of Zinc.
- (a) Chalcopyrites is contain sulphur that's why it is concentrated by froth floatation process.
- (a) Removal of silicious matter from ores is known as dressing or concentration of ore.
- (b) Wolframite ore $[FeWO_4]$ is present in tin stone as impurities and it has same mass per unit volume as that of tin stone. So it is separated by electromagnetic separator because wolframite is magnetic in nature hence it gets attracted by magnet while tin stone doesn't
- (b) Auto reduction is used for the extraction of copper from its ore with low copper content.
- (b) PbO & $PbSO_4$ get reduced by PbS itself which is already present in mixture so because the reduction took place by mixture itself, hence is known as self reduction.

$$2PbO + PbS \xrightarrow{\Delta} 3Pb + SO_2 \uparrow$$

$$PbSO_4 + PbS \xrightarrow{\Delta} 2Pb + 2SO_2 \uparrow$$
- (d) Zone refining is a method of purification used for semiconductors like Si , Ge and Ga .
- (d) By the process of zone refining pure silicon is obtained which is used in semiconductor.
- (d) $MgCO_3$ is the formula of magnesite.
- (a) Lapis lazuli is the aluminium silicate present in earth rocks as blue stone.

Assertion and Reason

- (e) Iron is highly reactive element, therefore, it is found in combined state. Here assertion is false but reason is true.
- (a) Both assertion and reason are true and reason is the correct explanation of assertion.
- (b) Both assertion and reason are true but reason is not the correct explanation of assertion. Non fusible mass present in ore in mixing with suitable flux are fused which are then reduced by coke to give free metal.

5. (c) Assertion is false but reason is true. Leaching is a process of concentration.

6. (c) Assertion is true but reason is false. Collectors absorbs themselves on polar groups to grains of ores and thus derive them on the surface to pass on into the froth.

7. (c) Assertion is true but reason is false.

Oxide ores being heavier than the earthy or rocky gangue particles settle down while lighter impurities are washed away.

8. (a) Both assertion and reason are true and reason is the correct explanation of assertion

9. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.

Silver nitrate is called lunar caustic because when it comes in contact with organic substances (e.g. skin, clothes) and reduced to metallic silver which is white like the iron lunar.

10. (c) Assertion is true but reason is false.

Wolframite being magnetic is attracted by the magnetic roller and forms a heap under it.

11. (a) Both assertion and reason are true and reason is correct and reason is the correct explanation of assertion.

Liquation process is based on the difference in fusibility of the metal and impurities. When the impurities are less fusible than the metal itself, the process is employed.

12. (a) Au is recovered from the solution by the addition of electropositive metal.

General Principles of Extraction of Metals

SET Self Evaluation Test -16

- The region in which main metals are found in earth is called
 - Atomophil
 - Lithophil
 - Calcophil
 - Siderophil
- Which metal is found in free state
 - Iron
 - Gold
 - Aluminium
 - Sodium
- Which metal is found in Khetri region of Rajasthan
 - Iron
 - Copper
 - Gold
 - Lead
- Sapphire** is mineral of [BHU 1977]
 - Cu
 - Zn
 - Al
 - Mg
- Of the following substances the one which does not contain oxygen is [JIPMER 1997]
 - Bauxite
 - Epsom salt
 - Cryolite
 - Dolomite
- The chief impurity present in red bauxite is : [DCE 2004]
 - SiO_2
 - Fe_2O_3
 - K_2SO_4
 - NaF
- In the froth floatation process for the purification of ores, the ore particles float because [MP PMT 1984; NCERT 1981; CPMT 1987; MNR 1992; UPSEAT 2002]
 - They are light
 - Their surface is not easily wetted by water
 - They bear electrostatic charge
 - They are insoluble
- Difference in density is the basis of [Kerala (Med.) 2002]
 - Ultrafiltration
 - Molecular sieving
 - Gravity separation
 - Molecular attraction
- Mark the wrong statement
 - Wrought iron is prepared by heating cast iron in a reverberatory furnace
 - The impurities present in cast iron are oxidised by air
 - The impurities are oxidised by Fe_2O_3
 - CO burns with blue flame and the Si, Mn and other impurities form slag with silica
- Thomas slag is [RPET 2003]
 - $CaSiO_3$
 - $Ca_3(PO_4)_2$
 - $MnSiO_3$
 - $CaCO_3$
- Which is correct [MADT Bihar 1995]
 - Aluminium : Calamine
 - Copper : Malachite
 - Magnesium : Calamine
 - Zinc : Carnellite

AS Answers and Solutions

(SET -16)

- (d)
 

Different zones of the earth

2. (b) Gold, *Ag* and *Pt* are called noble metals. They are unreactive and found in free state.
3. (b) Copper metal is found in khetri region of Rajasthan with that it is also found in singhbhum and Hazaribagh district in Bihar, Agnigundala in Andhra pradesh, Malanjkh in M.P.

4. (c) Sapphire (Blue colour) is mineral of *Al*.
5. (c) Cryolite (Na_3AlF_6)
6. (b) Red bauxite has chief impurity of Fe_2O_3 .
7. (b) Ore particles are wetted by oil. Hence, float on the surface.
8. (c) Levigation or gravity separation is used when the ore particles are heavier than the earthy or rocky gangue particles.
9. (b) The wrong statement is that the impurities present in cast iron are oxidised by air.
10. (b) Thomas slag $Ca_3(PO_4)_2$ is used as a valuable fertilizer.
11. (b) Malachite is an ore of copper.

Chapter 17

Hydrogen and Its compounds

Hydrogen

(i) Position of hydrogen in the periodic table

Hydrogen is the first element in the periodic table. Hydrogen is placed in no specific group due to its property of giving electron (When H^- is formed) and also losing electron (When H^+ is formed).

(i) Hydrogen is placed in group 1 (Alkali metals) as,

(a) It has one electron in its (Outer) shell- $1s^1$ like other alkali metals which have (inert gas) ns^1 configuration.

(b) It forms monovalent H^+ ion like Li^+ , Na^+ ...

(c) Its valency is also 1.

(d) Its oxide (H_2O) is stable as Li_2O , Na_2O .

(e) It is a good reducing agent (In atomic as well as molecular state) like Na , Li ...

(ii) Hydrogen also resembles halogens (Group VII A) as,

(a) It is also diatomic (H_2) like F_2 , Cl_2 ...

(b) It also forms anion H^- like F^- , Cl^- ... by gain of one electron.

(c) H^- has stable inert gas (He) configuration as CH_4 , C_2H_6 like halogens CCl_4 , SF_2Cl_2 etc.

(d) H is one electron short of duplet (Stable configuration) like F , Cl ,... which are also one electron deficient than octet, $F - 2s^2 2p^5$; $Cl - 3s^2 3p^5$.

(e) (IE) of $H(1312 kJ mol^{-1})$ is of the same order as that of halogens.

(iii) (IE) of H is very high in comparison with alkali metals. Also size of H^+ is very small compared to that of alkali metal ion. H forms stable

hydride only with strongly electropositive metals due to smaller value of its electron affinity ($72.8 kJ mol^{-1}$).

(iv) In view of the anomalous behaviour of hydrogen, it is difficult to assign any definite position to it in the periodic table. Hence it is customary to place it in group 1 (Along with alkali metals) as well as in group VII (Along with halogens).

(2) **Discovery and occurrence** : It was discovered by **Henry Cavendish** in 1766. Its name hydrogen was proposed by **Lavoisier**. Hydrogen is the 9th most abundant element in the earth's crust.

Hydrogen exists in diatomic state but in triatomic state it is called as *Hyzone*. Systematic name of water is *oxidane*.

(3) **Preparation of Dihydrogen** : Dihydrogen can be prepared by the following methods,

(i) *By action of water with metals*

(a) Active metals like Na , K react at room temperature

(b) Less active metals like Ca , Zn , Mg , Al liberate hydrogen only on heating.

(c) Metals like Fe , Ni , Co , Sn can react only when steam is passed over red hot metals.

(ii) *By the action of water on alkali and alkaline earth metal hydrides*

(iii) *By reaction of metals like Zn , Sn , Al with alkalies ($NaOH$ or KOH)*

(iv) **By action of metal with acids** : All active metals which lie above hydrogen in electrochemical series, can displace hydrogen gas from dilute mineral acids like HCl , H_2SO_4 .

(v) **By the electrolysis of acidified water**

(vi) **Laboratory method** : In laboratory, it is obtained by action of granulated zinc with dilute H_2SO_4 .

It must be noted that

(a) Pure zinc is not used for the preparation of H_2 as rate of reaction of pure Zn with dil. H_2SO_4 is quite slow.

(b) Conc. H_2SO_4 is not used because then SO_2 gas is evolved instead of H_2 .

(vii) **Preparation of pure hydrogen**: It can be obtained by

(a) The action of pure dil. H_2SO_4 on pure magnesium ribbon.

(b) Hydrogen of high purity (> 99.95%) is obtained by electrolysis of warm aqueous barium hydroxide between nickel electrodes.

(c) By the action of water on sodium hydride.

(d) By the action of KOH (aq.) on aluminium.

(viii) **Commercial production of dihydrogen**

(a) **Bosch process** : In this method, water gas is mixed with twice its volume of steam and passed over heated catalyst Fe_2O_3 in the presence of a promoter Cr_2O_3 or ThO_2 at 773 K when CO_2 and H_2 are obtained. CO_2 is removed by dissolving it in water under pressure (20–25 atm) and H_2 left undissolved is collected.

About 18% of the world's production of H_2 is obtained from coal.

(b) **Lane's process** : By passing steam over spongy iron at 773–1050 K.

The ferrosiferrous oxide (Fe_3O_4) so produced is reduced back to iron with water. this reaction is known as **Vivification reactions**

(c) **By electrolysis of water** : Electrolysis of acidified water using platinum electrodes is used for the bulk preparation of hydrogen.

(d) **From hydrocarbons** : Hydrocarbons (alkanes) react with steam at high temperature to produce carbon monoxide and hydrogen, e.g.,

The mixture of CO and H_2 so obtained can be converted into hydrogen as in Bosch process. About 77% of the world's production of H_2 is obtained from hydrocarbons.

(e) It is also produced as a by-product of the brine electrolysis process for the manufacture of Cl_2 and NaOH .

(4) **Physical properties of dihydrogen** : It is a colourless, tasteless and odourless gas. It is slightly soluble in water. It is highly combustible. The Physical constants of atomic hydrogen are,

Atomic radius (pm) – 37

Ionic radius of H^- ion (pm) – 210

Ionisation energy (kJ mol^{-1}) – 1312

Electron affinity (kJ mol^{-1}) – 72.8

Electronegativity – 2.1

(5) **Chemical properties of dihydrogen** : Dihydrogen is quite stable and dissociates into hydrogen atoms only when heated above 2000 K, $\text{H}_2 \xrightarrow{2000 \text{ K}} \text{H} + \text{H}$. Its bond dissociation energy is very high,

$\text{H}_2 \rightarrow \text{H} + \text{H}$; $\Delta H = 435.9 \text{ kJ mol}^{-1}$. Due to its high bond dissociation energy, it is not very reactive. However, it combines with many elements or compounds.

(i) **Action with metals** : To forms corresponding hydrides.

With transition metals (elements of d – block) such as Pd , Ni , Pt etc. dihydrogen forms interstitial hydrides in which the small molecules of dihydrogen occupy the interstitial sites in the crystal lattices of these hydrides. As a result of formation of interstitial hydrides, these metals adsorb large volume of hydrogen on their surface. This property of adsorption of a gas by a metal is called **occlusion**. The occluded hydrogen can be liberated from the metals by strong heating.

(ii) **Reaction with Non-metals**

The reactivity of halogen towards dihydrogen decreases as, $\text{F}_2 > \text{Cl}_2 > \text{Br}_2 > \text{I}_2$

As a result, F_2 reacts in dark, Cl_2 in the presence of sunlight, Br_2 reacts only upon heating while the reaction with I_2 occurs in the presence of a catalyst.

(iii) **Reaction with unsaturated hydrocarbons** : H_2 reacts with unsaturated hydrocarbons such as ethylene and acetylene to give saturated hydrocarbons.

This reaction is used in the **hydrogenation or hardening of oils**. The vegetable oils such as groundnut oil or cotton-seed oil are unsaturated in nature because they contain at least one double bond in their molecules. Dihydrogen is passed through the oils at about 473 K in the presence of catalyst to form solid fats. The vegetable ghee such as Dalda, Rath, etc. are usually prepared by this process.

(6) Uses of Dihydrogen

- (i) As a reducing agent
- (ii) In the hydrogenation of vegetable oils
- (iii) As a rocket fuel in the form of liquid H_2
- (iv) In the manufacture of synthetic petrol
- (v) In the preparation of many compounds such as NH_3 , CH_3OH , Urea etc.
- (vi) It is used in the oxy-hydrogen torch for welding if temperature around $2500^\circ C$ is required. It is also used in atomic hydrogen torch for welding purposes in which temperature of the order of $4000^\circ C$ is required.

Different forms of hydrogen

(1) **Atomic hydrogen** : It is obtained by the dissociation of hydrogen molecules. The atomic hydrogen is stable only for a fraction of a second and is extremely reactive. It is obtained by passing dihydrogen gas at atmospheric pressure through an electric arc struck between two tungsten rods.

The electric arc maintains a temperature around $4000 - 4500^\circ C$. As the molecules of dihydrogen gas pass through the electric arc, these absorb energy and get dissociated into atoms as

This arrangement is also called atomic hydrogen torch.

Fig. 17.1 Atomic hydrogen torch

(2) **Nascent hydrogen** : The hydrogen gas prepared in the reaction mixture in contact with the substance with which it has to react, is called nascent hydrogen. It is also called newly born hydrogen. It is more reactive than ordinary hydrogen. For example, if ordinary hydrogen is passed through acidified $KMnO_4$ (pink in colour), its colour is not discharged. On the other hand, if zinc pieces are added to the same solution, bubbles of

hydrogen rise through the solution and the colour is discharged due to the reduction on $KMnO_4$ by nascent hydrogen.

(3) **Ortho and para hydrogen** : A molecule of dihydrogen contains two atoms. The nuclei of both the atoms in each molecule of dihydrogen are spinning. Depending upon the direction of the spin of the nuclei, the hydrogen is of two types,

Fig. 17.2

(i) Molecules of hydrogen in which the spins of both the nuclei are in the same directions, called ortho hydrogen.

(ii) Molecules of hydrogen in which the spins of both the nuclei are in the opposite directions, called para hydrogen.

Ordinary dihydrogen is an equilibrium mixture of ortho and para hydrogen. Ortho hydrogen $\rightleftharpoons$ Para hydrogen. The amount of ortho and para hydrogen varies with temperature as,

- (a) At $0^\circ K$, hydrogen contains mainly para hydrogen which is more stable.
- (b) At the temperature of liquefaction of air, the ratio of ortho and para hydrogen is 1:1.
- (c) At the room temperature, the ratio of ortho to para hydrogen is 3:1.
- (d) Even at very high temperatures, the ratio of ortho to para hydrogen can never be more than 3:1.

Thus, it has been possible to get pure para hydrogen by cooling ordinary hydrogen gas to a very low temperature (close to 20 K) but it is never possible to get a sample of hydrogen containing more than 75% of ortho hydrogen. i.e., Pure ortho hydrogen can not be obtained.

(4) **Hydrides** : Hydrogen forms binary hydrides of the type MH_x or M_mH_n with

- (a) All main group elements except noble gases and probably indium and thallium.
- (b) All lanthanoids and actinoids.
- (c) Transition metals (Sc , Y , La , Ac , Tc , Zr , Hf and to a lesser extent V , Nb , Ta , Cr , Cu and Zn). In group 6 only Cr forms hydride (CrH).

Hydrides are classified into three main categories.

(i) **Saline or ionic hydrides** : Most of the s-block metals form this type of hydrides. These are non-volatile, non-conducting crystalline solids. However, BeH_2 and MgH_2 have covalent polymeric structure. These ionic hydrides have rock-salt structure. Thermal stability of 1^- and 2^- group hydrides are in the order;

BeH_2 , MgH_2 and LiH have significant covalent character.

Electrolysis of solution of saline hydride in molten alkali halide produces H_2 at anode. Saline hydrides react explosively with water.

The fire so produced cannot be extinguished by CO_2 as it gets reduced by the hot metal hydride. Only sand is useful, as it is a solid.

Alkali metal hydrides are used for making $LiAlH_4$, $NaBH_4$ etc. Alkali metal hydrides are also used for the removal of last traces of water from organic compounds.

(ii) **Metallic or interstitial hydrides** : Elements of groups 3, 4, 5 (*d*-block) and *f*-block elements form metallic hydrides. In group 6, only *Cr* forms hydride (*CrH*). Metals of group 7, 8, 9 do not form hydrides. This region of periodic table from group 7 to group 9 is known as hydride gap. Examples of hydrides of group 3 to 5 are, Sch_2 , YH_2 , YH_3 , LaH_2 , LaH_3 , TiH_2 , ZrH_2 , HfH_2 , VH ,

The *f*-block metals form hydrides of limiting compositions of MH_2 and MH_3 . All these hydrides are non-stoichiometric with variable composition e.g.,

Most of these hydrides are good conductors of electricity in solid state.

Metallic hydrides can be used to store hydrogen especially in cars working on fuel cells.

(iii) **Molecular or covalent hydrides** : Hydrogen form molecular compounds with *p*-block elements (*B, C, N, O, F, Si, P, S, Cl, Ga, Ge, As, Sb, Br, In, Sn, Pb, Te, I, Tl, Pb, At*). common examples of such hydrides are CH_4 , NH_3 , H_2O , HF etc. The stability of these hydrides decreases down the group. For example, $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$. In a period the stability increases with increasing electronegativity. For example, $CH_4 < NH_3 < H_2O < HF$. Molecular hydrides are classified as electron rich, electron precise and electron deficient hydrides.

(a) **Electron rich molecular hydrides** : These hydrides have one or more lone pairs of electrons around the central more electronegative element. For example

(b) **Electron precise molecular hydrides** : Elements of group 14 form such hydrides. The bond length increases on going down the group. A common example of electron precise molecular hydrides is CH_4 .

(c) **Electron deficient molecular hydrides** : These hydrides have lesser number of electrons than that required for writing the conventional Lewis

structure. A common example of such molecular hydride is diborane, B_2H_6 .

(d) **Systematic names of molecular hydrides** : The systematic names of these hydrides are obtained from the name of the element and the suffix -ane. For example,

Isotopes of Hydrogen

Isotopes are the different forms of the same element, which have the same atomic number but different mass numbers.

Table 17.1 Isotopes of hydrogen

Name	Symbol	Atomic number	Mass number	Relative abundance	Nature radioactive or non-radioactive
Protium or Hydrogen	1_1H or H	1	1	99.985%	Non-radioactive
Deuterium	2_1H or D	1	2	0.015%	Non-radioactive
Tritium	3_1H or T	1	3	$10^{-15}\%$	Radioactive

Table 17.2 Physical constants of H_2 , D_2 and T_2

Property	H_2	D_2	T_2
Molecular mass	2.016	4.028	6.03
Melting point (K)	13.8	18.7	20.63
Boiling point (K)	20.4	23.9	25.0
Heat of fusion (kJ mol^{-1})	0.117	0.197	0.250
Heat of vaporisation (kJ mol^{-1})	0.994	1.126	1.393
Bond energy (kJ mol^{-1})	435.9	443.4	446.9

Isotopic effect : In general chemical properties of isotopes are same but quantitative differences are noticed amongst them. For example, the reaction between H_2 and Cl_2 is 13.4 times faster between D_2 and Cl_2 under similar conditions. Such differences in chemical properties, which are due to difference in the mass numbers of isotopes is known as isotopic effect.

Water

Water is the oxide of hydrogen. It is an important component of animal and vegetable matter. Water constitutes about 65% of our body. It is the principal constituent of earth's surface.

(i) **Structure** : Due to the presence of lone pairs, the geometry of water is distorted and the $H-O-H$ bond angle is 104.5° , which is less than the normal tetrahedral angle (109.5°). The geometry of the molecule is regarded as angular or bent. In water, each $O-H$ bond is polar because of the high electronegativity of oxygen (3.5) in comparison to that of hydrogen (2.1). The resultant dipole moment of water molecule is 1.84D.

In ice, each oxygen atom is tetrahedrally surrounded by four hydrogen atoms; **two by covalent bonds and two by hydrogen bonds**. The resulting structure of ice is open structure having a number of vacant spaces. Therefore, the density of ice is less than that of

water and ice floats over water. It may be noted that water has maximum density (1 g cm^{-3}) at 4°C (277 K).

(2) **Heavy water** : Chemically heavy water is deuterium oxide (D_2O). It was discovered by **Urey**.

It is obtained as a by-product in some industries where H_2 is produced by the electrolysis of water.

Heavy water (D_2O) is used (a) as a moderator and coolant in nuclear reactors (b) in the study of mechanism of chemical reactions (c) as a starting material for the preparation of a number of deuterium compounds, e.g.,

(3) **Physical properties** : Water is colourless, odourless and tasteless liquid at ordinary temperature.

At 273 K water is in equilibrium with ice and vapour this point is known triple point.

Table 17.3 Some physical constants of H_2O and D_2O at 298 K

Constant	Ordinary water H_2O	Heavy water D_2O
Molecular mass	18.015	20.028
Maximum density (g cm^{-3})	1.000	1.106
Melting point (K)	273.2	276.8
Boiling point (K)	373.2	374.4
Heat of fusion (kJ mol^{-1}) at 273 K	6.01	6.28
Heat of vaporisation (kJ mol^{-1}) at 373 K	40.66	41.61
Heat of formation (kJ mol^{-1})	-285.9	-294.6
Ionisation constant	1.008×10^{-14}	1.95×10^{-15}

(4) **Chemical properties** : Water shows a versatile chemical behaviour. It behaves as an acid, a base, an oxidant, a reductant and as ligand to metals.

(i) **Dissociation of water** : Water is quite stable and does not dissociate into its elements even at high temperatures. Pure water has a small but measurable electrical conductivity and it dissociates as,

$$K_w = 1.0 \times 10^{-14} \text{ mol}^2 \text{ L}^{-2} \text{ at } 298\text{ K}$$

(ii) **Amphoteric nature** : Water can act both as an acid and a base and is said to be amphoteric. However, water is neutral towards litmus and its pH is 7.

(iii) **Oxidising and reducing nature** : Water can act both as an oxidising and a reducing agent in its chemical reactions. e.g.

(iv) **Hydrolytic reactions** : Water can hydrolyse many oxides, halides, hydrides, carbides, nitrides, phosphides, carbonates etc. to give an acid or a base or both as shown below :

(v) **Water forms hydrates with metal salts** : There are three main types of hydrates.

(a) Compounds in which water molecule are co-ordinated to the metal ion (complex compounds) $[\text{Ni(OH}_2\text{)}](\text{NO}_3)_2$, $\text{Fe(OH}_2\text{)}_6\text{Cl}_3$ etc.

(b) Compound in which water molecule may be hydrogen bonded to oxygen to form oxo-anion. For example in $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, 4 molecules of water are co-ordinated to Cu^{2+} while the fifth molecule is hydrogen bonded to SO_4^{2-} ion.

(c) In some compounds, water molecule occupies, interstitial sites in the crystal lattice e.g., $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$.

(5) **Hard and Soft water**

Water which produces lather with soap solution readily is called **soft water**. e.g. distilled water, rain water and demineralised water.

Water which does not produce lather with soap solution readily is called **hard water**. e.g. sea water, river water, well water and tap water.

(i) **Cause of hardness of water** : The hardness of water is due to the presence of bicarbonates, chlorides and sulphates of calcium and magnesium.

Hard water does not produce lather because the cations (Ca^{+2} and Mg^{+2}) present in hard water react with soap to form insoluble precipitates,

Where $\text{M} = \text{Ca}$ or Mg

Therefore, no lather is produced until all the calcium and magnesium ions are precipitated. This also results into wastage of lot of soap.

(ii) **Type of hardness of water** : The hardness of water is of two types,

(a) **Temporary hardness** : This is due to the presence of bicarbonates of calcium and magnesium. It is also called carbonate hardness.

(b) **Permanent hardness** : This is due to the presence of chlorides and sulphates of calcium and magnesium. It is also called non-carbonate hardness.

(iii) **Softening of water** : The process of the removal of hardness from water is called softening of water.

(a) **Removal of temporary hardness** : It can be removed by the following methods,

• By boiling : During boiling, the bicarbonates of *Ca* and *Mg* decompose into insoluble carbonates and give CO_2 . The insoluble carbonates can be removed by filtration.

• Clark's method : This process is used on a commercial scale. In this process, calculated amount of lime $[\text{Ca}(\text{OH})_2]$ is added to temporary hard water.

(b) *Removal of permanent hardness* : Permanent hardness can be removed by the following methods,

• By washing soda method : In this method, water is treated with a calculated amount of washing soda (Na_2CO_3) which converts the chlorides and sulphates of *Ca* and *Mg* into their respective carbonates which get precipitated.

• Permutit method : This is a modern method employed for the softening of hard water. hydrated sodium aluminium silicate ($\text{Na}_2\text{Al}_2\text{Si}_2\text{O}_8 \cdot x\text{H}_2\text{O}$) is called permutit. These complex salts are also known as zeolites.

The permutit as loosely packed in a big tank over a layer of coarse sand. Hard water is introduced into the tank from the top. Water reaches the bottom of the tank and then slowly rises through the permutit layer in the tank. The cations present in hard water are exchanged for sodium ions. Therefore this method is also called ion exchange method.

where $\text{Z} = \text{Al}_2\text{Si}_2\text{O}_8 \cdot x\text{H}_2\text{O}$

Hydrogen peroxide

Hydrogen peroxide (H_2O_2) was discovered by French chemist **Thenard**.

(1) **Preparation** : It is prepared by

(i) **Laboratory method** : In laboratory, H_2O_2 is prepared by Merck's process. It is prepared by adding calculated amounts of sodium peroxide to ice cold dilute (20%) solution of H_2SO_4 .

(ii) By the action of sulphuric acid or phosphoric acid on hydrated barium peroxide $\text{BaO}_2 \cdot 8\text{H}_2\text{O}$

It must be noted that anhydrous barium peroxide does not react readily with sulphuric acid (because a coating of insoluble barium sulphate is formed on its surface which stops further action of the acid). Therefore, hydrated barium peroxide, $\text{BaO}_2 \cdot 8\text{H}_2\text{O}$ must be used.

Phosphoric acid is preferred to H_2SO_4 because soluble impurities like barium persulphate (from $\text{BaO}_2 \cdot 8\text{H}_2\text{O} + \text{H}_2\text{SO}_4$) tends to decompose H_2O_2 while H_3PO_4 acts as preservative (negative catalyst) for H_2O_2 .

(iii) **Industrial method** : On a commercial scale, H_2O_2 can be prepared by the electrolysis of 50% H_2SO_4 solution. In a cell, peroxy disulphuric acid is formed at the anode.

This is drawn off from the cell and hydrolysed with water to give H_2O_2 .

$\text{H}_2\text{S}_2\text{O}_8 + 2\text{H}_2\text{O} \longrightarrow 2\text{H}_2\text{SO}_4 + \text{H}_2\text{O}_2$ The resulting solution is distilled under reduced pressure when H_2O_2 gets distilled while H_2SO_4 with high boiling point, remains undistilled.

(iv) **By redox process** : Industrially H_2O_2 is prepared by the auto-oxidation of 2-alkylanthraquinols. The process involves a cycle of reactions. The net reaction is the catalytic union of H_2 and O_2 to give H_2O_2 .

The H_2O_2 formed (about 1%) is extracted with water and concentrated.

(2) Physical properties

- (i) Pure hydrogen peroxide is a pale blue syrupy liquid.
- (ii) It freezes at -0.5°C and has a density of 1.4 in pure state.
- (iii) Hydrogen peroxide is diamagnetic.
- (iv) It is more highly associated via hydrogen bonding than water.
- (v) Although it is a better polar solvent than H_2O . However, it can't be used as such because of strong autooxidation ability.
- (vi) Dipole moment of H_2O_2 is 2.1 D.

(3) Chemical properties

(i) **Decomposition** : Pure H_2O_2 is an unstable liquid and decomposes into water and O_2 either upon standing or upon heating,

$$2\text{H}_2\text{O}_2 \longrightarrow 2\text{H}_2\text{O} + \text{O}_2; \Delta H = -196.0 \text{ kJ}$$

(ii) **Oxidising nature** : It is a powerful oxidising agent. It acts as an oxidising agent in neutral, acidic or in alkaline medium. e.g.

$$2KI + H_2O_2 \longrightarrow 2KOH + I_2 \text{ [In neutral medium]}$$

$$2FeSO_4 + H_2SO_4 + H_2O_2 \longrightarrow Fe_2(SO_4)_3 + 2H_2O \text{ [In acidic medium]}$$

$$MnSO_4 + H_2O_2 + 2NaOH \longrightarrow MnO_2 + Na_2SO_4 + 2H_2O \text{ [In alkaline medium]}$$

(iii) **Reducing nature** : H_2O_2 has tendency to take up oxygen from strong oxidising agents and thus, acts as a reducing agent, $H_2O_2 + O \xrightarrow[\text{From oxidising agent}]{}$ $H_2O + O_2$. It can act as a reducing agent in acidic, basic or even neutral medium.

In acidic medium, $H_2O_2 \longrightarrow 2H^+ + O_2 + 2e^-$

In alkaline medium, $H_2O_2 + 2OH^- \longrightarrow 2H_2O + O_2 + 2e^-$

(iv) **Bleaching action** : H_2O_2 acts as a bleaching agent due to the release of nascent oxygen.

Thus, the bleaching action of H_2O_2 is due to oxidation. It oxidises the colouring matter to a colourless product, Colouring matter $+O \rightarrow$ Colour less matter.

H_2O_2 is used to bleach delicate materials like ivory, silk, wool, leather etc.

(v) **Acidic nature** : Anhydrous hydrogen peroxide is acidic in character ($K_a = 1.55 \times 10^{-12}$ at 298 K). its dissociation in aqueous solution may be given as

It forms two types of salts

(vi) **Addition reactions** : Hydrogen peroxide is capable of adding itself to ethylenic linkage.

(4) **Structure of H_2O_2** : Hydrogen peroxide is non-linear, non-planar molecule. It has an open book structure. The $-O-O-$ linkage is called peroxy linkage. The structure is shown below.

(5) **Concentration of H_2O_2** : Dilute H_2O_2 is concentrated to about 50% by slow evaporation on a water bath. It is further concentrated to 90% in a vacuum desiccator using conc. H_2SO_4 as dehydrating agent. Further concentration to 99% is obtained by distillation under reduced pressure. Last traces of moisture in 99% of H_2O_2 are removed or anhydrous

H_2O_2 is obtained by cooling it to 263 K in a cold bath of ether and dry ice followed by seeding with a few crystals of solid H_2O_2 when needle-shaped crystals of 100% H_2O_2 separate out. These crystals are removed, dried and melted to get 100% H_2O_2 .

(6) **Storage of H_2O_2** : H_2O_2 is not stored in glass bottles since the alkali metal oxides present in glass catalyse its decomposition. It is, therefore, stored in paraffin wax coated glass, plastic or teflon bottles. Small amounts of acid, glycerol, alcohol, acetanilide and H_3PO_4 are often used as stabilizers to check its decomposition.

Uses of hydrogen peroxide

- For bleaching delicate articles like wool, hair, feather, ivory, etc.
- For restoring colour of old lead paintings whose white lead has blackened due to formation of PbS by H_2S of atmosphere. Hydrogen peroxide converts the black lead sulphide to white lead sulphate
- As an aerating agent in production of sponge rubber.
- As an antiseptic and germicide for washing wounds, teeth and ears, under the name of perhydrol.
- In the manufacture of sodium perborate, sodium percarbonate. These are used in high quality detergents.
- As an antichlor.
- As an oxidant for rocket fuel.
- In the detection of Ti , V and Cr ions with which it forms peroxides of characteristics colours.
- In the production of epoxides, propylene oxide and polyurethanes.
- In the synthesis of hydroquinone, pharmaceuticals (cephalosporin) and food products like tartaric acid.
- For pollution control of domestic effluents where it restores the aerobic conditions of sewage wastes. For pollution control of industrial effluents containing CN^- ions. H_2O_2 oxidises CN^- ions to harmless products.

Tips & Tricks

✍ Hydrogen forms more compounds than even carbon.

✍ Metals like Pd , Pt , Au etc., have the property of absorbing large quantity of hydrogen at normal or higher temperature. Colloidal Pd can absorb 2950 times its own volume of hydrogen and Pd metal can absorb 900 times its own volume of hydrogen.

This phenomenon is known as occlusion of hydrogen. the occlusion property of these metals is in the order

Colloidal Palladium > Palladium > Platinum > Gold > Nickel.

✍ In solids, water molecules can also be present as zeolite water and clathrate water.

✍ Ice is a good thermal insulator.

✍ 30% H_2O_2 is called perhydrol. Its volume strength is 100 and molarity is 8.8.

Ordinary Thinking

Objective Questions

Hydrogen

1. Which is used hydrogen generators [CPMT 1999]
(a) NaH (b) HI
(c) S_6H_3 (d) None of these
2. Metal hydride on treatment with water gives [Bihar CEE 1995]
(a) H_2O_2 (b) H_2O
(c) Acid (d) Hydrogen
3. Hydrogen burns in air with a [RPET 2003]
(a) Light bluish flame (b) Yellow flame
(c) Green flame (d) None of these
4. Which pair does not show hydrogen isotopes [UPSEAT 2003]
(a) Ortho hydrogen and para hydrogen
(b) Protium and deuterium
(c) Deuterium and tritium
(d) Tritium and protium
5. Which is distilled first [Pb. PMT 2002]
(a) Liquid CO_2 (b) Liquid N_2
(c) Liquid O_2 (d) Liquid H_2
6. On reaction with Mg , very dilute nitric acid produces [CPMT 2003]
(a) NH_3 (b) Nitrous oxide
(c) Nitric oxide (d) Hydrogen

7. Among the following, identify the compound which cannot act as both oxidising and reducing agents [AMU 2002]
 (a) H_2O_2 (b) H_2
 (c) SO_2 (d) Cl_2
8. Which of the following reaction produces hydrogen [AIIMS 2002]
 (a) $Mg + H_2O$ (b) $BaO_2 + HCl$
 (c) $H_2S_4O_8 + H_2O$ (d) $Na_2O_2 + 2HCl$
9. Hydrogen resembles in many of its properties [MH CET 2001]
 (a) Halogen (b) Alkali metals
 (c) Both (a) and (b) (d) None of these
10. Ortho and para hydrogen differ in [AFMC 2001]
 (a) Proton spin (b) Electron spin
 (c) Nuclear charge (d) Nuclear reaction
11. Action of water or dilute mineral acids on metals can give [Kerala (Med.) 2002]
 (a) Monohydrogen (b) Tritium
 (c) Dihydrogen (d) Trihydrogen
12. Hydrogen from HCl can be prepared by [Pb. CET 1997]
 (a) Mg (b) Cu
 (c) P (d) Pt
13. Which of the following can adsorb largest volume of hydrogen gas
 (a) Finely divided platinum (b) Finely divided nickel
 (c) Colloidal palladium (d) Colloidal platinum
14. The nuclei of tritium (H^3) atom would contain neutrons
 (a) 1 (b) 2
 (c) 3 (d) 4
15. The colour of hydrogen is [MP PET 2004]
 (a) Black (b) Yellow
 (c) Orange (d) Colourless
16. Ordinary hydrogen at room temperature is a mixture of
 (a) 75% of α -Hydrogen + 25% of β -Hydrogen
 (b) 25% of α -Hydrogen + 75% of β -Hydrogen
 (c) 50% of α -Hydrogen + 50% of β -Hydrogen
 (d) 1% of α -Hydrogen + 99% of β -Hydrogen
17. Hydrogen cannot reduce
 (a) Hot CuO (b) Fe_2O_3
 (c) Hot SnO_2 (d) Hot Al_2O_3
18. Hydrogen does not combine with
 (a) Antimony (b) Sodium
 (c) Bismuth (d) Helium
19. The adsorption of hydrogen by metals is called [EAMCET 1999; Manipal PMT 1999]
 (a) Dehydrogenation (b) Hydrogenation
 (c) Occlusion (d) Adsorption
20. Which of the following produces hydrolith with dihydrogen
 (a) Mg (b) Al
 (c) Cu (d) Ca
21. The metal which displaces hydrogen from a boiling caustic soda solution is
 (a) As (b) Zn
 (c) Mg (d) Fe
22. Metals like platinum and palladium can absorb large volumes of hydrogen under special conditions. Such adsorbed hydrogen by the metal is known as
 (a) Adsorbed hydrogen (b) Occluded hydrogen
 (c) Reactive hydrogen (d) Atomic hydrogen
23. Which is poorest reducing agent
 (a) Nascent hydrogen
 (b) Atomic hydrogen
 (c) Dihydrogen
 (d) All have same reducing strength
24. The sum of protons, electrons and neutrons in the heaviest isotope of hydrogen is
 (a) 6 (b) 5
 (c) 4 (d) 3
25. Number of nucleons in D_2 molecule is
 (a) 1 (b) 2
 (c) 3 (d) 4
26. An ionic compound is dissolved simultaneously in heavy water and simple water. Its solubility is
 (a) Larger in heavy water (b) Smaller in heavy water
 (c) Solubility is same in both (d) Smaller in simple water
27. Ortho-hydrogen and para-hydrogen resembles in which of the following property
 (a) Thermal conductivity (b) Magnetic properties
 (c) Chemical properties (d) Heat capacity
28. The difference between heat of adsorption of ortho and para hydrogen is
 (a) 0.4 kJ mol^{-1} (b) 0.8 kJ mol^{-1}
 (c) Zero (d) None of these
29. Hydrogen ion H^- is isoelectronic with
 (a) Li (b) He
 (c) H^+ (d) Li^-
30. Hydrogen can be fused to form helium at [AFMC 2005]
 (a) High temperature and high pressure
 (b) High temperature and low pressure
 (c) Low temperature and high pressure
 (d) Low temperature and low pressure
31. Hydrogen can be prepared by mixing steam, and water gas at $500^\circ C$ in the presence of Fe_3O_4 and Cr_2O_3 . This process is called
 (a) Nelson process (b) Serpeck's process
 (c) Bosch process (d) Parke's process
32. Which of the following metal do not liberate hydrogen from dilute hydrochloric acid
 (a) Zn (b) Mg
 (c) Fe (d) Au
33. An element reacts with hydrogen to form a compound A which on treatment with water liberates hydrogen gas. The element can be
 (a) Nitrogen (b) Chlorine
 (c) Selenium (d) Calcium
34. Hydrogen combines with other elements by
 (a) Losing an electron
 (b) Gaining an electron
 (c) Sharing an electron
 (d) Losing, gaining or sharing electron
35. Which of the following explanation is best for not placing hydrogen with alkali metals or halogen
 (a) The ionization energy of hydrogen is high for group of alkali metals or halogen
 (b) Hydrogen can form compounds
 (c) Hydrogen is a much lighter element than the alkali metals or halogens
 (d) Hydrogen atom does not contain any neutron
36. Which of the following terms is not correct for hydrogen
 (a) Its molecule is diatomic

- (b) It exists both as H^+ and H^- in different chemical compounds
 (c) It is the only species which has no neutrons in the nucleus
 (d) Heavy water is unstable because hydrogen is substituted by its isotope deuterium
37. When electric current is passed through an ionic hydride in the molten state
 (a) Hydrogen is liberated at the anode
 (b) Hydrogen is liberated at the cathode
 (c) No reaction takes place
 (d) Hydride ion migrates towards cathode
38. Which of the halogen has maximum affinity for hydrogen
 (a) F_2 (b) Cl_2
 (c) Br_2 (d) I_2
39. Which of the following statements is most applicable to hydrogen
 (a) It can act as a reducing agent
 (b) It can act as an oxidising agent
 (c) It can act both as oxidising and reducing agent
 (d) It can neither act as oxidising nor as a reducing agent
40. Hydrogen is
 (a) Electropositive
 (b) Electronegative
 (c) Both electropositive as well as electronegative
 (d) Neither electropositive nor electronegative
41. Ionization energy of hydrogen is
 (a) Equal to that of chlorine
 (b) Lesser than that of chlorine
 (c) Slightly higher than that of chlorine
 (d) Much higher than that of chlorine
42. Hydrogen acts as a reducing agent and thus resembles
 (a) Halogen (b) Noble gas
 (c) Radioactive elements (d) Alkali metals
43. Which position for hydrogen explain all its properties
 (a) At the top of halogen
 (b) At the top of alkali metals
 (c) At the top of carbon family
 (d) None of these
44. Hydrogen readily combines with non-metals and thus it shows its
 (a) Electronegativity character
 (b) Electropositive character
 (c) Both (a) and (b)
 (d) None of these
45. The oxidation states shown by hydrogen are
 (a) -1 only (b) Zero only
 (c) $+1, -1, 0$ (d) $+1$ only
46. Hydrogen readily combines with metals and thus shows its
 (a) Electropositive character (b) Electronegative character
 (c) Both (a) and (b) (d) None of these
47. Electrolysis of fused sodium hydride liberate hydrogen at the
 (a) Anode
 (b) Cathode
 (c) Cathode and anode both
 (d) None of these
48. Protionic acid is
 (a) A compound that form solvated hydrogen ion in polar solvent
 (b) An acid which accepts the proton
 (c) A compound that forms hydride ion in polar solvent
 (d) An acid which donates the proton
49. In all its properties, hydrogen resembles
 (a) Alkali metals only
 (b) Halogen only
 (c) Both alkali metals and halogens
 (d) Neither alkali metals nor halogens
50. Hydrogen molecule differs from chlorine molecule in the following respect
 (a) Hydrogen molecule is non-polar but chlorine molecule is polar
 (b) Hydrogen molecule is polar while chlorine molecule is non-polar
 (c) Hydrogen molecule can form intermolecular hydrogen bonds but chlorine molecule does not
 (d) Hydrogen molecule cannot participate in coordination bond formation but chlorine molecule can
51. Which of the following statements concerning protium, deuterium and tritium is not true
 (a) They are isotopes of each other
 (b) They have similar electronic configurations
 (c) They exist in the nature in the ratio of $1 : 2 : 3$
 (d) Their mass numbers are in the ratio of $1 : 2 : 3$
52. When SO_3 is treated with heavy water the product is/are
 (a) Deuterium and sulphuric acid
 (b) Deuterium and sulphurous acid
 (c) Only deuterium
 (d) Dideuterosulphuric acid
53. Hydrogen has three isotopes, the number of possible diatomic molecules will be
 (a) 2 (b) 6
 (c) 9 (d) 12
54. In which of the compounds does hydrogen have an oxidation state of -1
 (a) CH_4 (b) NH_3
 (c) HCl (d) CaH_2
55. Pure hydrogen is obtained by carrying electrolysis of
 (a) Water containing H_2SO_4
 (b) Water containing $NaOH$
 (c) $Ba(OH)_2$ solution
 (d) KOH solution
56. In Bosch's process which gas is utilised for the production of hydrogen gas
 (a) Producer gas (b) Water gas
 (c) Coal gas (d) None of these
57. Deuterium differs from hydrogen in
 (a) Chemical properties
 (b) Physical properties
 (c) Both physical and chemical properties
 (d) Radioactive properties
58. Tritium undergoes radioactive decay giving
 (a) α -particles (b) β -particles
 (c) Neutrons (d) γ -rays
59. The gas used in the hydrogenation of vegetable oils in the presence of nickel as catalyst is
 (a) Methane (b) Ethane
 (c) Ozone (d) Hydrogen
60. The conversion of atomic hydrogen into ordinary hydrogen is
 (a) Exothermic change
 (b) Endothermic change
 (c) Nuclear change
 (d) Photochemical change
61. The name hydrogen was given by

- (a) Cavendish (b) Lavoisier
(c) Urey (d) None of these
62. The ratio C_p / C_v for H_2 is
(a) 1.40 (b) 1.67
(c) 1.33 (d) None of these
63. Triatomic hydrogen is called
(a) Deuterium (b) Hyzone
(c) Ortho form (d) Hydronium ion
64. $LiAlH_4$ is obtained by reacting an excess of With an ethereal solution of $AlCl_3$
(a) $LiCl$ (b) LiH
(c) Li (d) $LiOH$
65. Alkali metal hydrides react with water to give
(a) Acidic solution (b) Basic solution
(c) Neutral solution (d) Hydride ion
66. Ionic hydrides are usually
(a) Good electrically conductors when solid
(b) Easily reduced
(c) Good reducing agents
(d) Liquid at room temperature
67. When $NaBH_4$ is dissolved in water
(a) It decomposes with the evolution of H_2
(b) Na^+ and BH_4^- are formed which are stable
(c) BH_4^- ions formed initially decompose to produce OH^- ions, which prevent further decomposition
(d) NaH and B_2H_6 are produced
68. Systematic name of H_2O (oxide of hydrogen) is
(a) Water (b) Hydrogen oxide
(c) Oxidane (d) None of these
69. Group 2 hydrides with significant covalent character is/are
(a) BeH_2 (b) MgH_2
(c) Both (a) and (b) (d) None of these
70. Limiting compositions of f-block hydrides are
(a) MH_2 and MH_3 (b) MH_3 and MH_5
(c) MH_2 and MH_8 (d) MH_2 and MH_6
71. Hydrogen directly combines with [Roorkee Entrance 1990]
(a) Au (b) Cu
(c) Ni (d) Ca
72. Chemical A is used for water softening to remove temporary hardness. A reacts with sodium carbonate to generate caustic soda. When CO_2 is bubbled through a solution of A , it turns cloudy. What is the chemical formula of A [Pb. CET 1990; AIIMS 1999]
(a) $CaCO_3$ (b) CaO
(c) $Ca(OH)_2$ (d) $Ca(HCO_3)_2$
73. When same amount of zinc is treated separately with excess of sulphuric acid and excess of sodium hydroxide solution the ratio of volumes of hydrogen evolved is [CPMT 1991]
(a) 1 : 1 (b) 1 : 2
(c) 2 : 1 (d) 9 : 4
74. Which one of the following substances is used in the laboratory for a fast drying of neutral gases [CBSE PMT 1992]
(a) Phosphorus pentoxide
(b) Active charcoal
(c) Anhydrous calcium chloride
(d) Na_3PO_4
75. Which is the lightest gas [CPMT 1993]
(a) Nitrogen (b) Helium
(c) Oxygen (d) Hydrogen
76. The composition of tritium is [UGET Manipal 1995]
(a) 1 electron, 1 proton, 1 neutron
(b) 1 electron, 2 protons, 1 neutron
(c) 1 electron, 1 proton, 2 neutrons
(d) 1 electron, 1 proton, 3 neutrons
77. The property of hydrogen which distinguishes it from alkali metals is
(a) Its electropositive character
(b) Its affinity for non metal
(c) Its reducing character
(d) Its non-metallic character
78. The hydride ion H^- is a stronger base than its hydroxide ion OH^- . Which of the following reactions will occur if sodium hydride (NaH) is dissolved in water [CBSE PMT 1997]
(a) $H^-(aq) + H_2O \rightarrow H_3O^-(aq)$
(b) $H^-(aq) + H_2O(l) \rightarrow OH^-(aq) + H_2(g)$
(c) $H^-(aq) + H_2O(l) \rightarrow$ No reaction
(d) None of these
79. Hydrogen accepts an electron to form inert gas configuration. In this it resembles [Pb. PMT 1997]
(a) Halogen (b) Alkali metals
(c) Chalcogens (d) Alkaline earth metals
80. Which of the following is correct for hydrogen [AFMC 1997; BHU 1997]
(a) It can form bonds in +1 as well as -1 oxidation state
(b) It is always collected at cathode
(c) It has a very high ionization potential
(d) It has same electronegativity as halogens
81. Which of the following will not displace hydrogen [Pb. PMT 1999]
(a) Ba (b) Pb
(c) Hg (d) Sn
82. Which of the following gas is insoluble in water [Pb. CET 2003]
(a) SO_2 (b) NH_3
(c) H_2 (d) CO_2
83. Which element forms maximum compound in chemistry [Pb. CET 2004]
(a) O (b) H
(c) Si (d) C
84. Hydrogen is not obtained when zinc reacts with [J & K 2005]
(a) Cold water (b) Hot $NaOH$ solution
(c) Conc. sulphuric acid (d) dilute HCl

1. Synthetic detergents are more effective in hard water than soaps because [AMU 2002]
 - (a) They are highly soluble in water
 - (b) Their Ca^{++} and Mg^{++} salts are water soluble
 - (c) Their Ca^{++} and Mg^{++} salts are insoluble in water
 - (d) None of these
2. D_2O is used more in [BHU 1997; CPMT 1997]
 - (a) Chemical industry
 - (b) Nuclear reactor
 - (c) Pharmaceutical preparations
 - (d) Insecticide preparation
3. Heavy water (D_2O) is [RPET/PMT 2000; CPMT 2000]
 - (a) A product of oxygen and hydrogen
 - (b) Water of mineral springs
 - (c) Water obtained by repeated distillation and condensation
 - (d) Ordinary water containing dissolved salts heavy metals
4. Temporary hardness may be removed from water by adding [Pb. PMT 2002]
 - (a) CaCO_3
 - (b) $\text{Ca}(\text{OH})_2$
 - (c) CaSO_4
 - (d) HCl
5. Heavy water is [AFMC 1997; UPSEAT 2003
MH CET 2003; Pb. CET 2001]
 - (a) Water containing Fe , Cr , Mn
 - (b) Water at 0°C
 - (c) D_2O
 - (d) Water obtained after a number of distillations
6. Heavy water is compound of [DPMT 2001; DCE 2002]
 - (a) Oxygen and heavier isotopes of hydrogen
 - (b) Hydrogen and heavier isotopes of oxygen
 - (c) Heavier isotopes of oxygen and hydrogen
 - (d) None of these
7. Which of the following pair of ions makes the water hard [AMU 2002]
 - (a) Na^+ , SO_4^{2-}
 - (b) K^+ , HCO_3^-
 - (c) Ca^{2+} , NO_3^-
 - (d) NH_4^+ , Cl^-
8. Temporary hardness of water can be removed by [Pb. PMT 2001]
 - (a) Addition of potassium permanganate
 - (b) Boiling
 - (c) Filtration
 - (d) Addition of chlorine
9. When zeolite (Hydrated sodium aluminium silicate) is treated with hard water the sodium ions are exchanged with [DPMT 2000]
 - (a) OH^- ions
 - (b) SO_4^{2-} ions
 - (c) Ca^{2+} ions
 - (d) H^+ ions
10. Which of the following statements do not define the characteristic property of water "Water is a universal solvent"
 - (a) It can dissolve maximum number of compounds
 - (b) It has very low dielectric constant
 - (c) It has high liquid range
 - (d) None of these
11. The velocity of neutrons in nuclear reactor is slowed down by
 - (a) Heavy water (D_2O)
 - (b) Ordinary water (H_2O)
 - (c) Zinc rod
 - (d) Fused caustic soda
12. Temporary hardness of water is due to the presence of
 - (a) Magnesium bicarbonate
 - (b) Calcium chloride
 - (c) Magnesium sulphate
 - (d) Calcium carbonate
13. Which of the following is not true
 - (a) Hardness of water depends on its behaviour towards soap
 - (b) The temporary hardness is due to the presence of Ca and Mg bicarbonates
 - (c) Permanent hardness is due to the presence of soluble Ca and Mg sulphates, chlorides and nitrates
 - (d) Permanent hardness can be removed by boiling the water
14. The molarity of pure water at 4°C is
 - (a) 1 M
 - (b) 2.5 M
 - (c) 5 M
 - (d) 55.5 M
15. Which of the following is not a hard water
 - (a) Water containing CaCl_2
 - (b) Water containing dil. HCl
 - (c) Water containing MgSO_4
 - (d) None of these
16. Heavy water is used in atomic reactor as
 - (a) Coolant
 - (b) Moderator
 - (c) Both moderator and coolant
 - (d) Neither coolant nor moderator
17. Heavy water freezes at
 - (a) 0°C
 - (b) 3.8°C
 - (c) 38°C
 - (d) -0.38°C
18. The pH of D_2O and H_2O at 298 K is
 - (a) 7.0, 7.0
 - (b) 7.35, 7.0
 - (c) 7.0, 6.85
 - (d) 6.85, 7.35
19. Which of the following is not true
 - (a) Ordinary water is electrolysed more rapidly than D_2O
 - (b) Reaction between H_2 and Cl_2 is much faster than D_2 and Cl_2
 - (c) D_2O freezes at lower temperature than H_2O
 - (d) Bond dissociation energy for D_2 is greater than H_2
20. Which of the following will determine whether the given colourless liquid is water or not
 - (a) Melting
 - (b) Tasting
 - (c) Phosphthalein
 - (d) Adding a pinch of anhydrous CuSO_4
21. Lead pipes are not used for carrying drinking water because
 - (a) They are covered with a coating of lead carbonate
 - (b) They are corroded by air and moisture
 - (c) Water containing dissolved air attacks lead forming soluble hydroxide
 - (d) None of these
22. Which one of the following removes temporary hardness of water
 - (a) Slaked lime
 - (b) Plaster of Paris
 - (c) Cuprous
 - (d) Hydrolith
23. Which of the following will cause softening of hard water
 - (a) Passing it through cation exchange resin

- (b) Passing it through anion exchange resin
(c) Passing it through sand
(d) Passing it through alumina
24. which of the following process permanent hardness of water can be removed, by adding [AFMC 2005]
(a) Soda lime (b) Sodium bicarbonate
(c) Washing soda (d) Sodium chloride
25. Permutit is technical name given to
(a) Aluminates of calcium and sodium
(b) Silicates of calcium and sodium
(c) Hydrated silicates of aluminium and sodium
(d) Silicates of calcium and magnesium
26. The approximate mass of tritium oxide molecule is
(a) 18 amu (b) 20 amu
(c) 22 amu (d) 24 amu
27. Molecular weight of heavy water is
(a) 19 (b) 18
(c) 17 (d) 20
28. Water is said to be permanently hard when it contains
(a) Sulphates of *Mg* and *Ca*
(b) Bicarbonates of *Mg* and *Ca*
(c) Sulphates of *Cu* and *Hg*
(d) Carbonates and bicarbonates of *Mg* and *Ca*
29. Sodium sulphate is soluble in water but barium sulphate is insoluble because [Pb. PMT 1995]
(a) The hydration energy of Na_2SO_4 is more than its lattice energy
(b) The lattice energy of $BaSO_4$ is more than its hydration energy
(c) The lattice energy has no role to play in solubility
(d) The hydration energy of Na_2SO_4 is less than its lattice energy
(e) Both (a) and (b)
30. The alum used for purifying water is [EAMCET 1999]
(a) Ferric alum (b) Chrome alum
(c) Potash alum (d) Ammonium alum
31. Which of the following metal will not reduce H_2O [CPMT 1999]
(a) *Ca* (b) *Fe*
(c) *Cu* (d) *Li*
32. Which of the following is correct about heavy water [DCE 2002]
(a) Water at $4^\circ C$ having maximum density is known as heavy water
(b) It is heavier than water (H_2O)
(c) It is formed by the combination of heavier isotope of hydrogen and oxygen
(d) None of these
33. The boiling point of water is exceptionally high because [KCET 2001]
(a) There is covalent bond between *H* and *O*
(b) Water molecule is linear
(c) Water molecules associate due to hydrogen bonding
(d) Water molecule is not linear
34. Match list I with list II and select the correct answer using the codes given below the lists [SCRA 2001]

	List I	List II
1.	Heavy water	(a) Bicarbonates of <i>Mg</i> and <i>Ca</i> in water
2.	Temporary hard water	(b) No foreign ions in water
3.	Soft water	(c) D_2O
4.	Permanent hard water	(d) Sulphates and chlorides of <i>Mg</i> and <i>Ca</i> in water

Codes

- (a) 1-c, 2-d, 3-b, 4-a (b) 1-b, 2-a, 3-c, 4-d
(c) 1-b, 2-d, 3-c, 4-a (d) 1-c, 2-a, 3-b, 4-d
35. The $H-O-H$ angle in water molecule is about [AFMC 2001]
(a) 90° (b) 180°
(c) 102° (d) 105°
36. When two ice cubes are pressed over each other, they unite to form one cube. Which of the following forces is responsible to hold them together [AFMC 2001]
(a) Hydrogen bond formation
(b) Van der Waals forces
(c) Covalent attraction
(d) Ionic interaction
37. What is formed when calcium carbide reacts with heavy water [Manipal PMT 2000]
(a) C_2D_2 (b) CaD_2
(c) Ca_2D_2O (d) CD_2
38. Pure water can be obtained from sea water by [CBSE PMT 2001]
(a) Centrifugation (b) Plasmolysis
(c) Reverse osmosis (d) Sedimentation
39. Action of water or dilute mineral acids on metals can give [Kerala PMT 2002]
(a) Monohydrogen (b) Tritium
(c) Dihydrogen (d) Trihydrogen
(e) D_2
40. Metal which does not react with cold water but evolves H_2 with steam is [DCE 2002]
(a) *Na* (b) *K*
(c) *Pt* (d) *Fe*
41. *pH* of neutral water at room temperature nearly
(a) 0 (b) 14
(c) 7 (d) 10^{-7}
42. Maximum number of hydrogen bonding in H_2O is [DCE 2004; MP PET 2004; MP PMT 2004; BHU 2004]
(a) 1 (b) 2
(c) 3 (d) 4
43. The low density of ice compared to water is due to [Pb. CET 2004]
(a) Induced dipole-induced dipole interactions
(b) Dipole-induced dipole interaction
(c) Hydrogen bonding interactions
(d) Dipole-dipole interactions
44. Which of the following acid is formed when SiF_4 reacts with water [BHU 2004]
(a) SiF_4 (b) H_2SiF_4
(c) H_2SO_4 (d) H_2SiF_6
45. Triple point of water is [AFMC 2004]
(a) 273K (b) 373K
(c) 203K (d) 193K
46. Hardness of water is due to presence of salts of [BHU 2005]

- (a) Na and K (b) Ca and Mg
(c) Ca and K (d) Ca and Na

Hydrogen peroxide

- In which of the following reaction hydrogen peroxide is a reducing agent [BHU 1995]
 - $2FeCl_2 + 2HCl + H_2O_2 \rightarrow 2FeCl_3 + 2H_2O$
 - $Cl_2 + H_2O_2 \rightarrow 2HCl + O_2$
 - $2HI + H_2O_2 \rightarrow 2H_2O + I_2$
 - $H_2SO_3 + H_2O_2 \rightarrow H_2SO_4 + H_2O$
- There is a sample of 10 volume of hydrogen peroxide solution. Calculate its strength [UPSEAT 2001]
 - 3.00% (b) 4.045%
 - 2.509% (d) 3.035%
- In lab H_2O_2 is prepared by [CPMT 2002; MH CET 2003; Pb. PMT 2004; BCECE 2005]
 - Cold $H_2SO_4 + BaO_2$ (b) $HCl + BaO_2$
 - Conc. $H_2SO_4 + Na_2O_2$ (d) $H_2 + O_2$
- The structure of H_2O_2 is [UPSEAT 2001]
 - $\begin{array}{c} H & & H \\ & \backslash & / \\ & O - O \end{array}$ (b) $\begin{array}{c} H & & H \\ & / & \backslash \\ & O - O \end{array}$
 - $H - O - O - H$ (d) $\begin{array}{c} H \\ | \\ O - O \end{array}$
- HCl is added to the following oxides which one would give H_2O_2 [Kurukshetra CET 1998]
 - MnO_2 (b) PbO_2
 - BaO_2 (d) None of these
- The oxide that gives hydrogen peroxide (H_2O_2) on the treatment with a dilute acid (H_2SO_4) is [Pb. PMT 1999]
 - MnO_2 (b) PbO_2
 - Na_2O_2 (d) TiO_2
- Hydrogen peroxide is reduced by [CPMT 2000; CBSE PMT 2000; KCET 2002]
 - Ozone
 - Barium peroxide
 - Acidic solution of $KMnO_4$
 - Lead sulphide suspension
- The reaction of $H_2S + H_2O_2 \rightarrow S + 2H_2O$ manifests [UPSEAT 2000]
 - Acidic nature of H_2O_2
 - Alkaline nature of H_2O_2
 - Oxidising nature of H_2O_2
 - Reducing action of H_2O_2
- What is the product of the reaction of H_2O_2 with Cl_2 [RPET 2003]
 - $O_2 + HOCl$ (b) $HCl + O_2$
 - $H_2O + HCl$ (d) $HCl + H_2$
- H_2O_2 will oxidise [Roorkee 1995]
 - $KMnO_4$ (b) PbS
 - MnO_2 (d) H_2S
- Fenton's reagent is [MP PET 2000; RPET 2000]
 - $FeSO_4 + H_2O_2$ (b) $Zn + HCl$
 - $Sn + HCl$ (d) None of these
- The structure of H_2O_2 is [CBSE 1999; AFMC 2004]
 - Planar (b) Linear
 - Spherical (d) Non-planar
- The volume strength of 1.5 N H_2O_2 solution is [BHU 2004; Pb. CET 2004]
 - 8.4 litres (b) 4.2 litres
 - 16.8 litres (d) 5.2 litres
- The volume of oxygen liberated from 15 ml of 20 volume H_2O_2 is [MH CET 2004]
 - 250 ml (b) 300 ml
 - 150 ml (d) 200 ml
- The strength in volumes of a solution containing 30.36 g/litre of H_2O_2 is [UPSEAT 2004]
 - 10 volume (b) 20 volume
 - 5 volume (d) None of these
- Hydrogen peroxide is used as
 - Oxidising agent
 - Reducing agent
 - Both as oxidising and reducing agent
 - Drying agent
- Equivalent weight of H_2O_2 is
 - 17 (b) 34
 - 8 (d) 18
- 20 volume H_2O_2 solution has a strength of about
 - 30% (b) 6%
 - 3% (d) 10%
- H_2O_2 is manufactured these days [DCE 2004]
 - By the action of H_2O_2 on BaO_2
 - By the action of H_2SO_4 on Na_2O_2
 - By electrolysis of 50% H_2SO_4
 - By burning hydrogen in excess of oxygen
- Which one of the following is a true peroxide
 - NO_2 (b) MnO_2
 - BaO_2 (d) SO_2
- 1 ml of H_2O_2 solution gives 10 ml of O_2 at NTP. It is
 - 10 vol. H_2O_2 (b) 20 vol. H_2O_2
 - 30 vol. H_2O_2 (d) 40 vol. H_2O_2
- Which substance does not speed up decomposition of H_2O_2
 - Glycerol (b) Pt
 - Gold (d) MnO_2
- Which of the following cannot be oxidised by H_2O_2
 - O_3 (b) KI / HCl
 - PbS (d) Na_2SO_3
- Which substance cannot be reduced by H_2O_2

- (a) $KMnO_4 / H_2SO_4$ (b) $K_2Cr_2O_7 / H_2SO_4$
(c) Ag_2O (d) Fe^{3+}
25. Which of the following statements is incorrect
(a) H_2O_2 can act as an oxidising agent
(b) H_2O_2 can act as a reducing agent
(c) H_2O_2 has acidic properties
(d) H_2O_2 has basic properties
26. H_2O_2 is
(a) Poor polar solvent than water
(b) Better polar solvent than H_2O
(c) Both have equal polarity
(d) Better polar solvent but its strong auto oxidising ability limits its use as such
27. H_2O_2 used in rockets has the concentration
(a) 50% (b) 70%
(c) 30% (d) 90%
28. H_2O_2 is a
(a) Weak acid (b) Weak base
(c) Neutral (d) None of these
29. Nitrates of all metals are
(a) Soluble in water (b) Insoluble
(c) Coloured (d) Unstable
30. Decomposition of H_2O_2 is prevented by
(a) $NaOH$ (b) MnO_2
(c) Acetanilide (d) Oxalic acid
31. H_2O_2 is always stored in black bottles because
(a) It is highly unstable
(b) Its enthalpy of decomposition is high
(c) It undergo autooxidation on prolonged standing
(d) None of these
32. H_2O_2 on reacting with ethene gives
(a) Ethane (b) Ethanal
(c) Ethylene glycol (d) Ethanol
33. Which of the following is wrong about H_2O_2 ? It is used
(a) As aerating agent in production of spong rubber
(b) As an antichlor
(c) For restoring white colour of blackened lead painting
(d) None of these
34. $H_2O_2 \rightarrow 2H^+ + O_2 + 2e^-$; $E^\circ = -0.68 V$. This equation represents which of the following behaviour of H_2O_2
(a) Reducing (b) Oxidising
(c) Acidic (d) Catalytic
35. The structure of H_2O_2 is
(a) Open book like (b) Linear
(c) Closed book (d) Pyramidal
36. On shaking H_2O_2 with acidified potassium dichromate and ether, ethereal layer becomes
(a) Green (b) Red
(c) Blue (d) Black
37. K_a of H_2O_2 is of the order of [MP PMT 1994]
(a) 10^{-12} (b) 10^{-14}
(c) 10^{-16} (d) 10^{-10}
38. In which of the following reactions, H_2O_2 acts as a reducing agent [EAMCET 2002]
(a) $PbO_2(s) + H_2O_2(aq) \rightarrow PbO(s) + H_2O(l) + O_2(g)$
(b) $Na_2SO_3(aq) + H_2O_2(aq) \rightarrow Na_2SO_4(aq) + H_2O(l)$
(c) $2KI(aq) + H_2O_2(aq) \rightarrow 2KOH(aq) + I_2(s)$
(d) $KNO_2(aq) + H_2O_2(aq) \rightarrow KNO_3(aq) + H_2O(l)$
39. H_2O_2 acts as an oxidising agent in [Kerala PMT 2004]
(a) Neutral medium
(b) Acidic medium
(c) Alkaline medium
(d) Alkaline and neutral medium
(e) Acidic and alkaline medium
40. The $H-O-O$ bond angle in H_2O_2 is [Kerala PMT 2004]
(a) 107.28° (b) 109.28°
(c) 104.5° (d) 106°
(e) 97°
41. The volume of oxygen liberated from 0.68 gm of H_2O_2 is [Pb. PMT 2004]
(a) 112 ml (b) 224 ml
(c) 56 ml (d) 336 ml

Critical Thinking

Objective Questions

1. Polyphosphates are used as water softening agents because they
(a) Form soluble complexes with anionic species
(b) Precipitate anionic species
(c) Forms soluble complexes with cationic species
(d) Precipitate cationic species
2. The critical temperature of water is higher than that of O_2 because H_2O molecule has [IIT 1997]
(a) Fewer electrons than oxygen
(b) Two covalent bonds
(c) V-shape
(d) Dipole moment
3. One mole of calcium phosphide on reaction with excess water gives [IIT 1999]
(a) One mole of phosphene
(b) Two moles of phosphoric acid
(c) Two moles of phosphene
(d) One mole of phosphorus pentaoxide
4. When zeolite, which is hydrated sodium aluminium silicate, is treated with hard water the sodium ions are exchanged with
(a) H^+ ions (b) Ca^{2+} ions
(c) Mg^{2+} ions (d) Both Ca^{2+} and Mg^{2+}
5. Hydrogen peroxide is
(a) A stronger acid than water
(b) A weaker acid than water
(c) An oxidising agent
(d) A reducing agent

6. Hydrogen can be obtained from water by
 (a) Reaction with metal oxides
 (b) Reaction with non-metal oxides
 (c) Reaction with metals
 (d) Reaction with metal hydrides
7. Which of the following is/are hard water(s)
 (a) Water containing some potash alum
 (b) Water containing a few drops of HCl
 (c) Water containing common salt
 (d) Water containing calcium nitrate
8. Pick the odd one out
 (a) Sodium borohydride reacts very slowly with cold water
 (b) Sodium borohydride reacts very violently with cold water to produce H_2
 (c) Solubility of sodium borohydride in water at $25^\circ C$ is 10.05 g/mL
 (d) Melting point of sodium borohydride is $500^\circ C$
9. Hydrogen can be obtained from water, by the action of water on
 (a) Calcium carbide (b) Calcium hydride
 (c) Calcium oxide (d) Calcium
10. What is true about ice
 (a) Its density is more than water
 (b) It is a good conductor of heat
 (c) It is a thermal insulator
 (d) Its density is less than water
11. Hydrogen will not reduce [IIT 1985]
 (a) Heated cupric oxide (b) Heated ferric oxide
 (c) Heated stannic oxide (d) Heated aluminium oxide
12. HCl is added to following oxides. Which one would give H_2O_2 [IIT 1980]
 (a) MnO_2 (b) PbO_2
 (c) BaO (d) None of these
13. Which of the following pair will not produce dihydrogen gas [IIT 1994]
 (a) $Cu + HCl(dil)$ (b) $Fe + H_2SO_4$
 (c) $Mg + \text{steam}$ (d) $Na + \text{alcohol}$
14. The amount of H_2O_2 present in 1 L of 1.5 N H_2O_2 solution is
 (a) 2.5 g (b) 25.5 g
 (c) 3.0 g (d) 8.0 g
15. Hydrogen is evolved by the action of cold dil. HNO_3 on [IIT 1998]
 (a) Fe (b) Mn
 (c) Cu (d) Al
16. Hydrogen can behave as a metal
 (a) At very high temperature (b) At very low temperature
 (c) At very high pressure (d) At very low pressure
17. D_2O is preferred to H_2O , as a moderator, in nuclear reactors because
 (a) D_2O slows down fast neutrons better
 (b) D_2O has high specific heat
 (c) D_2O is cheaper
 (d) None of these
18. Out of the two allotropic forms of dihydrogen, the form with lesser molecular energy is
 (a) Ortho (b) Meta
 (c) Para (d) All have same energy
19. Saline hydrides react explosively with water, such fires can be extinguished by
 (a) Water (b) Carbon dioxide
 (c) Sand (d) None of these
20. Metals of groups 7, 8 and 9 do not form metallic hydrides. This is termed as
 (a) Hydride gap (b) Hydride shift
 (c) Anhydride (d) Dehydride
21. When temporary hard water containing $Mg(HCO_3)_2$ is boiled the ppt. formed is of
 (a) $MgCO_3$ (b) MgO
 (c) $Mg(OH)_2$ (d) None of these
22. Permanent hardness due to Mg^{2+} ions is best removed by
 (a) $Ca(OH)_2$ (b) Na_2CO_3
 (c) $Na_2CO_3 + Ca(OH)_2$ (d) None of these
23. The most abundant element in the universe is
 (a) Carbon (b) Silicon
 (c) Hydrogen (d) Helium
24. Pick out the correct statement
 (a) By decreasing the temperature pure para-hydrogen can be obtained
 (b) By increasing the temperature pure ortho-hydrogen can be obtained
 (c) By decreasing the temperature pure ortho-hydrogen can be obtained
 (d) By increasing the temperature pure para-hydrogen can be obtained
25. Hydrogen can be produced by heating
 (a) Cu with H_2SO_4 (b) Sodium formate
 (c) Sodium oxalate (d) None of these
26. Plumbosolvency is a health hazard in the transportation of
 (a) Hard water only
 (b) Soft water only
 (c) Both (a) and (b)
 (d) Water containing plum juice
27. A sample of water contains sodium chloride. It is [IIT 1991]
 (a) Hard water (b) Soft water
 (c) Moderately hard (d) None of these
28. Hardness producing salt, whose solubility in water decreases with rise of temperature is
 (a) $CaCl_2$ (b) $CaSO_4$
 (c) $Ca(HCO_3)_2$ (d) $MgSO_4$
29. A sample of water containing some dissolved table sugar and common salt is passed through organic ion exchange resins. The resulting water will be
 (a) Tasteless (b) Sweet
 (c) Salty (d) None of these
30. Water obtained by purification with organic ion exchange resins is
 (a) Pure water
 (b) Free from only Ca^{2+} , Mg^{2+} ions
 (c) Free from HCO_3^- , SO_4^{2-} and Cl^- ions only
 (d) None of these
31. Which of the following can effectively remove all types of hardness of water
 (a) Soap (b) Washing soda
 (c) Slaked lime (d) None of these

32. A commercial sample of hydrogen peroxide is labelled as 10 volume. Its percentage strength is nearly [KCET 2005]
- (a) 1% (b) 3%
(c) 10% (d) 90%

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

- Assertion : Hydrogen combines with other elements by losing, gaining or sharing of electrons.
Reason : Hydrogen forms electrovalent and covalent bonds with other elements.
- Assertion : Calgon is used for removing Ca^{2+} and Mg^{2+} ions from hard water.
Reason : Calgon forms precipitates with Ca^{2+} and Mg^{2+} .
- Assertion : Decomposition of H_2O_2 is a disproportionation reaction.
Reason : H_2O_2 molecule simultaneously undergoes oxidation and reduction.
- Assertion : H_2O_2 has higher boiling point than water.
Reason : H_2O_2 has stronger dipole-dipole interactions than water.
- Assertion : H_2O_2 is not stored in glass bottles.
Reason : Alkali oxides present in glass catalyse the decomposition of H_2O_2 .
- Assertion : H_2O_2 reduces Cl_2 to HCl .
Reason : H_2O_2 is called antichlor.
- Assertion : In acidic medium, H_2O_2 reacts with MnO_2 to give O_2 .
Reason : H_2O_2 is a strong oxidising agent.
- Assertion : In alkaline solution, H_2O_2 reacts with potassium ferricyanide.
Reason : H_2O_2 is a strong reducing agent.
- Assertion : Acidulated water is an example of hard water.
Reason : In the presence of an acid, soap is converted into insoluble free fatty acids.
- Assertion : Hydrogen peroxide forms only one series of salts called peroxides.
Reason : Hydrogen peroxide molecule has only one replaceable hydrogen atom.

Answers

46. (b) $2Na + H_2 \rightarrow 2Na^+H^-$
Hydrogen has $-ve$ (-1) oxidation state.
47. (a) $NaH \rightleftharpoons Na^+ + H^-$
At anode : $H^- \rightarrow H + e^-$
 $H + H \rightarrow H_2$
48. (a) For example HCl is a protonic acid
 $HCl + H_2O \rightleftharpoons [H_3O]^+ + Cl^-$
49. (c) Hydrogen resembles both alkali metals and halogens.
50. (d) Chlorine has lone pair which it can donate to form co-ordinate bond while hydrogen cannot.
51. (c) Actually these exist in the ratio.
Protium : Deuterium : Tritium
1 : 1.56×10^{-2} : 1×10^{-17}
52. (d) $SO_3 + D_2O \rightarrow D_2SO_4$ dideutero-sulphuric acid.
53. (b) $H^1H^1, H^1H^2, H^2H^2, H^3H^3, H^2H^3$
54. (d) CaH_2 i.e., $2 + 2x = 0$, $x = -1$
 $2x = -2$ or $x = \frac{-2}{2} = -1$
55. (c) Pure hydrogen is obtained by the electrolysis of $Ba(OH)_2$ solution in a U -tube using nickel electrode. The gas is liberated at the cathode and is passed over heated platinum gauze to remove oxygen if present as impurity.
56. (b) $\underbrace{CO + H_2}_{\text{water gas}} + H_2O \xrightarrow{\text{catalyst}} CO_2 + 2H_2$
57. (b) Deuterium (2_1H) and hydrogen (1_1H) both have same atomic number but different mass number so they have similar chemical but different physical properties.
58. (b) ${}^3_1H \rightarrow {}^3_2He + {}^0_{-1}e$
59. (d) $V. oil + H_2 \xrightarrow[\Delta]{Ni} \text{Fat}$
60. (a) $2H \rightleftharpoons H_2$; $\Delta H = -104.5 \text{ kcal}$
61. (b) Lavoisier give the name hydrogen which means water maker.
62. (a) For diatomic gases (e.g. H_2) $r = C_p / C_v = 1.40$
For monoatomic gases $r = 1.66$
For triatomic gases $r = 1.33$
63. (b) H_3 is also called H₃zone.
64. (b) $4LiH + AlCl_3 \xrightarrow{\text{Ether}} LiAlH_4 + 3LiCl$
65. (b) Alkali metal hydrides react with water to give metal hydroxide and H_2 e.g.,
 $NaH + H_2O \rightarrow NaOH + H_2$
Alkali metal hydroxides are strongly basic in nature.
66. (c) Ionic hydrides are good reducing agents.
68. (c) Systematic name of water is oxidane.
69. (c) BeH_2 and MgH_2 have significant covalent character.
70. (a) Limiting composition of f block hydrides are MH_2 and MH_3 .
71. (d) H_2 does not react with Au , Cu or Ni with Ca it gives CaH_2 .
 $Ca + H_2 \rightarrow CaH_2$
72. (c) $Ca(OH)_2$ is used for the softening of temporary hard water.
- $Ca(OH)_2(aq) + CO_2(g) \rightarrow CaCO_3(s) + H_2O(l)$
cloudiness
73. (a) $Zn + H_2SO_4 \rightarrow ZnSO_4 + H_2$
 $Zn + 2NaOH \rightarrow Na_2ZnO_2 + H_2$
 $\therefore$ Ratio of volumes of H_2 evolved is 1 : 1.
74. (c) Anhydrous $CaCl_2$ is used for fast drying of neutral gases.
75. (d) Hydrogen is the lightest gas.
76. (c) An atom of tritium contains 1 proton, 1 electron and 2 neutrons.
77. (d) Hydrogen is a non-metal while all other members of group 1 (alkali metals) are metals.
78. (b) $H^-(aq) + H_2O(l) \rightarrow OH^-(aq) + H_2(g)$
base 1 acid 2 base 2 acid 1
79. (a) $H + e^- \rightarrow H^-$
 $1s^1 \quad 1s^2 \text{ or } [He]^2$
 $F + e^- \rightarrow F^-$
 $[He]^2 2s^2 2p^5 \quad [He]^2 2s^2 2p^6 \text{ or } [Ne]^10$
80. (a) Hydrogen from bonds in $+1$ and -1 oxidation state.
81. (c) Mercury (Hg) will not displace hydrogen.
82. (c) Hydrogen is the lightest gas. It is insoluble in water.
83. (b) Hydrogen forms maximum number of compounds in chemistry comparison than carbon.
84. (c) $Zn + H_2O \rightarrow ZnO + H_2$
 $Zn + 2NaOH \rightarrow Na_2ZnO_2 + H_2$
 $Zn + 2HCl \rightarrow ZnCl_2 + H_2$
 $Zn + 2H_2SO_4 \rightarrow ZnSO_4 + SO_2 + 2H_2O$.

Water or hydride of oxygen

4. (b) $Ca(HCO_3)_2 + Ca(OH)_2 \rightarrow 2CaCO_3 \downarrow + 4H_2O$
ppt.
5. (c) D_2O in which $D = {}^2_1H^2$
7. (b) HCO_3^- is main reason of temporary hardness of water.
8. (b) By boiling temporary hardness of water can be removed.
 $Ca(HCO_3)_2 \xrightarrow{\text{Boil}} CaCO_3 + H_2O + CO_2$
(insoluble)
9. (c) $Na_2Al_2Si_2O_8 \cdot xH_2O + Ca^{+2} \rightarrow$
Zeolite
 $CaAl_2Si_2O_8 \cdot xH_2O + 2Na^+$
10. (b) Water has high dielectric constant i.e., 82, high liquid range and can dissolve maximum number of compounds. That is why it is used as universal solvent.
11. (a) Heavy water i.e., D_2O slows down the speed of neutrons in nuclear reactors..
12. (a) Chlorides and sulphates of Mg and Ca produces permanent hardness and bicarbonates of Mg and Ca produces temporary hardness.
13. (d) Permanent hardness cannot be removed by boiling of water but temporary hardness can be removed.
14. (d) The density of water is 1 g cm^{-3} at $4^\circ C$
so molarity = $\frac{1000}{18} = 55.5 \text{ M}$.
15. (d) Water containing Ca^{+2} , Mg^{+2} and H^+ ($> 10^{-7} \text{ m}$) is a hard water.

16. (c) Heavy water is used as a moderator to slow down the speed of fast moving neutrons and as well as a coolant.
17. (b) Heavy water freezes at a slightly higher temperature than water.
18. (b) pH of heavy water is slightly more than seven.
19. (c) D_2O actually has higher freezing point ($3.8^\circ C$) than water H_2O ($0^\circ C$).
20. (d) Colourless anhydrous $CuSO_4$ becomes blue on reaction with water.
21. (c) Due to plumbosolvency, lead dissolves in water to a small extent to form soluble hydroxide which is poisonous so lead pipe is not used for carrying drinking water.

23. (a) In cation exchange resin Mg^{+2} and Ca^{+2} (cations) are replaced by Na^{+} ions.
24. (c) Washing soda removes both the temporary and permanent hardness by converting soluble calcium and magnesium compounds into insoluble carbonates.

25. (c) It is $Na_2Al_2Si_2O_8 \cdot xH_2O$

- 26.** (c) ${}_1H_2^3O = 16 + 2 \times 3 = 22 amu$

27. (d) $H_2O(H = {}_1H^2)$
 $16 + 2 \times 2 = 20 \text{ amu}$

30. (c) $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$

Potash alum is generally used for purifying water.

- 31.** (c) Copper will not reduce H_2O to H_2 because of low reducing power of copper comparison than hydrogen.

- 32.** (c) Heavy water is formed by the combination of heavier isotope (${}_1H^2$ or D) with oxygen.

- 33.** (c) Water molecule associate due to inter molecular hydrogen bonding.

- 34.** (d) Heavy water is D_2O $(1 - c)$

Temporary hard water contains bicarbonates of Ca^{2+} and Mg^{2+} (2-a)

Soft water may have no foreign ions (3-b).

Permanent hard water contains sulphates and chlorides of Ca^{+2} and Mg^{+2} (4 - d)

35. (d) The $H-O-H$ angle in water molecule is about 105° (due to two lone pair of electron).

- 36.** (a) Two ice cubes when pressed over each other unite due to hydrogen bond formation.

37. (a) $CaC_2 + 2D_2O \rightarrow C_2D_2 + Ca(OD)_2$
38. (c) Pure water can be obtained from sea water by reverse osmosis.
39. (c) Action of water on dil. Mineral acids (HCl, H_2SO_4) can give dihydrogen.
40. (d) Iron (Fe) does not react with cold water to give H_2 . However, iron reacts with steam to give H_2 .

41. (c) pH of neutral water at room temperature is seven.
43. (c) The low density of ice compared to water is due to hydrogen bonding interactions.
44. (b) Silicon tetra fluoride on hydrolysis furnish ortho silicic acid and hydrogen silicofluoride.

45. (a) The triple point of any substance is that temperature and pressure at which the material can exist in all three phases (Solid, liquid and gas) in equilibrium specifically the triple point of water is $273.16K$ at $611.2 Pa$.
46. (b) Hardness of water is due to the presence of bicarbonates, chlorides and sulphates of Ca and Mg on it. These Ca^{2+} and Mg^{2+} ions react with the anions of fatty acids present in soaps to form curdy white precipitates. As a result, hard water does not produce lather with soap immediately.

Hydrogen peroxide

1. (b) $Cl_2 + H_2O_2 \rightarrow 2HCl + O_2$

In this reaction H_2O_2 works as reducing agent.

2. (d) $[H_2O_2 \rightarrow H_2O + \frac{1}{2}O_2] \times 2$

$\therefore$ 22.4 litre O_2 at N.T.P. obtained by 68 gm of H_2O_2

$\therefore$ 10 litre O_2 at N.T.P. obtained by

$$\frac{68}{22.4} \times 10 = 30.35 \text{ gm / litre}$$

$$\therefore 1000 \text{ ml } O_2 \text{ at N.T.P. obtained by} = 30.35 \text{ gm}$$

$\therefore 100 \text{ ml } O_2 \text{ at N.T.P. obtained by}$

$$= \frac{30.35}{1000} \times 100 = 3.035\%$$

3. (a) $H_2SO_4 + BaO_2 \rightarrow BaSO_4 + H_2O_2$

5. (c) $BaO_2 + 2HCl \rightarrow BaCl_2 + H_2O_2$

- 6.** (c) $Na_2O_2 + H_2SO_4 \rightarrow Na_2SO_4 + H_2O_2$

7. (d) $PbS + 4H_2O_2 \rightarrow PbSO_4 + 4H_2O$

8. (c) $H_2S + H_2O_2 \rightarrow S + 2H_2O$

In this reaction H_2O_2 shows oxidising nature.

9. (b) $H_2O_2 + Cl_2 \rightarrow 2HCl + O_2$

13. (a) Volume strength = $5.6 \times \text{Normality}$

$$= 5.6 \times 1.5 = 8.4 \text{ litre}$$

14. (b) Quantity of $H_2O_2 = 15 \text{ ml}$ and volume of $H_2O_2 = 20$

We know that 20 volume of H_2O_2 means 1 litre of this solution will give 20 litre of oxygen at N.T.P.

Since, oxygen liberated from 1000 ml (1 litre) of $H_2O_2 = 20 \text{ litre}$, therefore oxygen liberate from 15 ml of

$$H_2O_2 = \frac{20}{1000} \times 15 = 0.3 \text{ litre} = 300 \text{ ml}$$

15. (a) E.W. of $H_2O_2 = 17$

$$N = \frac{30.36}{17} = 1.78 \text{ N}$$

Volume strength = $5.6 \times \text{Normality}$

$$= 5.6 \times 1.78 = 10 \text{ litre}$$

17. (a) Equivalent weight of H_2O_2 is 17.

18. (b) $\therefore 22.4 \text{ litre } O_2$ at N.T.P. obtained by 68 gm of H_2O_2

$$\therefore 1 \text{ litre } O_2 \text{ at N.T.P. obtained by } \frac{68}{22.4} \text{ gm of } H_2O_2$$

$\therefore 20 \text{ litre } O_2$ at N.T.P. obtained by

$$\frac{68}{22.4} \times 20 \text{ gm of } H_2O_2 = 60.71 \text{ gm of } H_2O_2$$

$\therefore 1000 \text{ ml } O_2$ at N.T.P. obtained by = 60.71 gm of H_2O_2

$$\therefore 100 \text{ ml } O_2 \text{ at N.T.P. obtained by} \\ = \frac{60.71}{1000} \times 100 = 6.71\%$$

19. (c) Electrolysis of 50% sulphuric acid gives per disulphuric acid ($H_2S_2O_8$) which on distillation yields 30% solution of hydrogen peroxide.

20. (c) Due to O—O bond.

21. (a) 10 volume of H_2O_2 means 10 ml of O_2 is obtained from 1 ml of H_2O_2 .

22. (a) Glycerol, phosphoric acid or acetanilide is added to H_2O_2 to check its decomposition.

23. (a) H_2O_2 reduces O_3 to O_2

24. (d) Fe^{+3} cannot be reduced by H_2O_2 while all other get reduced.

25. (d) Hydrogen peroxide does not show basic properties.

26. (d) Although H_2O_2 is a better polar solvent than H_2O . However it cannot be used as such because of the strong autooxidation ability.

27. (d) H_2O_2 is used as an oxidant for rocket fuel and has 90% concentration to be used in rockets.

28. (a) $H_2O_2 \rightarrow H_2O + [O]$
weak acid

29. (a) Lattice energy of all metal nitrate are less than that of their solvation energy so nitrates of metals soluble in water.

31. (c) H_2O_2 is unstable liquid and decomposes into water and oxygen either on standing or on heating.

33. (d) H_2O_2 show all these properties.

34. (a) As H_2O_2 is losing electrons so it is acting as reducing agent.

36. (c) This is due to the formation of CrO_5 .

37. (a) K of $H_2O_2 = 1.55 \times 10^{-12}$

38. (a) In the following reaction H_2O_2 acts as a reducing agent.

39. (e) H_2O_2 acts as an oxidising agent in acidic and alkaline medium.

41. (b) We know that

$$2 \times 34g \qquad 22400 \text{ ml}$$

$$\therefore 2 \times 34 \text{ gm} = 68 \text{ gm of } H_2O_2 \text{ liberates}$$

$$22400 \text{ ml } O_2 \text{ at STP}$$

$$\therefore .68 \text{ gm of } H_2O_2 \text{ liberates}$$

$$= \frac{.68 \times 22400}{68} = 224 \text{ ml}$$

Critical Thinking Questions

- (c) Polyphosphates (sodium hexametaphosphates, sodium tripolyphosphate or STPP) form soluble complexes with Ca^{+2} , Mg^{+2} present in hard water.
- (d) Critical temperature of water is more than O_2 due to its dipole moment (Dipole moment of water = 1.84 D; Dipole moment of O_2 = zero D).
- (c) $Ca_3P_2 + 6H_2O \rightarrow 2PH_3 + 3Ca(OH)_2$
(Cal. phosphide) 1 mole phosphene (2 moles)
- (d) Zeolite when treated with hard water exchange Cu^{+2} and Mg^{+2} ions (present in hard water) with Na^+ ions.
- (c,d) $Mg + 2H_2O \rightarrow Mg(OH)_2 + H_2 \uparrow$
 $LiH + H_2O \rightarrow LiOH + H_2 \uparrow$
- (a,b,d) Water containing any cation other than NH_4^+ and alkali metal is a hard water.

8. (b) Reaction of NaBH_4 with cold water is very slow. All other statements except (b) are correct.
9. (b,d) $\text{CaH}_2 + 2\text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2 + 2\text{H}_2 \uparrow$
 $\text{Ca} + 2\text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2 + \text{H}_2 \uparrow$
10. (c,d) Ice is a poor conductor of heat (a good thermal insulator) and its density is less than water.
11. (d) H_2 will not reduce heated Al_2O_3 .
12. (d) MnO_2 , PbO_2 and BaO will not give H_2O_2 with HCl . MnO_2 and PbO_2 will give Cl_2 and BaO will react with HCl to give BaCl_2 and water.
13. (a) Cu and dil. HCl will not produce H_2 .
14. (b) Strength = Normality $\times$ Eq. mass
 $= 1.5 \times 17$ (eq. mass of H_2O_2)
 $= 25.5 \text{ gL}^{-1}$
15. (b) $\text{Mn} + 2\text{HNO}_3 (\text{dil}) \rightarrow \text{Mn(NO}_3)_2 + \text{H}_2$
16. (c) Hydrogen behaves as a metal at very high pressure.
17. (d) H_2O absorbs neutrons more than D_2O and this decreases the number of neutrons for the fission process.
18. (c) The para form of H_2 has lesser energy than the ortho form.
19. (c) Fire due to action of water on saline hydrides cannot be extinguished with water or CO_2 . These hydrides can reduce CO_2 at high temperature to produce O_2 .
21. (c) Mg(OH)_2 is less soluble than MgCO_3 . On boiling temporary hard water containing Mg^{+2} ions, the ppt. obtained is of Mg(OH)_2 are not that of MgCO_3 .
22. (c) Ca(OH)_2 removes the permanent hardness due to Mg^{2+} ion, but it produces Ca^{2+} ions which are removed by Na_2CO_3 .
 $\text{Mg}^{2+} + \text{Ca(OH)}_2 \rightarrow \text{Mg(OH)}_2 \downarrow + \text{Ca}^{2+}$
 $\text{Ca}^{2+} + \text{Na}_2\text{CO}_3 \rightarrow \text{CaCO}_3 \downarrow + 2\text{Na}^+$
 Ca(OH)_2 or Na_2CO_3 alone cannot remove the permanent hardness.
25. (b) $2\text{HCOONa(s)} \xrightarrow{\Delta} \text{H}_2(\text{g}) \uparrow + \begin{matrix} \text{COONa} \\ \text{COONa} \\ \text{Sod. oxalate} \end{matrix} (\text{s})$
Sod. formate
26. (b) Presence of CO_3^{2-} and SO_4^{2-} ions in water reduced the tendency of dissolution of Pb in water as Pb(OH)_2 .
27. (b) NaCl does not make water hard.
28. (b) Solubility of CaSO_4 in water decreases with increase in temperature.
29. (b) Organic ion exchange resins can remove only ionic impurities.
30. (d) Water obtained from organic ion-exchange resins is free from all ionic impurities.
31. (a) Soap can remove all types of hardness of water as it converts the hardness producing cations into insoluble ppt.

32. (b) 10 volume solution of H_2O_2 is 3.035% solution
 i.e., 3.035 g of H_2O_2 is present in 100ml of the solution.

Assertion & Reason

2. (d) Both assertion (A) and reason (R) are not true.
Correct Assertion : Calgon mask the properties of Ca^{2+} and Mg^{2+} ions present in water without removing them as ppt.
Correct Reason : Calgon forms soluble complexes with Ca^{2+} and Mg^{2+} in which properties of these ions are masked.
3. (a) Both assertion (A) and reason (R) are true and R is the correct explanation of A.
Correct Reason : H_2O_2 is a strong reducing agent.
4. (c) Assertion (A) is correct but reason (R) is not the correct explanation of A.
10. (d) Both assertion (A) and reason (R) are not true.
Correct Assertion : Hydrogen peroxide forms two series of salts called hydroperoxides and peroxides.
Correct Reason : Hydrogen peroxide molecule has two replaceable hydrogen atoms.

Hydrogen and Its compounds

SET Self Evaluation Test -17

- Temperature of maximum density in H_2O and D_2O respectively are
 - 277.15 K, 284.75 K
 - 273.15 K, 277.15 K
 - 277.15 K, 285.75 K
 - 284.75 K, 277.15 K
- Non-metallic oxides dissolves in water to form
 - Acidic solution
 - Alkaline solution
 - Neutral solution
 - None of these
- Ordinary water is not used as a moderator in nuclear reactors because
 - It cannot slow down fast moving neutrons
 - It cannot remove the heat from the reactor core
 - It absorbs the fast moving neutrons
 - Of its corrosive action on the metallic parts of the nuclear reactor
- Brackish water mostly contains
 - Calcium chloride
 - Barium sulphate
 - Sodium chloride
 - Mineral acids
- $TiH_{1.73}$ is an example of
 - Ionic hydride
 - Covalent hydride
 - Metallic hydride
 - Polymeric hydride
- The volume strength of perhydrol is
 - 20
 - 30
 - 100
 - 10
- The solubility of an ionic compound is compared in heavy and simple water. It is
 - Higher in heavy water
 - Lower in heavy water
 - Same in heavy water and simple water
 - Lower in simple water
- Which of the following cannot be reduced by H_2O_2
 - Ag_2O
 - Fe^{3+}
 - Acidified $KMnO_4$
 - Acidified $K_2Cr_2O_7$
- Hydrogen can be prepared by the action of dil. H_2SO_4 on
 - Copper
 - Iron
 - Lead
 - Mercury
- The element whose hydride contains maximum number of hydrogen per atom of the element is
 - Na
 - O
 - B
 - Si
- Indicator type silica gel used as a dehumidifier contains
 - Cu^{2+} ions
 - Ni^{2+} ions
 - Co^{2+} ions
 - Fe^{2+} ions
- To an aqueous solution of $AgNO_3$ some $NaOH(aq)$ is added, till a brown ppt. is obtained. To this H_2O_2 is added dropwise. The ppt. turns black with the evolution of O_2 . The black ppt. is
 - Ag_2O
 - Ag_2O_2
 - $AgOH$
 - None of these
- Atomic hydrogen reacts with oxygen to give
 - Almost pure water
 - Almost pure hydrogen peroxide
 - A mixture of water and hydrogen peroxide
 - None of these
- Which of the following cannot be used for the preparation of H_2
 - $Zn + HCl(dil) \rightarrow$
 - $NaH + H_2O \rightarrow$
 - $Zn + HNO_3(dil) \rightarrow$
 - $HCOONa \xrightarrow{\Delta}$
- The process used for the removal hardness of water is
 - Calgon
 - Baeyer
 - Serpeck
 - Hoope

[EAMCET 2001]

1. (a) Temperature of maximum density of H_2O is 277.15 K.
Temperature of maximum density of D_2O is 284.75 K.
2. (a) Non metallic oxides in water are form acidic solutions e.g.
 $P_2O_5 + 3H_2O \rightarrow 2H_3PO_4$
phosphoric acid
3. (c) Ordinary water absorbs fast moving neutrons, thus stopping the process of nuclear fission.
4. (c) Brackish water mostly contains sodium chloride.
5. (c) It is a metallic hydride.
6. (c) The volume strength of perhydral is 100
perhydral is 30% H_2O_2
10 vol. $H_2O_2 \equiv 3\% H_2O_2$
 $\therefore 30\% \text{ of } H_2O_2 \equiv 100 \text{ vol. } H_2O_2$
7. (b) The solubility of an ionic compound is more in simple water and less in heavy water.
8. (b) H_2O_2 cannot reduce Fe^{3+} . All other compounds are reduced by H_2O_2 .
9. (b) Hydrogen cannot be prepared by the action of dil. H_2SO_4 on copper or mercury as these two metals cannot displace hydrogen from acids. Action of dil. H_2SO_4 are stops after sometimes due to the formation of insoluble $PbSO_4$. Only, iron reacts rapidly with dil. H_2SO_4 to give H_2 .

10. (d) Hydride of $Si(SiH_4)$ contains more hydrogen atoms than hydrides of $Na(NaH)$, $O(H_2O)$, $B(BH_3)$.
11. (c) Indicator type of gel used as a dehumidifier contains CO^{2+} ions, when dry it is blue in colour and on absorbing moisture it becomes pink.
12. (d) $2AgNO_3(aq) + 2NaOH(aq) \rightarrow$

The finely divided Ag is black in colour.

13. (b) Atomic hydrogen reacts with oxygen to give almost pure hydrogen peroxide.

14. (c) $Zn + 2HCl(dil) \rightarrow ZnCl_2 + H_2$

15. (a) Calgon process is used for the removal of hardness of water.

Chapter 18 s and p-Block Elements

Alkali Metals and Their Compounds

The group 1 of the periodic table contains six elements, namely lithium (*Li*), sodium (*Na*), potassium (*K*), rubidium (*Rb*), caesium (*Cs*) and francium (*Fr*). All these elements are **typical metals**. Francium is radioactive with longest lived isotope ^{223}Fr with half life period of only 21 minute. These are usually referred to as alkali metals since their hydroxides form strong bases or alkalies.

(1) Electronic configuration

Elements	Discovery	Electronic configuration (ns^1)
${}_3\text{Li}$	Arfwedson (1817)	$[\text{He}]^2 2s^1$
${}_{11}\text{Na}$	Davy (1807)	$[\text{Ne}]^{10} 3s^1$
${}_{19}\text{K}$	Davy (1807)	$[\text{Ar}]^8 4s^1$
${}_{37}\text{Rb}$	Bunsen (1861)	$[\text{Kr}]^{36} 5s^1$
${}_{55}\text{Cs}$	Bunsen (1860)	$[\text{Xe}]^{54} 6s^1$
${}_{87}\text{Fr}$	Percy (1939)	$[\text{Rn}]^{86} 7s^1$

(2) **Occurrence** : Alkali metals are very reactive and thus found in combined state some important ores of alkali metals are given ahead.

(i) **Lithium** : Triphylite, Petalite, lepidolite, Spodumene [$\text{LiAl}(\text{SiO}_3)_2$], Amblygonite [$\text{LiAl}(\text{FPO})_2$]

(ii) **Sodium** : Chile salt petre (NaNO_3), Sodium chloride (NaCl), Sodium sulphate (Na_2SO_4), Borax ($\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$), Glauber salt ($\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$)

(iii) **Potassium** : Sylite (KCl), carnallite ($\text{KCl} \cdot \text{MgCl}_2 \cdot 6\text{H}_2\text{O}$) and Felspar ($\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$)

(iv) **Rubidium** : Lithium ores Lepidolite, triphylite contains 0.7 to 3% Rb_2O

(v) **Caesium** : Lepidolite, Pollucite contains 0.2 to 7% Cs_2O

(3) **Extraction of alkali metals** : Alkali metals cannot be extracted by the usual methods for the extraction of metals due to following reasons.

(i) Alkali metals are strong reducing agents, hence cannot be extracted by reduction of their oxides or other compounds.

(ii) Being highly electropositive in nature, it is not possible to apply the method of displacing them from their salt solutions by any other element.

(iii) The aqueous solutions of their salts cannot be used for extraction by electrolytic method because hydrogen ion is discharged at cathode instead of an alkali metal ions as the discharge potentials of alkali metals are high. However, by using *Hg* as cathode, alkali metal can be deposited. The alkali metal readily combines with *Hg* to form an amalgam from which its recovery difficult. The only successful method, therefore, is the electrolysis of their fused salts, usually chlorides. Generally, another metal chloride is added to lower their fusion temperature.

(4) Alloys Formation

(i) The alkali metals form alloys among themselves as well as with other metals.

(ii) Alkali metals also get dissolved in mercury to form amalgam with evolution of heat and the amalgamation is highly exothermic.

Physical properties

(1) Physical state

(i) All are silvery white, soft and light solids. These can be cut with the help of knife. When freshly cut, they have bright lustre which quickly tarnishes due to surface oxidation.

(ii) These form diamagnetic colourless ions since these ions do not have unpaired electrons, (*i.e.* *M* has *ns* configuration). That is why alkali metal salts are colourless and diamagnetic.

(2) Atomic and ionic radii

(i) The alkali metals have largest atomic and ionic radii than their successive elements of other groups belonging to same period.

(ii) The atomic and ionic radii of alkali metals, however, increases down the group due to progressive addition of new energy shells.

No doubt the nuclear charge also increases on moving down the group but the influence of addition of energy shell predominates

	<i>Li</i>	<i>Na</i>	<i>K</i>	<i>Rb</i>	<i>Cs</i>	<i>Fr</i>
Atomic radius (pm)	152	186	227	248	265	375
Ionic radius of <i>M</i>	60	95	133	148	169	—

ions (pm)

(3) Density

(i) All are light metals, *Li*, *Na* and *K* have density less than water. Low values of density are because these metals have high atomic volume due to larger atomic size. On moving down the group the atomic size as well as atomic mass both increase but increase in atomic mass predominates over increase in atomic size or atomic volume and therefore the ratio mass/volume *i.e.* density gradually increases down the groups

(ii) The density increases gradually from *Li* to *Cs*, *Li* is lightest known metal among all.

$Li = 0.534$, $Na = 0.972$, $K = 0.86$, $Rb = 1.53$ and $Cs = 1.87$ g/ml at 20°C.

(iii) *K* is lighter than *Na* because of its unusually large atomic size.

(iv) In solid state, they have body centred cubic lattice.

(4) Melting point and Boiling point

(i) All these elements possess low melting point and boiling point in comparison to other group members.

	<i>Li</i>	<i>Na</i>	<i>K</i>	<i>Rb</i>	<i>Cs</i>	<i>Fr</i>
melting point (K)	453.5	370.8	336.2	312.0	301.5	–
boiling point (K)	1620	1154.4	1038.5	961.0	978.0	–

(ii) The lattice energy of these atoms in metallic crystal lattice relatively low due to larger atomic size and thus possess low melting point and boiling point on moving down the group, the atomic size increases and binding energy of their atoms in crystal lattice decreases which results lowering of melting point.

(iii) Lattice energy decreases from *Li* to *Cs* and thus melting point and boiling also decreases from *Li* to *Cs*.

(5) Ionisation energy and electropositive or metallic character

(i) Due to unpaired lone electron in *ns* sub-shell as well as due to their larger size, the outermost electron is far from the nucleus, the removal of electron is easier and these low values of ionisation energy. (*IE*)

(ii) Ionisation energy of these metal decreases from *Li* to *Cs*.

Ionisation energy	<i>Li</i>	<i>Na</i>	<i>K</i>	<i>Rb</i>	<i>Cs</i>	<i>Fr</i>
IE_1	520	495	418	403	376	–
IE_2	7296	4563	3069	2650	2420	–

A jump in 2nd ionisation energy (huge difference) can be explained as,

Removal of 1s electrons from *Li* and that too from completely filled configuration requires much more energy and a jump in 2nd ionisation is noticed.

(iii) Lower are ionisation energy values, greater is the tendency to lose *ns* electron to change in *M* ion (*i.e.* $M \rightarrow M^+e$) and therefore stronger is electropositive character.

(iv) Electropositive character increases from *Li* to *Cs*.

Due to their strong electropositive character, they emit electrons even when exposed to light showing **photoelectric effect**. This property is responsible for the use of *Cs* and *K* in photoelectric cell.

(6) Oxidation number and valency

(i) Alkali metals are univalent in nature due to low ionisation energy values and form ionic compounds. Lithium salts are, however, covalent.

(ii) Further, the *M* ion acquires the stable noble gas configuration. It requires very high values of energy to pull out another electron from next to outer shell of *M* ion and that is why their second ionisation energy is very high. Consequently, under ordinary conditions, it is not possible for these metals to form *M* ion and thus they show +1 oxidation state.

(iii) Since the electronic configuration of *M* ions do not have unpaired electron and thus alkali metal salts are diamagnetic and colourless. Only those alkali metal salts are coloured which have coloured anions *e.g.*

$K_2Cr_2O_7$ is orange because of orange coloured $Cr_2O_7^{2-}$ ion, $KMnO_4$ is violet because of violet coloured MnO_4^- ion.

(7) Hydration of Ions

(i) Hydration represents for the dissolution of a substance in water to get adsorb water molecule by weak valency force. Hydration of ions is the exothermic process (*i.e.* energy is released during hydration) when ions on dissolution water get hydration.

(ii) The energy released when 1 mole of an ion in the gaseous state is dissolved in water to get it hydrated is called hydration energy

(iii) Smaller the cation, greater is the degree of hydration. Hydration energy is in the order of, $Li^+ > Na^+ > K^+ > Rb^+ > Cs^+$

(iv) *Li* being smallest in size has maximum degree of hydration and that is why lithium salts are mostly hydrated, $LiCl \cdot 2H_2O$ also lithium ion being heavily hydrated, moves very slowly under the influence of electric field and, therefore, is the poorest conductor current among alkali metals ions. It may, therefore, be concluded that it is the degree of hydration as well as the size of ion is responsible for the current carried by an ion.

Relative ionic radii $Cs^+ > Rb^+ > K^+ > Na^+ > Li^+$

Relative hydrated ionic radii $Li^+ > Na^+ > K^+ > Rb^+ > Cs^+$

Relative conducting power $Cs^+ > Rb^+ > K^+ > Na^+ > Li^+$

(8) Electronegativity, Electro positivity and metallic character.

(i) These metals are highly electropositive and thereby possess low values of electronegativities. Metallic character and electro positivity increase from *Li* to *Cs* ($Li < Na < K < Rb < Cs$)

(ii) Electronegativity of alkali metals decreases down the group as the trend of numerical values of electronegativity given below on Pauling scale suggests.

	<i>Li</i>	<i>Na</i>	<i>K</i>	<i>Rb</i>	<i>Cs</i>	<i>Fr</i>
Electronegativity	0.98	0.93	0.82	0.82	0.79	–

Fr being radioactive elements and thus studies on physical properties of this element are limited.

(9) Specific heat : It decreases from *Li* to *Cs*.

	<i>Li</i>	<i>Na</i>	<i>K</i>	<i>Rb</i>	<i>Cs</i>	<i>Fr</i>
Specific heat (Cal/g)	0.941	0.293	0.17	0.08	0.049	–

(10) Conduction power : All are good conductors of heat and electricity, because of loosely held valence electrons.

(11) Standard oxidation potential and reduction properties

(i) Since alkali metals easily lose *ns* electron and thus they have high values of oxidation potential *i.e.*,

(ii) The standard oxidation potentials of a alkali metals (in volts) are listed below,

<i>Li</i>	<i>Na</i>	<i>K</i>	<i>Rb</i>	<i>Cs</i>
+3.05	+2.71	+2.93	+2.99	+2.99

(iii) More is oxidation potential, more is the tendency to get oxidized and thus more powerful is reducing nature in aqueous medium that is why alkali metals liberate H_2 from H_2O and HCl .

(iv) However, an examination of ionisation energy for alkali metals reveals that *Li* should have the minimum tendency to lose electron and thus its reducing nature should be minimum. The greatest reducing nature of *Li* in aq. medium is accounted due to the maximum hydration energy of *Li* ion. For Lithium

Similarly, for sodium,

ΔH_i for $Li > \Delta H_i$ for Na . Therefore, large negative ΔH values are observed in case of Li and this explains for more possibility of Li to get itself oxidized or have reducing nature.

(12) Characteristic flame colours : The alkali metals and their salts give characteristic colour to Bunsen flame. The flame energy causes and excitation of the outermost electron which on reverting back to its initial position gives out the absorbed energy as visible light. These colour differ from each other Li –crimson, Na –Golden yellow, K – Pale violet, Rb –Red violet and Cs –Blue violet. These different colours are due to different ionisation energy of alkali metals. The energy released is minimum in the case of Li and increases in the order.

Energy released : $Li^+ < Na^+ < K^+ < Rb^+ < Cs^+$

λ released : $Li^+ > Na^+ > K^+ > Rb^+ > Cs^+$

Frequency released : $Li^+ < Na^+ < K^+ < Rb^+ < Cs^+$

Chemical properties

(1) Formation of oxides and hydroxides

(i) These are most reactive metals and have strong affinity for O , quickly tranish in air due to the formation of a film of their oxides on the surface. These are, therefore, kept under kerosene or paraffin oil to protect them from air,

(ii) When burnt air (O), lithium forms lithium oxide (Li_2O) sodium forms sodium peroxide (Na_2O_2) and other alkali metals form super oxide (MO , i.e. KO, RbO or CsO)

The reactivity of alkali metals towards oxygen to form different oxides is due to strong positive field around each alkali metal cation. Li being smallest, possesses strong positive field and thus combines with small anion O to form stable Li_2O compound. The Na and K being relatively larger thus exert less strong positive field around them and thus reacts with larger oxygen anion i.e. O_2^{2-} and O_2^{1-} to form stable oxides.

The monoxide, peroxides and superoxides have O , and O_2^{2-} , O_2^{1-} ions respectively. The structures of each are,

The O_2^- ion has a three electron covalent bond and has one electron unpaired. It is therefore superoxides are paramagnetic and coloured KO_2 is light yellow and paramagnetic substance.

(iii) The oxides of alkali metals and metal itself give strongly alkaline solution in water with evolution of heat

The peroxides and superoxides act as strong oxidising agents due to formation of H_2O .

(iv) The reactivity of alkali metals towards air and water increases from Li to Cs that is why lithium decomposes H_2O very slowly at $25^\circ C$

whereas Na does so vigorously, K reacts producing a flame and Rb , Cs do so explosively.

(v) The basic character of oxides and hydroxides of alkali metals increases from Li to Cs . This is due to the increase in ionic character of alkali metal hydroxides down the group which leads to complete dissociation and leads to increase in concentration of OH^- ions.

(2) Hydrides

(i) These metals combine with H to give white crystalline ionic hydrides of the general of the formula MH .

(ii) The tendency to form their hydrides, basic character and stability decreases from Li to Cs since the electropositive character decreases from Cs to Li .

$2M + H_2 \rightarrow 2MH$; Reactivity towards H_2 is $Cs < Rb < K < Na < Li$.

(iii) The metal hydrides react with water to give MOH and H_2 ; $MH + H_2O \rightarrow MOH + H_2$

(iv) The ionic nature of hydrides increases from Li to Cs because of the fact that hydrogen is present in the these hydrides as H^- and the smaller cation will produce more polarisation of anion (according to Fajans rule) and will develop more covalent character.

(v) The electrolysis of fused hydrides give H_2 at anode. NaH_{fused} Contains Na^+ and H^- i.e.,

(vi) Alkali metals also form hydrides like $NaBH_4$, $LiAlH_4$ which are good reducing agent.

(3) Carbonates and Bicarbonates

(i) The carbonates (MCO_3) & bicarbonates ($MHCO_3$) are highly stable to heat, where M stands for alkali metals.

(ii) The stability of these salts increases with the increasing electropositive character from Li to Cs . It is therefore Li_2CO_3 decompose on heating, $Li_2CO_3 \rightarrow Li_2O + CO_2$

(iii) Bicarbonates are decomposed at relatively low temperature, $2MHCO_3 \xrightarrow{300^\circ C} M_2CO_3 + H_2O + CO_2$

(iv) Both carbonates and bicarbonates are soluble in water to give alkaline solution due to hydrolysis of carbonate ions or bicarbonate ions.

(4) Halides

(i) Alkali metals combine directly with halogens to form ionic halide M^+X^- .

(ii) The ease with which the alkali metals form halides increases from Li to Cs due to increasing electropositive character from Li to Cs .

(iii) Lithium halides however have more covalent nature. Smaller is the cation, more is deformation of anion and thus more is covalent nature in compound. Also among lithium halides, lithium iodide has maximum covalent nature because of larger anion which is easily deformed by a cation. Thus covalent character in lithium halides is, $LiI > LiBr > LiCl > LiF$

(iv) These are readily soluble in water. However, lithium fluoride is sparingly soluble. The low solubility of LiF is due to higher forces of attractions among smaller Li and smaller F^- ions (high lattice energy).

(v) Halides having ionic nature have high m.pt. and good conductor of current. The melting points of halides shows the order, $NaF > NaCl > NaBr > NaI$

(vi) Halides of potassium, rubidium and caesium have a property of combining with extra halogen atoms forming polyhalides.

(5) Solubility in liquid NH_3

(i) These metals dissolve in liquid NH_3 to produce blue coloured solution, which conducts electricity to an appreciable degree.

(ii) With increasing concentration of ammonia, blue colour starts changing to that of metallic copper after which dissolution of alkali metals in NH_3 ceases.

(iii) The metal atom is converted into ammoniated metal in i.e. $M(NH_3)$ and the electron set free combines with NH_3 molecule to produce ammonia solvated electron.

(iv) It is the ammoniated electron which is responsible for blue colour, paramagnetic nature and reducing power of alkali metals in ammonia solution. However, the increased conductance nature of these metals in ammonia is due to presence of ammoniated cation and ammonia solvated electron.

(v) The stability of metal-ammonia solution decreases from Li to Cs .

(vi) The blue solution on standing or on heating slowly liberates hydrogen, $2M + 2NH_3 \rightarrow 2MNH_2 + H_2$. Sodamide ($NaNH_2$) is a waxy solid, used in preparation of number of sodium compounds.

(6) Nitrates : Nitrates of alkali metals (MNO_3) are soluble in water and decompose on heating. $LiNO_3$ decomposes to give NO_2 and O_2 and rest all give nitrites and oxygen.

**(7) Sulphates**

(i) Alkali metals' sulphate have the formula MSO_4 .

(ii) Except Li_2SO_4 , rest all are soluble in water.

(iii) These sulphates on fusing with carbon form sulphides, $MSO_4 + 4C \rightarrow MS + 4CO$

(iv) The sulphates of alkali metals (except Li) form double salts with the sulphate of the trivalent metals like Fe , Al , Cr etc. The double sulphates crystallize with large number of water molecules as alum. e.g. $K_2SO_4 \cdot Al(SO_4)_3 \cdot 24H_2O$.

(8) Reaction with non-metals

(i) These have high affinity for non-metals. Except carbon and nitrogen, they directly react with hydrogen, halogens, sulphur, phosphorus etc. to form corresponding compounds on heating.

(ii) Li reacts, however directly with carbon and nitrogen to form carbides and nitrides.

(iii) The nitrides of these metals on reaction with water give NH_3 .

(9) Reaction with acidic hydrogen : Alkali metals react with acids and other compounds containing acidic hydrogen (i.e. H atom attached on F , O , N and triply bonded carbon atom, for example, HF , H_2O , ROH , RNH_2 , $CH \equiv CH$) to liberate H_2 .

(10) Complex ion formation : A metal shows complex formation only when it possesses the following characteristics, (i) Small size (ii) High nuclear charge (iii) Presence of empty orbitals in order to accept electron pair ligand. Only Lithium in alkali metals due to small size forms a few complex ions. Rest all alkali metals do not possess the tendency to form complex ion.

Anomalous behaviour of Lithium

Anomalous behaviour of lithium is due to extremely small size of lithium its cation on account of small size and high nuclear charge, lithium exerts the greatest polarizing effect out of all alkali metals on negative ion. Consequently lithium ion possesses remarkable tendency towards solvation and develops covalent character in its compounds. Li differs from other alkali metals in the following respects,

(1) It is comparatively harder than other alkali metals. Li can't be stored in kerosene as it floats to the surface, due to its very low density. Li is generally kept wrapped in paraffin wax.

(2) It can be melted in dry air without losing its brilliance.

(3) Unlike other alkali metals, lithium is least reactive among all. It can be noticed by the following properties,

(i) It is not affected by air. (ii) It decomposes water very slowly to liberate H_2 . (iii) It hardly reacts with bromine while other alkali metals react violently.

(4) Lithium is the only alkali metal which directly reacts with N_2 to form Lithium nitride (Li_3N)

(5) Lithium when heated in NH_3 forms amide, $LiNH_2$ while other metals form amides, MNH_2 .

(6) When burnt in air, lithium forms Li_2O sodium forms Na_2O and Na_2O_2 other alkali metals form monoxide, peroxide and superoxide.

(7) Li_2O is less basic and less soluble in water than other alkali metals.

(8) $LiOH$ is weaker base than $NaOH$ or KOH and decomposes on heating.

(9) $LiHCO_3$ is liquid while other metal bicarbonates are solid.

(10) Only Li_2CO_3 decomposes on heating

Na_2CO_3 , K_2CO_3 etc. do not decompose on heating.

(11) $LiNO_3$ and other alkali metal nitrates give different products on heating

(12) $LiCl$ and $LiNO_3$ are soluble in alcohol and other organic solvents. These salts of other alkali metals are, however, insoluble in organic solvents.

(13) $LiCl$ is deliquescent while $NaCl$, KBr etc. are not. Lithium chloride crystals contain two molecules of water of crystallisation ($LiCl \cdot 2H_2O$). Crystals of $NaCl$, KBr , KI etc do not contain water of crystallisation.

(14) Li_2SO_4 does not form alums like other alkali metals.

(15) Li reacts with water slowly at room temperature Na reacts vigorously. Reaction with K , Rb and Cs is violent.

(16) Li reacts with Br_2 slowly. Reaction of other alkali metals with Br_2 is fast.

(17) Li_2CO_3 , $Li_2C_2O_4$, LiF , $LiPO_4$ are the only alkali metal salts which are insoluble or sparingly soluble in water.

Diagonal Relationship of Li with Mg

Due to its small size lithium differs from other alkali metals but resembles with Mg as its size is closer to Mg . Its resemblance with Mg is known as diagonal relationship. Generally the periodic properties show either increasing or decreasing trend along the group and vice versa along

Period	Group I	Group II
2	<i>Li</i>	<i>Be</i>
3	<i>Na</i>	<i>Mg</i>

Zn, Al, Sb, Pb, Sn and As forms insoluble hydroxide which dissolve in excess of $NaOH$ (amphoteric hydroxide).

(b) *Reaction with halogens :*

(X = Cl, Br, I)

(c) *Reaction with metals :* Weakly electropositive metals like Zn, Al and Sn etc.

(d) *Reaction with sand, SiO₂ :*

(e) *Reaction with CO:*

NaOH breaks down the proteins of the skin flesh to a pasty mass, therefore it is commonly known as caustic soda.

Caustic property : sodium hydroxide breaks down the proteins of the skin flesh to a pasty mass, therefore, it is commonly known as caustic soda.

Uses : Sodium hydroxide is used :

(a) in the manufacture of sodium metal, soap (from oils and fats), rayon, paper, dyes and drugs,

(b) for mercuring cotton to make cloth unshrinkable and

(c) as a reagent in the laboratory.

(iii) **Sodium carbonate or washing soda, Na₂CO₃**

It exists in various forms, namely anhydrous sodium carbonate Na₂CO₃ (soda-ash); monohydrate Na₂CO₃·H₂O (crystal carbonate); heptahydrate Na₂CO₃·7H₂O and decahydrate Na₂CO₃·10H₂O (washing soda or sal soda).

Preparation : (a) *Solvay process :* In this process, brine (NaCl), NH₃ and CO₂ are the raw materials.

CaCl₂ so formed in the above reaction is a by product of solvay process.

Properties

It does not decompose on further heating even to redness (m.pt. 853°C)

(b) It is soluble in water with considerable evolution of heat.

(c) It is readily decomposed by acids with the evolution of CO₂ gas.

Uses : In textile and petroleum refining. Manufacturing of glass, NaOH soap powders etc.

(iv) **Sodium peroxide (Na₂O₂)**

Preparation : It is manufactured by heating sodium metal on aluminium trays in air (free from CO₂)

Properties : (a) When pure it is colourless. The faint yellow colour of commercial product is due to presence of small amount of superoxide (NaO₂).

(b) On coming with moist air it become white due to formation of NaOH and Na₂CO₃.

(c) It is powerful oxidising agent. It oxidises Cr (III) hydroxide to sodium chromate, Mn (II) to sodium manganate and sulphides to sulphates.

Uses : As a bleaching agent and it is used for the purification of air in confined spaces such as submarines because it can combine with CO₂ to give Na₂CO₃ and oxygen, 2CO₂ + 2Na₂O₂ → 2Na₂CO₃ + O₂.

(v) **Micro cosmic salt [Na (NH₄) HPO₄ · 4H₂O]**

Prepared by dissolving equimolar amounts of Na₂HPO₄ and NH₄Cl in water in 1 : 1 ratio followed by crystallization

Chemical properties :

On heating M.C.S, NaPO₃ is formed. NaPO₃ forms coloured beads with oxides of transition metal cloudy SiO₂

Uses : (a) For the formation of sodium meta phosphate and copper sodium phosphate

(b) It is used for the detection of colored ion

(c) It is especially used for testing silica with which a cloudy bead containing floating properties of silica is obtained.

(vi) **Sodium bi Carbonate (NaHCO₃, Baking soda)**

Preparation : It is an intermediate compound in manufacture of sodium carbonate by the solvay's process

It is amphoteric $HCO_3^- + H^+ \rightleftharpoons H_2CO_3$

Uses : (a) Baking powder contains $NaHCO_3$, $Ca(H_2PO_4)_2$ and starch.

Improved Baking powder contains 40% starch 30% $NaHCO_3$, 20% $NaAl(SO_4)_2$ and 10% $CaH_2(PO_4)$

(b) In pharmaceutical industry (Antacids etc.)

(c) Fire extinguishers.

(vii) **Sodium Sulphate Na_2SO_4 or salt cake**

Preparation : It is the by-product of HCl industry

Properties : When aqueous solution of Na_2SO_4 is cooled below $32^\circ C$ Glauber's salt ($Na_2SO_4 \cdot 10H_2O$) gets crystallised and if cooled to $12^\circ C$, $Na_2SO_4 \cdot 7H_2O$ crystals are formed.

Uses : Na_2SO_4 finds use in paper industry detergent and glass manufacturing.

Alkaline Earth Metals and Their Compounds

The group 2 of the periodic table consists of six metallic elements. These are beryllium (Be), magnesium (Mg), calcium (Ca), strontium (Sr), barium (Ba) and radium (Ra). These (except Be) are known as alkaline earth metals as their oxides are alkaline and occur in earth crust.

(i) Electronic configuration

Element	Electronic configurations (ns^2)
${}_4 Be$	$[He]2s^2$
${}_{12} Mg$	$[Ne]3s^2$
${}_{20} Ca$	$[Ar]4s^2$
${}_{38} Sr$	$[Kr]5s^2$
${}_{56} Ba$	$[Xe]6s^2$
${}_{88} Ra$	$[Rn]7s^2$

Radium was discovered in the ore pitch blende by madam Curie. It is radioactive in nature.

(2) **Occurrence :** These are found mainly in combined state such as oxides, carbonates and sulphates Mg and Ca are found in abundance in nature. Be is not very abundant, Sr and Ba are less abundant. Ra is rare element. Some important ores of alkaline earth metals are given below,

(i) **Beryllium :** Beryl ($3BeO \cdot Al_2O_3 \cdot 6SiO_2$); Phenacite (Be_2SiO_5)

(ii) **Magnesium :** Magnesite ($MgCO_3$); Dolomite ($CaCO_3 \cdot MgCO_3$); Epsomite ($MgSO_4 \cdot 7H_2O$); Carnallite ($MgCl_2 \cdot KCl \cdot 6H_2O$); Asbestos [$CaMg(SiO_3)_2$]

(iii) **Calcium :** Limestone ($CaCO_3$); Gypsum : ($CaSO_4 \cdot 2H_2O$), Anhydrite ($CaSO_4$); Fluorapatite [$(3Ca_3(PO_4)_2 \cdot CaF_2)$]; Phosphorite rock [$Ca_3(PO_4)_2$]

(iv) **Barium :** Barytes ($BaSO_4$); witherite ($BaCO_3$)

(v) **Radium :** Pitch blende (UO_2); (Ra in traces); other radium rich minerals are carnotite [$K_2(UO)_6$] (VO), $8H_2O$ and antamite [$Ca(UO)_4$].

(3) Extraction of alkaline earth metals

(i) Be and Mg are obtained by reducing their oxides carbon,

(ii) The extraction of alkaline earth metals can also be made by the reduction of their oxides by alkali metals or by electrolysis of their fused salts.

(4) **Alloy formation :** These dissolve in mercury and form amalgams.

Physical properties

(1) **Physical state :** All are greyish-white, light, malleable and ductile metals with metallic lustre. Their hardness progressively decrease with increase in atomic number. Although these are fairly soft but relatively harder than alkali metals.

(2) Atomic and ionic radii

(i) The atomic and ionic radii of alkaline earth metals also increase down the group due to progressive addition of new energy shells like alkali metals.

	Be	Mg	Ca	Sr	Ba	Ra
Atomic radius (pm)	112	160	197	215	222	—
Ionic radius of M^{2+} (pm)	31	65	99	113	135	140

(ii) The atomic radii of alkaline earth metals are however smaller than their corresponding alkali metal of the same period. This is due to the fact that alkaline earth metals possess a higher nuclear charge than alkali metals which more effectively pulls the orbit electrons towards the nucleus causing a decrease in size.

(3) Density

(i) Density decreases slightly upto Ca after which it increases. The decrease in density from Be to Ca might be due to less packing of atoms in solid lattice of Mg and Ca .

Be	Mg	Ca	Sr	Ba	Ra
1.84	1.74	1.55	2.54	3.75	6.00

(ii) The alkaline earth metals are more denser, heavier and harder than alkali metal. The higher density of alkaline earth metals is due to their smaller atomic size and strong intermetallic bonds which provide a more close packing in crystal lattice as compared to alkali metals.

(4) Melting point and Boiling point

(i) Melting points and boiling points of alkaline earth metals do not show any regular trend.

	Be	Mg	Ca	Sr	Ba	Ra
melting points (K)	1560	920	1112	1041	1000	973
boiling point (K)	2770	1378	1767	1654	1413	—

(ii) The values are, however, more than alkali metals. This might be due to close packing of atoms in crystal lattice in alkaline earth metals.

(5) Ionisation energy and electropositive or metallic character

(i) Since the atomic size decreases along the period and the nuclear charge increases and thus the electrons are more tightly held towards nucleus. It is therefore alkaline earth metals have higher ionisation energy in comparison to alkali metals but lower ionisation energies in comparison to p-block elements.

(ii) The ionisation energy of alkaline earth metals decreases from Be to Ba .

	Be	Mg	Ca	Sr	Ba	Ra
First ionisation energy ($kJ mol^{-1}$)	899	737	590	549	503	509
Second ionisation energy ($kJ mol^{-1}$)	1757	1450	1146	1064	965	979

(iii) The higher values of second ionisation energy is due to the fact that removal of one electron from the valence shell, the remaining electrons are more tightly held in which nucleus of cation and thus more energy is required to pull one more electron from monovalent cation.

(iv) No doubt first ionisation energy of alkaline earth metals are higher than alkali metals but a closer look on 2nd ionisation energy of alkali metals and alkaline earth metals reveals that 2nd ionisation energy of alkali metals are more

	Li	Be
1st ionisation energy (kJ mol^{-1})	520	899
2nd ionisation energy (kJ mol^{-1})	7296	1757

This may be explained as,

The removal of $2s$ electron from alkali metals takes place from $1s$ sub shell which are more closer to nucleus and exert more nuclear charge to hold up $1s$ electron core, whereas removal of $2nd$ electron from alkaline earth metals takes from $2s$ sub shell. More closer are shells to the nucleus, more tightly are held electrons with nucleus and thus more energy is required to remove the electron.

(v) All these possess strong electropositive character which increases from Be to Ba .

(vi) These have less electropositive character than alkali metals as the later have low values of ionisation energy.

(6) Oxidation number and valency

(i) The IE of the these metals are much lower than IE and thus it appears that these metals should form univalent ion rather than divalent ions but in actual practice, all these give divalent ions. This is due to the fact that M ion possesses a higher degree of hydration or M ions are extensively hydrated to form $[M(H_2O)_n]^+$, a hydrated ion. This involves a large amount of energy evolution which counter balances the higher value of second ionisation energy.

(ii) The tendency of these metals to exist as divalent cation can thus be accounted as,

(a) Divalent cation of these metals possess noble gas or stable configuration.

(b) The formation of divalent cation lattice leads to evolution of energy due to strong lattice structure of divalent cation which easily compensates for the higher values of second ionisation energy of these metals.

(c) The higher heats of hydration of divalent cation which accounts for the existence of the divalent ions of these metals in solution state.

(7) Hydration of ions

(i) The hydration energies of alkaline earth metals divalent cation are much more than the hydration energy of monovalent cation.

	Mg^{2+}	Mg^{2+}
Hydration energy or Heat of hydration (kJ mol^{-1})	353	1906

The abnormally higher values of heat of hydration for divalent cations of alkaline earth metals are responsible for their divalent nature. $MgCl_2$ formation occurs with more amount of heat evolution and thus $MgCl_2$ is more stable.

(ii) The hydration energies of M ion decreases with increase in ionic radii.

	Be^{2+}	Mg^{2+}	Ca^{2+}	Sr^{2+}	Ba^{2+}
Heat of hydration kJ mol^{-1}	2382	1906	1651	1484	1275

(iii) Heat of hydration are larger than alkali metals ions and thus alkaline earth metals compounds are more extensively hydrated than those

of alkali metals e.g $MgCl_2$ and $CaCl_2$ exists as $MgCl_2 \cdot 6H_2O$ and $CaCl_2 \cdot 6H_2O$ which $NaCl$ and KCl do not form such hydrates.

(iv) The ionic mobility, therefore, increases from Be to Ba , as the size of hydrated ion decreases.

(8) Electronegativities

(i) The electronegativities of alkaline earth metals are also small but are higher than alkali metals.

(ii) Electronegativity decreases from Be to Ba as shown below,

	Be	Mg	Ca	Sr	Ba
Electronegativity	1.57	1.31	1.00	0.95	0.89

(9) **Conduction power** : Good conductor of heat and electricity.

(10) Standard oxidation potential and reducing properties

(i) The standard oxidation potential (in volts) are,

Be	Mg	Ca	Sr	Ba
1.69	2.35	2.87	2.89	2.90

(ii) All these metals possess tendency to lose two electrons to give M ion and are used as reducing agent.

(iii) The reducing character increases from Be to Ba , however, these are less powerful reducing agent than alkali metals.

(iv) Beryllium having relatively lower oxidation potential and thus does not liberate H_2 from acids.

(11) Characteristic flame colours

The characteristic flame colour shown are : Ca - brick red; Sr - crimson ; Ba -apple green and Ra - crimson.

Chemical Properties

(1) Formation of oxides and hydroxides

(i) The elements (except Ba and Ra) when burnt in air give oxides of ionic nature MO which are crystalline in nature. Ba and Ra however give peroxide. The tendency to form higher oxides increases from Be to Ra .

(ii) Their less reactivity than the alkali metals is evident by the fact that they are slowly oxidized on exposure to air, However the reactivity of these metals towards oxygen increases on moving down the group.

(iii) The oxides of these metals are very stable due to high lattice energy.

(iv) The oxides of the metal (except BeO and MgO) dissolve in water to form basic hydroxides and evolve a large amount of heat. BeO and MgO possess high lattice energy and thus insoluble in water.

(v) BeO dissolves both in acid and alkalies to give salts i.e. BeO possesses amphoteric nature.

(vi) The basic nature of oxides of alkaline earth metals increases from Be to Ra as the electropositive Character increases from Be to Ra .

(vii) The tendency of these metal to react with water increases with increase in electropositive character i.e. Be to Ra .

(viii) Reaction of Be with water is not certain, magnesium reacts only with hot water, while other metals react with cold water but slowly and less energetically than alkali metals.

(ix) The inertness of Be and Mg towards water is due to the formation of protective, thin layer of hydroxide on the surface of the metals.

(x) The basic nature of hydroxides increase from Be to Ra . It is because of increase in ionic radius down the group which results in a decrease in strength of $M-O$ bond in $M-(OH)_2$ to show more dissociation of hydroxides and greater basic character.

(xi) The solubility of hydroxides of alkaline earth metals is relatively less than their corresponding alkali metal hydroxides Furthermore, the

solubility of hydroxides of alkaline earth metals increases from *Be* to *Ba*. *Be* (OH) and *Mg* (OH) are almost insoluble, *Ca* (OH) (often called lime water) is sparingly soluble whereas *Sr* (OH) and *Ba* (OH) (often called baryta water) are more soluble.

The trend of the solubility of these hydroxides depends on the values of lattice energy and hydration energy of these hydroxides. The magnitude of hydration energy remains almost same whereas lattice energy decreases appreciably down the group leading to more $-Ve$ values for ΔH_{hyd} down the group.

$$\Delta H_{\text{soln}} = \Delta H_{\text{lattice energy}} + \Delta H_{\text{hydration energy}}$$

More negative is ΔH_{soln} more is solubility of compounds.

(xii) The basic character of oxides and hydroxides of alkaline earth metals is lesser than their corresponding alkali metal oxides and hydroxides.

(xiii) Aqueous solution of lime water [$Ca(OH)_2$] or baryta water [$Ba(OH)_2$], are used to qualitative identification and quantitative estimation of carbon dioxide, as both of them gives white precipitate with CO_2 due to formation of insoluble $CaCO_3$ or $BaCO_3$.

SO_2 also give white ppt of $CaSO_3$ and $BaSO_3$ on passing through lime water or baryta water. However on passing CO_2 in excess, the white turbidity of insoluble carbonates dissolve to give a clear solution again due to the formation of soluble bicarbonates,

(2) Hydrides

(i) Except *Be*, all alkaline earth metals form hydrides (MH) on heating directly with H_2 . $M + H_2 \rightarrow MH_2$.

(ii) BeH_2 is prepared by the action of $LiAlH_4$ on $BeCl_2$

(iii) BeH_2 and MgH_2 are covalent while other hydrides are ionic.

(iv) The ionic hydrides of *Ca*, *Sr*, *Ba* liberate H_2 at anode and metal at cathode.

(v) The stability of hydrides decreases from *Be* to *Ba*.

(vi) The hydrides having higher reactivity for water, dissolves readily and produce hydrogen gas.

(3) Carbonates and Bicarbonates

(i) All these metal carbonates (MCO_3) are insoluble in neutral medium but soluble in acid medium. These are precipitated by the addition of alkali metal or ammonium carbonate solution to the solution of these metals.

(ii) Alkaline earth metal carbonates are obtained as white precipitates when calculated amount of carbon dioxide is passed through the solution of the alkaline metal hydroxides.

and sodium or ammonium carbonate is added to the solution of the alkaline earth metal salt such as $CaCl_2$.

(iii) Solubility of carbonates of these metals also decreases downward in the group due to the decrease of hydration energy as the lattice energy remains almost unchanged as in case of sulphates.

(vi) The carbonates of these metals decompose on heating to give the oxides, the temperature of decomposition increasing from *Be* to *Ba*. Beryllium carbonate is unstable.

(4) Halides

(i) The alkaline earth metals combine directly with halogens at appropriate temperatures forming halides, MX_2 . These halides can also be prepared by the action of halogen acids (HX) on metals, metal oxides, hydroxides and carbonates.

Beryllium chloride is however, conveniently obtained from oxide

(ii) $BeCl_2$ is essentially covalent, the chlorides $MgCl_2$, $CaCl_2$, $SrCl_2$ and $BaCl_2$ are ionic; the ionic character increases as the size of the metal ion increases. The evidence is provided by the following facts,

(a) Beryllium chloride is relatively low melting and volatile whereas $BaCl_2$ has high melting and stable.

(b) Beryllium chloride is soluble in organic solvents.

(iii) The halides of the members of this group are soluble in water and produce neutral solutions from which the hydrates such as $MgCl_2 \cdot 6H_2O$, $CaCl_2 \cdot 6H_2O$, $BaCl_2 \cdot 2H_2O$ can be crystallised. The tendency to form hydrated halides decreases with increasing size of the metal ions.

(iv) $BeCl_2$ is readily hydrolysed with water to form acid solution, $BeCl_2 + 2H_2O \rightarrow Be(OH)_2 + 2HCl$.

(v) The fluorides are relatively less soluble than the chlorides due to high lattice energies. Except $BeCl_2$ and $MgCl_2$ the chlorides of alkaline earth metals impart characteristic colours to flame.

$CaCl_2$	$SrCl_2$	$BaCl_2$
Brick red colour	Crimson colour	Grassy green colour

Structure of $BeCl_2$: In the solid phase polymeric chain structure with three centre two electron bonding with $Be-Cl-Be$ bridged structure is shown below,

In the vapour phase it tends to form a chloro-bridged dimer which dissociates into the linear triatomic monomer at high temperature at nearly 1200 K.

(5) **Solubility in liquid ammonia:** Like alkali metals, alkaline earth metals also dissolve in liquid ammonia to form coloured solutions. When such a solution is evaporated, hexammoniate, $M(NH_4)_2$, is formed.

(6) Nitrides

(i) All the alkaline earth metals directly combine with N_2 give nitrides, M_3N_2 .

(ii) The ease of formation of nitrides however decreases from *Be* to *Ba*.

(iii) These nitrides are hydrolysed with water to liberate

(7) Sulphates

(i) All these form sulphate of the type MSO_4 by the action of H_2SO_4 on metals, their oxides, carbonates or hydroxides.

(ii) The solubility of sulphates in water decreases on moving down the group. $BeSO_4$ and $MgSO_4$ are fairly soluble in water while $BaSO_4$ is completely insoluble. This is due to increases in lattice energy of sulphates down the group which predominates over hydration energy.

(iii) Sulphate is quite stable to heat however reduced to sulphide on heating with carbon.

(8) **Action with carbon** : Alkaline metals (except *Be*, *Mg*) when heated with carbon form carbides of the type MC . These carbides are also called acetylides as on hydrolysis they evolve acetylene.

(9) **Action with sulphur and phosphorus** : Alkaline earth metals directly combine with sulphur and phosphorus when heated to form sulphides of the type MS and phosphides of the type MP respectively.

Sulphides on hydrolysis liberate H_2S while phosphides on hydrolysis evolve phosphine.

Sulphides are phosphorescent and are decomposed by water

(10) **Nitrates** : Nitrates of these metals are soluble in water. On heating they decompose into their corresponding oxides with evolution of a mixture of nitrogen dioxide and oxygen.

(11) Formation of complexes

(i) Tendency to show complex ion formation depends upon smaller size, high nuclear charge and vacant orbitals to accept electron. Since alkaline metals too do not possess these characteristics and thus are unable to form complex ion.

(ii) However, *Be* on account of smaller size forms many complex such as $(BeF)_2$, $(BeF)_4^{2-}$.

Anomalous behaviour of Beryllium

Beryllium differs from rest of the alkaline earth metals on account of its small atomic size, high electronegativity *Be* exerts high polarizing effect on anions and thus produces covalent nature in its compounds. Following are some noteworthy difference of *Be* from other alkaline earth metals,

- (1) *Be* is lightest alkaline earth metal.
- (2) *Be* possesses higher m.pt. and b.pt than other group members.
- (3) *BeO* is amphoteric in nature whereas oxides of other group members are strong base.
- (4) It is not easily effected by dry air and does not decompose water at ordinary temperature.
- (5) *BeSO* is soluble in water.
- (6) *Be* and *Mg* carbonates are not precipitated by $(NH_4)_2CO_3$ in presence of NH_4Cl .
- (7) *Be* and *Mg* salts do not impart colour to flame.
- (8) *Be* does not form peroxide like other alkaline earth metals.
- (9) It does not evolve hydrogen so readily from acids as other alkaline earth metals do so.
- (10) It has strong tendency to form complex compounds.
- (11) BeN_2 is volatile whereas nitrides of other alkaline earth metals are non-volatile.
- (12) Its salts can never have more than four molecules of water of crystallization as it has only four available orbitals in its valence shell.
- (13) Beryllium carbide reacts water to give methane whereas magnesium carbide and calcium carbide give propyne and acetylene respectively.

Diagonal relationship of *Be* with *Al*

Due to its small size *Be* differs from other earth alkaline earth metals but resembles in many of its properties with *Al* on account of diagonal relationship.

- (1) *Be* and *Al* have almost same and smaller size and thus favour for covalent bonding.
- (2) Both these form covalent compounds having low m. pt and soluble in organic solvent.
- (3) Both have same value of electronegativity (i.e. 1.5).
- (4) The standard O.P of these elements are quite close to each other ; *Be*=1.69 volts and *Al*= 1.70 volts.
- (5) Both become passive on treating with conc. HNO_3 in cold.
- (6) Both form many stable complexes e.g. $(BeF)_4^{2-}$, $(AlH)_3$.
- (7) Like *BeO*, Al_2O_3 is amphoteric in nature. Also both are high melting point solids.

(8) *Be* and *Al* both react with $NaOH$ to liberate H_2 forming beryllates and alluminates.

(9) *Be*, *C* and $AlCl_3$ both give CH_4 on treating with water.

(10) Both occur together in nature in beryl ore, $3BeO \cdot Al_2O_3 \cdot 6SiO_2$.

(11) Unlike other alkaline earths but like aluminium, beryllium is not easily attacked by air (Also *Mg* is not attacked by air)

(12) Both *Be* and *Al* react very slowly with dil. HCl to liberate H_2 .

(13) Both *Be* and *Al* form polymeric covalent hydrides while hydrides of other alkaline earth are ionic.

(14) Both $BeCl_2$ and $AlCl_3$ are prepared by similar way.

(15) Both $BeCl_2$ and $AlCl_3$ are soluble in organic solvents and act as catalyst in Friedel – Crafts reaction.

(16) Both $Be(OH)_2$ and $Al(OH)_3$ are amphoteric whereas hydroxides of other alkaline earths are strong alkali.

(17) The salts of *Be* and *Al* are extensively hydrated.

(18) $BeCl_2$ and $AlCl_3$ both have a bridged polymeric structure.

(19) *Be* and *Al* both form fluoro complex ions $[BeF_4]^{2-}$ and $[AlF_6]^{3-}$ in solution state whereas other members of 2nd group do not form such complexes.

Magnesium and its compounds

(1) **Ores of magnesium** : Magnesite ($MgCO_3$), Dolomite ($MgCO_3 \cdot CaCO_3$), Epsomite (epsom salt) ($MgSO_4 \cdot 7H_2O$) Carnallite ($MgCl_2 \cdot KCl \cdot 6H_2O$) Asbestos ($CaMg_3(SiO_3)_4$), Talc ($Mg_3(Si_2O_5)_2 \cdot Mg(OH)_2$).

(2) **Extraction of magnesium** : It is prepared by the electrolysis of fused magnesium chloride which in turn is obtained from carnallite and magnesite.

Carnallite ($MgCl_2 \cdot KCl \cdot 6H_2O$) can't be directly converted into anhydrous $MgCl_2$ by heating because all the water of crystallisation cannot be removed by heating. Moreover, strong heating may change it to MgO .

In Dow's process, magnesium chloride is obtained from sea water as $MgCl_2 \cdot 6H_2O$. It is rendered anhydrous by heating it in a current of dry

HCl gas. The anhydrous magnesium chloride is fused with *NaCl* (to provide conductivity to the electrolyte and to lower the fusing temperature of anhydrous *MgCl*₂) and then electrolysed at 700°C.

(3) Compounds of magnesium

(i) **Magnesia (MgO)** : It is used as magnesia cement. It is a mixture of MgO and $MgCl_2$. It is also called Sorel's cement.

(ii) **Magnesium hydroxide** : It aqueous suspension is used in Medicine as an antacid. Its medicinal name is milk of magnesia.

(iii) **Magnesium sulphate or Epsom salt** ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$): It is isomorphous with $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$. It is used as a purgative in medicine, as a mordant in dyeing and as a stimulant to increase the secretion of bile.

(iv) **Magnesium chloride** ($MgCl_2 \cdot 6H_2O$): It is a deliquescent solid. Hydrated salt on heating in air undergoes partial hydrolysis.

Calcium and its compounds

(1) **Ores of calcium** : Lime stone or marble or chalk ($CaCO_3$), Gypsum ($CaSO_4 \cdot 2H_2O$), Dolomite ($CaCO_3 \cdot MgCO_3$), Fluorspar (CaF_2), phosphorite $Ca_3(PO_4)_2$. Calcium phosphate is a constituent of bones and teeth.

(2) **Manufacture** : It is manufactured by the electrolysis of a molten mixture of calcium chloride containing some calcium fluoride. Calcium chloride is obtained as a by product of the solvay process.

(3) Compounds of calcium

(i) **Calcium oxide or Quick lime or Burnt lime (CaO)** : It's aqueous suspension is known as slaked lime.

When exposed to oxy-hydrogen flame, it starts emitting light called lime light.

CaO is used as basic flux, for removing hardness of water, as a drying agent (for NH_3 gas) for preparing mortar (CaO + sand +water).

Mortar : Mortar used in making buildings is a mixture of lime (CaO) and sand in the ratio 1 : 3 with enough water to make a thick paste. When the mortar is placed between bricks, it slowly absorbs CO_2 from the air and the slaked lime reverts to $CaCO_3$.

Although the sand in the mortar is chemically inert, the grains are bound together by the particles of calcium carbonate and a hard material results.

(ii) **Calcium chloride** ($\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$): Fused CaCl_2 is a good desiccant (drying agent). It can't be used to dry alcohol or ammonia as it forms additional products with them.

(iii) **Calcium carbonate (CaCO_3) :**

It is insoluble in water but dissolves in the presence of CO_2 due to the formation of calcium bicarbonate.

It is a constituent of protective shells of marine animals.

(iv) **Gypsum** ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$): On partially dehydrates to produce plaster of paris.

Plaster of paris :

Gypsum when heated to about 200°C is converted into anhydrous calcium sulphate. The anhydrous form (anhydrite) is known as dead burnt plaster because it does not set like plaster of paris when moistened with water.

(v) **Calcium Hydroxide** $\text{Ca}(\text{OH})_2$ (slaked lime)

Suspension of Ca(OH)_2 in water is called milk of lime.

(vi) **Cement** : (a) It is essentially a mixture of lime stone and clay. It is also called Portland cement because in presence of water it sets to a hard stone-like mass resembling with the famous Portland rock, a famous building stone of England. The approximate composition of cement is

Calcium oxide (CaO)	50 – 60 %
Silica (SiO_2)	20 – 25%
Alumina (Al_2O_3)	5 – 10%
Magnesia (MgO)	1 – 3%
Ferric oxide (Fe_2O_3)	1 – 3%

The above compounds are provided by the two raw materials, namely lime stone (which provides CaO) and clay which provides SiO_2 , Al_2O_3 and Fe_2O_3 . In cement, almost entire amount of lime is present in the combined state as calcium silicates ($2CaO.SiO_2$ and $3CaO.SiO_2$) and calcium aluminates ($3CaO.Al_2O_3$ and $4CaO.Al_2O_3$).

(b) Cement containing excess amount of lime cracks during setting; while cement containing less amount of lime is weak in strength.

(c) Cement with excess of silica is slow-setting and that having an excess of alumina is quick-setting.

(d) Cement containing no iron oxide is white but hard to burn.

Cement is manufactured by two processes, viz, wet and dry. A small amount (2–3%) of gypsum is added to slow down the setting of the cement so that it gets sufficiently hardened. Setting of cement is an exothermic process and involves hydration of calcium aluminates and calcium silicates.

Boron Family

Group 13 of long form of periodic table (previously reported as group III A according to Mendeleef's periodic table) includes boron (*B*) ; aluminium (*Al*) , gallium (*Ga*), indium (*In*) and thallium (*Tl*) Boron is the first member of group 13 of the periodic table and is the only non-metal of this group. The all other members are metals. The non-metallic nature of boron is due its small size and high ionisation energy. The members of this family are collectively known as boron family and sometimes as aluminium family.

(1) Electronic configuration

Element	Electronic configuration ($ns^2 np^1$)
${}_5B$	$[He]2s^2 2p^1$
${}_{13}Al$	$[Ne]3s^2 3p^1$
${}_{31}Ga$	$[Ar]3d^{10} 4s^2 4p^1$
${}_{49}In$	$[Kr]4d^{10} 5s^2 5p^1$
${}_{81}Tl$	$[Xe]4f^{14} 5d^{10} 6s^2 6p^1$

(2) **Occurrence** : The important of this group elements are given below,

Boron : Borax (Tincal) ($NaBO_2 \cdot 10H_2O$), Colemanite ($CaB_2O_7 \cdot 5H_2O$)

Boracite ($2MgB_2O_4 \cdot MgCl_2$), Boronatro calcite ($CaB_2O_7 \cdot NaBO_2 \cdot 8H_2O$),

Kernite ($Na_2B_4O_7 \cdot 4H_2O$), Boric acid (H_3BO_3)

Aluminium : Corundum (Al_2O_3), Diaspore ($Al_2O_3 \cdot H_2O$), Bauxite ($Al_2O_3 \cdot 2H_2O$), and Cryolite (Na_3AlF_6).

Physical properties

(1) A regular increasing trend in density down the group is due to increase in size.

(2) Melting points do not vary regularly and decrease from B to Ga and then increase.

(3) Boron has very high melting point because it exist as giant covalent polymer in both solid and liquid state.

(4) Low melting point of Ga ($29.8^\circ C$) is due to the fact that consists of only Ga molecule; it exist as liquid upto $2000^\circ C$ and hence used in high temperature thermometry.

(5) Boiling point of these elements however show a regular decrease down the group.

(6) The abrupt increase in the atomic radius of Al is due to greater screening effect in Al (it has 8 electrons in its penultimate shell) than in B (it has 2 electrons in its penultimate shell)

(7) The atomic radii of group 13 elements are smaller than the corresponding s-block elements. This is due to the fact that when we move along the period, the new incoming electron occupy the same shell whereas the nuclear charge increases regularly showing more effective pull of nucleus towards shell electrons. This ultimately reduces the atomic size.

(8) The atomic radius of Ga is slightly lesser than of Al because in going from Al to Ga , the electrons have already occupied $3d$ sub shell in Ga . The screening effect of these intervening electrons being poor and has less influence to decrease the effective nuclear charge, therefore the electrons in Ga experience more force of attractions towards nucleus to result in lower size of Ga than Al

(9) Oxidation state

(i) All exhibit +3 oxidation state and thus complete their octet either by covalent or ionic union.

(ii) Boron being smaller in size cannot lose its valence electrons to form B^3+ ion and it usually show +3 covalence. The tendency to show +3 covalence however decreases down the group even Al shows +3 covalence in most of its compounds.

(iii) Lower elements also show +1 ionic state e.g. Tl , Ga . This is due to inert pair effect. The phenomenon in which outer shell 's' electrons (ns) penetrate to ($n-1$) d-electrons and thus become closer to nucleus and are

more effectively pulled the nucleus. This results in less availability of ns electrons pair for bonding or ns electron pair becomes inert. The inert pair effect begins after $n \geq 4$ and increases with increasing value of n .

(iv) The tendency to form M^+ ion increases down the gp. $Ga < Tl$

(10) **Hydrated ions** : All metal ions exist in hydrated state.

(11) Ionisation energy

(i) In spite of the more charge in nucleus and small size, the first ionisation energies of this group elements are lesser than the corresponding elements of s block. This is due to the fact that removal of electron from a p-orbitals (being far away from nucleus and thus less effectively held than s-orbitals) is relatively easier than s-orbitals.

(ii) The ionisation energy of this group element decrease down the group due to increases in size like other group elements.

(iii) However, ionisation energy of Ga are higher than that of Al because of smaller atomic size of Ga due to less effective shielding of $3d$ electrons in Ga . Thus valence shell exert more effective nuclear charge in Ga to show higher ionisation energies.

(12) Electropositive character

(i) Electropositive character increases from B to Tl .

(ii) Boron is semi metal, more closer to non-metallic nature whereas rest all members are pure metals.

(iii) Furthermore, these elements are less electropositive than s-block elements because of smaller size and higher ionisation energies.

(13) Oxidation potential

(i) The standard oxidation potentials of these element are quite high and are given below,

	B	Al	Ga	In	Tl
E°_{op} for $M \rightarrow M^{3+} + 3e^-$	—	+1.66	+0.56	+0.34	+1.26
E°_{op} for $M \rightarrow M^+ + e^-$	+0.55	—	+0.18	+0.34	—

(ii) However Boron does not form positive ions in aqueous solution and has very low oxidation potential.

(iii) The higher values of standard oxidation potentials are due to higher heats of hydration on account of smaller size of trivalent cations.

(iv) Aluminium is a strong reducing agent and can reduce oxides which are not reduced even by carbon. This is due to lower ionisation energy of aluminium than carbon. The reducing character of these elements is $Al > Ga > In > Tl$

(14) **Complex formation** : On account of their smaller size and more effective nuclear charge as well as vacant orbitals to accept elements, these elements have more tendency to form complexes than s block elements.

Chemical properties

(1) Hydrides

(i) Elements of group 13 do not react directly with hydrogen but a number of polymeric hydrides are known to exist.

(ii) Boron forms a large no. of volatile covalent hydrides, known as boranes e.g. BH_3 , B_2H_6 , B_4H_{10} , B_5H_9 . Two series of boranes with general formula B_nH_n and B_nH_{n+2} are more important.

(iii) Boranes are electron deficient compounds. It is important to note that although BX_3 are well known, BH_3 is not known. This is due to the fact that hydrogen atoms in BH_3 have no free electrons to form $p\pi-p\pi$ back bonding and thus boron has incomplete octet and hence BH_3 molecules dimerise to form B_2H_6 having covalent and three centre bonds.

(iv) Al forms only one polymeric hydride (AlH_3) commonly known as alane. It contains $Al \cdots H \cdots Al$ bridges.

(v) Al and Ga forms anionic hydrides e.g. $LiAlH_4$ and $LiGaH_4$,

(2) Reactivity towards air

(i) Pure boron is almost unreactive at ordinary temperature. It reacts with air to form B_2O_3 when heated. It does react with water. Al burns in air with evolution of heat give Al_2O_3 .

(ii) Ga and In are not effected by air even when heated whereas Tl is little more reactive and also form an oxide film at surface. In moist air, a layer of $Tl(OH)$ is formed.

(iii) Al decomposes H_2O and reacts readily in air at ordinary temperature to form a protective film of its oxides which protects it from further action.

(3) Oxides and hydroxides

(i) The members of boron family form oxide and hydroxides of the general formula MO_x and $M(OH)_x$ respectively.

(ii) The acidic nature of oxides and hydroxides changes from acidic to basic through amphoteric from B to Tl .

$B(OH)_3$ or H_3BO_3 is weak monobasic Lewis acid.

(iii) Boric acid, $B(OH)_3$ is soluble in water as it accepts lone pair of electron to act as Lewis acid. Rest all hydroxides of group 13 are insoluble in water and form a gelatinous precipitate.

(iv) Al_2O_3 being amphoteric dissolves in acid and alkalis both.

(v) One of the crystalline form of alumina (Al_2O_3) is called corundum. It is very hard and used as abrasive. It is prepared by heating amorphous form of Al_2O_3 to 2000 K.

(4) Action of Acids

(i) Boron does not react with non oxidizing acids, however, it dissolves in nitric acid to form boric acids.

(ii) Al , Ga and In dissolve in acids forming their trivalent cations; however, Al and Ga become passive due to the formation of protective film of oxides.

(iii) Thallium dissolves in acids forming univalent cation and becomes passive in HCl due to the formation of water insoluble $TlCl$.

(5) Action of Alkalies

(i) Boron dissolves only in fused alkalies,

(ii) Al and Ga dissolves in fused as well as in aqueous alkalies, $2Al + 2NaOH + 2H_2O \rightarrow 2NaAlO_2 + 3H_2$

(iii) Indium remains unaffected in alkalies even on heating.

(6) Halides

(i) All the group 13 elements from the trihalides, MX_3 on directly combining with halogens.

(ii) All the trihalides of group 13 elements are known except $Tl(III)$ iodide.

(iii) Due to small size and high electronegativity of boron, all boron halides are covalent and Lewis acids. These exist as monomeric molecules having plane triangular geometry (sp^2 hybridization).

(iv) All Boron trihalides except BF_3 are hydrolysed to boric acid.

However, BF_3 forms as addition product with water,

BF_3 having less tendency for hydrolysis as well as Lewis acid nature, is extensively used as a catalyst in organic reactions e.g. Friedel-Crafts reaction.

(v) Boron atom, in BX_3 , has six electrons in the outermost orbit and thus it can accept a pair of electrons form a donor molecule like NH_3 to complete its octet. Hence boron halides act as very efficient Lewis acids. The relative Lewis acid character of boron trihalides is found to obey the order ; $BI_3 > BBr_3 > BCl_3 > BF_3$.

However, the above order is just the reverse of normally expected order on the basis relative electronegativities of the halogens. Fluorine, being the most electronegative, should create the greatest electron deficiency on boron and thus B in BF_3 should accept electron pair from a donor very rapidly than in other boron trihalides. But this is not true.

This anomalous behaviour has been explained on the basis of the relative tendency of the halogen atom to back-donate its unutilised electrons to the vacant p orbitals of boron atom. In boron trifluoride, each fluorine has completely filled unutilised $2p$ orbitals while boron has a vacant $2p$ orbital. Now since both of these orbitals belong to same energy level ($2p$) they can overlap effectively as a result of which fluorine electrons are transferred into the vacant $2p$ orbital of boron resulting in the formation of an additional $p\pi-p\pi$ bond. This type of bond formation is known as **back bonding** or **back donation**. Thus the $B-F$ bond has some double bond character. Back bonding may take place between boron and of the three fluorine atoms and thus boron trifluoride is regarded as a resonance hybrid of some structures.

Resonance in boron trifluoride is also evidenced by the fact that the three boron-fluorine bonds are *identical* and are shorter than the usual single boron-fluorine bond. As a result of back bonding, the electron deficiency of boron is reduced and hence Lewis acid nature is decreased. The tendency for the formation of back bonding ($p\pi-p\pi$ bond) is maximum in BF_3 and decreases very rapidly from BF_3 to BI_3 . This is probably due to the fact that overlapping of the vacant $2p$ orbitals of boron cannot take place easily with the p -orbitals of high energy levels ($3p$ in Cl , $4p$ in Br and $5p$ in iodine). Thus BI_3 and BCl_3 are stronger Lewis acids than the BF_3 .

(vi) Lewis acid character of halides of the group 13 elements decreases in the order, $B > Al > Ga > In$.

(vii) Boron halides form complex halides of the type, $[BF_4]^-$, in which boron atom extends its coordination number to four by utilising empty p -orbital. It cannot extend its coordination number beyond four due to non availability of d -orbitals. However, the other trihalides of this group form complex halides of the type $(AlF_6)^-$, $(GaCl_4)^-$ and $(InCl_4)^-$, etc where the central atom extends its coordination number to 6 by the use of d -orbitals.

(viii) The fluorides of Al , Ga , In and Tl are ionic and have high melting points. The high melting points of metal fluorides can be explained on the basis that their cations are sufficiently large and have vacant d -orbitals for attaining a coordination number of six towards the relatively small fluorine atom.

(ix) Other halides of Al , Ga , In and Tl are largely covalent in anhydrous state and possess low melting point. These halides do not show backbonding because of increases in the size of the element. However, they make use of vacant p -orbitals by co-ordinate bond i.e. metal atoms complete their octet by forming dimers. Thus aluminium chloride, aluminium bromide and indium iodide exist as dimers, both in the vapour state and in non-polar solvents.

The dimer structure for Al_2Cl_6 is evidenced by the following facts,

(a) Vapour density of aluminium chloride measured at $400^\circ C$ corresponds to the formula Al_2Cl_6 .

(b) Bond distance between aluminium-chlorine bond forming bridge is greater ($2.21 \text{ \AA}$) than the distance between aluminum-chlorine bond present in the end ($2.06 \text{ \AA}$). The dimeric structure disappears when the halides are dissolved in water. This is due to high heat of hydration which splits the dimeric structure into $[M(H_2O)_6]^+$ and $3X^-$ ions and the solution becomes good conductor of electricity.

The dimeric structure may also split by reaction with donor molecules e.g. RN . This is due to the formation of complexes of the type $RNAlCl$. The dimeric structure of $AlCl_3$ exist in vapour state below $473K$ and at higher temperature it dissociates to trigonal planar $AlCl_3$ molecule.

Boron halides do not exist as dimer due to small size of boron atom which makes it unable to co-ordinate four large-sized halide ions.

(x) BF_3 and $AlCl_3$ acts as catalyst and Lewis acid in many of the industrial process.

Anomalous Behaviour of Boron

Like Li and Be , Boron – the first member of group 13 also shows anomalous behaviour due to extremely low size and high nuclear charge/size ratio, high electronegativity and non-availability of d electrons. The main point of differences are,

- (1) Boron is a typical non-metal whereas other members are metals.
- (2) Boron is a bad conductor of electricity whereas other metals are good conductors.
- (3) Boron shows allotropy and exists in two forms – crystalline and amorphous. Aluminium is a soft metal and does not exist in different forms.
- (4) Like other non-metals, the melting point and boiling point of boron are much higher than those of other elements of group 13.
- (5) Boron forms only covalent compounds whereas aluminium and other elements of group 13 form even some ionic compounds.
- (6) The hydroxides and oxides of boron are acidic in nature whereas those of others are amphoteric and basic.
- (7) The trihalides of boron (BX_3) exist as monomers. On the other hand, aluminium halides exist as dimers (Al_2X_6).
- (8) The hydrides of boron i.e. boranes are quite stable while those of aluminium are unstable.
- (9) Dilute acids have no action on boron. Others liberate H_2 from them.
- (10) Borates are more stable than aluminates.
- (11) Boron exhibit maximum covalency of four e.g., BH_4^- ion while other members exhibit a maximum covalency of six e.g., $[Al(OH)_6]^-$.
- (12) Boron does not decompose steam while other members do so.
- (13) Boron combines with metals to give borides e.g. Mg_2B . Other members form simply alloys.
- (14) Concentrated nitric acid oxidises boron to boric acid but no such action is noticed other group members.

Diagonal relationship between Boron and Silicon

Due to its small size and similar charge/mass ratio, boron differs from other group 13 members, but it resembles closely with silicon, the second element of group 14 to exhibit diagonal relationship. Some important similarities between boron and silicon are given below,

- (1) Both boron and silicon are typical non-metals, having high m.pt. b.pt nearly same densities ($B=2.35g/ml$ $Si=2.34 g/ml$). low atomic volumes and bad conductor of current. However both are used as semiconductors.
- (2) Both of them do not form cation and form only covalent compounds.
- (3) Both exists in amorphous and crystalline state and exhibit allotropy.
- (4) Both possess closer electronegativity values ($B=2.0$; $Si=1.8$).
- (5) Both form numerous volatile hydrides which spontaneously catch fire on exposure to air and are easily hydrolysed.
- (6) The chlorides of both are liquid, fume in moist air and readily hydrolysed by water.

(7) Both form weak acids like H_3BO_3 and H_2SiO_3 .

(8) Both form binary compounds with several metals to give borides and silicides. These borides and silicides react with H_2PO_4 to give mixture of boranes and silanes.

(9) The carbides of both Boron and silicon (BC and SiC) are very hard and used as abrasive.

(10) Oxides of both are acidic and can be reduced by limited amount of Mg . In excess of Mg boride and silicide are formed.

(11) Both the metals and their oxides are readily soluble in alkalis.

Both borates and silicates have tetrahedral structural units BO_4^{n-} and SiO_4^{n-} respectively. Boro silicates are known in which boron replaces silicon in the three dimensional lattice. Boron can however form planar BO units.

(12) Acids of both these elements form volatile esters on heating with alcohol in presence of conc. H_2SO_4 .

Boron and its compounds

Boron is the first member of group -13 (IIIA) of the periodic table. Boron is a non-metal. It has a small size and high ionization energy due to which it can not lose its valence electrons to form B^{+3} ion. Its compounds especially the hydrides and halides are electron deficient and behave as Lewis acid.

(1) Ores of boron

(i) *Borax or tincal*: $Na_2B_4O_7 \cdot 10H_2O$

(ii) *Kernite or Rasorite*: $Na_2B_4O_7 \cdot 4H_2O$

(iii) *Colemanite*: $Ca_2B_6O_{11} \cdot 5H_2O$

(iv) *Orthoboric acid*: H_3BO_3 (It occurs in the jets of steam called soffioni escaping from ground in the volcanic region of the *Tuscany*). Boron is present to a very small extent (0.001%) in earth's crust.

(2) **Isolation**: Elemental boron in the form of dark brown powder is obtained either by reduction of boric oxide with highly electropositive metals like K , Mg , Al , Na , etc. in the absence of air and boron halides with hydrogen at high temperature eg.

By thermal decomposition of boron triiodide over red hot tungsten filament and boron hydrides for example,

(3) **Properties**: It exists in mainly two allotropic forms i.e. amorphous dark brown powder and crystalline black very hard solid. It occurs in two isotopic forms, i.e., $^{10}_5B$ (20% abundance) and $^{11}_5B$ (80% abundance). With air, boron forms B_2O_3 and BN at $973K$, with halogens, trihalides (BX_3) are formed, with metals borides are formed. eg.

This reaction is used as a test for borate radical in qualitative analysis.

Uses : (a) In making optical and hard glasses. (b) In the laboratory for borax bead test. (c) In softening of water. (d) In the preparation of medicinal soaps due to its antiseptic character.

(iv) **Boric acid or orthoboric acid** (H_3BO_3)

It is obtained from borax by treating with dil. HCl or dil. H_2SO_4 ,

It can also be obtained from the mineral colemanite by passing SO_2 through a mixture of powdered mineral in boiling water,

Properties : (a) It is a very weak monobasic acid, does not act as a proton donor but behaves as a Lewis acid i.e. it accepts a pair of electrons from OH^- ion of H_2O ,

It acts as a strong acid in presence of polyhydroxy compounds such as glycerol, mannitol etc. and can be titrated against strong alkali.

(b) With $NaOH$ it forms, sodium metaborate,

(c) With C_2H_5OH and conc. H_2SO_4 , it gives triethyl borate

(d) **Action of heat :** The complete action of heat on boric acid may be written as,

Structure : In boric acid, planar BO_3^{3-} units are joined by hydrogen bonds to give a layer structure.

Uses : (a) As a food preservative. (b) As a mild antiseptic for eye wash under the name boric lotion. (c) For the preparation of glazes and enamels in pottery.

(v) **Borazole or Borasole or Triborine triamine** ($B_3N_3H_6$)

It is a compound of B , N and H . It is a colourless liquid and is also called inorganic benzene.

It has a six membered ring of alternating B and N atoms, each is further linked to a H atom.

Borazine

(vi) **Boron nitride (BN)**

It is prepared by treating BCl_3 with an excess of NH_3 and pyrolysing the resulting mixture in an atmosphere of NH_3 at $750^\circ C$,

It is a colourless, good insulator, diamagnetic and almost unreactive solid

Aluminium and its compounds

(i) **Ores of Aluminium :** Bauxite ($Al_2O_3 \cdot 2H_2O$), Cryolite (Na_3AlF_6), Felspar ($KAlSi_3O_8$), Kaolinite ($Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$), Mica ($K_2O \cdot 3Al_2O_3 \cdot 6SiO_2 \cdot 2H_2O$), Corundum (Al_2O_3), Diaspore

($Al_2O_3 \cdot H_2O$), Alunite or alum stone [$K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 4Al(OH)_3$].

(2) **Extraction :** Aluminium is obtained by the electrolysis of the oxide (alumina) dissolved in fused cryolite. This involves following steps,

Purification of ore

(i) **Bayer's process**

(ii) **Hall's process**

(iii) **Serppe's process**

(iv) **Hall and Heroult process :** It is used for extraction of aluminium. In this process a fused mixture of alumina (20%), cryolite (60%) and fluorspar (20%) is electrolysed using carbon electrodes. Whereas cryolite makes Al_2O_3 conducting fluorspar decreases the melting point of alumina.

Aluminium is refined by Hoopes' electrolytic process.

(3) Compounds of Aluminium

(i) **Aluminium oxide or Alumina** (Al_2O_3) : It occurs in nature as colourless corundum and several coloured minerals like ruby (red), topaz (yellow), Sapphire (blue), amethyst (violet) and emerald (green). These minerals are used as **precious stones** (gems).

(ii) **Aluminium chloride** (Al_2Cl_6) : It is prepared by passing dry chlorine over aluminium powder.

It exists as dimer Al_2Cl_6 , in inert organic solvents and in vapour state. It sublimes at $100^\circ C$ under vacuum. Dimeric structure disappears when $AlCl_3$ is dissolved in water. It is hygroscopic in nature and absorbs moisture when exposed to air.

(iii) **Thermite :** A mixture of aluminium powder and Fe_2O_3 in the ratio 1:3. It is used for welding of iron. The reaction between Al and Fe_2O_3 is highly exothermic,

(iv) **Aluminium sulphate** [$Al(SO_4)_3$] : It is used for the preparation of alums e.g., potash alum $Al_2(SO_4)_3 \cdot K_2SO_4 \cdot 24H_2O$. It is also used for making fire proof clothes.

(iv) **Alums :** In general, the term alum is given to double sulphates of the type $M_2SO_4 \cdot M'_2(SO_4)_3 \cdot 24H_2O$ where M is a univalent cation like Na^+ , K^+ and NH_4^+ , M' is a trivalent cation like Al^{3+} , Fe^{3+} and Cr^{3+} .

Some important points to be noted about the alums are

(a) General formula is $M_2SO_4 \cdot M'_2(SO_4)_3 \cdot 24H_2O$

M = Monovalent metal; M' = Trivalent metal

In alum crystals, 6 water molecules are held by monovalent ion, 6 water molecules are held by trivalent ion, 12 water molecules are held in the crystal structure.

(b) All alums are isomorphous. Aqueous solutions of alums are acidic due to cationic hydrolysis of trivalent cation.

(c) Double sulphates of divalent ions and trivalent ions with 24 water molecules in their crystals are known as Pseudoalums. General formula is $MSO_4 \cdot M'_2(SO_4)_3 \cdot 24H_2O$

M = Bivalent metal; M' = Trivalent metal

(d) Pseudoalums are not isomorphous with alums.

(e) Feather alum or 'Hair-salt' $Al_2SO_4 \cdot 18H_2O$ is a native form of aluminium sulphate.

(f) Potash alum is used for tanning of leather, as mordant in dyeing and calico printing, for sizing paper, as a syptic to stop bleeding and purification of water.

Some important alums are

Potash alum $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$

Sodium alum $Na_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$

Ammonium alum $(NH_4)_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$

Chrome alum $K_2SO_4 \cdot Cr_2(SO_4)_3 \cdot 24H_2O$

Carbon Family

Carbon is the first member of group 14 or IVA of the periodic table. It consists of five elements carbon (*C*), silicon (*Si*), germanium (*Ge*), tin (*Sn*) and lead (*Pb*). Carbon and silicon are nonmetals, germanium is metalloid and tin and lead are metals.

(i) Electronic configuration

Elements	Electronic configuration ($ns^2 np^2$)
${}_6C$	$[He]2s^2 2p^2$
${}_{14}Si$	$[Ne]3s^2 3p^2$
${}_{32}Ge$	$[Ar]3d^{10} 4s^2 4p^2$
${}_{50}Sn$	$[Kr]4d^{10} 5s^2 5p^2$
${}_{82}Pb$	$[Xe]4f^{14} 5d^{10} 6s^2 6p^2$

Physical properties

(1) **Non-metallic nature** : The non-metallic nature decreases along the group.

<i>C</i>	<i>Si</i>	<i>Ge</i>	<i>Sn</i>	<i>Pb</i>
Non-metals		metalloid	metal	metal

(2) **Abundance** : Carbon and silicon are most abundant elements in earth's crust whereas germanium occurs only as traces. Tin and lead also occur in small amounts. Only carbon occurs in free state as coal, diamond and graphite and in combined state as carbonates, CO , petroleum and natural gas. Silicon is the second most abundant element after oxygen in earth's crust in form of silicates and silica. Germanium found in traces in coal and in certain deposits. It is an important constituent for making conductors and transistors. The important ore of tin is tin stone (SnO) or cassiterite. Lead is found in the form of galena (PbS), anglesite ($PbSO_4$) and cerussite ($PbCO_3$). The abundance ratio in earth's crust is given below,

(3) **Density** : The density of these elements increases down the group as reported below

Element	<i>C</i>	<i>Si</i>	<i>Ge</i>	<i>Sn</i>	<i>Pb</i>
Density (g/ml)	3.51 (for diamond) 2.22 (for graphite)	2.34	5.32	7.26	11.34

(4) Melting point and boiling points

(i) The melting point and boiling point of this group members decrease down the group.

Element	<i>C</i>	<i>Si</i>	<i>Ge</i>	<i>Sn</i>	<i>Pb</i>
m.pt(K)	4373	1693	1218	505	600
b.pt(K)	–	3550	3123	2896	2024

(ii) The melting point and boiling point of group 14 elements are however, higher than their corresponding group 13 elements. This is due to the formation of four covalent bonds on account of four electrons in their valence shells which results in strong binding forces in between their atoms in solid as well as in liquid state.

(5) Atomic radii and atomic volume

(i) Both atomic radii and atomic volume increases gradually on moving down the group due to the effect of extra shell being added from member to member.

	<i>C</i>	<i>Si</i>	<i>Ge</i>	<i>Sn</i>	<i>Pb</i>
Atomic radius (pm)	0.77	111	122	141	144
Atomic volume (m^3)	3.4	11.4	13.6	16.3	18.27

(ii) The atomic radii of group 14 elements are larger than their corresponding group 13 elements due to increase in nuclear charge in the same period.

(iii) Some of the ionic radii involving six co-ordination of these group elements are given below,

	<i>C</i>	<i>Si</i>	<i>Ge</i>	<i>Sn</i>	<i>Pb</i>
Ionic radius (M^{4+}) in pm	–	–	73	118	119
Ionic radius (M^{2+}) in pm	–	40	53	69	78

(6) **Electronegativity** : The electronegativity decreases from *C* to *Si* and then becomes constant.

	<i>C</i>	<i>Si</i>	<i>Ge</i>	<i>Sn</i>	<i>Pb</i>
Electronegativity on Pauling scale	2.5	1.8	1.8	1.7	1.6

The electronegativity from silicon onwards is almost constant or shows a comparatively smaller decrease due to screening effects of d electrons in elements from *Ge* onwards.

(7) Ionisation energy

(i) The ionisation energy decreases regularly down the group; *Pb* however shows a higher value than *Sn* due to poor shielding of inner f -orbitals as a result of which effective nuclear charge experienced by outer shell electrons becomes more in *Pb*.

Ionisation energy ($kJ\ mol^{-1}$)	<i>C</i>	<i>Si</i>	<i>Ge</i>	<i>Sn</i>	<i>Pb</i>
IE ₁	1086	786	761	708	715
IE ₂	2352	1577	1537	1411	1450

(ii) The first ionisation energies of group 14 elements are higher than their corresponding group 13 elements because of smaller size.

(iii) The electropositive character of these elements increases down the group because of decrease in ionisation energy.

(8) Oxidation state

(i) Presence of four electrons in outermost shell of these elements reveals that the members of this family can gain four electrons forming M^{4-} or M^{4+} ions to show ionic nature or exhibit tetravalent covalent nature by sharing of four electron pairs in order to attain stable configuration.

(ii) The formation of M^{4-} or M^{4+} ions require huge amount of energy which is normally not available during normal course of reactions, therefore, these elements usually do not form M^{4-} or M^{4+} ions, but they usually form compounds with covalence of four.

(iii) *Ge*, *Sn* and *Pb* also exhibit +2 oxidation state due to inert pair effect.

(iv) *Sn* and *Pb* show ionic nature.

(v) The tendency to form +2 ionic state increases on moving down the group due to inert pair effect.

(9) Catenation

(i) The tendency of formation of long open or closed atom chains by the combination of same atoms in themselves is known as catenation.

(ii) The catenation is maximum in carbon and decreases down the group.

(iii) This is due to high bond energy of catenation.

(iv) Only carbon atoms also form double or triple bonds involving $p\pi-p\pi$ multiple bond within itself.

(v) Carbon also possesses the tendency to form closed chain compounds with *O*, *S* and *N* atoms as well as forming $p\pi-p\pi$ multiple bonds with other elements particularly nitrogen and oxygen e.g. $C=O$; $C=N$; $C\equiv N$; $C=S$ are the functional groups present in numerous molecules due to this reason.

(vi) Carbon can form chain containing any number of carbon atoms. *Si* and *Ge* cannot extend the chain beyond 6 atoms, while *Sn* and *Pb* do not form chains containing more than one or two atoms.

(vii) The reason for greater tendency of carbon for catenation than other elements in the group may further be explained by the fact that the $C-C$ bond energy is approximately of the same magnitude as the energies of the bond between *C* and other elements. On the other hand, the $Si-Si$ bond is weaker than the bond between silicon and other elements.

Bond	Bond energy (kJ/mol)	Bond	Bond energy (kJ/mol)
C–C	348	Si–Si	180
C–O	315	Si–O	372
C–H	414	Si–H	339
C–Cl	326	Si–Cl	360
C–F	439	Si–F	536

(10) Allotropy

The phenomenon of existence of a chemical element in two or more forms differing in physical properties but having almost same chemical nature is known as allotropy. If an element or compound exists in two or more forms, it is also known as polymorphism e.g. zinc blende and wurtzite are polymorphs of ZnS .

Kinds of allotropy. Allotropy is of three types :

(i) **Enantiotropy** : When two forms of a solid substance exist together in equilibrium with each other at a particular temperature under normal pressure it is called enantiotropy.

For example, at normal pressure and temperature between 368.6 K and 285 K , sulphur (solid) exist in two forms (rhombic sulphur), S_R and (monoclinic sulphur), S_M in equilibrium with each other. $S_R \rightleftharpoons S_M$

(ii) **Monotropy** : It is the type of allotropy in which only one allotrope is stable, under normal conditions the other being unstable e.g., diamond and graphite, oxygen and ozone etc.

(iii) **Dynamictropy** : It is the type of allotropy in which there is a true equilibrium between the two allotropes, one changing into the other at exactly the same rate as the reverse occurs. Both allotropes are stable over a wide range of temperature.

For example, liquid sulphur exist in two forms, the pale yellow mobile form called S_λ and dark viscous form called S_μ in equilibrium with each other. $S_\lambda \rightleftharpoons S_\mu$

With increase in temperature, the later form is formed at the expense of the former but when the liquid is cooled, the reverse change occur. Thus sulphur shows both enantiotropy and dynamictropy.

Cause of allotropy : (i) In general the allotropy among solid substances is due to the difference in crystalline structure. (ii) It may also be due to the presence of different number of atoms e.g., O_2 and O_3 , S_8 , S_2 etc. (iii) It may be due to the difference in nuclear spins e.g., ortho and para hydrogen.

Different allotropic forms Except lead, all elements show allotropy.

(i) Carbon has two crystalline allotropic forms i.e., diamond and graphite. In diamond C atom is sp^3 hybridised and it has a three dimensional network structure. Since no valence electron is available, hence diamond is a bad conductor of electricity. However in graphite C atom is sp^2 hybridised and has a delocalised π -electron cloud responsible for its high electrical conductivity. It may be noted that diamond is thermodynamically less stable than graphite at ordinary temperatures.

(ii) Silicon has both crystalline and amorphous forms.

(iii) Tin has three crystalline modifications with the following equilibrium temperature

The conversion of white tin to grey tin is accompanied by an increase in volume and the latter, being very brittle, easily crumbles down to powder. This phenomenon is called tin disease tin pest or tin plague.

Chemical properties

(1) **Hydrides** : All the elements of group 14 combine with hydrogen directly or indirectly to form the covalent hydrides, MH_4 ($M = C, Si, Ge, Sn$ or Pb). The number of hydrides and the ease of preparation decrease on going from carbon to lead.

The hydrides of silicon are called *silanes* having the general formula Si_nH_{2n+2} . The hydrides of germanium are called *germanes* while those of tin are called the *stannanes*. Only lead forms an unstable hydride of the formula, PbH_4 called the *plumbane*.

Three hydrides of germanium, i.e., GeH_4 , Ge_2H_6 and Ge_3H_8 and only two hydrides of tin i.e., SnH_4 and Sn_2H_6 are well known.

(2) **Oxides** : Carbon forms five oxides CO, CO_2, C_3O_2 (carbon suboxide), C_5O_2 and $C_{12}O_9$, C_3O_2 is the anhydride of malonic acid and CO_2 is the anhydride of H_2CO_3 (carbonic acid) CO_2 is a non-polar linear molecule due to maximum tendency of C to form $p\pi-p\pi$ multiple bond with oxygen. Si forms SiO_2 . Pb forms a number of oxides. PbO can be obtained by heating $Pb(NO_3)_2$, $2Pb(NO_3)_2 \xrightarrow{\text{Heat}} 2PbO + 4NO_2 + O_2$.

The red form of PbO is called *litharge* and the yellow form is *massicot*. Pb_3O_4 (Red lead, or Sindur) is prepared by heating litharge in air at 470°C , $6PbO + O_2 \xrightarrow{470^\circ\text{C}} 2Pb_3O_4$, Pb_3O_4 is a mixed oxide of $PbO_2 \cdot 2PbO$. Pb_2O_3 is called lead sesquioxide. GeO_2, SnO_2 etc. are also network solids.

CO_2 and SiO_2 is acidic, GeO_2 is weakly acidic while SnO_2 and PbO_2 are amphoteric in nature.

All the elements of group 14 except silicon form monoxides e.g., CO, GeO, SnO and PbO . Out of these monoxides only CO is neutral, while all other monoxides are basic.

(3) **Halides** : Elements of group 14 react with halogens directly to form tetrahedral and covalent halides except C where its halide is produced by the action of halogens on hydrocarbons. $PbBr_4$ and PbI_4 do not exist because Pb^{4+} is a strong oxidant and Br^- and I^- are strong reductants. Hence Pb^{4+} ion is difficult to survive in presence of strong reductants Br^- and I^- and is immediately reduced to Pb^{2+} .

(4) **Carbides** : Carbides are binary compounds of carbon with elements of lower or about equal electronegativity.

Preparation : Carbides are generally prepared by heating the elements or its oxide with carbon or hydrocarbon at very high temperatures.

Carbides are classified into three types on the basis of chemical bonding.

(i) **Salt like carbides** : These carbides are formed by the metals of groups 1A, 2A, 3A (except boron), coinage metals, Zinc, cadmium & some lanthanides.

(ii) **Acetylides** : These are ionic carbides which yield acetylene on hydrolysis. The alkali metals and copper, silver and gold form M_4C type compounds. These contain C_2^{2-} ions.

(iii) **Methanides** : These carbides evolve methane on hydrolysis. Al_4C_3, Be_2C, Mn_3C etc are some are of methanides. These contains C^{4-} groups.

(iv) **Allylides** : These carbides evolve allylene (methyl acetylene) on hydrolysis. This type of the carbides is only Mg_2C_3 it contains C_3^{4-} discrete groups.

(v) **Mixed carbides** : These carbides yield a mixture of hydrocarbons on hydrolysis, carbides of iron group, UC_2 and ThC_2 belong to this group.

(vi) **Covalent carbides** : The only true covalent carbides are those of SiC (carborundum) and $B_4C, B_{10}C_2$ etc. These are chemically inert so become hard.

On account of hardness, these are used as abrasives.

(vii) **Metallic or interstitial carbides** : If these carbides possess metallic lustre high electrical conductivity and chemically inert. These are extremely hard like diamond and possess very high melting points.

Ability to form complexes : The ability of group 14 elements to form complexes is highly favoured by a high charge, small size and availability of empty orbitals of the right energy. The compounds in which carbon shows a covalency of four possess a closed shell electronic configuration of a noble gas and therefore carbon does not form complexes. Silicon and other heavier elements, however, can form complexes due to the availability of energetically suitable empty d -orbitals and a coordination number of six is found in these complexes. For example, in the formation of $[SiF_6]^{2-}$, four covalent and two co-ordinate bonds are formed as a result of sp^3d^2 hybridisation. As such the resulting ion has an octahedral geometry. Thus elements like Si, Ge, Sn and Pb have an ability to increase their co-ordination number from four to six. Other examples of hexa co-ordinated species are :

Anomalous behaviour of Carbon

Carbon is found differ in many properties from the rest of the members of group 14. This is because of the following : (i) Its smallest size (ii) Its high electronegativity (iii) Its property to catenate (iv) Absence of d -orbitals in it.

Some of the properties in which it differs from other members are,

(1) The melting and boiling points of carbon are very high as compared to the rest to the members of the family.

(2) Carbon in its diamond form is one of the hardest substance known.

(3) It has maximum tendency to show catenation.

(4) Carbon has high tendency to form $P\pi - P\pi$ multiple bonds with other elements like nitrogen, oxygen, sulphur etc. Other members of the family form $P\pi - d\pi$ bonds and that also to a lesser extent.

(5) CO_2 is a gas while the dioxides of all other members are solids.

(6) Carbon is not affected by alkalies whereas other members react on fusion. For example, silicon form silicates, $Si + 2NaOH + 1/2 O_2 \rightarrow Na_2SiO_3 + H_2$.
Sodium silicate

Silicon and its compounds

Silicon, being a second member of group – 14, has a much larger size and lower electronegativity than that of carbon. As a result silicon does not form double bond with itself or with oxygen. Thus SiO bonds are much stronger than $Si - Si$ and $Si - H$ bonds. Silicon has vacant $3d$ -orbitals in its valence shell due to which it can extend its covalency from four to five and six.

(i) **Occurrence** : Silicon is the second most abundant element (27.7%) in earth's crust next to oxygen. It does not occur in free state. It occurs mainly in the form of Silica and silicates. Silicates are formed in rocks and clay as silicates of Mg, Al, K or Fe . e.g. Feldspar ; $K_2Al_2O_3 \cdot 6SiO_2$, Kaolinite; $Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$.

(ii) **Preparation** : Elemental silicon is obtained by reduction of silica with high purity coke in an electric furnace using excess of silica e.g. $SiO_2 + 2C \longrightarrow Si + 2CO$

Very high purity silicon required for making semiconductors is obtained by reduction of highly purified $SiCl_4$ form ($SiHCl_3$) with hydrogen followed by purification by zone refining eg.

(3) **Properties** : (i) Silicon exists in three isotopes $^{28}_{14}Si$ (most common), $^{29}_{14}Si$ with air at high temperature SiO_2 form,

(ii) With steam, Si reacts when heated to redness to liberate hydrogen, $Si + 2H_2O \xrightarrow{\text{Redness}} SiO_2 + 2H_2$.

(iii) With halogens, Si reacts at elevated temperature forming SiX_4 except fluorine which reacts at room temperature.

(iv) Silicon combines with C at $2500K$ forming Silicon Carbide (SiC) known as carborundum (an extremely hard substance),

(v) It reacts with metals like Ca, Mg etc in an electric arc furnace to form Silicides (Ca_2Si, Mg_2Si etc.)

(vi) Silicon dissolves in hot aqueous alkalies liberating hydrogen, $Si + 4NaOH \xrightarrow{\text{Heat}} Na_4SiO_4 + 2H_2 \uparrow$

(vii) It also dissolves in fused Na_2CO_3 displacing carbon $Na_2SiO_3 + C$.

(4) **Uses of silicon** : (i) It is added to steel as ferrosilicon (an alloy of Fe and Si) to make it acid resistant.

(ii) It is used in the pure form as a starting material for production of silicon polymers (Silicones).

(5) Compounds of silicon

(i) **Silicates** : Silicates are the metal derivatives of silicic acid (H_4SiO_4). The basic of all silicates is the SiO_4^{4-} anion. In SiO_4^{4-} anion, Si is sp^3 hybridised, and it forms four covalent bonds with four negatively charged oxygen atoms. SiO_4^{4-} anion has a tetrahedral shape.

Alkali metal silicates are commonly prepared by fusing metal oxides or metal carbonates with sand (SiO_2) at high temperatures. For examples, sodium silicate can be prepared by fusing sand with sodium carbonate.

Table 18.1 Classification of silicates

No. of corners of SiO_4 tetrahedra shared	No. of common oxygen atoms	Structure	Net charge and Anion in the silicate structure	Example
		Diagram and Description		
Zero	Zero	 Discrete SiO_4^{4-} anion	$\text{Si} = +4$ $\text{O} = -8$ Net = -4 SiO_4^{4-}	Ortho-silicates Mg_2SiO_4
1	1	 Island structure	$\text{Si} = +8$ $\text{O} = -14$ Net = -6 $(\text{Si}_2\text{O}_7)^{6-}$	Pyro-silicates
2	2	Ring anion	$\text{Si} = +12$ $\text{O} = -18$ Net = -6 $(\text{Si}_3\text{O}_9)^{6-}$	Wollastonite $\text{Ca}_3\text{Si}_3\text{O}_9$
2	2	 Ring anion	$\text{Si} = +24$ $\text{O} = -36$ Net = -12 $(\text{Si}_6\text{O}_{18})^{12-}$	Beryl, $\text{Be}_3\text{Al}_2\text{Si}_6\text{O}_{18}$
2	2	 Chain anion	$\text{Si} = +4$ $\text{O} = -6$ Net = -2 $(\text{SiO}_3^{2-})_n$	Pyroxenes, e.g., $\text{MgCaSi}_2\text{O}_6$ Asbestos
3	3	 Two dimensional sheet structure	$\text{Si} = +8$ $\text{O} = -10$ Net = -2 $(\text{Si}_2\text{O}_5^{2-})_n$	Clays, talc kaolinite
4	4	— Three dimensional network	$\text{Si} = +4$ $\text{O} = -4$ $(\text{SiO}_2)_n$	Quartz, Tridymite and Cristobalite

(ii) **Silica or silicon dioxide (SiO_2)**

It occurs in nature in various forms such as sand, quartz and flint. It is also a constituent of various rocks. It is solid at room temperature. It is insoluble in water.

Silica has a three dimensional network structure in which each Si is bonded to four oxygen atoms which are tetrahedrally disposed around silicon atom. Each O atom is shared by two Si atoms. It may be noted that CO_2 is a gas, while SiO_2 is hard solid with very high melting point.

HF readily dissolves Silica, therefore HF can not be store in glass bottles which contain Silica.

It is used in large amount to form mortar which is a building material. It is also used in the manufacture of glass and lenses.

(iii) **Silicones**

Polymeric organo-silicon compounds containing $\text{Si}-\text{O}-\text{Si}$ bonds are called silicones. These have the general formula $(\text{R}_2\text{SiO})_n$. Where R is CH_3 -group (majority cases) or C_6H_5 -group.

Preparation : The preparation of silicones is generally carried out by the hydrolysis of dialkyldichlorosilanes (R_2SiCl_2) or diaryldichlorosilanes (Ar_2SiCl_2), which are prepared by passing vapours of RCl or ArCl over silicon at 570K with copper as a catalyst.

Silicones may be obtained in the form of oils, rubber or resins depending upon the extent of polymerisation which depends upon reaction conditions and nature of alkyl groups.

Properties and Uses : Silicones are water repellent and quite inert chemically. These resist oxidation, thermal decomposition and attack by organic reagents. These are also good electrical insulators and antifoaming agents. These have found the following uses :

- Silicones have been used for making water-proof papers, wools, textiles, wood etc., after coating these articles with silicones.
- The viscosities of silicones do not change with changes in temperature, therefore, these are used as all weather lubricants.
- As antifoaming agent in industrial processes.
- As a mould releasing agent in rubber industry and foundry. It avoids the sticking of the castings to the mould.
- For making body implants in cosmetic surgery due to its inert nature.
- Silicones are now incorporated in paints for resisting dampness and for water proofing.
- Due to their water repellent nature and high dielectric constant, silicones are used in electrical condensers.

(iv) **Silica gel :** When a mineral acid (Such as HCl) is added to a concentrated solution of a silicate, gelatinous white ppt. of hydrated silica (silicic acid) separate out.

The white ppt. thus obtained is heated to lose water. When the water content is very low, the solid product is called silica gel. It possesses excellent absorptive properties due to its porous nature and is used for absorbing moisture and an adsorbent in chromatography.

(v) **Silanes** : The hydrides of silicon are called silanes. For example; SiH_4 Silane, Si_2H_6 disilane, Si_3H_8 Trisilane Si_4H_{10} Tetrasilane.

Silanes are poisonous. These are much less stable than the corresponding alkanes and are decomposed into elements on heating above $450^\circ C$. Their thermal stability decreases with increase in molecular mass. Unlike alkanes, silanes are reducing agents.

(vi) **Glass**

Glass is an amorphous and transparent solid which is obtained by solidification of various silicates and borates of potassium and calcium.

Preparation : Ordinary glass is a mixture of sodium and calcium silicates and is produced by fusing together a mixture of sodium carbonate, calcium oxide and silicon dioxide (Silica) in a furnace at about 1700K

On continuously heating the entire amount of CO_2 is driven out and clear viscous fused mass is obtained. It is poured into moulds to get different types of articles, which are allowed to cool gradually.

This type of glass is called soda glass or soft glass which has the approximate composition, $Na_2SiO_3, CaSiO_3, 4SiO_2$.

Various varieties of glass : The different varieties of glasses and their special constituents are given below,

Table 18.2

Type of glass	Constituents	Special use
Soft glass	$Na_2CO_3, CaCO_3, SiO_2$	Ordinary glass for window panes, test tubes, bottles, etc.
Hard glass	$K_2CO_3, CaCO_3, SiO_2$	For combustion tubes and chemical glassware
High refractive index glass (Flint glass)	Lead oxide, K_2CO_3	For making lenses cut glasses
Pyrex glass	$Na_2CO_3, Al_2O_3, B_2O_3$ or borax, sand	For high quality glass apparatus cooking utensils
Crook's glass	$K_2CO_3, PbCO_3, CeO_2$, sand	Absorbs ultra violet rays, for making lenses
Jena glass	Zinc and Barium Boro silicates	It is resistant to heat shock and common reagent. It is used for making good quality of glass wares.

Coloured glass : Addition of transition metal compounds to glass give coloured glasses. Small amounts of $Cr(III)$, $Mn(IV)$, $Co(II)$ and $Fe(III)$ compounds impart green, violet blue or brown colour respectively

Table 18.3

Compound added – Colour imparted	Compound added – Colour imparted
Cobalt oxide (CoO) – Blue	Chromium oxide (Cr_2O_3) – Green
Cuprous oxide (Cu_2O) – Red	Auric chloride ($AuCl_3$) – Ruby
Cadmium sulphide (CdS) – Lemon yellow	Manganese dioxide (MnO_2) – Purple

Etching of glass : Glass is attacked by hydrofluoric acid. This property is used in the etching of glass. The glass to be etched is coated with a thin layer of wax and the design to be produced is scratched with a needle. An aqueous solution of HF is applied to the exposed part. After some time it is placed in hot water and wax is removed from the surface. The marks are engraved on the exposed parts.

Tin and its Compounds

(1) **Important ore** : Cassiterite (tin stone) SnO_2

(2) **Extraction of tin from tin stone.**

(i) **Concentration** : The powdered tin stone is concentrated by gravity separation and the magnetic impurities like wolframite etc., are separated from tin stone by magnetic separators.

(ii) **Roasting** : The concentrated ore is heated in a current of air when impurities like S and As are oxidised to volatile SO_2 and As_2O_3 . Iron pyrites change to their oxides and sulphates.

(iii) **Leaching and washing** : The roasted ore is treated with water when $CuSO_4$ and $FeSO_4$ are washed away from the main ore. Further lighter ferric oxide is washed away leaving behind heavier ore particles known as black tin containing 60 to 70% SnO_2 .

Molten tin is drawn into blocks. It contains 99.5 percent of tin metal and is called block tin.

Refining of tin : It is purified by liquation, poling and electrolytic refining.

For very high purity, it is purified by electrolytic method. The electrolyte consists of tin sulphate containing a small amount of hydrofluorosilicic acid (H_2SiF_6) and sulphuric acid. Impure tin makes anode while pure tin sheet serves as cathode.

(3) **Compounds of Tin**

(i) **Stannic oxide, SnO_2** : It is prepared by heating tin strongly in air.

It can also be prepared by heating metastannic acid obtained by the action of conc. HNO_3 on tin.

It occurs in nature as tin stone. It is a white solid insoluble in water and is amphoteric in nature. With $NaOH$ it forms Na_2SnO_3 . It is used for making enamels and glazes for tiles, pottery etc. it is also used as a polishing powder.

(ii) **Stannous oxide, SnO** : It is prepared by heating stannous oxalate $SnC_2O_4 \xrightarrow{\Delta} SnO + CO + CO_2$

Oxidation of SnO to SnO_2 is checked by CO . It is a grey solid which oxidises readily to SnO_2 when heated in air.

It is amphoteric in nature and reacts both with acids and alkalies. With $NaOH$ it forms Na_2SnO_2 .

(iii) **Stannous sulphide, SnS** : It is insoluble in water but soluble in hot conc. HCl . In yellow ammonium polysulphide it gets converted to ammonium thiostannate $(NH_4)_2SnS_3$.

(iv) **Stannous chloride, $SnCl_2$** : When Sn is heated with HCl (conc.) $SnCl_2$ is formed.

On concentrating the resulting solution, crystals of $SnCl_2 \cdot 2H_2O$ are obtained. When it is heated, basic tin chloride is obtained.

To obtain anhydrous $SnCl_2$, heat Sn in dry HCl gas.

(a) It exists as a anhydrous (white powder, m.p. = 520K, rhombic solid) as well as dihydrate $SnCl_2 \cdot 2H_2O$ (white, m.p. = 480K, monoclinic) and is used as a strong reducing agent in conc. HCl in laboratory.

$SnCl_2$ also reduces $HgCl_2$

(b) It is precipitated as hydroxide by an alkali.

(c) It forms addition compounds with NH_3 such as $SnCl_2 \cdot NH_3$ and $SnCl_2 \cdot 2NH_3$.

(v) **Stannic chloride, $SnCl_4$** : It is obtained by the action of Cl_2 on molten Sn

It can also be obtained by distilling tin with mercuric chloride.

(a) It is a colourless fuming liquid (b.p. 388K) soluble in water.

It is used as a strong reducing agent in laboratory. It is also used as a mordant in dyeing.

(b) It can exist as $SnCl_4 \cdot 5H_2O$ and with excess water it is hydrolysed to form basic chloride and ultimately stannic acid (H_2SnO_4).

Its hydrolysis is prevented by HCl which forms complex anion $[SnCl_6]^{2-}$

(c) It forms double salts with NH_3 , N_2O , PCl_5 e.g., $SnCl_4 \cdot 4NH_3$.

It is used as a mordant and tinning agent.

(vi) **Stannous fluoride, SnF_2** : It is obtained by dissolving SnO in HF

It is a white crystalline solid insoluble in water. It is used in tooth pastes to help in controlling dental decay.

Tinning: During cooking, organic acids present in food stuff attack the household utensils made of copper, brass etc. in the presence of air. since tin is not attacked by organic acids, the utensils are protected by tinning.

Lead

(1) Some important ores

Galena; $-PbS$ (Main); Cerussite $-PbCO_3$

Anglesite $-PbSO_4$, lararkite $PbO \cdot PbSO_4$

(2) Extraction from galena

(i) **Concentration**: The finely powdered ore is concentrated by froth floatation process.

(ii) Reduction process

(a) Self reduction process

• **Roasting**: The concentrated ore is heated in air, lead sulphide is partially converted into lead oxide and lead sulphate.

• **Self reduction**: The supply of air is cut off and the temperature is raised to melt the charge. The galena reduces both PbO and $PbSO_4$ to metallic lead.

(b) Carbon reduction process

• **Roasting**: The powdered ore is mixed with lime and roasted in excess of air. the impurities like S and As are oxidised to their volatile oxides while PbS is converted to PbO .

• **Smelting**: Roasted ore is mixed with coke and lime (flux) and smelted in a blast furnace. PbO is reduced to Pb .

(iii) **Purification** : It is purified electrolytically. The electrolyte consists of lead silicofluoride (PbSiF_6) and hydrofluosilicic acid. Impure lead is made anode and sheet of pure lead serves as cathode.

Properties of Lead

With oxygen lead form oxides, with chlorine it forms chloride PbCl_2 , with sulphur it gives sulphide PbS and with H_2SO_4 the corresponding sulphate PbSO_4 . With NaOH it forms plumbate.

(3) Compounds of Lead

(i) **Lead oxide (Litharge), PbO** : It is prepared by heating the nitrate.

It exist in two varieties yellow form (messicol) and red form (litharge). Yellow form is prepared by gently heating lead in air while fusion yield red form. It is insoluble in water and amphoteric in nature.

It dissolves in NaOH to form sod. Plumbite.

It can be reduced with various reducing agents (C , H_2 , CO etc.) to lead.

It is used in paints and varnishes, for making flint glass, for making lead (II) salts and for glazing pottery.

(ii) **Lead dioxide, PbO_2** : It is prepared by heating Pb_3O_4 ($2\text{PbO} + \text{PbO}_2$) with dilute HNO_3

It is amphoteric in nature and dissolve in NaOH to form sodium plumbate.

It is a powerful oxidising agent. It reacts with conc. HCl on warming to give PbCl_4

It is a chocolate brown solid insoluble in water and nitric acid. It is a powerful oxidizing agent. It is amphoteric in nature and is used in lead storage batteries and in safety matches.

(iii) **Minium or sindhur or Red lead, Pb_3O_4** : It is prepared by heating PbO in air to above 673K .

It is a red crystalline solid insoluble in water.

It is a mixed oxide $\text{PbO}_2 + 2\text{PbO}$ and reacts with HNO_3 to form $\text{Pb}(\text{NO}_3)_2$ and PbO_2

It is a strong oxidising agent. It liberates chlorine with conc. HCl and O_2 with conc. H_2SO_4

It is used as a protective paint in iron, steel and silver mirrors and in glass industry.

(iv) **Lead chloride, PbCl_2** : It can be prepared by treating a salt of lead with dil. HCl

It can also be obtained by dissolving lead (II) oxide to lead (II) carbonate in HCl . It is soluble in hot water but precipitate out in cold water. it is soluble in conc. HCl due to the formation of a complex, tetrachloroplumbate (II) ion.

It also reacts with hot lime water to give $\text{Pb}(\text{OH})\text{Cl}$ which is used as white pigment.

(v) **Lead tetrachloride, PbCl_4** : It is obtained by heating of PbO_2 with conc. HCl .

It is a yellow oily fuming liquid which decomposes into PbCl_2 at 373K .

It also combines with HCl to form complex hexachloroplumbate (IV) ion.

Nitrogen Family

Nitrogen is the first member of group 15 or VA of the periodic table. It consists of five elements nitrogen (N), phosphorus (P), arsenic (As), antimony (Sb) and bismuth (Bi). The elements of this group are collectively called **pnictogens** and their compounds as pniconides. The name is derived from Greek word "Pniomigs" meaning suffocation. Pniconide contain M^{3-} species.

(1) Electronic configuration

Elements	Electronic configuration ($ns^2 np^3$)
${}_7N$	$[\text{He}]2s^2 2p^3$
${}_{15}P$	$[\text{Ne}]3s^2 3p^3$
${}_{33}As$	$[\text{Ar}]3d^{10} 4s^2 4p^3$
${}_{51}Sb$	$[\text{Kr}]4d^{10} 5s^2 5p^3$
${}_{83}Bi$	$[\text{Xe}]4f^{14} 5d^{10} 6s^2 6p^3$

Physical properties

(1) **Physical state** : Nitrogen – (gas), phosphorus – (solid) (vaporises easily), As , Sb , Bi – solids.

Nitrogen is the most abundant gas in the atmosphere. It constitutes about 78% by volume of the atmosphere. Phosphorus is the most reactive element in this group and its yellow form is always kept under water.

(2) **Atomic radii** : Atomic radii increases with atomic number down the group i.e., from N to Bi due to addition of extra principal shell in each succeeding elements.

(3) **Ionisation energy** : The ionisation values of the elements of this group decreases down the group due to gradual increases in atomic size.

(4) **Electronegativity** : Generally the elements of nitrogen family have high value of electronegativity. This value shows a decreasing trend in moving down the group from nitrogen to bismuth.

(5) **Non-metallic and metallic character** : Nitrogen and phosphorus are non-metals, arsenic and antimony are metalloids (semi-metal) and bismuth a typical metal.

(6) **Molecular state** : Nitrogen readily forms triple bond (two $p\pi - p\pi$ bonds) and exists as discrete diatomic gaseous molecule ($N \equiv N$) at room temperature. Phosphorus, arsenic and antimony exist in the form of discrete tetra atomic molecules such as P_4, As_4, Sb_4 in which the atoms are linked to each other by single bonds.

(7) **Melting and boiling points** : The melting points and boiling points of group 15 elements do not show a regular trend.

M.pt. first increases from N to As and then decreases from As to Bi . Boiling point increases from N to Sb . Boiling point of Bi is less than Sb .

(8) **Allotropy** : All the members of group 15 except Bi exhibit the phenomenon of allotropy.

(i) Nitrogen exists in two solid and one gaseous allotropic forms.

(ii) Phosphorus exists in several allotropic forms such as white, red, scarlet, violet and black form.

(a) **White or yellow phosphorus** : White phosphorus is prepared from rock phosphate $Ca_3(PO_4)_2$, SiO_2 and coke which are electrically heated in a furnace.

When exposed to light, it acquires a yellow colour.

(b) **Red phosphorus** : It is obtained by heating yellow phosphorus, between $240 - 250^\circ C$ in the presence of an inert gas. Yellow phosphorus can be separated from red phosphorus by reaction with $NaOH(aq)$ or $KOH(aq)$ when the former reacts and the latter remains unreacted.

(iii) Arsenic exists in three allotropic forms namely grey, yellow and black. Antimony also exists in three forms, viz., metallic, yellow and explosive.

(9) **Oxidation state** : The members of the group 15 exhibit a number of positive and negative oxidation states.

(i) **Positive oxidation states** : The electronic configuration (ns^2np^3) for the valence shell of these elements shows that these elements can have +3 and +5 oxidation states. In moving down this group, the stability of +3 oxidation state increases. It may be pointed out here that nitrogen does not exhibit an oxidation state of +5, because it fails to expand its octet due to nonavailability of vacant d -orbitals.

(ii) **Negative oxidation states** : For example oxidation state of nitrogen is -3. The tendency of the elements to show -3 oxidation state decreases on moving down the group from N to Bi .

(10) **Catenation** (self linkage) : Elements of group 15 also show some tendency to exhibit catenation. This tendency goes on decreasing in moving down the group due to gradual decrease in their bond ($M-M$) energies.

Chemical properties

(i) **Hydrides** : All the members form volatile hydrides of the type AH_3 . All hydrides are pyramidal in shape. The bond angle decreases on moving down the group due to decrease in bond pair-bond pair repulsion.

The decreasing order of basic strength of hydrides is as follows : $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$.

The increasing order of boiling points is as follows :

NH_3 is thermally most stable and BiH_3 is least stable. This is because in NH_3 , $N-H$ covalent bond is the strongest due to small size of N atom. Hence, the *decomposition temperature of NH_3 will be the highest*. The increasing order of reducing character is as follows, $NH_3 < PH_3 < AsH_3 < SbH_3 < BiH_3$.

(2) **Halides** : The members of the family form trihalides (MX_3) and pentahalides (MX_5). The trihalides are sp^3 -hybridized with distorted tetrahedral geometry and pyramidal shape while pentahalides are sp^3d -hybridized and are trigonal bipyramidal in shape. The trihalides are hydrolysed by water and ease of hydrolysis decreases when we move down the group. Hence, NCl_3 is easily hydrolysed but $SbCl_3$ and $BiCl_3$ are partly and reversibly hydrolysed. NF_3 is not hydrolysed due to lack of vacant d -orbital with nitrogen. PF_3 and PF_5 are also not hydrolysed because the $P-F$ bond is stronger than $P-O$ covalent bond. The hydrolysis products of the halides are as follows :

Their basic character follows this decreasing order as $Ni_3 > NBr_3 > NCl_3 > NF_3$. Except NF_3 , the trihalides of nitrogen are unstable and decompose with explosive violence. NF_3 is stable and inert.

NCl_3 is highly explosive. Trifluorides and trichlorides of phosphorus and antimony act as Lewis acid. The acid strength decreases down the group. For example, acid strength of tri-chlorides is in the order ; $PCl_3 > AsCl_3 > SbCl_3$.

Nitrogen does not form pentahalides due to non-availability of vacant d -orbitals. The pentachloride of phosphorus is not very stable because axial bonds are longer (and hence weaker) than equatorial bond. Hence, PCl_5 decomposes to give PCl_3 and Cl_2 ;

The instability of PCl_5 makes it a very good chlorinating agent. All pentahalides act as Lewis acids since they can accept a lone pair of electron from halide ion.

Solid PCl_5 is an ionic compound consisting of $[PCl_4]^+$ $[PCl_6]^-$, $[PCl_4]^+$ has a tetrahedral structure, while $[PCl_6]^-$ has an octahedral structure.

Since, PCl_5 reacts readily with moisture it is kept in well stoppered bottles.

PI_5 does not exist due to large size of I atoms and lesser electronegativity difference between phosphorus and iodine.

Down the group, the tendency to form pentahalides decreases due to inert pair effect. *e.g., BiF_5 does not exist.*

(3) **Oxides** : These elements form oxides of the type X_2O_3 , X_2O_4 and X_2O_5 .

The acidic strength of oxides :

The decreasing order of stability of oxides of group 15 follows as,

The nature of oxides of group 15 elements is as follows,

(4) **Oxyacids** : N_2 and P_4 of this group forms oxyacids which are discussed further. In this chapter.

Anomalous behaviour of Nitrogen

Nitrogen is known to differ from other members of the family because of the following facts,

(1) Its small size (2) Its high electronegativity (3) Its high ionisation energy (4) non-availability of d -orbital in the valence shell. (5) Its capacity to form $p\pi-p\pi$ multiple bonds.

The main points of difference are,

(i) Nitrogen is a gas while other members are solids.
(ii) Nitrogen is diatomic while other elements like phosphorus and arsenic form tetra-atomic molecules (P_4 , As_4).

(iii) Nitrogen forms five oxides (N_2O , NO , N_2O_3 , N_2O_4 and N_2O_5) while other members of the family form two oxides (tri and pentaoxides).

(iv) Hydrides of nitrogen show H-bonding while those of other elements do not.

(v) Nitrogen does not show pentacovalency because of absence of d -orbitals while all other elements show pentacovalency.

(vi) Nitrogen does not form complexes because of absence of d -orbitals while other elements show complex formation e.g., $[PCl_6]^-$, $[AsCl_6]^-$ etc.

(vii) The hydride of nitrogen (NH_3) is highly basic in nature while the hydrides of other elements are slightly basic.

(viii) Except for NF_3 , other halides of nitrogen e.g., NCl_3 , NBr_3 and NI_3 are unstable.

Nitrogen and its compounds

N_2 was discovered by **Daniel Rutherford**. It is the first member of group 15 in the periodic table.

Occurrence : N_2 occurs both in the free state as well as in the combined state. N_2 occurs in atmosphere to the extent of 78% by volume in free state. N_2 is present in many compounds such as potassium nitrate (nitre). Sodium nitrate (Chile salt peter) and many ammonium compounds. N_2 is an important constituent of proteins in plants and animals in combined state.

Preparation : It is prepared by the following methods,

(1) **Laboratory method** : In the laboratory N_2 is prepared by heating an aqueous solution containing an equivalent amount of NH_4Cl and $NaNO_2$.

(2) **Commercial preparation** : Commercially N_2 is prepared by the fractional distillation of liquid air.

Physical properties : N_2 is a colourless, odourless and tasteless gas. It is a non-toxic gas. Its vapour density is 14. It has very low solubility in water.

Chemical properties

(1) N_2 is neutral towards litmus. It is chemically unreactive at ordinary temp. It is neither combustible nor it supports combustion.

(2) The $N-N$ bond in N_2 molecule is a triple bond ($N \equiv N$) with a bond distance of 109.8 pm and bond dissociation energy of 946 kJ/mol

(3) **Combination with compounds** : N_2 combines with certain compounds on strong heating. eg

Both these compounds are hydrolysed on boiling with water to give ammonia.

Therefore, calcium cyanamide is used as a fertilizer under the name nitrolim ($CaCN_2 + C$)

Uses of nitrogen : N_2 is mainly used in the manufacture of compounds like NH_3 , HNO_3 , $CaCN_2$ etc.

Compounds of nitrogen

(1) Hydrides of nitrogen – Ammonia

Preparation of ammonia : Ammonia is prepared in the laboratory by heating a mixture of NH_4Cl and slaked lime, $Ca(OH)_2$

Moist NH_3 gas is dried over quick lime, CaO . However, it cannot be dried over conc. H_2SO_4 , P_2O_5 because being basic it forms salts with them. Anhydrous $CaCl_2$ also cannot be used because it forms a complex $CaCl_2 \cdot 8NH_3$ with it.

Manufacture : (i) Ammonia is manufactured by Haber's process. A mixture of pure N_2 and H_2 (in the ratio 1 : 3 by volume) is compressed to 200 – 1000 atmospheres and passed over finely divided Fe (as catalyst) and Mo (as promoter) at 750K

Favourable conditions for maximum yield of NH_3 are :

(a) excess of reactants (N_2 and H_2) (b) high pressure (c) low temperature and (d) use of catalyst and a promoter.

(ii) By the hydrolysis of calcium cyanamide ($CaCN_2$) with superheated steam at 450K. $CaCN_2$ itself is obtained by heating CaC_2 and N_2 at 1270K.

Properties of NH_3 : It is a colourless gas with pungent smell, highly soluble in H_2O and basic in nature. It liquefies on cooling under pressure to give liquid ammonia (bp. 240K). On heating, it causes intense cooling and hence is used as a refrigerant in ice, factories and cold storages.

It burns in excess of air to give N_2 and H_2O and is oxidised to NO when passed over heated Pt at 1075K.

It reduces heated CuO to Cu and Cl_2 to HCl (which combines with NH_3 to give NH_4Cl).

With excess of Cl_2 , it gives NCl_3 . With Br_2 it gives NH_4Br and N_2 is set free.

With I_2 , it gives nitrogen triiodide ammonia (brown ppt) which is explosive in dry state and decomposes when struck

It forms amides with active metals like Na , K etc.

It forms complexes with many substances, e.g.,

Its aqueous solution is weakly basic due to the formation of OH^- ions, $\text{NH}_3 + \text{H}_2\text{O} \longrightarrow \text{NH}_4^+ + \text{OH}^-$

With sodium hypochlorite in presence of glue or gelatine, excess of ammonia gives hydrazine

It undergoes self ionization in liquid state and acts as a solvent.

Many polar compounds are soluble in liquid ammonia.

With Nessler's reagent (an alkaline solution of K_2HgI_4), ammonia and ammonium salts give a brown precipitate due to the formation of Millon's base.

It is used as a refrigerant and in the manufacture of fertilizers.

Structure of NH_3 : The N atom in NH_3 is sp^3 -hybridized containing a lone pair of electrons due to which the $\text{H} - \text{N} - \text{H}$ bond angle is 107.5° . As a result NH_3 molecule is pyramidal.

(2) **Oxides of nitrogen :** Nitrogen combines with O_2 under different conditions to form a number of binary oxides which differ with respect to the oxidation state of the nitrogen atom. The important oxides are N_2O , NO , N_2O_3 , NO_2 , N_2O_4 and N_2O_5 . N_2O and NO both are neutral. Nitrous oxide (N_2O) has a sweet taste and its main use is as anaesthetic. When inhaled in mild quantities it causes hysterical laughter so it is also called Laughing gas. Nitric oxide (NO) can be obtained by treating a mixture of sodium nitrite and ferrous sulphate with dil. $\text{H}_2\text{SO}_4 \cdot \text{N}_2\text{O}_5$ is the strongest oxidising agent.

Table : 18.4 Oxides of Nitrogen

Oxide	Structure	Physical appearance	Preparation
Nitrous oxide (N_2O) +1	$N \equiv N \rightarrow O$	Colourless gas	By heating ammonium nitrate upto $240^\circ C$ $NH_4NO_3 \xrightarrow{\Delta} N_2O + 2H_2O$, It is Collected over hot water
Nitric oxide (NO) +2	$N = O$	Colourless	(a) By the action of cold dil. HNO_3 on copper turnings (Laboratory method) $3Cu + 8 \text{ dil. } HNO_3 \rightarrow 3Cu(NO_3)_2 + 4H_2O + 2NO$ (b) By the action of H_2SO_4 on a mixture of $FeSO_4$ and KNO_3 (4:1) $2KNO_3 + 5H_2SO_4 + 6FeSO_4 \rightarrow 2KHSO_4 + 3Fe_2(SO_4)_3 + 4H_2O + 2NO$ (c) By catalytic oxidation of ammonia. $4NH_3 + 5O_2 \xrightarrow[850^\circ C]{Pt} 4NO + 6H_2O$
Dinitrogen trioxide (N_2O_3) +3	$O=N-N \begin{matrix} \nearrow O \\ \searrow O \end{matrix}$	Blue solid	(a) By the action of 50% HNO_3 on arsenious oxide. $2HNO_3 + As_2O_3 + 2H_2O \rightarrow NO + NO_2 + 2HAsO_2$ $\downarrow 250 K$ N_2O_3
Dinitrogen tetroxide (N_2O_4) +4	$O=N-N \begin{matrix} \nearrow O \\ \searrow O \end{matrix}$	Colourless liquid	(a) By heating nitrates of heavy metals, e.g., lead nitrate. $2Pb(NO_3)_2 \xrightarrow{673 K} 4NO_2 + 2PbO + 2O_2$
Nitrogen dioxide (NO_2) +4	$O=N \rightarrow O$	Brown gas	(b) By heating copper turnings with conc. HNO_3 $Cu + 4 HNO_3 (\text{conc.}) \rightarrow Cu(NO_3)_2 + 2H_2O + 2NO_2$
Dinitrogen pentoxide (N_2O_5) +5	$O=N-O-N \begin{matrix} \nearrow O \\ \searrow O \end{matrix}$	Colourless gas	(a) By dehydrating HNO_3 with phosphorus pentoxide $4HNO_3 + P_2O_5 \rightarrow 2N_2O_5 + 4HPO_3$

(3) **Oxyacids of nitrogen** : Oxyacids of nitrogen are HNO_2 , HNO_3 , $H_4N_2O_4$ and HNO_4 , which are explosive.
(Nitroxyllic acid) (Pernitric acid)

(i) **Nitrous acid (HNO)** : It is prepared by adding ice cold dil. HCl or dil. H_2SO_4 to a well cooled solution of any nitrite ($NaNO_2$, $Ba(NO_2)_2$ etc.).

It oxidises H_2S to S , KI to I_2 and acts as a reducing agent in presence of strong oxidising agent, i.e., it reduces acidified $KMnO_4$, $K_2Cr_2O_7$, H_2O_2 etc. to Mn^{2+} , Cr^{3+} and H_2O respectively.

(ii) **Nitric acid (HNO_3)** : HNO_3 is called aqua fortis. It is prepared in the laboratory by distillation of nitre with conc. H_2SO_4 .

Commercially, it is obtained by Ostwald's process. In this process, NH_3 is first catalytically oxidised to NO which is cooled to about $300K$ and then oxidised by air to NO_2 . Absorption of NO_2 in water in presence of oxygen gives HNO_3

From air (Birkeland Eyde electric arc process)

Properties : It is a very strong acid and decomposes on boiling or in presence of sunlight. It acts as a strong oxidising agent. It oxidises nonmetals and metalloids to their respective oxy-acids, i.e., C to H_2CO_3 , S to H_2SO_4 , P to H_3PO_4 , I_2 to HIO_3 , As to H_3AsO_4 (arsenic acid) and Sb to H_3SbO_4 (antimonic acid), while nitric acid itself is reduced to NO_2 .

Nitric acid reacts with metals to form nitrates and is itself reduced to NO , N_2O , NO_2 or NH_3 (which further reacts with HNO_3 to give

NH_4NO_3) depending upon the concentration of the acid, activity of the metal and the temperature of the reaction.

(i) Very active metals such as Mn, Mg, Ca , etc. give H_2 on treatment with very dilute HNO_3 (2%).

(ii) Less active metals like Cu, Hg, Ag, Pb etc. give NO with dil. HNO_3 . Zinc, however, gives N_2O with dil HNO_3 and NH_4NO_3 with very dilute HNO_3 .

Similarly, Fe and Sn react with dilute nitric acid to give NH_4NO_3 .

(iii) Conc. HNO_3 gives NO_2 both with active metals (Zn, Pb etc.) and less active metals (Cu, Hg, Ag etc.)

Tin is, however, oxidized by conc. HNO_3 to metastannic acid (H_2SnO_3).

Passivity : Fe, Cr, Ni and Al become passive in conc. HNO_3 (i.e., lose their normal reactivity) due to the formation of a thin protective layer of the oxide on the surface of the metal which prevents further action.

Nitric acid has no action on noble metals (Au, Pt) but these metals dissolve in aqua regia (3 vol. HCl + 1 vol. HNO_3) forming their respective chlorides.

These chlorides subsequently dissolve in excess of HCl forming their corresponding soluble complexes. Thus,

Sugar on oxidation with nitric acid gives oxalic acid. Nitric acid reacts with glycerine to give glycerol trinitrate or nitro glycerine, with toluene it gives 2, 4, 6-trinitrotoluene (T.N.T.) and with cellulose (cotton) it gives cellulose trinitrate (gun cotton). All these are used as explosives.

Table : 18.5 Oxyacids of nitrogen

Name of oxoacid	F.	Structure	Oxidation State of N	Basicity	pK _a	Nature
Hyponitrous acid	H_2NO_2	$\begin{array}{c} \cdot\cdot \\ \cdot\cdot \\ N - OH \\ \\ HO - N \\ \cdot\cdot \end{array}$	+1	2(dibasic)	Very weak	Highly explosive
Nitrous acid	HNO_2	$\begin{array}{c} H - N = O \\ \downarrow \\ O \end{array}$	+3	1 (monobasic)	3.3	Unstable, Weak acid
Nitric acid	HNO_3	$\begin{array}{c} H - O - N = O \\ \downarrow \\ O \end{array}$	+5	1 (monobasic)	-3.0	Stable, Strong acid
Pernitric acid	HNO_4	$\begin{array}{c} O = N - O - O - H \\ \downarrow \\ O \end{array}$	+5	1 (monobasic)		Unstable and explosive

Phosphorus and its compounds

It is the second member of group 15 (VA) of the Periodic table. Due to larger size of P , it can not form stable $P\pi - P\pi$ bonds with other phosphorous atoms where as nitrogen can form $P\pi - P\pi$ bonds.

(i) **Occurrence** : Phosphorous occurs mainly in the form of phosphate minerals in the crust of earth. Some of these are :

- (i) Phosphorite $Ca_3(PO_4)_2$, (ii) Fluorapatite $Ca_5(PO_4)_3F$,
(iii) Chlorapatite $3Ca_3(PO_4)_2 \cdot CaCl_2$, (iv) Hydroxyapatite;

$Ca_5(PO_4)_3OH$. Phosphates are essential constituents of plants and animals. It is mainly present in bones, which contains about 58% calcium phosphate.

(2) **Isolation** : Elemental phosphorus is isolated by heating the phosphorite rock with coke and sand in an electric furnace at about 1770K,

(3) **Allotropic forms of phosphorus** : Phosphorus exists in three main allotropic forms,

(i) White phosphorus, (ii) Red phosphorus, (iii) Black phosphorus

(i) **White or yellow phosphorus** : It is obtained from phosphate rock or phosphorite as explained above. It exists as P_4 units where four P atoms lie at the corners of a regular tetrahedron with $\angle PPP = 60^\circ$. Each P atom is linked to three other P atoms by covalent bonds. There are total six bonds and four lone pairs of electrons present in a P_4 molecule of white phosphorus.

Properties : White phosphorus is extremely reactive due to strain in the P_4 molecule, poisonous, soft, low melting (317K) solid, soluble in CS_2 , alcohols and ether. It has a garlic odour. Persons working with white P develop a disease known as Phossy jaw in which jaw bones decay. It turns yellow on exposure to light. Hence, it is also called yellow phosphorus.

It spontaneously catches fire in air with a greenish glow which is visible in the dark ($P_4 + 3O_2 \rightarrow P_4O_6$). This phenomenon is called phosphorescence. Because of its very low ignition temperature (303K), it is always kept under water.

With sulphur it gives tetraphosphorus trisulphide with explosive violence which is used in "strike anywhere matches".

With metals phosphorus forms phosphides. For example,

With aqueous alkalis, on heating, white phosphorus gives phosphine

It is an example of a disproportionation reaction where the oxidation state of P decreases from 0 to -3 (in PH_3) and increases to $+1$ (in NaH_2PO_2)

White phosphorus acts as a strong reducing agent. It reduces HNO_3 to NO_2 and H_2SO_4 to SO_2 . It also reduces solutions of Cu , Ag and Au salts to their corresponding metals. For examples,

(ii) **Red phosphorus** : It is obtained by heating white phosphorus at 540–570K out of contact with air in an inert atmosphere (CO_2 or coal gas) for several hours.

Red phosphorus exists as chains of P_4 tetrahedra linked together through covalent bonds to give a polymeric structure as shown.

Due to its polymeric structure, red phosphorus is much less reactive and has m.p. much higher than that of white phosphorus.

Properties : Red phosphorus is a hard, odourless, non poisonous solid, insoluble in organic solvents such as CS_2 , alcohol and ether. Its ignition temperature is much higher than that of white phosphorus and thus does not catch fire easily. It does not show phosphorescence.

It sublimes on heating giving vapours which condense to give white phosphorus. It is denser than white phosphorus and is a bad conductor of electricity.

It burns in oxygen at 565K to give phosphorus pentoxide, reacts with halogens, sulphur and alkali metals only when heated forming their corresponding salts.

It does not react with caustic alkalis and this property is made use in separating red phosphorus from white phosphorus.

(iii) **Black phosphorus** : It is obtained by heating white phosphorus at 470K under high pressure (4000–12000atm) in an inert atmosphere.

It has a double layered structure. Each layer is made up of zig-zag chains with $P-P-P$ bond angle of 99° . Since it is highly polymeric, it has high density. It is the most stable (inactive) form of phosphorus and has a black metallic luster. It is a good conductor of heat and electricity.

(4) Compounds of phosphorus

(i) **Oxides and oxyacids of phosphorus** : Phosphorus is quite reactive and forms number of compounds in oxidation states of -3 , $+3$ and $+5$. Phosphorus forms two common oxides namely, (a) phosphorus trioxide (P_4O_6) and (b) phosphorus penta oxide (P_4O_{10}).

(a) **Phosphorus (III) oxide (P_4O_6)** :

It is formed when P is burnt in a limited supply of air, $P_4 + 3O_2 \rightarrow P_4O_6$.
(limited)

It is a crystalline solid with garlic odour. It dissolves in cold water to give phosphorous acid,

anhydride of phosphorus acid.

With hot water, it gives phosphoric acid and inflammable phosphine, $P_4O_6 + 6H_2O \xrightarrow{\text{hot}} 3H_3PO_4 + PH_3$
Phosphoric acid

It reacts vigorously with Cl_2 to form a mixture of phosphoryl chloride and meta phosphoryl chloride.

(b) **Phosphorus (V) oxide (P_4O_{10})** :

It is prepared by heating white phosphorus in excess of air, $P_4 + 5O_2(\text{excess}) \rightarrow P_4O_{10}$. It is snowy white solid. It readily dissolves in cold water forming metaphosphoric acid.

phosphoric acid, $P_4O_{10} + 6H_2O \xrightarrow{\text{Hot}} 4H_3PO_4$.

P_4O_{10} is a very strong dehydrating agent. It extracts water from many compounds including H_2SO_4 and HNO_3 ,

(ii) **Oxyacids of phosphorus** : Phosphorus forms a number of oxyacids which differs in their structure and oxidation state of phosphorus. These are $H_3PO_2, H_3PO_3, H_4P_2O_6, H_3PO_4$, $(HPO_3)_n, H_4P_2O_5, H_4P_2O_7$. From these H_3PO_2, H_3PO_3 are reducing agents. $H_4P_2O_5$ (pyrophosphoric acid) is dibasic acid.

$(HPO_3)_n$ is formed by dehydration of H_3PO_4 at $316^\circ C$.

Table : 18.6 Oxyacids of phosphorus

Name	Oxidation state of P and Basicity	Structure
Hypophosphorous acid H_3PO_2	+1 Monobasic	
Phosphorous acid H_3PO_3	+3 Dibasic	
Hypophosphoric acid $H_4P_2O_6$	+4 Tetrabasic	
Orthophosphoric acid H_3PO_4	+5 Tribasic	

Metaphosphoric acid $(HPO_3)_n$	+5 Monobasic	
Pyrophosphoric acid (Diphosphoric acid). $H_4P_2O_7$	+5 Tetrabasic	

(5) **Chemical Fertilizers** : The chemical substances which are added to the soil to keep up the fertility of soil are called fertilizers.

Types of fertilizers : Chemical fertilizers are mainly of four types,

(i) **Nitrogenous fertilizers** : e.g. Ammonium sulphate $(NH_4)_2SO_4$, Calcium cyanamide $CaCN_2$, Urea NH_2CONH_2 etc.

(ii) **Phosphatic fertilizers** : e.g. $Ca(H_2PO_4)_2 \cdot H_2O$ (Triple super phosphate), Phosphatic slag etc.

(iii) **Potash fertilizers** : e.g. Potassium nitrate (KNO_3) , Potassium sulphate (K_2SO_4) etc.

(iv) **Mixed fertilizers** : These are made by mixing two or more fertilizers in suitable proportion. e.g. *NPK* (contains nitrogen, phosphorus and potassium).

NPK is formed by mixing ammonium phosphate, super phosphate and some potassium salts.

Oxygen Family

Oxygen is the first member of group 16 or VIA of the periodic table. It consists of five elements Oxygen (*O*), sulphur (*S*), selenium (*Se*), tellurium (*Te*) and polonium (*Po*). These (except polonium) are the ore forming elements and thus called **chalcogens**.

(1) Electronic configuration

Elements	Electronic configuration ($ns^2 np^4$)
${}_8O$	$[He]2s^2 2p^4$
${}_{16}S$	$[Ne]3s^2 3p^4$
${}_{34}Se$	$[Ar]3d^{10} 4s^2 4p^4$
${}_{52}Te$	$[Kr]4d^{10} 5s^2 5p^4$
${}_{84}Po$	$[Xe]4f^{14} 5d^{10} 6s^2 6p^4$

Physical properties

(1) **Physical state** : Oxygen is gas while all other are solids.

(2) **Atomic radii** : Down the group atomic radii increases because the increases in the number of inner shells overweighs the increase in nuclear charge.

(3) **Ionisation energy** : Down the group the ionisation energy decrease due to increase in their atomic radii and shielding effect.

(4) **Electronegativity** : Down the group electronegativity decreases due to increase in atomic size.

(5) **Electron affinity** : Element of this group have high electron affinity, electron affinity decreases down the group.

(6) **Non – metallic and metallic character** : These have very little metallic character because of their higher ionisation energies.

(7) **Nature of bonding** : Compound of oxygen with non metals are predominantly covalent. *S*, *Se*, and *Te* because of low electronegativities show more covalent character.

(8) **Melting and boiling points** : The melting point and boiling points increases on moving down the group.

(9) **Catenation** : Oxygen has some but sulphur has greater tendency for catenation.

(10) **Allotropy**

Oxygen	–	O_2 and O_3
Sulphur	–	Rhombic, monoclinic, plastic sulphur
Selenium	–	Red (non-metallic) grey (metallic)
Tellurium	–	Non-metallic and metallic (more stable)
Polonium	–	α and β (both metallic)

(11) **Oxidation states** : Oxygen shows – 2, + 2 and – 1 oxidation states. Other elements show +2, +4 and +6 oxidation states.

Chemical properties

(i) **Hydrides** : The elements of this group form hydrides such as H_2O , H_2S , H_2Se , H_2Te and H_2Po . Following are their characteristics.

(i) **Physical states** : Water is colourless and odourless while hydrides of the rest of the elements of this group are colourless, unpleasant smelling poisonous gases.

(ii) **Volatile nature** : Volatility increases from H_2O to H_2S and then decreases. The low volatility and abnormally high boiling point of water is due to the association of water molecules on account of hydrogen bonding because of strongly electronegative oxygen atom linked to hydrogen atom. thus, water is liquid while H_2S and other hydrides are gases under normal condition of temperature and pressure.

(iii) **Acidic character** : The hydrides of this group behave as weak diprotic acids in aqueous solution, the acidic character increasing from H_2S to H_2Te when H_2O is neutral.

(iv) **Thermal stability** : The thermal stability decreases from H_2O to H_2Po because the size of the central atom (from *O* to *Po*) increases resulting in longer and weaker $M-H$ bond consequently the bond strength decreases. This results in the decrease of the thermal stability.

(v) **Reducing character** : The reducing power of the hydrides increases from H_2O to H_2Po due to the decreasing bond strength from H_2O to H_2Po .

(vi) **Bond angle** : All these hydrides are angular molecules and the bond angle $H-X-H$ (*X* is *O*, *S*, *Se*, *Te*) decreases from H_2O to H_2Te .

Increasing order of reducing power of hydrides :

Increasing order of bond angles in hydrides :

The order of stability of hydrides :

The order of increasing acidic nature of hydrides :

(2) **Oxides** : These elements form monoxides (MO), dioxides (MO_2) and trioxides (MO_3).

(i) **Dioxides** : Sulphur, selenium and tellurium burn in air to form SO_2 , SeO_2 and TeO_2 . The dioxide molecules contain $p\pi-p\pi$ bonds which become weaker with increase in atomic number because of the increase in the bond length.

(a) Sulphur dioxide, SO_2 is a gas at room temperature and exists as individual molecules even in the solid state. Its molecule has bent structure and is a resonance hybrid of the following canonical structures.

SO_2 is acidic in nature and also called the anhydride of sulphurous acid. It can act as reducing and oxidising agent. SO_2 also acts as a bleaching agent in the presence of moisture, but in contrast to Cl_2 , its bleaching action is temporary.

Colouring matter + 2[H] = Colourless compound

Hence, SO_2 bleaches due to reduction and the bleaching action is temporary.

(b) Selenium dioxide, SeO_2 is a solid with polymeric zig-zag structure at room temperature however it exist as discrete molecules in the gaseous phase.

(c) Tellurium dioxide, TeO_2 is also a solid with polymeric zig-zag structure at room temperature very similar to that of selenium dioxide.

(ii) **Trioxides** : Sulphur, selenium and tellurium can form trioxides also.

(a) **Sulphur trioxide**, SO_3 : In the gaseous state monomeric SO_3 has a planar structure with $S-O$ bond distance of 143 pm and $O-S-O$ bond angle of 120° . SO_3 molecule is a resonance hybrid of following structures.

In the solid phase sulphur trioxide polymerises to cyclic trimer or to a stable linear chain structure. SO_3 is the anhydride of H_2SO_4 . It is acidic in nature and acts as oxidising agent.

(b) **Selenium trioxide**, SeO_3 : it is a solid substance which exists as a cyclic tetramer, however in the vapour phase it exists as a monomer

(c) **Tellurium trioxide**, TeO_3 : It is a solid at room temperature existing as a polymer.

The increasing order of acidic nature of oxides is $TeO_3 < SeO_3 < SO_3$.

(3) **Oxyacids :**(4) **Halides :** Oxygen : OF_2, Cl_2O, Br_2O **Anomalous Behaviour of Oxygen**

Oxygen is the first member of the group 16 family and differs from the other members of the family because of

- (1) Its small size
- (2) Its high electronegativity
- (3) Its high ionisation energy
- (4) Absence of d -orbitals in the valence shell

It differs from the other members of the family as follows

(1) **Elemental state :** Oxygen is a diatomic gas while others are octatomic solids with eight membered puckered ring structure.

(2) **Oxidation states :** Oxygen shows O.S. of -2 in most of its compounds. It also shows an O. S. of $+2$ in F_2O and -1 in H_2O_2 or other peroxides. It cannot show O.S. beyond 2. Other elements show oxidation states of $+2, +4$ and $+6$ because these elements have vacant d -orbitals so that their valence shell can expand.

(3) **Hydrogen-bonding :** Oxygen atom is very small and has quite high nuclear charge. therefore, it has high value of electronegativity and is able to form H -bonds. the other elements, because of their large size, cannot form H -bonds. As a result, H_2O is liquid while H_2S is a gas and H_2Se etc., are solids.

(4) **Maximum covalency :** Oxygen has a maximum covalency of two while other elements can show a maximum covalency of six. This is because these elements have vacant d -orbitals while oxygen has not.

(5) **Types of compounds :** The compounds of oxygen are mainly ionic and polar covalent due to high electronegativity of oxygen while those of others are not.

(6) **Magnetic character :** Oxygen is paramagnetic while others are not.

Oxygen and its compounds

Oxygen is the most abundant element in the earth crust (46.5%). It was discovered by **Karl Scheele** and **Joseph Priestley**. It occurs in three isotopic forms :

Out of the three isotopes, ${}^8O^{18}$ is radioactive.

Occurrence : In free state, it occurs in air and constitutes 21% by volume of air.

Preparation of Dioxygen : Oxygen is prepared by the following methods.

(1) **By the decomposition of oxygen rich compounds :** e.g.

(2) **By heating dioxides, Peroxides and higher oxides :** e.g.

(3) **Laboratory Method :** In the laboratory, O_2 is prepared by thermal decomposition of potassium chlorate.

In the absence of MnO_2 catalyst, the decomposition takes place at 670-720 K. Therefore, MnO_2 acts as a catalyst and also lowers the temperature for the decomposition of $KClO_3$.

(4) O_2 can also be prepared by the action of water on sodium peroxide as, $2Na_2O_2 + 2H_2O \rightarrow 4NaOH + O_2$.

(5) **Industrial preparation :** The main sources for the industrial preparation of dioxygen are air and water.

(i) **From air :** O_2 is prepared by fractional distillation of air. During this process, N_2 with less boiling point (78 K) distills as vapour while O_2 with higher boiling point (90 K) remains in the liquid state and can be separated.

(ii) **From water :** O_2 can also be obtained by the electrolysis of water containing a small amount of acid or alkali,

Physical properties of O_2 : It is a colourless, tasteless and odourless gas. It is slightly soluble in water and its solubility is about 30 cm^3 per litre of water at 298 K.

Table : 18.7 Physical properties of atomic and molecular oxygen

Atomic properties	Molecular properties
Atomic radius (pm) – 73	Bond length (pm) – 120.7
Ionic radius O (pm) – 140	Bond energy (kJ mol ⁻¹) – 493
Electronegativity – 3.5	Density at S.T.P. (g cm ⁻³) – 1.429
Ionisation energy (kJ mol ⁻¹) – 1310	Melting point (K) – 54.4
Electron affinity (kJ mol ⁻¹) – 140	Boiling point (K) – 90.2

Chemical properties of O_2 : It does not burn itself but helps in burning. It is quite stable in nature and its bond dissociation energy is very high. Therefore, it is not very reactive as such, $O_2 \rightarrow O + O$.

Therefore, dioxygen reacts at higher temperatures. However, once the reaction starts, it proceeds of its own. This is because the chemical reactions of dioxygen are exothermic and the heat produced during the reaction is sufficient to sustain the reactions.

(1) **Action with litmus :** Like dihydrogen, it is also neutral and has no action on blue or red litmus.

(2) **Reaction with metals :** Active metals like Na , Ca react at room temp. to form their respective oxides.

It reacts with Fe , Al , Cu etc. metals at high temperature

(3) **Action with Non-metals :** It form oxides.

(4) **Reaction with compounds :** Dioxygen is an oxidising agent and it oxidises many compounds under specific conditions. e.g.

**Uses of dioxygen**

- (1) It is used in the oxy-hydrogen or oxy-acetylene torches which are used for welding and cutting of metals.
- (2) It is used as an oxidising and bleaching agent,
- (3) Liquid O_2 is used as rocket fuel.
- (4) It is used in metallurgical processes to remove the impurities of metals by oxidation.

Compounds of Oxygen

(i) **Oxides** : A binary compound of oxygen with another element is called oxide. On the basis of acid-base characteristics, the oxides may be classified into the following four types,

(i) **Basic oxides** : Alkali, alkaline earth and transition metals form basic oxides - Na_2O , MgO , Fe_2O_3 etc. their relative basic character decreases in the order : alkali metal oxides > alkaline earth metal oxides > transition metal oxides.

(ii) **Acidic oxides** : Non-metal oxides are generally acidic - CO_2 , SO_2 , SO_3 , NO_2 , N_2O_5 , P_4O_{10} , Cl_2O_7 etc.

(iii) **Amphoteric oxides** : Al_2O_3 , SnO_2 etc.

(iv) **Neutral oxides** : H_2O , CO , N_2O , NO etc.

Trends of oxides in the periodic Table : On moving from left to the right in periodic table, the nature of the oxides change from basic to amphoteric and then to acidic. For example, the oxides of third period has the following behaviour,

Na_2O strongly basic	MgO basic	Al_2O_3 amphoter ic	SiO_2 weakly acidic	P_4O_{10} acidic	SO_2 strongly acidic	Cl_2O_7 very strongly acidic
--	-----------------------	---	------------------------------------	-------------------------------------	-------------------------------------	---

Basic to acidic character increases

However, on moving down a group, acidic character of the oxides decreases. For example in the third group, the acidic character of oxides decreases as:

B_2O_3 acidic	Al_2O_3 amphoter ic	Ga_2O_3 (weakly basic)	In_2O_3 , Tl_2O_3 basic
-------------------------------	---	---	--

Acidic to basic character increases

On the basis of oxygen content the oxides may be classified into the following types,

Normal oxides : These contain oxygen atoms according to the normal oxidation number *i.e.* - 2. For example, MgO , H_2O , CaO , Li_2O , Al_2O_3 etc.

Polyoxides : These contain oxygens atoms more than permitted by the normal valency. Therefore, these contain oxygen atoms in oxidation state different than -2.

Peroxides : These contains O_2^{2-} ion having oxidation number of oxygen as -1. For example,

Superoxides : These contains O_2^- ion having oxidation number of oxygen as -1/2. For example, KO_2 , PbO_2 , etc.

Suboxides : These oxides contain less oxygen than expected from the normal valency. For example, N_2O .

Mixed oxides : These oxides are made up of two simple oxides. For example, red lead $\text{Pb}_3\text{O}_4 (2\text{PbO}_2 + \text{PbO})$, magnetic oxide of iron, $\text{Fe}_3\text{O}_4 (\text{FeO} + \text{Fe}_2\text{O}_3)$ and mixed oxide of manganese, $\text{Mn}_3\text{O}_4 (\text{MnO}_2 + 2\text{MnO})$.

Ozone or trioxxygen

Ozone is an allotrope of oxygen. It is present in the upper atmosphere, where it is formed by the action of U. V. radiations on O_2 ,

O_3 protects us from the harmful U. V. radiations which causes skin cancer. Now a days, ozone layer in the atmosphere is depleting due to NO released by supersonic aircrafts and chlorofluoro carbons (CFC'S) *i.e.* freon which is increasingly being used in aerosols and as a refrigerant.

Preparation : Ozone is prepared by passing silent electric discharge through pure, cold and dry oxygen in a specially designed apparatus called ozoniser. The formation of ozone from oxygen is an endothermic reaction.

Ozone is prepared in the laboratory by the following two types of ozonisers,

(a) Siemen's ozoniser, (b) Brodie's ozoniser

For the better yield of ozone : (a) Only pure and dry oxygen should be used. (b) The ozoniser must be perfectly dry. (c) A fairly low temperature ($\approx 273\text{ K}$) must be maintained. (d) The electric discharge must be sparkless.

Physical properties : Ozone is a light blue coloured gas, having pungent odour. It is heavier than air. Its vapour density is 24. It is slightly soluble in water.

Chemical properties : The important chemical properties of ozone are discussed below,

(1) **Decomposition** : Pure ozone decomposes on heating above 475 K to form O_2 gas.

(2) **Oxidising agent** : Ozone is one of the most powerful oxidising agent with the liberation of dioxygen. In fact, ozone is a stronger oxidising agent than molecular oxygen because ozone has higher energy content and decomposes to give atomic oxygen as:

Therefore, ozone oxidises a number of non-metals and other reducing agents. *e.g.*

Mercury is oxidised to mercurous oxide,

During this reaction mercury loses its meniscus and starts sticking to the sides of the glass. This is known as tailing of mercury. Mercurous oxide formed in this reaction dissolves in mercury and starts sticking to the glass surface.

(3) **Bleaching agent** : Due to the oxidising action of ozone, it acts as a mild bleaching agent as well as a sterilizing agent. It acts as a bleaching agent for vegetable colouring matter.

For example, ozone bleaches indigo, ivory, litmus, delicate fabrics etc.

(4) **Formation of ozonides** : Ozone reacts with alkenes in the presence of CCl_4 to form an ozonide. e.g.

Structure of O_3 : The structure of O_3 molecule is angular as shown in fig. The $\text{O}-\text{O}-\text{O}$ bond angle is 116.8° and $\text{O}-\text{O}$ bond length is 128 pm.

Uses of ozone

(1) O_3 is used for disinfecting water for drinking purposes because ozone has germicidal properties.

(2) It is used for purifying air of crowded places such as cinemas, under ground railway, auditoriums, tunnels, mines etc.

(3) It is used in industry for the manufacture of KMnO_4 , artificial silk, synthetic camphor etc.

Sulphur and its compounds

Sulphur is the second member of oxygen family and belongs to group-16 (VI A) of the periodic table.

Occurrence : Sulphur occurs in the earth's crust to the extent of 0.05%. It occurs in the free state as well as in combined state. Sulphur occurs mainly as sulphides and sulphates. eg.

Table 18.8

Sulphide Ores	Sulphate Ores
Iron pyrites (fool's gold) – FeS_2	Gypsum – $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$
Galena – PbS	Epsom salt – $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$
Copper pyrites – CuFeS_2	Barytes – BaSO_4
Cinnabar – HgS	Zinc blende – ZnS

Extraction of sulphur (Frasch process) : Sulphur is generally extracted from underground deposits by drilling three concentric pipes upto the beds of sulphur (700 – 1200 feet deep).

Allotropy in sulphur : Sulphur exists in four allotropic forms,

(1) **Rhombic or octahedral or α -sulphur** : It is a bright yellow solid, soluble in CS_2 and stable at room temp. All other varieties of sulphur gradually change into this form on standing.

(2) **Monoclinic sulphur or prismatic or β -sulphur** : It is prepared by melting the sulphur and then cooling it till a crust is formed. On removing the crust, needle shaped crystals of monoclinic sulphur separate out. It is dull yellow in colour, soluble in CS_2 and stable only above 369K. Below this temperature it changes into rhombic form.

Thus, at 369K both these varieties co-exist. This temperature is called transition temperature and the two sulphurs are called enantiotropic substances. It also exist as molecules similar to that of rhombic sulphur but the symmetry of the crystals is different.

(3) **Plastic or amorphous or γ -sulphur** : It is a super cooled liquid insoluble in CS_2 , soft and amorphous. It consists of long zig-zag chains of S-atoms.

(4) **Colloidal or δ -sulphur** : It is prepared by passing H_2S

through a solution of an oxidizing agent or water or by treating sodium thiosulphate with dil. HCl .

Properties of sulphur : It burns in air with, a blue flame forming SO_2 , gives sulphur hexafluoride with F_2 and sulphur mono chloride with Cl_2 , sulphides with metals like Na , Ca , Zn , Hg , Fe , Cu etc., reduces HNO_3 to NO_2 and H_2SO_4 to SO_2 . With NaOH solution on heating,

It gives sodium sulphide and sodium thiosulphate, with excess of sulphur, $2\text{Na}_2\text{S} + \text{S}_8 \longrightarrow 2\text{Na}_2\text{S}_5$.

Uses of sulphur : It is used in the manufacture of matches, gun powder (mixture of charcoal, sulphur and potassium nitrate), explosives and fire works SO_2 , H_2SO_4 , CS_2 and dyes, sulpha drugs and ointment for curing skin diseases and in the vulcanization of rubber.

Compounds of Sulphur

(1) **Hydrogen Sulphide** : It is prepared in the laboratory by the action of dil. H_2SO_4 on ferrous sulphide in kipp's apparatus, $\text{FeS} + \text{H}_2\text{SO}_4 \rightarrow \text{FeSO}_4 + \text{H}_2\text{S}$. It is colourless gas having foul smell resembling that of rotten eggs. It reacts with many cations (of group II and IV) to give coloured sulphides,

The solubility of sulphides can be controlled by the H^+ ions concentration and therefore, H_2S finds extensive use in qualitative analysis of cation radicals.

(2) **Halides of sulphur** : Two important halides of sulphur are SF_4 and SF_6 .

(i) **Sulphur tetrafluoride** : SF_4 is formed by the reaction of sulphur with CoF_3 .

It is a colour gas which is quite reactive. It is hydrolysed with water.

It is used for fluorinating inorganic and organic compounds.

Structure : It has see-saw structure with sp^3d hybridization and is derived from trigonal bipyramid geometry in which an equatorial position is occupied by a lone pair of electrons.

(ii) **Sulphur hexafluoride** : SF_6 is prepared by burning sulphur in a stream of fluorine. OF_6 is not known though sulphur forms SF_6 . This is because oxygen has no d -orbitals in its valence shell.

SF_6 is a colourless gas. It is extremely inert substance even at red heat. It does not react with water, on account of its chemical inertness and dielectric strength, it is used as an insulator in high voltage generators and switch-gears.

Structure : It has an octahedral structure with sp^3d^2 -hybridisation around the central sulphur atom.

Therefore, all $S-F$ bond distances are equal in its structure.

(3) **Oxides of sulphur** : Sulphur forms several oxides of which sulphur dioxide (SO_2) and sulphur trioxide (SO_3) are most important.

(i) **Sulphur dioxide (SO_2)** : It is prepared by burning sulphur or iron pyrites in air.

In laboratory, it is prepared by heating copper turnings with conc. H_2SO_4

It is a colourless gas with irritating and suffocating smell.

SO_2 molecule has a bent structure with a $O-S-O$ bond angle of 119° . Sulphur is sp^2 hybridized.

(ii) **Sulphur trioxide (SO_3)** : It is formed by the oxidation of SO_2 .

In the gaseous phase, it exists as planar triangular molecular species involving hybridization of the S -atom. It has three $S-O$ σ bonds and three $S-O$ π bonds. The $O-S-O$ bond angle is of 120° .

(4) **Oxyacids of sulphur** : Sulphur forms many oxyacids. Some of these are,

Table : 18.9 Oxyacids of sulphur

Formula	Name	Important properties	Structural formula
H_2SO_3 (+4)	Sulphurous acid	Free acid does not exist diprotic, strong reducing agent	$ \begin{array}{c} \ddot{O} \\ \parallel \\ O = \ddot{S} - OH \\ \\ OH \end{array} $
H_2SO_4 (+6) (Oil of vitriol)	Sulphuric acid	Stable diprotic, dehydrating agent	$ \begin{array}{c} O \\ \parallel \\ O = \ddot{S} - OH \\ \\ OH \end{array} $
$H_2S_2O_3$ (-2 and +6)	Thiosulphuric acid	Free acid does not exist but its salts e.g. $Na_2S_2O_3$ All quite stable reducing agent	$ \begin{array}{c} S \\ \parallel \\ O = \ddot{S} - OH \\ \\ OH \end{array} $
$H_2S_2O_4$ (+3)	Dithionous acid		$ \begin{array}{c} O \quad O \\ \parallel \quad \parallel \\ HO - \ddot{S} - \ddot{S} - OH \end{array} $
$H_2S_2O_6$ (+5)	Dithionic acid	Free acid is moderately stable but its salts are quite stable.	$ \begin{array}{c} O \quad O \\ \parallel \quad \parallel \\ O = \ddot{S} - \ddot{S} = O \\ \quad \\ OH \quad OH \end{array} $
$H_2S_2O_7$ (+6) (Oleum)	Disulphuric acid (Pyrosulphuric acid)	Strong oxidising agent	$ \begin{array}{c} O \quad O \\ \parallel \quad \parallel \\ O = \ddot{S} - O - \ddot{S} = O \\ \quad \\ OH \quad OH \end{array} $
H_2SO_5 (+6) (Caro's acid)	Peroxomonosulphuric acid (Its salts known as persulphates)	Stable crystalline solid, powerful oxidising agent	$ \begin{array}{c} O \\ \parallel \\ HO - \ddot{S} - OOH \\ \\ O \end{array} $
$H_2S_2O_8$ (+6) (Marshals acid)	Peroxodisulphuric acid (its salts are known as disulphates)	Strong oxidising agent.	$ \begin{array}{c} O \quad O \\ \parallel \quad \parallel \\ O = \ddot{S} - O - O - \ddot{S} = O \\ \quad \\ OH \quad OH \end{array} $

Sulphuric acid (H_2SO_4) : H_2SO_4 is a very stable oxyacid of sulphur. It is often called king of chemicals, since it is one of the most useful chemicals in industry.

Manufacture of sulphuric acid : H_2SO_4 can be manufactured by following process,

Lead chamber process : In this process, SO_2 is oxidized to SO_3 by the oxides of nitrogen and the SO_3 thus formed is dissolved in steam to form H_2SO_4 .

Contact process : In the contact process, SO_2 obtained by burning of S or iron pyrites is catalytically oxidized to SO_3 in presence of finely divided Pt or V_2O_5 as catalyst.

V_2O_5 is, however, preferred since it is much cheaper than Pt and is also not poisoned by arsenic impurities.

The favorable conditions for maximum yield of SO_3 are,

(a) High concentration of SO_2 and O_2 (b) Low temperature of 673 to 723 K, (c) High pressure about 2 atmospheres.

SO_3 thus obtained is absorbed in 98% H_2SO_4 to form oleum which on dilution with water gives H_2SO_4 of desired concentration.

Contact process is preferred over lead chamber process (gives 98% pure H_2SO_4) since it gives H_2SO_4 of greater purity (100%).

Structure : H_2SO_4 is a covalent molecule with sulphur in a +6 oxidation state. The two oxygen atoms are linked to sulphur by double bonds while the other two oxygen atoms.

Are linked by single covalent bonds. Thus it has tetrahedral structure. Infact, sulphuric acid has an associated structure due to the presence of hydrogen bonds. As a result, it is a dense and viscous liquid and has a high boiling point of 590K

Structure of H_2SO_4

Properties : H_2SO_4 has high b.p. (611K) and is also highly viscous due to H-bonding in conc. H_2SO_4 . It has strong affinity for H_2O and a large amount of heat is evolved when it is mixed with water.

(i) H_2SO_4 is a strong dibasic acid. It neutralizes alkalis, liberates CO_2 from carbonates and bicarbonates.

(ii) It reacts with more electropositive (than hydrogen) metals to evolve H_2 and produces SO_2 on heating with less electropositive metals than hydrogen .eg.,

(iii) It is a strong oxidizing agent and oxidises as follows,

(iv) It reacts with number of salts. It liberates HCl from chlorides, H_2S from sulphides, HNO_3 from nitrates.

(v) It acts as a strong dehydrating agent, as it dehydrates, sugar to sugar charcoal (carbon), formic acid to CO , oxalic acid to $CO + CO_2$ and ethyl alcohol to ethylene.

(vi) It is also a good sulphonating agent and used for sulphonation of aromatic compounds. eg.,

Flow sheet diagram of its preparation is as follows

Uses : H_2SO_4 is used (i) in the preparation of fertilizers like $(NH_4)_2SO_4$ and super phosphate of lime, (ii) in lead storage batteries (iii) in preparation of dyes, paints and explosives (iv) in textile and paper industry (v) for tanning (vi) as a dehydrating agent.

(5) **Sodium thiosulphate** $Na_2S_2O_3 \cdot 5H_2O$: It is manufactured by saturating a solution of sodium carbonate with SO_2 which gives a solution of sodium sulphite,

The resulting solution is boiled with powdered sulphur as,

The solution is then cooled to get crystals of sodium thiosulphate.

Physical properties : (i) Sodium thiosulphate is a colourless crystalline solid. In the hydrated form, it is called hypo. (ii) It melts at 320 K and loses its water molecules of crystallization on heating to 490 K.

Chemical properties

(i) **Action with halogens** : It reacts with halogens as,

(a) Chlorine water oxidizes sodium thiosulphate to sodium sulphate and sulphur is precipitated,

This property enables it to act as an antichlor in bleaching i.e. it destroys the unreacted chlorine in the process of bleaching.

(b) Bromine water also oxidizes sodium thiosulphate to sodium sulphate and sulphur,

(c) With iodine it forms a soluble compound called sodium tetrathionate,

Therefore, hypo is commonly used to remove iodine stains from the clothes.

(ii) **Action of heat** : Upon heating, sodium thiosulphate decomposes to form sodium sulphate and sodium pentasulphide,

(iii) **Action with acids** : Sodium thiosulphate reacts with dilute hydrochloric acid or Sulphuric acid forming sulphur dioxide and sulphur. The solution turns milky yellow due to sulphur.

(iv) **Action with silver halides** : Sodium thiosulphate forms soluble complex when treated with silver chloride or silver bromide,

This property of hypo is made use in photography.

Uses of sodium thiosulphate

- (i) It is largely used in photography as a fixing agent.
- (ii) It is used as a preservative for fruit products such as jams and squashes.
- (iii) It is used as an antichlor in bleaching.
- (iv) It is used as a volumetric agent for the estimation of iodine.
- (v) It is used in medicine.

Halogen Family

Fluorine is the first member of group 17 or VIIA of the periodic table. It consists of five elements Fluorine (F), Chlorine (Cl), bromine (Br), iodine (I) and astatine (At). These are known as halogen because their salts are found in sea water. Halogen is a greek word meaning a sea salt.

(1) Electronic configuration

Elements	Electronic configuration ($ns^2 np^5$)
${}_9F$	$[He]2s^2 2p^5$
${}_{17}Cl$	$[Ne]3s^2 3p^5$
${}_{35}Br$	$[Ar]3d^{10} 4s^2 4p^5$
${}_{53}I$	$[Kr]4d^{10} 5s^2 5p^5$
${}_{85}At$	$[Xe]4f^{14} 5d^{10} 6s^2 6p^5$

Physical properties

(1) **Atomic and ionic radii** : A halogen atom has the smallest radius as compared to any other element in its period. This is due to the increased effective nuclear charge which results in greater attraction of the electrons by the nucleus. The atomic radii increase from fluorine to iodine down the group due to increase in number of shells.

Element	F	Cl	Br	I
Covalent radius (pm)	72	99	114	133
Ionic radius (pm)	133	184	196	220

(2) **Ionization energy** : Ionization energy of these elements are higher than those of the corresponding elements of group 16 due to increased nuclear charge. These values decrease systematically as we move down the group from F to I .

Element	F	Cl	Br	I
I.E. ($kJ\ mol^{-1}$)	1680	1256	1142	1008

Thus iodine which has a comparatively low value of I.E., has a tendency to lose an electron to form positive iodinium ion, I^+ and thus shown electropositive or metallic character.

(3) **Electronegativity** : Fluorine is the most electronegative element in the periodic table. With increase in atomic number down the group, the electronegativity decreases.

Element	F	Cl	Br	I	At
Electronegativity	4.0	3.2	3.0	2.7	2.2

The decreasing order of electronegativity is $F > Cl > Br > I$

(4) **Electron affinity** : Electron affinity of chlorine, bromine and iodine decrease as the size of the atom increases. The electron affinity of fluorine is, however, lower than that of Cl and Br , because of its small size as a result of which inter-electronic repulsions present in its $2p$ subshell are comparatively large. Thus chlorine has the highest electron affinity.

Element	F	Cl	Br	I
Electron affinity ($kJ\ mol^{-1}$)	333	348	325	296

The decreasing order of electron affinity is $Cl > F > Br > I$

(5) **Oxidation states** : All the halogens show an oxidation state of -1 . Fluorine being the most electronegative element always shows an oxidation state of -1 while other halogens also show positive oxidation states up to a maximum of $+7$ (i.e. $+1$, $+3$, $+5$ and $+7$) due to the availability of vacant d -

orbitals in the valence shell of these atoms. Some halogens also show +4 and +6 oxidation states in oxides and oxy acids.

(6) **Nature of bonds** : All the halogens have seven electrons in the valence shell and hence require one more electron to acquire the nearest inert gas configuration either by gaining an electron from the metallic atom to form halide, X^- ion, or by sharing an electron with an electronegative element. Thus, halogens form both ionic and covalent compounds. The halides of highly electropositive metals are ionic while those of weakly electropositive metals and non-metals are covalent. The tendency to form ionic compounds decreases from F to I . Thus, F because of its high electronegativity forms ionic compounds even with less electropositive metals like Hg, Bi, Sn etc. while other halogens form only covalent compounds.

(7) **Non-metallic character** : All the halogens are non-metallic in nature due to their high ionization energies. The non-metallic character gradually decreases down the group. However, iodine is, solid and has metallic lustre.

(8) **Atomicity and physical state** : All the halogens exist as diatomic covalent molecules (F_2, Cl_2, Br_2 and I_2). F_2 and Cl_2 are gases at room temperature, Br_2 is corrosive liquid and I_2 is volatile solid.

(9) **Colour** : All the halogens have characteristic colours. F_2 is light yellow, Cl_2 is greenish yellow, Br_2 is reddish brown and I_2 is deep violet. The colour of halogens is due to the reason that their molecules absorb light in the visible region as a result of which electron are excited to higher energy levels. The amount of energy needed for excitation decreases progressively from F_2 to I_2 and consequently there is a progressive deepening of colour of the halogens from F_2 to I_2 . Since, fluorine atom requires large amount of energy for excitation of electrons and therefore absorbs violet light and appears yellow. On the other hand, iodine requires low energy for excitation of electrons (absorbs yellow light) and appears deep violet.

(10) **Bond dissociation energy** : Bond dissociation energies of chlorine, bromine and iodine decrease down the group as the size of the atom increases. The bond dissociation energy of fluorine, is however, lower than those of chlorine and bromine because of inter electronic repulsions present in the small atom of fluorine

X	F	Cl	Br	I
Bond dissociation energy (kJ/mol)	158	243	192	151

Hence bond energy decreases in the order $Cl_2 > Br_2 > F_2 > I_2$

(11) **Bond length in X_2 molecule** : As the size of the halogen atom increase, the bond length of $X-X$ bond in X_2 molecule increases from F_2 to I_2

$X-X$ bond	$F-F$	$Cl-Cl$	$Br-Br$	$I-I$
Bond length (pm)	143	199	228	266

Thus, the bond length increases in the order $F_2 < Cl_2 < Br_2 < I_2$.

(12) **Melting points and boiling points** : Melting points and boiling points of these elements increase as we move down the group from F to

I due to an increase in the vander Waals forces of attraction which increase down the group as the size of the atom increases.

Element	F	Cl	Br	I
Melting point (K)	54	172	266	386
Boiling point (K)	85	239	332	458

Hence, the melting points and boiling points show the order as $F < Cl < Br < I$.

(13) **Solubility** : Halogens, being non polar in nature do not readily dissolve in a polar solvent like water. however, fluorine reacts with water vigorously even at low temperature (exothermally) forming a mixture of ozone and oxygen

Chlorine and bromine are fairly soluble but iodine is very little soluble in water. chlorine, bromine and iodine are more soluble in organic solvents like CCl_4, CS_2 or $CHCl_3$ and produce coloured solutions. Thus Cl_2, Br_2 and I_2 give yellow, brown and violet colour respectively. It is believed that in non-polar solvents, halogens exist as free molecules just as in the gas phase.

In nucleophilic (electron donating) polar solvents like alcohols, ketones or liquid SO_2 , halogens produce brown solution. This colour is due to the complex formation (solvent $\rightarrow$ halogen) which are charge transfer compounds.

The solubility of iodine (I_2) in water increases with addition of KI or NaI due to the formation of polyhalide (triiodide, I_3^-) ion, $KI + I_2 \rightleftharpoons KI_3$

However, this solution behaves as a simple mixture of KI and free I_2 and contains K^+ and I^- ions and free I_2 molecules. It has a brown colour. The solution of iodine in water (due to its very little solubility) is also brown.

(14) **Oxidising power** : All the halogens acts as strong oxidising agents since they have a strong tendency to attract electrons and have positive values of electrode potentials (E°). The oxidising power, however, decreases as we move down the group from F to I . i.e., $F_2 > Cl_2 > Br_2 > I_2$

Since F_2 is the strongest oxidising agent, it will oxidise all other halide ions to halogens.

Similarly, Cl_2 will displace Br^- and I^- ions from their solutions while Br_2 will displace I^- ions only.

Hence F_2 is the strongest and I_2 is the weakest oxidising agent.

This is also indicated by the decrease in the electrode potential (E°) for the reaction $X_2(aq) + 2e^- \longrightarrow 2X^-(aq)$ on moving down the group.

X_2	F_2	Cl_2	Br_2	I_2	At_2
$E^\circ(\text{volts})$	2.87	1.36	1.09	0.53	0.3

The electron affinity of fluorine is less than that of chlorine but still it is the strongest oxidising agent. This is because of its low bond dissociation energy (158 kJ mol^{-1}) and high heat hydration (510 kJ mol^{-1}) as compared to chlorine (for which the values are 243 and 372 kJ mol^{-1} , respectively).

(15) **Heat of hydration** : The heat of hydration of the halide ion (X^-) decreases as the size of the halogen decreases down the group from F to I .

X^- ion	F^-	Cl^-	Br^-	I^-
Heat of hydration (kJ mol^{-1})	510	372	339	301

Thus, the decreasing order of heat of hydration of halides is as follows :

Chemical properties

(1) **Reactivity** : The halogen are most reactive elements due to their low bond dissociation energy, high electron affinity and high enthalpy of hydration of halide ion. $F > Cl > Br > I$

(2) **Reaction with H_2O** : Halogens readily decomposes water. This tendency decreases on moving down the group. Fluorine decomposes water very energetically to give oxygen and ozone,

Fluorine gives fumes in moist air. This is due to the formation of HF , which is a liquid and can absorb moisture to form liquid droplets and therefore, gives fumes with moist air. Chlorine and bromine react less vigorously,

In the presence of sunlight, $HClO$ (hypochlorous acid) $HBrO$ (hypobromous acid) liberate oxygen.

Iodine is only slightly soluble in water. However, it dissolves in 10% aqueous solution of KI due to the formation of I_3^- ions.

(3) **Reaction with hydrogen** : Form covalent halides.

• Acidic strength in aqueous solution is in the order,

• Reducing character of hydrides follow the order,

• Boiling point $HF > HI > HBr > HCl$. Thermal stability,

HCl is also called Muriatic acid.

(4) **Hydrides** : All the halogens combine directly with hydrogen to form halogen acids but their reactivity progressively decreases from fluorine to iodine, $H_2 + X_2 \rightarrow 2HX$ ($X = F, Cl, Br$ or I).

(i) **Boiling points or volatility** : In other words volatility decreases in the order : $HCl > HBr > HI > HF$ as the boiling points increase in the order : $HCl (189K) < HBr (206K) < HI (238K) < HF (292.5K)$.

(ii) **Thermal stability** : Thermal stability of the hydrides decrease from HF to HI i.e., $HF > HCl > HBr > HI$.

(iii) **Acidic strength** : The acidic strength of halogen acids decreases from HI to HF i.e., $HI > HBr > HCl > HF$.

(iv) **Reducing properties** : Since the stability of hydrides decreases from HF to HI , their reducing properties increase in the order $HF < HCl < HBr < HI$.

(v) **Dipole moments** : The dipole moments of hydrogen halides decrease in the order : $HF > HCl > HBr > HI$ as the electro negativity of the halogen atom decreases from F to I .

HX	HF	HCl	HBr	HI
Dipole moment (D)	1.74	1.07	0.78	0.38

(5) **Oxides** : Halogens (except F) do not combine readily with oxygen. However, a number of compounds of halogens with oxygen have been prepared by indirect methods. Only two compounds of fluorine with oxygen, i.e. oxygen difluorine (OF_2) and oxygen fluoride (O_2F_2) are known. Chlorine forms largest number of oxides i.e. ClO , ClO_2 , ClO_3 and ClO_4 , while iodine forms the least, i.e. IO_2 . Bromine, however, forms three oxides (BrO , BrO_2 , BrO_3). In all these compounds, bonds are largely covalent. All the oxides of halogens are powerful oxidizing agents. These compounds are very reactive and are unstable towards heat. The stability of oxides is greatest for iodine while bromine oxides are the least stable. For a particular halogen, higher oxides are more stable than the lower ones.

Iodine-oxygen bond is stable due to greater polarity of the bond (due to larger electro negativity difference between I and O) while in chlorine-oxygen bond, the stability is gained through multiple bond formation involving the d -orbital of chlorine atom. Bromine lacks both these characteristics and hence forms least stable oxides.

Oxides of chlorine, bromine and iodine are acidic and the acidic character increases as the percentage of oxygen increases in them.

Iodine also forms IO_2 and IO_3 compounds which are believed not to be true oxides but are basic iodyl iodate, $IO_2(IO)$ and normal iodine triiodate, I_4O_9 , having tripositive iodine as the cation.

OF_2 is V-shaped having bond angle 103° , ClO_2 is also V-shaped with bond angle 117° while ClO_3 is angular with bond angle 118° . It is paramagnetic due to odd number of electrons having three-electron bond. It is regarded as a mixed anhydride of chloric and chlorous acids. $2ClO_2 + H_2O \rightarrow HClO_3 + HClO$.

(6) **Oxoacids of halogens** : Fluorine does not form any oxoacid since it is the strongest oxidizing agent. Chlorine, bromine and iodine mainly form four series of oxoacids namely hypohalous acid (HXO), halous acid (HXO_2), halic acid (HXO_3) and perhalic acid (HXO_4) as given below :

Table 18.10

Oxidation state	Chlorine	Bromine	Iodine	Thermal stability and acid strength	Oxidising power
+1	$HClO$	$HBrO$	HIO	Increases ↓	Decreases ↓
+3	$HClO_2$	—	—		
+5	$HClO_3$	$HBrO_3$	HIO_3		
+7	$HClO_4$	$HBrO_4$	HIO_4		
	Acidity decreases →				

(i) **Hybridized ion** : In all these oxoacids, the halogen atom is sp^3 - hybridized.

(ii) **Acidic character** : All these acids are monobasic containing an OH group. The acidic character of the oxoacids increases with increase in oxidation number, i.e., $HClO < HClO_2 < HClO_3 < HClO_4$ and the strength of the conjugate bases of these acids follows the order,

(iii) **Oxidising power and thermal stability** : The oxidizing power of these acids decreases as the oxidation number increases, i.e., $HClO < HClO_2 < HClO_3 < HClO_4$. Stability of oxoacids of chlorine in the increasing order is, $HClO < HClO_2 < HClO_3 < HClO_4$ and the increasing stability order of anions of oxoacids of chlorine is, $ClO^- < ClO_2^- < ClO_3^- < ClO_4^-$.

As the number of oxygen atoms in an ion increases there will be a greater dispersal of negative charge and thus greater will be the stability of ion formed. For different halogen having the same oxidation number, the thermal stability decreases with increase in atomic number i.e., it is in the order $HClO > HBrO > HIO$ and $ClO > BrO > IO$. However, in HXO_3 is most stable. The stability order being $HClO_4 < HBrO_4 < HIO_4$.

(iv) Perhalates are strong oxidizing agents, the oxidizing power is in the order, $BrO_4^- > IO_4^- > ClO_4^-$.

Thus BrO_4^- is the strongest oxidizing agent (though its reaction is quite slow) and ClO_4^- is the weakest.

(v) The acidity of oxoacids of different halogens having the same oxidation number decreases with increase in the atomic size of the halogen i.e. $HClO_4 > HBrO_4 > HIO_4$.

(7) **Reaction with alkalis** :

Halogen other than fluorine (Cl_2, Br_2, I_2) react with $NaOH$ as follows,

(8) **Bleaching action of halogen** : Cl_2 acts as bleaching agent, its bleaching action is permanent. Cl_2 water can also act as ink remover.

(9) **Reaction with other halides**

(10) **Inter halogen compounds** : The compounds of one halogen with the other are called inter halogens or inter halogen compounds. The main reason for their formation is the large electronegativity and the size differences between the different halogens. Taking A as the less electronegative and B as the more electronegative halogen, they are divided into the following four types the less electronegative halogen (A) is always written first.

AB	AB_2	AB_3	AB_5
ClF $BrF, BrCl, ICl$ IBr, IF	ClF_3, BrF_3 IF_3, ICl_3	BrF_5, IF_5	IF_7

These interhalogen compounds are unstable and more reactive

(i) **General properties**

(a) Largest halogen always serves the central atom.

(b) The highest interhalogen compound i.e. IF_7 is obtained with iodine, the largest halogen attached to the smallest one

(c) The bonds in interhalogen compounds are essentially covalent.

(d) Thermal stability decreases as the size difference decreases and increases as the polarity of the bond increases. Thus ClF is thermally more stable as compared to IBr .

(e) They ionize in solution or in the liquid state,

(f) Hydrolysis of interhalogen compounds always produces a halide ion derived from smaller halogen and oxyhalide derived from larger halogen, $ICl + H_2O \rightarrow Cl^- + OI^- + 2H^+$;

(g) They are strong oxidizing agents.

(h) Largest number of interhalogens are formed by fluorine due to its smaller size and higher electronegativity or oxidizing power.

(ii) **Structure** : Interhalogen compounds are,

(a) AB type i.e. ICl, IBr, IF etc, are linear

(b) AB_2 type i.e. IF_2, ClF_2, BrF_2 have distorted trigonal bipyramidal (dsp -hybridization) structures of T-shape due to two lone pairs in equatorial positions ICl_2 is dimeric, ICl_2 and has a planar structure.

(c) AB_3 types i.e. BrF_3, IF_3 have distorted octahedral (dsp -hybridization) shapes or square pyramidal due to a lone pair one of the axial positions.

(d) AB_5 type i.e. IF_5 have pentagonal bipyramidal (dsp -hybridization) structures.

(ii) **Polyhalide ions** : Halogens or interhalogens combine with halide ions to form polyhalide ions. The most common example of polyhalide ion formation is furnished by the increase in solubility of iodine in water in the presence of KI which is due to the formation of tri iodide ion, I_3^-

Many other examples of polyhalides ions are

(i) $Cl_3^-, Br_3^-, ICl_2^-, IBr_2^-$ including I_3^- . In these ions, one of the halogen atoms (in case of similar atoms) or halogen atom larger in size undergoes sp^3d -hybridization giving a linear shape with three lone pairs at equatorial positions.

(ii) $Cl_3^+, Br_3^+, I_3^+, ICl_2^+, IBr_2^+$. Here we find central atom sp^3 hybridized giving a bent shape with two lone pairs of electrons on the central atom.

(iii) ICl_4^-, BrF_4^-, I_5^- . Here central atom involves sp^3d^2 hybridization giving square planar shape with two lone pairs of electrons on axial positions.

(iv) ICl_4^+, BrF_4^+, I_5^+ . In these ions central atom involves sp^3d hybridization giving a distorted tetrahedral structure with one lone pair of electrons on equatorial position.

(v) I_7^-, IF_6^- . The central atom I undergoes sp^3d^3 hybridization giving a distorted octahedral structure with one lone pair of electrons.

(vi) I_7^+ . Here central I atom involves sp^3d^2 hybridization giving an octahedral structure.

Fluorine due to its highest electronegativity (and only -1 oxidation state) does not form polyhalide ions where it acts as a central atom.

(12) Pseudohalogen and pseudohalides

Pseudohalogen	Pseudohalide
Cyanogen $-(CN)_2$	Cyanide $-CN^-$
Oxocyanogen $-(OCN)_2$	Cyanate $-OCN^-$
Thiocyanogen $-(SCN)_2$	Thiocyanate $-SCN^-$
Selenocyanogen $-(SeCN)_2$	Selenocyanate $-SeCN^-$

(13) **Anomalous behaviour of fluorine** : Fluorine differs from rest of the elements of its family due to (i) its small size (ii) highest electronegativity, (iii) low bond dissociation energy and (iv) absence of d -orbitals in the valence shell. The main points of difference are :

(i) Fluorine is most reactive of all the halogens due to lower value of $F-F$ bond dissociation energy ($F_2 = 158, Cl_2 = 243$, bromine = 192 and iodine = 151 kJ mol⁻¹).

(2) Being the most electronegative element, it shows only an oxidation state of -1 and does not show positive oxidation states due to absence of d -orbitals in its valence shell. Other halogens show positive oxidation states of $+1, +3, +5$ and $+7$.

(3) Due to small atomic size and high electronegativity of F , HF undergoes strong H -bonding while other halogen acids do not. As a result,

(i) HF is a liquid (boiling point 292.5K), while other halogen acids are gases at room temperature (boiling point of $HCl = 189K$, $HBr = 206K$, $HI = 238K$).

(ii) HF is weakest of all the halogen acids due to high strength of $H-F$ bond.

(iii) Due to H -bonding, HF can form acid salts of the type KHF_2 , i.e., $K^+[H-F \cdots F^-]$ while HCl, HBr and HI do not form such salts (i.e., no $KHCl_2, KHBr_2$ and KHI_2 are known).

(4) Fluorides have the maximum ionic character. For example AlF_3 is ionic while other halides of Al are covalent.

(5) Of all the halogens, fluorine has the highest positive electrode potential ($F_2 = 2.87, Cl_2 = 1.36, Br_2 = 1.09$ and $I_2 = 0.53$ volt) i.e., it is most easily reduced and hence acts as the strongest oxidising agent. It brings about the highest oxidation of other elements with which it combines. For example with S , it gives SF_6 , with I_2 it gives IF_7 . Other halogens do not always bring about the highest oxidation state. For example, with sulphur Cl_2 gives SCl_4 , Br_2 gives SBr_2 while I_2 does not react at all. F_2 is so powerful oxidising agent that it can even oxidise inert-gases.

(6) HF cannot be stored in glass bottles since it reacts with silicates to form fluorosilicates.

While other halogen acids (HCl, HBr and HI) do not react with silicates and hence can be stored in glass bottles.

(7) AgF is soluble in H_2O while all other silver halides i.e., $AgCl, AgBr$ and AgI are insoluble in water. In contrast, CaF_2 is insoluble while other calcium halides i.e., $CaCl_2, CaBr_2, CaI_2$ are soluble in H_2O .

(8) Due to absence of d -orbitals, fluorine, does not form polyhalide ions while other halogens form polyhalides of the type I_3^-, Br_3^-, I_5^- etc.

Preparation of halogens and its uses

(1) Fluorine

(i) **Occurrence of fluorine** : Fluorine does not occur free in nature but occurs mostly as fluor spar CaF_2 , cryolite, Na_3AlF_6 and fluorapatite, $CaF_2 \cdot 3Ca_3(PO_4)_2$. Traces of fluoride occur in sea water, bones, teeth, blood, milk etc.

(ii) **Difficulties encountered during its isolation** : (a) F_2 attacks all the materials of the apparatus such as glass, platinum, carbon and other metals, (b) F_2 is the strongest oxidising agent and hence no oxidising agent can oxidise F^- ions to F_2 . (c) F_2 cannot be prepared even by electrolysis of an aqueous solution of HF because F_2 formed reacts violently with water. It also cannot be prepared by electrolysis of anhydrous HF because it is not only poisonous, corrosive and volatile but also is a bad conductor of electricity.

(iii) **Preparation** : F_2 is now prepared by electrolysis of a solution of KHF_2 (1 part) in anhydrous HF (5 parts) in a vessel (modern method) made of $Ni-Cu$ alloy or $Ni-Cu-Fe$ alloy called the monel metal using carbon electrodes. During the electrolysis following reactions occur.

At cathode : $K^+ + e^- \longrightarrow K ; 2K + 2HF \longrightarrow 2KF + H_2 \uparrow$

At anode : $F^- \longrightarrow F + e^- ; F + F \longrightarrow F_2$

(iv) **Properties** : It is the most reactive of all the halogens. It combines with metals as well as non-metals to form fluorides. It decomposes water forming O_2 and O_3 and reacts vigorously with hydrogen of hydrocarbons leaving behind fluorinated hydrocarbons.

(HF being a volatile liquid fumes in air)

It is a strong oxidising agent and oxidises $KClO_3$ to $KClO_4$, KIO_3 to KIO_4 and bisulphates to peroxy sulphates.

It reacts with NH_3 to form nitrogen and with H_2S forming SF_6 .

Fluorine reacts with cold and dilute sodium hydroxide solution to give oxygen difluoride (OF_2)

However, with hot and concentrated sodium hydroxide solution it gives oxygen

Since F_2 is the strongest oxidising agent, it is always reduced and hence does not show disproportionation reactions while others halogens do.

F_2 oxidises all other halide ions to the corresponding halogens ($\text{F}_2 + 2\text{X}^- \longrightarrow 2\text{F}^- + \text{X}_2$); ($\text{X} = \text{Cl}, \text{Br}$ or I)

(v) **Uses of fluorine** : Fluorine is used in the manufacture of UF_6 (which is used for nuclear power generation), SF_6 (which is used as an electrical insulator), chlorofluorocarbons, teflon, cryolite and HF .

(vi) **Fluorocarbons** are the derivatives of hydrocarbons in which H -atoms are replaced by F -atoms. these are obtained by fluorination of hydrocarbons with F_2 diluted with an inert gas such as N_2 in presence of CuF_2 as catalyst. Fluorocarbons are widely used in industry because of their extreme inertness (non-inflammability and extreme stability). Freon (CF_2Cl_2) is used as a refrigerant, tetrafluoroethylene ($\text{F}_2\text{C} = \text{CF}_2$) is used for the manufacture of teflon which is highly non-inflammable, has high thermal stability and is chemically inert *i.e.*, is not attacked by acids and corrosive chemicals. It is used for making pipes, surgical tubes, non-stick utensils and as an electrical insulator.

(2) Chlorine

(i) **Occurrence** : Chlorine mainly occurs as rock salt (NaCl) Carnallite, ($\text{KCl}, \text{MgCl}_2 \cdot 6\text{H}_2\text{O}$) and Calcium chloride. (CaCl_2).

(ii) **Preparation** : On a commercial scale chlorine is prepared by electrolysis of an aqueous solution of sodium chloride (brine solution) (Nelson cell, Castner and Kellner's cell for the manufacture of NaOH) when Cl_2 is evolved at the anode and H_2 is evolved at the cathode.

It can also be prepared by electrolysis of molten NaCl (Down's cell for the manufacture of metallic sodium). When Cl_2 is evolved at the anode and sodium metal at the cathode.

In the laboratory, Cl_2 is prepared by the action of MnO_2 or KMnO_4 or $\text{K}_2\text{Cr}_2\text{O}_7$ on conc. HCl or a mixture of NaCl and Conc. H_2SO_4

Other oxidising agents such as $\text{PbO}_2, \text{Pb}_3\text{O}_4, \text{CaOCl}_2, \text{O}_3$ etc. also react with HCl to liberate Cl_2 .

(iii) **Properties** : It combines with metals and non metals to form chlorides. it decomposes water forming HCl and HClO (hypochlorous acid) which is unstable and decomposes giving nascent oxygen which is responsible for oxidising and bleaching action of chlorine.

Coloured matter + $\text{O} \longrightarrow$ Colourless matter.

The bleaching action is permanent and colour is not restored on standing. However, it cannot be used for bleaching delicate articles such as straw, silk, wool etc. which are damaged by it.

Cl_2 oxidises Br^- and I^- ions to Br_2 and I_2 respectively.

It combines with alkalis forming hypochlorite and chlorate salts in cold and hot conditions respectively.

During these reactions, halogen is simultaneously reduced to X^- ion and is oxidised to either hypohalite (XO^-) or halate (XO_3^-) ion. Such reactions are called disproportionation reactions.

With slaked lime, Cl_2 gives bleaching powder (CaOCl_2)

With ammonia, Cl_2 reacts as follows :

With SO_2 and CO , addition compounds are formed

Cl_2 is strong oxidising agent. It oxidises FeCl_2 to FeCl_3 , moist SO_2 to H_2SO_4 , SO_3^{2-} to SO_4^{2-} , thiosulphate to sulphate and sulphur.

(iv) **Uses of chlorine** : It is used in the manufacture of HCl , NaOCl , bleaching powder, chlorates, vinyl chloride, insecticides such as DDT, chlorinated organic solvents like $\text{CHCl}_3, \text{CCl}_4$. It is also used in sterilisation of drinking water, in the extraction of Au and Pt and as a bleaching agent for paper, pulp and textiles.

(3) Bromine

(i) **Occurrence** : It mainly occurs in sea water and salt lakes as NaBr, KBr and MgBr_2 .

(ii) **Preparation** : On a commercial scale, bromine is prepared either from sea water (containing NaBr, KBr and MgBr_2) or the mother liquor (containing MgBr_2) left after crystallisation of chlorides from carnallite. On passing Cl_2 gas through these solutions, bromides get oxidised to bromine which is cooled and condensed to Br_2 liquid.

In the laboratory, bromine can be prepared by heating NaBr with MnO_2 and conc. H_2SO_4 .

It is also obtained by adding HCl to a mixture containing potassium bromide and potassium bromate.

(iii) **Properties** : Bromine is a reddish brown heavy liquid.

Its reaction with water, oxidising and bleaching action, reaction with alkalies, NH_3 , metals and non metals are similar to that of chlorine. Br_2 oxidises only iodide ions to I_2 . Bromine water reacts with mercuric oxide to form mercury oxy bromide

(iv) **Uses of bromine** : The main use of bromine is in the manufacture of ethylene bromide which is used as an additive to leaded petrol. It is also used to prepare AgBr , bromine water, dyes, drugs and benzyl bromide (an effective tear gas).

(4) Iodine

(i) **Occurrence** : It mainly occurs in sea weeds or alkali metal iodides. Caliche (crude chile salt petre) which is mainly sodium nitrate contains iodine as sodium iodate (NaIO_3).

(ii) **Preparation of iodine** : On a commercial scale iodine is prepared from sea weeds and caliche.

(a) **From sea weeds** : Sea weeds (Laminaria variety) are dried, burnt and ash (called kelp contains about 1% I_2 as iodides of alkali metals besides chlorides and sulphates) is extracted with hot water. sulphates and chlorides are separated by fractional crystallisation, the mother liquor is treated with Cl_2 gas or heated with MnO_2 and conc. H_2SO_4 to liberate I_2 which is cooled and condensed to give violet crystals.

(b) **From Caliche** : The mother liquor left after crystallisation of NaNO_3 is treated with NaHSO_3 to liberate I_2 from NaIO_3 .

In the laboratory, I_2 is prepared by heating a mixture of potassium iodide and MnO_2 with conc. H_2SO_4 .

(iii) **Properties** : It is a dark violet shining solid which sublimes on heating. It is least soluble in water. However, its solubility can be increased by adding 10% KI solution due to the formation of I_3^- complex ion in which I^- ion acts as a lewis base (ligand) and I_2 molecule behaves as a lewis acid (central atom) which accommodates lone pair of electrons donated by I^- ion in the antibonding sigma p_z molecular orbital.

The aqueous solution containing I_3^- complex ion has a brown colour. It is soluble in many organic solvents. Its solution in CS_2 , CHCl_3 and CCl_4 is violet while in strong donor solvents like alcohols, ethers and amines is brown.

With cold, dilute NaOH , iodine gives hypoiodous acid

However, with hot, conc. solution of NaOH , the reaction is similar to that of Cl_2 or Br_2 .

Iodine does not displace chlorine and bromine from chlorides and bromides respectively, but it displaces them from their oxy salts

With $\text{Na}_2\text{S}_2\text{O}_3$, iodine solution is decolourised due to the formation of colourless iodide and tetrathionate ions.

With ammonia it reacts as follows

With strong oxidising agents such as HNO_3 , O_3 and Cl_2 , iodine gives iodic acid (HIO_3)

(iv) **Uses of iodine** : It is used to prepare tincture of iodine (2% solution of I_2 in alcohol), iodox, iodoform, KI , iodised salt (which contains KI or NaI , 0.5 g per kg of NaCl) and as a laboratory reagent.

(5) **Hydrogen halides** : All the halogens combine with hydrogen to form hydrogen halides (HX).

(i) **Preparation of HF and HCl** : These are prepared by heating fluorides and chlorides respectively with conc. H_2SO_4 .

(ii) **Preparation of HBr and HI** : These are prepared by heating bromides and iodides respectively with phosphoric acid

Conc. H_2SO_4 cannot be used for the preparation of HBr and HI because these being strong reducing agents reduced H_2SO_4 to SO_2 and are themselves oxidised to Br_2 and I_2 respectively.

(6) **Bleaching powder** is obtained by the action of chlorine on dry slaked lime (Hasenclever method).

An aqueous solution of bleaching powder gives tests for Cl^- and ClO^- ions. On long standing, it undergoes auto-oxidation to form calcium chlorate. However, when heated, in presence of CoCl_2 , it gives O_2

It is used for bleaching cotton, wood pulp etc., as a disinfectant, as a germicide for sterilization of drinking water, in the manufacture of chloroform and for making wood unshrinkable.

Noble Gases

Helium is the first member of group 18 or zero of the periodic table. It consists of six elements helium (*He*), Neon (*Ne*), argon (*Ar*), krypton (*Kr*), xenon (*Xe*) and radon (*Rn*). Zero group occupies the intermediate position between the elements of VIIA (17th) and IA (1st) groups. These are collectively called as inactive gases or inert gases. However, these are now called noble gases as some compounds of these gases have been obtained under certain specific conditions.

(i) Electronic configuration

Elements	Discovery	Electronic configuration ($ns^2 np^6$)
${}_2\text{He}$	Lockyer and Janssen (1868)	$1s^2$
${}_{10}\text{Ne}$	Ramsay	$1s^2, 2s^2 2p^6$
${}_{18}\text{Ar}$	Rayleigh and Ramsay (1894)	$1s^2, 2s^2 2p^6, 3s^2 3p^6$
${}_{36}\text{Kr}$	Ramsay and Travers (1898)	$1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^6$
${}_{54}\text{Xe}$	Ramsay and Travers (1898)	$1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^6 4d^{10} 4f^{14}, 5s^2 5p^6$
${}_{86}\text{Rn}$	Dorn (1900)	$1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^6 4d^{10} 4f^{14}, 5s^2 5p^6 5d^{10}, 6s^2 6p^6$

(2) **Occurrence** : Due to the inert nature of noble gases, they always occur in the free state. Except radon, all these gases are present in atmosphere in the atomic state.

Element	<i>He</i>	<i>Ne</i>	<i>Ar</i>	<i>Kr</i>	<i>Xe</i>
Abundance (Volume %)	5.2×10^{-4}	1.8×10^{-3}	9.3×10^{-1}	1.4×10^{-3}	8.7×10^{-6}

He is also present in natural gas to the extent of 2 to 7%.

(3) Isolation

(i) **Helium** : It is commercially obtained from natural gas. The natural gas contains hydrocarbons (methane etc.), *CO*, *H₂S* and *He* as the main constituents.

The natural gas is compressed to about 100 atm and cooled to 73K. *He* remains unliquefied while other gases get liquefied. About 99% pure *He* is prepared by this method.

(ii) **Argon, Neon, Krypton and Xenon** : These gases are prepared by the fractionation distillation of liquid air. Fractional distillation of air gives *O₂*, *N₂* and mixture of noble gases. The individual gases may be obtained by adsorption of air on coconut charcoal. The charcoal adsorbs different gases at different temperatures and can be collected.

(iii) **Radon** : It can be obtained by radio active disintegration of radium (${}_{88}\text{Ra} \rightarrow {}_{86}\text{Rn} + {}_2\alpha$).

Properties :

(1) **Atomic radii** : The atomic radii of noble gases increases on moving down the group and their atomic radii correspond to the vander Waal's radii.

(2) **Boiling points** : The m.pt. and b.pt. increases from *He* to *Rn*, because of increase in magnitude of vander Waal's forces.

(3) **Polarizability** : The polarizability increases down the group, $He < Ne < Ar < Kr < Xe$

(4) **Ionisation energy and electron affinity** : Noble gases have stable $ns^2 np^6$ fully filled electronic configuration, so these have no tendency to add or lose electron. Therefore, ionisation energy of noble gases is very high. On the other hand their electron affinity is zero.

(5) **Heat of vaporisation** : They possess very low values of heat of vapourisation, because of presence of very weak vander Waal's forces of attraction between their monoatomic molecules. However the value of heat of vaporisation increases with atomic number down the group and this shows that there is an increasing polarizability of the larger electronic clouds of the elements with higher atomic number.

(6) **Solubility in water** : They are slightly soluble in water. Their solubility generally increases with the increase in atomic number down the group.

(7) **Adsorption by charcoal** : All of them except helium are adsorbed by coconut charcoal at low temperature. The extent of adsorption increases down the group.

(8) **Characteristic spectra** : All of them give characteristic spectra, by which they can be identified.

(9) **Liquification of gases** : It is difficult to liquify noble gases as their atoms are held by weak vander Waal's forces. Ease of liquification increases down the group from *He* to *Rn*. Helium has the lowest boiling point (4.18 K) of any known substance. The ease of liquification increases down the group due to increase in intermolecular forces.

The elements helium (*He*), neon (*Ne*), argon (*Ar*), krypton (*Kr*), xenon (*Xe*) and radon (*Rn*), constitute zero group of the periodic table. These are gases at ordinary temperature and do not have chemical reactivity and therefore, these are called inert gases.

Compounds of Xenon

In 1962, N. Bartlett noticed that *PtF₆* is a powerful oxidizing agent which combines with molecular oxygen to form ionic compound, dioxygenyl hexafluoro platinate (v) $\text{O}_2^+[\text{PtF}_6]^-$, $\text{O}_{2(g)} + \text{PtF}_{6(g)} \rightarrow \text{O}_2^+[\text{PtF}_6]^-$. This indicates that *PtF₆* has oxidized *O* to O_2^+ . Now, oxygen and xenon have some similarities,

(i) The first ionization energy of *Xe* gas (1170 kJ mol⁻¹) is fairly close to that of oxygen (1166 kJ mol⁻¹).

(ii) The molecular diameter of oxygen and atomic radius of *Xe* are similar (4 Å)

On this assumption, Bartlett reacted Xenon and *PtF₆* in gas phase and a orange yellow solid of the composition *XePtF₆* was obtained, $\text{Xe}_{(g)} + \text{PtF}_{6(g)} \rightarrow \text{Xe}^+[\text{PtF}_6]_{(s)}^-$.
Orange yellow

Some important stable compounds of *Xe* are,

+2	+4	+6
<i>XeF₂</i>	<i>XeF₄</i> , <i>XeOF₂</i>	<i>XeF₆</i> , <i>XeOF₄</i> , <i>XeO₃</i>

Fluorides : Xenon forms three compounds with fluorine. These are : Xenon difluoride (XeF_2), Xenon tetrafluoride (XeF_4) and Xenon hexafluoride (XeF_6).

(1) **Xenon difluoride (XeF_2)** is formed when a mixture of Xenon and fluorine in the ratio 1 : 3 by volume is passed through a nickel tube at 673 K, $Xe + F_2 \xrightarrow{Ni, 673K} XeF_2$

Structure : XeF_2 has trigonal bipyramid geometry due to sp^3d hybridization of Xe. Three equatorial positions are occupied by lone pairs of electrons giving a linear shape to the molecule.

Properties : XeF_2 is a colourless crystalline solid, reacts with H_2 to give Xe and HF. It is hydrolysed completely by water,

It also forms addition compounds with reactive pentafluorides like SbF_5 , TaF_5 etc.

It is a mild fluorinating agent and hence reacts with benzene to give fluorobenzene.

(2) **Xenon tetrafluoride (XeF_4)** is prepared by heating a mixture of xenon and fluorine in the ratio 1 : 5 in a nickel vessel at 673 K and then suddenly cooling it in acetone. XeF_4 is also formed when an electric discharge is passed through a mixture of xenon and excess of fluorine, $Xe + 2F_2 \xrightarrow{Ni, 673K} XeF_4$

Structure : XeF_4 has square planar shape due to sp^3d^2 hybridization of Xe giving octahedral geometry with two trans positions occupied by lone pairs of electrons.

Properties : XeF_4 is a colourless, crystalline solid, soluble in anhydrous HF, reacts with H_2 to form Xe and HF and reacts with water to give highly explosive solid, XeO_3 . (complete hydrolysis),

Partial hydrolysis yields $XeOF_4$,

It also forms addition compounds with SbF_5 , $XeF_4 + SbF_5 \rightarrow [XeF_3]^+ [SbF_6]^-$.

It also acts as a strong fluorinating agent.

(3) **Xenon hexafluoride (XeF_6)** is prepared by heating a mixture of xenon and fluorine in the ratio 1 : 20 at 473–523 K under a pressure of 50 atmospheres.

Structure : XeF_6 has pentagonal bipyramid geometry due to sp^3d^2 hybridization. One trans position is occupied by a lone pair giving a distorted octahedral shape.

Properties : It is colourless, crystalline solid, highly soluble in anhydrous HF giving solution which is a good conductor of electricity, $HF + XeF_6 \rightarrow XeF_5^+ + HF_2^-$.

It is the most powerful fluorinating agent and reacts with H_2 to give Xe and HF. Partial hydrolysis of XeF_6 yields $XeOF_4$, an complete hydrolysis yields xenon trioxide, XeO_3 .

It forms addition compounds with alkali metal fluorides (except LiF) of the formula $XeF \cdot MF$ where M represents the alkali metal.

Oxides : Xenon forms two oxides such as xenon trioxide (XeO_3) and xenon tetraoxide (XeO_4).

(1) **Xenon trioxide (XeO_3)** is prepared by complete hydrolysis of XeF_6 and XeF_4 ,

Structure : XeO_3 has tetrahedral geometry due to sp^3 hybridization of Xe. One of the hybrid orbitals contains a lone pair of electrons giving a trigonal pyramidal shape. The molecule has three $Xe=O$ double bonds containing $p\pi-d\pi$ overlapping.

Properties : It is a colourless solid, highly explosive and powerful oxidizing agent.

(2) **Xenon tetraoxide (XeO_4)** is prepared by the action of conc. H_2SO_4 on sodium or barium xenate (Na_4XeO_6 ; Ba_2XeO_6) at room temperature,

XeO_4 is purified by vacuum sublimation at 195 K.

Structure : XeO_4 has tetrahedral structure due to sp^3 hybridization of Xe. There are four $Xe-O$ double bonds containing $p\pi-d\pi$ overlapping.

Properties : It is quite unstable gas and decomposes to xenon and oxygen, $XeO_4 \rightarrow Xe + 2O_2$.

Oxyfluorides : Xenon forms three types of oxy fluorides such as xenon oxydifluoride ($XeOF_2$), xenon oxytetrafluoride $XeOF_4$ and xenon dioxydifluoride (XeO_2F_2).

(1) **Xenon oxydifluoride ($XeOF_2$)** is formed by partial hydrolysis of XeF_6 at 193 K,

Structure : $XeOF_2$ has trigonal bipyramid geometry due to sp^3d hybridization of Xe. Two equatorial positions are occupied by lone pairs of electrons giving a T-shape to the molecule. There is one $Xe-O$ double bond containing $p\pi-d\pi$ overlapping.

(2) **Xenon oxytetrafluoride ($XeOF_4$)** is prepared by partial hydrolysis of XeF_6 ; $XeF_6 + H_2O \rightarrow XeOF_4 + 2HF$. It can also be prepared by the reaction of SiO_2 with XeF_6 ,

Structure : $XeOF_4$ has octahedral geometry due to sp^3d^2 hybridization of Xe. One trans position is occupied by a lone pair giving pyramid shape to the molecule. There is one $Xe-O$ double bond containing $p\pi-d\pi$ overlapping.

Properties : It is a colourless volatile liquid which melts at 227 K. It reacts with water to give $XeOF_4$ and XeO_3 .

It is reduced by H_2 to Xe ,

(3) **Xenon dioxydifluoride ($XeOF_2$)** is formed by partial hydrolysis of $XeOF_4$ or XeF_6 .

It can also be prepared by mixing XeO_3 and $XeOF_4$ at low temperature (195 K). The product is purified by fractional distillation, $XeO_3 + XeOF_4 \xrightarrow{195 K} 2XeO_2F_2$

Structure : $XeOF_4$ has trigonal bipyramid geometry due to sp^3d hybridization of Xe . One equatorial position is occupied by a lone pair of electrons giving a see-saw structure (shape) to the molecule. There are two $Xe-O$ double bonds containing $p\pi-d\pi$ overlapping.

Properties : It is a colourless solid which melts at 303 K. It is easily hydrolysed to give XeO_3 .

Uses of noble gases

(1) He is used for filling of balloons and air ships because of its non-inflammability and high power (which is 92.6% to that of hydrogen).

(2) Oxygen-helium (1 : 4) mixture is used for treatment of asthma and for artificial respiration in deep sea diving because unlike nitrogen, helium is not soluble in blood even under high pressure.

(3) Helium is also used for creating inert atmosphere in chemical reactions.

(4) Liquid helium is used as a cryogenic fluid to produce and maintain extremely low temperatures for carrying out researches and as a coolant in atomic reactors and super conducting magnets.

(5) It is also used in low temperature gas thermometry and as a shield gas for arc welding.

(6) Argon is used for creating inert atmosphere in chemical reactions, welding and metallurgical operations and for filling in incandescent and fluorescent lamps. It is also used in filling Geiger-Counter tubes and thermionic tubes.

(7) Krypton and Xenon are also used in gas filled lamps. A mixture of Krypton and Xenon is also used in some flash tubes for high speed photography.

(8) Radon is used in radioactive research and therapeutics and in the non-surgical treatment of cancer and other malignant growths.

by sodium chloride while it is retard by borax or alum. Addition of alum to plaster of paris makes the setting very hard. The mixture is known as Keen's cement.

✍ BC_2 (boron carbide) is one of the hardest known artificial substance and is called carborundum.

✍ Bitter almonds contain HCN in free state. It is produced by the action of water on amygdalin (present in bitter almonds) in the presence of enzyme emulsin (also present in bitter almonds).

✍ Industrial lubricant oil-dag is a suspension of graphite in oil and colloidal solution of graphite is called aquadag.

✍ Broken glass pieces added during glass making is known as cullet.

Tips & Tricks

✍ Among all the alkali metals Li is the strongest and Na is the weakest reducing agent.

✍ Lindlar's catalyst is Pd poisoned with $BaSO_4$ in quinoline.

✍ Keen's cement : The setting of plaster of paris may be catalysed

Ordinary Thinking

Objective Questions

Alkali metals

- As compared to potassium, sodium has [MP PMT 1985]
 - Lower electronegativity
 - Higher ionization potential
 - Greater atomic radius
 - Lower melting point
- Potassium is kept in [CPMT 1976]
 - Alcohol
 - Water
 - Kerosene
 - Liquid ammonia
- The product obtained on fusion of $BaSO_4$ and Na_2CO_3 is [AFMC 2005]
 - $BaCO_3$
 - BaO
 - $Ba(OH)_2$
 - $BaHSO_4$
- Which of the following statement is correct regarding alkali metals
 - Cation is less stable than the atom
 - Cation is smaller than the atom
 - Size of cation and atom is the same
 - Cation is greater in size than the atom
- Valency electrons in alkali metals are [CPMT 1972]
 - 1
 - 7
 - 4
 - 2
- Magnitude of which of the following property of alkali metals increases with the increase of atomic number [MP PMT 1987]
 - Electronegativity
 - Ionic radius
 - First ionization energy
 - Melting point
- As compared to lithium, sodium reacts quickly with water because
 - Its molecular weight is less
 - It is stronger electronegative
 - It is stronger electropositive
 - It is a metal
- Which is an ore of potassium [DPMT 1984; CPMT 1986; Kurukshetra CEE 1998]
 - Carnellite
 - Cryolite
 - Bauxite
 - Dolomite
- Na_2CO_3 can be manufactured by Solvay's process but K_2CO_3 cannot be prepared because [MP PMT 1993]
 - K_2CO_3 is more soluble
 - K_2CO_3 is less soluble
 - $KHCO_3$ is more soluble than $NaHCO_3$
 - $KHCO_3$ is less soluble than $NaHCO_3$
- Which of the following alkali metals is smallest in size [CPMT 1990]
 - Rb
 - K
 - Na
 - Li
- When potassium dichromate crystal are heated with conc. HCl
 - O_2 is evolved
 - Chromyl chloride vapours are evolved
 - Cl_2 is evolved
 - No reaction takes place
- Which of the following does not illustrate the anomalous properties of lithium [MP PET 1993]
 - The melting point and boiling point of Li are comparatively high
 - Li is much softer than the other group 1 metals
 - Li forms a nitride Li_3N unlike group 1 metals
 - The ion of Li and its compounds are more heavily hydrated than those of the rest of the group
- Correct order of increasing activity is
 - Cu, Mg, Na
 - Na, Mg, Cu
 - Mg, Na, Cu
 - Cu, Na, Mg
- On heating anhydrous Na_2CO_3 , is evolved [CPMT 1971, 79]
 - CO_2
 - Water vapour
 - CO
 - No gas
- Chile saltpetre is [DPMT 1984; CPMT 1986, 89; CET Pune 1998; MP PMT 2003]
 - $NaNO_3$
 - Na_2SO_4
 - KNO_3
 - Na_2SO_3
- A mixture of KCl and KF is added to sodium chloride
 - To increase the conductivity of $NaCl$
 - To decrease the melting point of $NaCl$
 - To suppress the degree of dissociation of $NaCl$
 - To decrease the volatility of $NaCl$
- A well known reagent which contains copper sulphate, sodium potassium tartrate and sodium hydroxide is
 - Fenton's reagent
 - Schiff's reagent
 - Fehling's solution
 - Nessler's reagent
- Sodium metal is stored under [CPMT 1972, 85; BHU 1983]
 - Benzene
 - Kerosene
 - Alcohol
 - Toluene
- The most dangerous method of preparing hydrogen would be by the action of HCl and [JIPMER 2000]
 - Al
 - K
 - Fe
 - Zn
- Based on lattice energy and other considerations which one of the following alkali metal chlorides is expected to have the highest melting point [AIEEE 2005]
 - $LiCl$
 - $NaCl$
 - KCl
 - $RbCl$
- The correct formula of hypo is
 - $Na_2S_2O_3 \cdot 5H_2O$
 - Na_2SO_4
 - $Na_2S_2O_3 \cdot 4H_2O$
 - $Na_2S_2O_3 \cdot 3H_2O$
- The reagent commonly used to determine hardness of water titrimetrically is [AIIMS 2003]
 - Oxalic acid
 - Disodium salt of EDTA
 - Sodium citrate
 - Sodium thiosulphate
- K_2CS_3 can be called potassium [CPMT 1972, 74]
 - Carbon disulphide
 - Carbon trisulphide
 - Carbon tetrachloride
 - Carbon disulphide

- (a) Thiocyanate (b) Thiocarbonate
(c) Thiocarbide (d) Sulphocyanide
24. Which is most basic in character [BHU 1982]
(a) $RbOH$ (b) KOH
(c) $NaOH$ (d) $LiOH$
25. When washing soda is heated [AFMC 2005]
(a) CO is released
(b) $CO + CO_2$ is released
(c) CO_2 is released
(d) Water vapour is released
26. Which of the following is correct [CPMT 1971]
(a) All carbonates are soluble in water
(b) Carbonates of Na , K and NH_4 are soluble in water
(c) Carbonates of Ca , Sr , Ba are soluble in water
(d) All carbonates are insoluble
27. Nitre is [CPMT 1986]
(a) $AgNO_3$ (b) KNO_3
(c) NH_4NO_3 (d) $NaNO_3$
28. Nelson cell is used for the preparation of [CPMT 1985]
(a) Slaked lime (b) Baryta
(c) Sodium (d) Caustic soda
29. Potash alum is a [CPMT 1986; MNR 1981]
(a) Complex salt (b) Acid salt
(c) Double salt (d) Normal salt
30. The process of industrial manufacturing of sodium carbonate is known as [CPMT 1978, 86; MP PMT 1995]
(a) Castner process (b) Haber's process
(c) Le-blanc process (d) Chamber process
31. The colour of hydrogen is [IIT 1980]
(a) Black (b) Yellow
(c) Orange (d) None of these
32. Which one of the following salts gives aqueous solution which is weakly basic [Bihar CEE 1995]
(a) $NaHCO_3$ (b) $NaHSO_4$
(c) $NaCl$ (d) NH_4HCO_3
33. An example for a double salt is [KCET 2002]
(a) Silver nitrate (b) Mohr's salt
(c) Potassium ferricyanide (d) Cupromonium sulphate
34. The elements of group 1A provide a colour to the flame of Bunsen burner due to [AIIMS 1987]
(a) Low ionization potential
(b) Low melting point
(c) Softness
(d) Presence of one electron in the outermost orbit
35. Which of the following is the smallest cation [MP PMT 1993]
(a) Na^+ (b) Mg^{+2}
(c) Ca^{+2} (d) Al^{+3}
36. K , Ca and Li metals may be arranged in the decreasing order of their standard electrode potentials as [CPMT 1990]
(a) K , Ca , Li (b) Li , K , Ca
(c) Li , Ca , K (d) Ca , Li , K
37. Alkali metals lose electrons in [CBSE PMT 1990]
(a) s -orbitals (b) p -orbitals
(c) d -orbitals (d) f -orbitals
38. The alkali metal that reacts with nitrogen directly to form nitride is [Roorkee 1994]
(a) Li (b) Na
(c) K (d) Rb
39. Which of the following has density greater than water [MP PET 1994]
(a) Li (b) Na
(c) K (d) Rb
40. The reactivity of the alkali metal sodium with water, is made use of
(a) In drying of alcohols
(b) In drying of benzene
(c) In drying of ammonia solution
(d) As a general drying agent
41. Which of the following has smaller size [RPET 2003]
(a) H (b) He^+
(c) ${}_1H^2$ (d) Li^{2+}
42. KF combines with HF to form KHF_2 . The compound contains the species [IIT 1996]
(a) K^+ , F^- and H^+ (b) K^+ , F^- and HF
(c) K^+ and $[HF_2]^-$ (d) $[KHF]^+$ and F^-
43. Which alkali metal is most metallic in character [MH CET 2001]
(a) K (b) Cs
(c) Na (d) Li
44. The property of hydrogen which distinguishes it from other alkali metals is [MP PET 1996]
(a) Its electropositive character
(b) Its affinity for non-metals
(c) Its reducing character
(d) Its non-metallic character
45. Which of the following reacts with water with high rate [AFMC 1995]
(a) Li (b) K
(c) Na (d) Rb
46. The valence shell electronic configuration of alkali metals is [MP PET 1996; UPSEAT 2001]
(a) ns^2np^1 (b) ns^1
(c) $(n-1)p^6ns^2$ (d) $(n-1)d^2ns^2$
47. Alkali metals are [MP PMT 1996]
(a) Li , Na , Be , Mg , Cs (b) Li , Na , K , Rb , Cs
(c) Na , K , Mg , Ca , Rb (d) K , Rb , Cs , Ba , Sr
48. The atomic number of an element is 11. Its oxide will be [MP PMT 1996]
(a) Acidic (b) Basic
(c) Acid and basic both (d) Neutral
49. The commercial production of sodium carbonate is done by [CPMT 1982; MP PMT 1996]
(a) Lead-chamber process
(b) Haber's process
(c) Solvay's process

- (d) Castner's process
50. Alkali metals are strong reducing because
(a) These are monovalent
(b) Their ionisation potential are very high
(c) Their standard electrode potential are very much negative
(d) These are metals
51. Which of the following statement about $LiCl$ and $NaCl$ is correct [Kurukshetra CET 2002]g
(a) $LiCl$ has higher melting point than $NaCl$
(b) $LiCl$ dissolves in water whereas $NaCl$ does not
(c) $LiCl$ would ionize in water more than $NaCl$
(d) Fused $LiCl$ would be less conducting than fused $NaCl$
52. In the Castner's process for the extraction of sodium, the anode is made of.....metal. [EAMCET 2003]
(a) Copper (b) Iron
(c) Sodium (d) Nickel
53. Which of the following s-block elements forms nitride [RPET 2003]
(a) Ba (b) Be
(c) Ca (d) Li
54. Tincal is [Pb. PMT 2001]
(a) $Na_2CO_3 \cdot 10H_2O$ (b) $NaNO_3$
(c) $NaCl$ (d) $Na_2B_4O_7 \cdot 10H_2O$
55. Which has minimum solubility [BHU 2003]
(a) Br_2S_3 (b) Ag_2S
(c) CoS (d) PbS
56. Cryolite helps in [BHU 2003]
(a) Lowering the melting point
(b) Increasing the melting point
(c) Increasing the electrical conductivity
(d) Decreasing the electrical conductivity
57. In certain matters lithium differs from other alkali metals, the main reason for this is [MP PET/PMT 1998]
(a) Small size of Li atom and Li^+ ion
(b) Extremely high electropositivity of Li
(c) Greater hardness of Li
(d) Hydration of Li^+ ion
58. Acidified potassium permanganate solution is decolourised by
(a) Bleaching powder (b) Microcosmic salt
(c) Mohr salt (d) White vitriol
59. Which one of the following is used as a disinfectant in water treatment [NDA 1999]
(a) Alum (b) Charcoal
(c) Kieselguhr (d) Potassium permanganate
60. Sodium thiosulphate is used in photography [UPSEAT 1999]
(a) To convert metallic silver into silver salt
(b) $AgBr$ grain is reduced to non-metallic silver
(c) To remove reduced silver
(d) To remove undecomposed $AgBr$ in the form of $Na_3[Ag(S_2O_3)_2]$ (a complex salt)
61. Composition of borax is [UPSEAT 2001;04]
(a) $Na_2B_4O_7 \cdot 4H_2O$ (b) $Na_2B_4O_7 \cdot 10H_2O$
(c) $NaBO_2$ (d) Na_2BO_3
62. When sodium dicarbonate is heated strongly for calcined in a kiln, it forms [CPMT 2000; KCET (Med.) 2000]
(a) Na (b) Na_2CO_3
(c) $NaCO_3$ (d) $NaHCO_3$
63. The strongest reducing agent is [MP PET 2001]
(a) K (b) Al
(c) Br
64. The word 'alkali' is used for alkali metals indicates [RPMT 1999]
(a) Ash of the plants (b) Metallic nature
(c) Silvery lusture (d) Active metal
65. Potassium nitrate is called [RPMT 1999]
(a) Mohr's salt (b) Gypsum
(c) Indian salt petre (d) Chile salt petre
66. Which of the following chemicals, in addition to water, are used for the manufacture of Na_2CO_3 by Solvay process [Roorkee 1999]
(a) $NaCl, CO$ and NH_3
(b) $NaCl, CO_2$ and NH_3
(c) $NaCl, NH_4Cl$ and CO_2
(d) $NaHCO_3, CO$ and NH_3
67. Which metal forms amide with NH_3 at $300^\circ C$ [CPMT 1994]
(a) Mg (b) Pb
(c) Al (d) Na
68. When sodium is heated with moist air, then the product obtained is [AIIMS 1999]
(a) Na_2O (b) $NaOH$
(c) Na_2CO_3 (d) Na_2O_2
69. An inorganic compound first melts then resolidifies and then liberates a gas. It may be [DPMT 2002]
(a) MnO_2 (b) Al_2O_3
(c) $KMnO_4$ (d) $KClO_3$
70. On dissolving moderate amount of sodium metal in liquid NH_3 at low temperature, which one of the following does not occur [AIIMS 2003]
(a) Blue coloured solution is obtained [UPSEAT 2001]
(b) Na^+ ions are formed in the solution
(c) Liquid NH_3 becomes good conductor of electricity
(d) Liquid ammonia remains diamagnetic
71. The solubility of the alkali metal carbonates [Pune CET 1998]
(a) Increases at first and then decreases
(b) Does not show regular variation
(c) Increases as we go down the group
(d) Decreases as we go down the group
72. Which of the following properties is not true for an alkali metal [Pune CET 1998]
(a) Low atomic volume
(b) Low ionization energy
(c) Low density
(d) Low electronegativity

73. Which of the following alkali metals has the biggest tendency for the half reaction, $M(g) \rightarrow M^+(aq) + e^-$ [DPMT 2001]
 (a) Lithium (b) Sodium
 (c) Cesium (d) Potassium
74. Which one of the following metallic hydroxides does not dissolve in sodium hydroxide solution [KCET (Med.) 2001]
 (a) $Zn(OH)_2$ (b) $Al(OH)_3$
 (c) $Fe(OH)_3$ (d) $Pb(OH)_2$
75. Which one of the following on heating will not give CO_2 [NDA 1999; BHU 2000]
 (a) $CaCO_3$ (b) Na_2CO_3
 (c) $PbCO_3$ (d) Li_2CO_3
76. $NaOH$ is prepared by the method [AFMC 2005]
 (a) Down's cell (b) Castner cell
 (c) Solvay process (d) Castner Kellner cell
77. Sodium gives blue colour with NH_3 solution, this blue colour is due to [UPSEAT 2000,02; AMU 2002; RPMT 2002]
 (a) Ammoniated Na^+ (b) Ammoniated $Na^\ominus$
 (c) Ammoniated e^- (d) Na^+ / Na^- pair
78. The strongest reducing agent of the alkali metal is [CPMT 1999; Pb.CET 2001]
 (a) Li (b) Na
 (c) K (d) Cs
79. With the increase in atomic weights, melting points of the alkali metals [MP PMT 1995]
 (a) Increase
 (b) Decrease
 (c) Remain constant
 (d) Do not show definite trend
80. The reaction of water with sodium and potassium is [BHU 1999]
 (a) Exothermic
 (b) Endothermic
 (c) Reversible
 (d) Irreversible and endothermic
81. When potassium ferrocyanide crystals are heated with concentrated sulphuric acid, the gas evolved is [CBSE PMT PMT 1999; KCET 2000]
 (a) Ammonia (b) Sulphur dioxide
 (c) Carbon dioxide (d) Carbon monoxide
82. Characteristic feature of alkali metals is [RPMT 2000; MP PMT 2004]
 (a) Good conductor of heat and electricity
 (b) High melting points
 (c) Low oxidation potentials
 (d) High ionization potentials
83. A substance X is a compound of an element of group 1A the substance X gives a violet colour in flame test, X is [MP PMT 1980, 85, 86; CPMT 1985; DCE 2000]
 (a) $LiCl$ (b) $NaCl$
 (c) KCl (d) None
84. Which of the following alkali metal ions has lowest ionic mobility in aqueous solution [KCET 2000]
 (a) Rb^+ (b) Cs^+
 (c) Li^+ (d) Na^+
85. Lithium shows similarities to magnesium in its chemical behaviour because [Pb. PMT 2000]
 (a) Similar size, greater electronegativity and similar polarizing power.
 (b) Similar size same electronegativity and lower polarizing power
 (c) Similar size, same electronegativity and similar high polarizing power
 (d) None of these
86. Which one of the following is the most electropositive element [Pb. PMT 2000]
 (a) Calcium (b) Chlorine
 (c) Potassium (d) Carbon
87. Electrolysis of molten sodium chloride leads to the formation of [KCET 1990]
 (a) Na and H_2 (b) Na and O_2
 (c) H_2 and O_2 (d) Na and Cl_2
88. When sodium bicarbonate is heated the product obtained is [Pb. CET 2000; DCE 2004]
 (a) Na (b) Na_2CO_3
 (c) $NaCO_3$ (d) $Na_2(HCO_3)_2$
89. Which of the following is a use of alum [CPMT 2004]
 (a) Making explosives (b) Bleaching clothes
 (c) Water softening (d) All of the above
90. Which of the following salt does not get hydrolysed in water [CPMT 2004]
 (a) $KClO_4$ (b) NH_4Cl
 (c) CH_3COONa (d) None of these
91. A fire of lithium, sodium and potassium can be extinguished by [DCE 2003]
 (a) H_2O (b) Nitrogen
 (c) CO_2 (d) Asbestos blanket
92. Which of the following metal has stable carbonates [AFMC 2004]
 (a) Na (b) Mg
 (c) Al (d) Si
93. Aluminium reacts with caustic soda to form [DCE 2004]
 (a) Aluminium hydroxide
 (b) Aluminium oxide
 (c) Sodium meta-aluminate
 (d) Sodium tetra aluminate
94. Alkaline earth metals are denser than alkali metals, because metallic bonding in alkaline earth's metal, is [BHU 2004]
 (a) Stronger (b) Weaker
 (c) Volatile (d) Not present
95. Which of the following is a false statement [CPMT 2004]
 (a) Fluorine is more electronegative than chlorine
 (b) Nitrogen has greater IE_1 than oxygen
 (c) Lithium is amphoteric
 (d) Chlorine is an oxidising agent
96. Which is most basic in character [UPSEAT 2004]
 (a) $CsOH$ (b) KOH
 (c) $NaOH$ (d) $LiOH$
97. Photoelectric effect is maximum in [AFMC 2004]
 (a) Cs (b) Na
 (c) K (d) Li

98. A metal M reacts with N_2 to give a compound ' A ' (M_3N). ' A ' on heating at high temperature gives back ' M ' and ' A ' on reacting with H_2O gives a gas ' B '. ' B ' turns $CuSO_4$ solution blue on passing through it. A and B can be [DCE 2003]
- (a) Al and NH_3 (b) Li and NH_3
(c) Na and NH_3 (d) Mg and NH_3
99. A solid compound ' X ' on heating gives CO_2 gas and a residue. The residue mixed with water forms ' Y '. On passing an excess of CO_2 through ' Y ' in water, a clear solution, ' Z ' is obtained. On boiling ' Z ', compound ' X ' is reformed. The compound ' X ' is [CBSE PMT 2004]
- (a) Na_2CO_3 (b) K_2CO_3
(c) $Ca(HCO_3)_2$ (d) $CaCO_3$
100. Amongst $LiCl$, $RbCl$, $BeCl_2$ and $MgCl_2$ the compounds with the greatest and least ionic character respectively are [Pb. CET 2004]
- (a) $LiCl$ and $RbCl$ (b) $MgCl_2$ and $BeCl_2$
(c) $RbCl$ and $BeCl_2$ (d) $RbCl$ and $MgCl_2$
101. Salt cake is
- (a) Sodium sulphate
(b) Sodium chloride
(c) Sodium bisulphite
(d) Sodium sulphate and Sodium chloride
102. Globar salt is [BHU 1983; CPMT 1988, 91; IIT 1985; MP PET 2000]
- (a) $MgSO_4 \cdot 7H_2O$ (b) $CuSO_4 \cdot 5H_2O$
(c) $FeSO_4 \cdot 7H_2O$ (d) $Na_2SO_4 \cdot 10H_2O$
103. The colour given to the flame by sodium salts is [CPMT 1980; MP PET 1986]
- (a) Light red (b) Golden yellow
(c) Green (d) Pink
104. Solvay's process is used for the preparation of [CPMT 1982; AIIMS 1987]
- (a) Ammonia (b) Sodium bicarbonate
(c) Sodium carbonate (d) Calcium carbonate
105. Sodium when heated in a current of dry ammonia gives [NCERT 1981; KCET 2000]
- (a) Sodium nitrite (b) Sodium hydride
(c) Sodium amide (d) Sodium azide
106. Washing soda is [CPMT 1982; DPMT 1982; CBSE PMT 1990; MP PMT 1987, 96]
- (a) $Na_2CO_3 \cdot 10H_2O$ (b) $Na_2CO_3 \cdot H_2O$
(c) $Na_2CO_3 \cdot 5H_2O$ (d) Na_2CO_3
107. The substance used to decolourise and purify oils is [MP PMT 1987]
- (a) Sodium carbonate (b) Sodium chloride
(c) Sodium hydroxide (d) Sodium sulphate
108. The main salt soluble in sea water is [MP PMT 1998]
- (a) $MgCl_2$ (b) $NaCl$
(c) $MgSO_4$ (d) $CaSO_4$
109. The metallic lustre exhibited by sodium is explained by [IIT 1987]
- (a) Diffusion of sodium ions
(b) Oscillation of loose electrons
(c) Excitation of free protons
(d) Existence of body centred cubic lattice
110. The metal which reacts with water at room temperature is [CPMT 1985; MP PMT 1996; MP PET 1998]
- (a) Copper (b) Iron
(c) Magnesium (d) Sodium
111. When $NaCl$ is dissolved in water, the sodium ion is [CPMT 1989]
- (a) Oxidised (b) Reduced
(c) Hydrolysed (d) Hydrated
112. Sodium metal cannot be stored under [CPMT 1985, 88, 94]
- (a) Benzene (b) Kerosene
(c) Alcohol (d) Toluene
113. Causticization process is used for the preparation of [CPMT 1985; BHU 1986]
- (a) Caustic soda (b) Caustic potash
(c) Baryta (d) Slaked lime
114. When CO is passed over solid $NaOH$ heated to $200^\circ C$, it forms [MP PMT 1985]
- (a) Na_2CO_3 (b) $NaHCO_3$
(c) $HCOONa$ (d) None
115. $NaOH$ is manufactured by electrolysis of brine solution. The products of the reaction are [KCET 1990]
- (a) Cl_2 and H_2 (b) Cl_2 and $Na-Hg$
(c) Cl_2 and Na (d) Cl_2 and O_2
116. Sodium carbonate is manufactured by Solvay process, the products that are recycled are [KCET 1993; DCE 1999]
- (a) CO_2 and NH_3 (b) CO_2 and NH_4Cl
(c) $NaCl$, CaO (d) $CaCl_2$, CaO
117. The useful by-products, obtained in the Solvay process of manufacturing sodium carbonate, are [KCET 1989, 93]
- (a) Quick lime and CO_2
(b) $NaHCO_3$ and NH_4Cl
(c) NH_4Cl solution and quick lime
(d) $NaHCO_3$ and CO_2
118. In the preparation of sodium carbonate, which of the following is used [AFMC 1992]
- (a) Slaked lime (b) Quick lime
(c) Lime stone (d) $NaOH$
119. When $NaOH$ crystals are left in open air, they acquire a fluid layer around each crystal as [CPMT 1974]
- (a) They start melting
(b) They absorb moisture from air
(c) They react with air to form a liquid compound
(d) They absorb CO_2 from air
120. Sodium carbonate reacts with SO_2 in aqueous medium to give [MP PMT 1982, 85]
- (a) $NaHSO_3$ (b) Na_2SO_3
(c) $NaHSO_4$ (d) Na_2SO_4
121. Baking soda is [CPMT 1974, 78, 79, 91; BHU 1979; Manipal MEE 1995; AIIMS 1996;

- CPMT 1973; RPET 1999; AFMC 2001, 05; Pb. CET 2002]
- (a) Na_2CO_3 (b) NaHCO_3
(c) Na_2SO_4 (d) K_2CO_3
122. Soda ash is [KCET 1993]
(a) $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ (b) NaOH
(c) Na_2CO_3 (d) NaHCO_3
123. Soda lime is [KCET 1993]
(a) NaOH (b) CaO
(c) NaOH and CaO (d) Na_2CO_3
124. Molten sodium is used in nuclear reactors to [KCET 1989]
(a) Absorb neutrons in order to control the chain reaction
(b) Slow down the fast neutrons
(c) Absorb the heat generated by nuclear fission
(d) Extract radio-isotopes produced in the reactor
125. Squashes are stored by adding [AFMC 1989]
(a) Citric acid (b) KCl
(c) Na_2SO_3 (d) Sodium metabisulphite
126. Sodium thiosulphate ($\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$) is used in photography to [CPMT 1972, 74, 79; DPMT 1983; Bihar CEE 1995; MNR 1995]
(a) Reduce silver bromide to metallic silver
(b) Convert metallic silver to silver salt
(c) Remove undecomposed AgBr as a soluble silver thiosulphate complex
(d) Remove unreduced silver
127. Which of the following pair can't exist in solution [IIT 1986; DCE 1999]
(a) NaHCO_3 and NaOH (b) Na_2CO_3 and NaOH
(c) Na_2CO_3 and NaCl (d) NaHCO_3 and NaCl
128. Sodium thiosulphate is prepared by [IIT 1996]
(a) Reducing Na_2SO_4 solution with H_2S
(b) Boiling Na_2SO_3 solution with S in alkaline medium
(c) Neutralising $\text{H}_2\text{S}_2\text{O}_3$ solution with NaOH
(d) Boiling Na_2SO_3 solution with S in acidic medium
129. When NaOH is prepared, the gas released is [CPMT 1996]
(a) Cl_2 (b) H_2
(c) O_2 (d) H_2O
130. What is lye [BHU 1997]
(a) 10% solution of NaCl
(b) 10% solution of KOH
(c) 10% solution of Ca(OH)_2
(d) 10% solution of Na_2CO_3
131. Na imparts yellow colour to Bunsen flame because of [RPMT 1997]
(a) Low ionisation potential
(b) Sensitivity
(c) Sublimation
(d) Absorbed high radiation
132. Sn is dissolved in excess of NaOH solution, the compound obtained is [RPMT 1997]
(a) Sn(OH)_2 (b) Na_2SnO_3
(c) Na_2SnO_2 (d) SnO_2
133. Identify the correct statement [CPMT 1997]
(a) Elemental sodium can be prepared and isolated by electrolysis of an aqueous solution of sodium chloride
(b) Elemental sodium is a strong oxidizing agent
(c) Elemental sodium is insoluble in ammonia
(d) Elemental sodium is easily oxidized
134. Calcium is obtained by [CBSE PMT 1997]
(a) Roasting of limestone
(b) Electrolysis of solution of calcium chloride in H_2O
(c) Reduction of calcium chloride with carbon
(d) Electrolysis of molten anhydrous calcium chloride
135. When sodium chloride solution is electrolysed, the gas that is liberated at the cathode is [Kurukshetra CEE 1998]
(a) Oxygen (b) Hydrogen
(c) Chlorine (d) Air
136. During the electrolysis of fused sodium chloride, the anodic reaction is [KCET 1998]
(a) Reduction of sodium ions
(b) Oxidation of sodium ions
(c) Reduction of chloride ions
(d) Oxidation of chloride ions
137. Which of the following does not participate in the Solvay's process for the manufacture of Na_2CO_3 [EAMCET 1998]
(a) NH_3 (b) NaCl solution
(c) CO_2 (d) H_2SO_4
138. The colour of the precipitate produced by adding NaOH solution to HgCl_2 is [KCET 1998]
(a) Yellow (b) Black
(c) Brown (d) White
139. The cell used for the electrolysis of fused NaCl is [AFMC 1999; Kerala (Mea.) 2002]
(a) Down's cell (b) Castner cell
(c) Solvay cell (d) Nelson cell
140. Slaked lime [Ca(OH)_2] is used in the manufacture [UPSEAT 2000]
(a) Cement (b) Fire bricks
(c) Pigment (d) Medicine
141. The alum used for purifying water is [KCET (Med.) 2001]
(a) Ferric alum (b) Chrome alum
(c) Potash alum (d) Ammonium alum
142. Which one of the following metallic hydroxides does not dissolve in sodium hydroxide solution [KCET (Med.) 2001]
(a) Zn(OH)_2 (b) Al(OH)_3
(c) Fe(OH)_3 (d) Pb(OH)_2
143. In which of the following processes, fused sodium hydroxide is electrolysed at a 330°C temperature for extraction of sodium [CBSE PMT 2000]
(a) Castner's process (b) Down's process
(c) Cyanide process (d) Both (b) and (c)
144. Excess of Na^+ ions in our system causes

- (a) High B.P. (b) Low B.P.
(c) Diabetes (d) Anaemia
145. Ferric alum has the composition $(NH_4)_2SO_4 \cdot Fe_2(SO_4)_3 \cdot xH_2O$ [KCET (Med.) 2001] [Orissa JEE 2002]
(a) 7 (b) 24
(c) 6 (d) 15
146. If Na is heated in presence of air, it forms [AFMC 2002]
(a) Na_2CO_3 (b) Na_2O_2
(c) Na_2O (d) Both (b) and (c)
147. Which of the following is most reducing agent [RPMT 2002]
(a) HNO_3 (b) Na
(c) Cl_2 (d) Cr
148. Pyrolusite is [DPMT 2002]
(a) Carbonate ore (b) Sulphur ore
(c) Silicon ore (d) None of these
149. In the manufacture of metallic sodium by the fused salt electrolysis (Down's process) a small amount of calcium chloride is added to [MP PET 1993; MP PET 1994]
(a) Improve the electrical conduction
(b) Increase the temperature of electrolysis
(c) Bring down the melt temperature
(d) Stabilize the metallic sodium
150. Sodium metal is extracted by [MP PMT 1996]
(a) Electrolysis of aqueous solution of sodium chloride
(b) Electrolysis of fused sodium chloride
(c) Heating sodium oxide with carbon
(d) Heating sodium oxide with hydrogen
7. Setting of plaster of paris is [MP PMT 1985; CPMT 1989]
(a) Oxidation with atmospheric oxygen
(b) Combination with atmospheric CO_2
(c) Dehydration
(d) Hydration to yield another hydrate
8. To prevent magnesium from oxidation in electrolytic extraction process
(a) Some calcium fluoride is added
(b) Some chlorides are added
(c) Metal is taken out by spoons
(d) The whole process is done in an atmosphere of coal gas
9. Which of the following metal is found in green colouring pigment chlorophyll of plants [KCET 1993; RPMT 1999; MP PET 2002]
(a) Fe (b) Mg
(c) Na (d) Al
10. Which of the following metal carbonate is decomposed on heating [MNR 1985; MP PET 1994]
(a) $MgCO_3$ (b) Na_2CO_3
(c) K_2CO_3 (d) Rb_2CO_3
11. The outer electronic configuration of alkaline earth metal is [BHU 1980; CPMT 1985, 93; MP PAT 1993]
(a) ns^2 (b) ns^1
(c) np^6 (d) nd^{10}
12. Metallic magnesium is prepared by [BHU 1973, 77]
(a) Reduction of MgO by coke
(b) Electrolysis of aqueous solution of $Mg(NO_3)_2$
(c) Displacement of Mg by iron from $MgSO_4$ solution
(d) Electrolysis of molten $MgCl_2$
13. Of the metals Be, Mg, Ca and Sr of group II A. In the periodic table the least ionic chloride would be formed by [NCERT 1980; CPMT 1980]
(a) Be (b) Mg
(c) Ca (d) Sr
14. Which one of the following is fluorspar
(a) CaF_2 (b) CaO
(c) H_2F_2 (d) $CaCO_3$
15. Which one is known as barytes [CPMT 1987]
(a) $BaSO_4$ (b) $BaCl_2 \cdot 2H_2O$
(c) BaO (d) $BaCO_3$
16. Which of the following sulphates have the highest solubility in water [EAMCET 1998; Kurukshetra CEE 1998; AFMC 1990; MP PET 1994]
(a) $MgSO_4$ (b) $BaSO_4$
(c) $CaSO_4$ (d) $BeSO_4$
17. The composition formulae of gypsum is [CPMT 1975, 78, 82; DPMT 1982; IIT 1978; MNR 1981; MP PMT 1996; RPMT 1997]
(a) $(CaSO_4)_2 \cdot H_2O$ (b) $2CaSO_4$
(c) $CaSO_4 \cdot 2H_2O$ (d) $2CaSO_4 \cdot H_2O$
18. Mortar is a mixture of [EAMCET 1998; AIIMS 2000]
(a) $CaCO_3$, sand and water
(b) Slaked lime and water

Alkaline earth metals

1. To remove last traces of water from alcohol, the metal used is
(a) Sodium (b) Potassium
(c) Calcium (d) Aluminium
2. Plaster of Paris is [CPMT 1972, 76, 78, 83, 87, 88, 90, 91, 93, 94; JIPMER 2002; MP PET 1986, 2001; BHU 1992, 95, 2000; MNR 1982; DCE 2000; Manipal MEE 1995; NCERT 1976; Bihar MEE 1997; EAMCET 1978; AMU 1982, 84; DPMT 1982, 83]
(a) $CaSO_4 \cdot 2H_2O$ (b) $CaSO_4 \cdot 3H_2O$
(c) $CaSO_4 \cdot H_2O$ (d) $CaSO_4 \cdot \frac{1}{2}H_2O$
3. Which of the following substance is used as dehydrating agent in laboratory [MP PMT 1987]
(a) Calcium chloride (b) Sodium chloride
(c) Sodium carbonate (d) Potassium nitrate
4. The metal that is extracted from sea water is [EAMCET 1978; CPMT 1988; CET Pune 1998; MP PET 2000]
(a) Ba (b) Mg
(c) Ca (d) Sr
5. Which of the following ore contains both magnesium and calcium [MDAT Bihar 1984; MP PET 2003]
(a) Magnesite (b) Dolomite
(c) Carnallite (d) Phosphorite
6. Epsom salt is [EAMCET 1978, 80; BHU 1979; MP PET 1999; CPMT 1988, 89, 90; Bihar MEE 1996]
(a) $CaSO_4 \cdot 2H_2O$ (b) $BaSO_4 \cdot 2H_2O$
(c) $MgSO_4 \cdot 2H_2O$ (d) $MgSO_4 \cdot 7H_2O$

- (c) Slaked lime, sand and water
(d) CaCO_3 and CaO
19. Gypsum $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ on heating to about 120°C forms a compound which has the chemical composition represented by [CPMT 1978, 82, 88, 90; EAMCET 1978; DPMT 1982, 83; NCERT 1979]
(a) CaSO_4 (b) $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$
(c) $\text{CaSO}_4 \cdot \text{H}_2\text{O}$ (d) $2\text{CaSO}_4 \cdot 3\text{H}_2\text{O}$
20. The highly efficient method of obtaining beryllium is [NCERT 1982]
(a) Dissociation of beryllium carbide
(b) Electrolysis of fused beryllium chloride
(c) Reduction of beryllium oxide with carbon
(d) Reduction of beryllium halide with magnesium
21. Mark the incorrect statement
(a) Lithopone is cheap and possess good covering power
(b) Lithopone is yellow pigment
(c) Lithopone is prepared by mixing barium sulphide and zinc sulphate
(d) Lithopone is a mixture of barium sulphate and zinc sulphide
22. Pure anhydrous MgCl_2 can be prepared from the hydrated salt by [CPMT 1986; MP PMT 1989]
(a) Heating the hydrate with coke
(b) Heating the hydrate with Mg ribbon
(c) Melting the hydrate
(d) Heating the hydrate to red heat in an atmosphere of HCl gas
23. Bleaching powder is obtained by the interaction of chlorine and [CPMT 1972, 78, 89; 2002; DPMT 1983]
(a) Conc. solution of $\text{Ca}(\text{OH})_2$
(b) Dilute solution of $\text{Ca}(\text{OH})_2$
(c) Dry calcium oxide
(d) Dry slaked lime
24. Deep pink colour is given to flame by the salts of
(a) Strontium (b) Potassium
(c) Zinc (d) Barium
25. Calcium salts give which colour when put in a flame
(a) Brick red (b) Green
(c) White (d) Pink
26. Phosphine is obtained from the following ore [Roorkee 1995]
(a) Calcium superphosphate (b) Calcium phosphide
(c) Potassium phosphide (d) Calcium hypophosphite
27. Calcium is obtained by [DPMT 1980; IIT 1980; CPMT 1996; AIIMS 2001]
(a) Roasting of lime stone
(b) Reduction of CaCl_2 with carbon
(c) Electrolysis of a solution of CaCl_2 in water
(d) Electrolysis of molten CaCl_2
28. Which element possesses biggest atomic radii
(a) P (b) Si
(c) Al (d) Mg
29. Magnesia is
(a) MgCO_3 (b) MgO
(c) MgSO_4 (d) MgCl_2
30. Mixture of MgCl_2 and MgO is called [DPMT 1984]
(a) Double salt (b) Sorrel cement
(c) Portland cement (d) None of these
31. Lithopone is [AFMC 1992; BHU 1983, 86, 95; JIPMER 1999; RPET/PMT 1999]
(a) $\text{BaO} + \text{ZnSO}_4$ (b) $\text{ZnO} + \text{BaSO}_4$
(c) $\text{BaS} + \text{ZnSO}_4$ (d) $\text{ZnS} + \text{BaSO}_4$
32. For bleaching powder, which is incorrect [EAMCET 1984; CPMT 1985]
(a) Reacts with dilute acid to release chlorine
(b) Oxidising agent
(c) Light yellow coloured powder
(d) Highly soluble in water
33. Bleaching powder is a compound having the molecular formula [CPMT 1986, 89, 90, 93; MP PMT 1996; BHU 2005]
(a) CaOCl_3 (b) CaOCl_2
(c) CaClO (d) CaClO_3
34. Calcium cyanamide is [CPMT 1986, 93]
(a) CaCHNH_2 (b) CaCN_2
(c) CaC_2N_2 (d) $\text{Ca}(\text{CN})_2$
35. Which one of the following is a true peroxide [RPET 1999; CPMT 1981; Roorkee 1995]
(a) SO_2 (b) BaO_2
(c) MnO_2 (d) NO_2
36. Which of the following is not a water absorber and dehydrating substance [CBSE 1989; JIPMER 2002]
(a) Silica gel (b) P_2O_5
(c) Conc. H_2SO_4 (d) Aqueous CaCl_2
37. The dark red colour of bombs in fireworks is due to the presence of [Roorkee 1995; MP PMT 1985; AFMC 1989; Roorkee 1989]
(a) Na (b) Ba
(c) Sr (d) K
38. The most electropositive amongst the alkaline earth metals is [MP PMT 1993]
(a) Beryllium (b) Magnesium
(c) Calcium (d) Barium
39. Which of the following salts is insoluble in water at room temperature but soluble in boiling water [MP PMT 1993]
(a) CaCl_2 (b) BaCl_2
(c) SrCl_2 (d) PbCl_2
40. Electronegativity of beryllium is approximately equal to that of [MP PMT 1993]
(a) Aluminium (b) Boron
(c) Magnesium (d) Sodium
41. The right order of the solubility of sulphates of alkaline earth metals in water is [MP PET 1993; Pb. CET 2000; DPMT 2004]
(a) $\text{Be} > \text{Ca} > \text{Mg} > \text{Ba} > \text{Sr}$
(b) $\text{Mg} > \text{Be} > \text{Ba} > \text{Ca} > \text{Sr}$
(c) $\text{Be} > \text{Mg} > \text{Ca} > \text{Sr} > \text{Ba}$
(d) $\text{Mg} > \text{Ca} > \text{Ba} > \text{Be} > \text{Sr}$

42. Which of the following has highest electrode potential [CPMT 1990]
- (a) *Be* (b) *Mg*
(c) *Ca* (d) *Ba*
43. The alkaline earth metals *Ba*, *Sr*, *Ca* and *Mg* may be arranged in the order of their decreasing first ionisation potential as
- (a) *Mg*, *Ca*, *Sr*, *Ba*, (b) *Ca*, *Sr*, *Ba*, *Mg*
(c) *Sr*, *Ba*, *Mg*, *Ca* (d) *Ba*, *Mg*, *Ca*, *Sr*,
44. Which of the following alkaline earth metals shows some properties similar to aluminium [BHU 1983]
- (a) *Be* (b) *Ca*
(c) *Sr* (d) *Ba*
45. Which of the following ions forms highly soluble hydroxide in water [CPMT 1974, 76, 95, 82]
- (a) K^+ (b) Zn^{++}
(c) Al^{+++} (d) Ca^{++}
46. Sodium sulphate is soluble in water whereas barium sulphate is sparingly soluble because [IITJEE 1989]
- (a) The hydration energy of Na_2SO_4 is less than its lattice energy
(b) The hydration energy of Na_2SO_4 is more than its lattice energy
(c) The lattice energy of $BaSO_4$ is more than its hydration energy
(d) The lattice energy has no role to play in solubility
47. Which one of the following is most basic [CPMT 1977, 83]
- (a) Al_2O_3 (b) MgO
(c) SiO_2 (d) P_2O_5
48. Alloys of metal are light and strong and so are used in the manufacture of aeroplane parts [EAMCET 1978]
- (a) *Cr* (b) *Sn*
(c) *Fe* (d) *Mg*
49. In India at the occasion of marriages, the fire works used give green flame. Which one of the following radicals may be present [CPMT 1980; AFMC 1989; MP PET 2002]
- (a) *Na* (b) *K*
(c) *Ba* (d) *Ca*
50. $CaCO_3 \rightleftharpoons CaO + CO_2$ reaction in a line goes to completion because [AFMC 2005]
- (a) *CaO* does not react to CO_2 to give $CaCO_3$
(b) Backward reaction is very slow
(c) CO_2 formed escapes out
(d) None of these
51. The wire of flash bulb is made of [CPMT 1988]
- (a) *Mg* (b) *Cu*
(c) *Ba* (d) *Ag*
52. Bone ash contains [KCET 1992]
- (a) *CaO* (b) $CaSO_4$
(c) $Ca_3(PO_4)_2$ (d) $Ca(H_2PO_4)_2$
53. A substance absorbs CO_2 and violently reacts with water. That substance is [AFMC 1988]
- (a) $CaCO_3$ (b) *CaO*
(c) H_2SO_4 (d) *ZnO*
54. Setting of cement is an [DPMT 1984]
- (a) Exothermic reaction
(b) Endothermic reaction
(c) Neither exothermic nor endothermic
(d) None of these
55. Which is quick lime [CPMT 1990] [EAMCET 1993]
- (a) $Ca(OH)_2$ (b) *CaO*
(c) $CaCO_3$ (d) $Ca(OH)_2 + H_2O$
56. A major constituent of portland cement except lime is [CPMT 1982]
- (a) Silica (b) Alumina
(c) Iron oxide (d) Magnesia
57. Portland cement is manufactured by using [CPMT 1986]
- (a) Lime stone, clay and sand
(b) Lime stone, gypsum and sand
(c) Lime stone, gypsum and alumina
(d) Lime stone, clay and gypsum
58. Identify the correct statement [CBSE PMT 1995]
- (a) Gypsum contains a lower percentage of plaster of paris than plaster of paris
(b) Gypsum is obtained by heating plaster of paris
(c) Plaster of paris can be obtained by hydration of gypsum
(d) Plaster of paris is obtained by partial oxidation of gypsum
59. Which of the following decreases on going gradually from *Be* to *Ba* (in periodic table)
- (a) Basic character of hydroxides
(b) Solubility of sulphates in water
(c) Solubility of hydroxides in water
(d) Strength of elements as reducing agent
60. Alkaline earth metals are [MP PMT 1996]
- (a) *Li*, *Be*, *K*, *Mg*, *Ca* (b) *Be*, *Mg*, *Ca*, *Sr*, *Ba*
(c) *Be*, *K*, *Mg*, *Ca*, *Sr* (d) *Be*, *Mg*, *Ca*, *K*, *Rb*
61. Which of the following substances is used in the laboratory for fast drying of neutral gases [AIIMS 1998; AFMC 1999]
- (a) Sodium phosphate
(b) Phosphorus pentoxide
(c) Sodium sulphate
(d) Anhydrous calcium chloride
62. Which of the following can be represented by the configuration $[Kr]5s^2$? [MP PMT 1997]
- (a) *Ca* (b) *Sr*
(c) *Ba* (d) *Ra*
63. Point out the incorrect statement regarding *Be* (Group-IIA) [MP PMT 1997]
- (a) It forms an ionic carbide
(b) Its carbonate decomposes on heating
(c) Its halides are covalent
(d) It is easily attacked by water
64. Beryllium differs from rest of the members of its family (Group-IIA) in many ways. The reason for this is its [MP PMT 1997]
- (a) Small size and higher electronegativity
(b) Small size and lower electronegativity
(c) Large size and lower ionisation energy
(d) Large size and largest ionic radius
65. The oxide, which is best soluble in H_2O is [BHU 2001]

- (a) $Ba(OH)_2$ (b) $Mg(OH)_2$
(c) $Sr(OH)_2$ (d) $Ca(OH)_2$
66. The property of the alkaline earth metals that increases with their atomic number is [BHU 2001]
(a) Ionisation energy
(b) Electronegativity
(c) Solubility of their sulphates
(d) Solubility of their hydroxides
67. In the Alkaline earth metals, the element forming predominantly covalent compound is [BHU 2001]
(a) Be (b) Mg
(c) Sr (d) Ca
68. A mixture of lime paste is sand, water and [RPMT 1997]
(a) Gypsum (b) Slacked lime
(c) Quick lime (d) Lime stone
69. The formula for calcium chlorite is [CBSE PMT 1994, 96]
(a) $Ca(ClO_4)_2$ (b) $Ca(ClO_3)_2$
(c) $CaClO_2$ (d) $Ca(ClO_2)_2$
70. Which pair of substances gives same gaseous product, when these react with water [CBSE PMT 1994]
(a) Ca and CaH_2 (b) Na and Na_2O_2
(c) K and KO_2 (d) Ba and BaO_2
71. Magnesium does not decompose the [AFMC 1999]
(a) Steam (b) Hot water
(c) Cold Water (d) Semi hot water
72. Alkaline earth metals are denser than alkali metals because metallic bonding is [AIIMS 1999]
(a) Stronger (b) Weaker
(c) Not present (d) Volatile
73. Property of the alkaline earth metals that increases with their atomic number is [IIT 1997]
(a) Ionisation energy
(b) Solubility of their hydroxides
(c) Solubility of their sulphates
(d) Electronegativity
74. A metal is burnt in air and the ash on moistening smells of NH_3 . The metal is [KCET 1996]
(a) Na (b) Fe
(c) Mg (d) Al
75. Alkaline earth metals come under [Bihar MEE 1996]
(a) Halogens (b) Representative elements
(c) Transition elements (d) Inner transition elements
(e) None of these
76. Which of the following alkaline-earth metal hydroxides is the strongest base [CPMT 1996]
(a) $Be(OH)_2$ (b) $Mg(OH)_2$
(c) $Ca(OH)_2$ (d) $Ba(OH)_2$
77. Which one of the following is the strongest base [Pb. PMT 1998]
(a) $Be(OH)_2$ (b) $Mg(OH)_2$
(c) $Al(OH)_3$ (d) $Si(OH)_4$
78. Lime stone is [RPMT 1997]
(a) CaO (b) $Ca(OH)_2$
(c) Both (a) and (b) (d) None of these
79. Which of the alkaline earth metals is strongest reducing agent
(a) Ca (b) Sr
(c) Ba (d) Mg
80. Plaster of paris hardens by [CPMT 1994]
(a) Giving off CO_2 (b) Changing into $CaCO_3$
(c) Uniting with water (d) Giving out water
81. Which is not soluble in water [CPMT 1994]
(a) $CaCO_3$ (b) $BaCO_3$
(c) $SrCO_3$ (d) All of these
82. The correct order of the increasing ionic character is [MNR 1991; AFMC 1998]
(a) $BeCl_2 < MgCl_2 < CaCl_2 < BaCl_2$
(b) $BeCl_2 < MgCl_2 < BaCl_2 < CaCl_2$
(c) $BeCl_2 < BaCl_2 < MgCl_2 < CaCl_2$
(d) $BaCl_2 < CaCl_2 < MgCl_2 < BeCl_2$
83. $MgCl_2 \cdot 6H_2O$ when heated gives [CPMT 1997]
(a) Magnesium oxychloride
(b) Magnesium dichloride
(c) Magnesium oxide
(d) Magnesium chloride
84. Which of the following hydroxide is insoluble in water [AIIMS 2001]
(a) $Be(OH)_2$ (b) $Mg(OH)_2$
(c) $Ca(OH)_2$ (d) $Ba(OH)_2$
85. Which of the following statements is false [BHU 2005]
(a) $CaOCl_2$ gives OH, Cl and OCl in aqueous solution
(b) Diamond and graphite are allotrops of carbon
(c) Bleaching action of Cl in moist condition is not permanent
(d) Calomel is $HgCl_2$
86. A metal M readily forms its sulphate MSO_4 which is water-soluble. It forms its oxide MO which becomes inert on heating. It forms its insoluble hydroxide $M(OH)_2$ which is soluble in NaOH solution. Then M is [AIEEE 2002]
(a) Mg (b) Ba
(c) Ca (d) Be
87. In the lime (kiln), the reaction $CaCO_3(s) \rightarrow CO_2(g)$ goes to completion because [Kerala (Engg.) 2002]
(a) Of high temperature
(b) CaO is more stable than $CaCO_3$
(c) CO_2 escapes simultaneously
(d) CaO is not dissociated
88. The ionic compound $BaSO_4$ is insoluble in water due to [CPMT 1999]
(a) High lattice energy (b) Low lattice energy
(c) Low hydration energy (d) Both (a) and (c)
89. which is used to reduced the acidity of soil [DPMT 2001]
(a) Calcium hydroxide (b) Ammonium sulphate
(c) Ammonium nitrate (d) Ammonium chloride
90. Alkaline earth metals belong to the [KCET (Med.) 2001]

- (a) *s* – block in periodic table
(b) *p* – block in periodic table
(c) *d* – block in periodic table
(d) *f* – block in periodic table
91. The element having atomic number 56 belongs to [AFMC 2002]
(a) Actinides (b) Alkaline earth metals
(c) Transition series (d) Lanthanides
92. The thermal stability of alkaline earth metal carbonates $MgCO_3$, $CaCO_3$, $BaCO_3$ and $SrCO_3$ decreases as [MP PMT 2002]
(a) $CaCO_3 > SrCO_3 > MgCO_3 > BaCO_3$
(b) $BaCO_3 > SrCO_3 > MgCO_3 > CaCO_3$
(c) $BaCO_3 > SrCO_3 > CaCO_3 > MgCO_3$
(d) $MgCO_3 > CaCO_3 > SrCO_3 > BaCO_3$
93. A certain metal *M* is used to prepare an antacid, which is used as a medicine in acidity. This metal accidentally catches fire which can not be put out by using CO_2 based extinguishers. The metal *M* is
(a) *Ca* (b) *C*
(c) *Mg* (d) All of these
94. $Be(OH)_2$ is insoluble in water while $Ba(OH)_2$ is highly soluble due to [AMU 2002]
(a) Bond order (b) Lattice energy difference
(c) Common ion effect (d) Hard acid
95. Which of the following gives a green colour to flame [AFMC 2001]
(a) Barium (b) Calcium
(c) Strontium (d) None of these
96. Sparingly soluble salt is [RPMT 1999]
(a) KCl (b) $NaCl$
(c) NH_4Cl (d) $BaSO_4$
97. Among the alkaline earth metals the element forming predominantly covalent compound is [MP PET 1999]
(a) Barium (b) Strontium
(c) Calcium (d) Beryllium
98. Peroxide bond is present in [RPET 2003]
(a) MgO (b) CaO
(c) Li_2O (d) BaO_2
99. Least ionic character is found in [CPMT 1993]
(a) *Mg* (b) *Sr*
(c) *Ca* (d) *Ra*
100. The number of water molecules in gypsum and plaster of paris respectively are [Pb. PMT 1999]
(a) 1/2 and 2 (b) 2 and 1/2
(c) 2 and 1 (d) 5 and 2
101. Which of the following is formed when calcium combines with oxygen [MH CET 2000]
(a) *Ca* (b) *CaO*
(c) CaO_2 (d) Ca_2O_2
102. Slow acting nitrogenous fertilizer among the following is [DCE 2003]
(a) NH_2CONH_2 (b) NH_4NO_3
(c) $CaNCN$ (d) KNO_3
103. Plaster of paris is used [Pb. CET 2000; CPMT 2000]
(a) In surgery and dentistry
(b) As a white wash
(c) As a constituent of tooth paste
(d) For the preparation of RCC
104. Iron pipes lying under acidic soil are often attached to blocks of magnesium for protection from rusting. Magnesium offers protection to iron against corrosion because it [DPMT 2004; BHU 2004]
(a) Prevents air from reaching the surface of iron
(b) is more readily converted into positive ions
(c) Is higher than iron
(d) Forms a corrosion-resistance alloy with iron
105. Among *K*, *Ca*, *Fe*, and *Zn*, the element which can form more than one binary compound with chlorine is [CBSE PMT 2004]
(a) *K* (b) *Ca*
(c) *Fe* (d) *Zn*
106. *Li* shows the diagonal relationship with [Pb.CET 2001]
(a) *Mg* (b) *B*
(c) *Al* (d) *C*
107. A sodium salt on treatment with $MgCl_2$ gives white precipitate only on heating. The anion of the sodium salt is [IIT JEE Screening 2004]
(a) HCO_3^- (b) CO_3^{2-}
(c) NO_3^- (d) SO_4^{2-}
108. $MgCl_2 \cdot 6H_2O$. When heated gives [MHCET 2003]
(a) Magnesium oxide
(b) Magnesium oxychloride
(c) Magnesium dichloride
(d) Magnesium chloride
109. *Mg* burns in *CO* to produce [Pb.PMT 2001]
(a) MgO_2 (b) $MgCO_3$
(c) $MgO + CO$ (d) $MgO + C$
110. Sorel's cement is [Pb.CET 2003]
(a) Portland cement + MgO
(b) $MgCl_2 \cdot CaSiO_3 \cdot 2H_2O$
(c) $CaSiO_3 \cdot MgCO_3$
(d) $MgCl_2 \cdot 5MgO \cdot xH_2O$
111. Colemanite is [AFMC 2004]
(a) $Ca[B_3O_4(OH)_2] \cdot 2H_2O$
(b) $Ca_2B_6O_{11} \cdot 5H_2O$
(c) $Ca(OH)_2$
(d) $Na_2B_4O_7 \cdot 2H_2O$

Boron family

1. Which of the following statements about H_3BO_3 is not correct
(a) It is a strong tribasic acid
(b) It is prepared by acidifying an aqueous solution of borax
(c) It has a layer structure in which planar BO_3 units are joined by hydrogen bonds
(d) It does not act as proton donor but acts as a Lewis acid by accepting hydroxyl ion

2. The type of hybridisation of boron in diborane is [CPMT 1999]
 - (a) sp -hybridisation
 - (b) sp^2 - hybridisation
 - (c) sp^3 - hybridisation
 - (d) sp^3d^2 - hybridisation
3. In the reaction $B_2O_3 + C + Cl_2 \rightarrow A + CO$. The A is [Pb. PMT 2000]
 - (a) BCl_3
 - (b) BCl_2
 - (c) B_2Cl_2
 - (d) CCl_2
4. The molecular formula of felspar is [MP PMT 2003]
 - (a) $K_2O \cdot Al_2O_3 \cdot 6SiO_2$
 - (b) $K_2O \cdot 3Al_2O_3 \cdot 6SiO_2$
 - (c) Na_3AlF_6
 - (d) $CaSO_4 \cdot 2H_2O$
5. The most acidic of the following compounds is [Bihar CEE 1995]
 - (a) P_2O_3
 - (b) Sb_2O_3
 - (c) B_2O_3
 - (d) As_2O_3
6. Identify the statement that is not correct as far as structure of diborane is concerned [Pb. PMT 1998]
 - (a) There are two bridging hydrogen atoms in diborane
 - (b) Each boron atom forms four bonds in diborane
 - (c) The hydrogen atoms are not in the same plane in diborane
 - (d) All B - H bonds in diborane are similar
7. Soft heavy metal melts at $30^\circ C$ and is used in making heat sensitive thermometers the metal is [RPET 2000]
 - (a) Galium
 - (b) Sodium
 - (c) Potassium
 - (d) Caesium
8. Which of the following is formed when aluminium oxide and carbon is strongly heated in dry chlorine gas [AFMC 2000]
 - (a) Aluminium chloride
 - (b) Hydrate aluminium chloride
 - (c) Anhydrous aluminium chloride
 - (d) None of these
9. Which metal burn in air at high temperature with the evolution of much heat [UPSEAT 1999, 2001]
 - (a) Cu
 - (b) Hg
 - (c) Pb
 - (d) Al
10. Aluminium hydroxide is soluble in excess of sodium hydroxide forming the ion [AMU 2001]
 - (a) AlO_2^{+3}
 - (b) AlO_2^{-3}
 - (c) AlO_2^-
 - (d) AlO_3^-
11. Boron form covalent compound due to [Pb. PMT 2000]
 - (a) Higher ionization energy
 - (b) Lower ionization energy
 - (c) Small size
 - (d) Both (a) and (c)
12. In diborane, the two $H - B - H$ angles are nearly [AIIMS 2005]
 - (a) $60^\circ, 120^\circ$
 - (b) $95^\circ, 120^\circ$
 - (c) $95^\circ, 150^\circ$
 - (d) $120^\circ, 180^\circ$
13. Which of the following is a non-metal [MP PMT 1999]
 - (a) Gallium
 - (b) Indium
 - (c) Boron
 - (d) Aluminium
14. Which of the following is most acidic [BHU 1998]
 - (a) Na_2O
 - (b) MgO
 - (c) Al_2O_3
 - (d) CaO
15. When orthoboric acid (H_3BO_3) is heated, the residue left is [Pb. PMT 2002]
 - (a) Metaboric acid
 - (b) Boron
 - (c) Boric anhydride
 - (d) Borax
16. Which of the following form dimeric halides [Roorkee Qualifying 1998]
 - (a) Al
 - (b) Mg
 - (c) In
 - (d) Ga
17. The liquid field metal expanding on solidification is [AIIMS 2004]
 - (a) Ga
 - (b) Al
 - (c) Zn
 - (d) Cu
18. Aluminium chloride exists as dimer, Al_2Cl_6 in solid state as well as in solution of non-polar solvents such as benzene. When dissolved in water, it gives [AIEEE 2004]
 - (a) $[Al(OH)_6]^{3-} + 3HCl$
 - (b) $[Al(H_2O)_6]^{3+} + 3Cl^-$
 - (c) $Al^{3+} + 3Cl^-$
 - (d) $Al_2O_3 + 6HCl$
19. The hardest substance amongst the following is [Kerala PMT 2004]
 - (a) Be_2C
 - (b) Graphite
 - (c) Titanium
 - (d) SiC
 - (e) B_4C
20. Which of the following is known as inorganic benzene [Pb. CET 2001]
 - (a) Borazine
 - (b) Boron nitride
 - (c) *p*-dichlorobenzene
 - (d) Phosphonitric acid
21. Which of the following is only acidic in nature [AIIMS 2004]
 - (a) $Be(OH)_2$
 - (b) $Mg(OH)_2$
 - (c) $B(OH)_3$
 - (d) $Al(OH)_3$
22. Moissan boron is [DCE 2003]
 - (a) Amorphous boron of ultra purity
 - (b) Crystalline boron of ultra purity
 - (c) Amorphous boron of low purity
 - (d) Crystalline boron of low purity
23. Which of the following does not exist in free form [Kerala PMT 2004]
 - (a) BF_3
 - (b) BCl_3
 - (c) BBr_3
 - (d) BH_3
 - (e) None of these
24. Alumina is [DCE 2002]
 - (a) Acidic
 - (b) Basic
 - (c) Amphoteric
 - (d) None of these
25. The most abundant metal in the earth crust is [Pb. CET 2004]
 - (a) Al
 - (b) Ca
 - (c) Fe
 - (d) Na
26. Crystalline metal can be transformed into metallic glass by
 - (a) Gallium
 - (b) Indium
 - (c) Boron
 - (d) Aluminium

[NCERT 1984]

- (a) Alloying
(b) Pressing into thin plates
(c) Slow cooling of molten metal
(d) Very rapid cooling of a spray of the molten metal
27. Which metal is protected by a layer of its own oxide
[NCERT 1981; DPMT 1983; BHU 1998]
(a) *Al* (b) *Ag*
(c) *Au* (d) *Fe*
28. Aluminium is a self-preserving metal, because
(a) It is not tarnished by air
(b) A thin film of basic carbonate on its surface
(c) A non-porous layer of oxide is formed on its surface
(d) It is not affected by salt water
29. Anhydrous $AlCl_3$ cannot be obtained from which of the following reactions
[CPMT 1987]
(a) Heating $AlCl_3 \cdot 6H_2O$
(b) By passing dry HCl over hot aluminium powder
(c) By passing dry Cl_2 over hot aluminium powder
(d) By passing dry Cl_2 over a hot mixture of alumina and coke
30. An element *A* dissolves both in acid and alkali. It is an example of [NCERT 1972]
(a) Allotropic nature of *A* (b) Dimorphic nature of *A*
(c) Amorphous nature of *A* (d) Amphoteric nature of *A*
31. Hydrogen gas will not reduce [IIT 1984]
(a) Heated cupric oxide
(b) Heated ferric oxide
(c) Heated stannic oxide
(d) Heated aluminium oxide
32. Conc. HNO_3
(a) Reacts with aluminium vigorously
(b) Reacts with aluminium to form aluminium nitrate
(c) Does not react with aluminium
(d) Reacts with platinum
33. Anhydrous $AlCl_3$ is obtained from [BHU 1980; CPMT 1982]
(a) HCl and aluminium metal
(b) Aluminium and chlorine gas
(c) Hydrogen chloride gas and aluminium metal
(d) None of the above
34. Which is true for an element *R* present in III group of the periodic table [EAMCET 1991]
(a) It is gas at room temperature
(b) It has oxidation state of +4
(c) It forms R_2O_3
(d) It forms RX_2
35. When *Al* is added to KOH solution [NCERT 1974, 76; CPMT 1977]
(a) No action takes place
(b) Oxygen is evolved
(c) Water is produced
(d) Hydrogen is evolved

36. Aluminium is more reactive than iron. But aluminium is less easily corroded than iron because [KCET 1993]
(a) Aluminium is a noble metal
(b) Oxygen forms a protective oxide layer
(c) Iron undergoes reaction easily with water
(d) Iron forms mono and divalent ions
37. Aluminium vessels should not be washed with materials containing washing soda since [KCET 1993]
(a) Washing soda is expensive
(b) Washing soda is easily decomposed
(c) Washing soda reacts with aluminium to form soluble aluminate
(d) Washing soda reacts with aluminium to form insoluble aluminium oxide
38. Which of the statements about anhydrous aluminium chloride is correct [IIT 1981]
(a) It exists as $AlCl_3$ molecule
(b) It is not easily hydrolysed
(c) It sublimes at $100^\circ C$ under vacuum
(d) It is a strong Lewis base
39. Common alum is [DPMT 1982; CPMT 1978; AMU 1982, 83]
(a) $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$
(b) $K_2SO_4 \cdot Cr_2(SO_4)_3 \cdot 24H_2O$
(c) $K_2SO_4 \cdot Fe_2(SO_4)_3 \cdot 24H_2O$
(d) $(NH_4)_2SO_4 \cdot FeSO_4 \cdot 6H_2O$
40. Which of the following is not true about potash alum [MNR 1993; UPSEAT 2002]
(a) Its empirical formula is $KAl(SO_4)_2 \cdot 12H_2O$
(b) Its aqueous solution is basic
(c) It is used in dyeing industries
(d) On heating it melts in its water of crystallization
41. Which one of the following is correct statement
(a) The hydroxide of aluminium is more acidic than that of boron
(b) The hydroxide of boron is basic, while that of aluminium is amphoteric
(c) The hydroxide of boron is acidic, while that of aluminium is amphoteric
(d) The hydroxide of boron and aluminium are amphoteric
42. $AlCl_3$ is [AFMC 1995]
(a) Anhydrous and covalent (b) Anhydrous and ionic
(c) Covalent and basic (d) Coordinate and acidic
43. Aluminium (III) chloride forms a dimer because [CBSE PMT 1995]
(a) Higher coordination number can be achieved by aluminium
(b) Aluminium has high ionization energy
(c) Aluminium belongs to III group
(d) It cannot form a trimer
44. Aluminium has a great affinity for oxygen and its oxidation is an exothermic process. This fact is made use of in [MP PMT 1997]
(a) Preparing thin foils of aluminium
(b) Making utensils
(c) Preparing duralumin alloy
(d) Thermite welding
45. Number of water molecules in Mohr's salt is [CPMT 1997; AIIMS 2001; JIPMER 2001]
(a) 7 (b) 6
(c) 5 (d) 8

46. Which of the following is an amphoteric oxide [BHU 2001]
- (a) MgO (b) Al_2O_3
(c) Cl_2O_7 (d) Ti_2O_2
47. Aluminium oxide is not reduced by chemical reactions since [KCET 2002]
- (a) Aluminium oxide is reactive
(b) Reducing agents contaminate
(c) Aluminium oxide is highly stable
(d) The process pollutes the environment
48. Aluminium is not used [DPMT 2002]
- (a) In silvery paints
(b) For making utensils
(c) As a reducing agent
(d) As oxidizer in metallurgy
49. In the thermite process the reducing agent is [Pb. PMT 2002]
- (a) Al (b) C
(c) Mg (d) Na
50. In Goldschmidt aluminothermic process, thermite contains [KCET 2003]
- (a) 3 parts of Al_2O_3 and 4 parts of Al
(b) 3 parts of Fe_2O_3 and 2 parts of Al
(c) 3 parts of Fe_2O_3 and 1 part of Al
(d) 1 part of Fe_2O_3 and 1 part of Al
51. Bauxite containing impurities of iron oxide is purified by [CPMT 1987; AIIMS 1998]
- (a) Hoop's process (b) Serpeck's process
(c) Baeyer's process (d) Electrolytic process
52. In the purification of bauxite by Hall's process
- (a) Bauxite ore is heated with $NaOH$ solution at $50^\circ C$
(b) Bauxite ore is fused with Na_2CO_3
(c) Bauxite ore is fused with coke and heated at $1800^\circ C$ in a current of nitrogen
(d) Bauxite ore is heated with $NaHCO_3$
53. Which one is used as a bye-product in Serpeck's process
- (a) NH_3 (b) CO_2
(c) N_2 (d) PH_3
54. In the metallurgy of aluminium, cryolite is mixed in the molten state because it [Roorkee 1995]
- (a) Increases the melting point of alumina
(b) Oxidises alumina
(c) Reduces alumina
(d) Decreases the melting point of alumina
55. In the electrolytic extraction of aluminium, cryolite is used [NCERT 1981; CPMT 1989; RPMT 2000; MP PMT 2000, 02]
- (a) To obtain more aluminium
(b) To decrease temperature to dissolve bauxite
(c) To protect the anode
(d) As reducing agent
56. In the extraction of aluminium, bauxite is dissolved in cryolite because
- (a) It acts as a solvent
(b) It reduces melting point of aluminium oxide
(c) It increases the resistance of aluminium oxide
(d) Bauxite becomes active
57. In the extraction of aluminium the electrolyte is [CBSE PMT 1989; AIEEE 2002]
- (a) Fused cryolite with felspar
(b) Fused cryolite with fluorspar
(c) Pure alumina in molten cryolite
(d) Pure alumina with bauxite and molten cryolite
58. Aluminium is obtained by [KCET 1992; RPMT 2002]
- (a) Reducing Al_2O_3 with coke
(b) Electrolysing Al_2O_3 dissolved in Na_3AlF_6
(c) Reducing Al_2O_3 with chromium
(d) Heating alumina and cryolite
59. In the electrolysis of alumina, cryolite is added to [IIT 1986; BHU 1987]
- (a) Increase the melting point of alumina
(b) Increase the electrical conductivity
(c) Minimise the anodic effect
(d) Remove impurities from alumina
60. The function of fluorspar in the electrolytic reduction of alumina dissolved in fused cryolite (Na_3AlF_6) is [KCET 1993; IIT 1993]
- (a) As a catalyst
(b) To lower the temperature of the melt and to make the fused mixture very conducting
(c) To decrease the rate of oxidation of carbon at the anode
(d) None of the above
61. For purification of alumina, the modern processes most useful when (i) the impurity present is a lot of iron oxides and (ii) the impurity present is a lot of silica, are
- (a) For (i) Hall's process; for (ii) Baeyer's process
(b) For (i) Hall's process; for (ii) Serpeck's process
(c) For (i) Serpeck's process; for (ii) Baeyer's process
(d) For (i) Baeyer's process; for (ii) Serpeck's process
62. For the electrolytic production of aluminium, (i) the cathode and (ii) the anode are made of
- (a) (i) Platinum and (ii) Iron
(b) (i) Copper and (ii) Iron
(c) (i) Copper and (ii) Carbon
(d) (i) Carbon and (ii) Carbon
63. In the commercial electrochemical process for aluminium extraction, the electrolyte used is [IIT-JEE 1999]
- (a) $Al(OH)_3$ in $NaOH$ solution
(b) An aqueous solution of $Al_2(SO_4)_3$
(c) A molten mixture of Al_2O_3 and Na_3AlF_6
(d) A molten mixture of $Al(OH)_3$ and $Al(OH)_3$
64. In electrolysis of aluminium oxide which of the following is added to accelerate the process [AFMC 1999; CPMT 1999]
- (a) Silica (b) Cryolite
(c) Nickel (d) Silicate
65. The purification of alumina is called [CPMT 1997; AFMC 1998; AIIMS 1999]
- (a) Bosch process (b) Caster process
(c) Baeyer's process (d) Hoop's process
66. Electrolytic reduction of alumina to aluminium by Hall-Heroult process is carried out in the presence of [IIT-JEE (Screening) 2000]
- (a) $NaCl$
(b) Fluorite
(c) Cryolite which forms a melt with lower melting temperature
(d) Cryolite which forms a melt with higher melting temperature
67. In the electrolytic method of obtaining aluminium from purified bauxite, cryolite is added to the charge in order to [KCET 2004]
- (a) Minimize the heat loss due to radiation

- (b) Protect aluminium produced from oxygen
(c) Dissolve bauxite and render it conductor of electricity
(d) Lower the melting point of bauxite
68. Hoop's process is used for the purification of the metal
[MP PET 1995; MP PMT 2001]
(a) *Al* (b) *Zn*
(c) *Ag* (d) *Cu*
69. Purification of aluminium done by electrolytic refining is known as
[CPMT 1989; CBSE PMT 1999; RPET 2003; BCECE 2005]
(a) Serpeck's process (b) Hall's process
(c) Baeyer's process (d) Hoop's process
70. In the Hoop's process for refining of aluminium, the fused materials form three different layers and they remain separated during electrolysis also. This is because
[MP PET 1996]
(a) The upper layer is kept attracted by the cathode and the lower layer is kept attracted by the anode
(b) There is special arrangement in the cell to keep the layers separate
(c) The 3 layers have different densities
(d) The 3 layers are maintained at different temperatures
71. During metallurgy of aluminium bauxite is dissolved in cryolite because
(a) Bauxite is non-electrolyte
(b) Cryolite is a flux
(c) Cryolite acts as an electrolyte
(d) All are correct
72. For the electrolytic refining of aluminium, the three fused layers consist of
- | | Bottom Layer | Middle Layer | Upper Layer |
|-----|--|---------------------------------|--|
| (a) | Cathode of pure <i>Al</i> | Cryolite and fluorspar | Anode of <i>Al</i> and <i>Cu</i> alloy |
| (b) | Cathode of <i>Al</i> and <i>Cu</i> alloy | Bauxite and cryolite | Anode of pure <i>Al</i> |
| (c) | Anode of <i>Al</i> and <i>Cu</i> alloy | Cryolite and barium fluoride | Cathode of pure <i>Al</i> |
| (d) | Anode of impure <i>Al</i> | Bauxite, cryolite and fluorspar | Cathode of pure <i>Al</i> |
73. Heating an aqueous solution of aluminium chloride to dryness will give [AIEEE 2005]
(a) $AlCl_3$ (b) Al_2Cl_6
(c) Al_2O_3 (d) $Al(OH)Cl_2$
74. The structure of diborane (B_2H_6) contains [AIEEE 2005]
(a) Four 2c-2e bonds and two 3c-2e bonds
(b) Two 2c-2e bonds and four 3c-2e bonds
(c) Two 2c-2e bonds and two 3c-3e bonds
(d) Four 2c-2e bonds and four 3c-2e bonds
75. Which of the following is the electron deficient molecule
[CBSE PMT 2005]
(a) B_2H_6 (b) C_2H_6
(c) PH_3 (d) SiH_4
76. In Hall's process, the main reagent is mixed with
[AFMC 2005]
(a) NaF (b) Na_3AlF_6
(c) AlF_3 (d) None of these
77. Acedic strength of Boron trihalide are in order of
[Kerala CET 2005]
(a) $BF_3 < BCl_3 < BBr_3 < BI_3$
(b) $BI_3 < BBr_3 < BCl_3 < BF_3$
(c) $BBr_3 < BCl_3 < BF_3 < BI_3$
(d) $BF_3 < BI_3 < BCl_3 < BBr_3$

Carbon family

- Carbon and silicon belong to (IV) group. The maximum coordination number of carbon in commonly occurring compounds is 4, whereas that of silicon is 6. This is due to
[CBSE PMT 1994]
(a) Large size of silicon
(b) More electropositive nature of silicon
(c) Availability of low lying d -orbitals in silicon
(d) Both (a) and (b)
- The ionic carbide is
[JIPMER 2000]
(a) ZnC (b) TiC
(c) SiC (d) CaC_2
- PbO_2 is
[JIPMER 2000]
(a) Basic (b) Acidic
(c) Neutral (d) Amphoteric
- Lead pipes are not suitable for drinking water because
[JIPMER 2000]
(a) A layer of lead dioxide is deposited over pipes
(b) Lead reacts with air to form litharge
(c) Lead reacts with water containing air to form $Pb(OH)_2$
(d) Lead forms basic lead carbonate
- Silicon dioxide is formed by the reaction of
[KCET (Med.) 2001]
(a) $SiCl_4 + 2H_2O$ (b) $SiO_2 + 4HF$
(c) $SiO_2 + NaOH$ (d) $SiCl_4 + NaOH$
- Which alkali metal carbonate decomposes on heating to liberate CO_2 gas
[Pb. PMT 2000]
(a) Li_2CO_3 (b) $CaCO_3$
(c) Na_2CO_3 (d) Al_2CO_3
- Which of the following gives propyne on hydrolysis
[AIIMS 2005]
(a) Al_4C_3 (b) Mg_2C_3
(c) B_4C (d) La_4C_3
- Which one of the following statements is not correct
[CBSE PMT 1994]
(a) Zinc dissolves in sodium hydroxide solution
(b) Carbon monoxide reduces iron (III) oxide to iron
(c) Mercury (II) iodide dissolves in excess of potassium iodide solution
(d) Tin (IV) chloride is made by dissolving tin solution in concentrated hydrochloric acid
- In laboratory silicon can be prepared by the reaction
[Pb. PMT 1999]
(a) By heating carbon in electric furnace
(b) By heating potassium with potassium dichromate
(c) Silica with magnesium
(d) None of these
- Which of the following is the correct statement for red lead
[AIIMS 2000]
(a) It is an active form of lead
(b) Its molecular formula is Pb_2O_3
(c) It decomposes into Pb and CO_2
(d) It decomposes into PbO and O_2
- Suppose you have to determine the percentage of carbon dioxide in a sample of a gas available in a container. Which is the best absorbing material for the carbon dioxide
[Pb. PMT 2001]
(a) Heated copper oxide
(b) Cold, solid calcium chloride
(c) Cold, solid calcium hydroxide
(d) Heated charcoal
- The number and type of bonds between 2 carbon atoms in CaC_2
(a) One sigma (σ) and one pi (π) bond
(b) One sigma (σ) and two pi (π) bond
(c) One sigma (σ) and half pi (π) bond
(d) One sigma (σ) bond
- Metalloid among the following is
[DPMT 2001]
(a) Si (b) C
(c) Pb (d) Ge
- 'Lead pencil' contains
[DPMT 2001; IIT 1990]
(a) PbS (b) Graphite
(c) FeS (d) Pb
- Nitrogen gas is absorbed by
[DPMT 2001]
(a) Calcium hydroxide (b) Ferrous sulphate
(c) Calcium carbide (d) Aluminium carbide
- In laboratory silicon can be prepared by the reaction
[Pb. PMT 1999; AFMC 2002]
(a) Silica with magnesium
(b) By heating carbon in electric furnace
(c) By heating potassium fluosilicate with potassium
(d) None of these
- Formation of in-numberable compounds of carbon is due to its
(a) High reactivity
(b) Catenation tendency
(c) Covalent and ionic tendency
(d) Different valency
- Colour is imparted to glass by mixing
[Pb. PMT 2002]
(a) Synthetic dyes (b) Metal oxide
(c) Oxides of non-metal (d) Coloured salt
- Which of the following is insoluble in water
[MP PET 2002]
(a) Na_2CO_3 (b) $CaCO_3$
(c) $ZnCO_3$ (d) $Al_2(CO_3)_3$
- In which of the following the inert pair effect is most prominent
(a) C (b) Si
(c) Ge (d) Pb
- Plumbosolvency implies dissolution of lead in
[DCE 1999]
(a) Bases (b) Acids
(c) Ordinary water (d) $CuSO_4$ sol
- Which of the following glass is used in making wind screen of automobiles
[AIIMS 1999; Pb. CET 2000]
(a) Crook's (b) Jena
(c) Safety (d) Pyrex
- Glass reacts with HF to produce
[KCET 2000; CBSE PMT 2000]
(a) SiF_4 (b) H_2SiF_6
(c) H_2SiO_3 (d) Na_3AlF_6

24. The type of glass used in making lenses and prisms is [JIPMER 1999]
 (a) A flint glass (b) Jena glass
 (c) Pyrex glass (d) Quartz glass
25. When carbon monoxide is passed over solid caustic soda heated to 200°C , it forms [KCET (Med.) 1999]
 (a) Na_2CO_3 (b) NaHCO_3
 (c) $\text{H}-\text{COONa}$ (d) CH_3COONa
26. Which is used to produce smoke screens [AFMC 2005]
 (a) Calcium phosphide (b) Zinc sulphide
 (c) Sodium carbonate (d) Zinc phosphide
27. Sodium oxalate on heating with conc. H_2SO_4 gives [Roorkee 2000]
 (a) CO only (b) CO_2 only
 (c) CO and CO_2 (d) SO_2 and SO_3
28. Extraction of lead by reduction methods is done by [AMU 2000]
 (a) Adding more galena into reverberatory furnace
 (b) Adding more lead sulphate into reverberatory furnace
 (c) Adding more galena and coke into the reverberatory furnace
 (d) Self reduction of oxide from sulphide present in the furnace
29. Which gas is used in excess water [BVP 2003]
 (a) CO_2 (b) SO_2
 (c) CO (d) Water vapours
30. The compound which does not possess a peroxide linkage is
 (a) Na_2O_2 (b) CrO_5
 (c) H_2SO_5 (d) PbO_2
31. Silicon is an important constituent of [MH CET 2001]
 (a) Rocks (b) Amalgams
 (c) Chlorophyll (d) Haemoglobin
32. Carborundum is [AFMC 2002; MH CET 2003; BHU 2003, 05]
 (a) SiC (b) AlCl_3
 (c) $\text{Al}_2(\text{SO}_4)_3$ (d) $\text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$
33. SiF_4 gets hydrolysed giving [Orissa JEE 2002]
 (a) SiO_2 (b) $\text{Si}(\text{OH})_2\text{F}_2$
 (c) H_2SiF_6 (d) $\text{Si}(\text{OH})_4$
34. Glass is a [AIIEE 2003; RPET 2003]
 (a) Micro-crystalline solid
 (b) Super cooled liquid
 (c) Gel
 (d) Polymeric mixture
35. H_2O_2 on reaction with PbS gives [RPET 2003]
 (a) PbO (b) PbSO_4
 (c) PbO_2 (d) PbHSO_4
36. Soldiers of Napoleon army while at Alps during freezing winter suffered a serious problem as regards to the tin buttons of their uniforms. White metallic tin buttons got converted to grey powder. This transformation is related to [AIIEE 2004]
 (a) A change in the partial pressure of oxygen in the air
 (b) A change in the crystalline structure of tin
 (c) An interaction with nitrogen of the air at very low to temperatures
 (d) An interaction with water vapour contained in the humid air
37. Solid CO_2 is known as dry ice, because [Pb. CET 2000]
 (a) It melts at 0°C
 (b) It evaporates at 40°C
 (c) It evaporates at -78°C without melting
 (d) Its boiling point is more than 199°C
38. Which one of the following statements about the zeolites is false [CBSE PMT 2004]
 (a) Zeolites are aluminosilicates having three dimensional network
 (b) Some of the SiO_4^{4-} units are replaced by AlO_4^{5-} and AlO_6^{9-} ions in zeolites
 (c) They are used as cation exchangers
 (d) They have open structure which enables them to take up small molecules
39. Which of the following cuts ultraviolet rays [AFMC 2004]
 (a) Soda glass (b) Crooke's glass
 (c) Pyrex (d) None of these
40. In IIIA group, Tl (thallium) shows +1 oxidation state while other members show +3 oxidation state. Why [JEE Orissa 2004]
 (a) Presence of lone pair of electron in Tl
 (b) Inert pair effect
 (c) Large ionic radius of Tl ion
 (d) None of these
41. Carbon suboxide C_3O_2 has [DCE 2003]
 (a) Linear structure
 (b) Bent structure
 (c) Trigonal planar structure
 (d) Distorted tetrahedral structure
42. Which of the following is a mixed oxide [Pb. CET 2003]
 (a) Fe_2O_3 (b) PbO_2
 (c) Pb_3O_4 (d) BaO_2
43. Noble gases are absorbed on [BVP 2004]
 (a) Anhydrous CaCl_2 (b) Charcoal
 (c) Conc. H_2SO_4 (d) Coconut
44. Lapis lazuli is [AFMC 2004]
 (a) Ferrous sulphate (b) Copper sulphate
 (c) Sodium aluminosilicate (d) Zinc sulphate
45. Which of the following statement is correct with respect to the property of elements in the carbon family with an increase in atomic number, their [Pb. CET 2002]
 (a) Atomic size decreases
 (b) Ionization energy increases
 (c) Metallic character decreases
 (d) Stability of +2 oxidation state increases
46. When tin is treated with concentrated nitric acid [DCE 2004]
 (a) It is converted into stannous nitrate
 (b) It is converted into stannic nitrate
 (c) It is converted into metastannic acid
 (d) It becomes passive
47. Solder is an alloy of [Pb. CET 2003]
 (a) $\text{Pb} + \text{Zn} + \text{Sn}$ (b) $\text{Pb} + \text{Zn}$
 (c) $\text{Pb} + \text{Sn}$ (d) $\text{Sn} + \text{Zn}$
48. A metal used in storage batteries is
 (a) Copper (b) Lead
 (c) Tin (d) Nickel
49. Name of the structure of silicates in which three oxygen atoms of $[\text{SiO}]^-$ are shared is [IIT 2005]
 (a) Pyrosilicate

- (b) Sheet silicate
(c) Linear chain silicate
(d) Three dimensional silicate
50. Red lead is [CPMT 1972, 74, 94; MNR 1985; DPMT 1982, 2002; Bihar CEE 1995; MP PET 1995]
(a) Pb_3O_4 (b) PbO
(c) PbO_2 (d) Pb_4O_3
51. White lead is [CPMT 1983, 93, 2002; MNR 1984; MP PMT 1995; UPSEAT 1999; DCE 2000]
(a) $PbCO_3$ (b) $PbCO_3 \cdot PbO$
(c) $2PbCO_3 \cdot Pb(OH)_2$ (d) $2PbSO_4 \cdot PbO$
52. Lead pipes are corroded quickly by [AFMC 1981]
(a) Dil. H_2SO_4 (b) Conc. H_2SO_4
(c) Acetic acid (d) Water
53. In silicon dioxide [AIIEE 2005]
(a) Each silicon atom is surrounded by four oxygen atoms and each oxygen atom is bonded to two silicon atoms
(b) Each silicon atom is surrounded by two oxygen atoms and each oxygen atom is bonded to two silicon atoms
(c) Silicon atom is bonded to two oxygen atoms
(d) There are double bonds between silicon and oxygen atoms
54. Litharge is chemically [DPMT 1984; JIPMER 2001]
(a) PbO (b) PbO_2
(c) Pb_3O_4 (d) $Pb(CH_3COO)_2$
55. The element of $s^2 p^2$ configuration is of group
(a) IV (b) III
(c) V (d) II
56. Which of the following compounds of elements in group IV would you expect to be most ionic in character [NCERT 1978]
(a) CCl_4 (b) $SiCl_4$
(c) $PbCl_2$ (d) $PbCl_4$
57. Which of the following compounds of lead is used in match industry
(a) PbO (b) PbO_2
(c) $PbCl_2$ (d) None of these
58. Type metal is an alloy of Pb, Sb and Sn . It consists of
(a) Equal amounts of the three metals
(b) More amount of lead
(c) More amount of antimony
(d) More amount of tin
59. Which is correct oxidation state of lead [AFMC 1987]
(a) +2, +4 (b) +1, +2
(c) +3, +4 (d) +4
60. Sugar of lead is
(a) $2PbSO_4 \cdot PbO$ (b) $(CH_3COO)_2 Pb$
(c) $PbCO_3$ (d) $PbCO_3 \cdot Pb(OH)_2$
61. Which of the following compounds has peroxide linkage [CPMT 1988]
(a) Pb_2O_3 (b) SiO_2
(c) CO_2 (d) PbO_2
62. Percentage of lead in lead pencil is [CBSE PMT 1999]
(a) Zero (b) 20
(c) 80 (d) 70
63. Which of the following has most density [CPMT 1996]
(a) Fe (b) Cu
(c) B (d) Pb
64. Red lead is an example of a/an oxide [JIPMER 2001]
(a) Basic (b) Super
(c) Mixed (d) Amphoteric
65. Which of the following lead oxides is 'Sindhur' [MP PET 2002]
(a) PbO (b) PbO_2
(c) Pb_2O_3 (d) Pb_3O_4
66. Element showing the phenomenon of allotropy is [MP PMT 1999]
(a) Aluminium (b) Tin
(c) Lead (d) Copper
67. Which of the following element is a metalloid [CPMT 2004]
(a) Bi (b) Sn
(c) Ge (d) C
68. Which gas is liberated when Al_4C_3 is hydrolysed [AFMC 2005]
(a) CH_4 (b) C_2H_2
(c) C_2H_6 (d) CO_2
69. Which of the following attacks glass [NCERT 1976; AFMC 2005]
(a) HCl (b) HF
(c) HI (d) HBr

Nitrogen family

1. Which of the following elements does not form stable diatomic molecules [CBSE PMT 1989, 94]
(a) Iodine (b) Phosphorus
(c) Nitrogen (d) Oxygen
2. Producer gas is a mixture of [DPMT 1982; CPMT 1978]
(a) CO and N_2 (b) CO_2 and H_2
(c) CO and H_2 (d) CO_2 and N_2
3. Which one of the following combines with $Fe(II)$ ions to form a brown complex [AIIMS 1982, 83, 87; BHU 1998; CBSE PMT 2000; Pb. PMT 2000; AFMC 1988, 92; MP PET 1997, 2000, 01]
(a) N_2O (b) NO
(c) N_2O_3 (d) N_2O_5
4. Metaphosphoric acid has the formula [CPMT 1973, 89, 93]
(a) H_3PO_4 (b) HPO_3
(c) H_2PO_3 (d) H_3PO_2
5. Which of the following is the most suitable drying agent for ammonia gas [MP PMT 1989; CBSE PMT 1989; DPMT 1982; CPMT 1974, 78, 91; BHU 1986, 96; 2001; IIT (Screening) 2000]
(a) Calcium oxide
(b) Anhydrous calcium chloride

- (c) Phosphorus pentoxide
(d) Conc. sulphuric acid
6. Each of the following is true for white and red phosphorus except that they [CBSE PMT 1989]
(a) Are both soluble in CS_2
(b) Can be oxidised by heating in air
(c) Consists of same kind of atoms
(d) Can be converted into one another
7. Which of the following is a tetrabasic acid [CPMT 1988]
(a) Orthophosphorus acid (b) Orthophosphoric acid
(c) Metaphosphoric acid (d) Pyrophosphoric acid
8. Phosphine is prepared by the reaction of [MP PET/PMT 1988]
(a) P and H_2SO_4 (b) P and $NaOH$
(c) P and H_2S (d) P and HNO_3
9. Which of the following is not known [MP PET/PMT 1988; NCERT 1982; CBSE PMT 1989; MP PET 1993]
(a) NCl_5 (b) NI_3
(c) $SbCl_3$ (d) NCl_3
10. Chemical formula for the phosphorus molecule is [CPMT 1976, 80, 84, 90; BHU 1984, 86; NCERT 1977]
(a) P (b) P_4
(c) P_2 (d) P_5
11. White phosphorus (P_4) has [IIT 1998]
(a) Six $P-P$ single bonds
(b) Four $P-P$ single bonds
(c) Four lone pairs of electrons
(d) PPP angle of 60°
12. Ammonium nitrate decomposes on heating into [NCERT 1974,75; CPMT 1973, 78, 88, 94; AMU 1984]
(a) Ammonia and nitric acid
(b) Nitrous oxide and water
(c) Nitrogen, hydrogen and ozone
(d) Nitric oxide, nitrogen dioxide and hydrogen
13. In Birkeland-Eyde process, the raw material used is [CPMT 1982, 86]
(a) Air (b) NH_3
(c) NO_2 (d) HNO_3
14. Among the following nitrates, *Lead nitrate*, *Silver nitrate* and *Ammonium nitrate*; the one that decomposes without leaving any solid residue is [NCERT 1983]
(a) Lead nitrate (b) Ammonium nitrate
(c) Silver nitrate (d) Sodium nitrate
15. Of the different allotropes of phosphorus, the one which is most reactive is [CPMT 1983; NCERT 1978; CBSE PMT 1999; Kurukshetra CEE 1998]
(a) Violet phosphorus (b) Scarlet phosphorus
(c) Red phosphorus (d) White phosphorus
16. Phosphine is generally prepared in the laboratory [CPMT 1983, 2003]
(a) By heating phosphorus in a current of hydrogen
(b) By heating white phosphorus with aqueous solution of caustic potash
(c) By decomposition of P_2H_4 at $110^\circ C$
(d) By heating red phosphorus with an aqueous solution of caustic soda
17. Which of the following elements is most metallic [CPMT 1983; MP PMT 1993]
(a) Phosphorus (b) Arsenic
(c) Antimony (d) Bismuth
18. The basicity of orthophosphoric acid is [CPMT 1984, 91]
(a) 2 (b) 3
(c) 4 (d) 5
19. HNO_2 acts as [AFMC 1992]
(a) Oxidising agent (b) Reducing agent
(c) Both (a) and (b) (d) Its solution is stable
20. Nitrogen dioxide cannot be obtained by heating [CPMT 1989; IIT 1985; CPMT 1993]
(a) KNO_3 (b) $Pb(NO_3)_2$
(c) $Cu(NO_3)_2$ (d) $AgNO_3$
21. When heated NH_3 is passed over CuO gas evolved is [BCECE 2005]
(a) N_2 (b) N_2O
(c) HNO_3 (d) NO_2
22. Non-combustible hydride is [CPMT 1979]
(a) NH_3 (b) PH_3
(c) AsH_3 (d) SbH_3
23. On heating a mixture of NH_4Cl and KNO_2 we get [CPMT 1972, 79; NCERT 1977]
(a) NH_4NO_3 (b) N_2
(c) N_2O (d) NO
24. Which of the following oxide of nitrogen is the anhydride of HNO_3 [CPMT 1979,80,89,97; MP PET/PMT 1988; KCET 1991; CBSE PMT 1989, 91,99; EAMCET 1991; NCERT 1975; MP PET 1989; MP PMT 1994]
(a) NO (b) N_2O_3
(c) N_3O_4 (d) N_2O_5
25. Phosphorus is manufactured by heating in a electric furnace a mixture of [NCERT 1977; CPMT 1974, 78, 81, 86]
(a) Bone ash and coke
(b) Bone ash and silica
(c) Bone ash, silica and coke
(d) None of these
26. A certain element forms a solid oxide which when dissolved in water forms an acidic solution, the element is [CPMT 1972, 78]
(a) Argon (b) Potassium
(c) Phosphorus (d) Sulphur
27. Dissociation of H_3PO_4 occurs in following stages [CPMT 1976]
(a) 1 (b) 2
(c) 3 (d) 4
28. Nitrogen forms how many oxides

- (a) 3 (b) 4
(c) 5 (d) 6
29. The *P-P-P* bond angle in white phosphorus is [MP PET 1991]
(a) 120° (b) $109^\circ 28'$
(c) 90° (d) 60°
30. Ammonium dichromate on heating gives [BHU 1973, 78; CBSE PMT 1993; MP PMT 1993]
(a) Chromium oxide and ammonia
(b) Chromic acid and nitrogen
(c) Chromium oxide and nitrogen
(d) Chromic acid and ammonia
31. When concentrated nitric acid is heated, it decomposes to give
(a) O_2 and N_2 (b) NO
(c) N_2O_5 (d) NO_2 and O_2
32. The element which catches fire in air at $30^\circ C$ and is stored under water is [BHU 1973; MP PET 1989,99]
(a) Calcium (b) Sodium
(c) Phosphorus (d) Zinc
33. A solution of ammonia in water contains [CBSE PMT 1991]
(a) H^+
(b) OH^-
(c) Only NH_4^+
(d) OH^- , NH_4^+ and NH_4OH molecules
34. Among the members of V A group (*N, P, As, Sb* and *Bi*), which of the following properties shows an increase as we go down from nitrogen to bismuth [CPMT 1982]
(a) Stability of +3 oxidation state
(b) Reducing character of hydrides
(c) Electronegativity
(d) Acidic nature of the pentoxide
35. The important method for the fixation of nitrogen is [CPMT 1985, 94]
(a) Haber (b) Solvay
(c) Deacon (d) Fischer method
36. Which of the following is oxidised in air [AFMC 1987; KCET 1991]
(a) White phosphorus (b) CH_4
(c) H_2O (d) $NaCl$
37. A pure sample of nitrogen is prepared by heating
(a) Calcium cyanamide (b) Barium azide
(c) Ammonium hydroxide (d) Ammonium nitrite
38. Nitrous oxide
(a) Is a mixed oxide
(b) Is an acidic oxide
(c) Is highly soluble in hot water
(d) Supports the combustion of sulphur
39. Which of the following represents laughing gas [CPMT 1986, 89; Manipal MEE 1995; MP PMT 1990; MP PET 1995; RPMT 1999; AFMC 2002]
(a) NO (b) N_2O
(c) NO_2 (d) N_2O_3
40. NO_2 is a mixed oxide is proved by the first that with $NaOH$, it forms
(a) Nitrites salt
(b) Nitrates salt
(c) Mixture of nitrate and nitrite
(d) Ammonia
41. Which of the following metal produces nitrous oxide with dil. HNO_3
(a) Fe (b) Zn
(c) Cu (d) Ag
42. Which of the following acid exist in polymeric form
(a) HPO_3 (b) $H_4P_2O_7$
(c) H_3PO_4 (d) None of these
43. Superphosphate of lime is [AMU 1985]
(a) A mixture of normal calcium phosphate and gypsum
(b) A mixture of primary calcium phosphate and gypsum
(c) Normal calcium phosphate
(d) Soluble calcium phosphate
44. If phosphoric acid is allowed to react with sufficient quantity of $NaOH$, the product obtained is [DPMT 1983; MP PMT 1983]
(a) $NaHPO_3$ (b) Na_2HPO_4
(c) NaH_2PO_4 (d) Na_3PO_4
45. White phosphorus contains [CPMT 1978; KCET (Med.) 2000; MP PET 1990]
(a) P_5 molecules (b) P_4 molecules
(c) P_6 molecules (d) P_2 molecules
46. In the catalytic oxidation of ammonia an oxide is formed which is used in the preparation of HNO_3 . This oxide is [CPMT 1984; KCET 1990; AIIMS 1996]
(a) N_2O_5 (b) N_2O_4
(c) NO_2 (d) NO
47. Nitric acid oxidises phosphorus to [CPMT 1984; JIPMER 2002]
(a) $H_2P_2O_7$ (b) H_3PO_3
(c) P_2O_5 (d) H_3PO_4
48. Which one of the following statements is true for HNO_2 [CPMT 1980, 84]
(a) It is very stable in aqueous solution
(b) It cannot act both as an oxidant and as a reductant
(c) It cannot act as an oxidising agent
(d) It cannot act as reducing agent
49. Which oxide is alkaline [MP PET 1990]
(a) P_2O_3 (b) Bi_2O_3
(c) As_2O_3 (d) B_2O_3
50. Which acid is formed by P_2O_3 [MP PET 1991]
(a) H_3PO_4 (b) H_3PO_3
(c) HPO_3 (d) $H_4P_2O_7$
51. Which nitrogen trihalides is least basic [IIT 1987; Kurukshetra CEE 1998; CPMT 1999]
(a) NF_3 (b) NCl_3
(c) NBr_3 (d) NI_3
52. Dehydrated phosphorus trichloride in water gives [MP PET 1990]
(a) HPO_3 (b) H_3PO_4
(c) H_3PO_2 (d) H_3PO_3
53. Which is used in the manufacture of safe matchsticks [DPMT 1982, CPMT 1974, 75]
(a) White phosphorus (b) Sulphur

54. (c) Red phosphorus (d) Selenium
Which oxide of nitrogen is coloured gas [IIT 1987; Kurukshetra CEE 1998]
(a) N_2O (b) NO
(c) N_2O_5 (d) NO_2
55. Which oxide do not act as a reducing agent [MP PET 1990]
(a) NO (b) NO_2
(c) N_2O (d) N_2O_5
56. In NH_4NO_2 , the oxidation number of nitrogen will be [MP PET 1990]
(a) +3 (b) +5
(c) -3 and +3 (d) +3 and +5
57. In which compound, the oxidation state of phosphorus is +4 [MP PET 1991]
(a) P_4O_{11} (b) P_4O_8
(c) P_4O_6 (d) H_3PO_4
58. In which compound, the oxidation state of nitrogen is -1 [MP PMT 1989]
(a) NO (b) N_2O
(c) NH_2OH (d) N_2H_4
59. Which of the following oxide is least acidic [MP PMT 1990; CBSE PMT 1996]
(a) P_4O_6 (b) P_4O_{10}
(c) As_4O_6 (d) As_4O_{10}
60. The basic character of hydrides of the V-group elements decreases in the order [CBSE PMT 1996]
(a) $SbH_3 > PH_3 > AsH_3 > NH_3$
(b) $NH_3 > SbH_3 > PH_3 > AsH_3$
(c) $NH_3 > PH_3 > AsH_3 > SbH_3$
(d) $SbH_3 > AsH_3 > PH_3 > NH_3$
61. Which is least stable [MP PET 1989]
(a) BiH_3 (b) SbH_3
(c) AsH_3 (d) PH_3
62. Which of the following is not hydrolysed [DPMT 2005]
(a) $AsCl_3$ (b) PF_3
(c) $SbCl_3$ (d) NF_3
63. Electrolysis temperature is maximum for [MP PET 1990]
(a) AsH_3 (b) NH_3
(c) PH_3 (d) SbH_3
64. Which of the following is kept in water? [BCECE 2005]
(a) White phosphorous (b) Sodium
(c) Potassium (d) Calcium
65. Which of the following substances is used as a fertilizer
(a) $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$
(b) $Ca(H_2PO_4)_2 \cdot H_2O + CaSO_4$
(c) $NaAlO_2$
(d) CaC_2
66. On adding water to $BiCl_3$ solution in HCl , the compound produced is
(a) Bi_2O_3 (b) $Bi(OH)_3$
(c) $BiOCl$ (d) $BiOCl_2$
67. V-A group precipitate was dissolved in HNO_3 and treated with excess of NH_4OH . It gives a white ppt. because of
(a) $Cu(OH)_2$ (b) $Cd(OH)_2$
(c) $Bi(OH)_3$ (d) $Hg(OH)_2$
68. N, P, As, Sb, Bi elements belong to [DPMT 1982]
(a) VA group (b) IVA group
(c) VIIA group (d) VB group
69. Which one of the following elements occur free in nature [CPMT 1988]
(a) Nitrogen (b) Phosphorus
(c) Arsenic (d) Antimony
70. Which of the following elements of group VA does not show allotropy [CPMT 1980]
(a) N (b) Bi
(c) P (d) As
71. Which does not form complex [CPMT 1986]
(a) N (b) P
(c) As (d) Bi
72. The strongest base is [IIT 1989; CPMT 1997; MP PET 2001, 03]
(a) NH_3 (b) PH_3
(c) AsH_3 (d) SbH_3
73. The most stable hydride is [EAMCET 1988]
(a) NH_3 (b) PH_3
(c) AsH_3 (d) SbH_3
74. Which has the lowest boiling point [CBSE PMT 1989]
(a) NH_3 (b) PH_3
(c) AsH_3 (d) SbH_3
75. Which is the most explosive [BHU 1984; Roorkee 1989; AIIMS 1996; MP PMT 1985, 2001]
(a) NCl_3 (b) PCl_3
(c) $AsCl_3$ (d) All of these
76. Of the following, the most acidic is [EAMCET 1980]
(a) As_2O_3 (b) P_2O_3
(c) Sb_2O_3 (d) Bi_2O_3
77. Of the following, non-existent compound is [NCERT 1975, 79]
(a) PH_4I (b) As_2O_3
(c) $SbCl_2$ (d) As_2H_3
78. Pure N_2 gas is obtained from [CBSE PMT 1991]
(a) $NH_3 + NaNO_2$ (b) $NH_4Cl + NaNO_2$
(c) $N_2O + Cu$ (d) $(NH_4)_2Cr_2O_7$
79. Pure nitrogen can be prepared from [KCET 1991; AFMC 1993; AMU 1985]
(a) NH_4OH (b) Ca_3N_2
(c) NH_4NO_2 (d) $Ba(NO_3)_2$
80. Nitrogen combines with metals to form [CPMT 1981, 93]
(a) Nitrites (b) Nitrates
(c) Nitrosyl chloride (d) Nitrides
81. Nitrogen is relatively inactive element because [CBSE PMT 1992]
(a) Its atom has a stable electronic configuration
(b) It has low atomic radius
(c) Its electronegativity is fairly high

- (d) Dissociation energy of its molecule is fairly high [CPMT 1986]
82. The cyanide ion, CN^- and N_2 are isoelectronic. But in contrast to CN^- , N_2 is chemically inert because of [IIT 1992]
- (a) Low bond energy
(b) Absence of bond polarity
(c) Unsymmetrical electron distribution
(d) Presence of more number of electrons in bonding orbitals
83. Which statement is not correct for nitrogen [AIIMS 1991]
- (a) It has a small size
(b) It does not readily react with O_2
(c) It is a typical non-metal
(d) d -orbitals are available for bonding
84. The element which is essential in nitrogen fixation is [NCERT 1981]
- (a) Zinc (b) Copper
(c) Molybdenum (d) Boron
85. Laughing gas is prepared by heating [EAMCET 1980]
- (a) NH_4Cl (b) $(NH_4)_2SO_4$
(c) $NH_4Cl + NaNO_3$ (d) NH_4NO_3
86. Nitrogen (I) oxide is produced by [IIT 1989]
- (a) Thermal decomposition of ammonium nitrate
(b) Disproportionation of N_2O_4
(c) Thermal decomposition of ammonium nitrite
(d) Interaction of hydroxyl amine and nitrous acid
87. Which of the following is not correct for N_2O [CPMT 1984]
- (a) It is called laughing gas
(b) It is nitrous oxide
(c) It is not a linear molecule
(d) It is least reactive in all oxides of nitrogen
88. Which of the following oxides of nitrogen is the anhydride of nitrous acid [NCERT 1975; AIIMS 1991]
- (a) NO (b) N_2O_3
(c) N_2O_4 (d) N_2O_5
89. Which of the following is a true acidic anhydride [NCERT 1977]
- (a) CO (b) NO
(c) ClO_2 (d) N_2O_5
90. On strongly heating $Pb(NO_3)_2$ crystals, the gas formed is [NCERT 1980; CPMT 1997]
- (a) NO_2 (b) O_2
(c) $NO_2 + O_2$ (d) NO
91. Nitrogen dioxide is released by heating [AFMC 1992]
- (a) $Pb(NO_3)_2$ (b) KNO_3
(c) $NaNO_2$ (d) $NaNO_3$
92. Nitric oxide is prepared by the action of HNO_3 on [AFMC 1990]
- (a) Fe (b) Cu
(c) Zn (d) Sn
93. When lightning flash is produced, which gas may form [EAMCET 1992; AFMC 1989]
- (a) Nitrous oxide (b) Nitrogen dioxide
(c) Dinitrogen pentoxide (d) Nitric oxide
94. Of the following, which has three electron bond in its structure
- (a) Nitrous oxide (b) Nitric oxide
(c) Dinitrogen trioxide (d) Nitrogen pentoxide
95. Which of the following oxides of nitrogen is neutral [CPMT 1988]
- (a) N_2O_5 (b) N_2O_3
(c) N_2O_4 (d) N_2O
96. Oxidation of NO in air produces [KCET 1992]
- (a) N_2O (b) N_2O_3
(c) NO_2 (d) N_2O_5
97. The reddish brown coloured gas formed when nitric oxide is oxidised by air is [IIT 1979]
- (a) N_2O_5 (b) N_2O_4
(c) NO_2 (d) N_2O_3
98. When $AgNO_3$ is heated strongly, the products formed are [Roorkee 1990]
- (a) NO and NO_2 (b) NO_2 and O_2
(c) NO_2 and N_2O (d) NO and O_2
99. Which of the nitrates on strong heating leaves the metal as the residue [KCET 1990]
- (a) $AgNO_3$ (b) $Pb(NO_3)_2$
(c) $Cu(NO_3)_2$ (d) $Al(NO_3)_3$
100. Nitrogen dioxide [KCET 1989]
- (a) Dissolves in water forming nitric acid
(b) Does not dissolve in water
(c) Dissolves in water to form nitrous acid and gives off oxygen
(d) Dissolves in water to form a mixture of nitrous and nitric acids
101. Concentrated nitric acid oxidises cane sugar to [CBSE PMT 1991]
- (a) CO_2 and H_2O (b) CO and H_2O
(c) CO , CO_2 and H_2O (d) Oxalic acid and water
102. A mixture of ammonia and air at about $800^\circ C$ in the presence of Pt gauze forms [Pb. CET 1989]
- (a) N_2O (b) NO
(c) NH_2OH (d) N_2O_3
103. Which of the following acid possesses oxidising, reducing and complex forming properties [MNR 1985]
- (a) HNO_3 (b) H_2SO_4
(c) HCl (d) HNO_2
104. Nitrogen is essential constituent of all [MP PMT 1990]
- (a) Proteins (b) Fats
(c) Proteins and fats (d) None of these
105. Ammonia gas can be collected by the displacement of [NCERT 1989, 90]
- (a) Conc. H_2SO_4 (b) Brine
(c) Water (d) Mercury
106. The chemical used for cooling in refrigeration is [CPMT 1981, 88]
- (a) CO_2 (b) NH_4OH
(c) NH_4Cl (d) Liquid NH_3
107. A hydride of nitrogen which is acidic is [NCERT 1978, 80; CPMT 1980; BHU 1986]

- (a) NH_3 (b) N_2H_4
(c) N_2H_2 (d) N_3H
108. PCl_5 exists but NCl_5 does not because [EAMCET 1977, 82]
(a) Nitrogen has no vacant orbitals
(b) NCl_5 is unstable
(c) Nitrogen atom is much smaller
(d) Nitrogen is highly inert
109. Phosphide ion has the electronic structure similar to that of [CPMT 1988]
(a) Nitride ion (b) Fluoride ion
(c) Sodium ion (d) Chloride ion
110. Which of the following phosphorus is most stable [AFMC 1992]
(a) Red (b) White
(c) Black (d) All stable
111. Red phosphorus can be obtained from white phosphorus by [KCET 1989]
(a) Heating it with a catalyst in an inert atmosphere
(b) Distilling it in an inert atmosphere
(c) Dissolving it in carbon disulphide and crystallizing
(d) Melting it and pouring the liquid into water
112. Bones glow in the dark because [EAMCET 1980]
(a) They contain shining material
(b) They contain red phosphorus
(c) White phosphorus undergoes slow combustion in contact with air
(d) White phosphorus changes into red form
113. Which of the following properties of white phosphorus are shared by red phosphorus [NCERT 1973, 74]
(a) It shows phosphorescences in air
(b) It reacts with hot aqueous $NaOH$ to give phosphine
(c) It dissolves in carbon disulphide
(d) It burns when heated in air
114. Mixture used for the tips of match stick is [DPMT 1984]
(a) $S + K$
(b) Sb_2S_3
(c) $K_2Cr_2O_7 + S + \text{red } P$
(d) $K_2Cr_2O_7 + K + S$
115. In modern process phosphorus is manufactured by [CPMT 1974, 78, 81]
(a) Heating a mixture of phosphorite mineral with sand and coke in electric furnace
(b) Heating calcium phosphate with coke
(c) Heating bone ash with coke
(d) Heating the phosphate mineral with sand
116. White phosphorus when boiled with strong solution of caustic soda produces [CPMT 1989, 03]
(a) Phosphine (b) Phosphoric acid
(c) Phosphorus acid (d) No reaction
117. White phosphorus reacts with caustic soda. The products are PH_3 and NaH_2PO_2 . This reaction is an example of [IIT 1980; KCET 1993]
(a) Oxidation (b) Reduction
(c) Oxidation and reduction (d) Neutralisation
118. Phosphine is not obtained by the reaction [MP PMT 1989]
(a) White P is heated with $NaOH$
(b) Red P is heated with $NaOH$
(c) Ca_3P_2 reacts with water
(d) Phosphorus trioxide is boiled with water
119. $PH_4I + NaOH$ forms [CBSE PMT 1991]
(a) PH_3 (b) NH_3
(c) P_4O_6 (d) P_4O_{10}
120. Phosphine is produced by adding water to [KCET 1991]
(a) CaC_2 (b) HPO_3
(c) Ca_3P_2 (d) P_4O_{10}
121. When aluminium phosphide is treated with dil. sulphuric acid [KCET 1989]
(a) SO_2 is liberated (b) PH_3 is evolved
(c) H_2S is evolved (d) H_2 is evolved
122. With reference to protonic acids, which of the following statements is correct [CPMT 1990]
(a) PH_3 is more basic than NH_3
(b) PH_3 is less basic than NH_3
(c) PH_3 is equally basic as NH_3
(d) PH_3 is amphoteric while NH_3 is basic
123. One of the acid listed below is formed from P_2O_3 and the rest are formed from P_2O_5 . The acid formed from phosphorus (III) oxide is
(a) HPO_3 (b) $H_4P_2O_7$
(c) H_3PO_4 (d) H_3PO_3
124. P_2O_5 is heated with water to give [CBSE PMT 1991; DPMT 2000]
(a) Hypophosphorus acid (b) Orthophosphorus acid
(c) Hypophosphoric acid (d) Orthophosphoric acid
125. Hypophosphorus acid is [NCERT 1977; MP PMT 1992]
(a) A tribasic acid (b) A dibasic acid
(c) A monobasic acid (d) Not acidic at all
126. PCl_3 reacts with water to form [KCET 1990; CBSE PMT 1991; CPMT 2003]
(a) PH_3 (b) H_3PO_3, HCl
(c) $POCl_3$ (d) H_3PO_4
127. H_3PO_3 is [CPMT 1977, 79, 94; NCERT 1981; MP PMT 1980]
(a) A tribasic acid (b) A dibasic acid
(c) Neutral (d) A monobasic acid
128. Oxidation state of +1 for phosphorus is found in [MP PMT 1991; MP PET 2001]
(a) H_3PO_3 (b) H_3PO_4
(c) H_3PO_2 (d) $H_4P_2O_7$
129. Which is not an acid salt [MNR 1989]
(a) NaH_2PO_3 (b) NaH_2PO_2
(c) $Na_3HP_2O_6$ (d) $Na_4P_2O_7$
130. By the action of hot conc. H_2SO_4 , phosphorus changes to [Roorkee 1992]
(a) Phosphorus acid
(b) Orthophosphoric acid
(c) Metaphosphoric acid
(d) Pyrophosphoric acid

131. Cyanamide process is used in the formation of [BHU 1995]
 (a) N_2 (b) HNO_3
 (c) NH_3 (d) PH_3
132. The number of hydroxyl group in pyrophosphoric acid is [KCET 1993]
 (a) 3 (b) 4
 (c) 5 (d) 7
133. There is very little difference in acid strength in the series H_3PO_4 , H_3PO_3 , and H_3PO_2 because [KCET 1990]
 (a) Phosphorus in these acids exists in different oxidation states
 (b) The hydrogen in these acids are not all bounded to the phosphorus
 (c) Phosphorus is not a highly electronegative element
 (d) Phosphorus oxides are less basic
134. $BiCl_3$ on hydrolysis forms a white precipitate of [CPMT 1988]
 (a) Bismuthio acid
 (b) Bismuth oxychloride
 (c) Bismuth pentachloride
 (d) Bismuth hydroxide
135. At high temperature nitrogen combines with calcium carbide (CaC_2) to give [DPMT 1981, 85; AFMC 1998; MP PET 2000]
 (a) Calcium cyanide (b) Calcium cyanamide
 (c) Calcium carbonate (d) Calcium nitride
136. Calcium cyanamide on treatment with steam under pressure gives ammonia and [EAMCET 1984, 88; CPMT 1986]
 (a) Calcium carbonate (b) Calcium hydroxide
 (c) Calcium oxide (d) Calcium bicarbonate
137. Which one has the highest percentage of nitrogen [KCET 1991; CBSE PMT 1993; AIIMS 1996, MP PET 2001; RPET 2003]
 (a) Urea (b) Ammonium sulphate
 (c) Ammonium nitrate (d) Calcium nitrate
138. Superphosphate of lime contains [CPMT 1984]
 (a) $Ca_3(PO_4)_2$ (b) $CaHPO_4$
 (c) $Ca_3(PO_4)_2 + H_3PO_4$ (d) $Ca(H_2PO_4)_2$
139. Thomas slag is [CPMT 1988]
 (a) $Ca_3(PO_4)_2$ (b) $MnSiO_3$
 (c) $CaSiO_3$ (d) $FeSiO_3$
140. When equal weights of the two fertilizers, urea and ammonium sulphate are taken, urea contains [KCET 1989]
 (a) Less nitrogen than ammonium sulphate
 (b) As much nitrogen as ammonium sulphate
 (c) Twice the amount of nitrogen present in ammonium sulphate
 (d) More than twice the amount of nitrogen present in ammonium sulphate
141. Which statement is wrong for NO [DPMT 2005]
 (a) It is anhydride of nitrous acid
 (b) Its dipole moment is 0.22 D
 (c) It forms dimer
 (d) it is paramagnetic
142. The resonance hybrid of nitrate ion is [AFMC 2002]

$$\begin{array}{c} \text{.....} \quad \text{.....} \\ | \quad | \\ \text{O} \quad \text{O} \\ | \\ \text{N} \\ | \\ \text{O} \end{array}$$

143. Blasting of TNT is done by mixing [AFMC 1993]
 (a) NH_4Cl (b) NH_4NO_3
 (c) NH_4NO_2 (d) $(NH_4)_2SO_4$
144. Sodium hydroxide solution reacts with phosphorus to give phosphine. To bring about this reaction, we need [KCET 1989]
 (a) White phosphorus and dil. $NaOH$
 (b) White phosphorus and conc. $NaOH$
 (c) Red phosphorus and dil. $NaOH$
 (d) Red phosphorus and conc. $NaOH$
145. Which of the following exhibits highest solubility in water [MP PET 1994]
 (a) NH_3 (b) PH_3
 (c) AsH_3 (d) SbH_3
146. Which of the following has highest boiling point [MP PET 1994]
 (a) NH_3 (b) PH_3
 (c) AsH_3 (d) SbH_3
147. In the following reaction
 $P_4 + 3NaOH + 3H_2O \rightarrow PH_3 + 3NaH_2PO_2$ [MP PMT 1994]
 (a) Phosphorus is oxidised
 (b) Phosphorus is oxidised and reduced
 (c) Phosphorus is reduced
 (d) Sodium is oxidised
148. HNO_3 in aqueous solution yields [AMU 2000]
 (a) NO_3^- and H^+ (b) NO_3^- and H_3O^+
 (c) NO_2^- and OH^- (d) N_2O_5 and H_2O
149. The oxyacid of phosphorus, in which phosphorus has the lowest oxidation state, is [KCET (Med.) 2001]
 (a) Hypophosphorus acid (b) Orthophosphoric acid
 (c) Pyrophosphoric acid (d) Metaphosphoric acid
150. Superphosphate is a mixture of [KCET (Med.) 2001]
 (a) $Ca(H_2PO_4)_2 \cdot H_2O + CaCl_2 \cdot 2H_2O$
 (b) $Ca_3(PO_4)_2 \cdot H_2O + CaCl_2 \cdot 2H_2O$
 (c) $Ca_3(PO_4)_2 \cdot H_2O + 2CaSO_4 \cdot 2H_2O$
 (d) $Ca(H_2PO_4)_2 \cdot H_2O + 2CaSO_4 \cdot 2H_2O$
151. Solid PCl_5 exists as [JIPMER 2002]
 (a) PCl_5 (b) PCl_4^+
 (c) PCl_6^- (d) PCl_4^+ and PCl_6^-
152. In the reaction, $P_2O_5 + 3CaO \rightarrow Ca_3(PO_4)_2$; P_2O_5 acts as.....
 (a) Acidic flux (b) Basic flux
 (c) Basic impurity (d) Acidic impurity

153. Atoms in a P_4 molecule of white phosphorus are arranged regularly in space in which of the following way
[Kerala (Engg.) 2002]
- At the corners of tetrahedron
 - At the corners of a cube
 - At the corners of a four membered ring
 - At the centre and corners of an equilateral triangle
154. The most common minerals of phosphorus are
[Kerala (Med.) 2002]
- Hydroxy apatite and kernite
 - Colemanite and fluorapatite
 - Borax and fluorapatite
 - Hydroxy apatite and colemanite
 - Hydroxy apatite and fluorapatite
155. The three important oxidation states of phosphorus are
[Kerala (Med.) 2002]
- 3, +3 and +5
 - 3, +3 and -5
 - 3, +4 and -4
 - 3, +3 and +4
156. In case of nitrogen, NCl_3 is possible but not NCl_5 while in case of phosphorous, PCl_3 as well as PCl_5 are possible. It is due to
- Availability of vacant d -orbital in P but not in N
 - Lower electronegativity of P than N
 - Lower tendency of H bond formation in P than N
 - Occurrence of P in solid while N in gaseous state at room temperature
157. When ammonia is passed over heated copper oxide, the metallic copper is obtained. the reaction shows that ammonia is
- A dehydrating agent
 - An oxidising agent
 - A reducing agent
 - A nitrating agent
158. Urea is preferred to ammonium sulphate as a nitrogenous fertilizer because
[KCET 2003]
- It is more soluble in water
 - It is cheaper than ammonium sulphate
 - It is quite stable
 - It does not cause acidity in the soil
159. Liquid ammonia is used for refrigeration because
[MP PET 2002]
- It has a high dipole moment
 - It has a high heat of vapourisation
 - It is basic
 - It is a stable compound
160. Action of concentrated nitric acid (HNO_3) on metallic tin produces
[BHU 2002]
- Stannic nitrate
 - Stannous nitrate
 - Stannous nitrite
 - Meta stannic acid
161. How can you synthesize nitric oxide in the laboratory
[Orissa JEE 2003]
- Zinc with cold and dilute HNO_3
 - Zinc with concentrated HNO_3
 - Copper with cold and dilute HNO_3
 - Heating NH_4NO_3
162. What would happen when a solution of potassium chromate is treated with an excess of dilute nitric acid
[AIEEE 2003]
- Cr^{3+} and $Cr_2O_7^{2-}$ are formed
 - $Cr_2O_7^{2-}$ and H_2O are formed
 - CrO_4^{2-} is reduced to +3 state of Cr
 - CrO_4^{2-} is oxidized to +7 state of Cr
163. The pentavalence in phosphorus is more stable as compared to that of nitrogen even though they belong to the same group. It is due to
- Inert nature of nitrogen
 - Reactivity of phosphorus
 - Larger size of phosphorus atom
 - Dissimilar electronic configuration
164. A neutral fertilizer among the following compounds is
[KCET 2002]
- Urea
 - Ammonium nitrate
 - Ammonium sulphate
 - Calcium ammonium nitrate
165. Which is true with regard to the properties of PH_3
[BHU 2000]
- PH_3 is not much stable
 - PH_3 is neutral towards litmus
 - PH_3 has fishy smell
 - PH_3 is insoluble in water
166. Nitrogen is obtained when $NaNO_2$ reacts with
[AIEEE 2002]
- NH_4Cl
 - NH_4NO_3
 - $(NH_4)_2CO_3$
 - NH_4OH
167. N_2 combines with metal to form
[JIPMER 2000]
- Nitride
 - Nitrate
 - Nitrosyl chloride
 - Nitrosyl chloride
168. The number of $P-O-P$ bridges in the structure of phosphorous pentoxide and phosphorous trioxide are respectively
[AIIMS 2005]
- 6, 6
 - 5, 5
 - 5, 6
 - 6, 5
169. Sodium pyrophosphate is
[CPMT 2003]
- $Na_2P_2O_7$
 - $Na_4P_2O_7$
 - $NaPO_4$
 - Na_2PO_2
170. Which of the following is solid in nature
[UPSEAT 2003; AFMC 2004]
- NO
 - N_2O
 - N_2O_3
 - N_2O_5
171. Which of the following is a cyclic phosphate
[KCET 1996]
- $H_5P_3O_{10}$
 - $H_6P_4O_{13}$
 - $H_5P_5O_{15}$
 - $H_7P_5O_{16}$
172. The reaction, which forms nitric oxide, is
[KCET (Med.) 2001]
- C and N_2O
 - Cu and N_2O
 - Na and NH_3
 - Cu and HNO_3
173. Which one of the following can be used as an anaesthetic
[EAMCET 1998]
- N_2O
 - NO
 - NCl_3
 - NO_2
174. Solution of sodium metal in liquid ammonia is strongly reducing due to the presence in the solution of the following
[KCET 2000; MP PMT 2001]
- Sodium hydride
 - Sodium amide

- (c) Sodium atoms (d) Solvated electrons
175. What may be expected to happen when phosphine gas is mixed with chlorine gas [AIEEE 2003]
- (a) The mixture only cools down
(b) PCl_3 and HCl are formed and the mixture warms up
(c) PCl_5 and HCl are formed and the mixture cools down
(d) $PH_3 \cdot Cl_2$ is formed with warming up
176. P_4O_{10} is not used with dry NH_3 gas because [KCET 2001]
- (a) P_4O_{10} is basic and NH_3 is acidic
(b) P_4O_{10} is acidic and NH_3 is basic
(c) P_4O_{10} is not a drying agent
(d) P_4O_{10} reacts with moisture in NH_3
177. When ammonia reacts with sodium hypochlorite, product containing nitrogen is [AFMC 2000]
- (a) N_2 (b) N_2O
(c) NH_2OH (d) $H_2N \cdot NH_2$
178. P_2O_5 is used extensively as a [BVP 2003]
- (a) Reducing agent (b) Oxidising agent
(c) Dehydrating agent (d) Preservative
179. Inertness of N_2 gas is due to [DCE 2000; MP PET 2001]
- (a) No vacant d -orbital
(b) High dissociation energy
(c) High electronegativity
(d) None
180. Which show maximum valency [CPMT 2003]
- (a) Phosphorus (b) Tin
(c) Antimony (d) Bismuth
181. Which is used in the Haber process for the manufacture of NH_3
- (a) Pt (b) $Fe + Mo$
(c) CuO (d) Al_2O_3
182. On adding excess of ammonium hydroxide to a copper chloride solution. [MH CET 1999]
- (a) A deep blue solution is obtained
(b) No change is observed
(c) Blue precipitate of copper hydroxide is obtained
(d) Black precipitate of copper oxide is obtained
183. The product obtained by heating $(NH_4)_2SO_4$ and $KCNO$ is [DPMT 2000]
- (a) Hydrocyanic acid (b) Ammonia
(c) Ammonium cyanide (d) Urea
184. The number of $P-O-P$ bonds in cyclic metaphosphoric acid is [IIT-JEE (Screening) 2000]
- (a) Zero (b) Two
(c) Three (d) Four
185. When HNO_3 is dropped into the palm and washed with water, it turns into yellow. It shows the presence of [CPMT 1997]
- (a) NO_2 (b) N_2O
(c) NO (d) N_2O_5
186. Which of the following is nitrogenous fertilizers [CPMT 1999]
- (a) Bone meal (b) Thomas meal
(c) Nitro phosphate (d) Ammonium sulphate
187. Which compound is related to Haber's process [RPET 1999]
- (a) CO_2 (b) H_2
(c) NO_2 (d) NH_3
188. Ammonia is dried over [CPMT 2002; JIPMER 2002]
- (a) Quick lime (b) Slaked lime
(c) Anhy. $CaCl_2$ (d) None of these
189. Which of the following compounds is sparingly soluble in ammonia
- (a) AgI (b) $AgBr$
(c) $AgCl$ (d) $CuCl_2$
190. The carbonate which does not leave a residue on heating is [JIPMER 1999; DCE 1999]
- (a) Na_2CO_3 (b) Ag_2CO_3
(c) $CuCO_3$ (d) $(NH_4)_2CO_3$
191. Which of the following has the highest dipole moment [CBSE PMT 1997]
- (a) NH_3 (b) PH_3
(c) SbH_3 (d) AsH_3
192. The structural formula of hypophosphorus acid is [CBSE PMT 1997; AIIMS 2001; BCECE 2005; Pb. CET 2002]
- (a)  (b) 
(c)  (d) 
193. Repeated use of which of the following fertilizers would increase the acidity of the soil [CBSE PMT 1998]
- (a) Urea (b) Potassium nitrate
(c) Ammonium sulphate (d) Superphosphate of lime
194. Aqua-regia is [Orissa JEE 2005]
- (a) 1 : 3 conc. HNO_3 and conc. HCl
(b) 1 : 2 conc. HNO_3 and conc. HCl
(c) 3 : 1 conc. HNO_3 and conc. HCl
(d) 2 : 1 conc. HNO_3 and conc. HCl
195. Which oxide of nitrogen is obtained on heating ammonium nitrate at $250^\circ C$ [AIIMS 1999]
- (a) Nitric oxide (b) Nitrous oxide
(c) Nitrogen dioxide (d) Dinitrogen oxide
196. The oxidation number of phosphorus vary from [Kurukshetra CEE 1998; DCE 2001]
- (a) -1 to +3 (b) -3 to +3
(c) -3 to +5 (d) -5 to +1
197. Inorganic graphite is [KCET 2003]
- (a) $B_3N_3H_6$ (b) B_3N_3
(c) SiC (d) $Fe(CO)_5$
198. Conc. HNO_3 can be stored in container of [MH CET 2001]
- (a) Al (b) Sn
(c) Cu (d) Zn
199. Which of the following compounds does not exist [JIPMER 1997]
- (a) $SbCl_3$ (b) $BiCl_5$
(c) $SbCl_5$ (d) $AsCl_5$
200. The formula of an oxyacid of phosphorus is H_3PO_4 . It is a

[MP PMT 1996; CPMT 1999; J & K CET 2005]

[IIT-JEE 1999]

- (a) Dibasic acid (b) Monobasic acid
(c) Tribasic acid (d) Tetrabasic acid
201. Which salt can be classified as an acid salt [CPMT 1993]
(a) Na_2SO_4 (b) $BiOCl$
(c) $Pb(OH)Cl$ (d) Na_2HPO_4
202. In NH_3 and PH_3 , the common is [AFMC 1995]
(a) Odour (b) Combustibility
(c) Basic nature (d) None of these
203. Which one of the following hydrides is least stable
(a) AsH_3 (b) SbH_3
(c) NH_3 (d) PH_3
204. Which element from V group, gives most basic compound with hydrogen [MP PMT 1995]
(a) Nitrogen (b) Bismuth
(c) Arsenic (d) Phosphorus
205. The acid which forms two series of salts is [KCET 1996]
(a) H_3PO_4 (b) H_3PO_3
(c) H_3BO_3 (d) H_3PO_2
206. Which gas is obtained when urea is heated with HNO_2 [CPMT 1996]
(a) N_2 (b) H_2
(c) O_2 (d) NH_3
207. Atomic number of N is 7. The atomic number of IIIrd member of nitrogen family is [CPMT 1996]
(a) 23 (b) 15
(c) 33 (d) 43
208. Which of the following have least covalent P-H bond [CPMT 1996]
(a) PH_3 (b) P_2H_6
(c) P_2H_5 (d) PH_6^+
209. Sides of match box have coating of [BHU 1995]
(a) Potassium chlorate, red lead
(b) Potassium chlorate, antimony sulphide
(c) Antimony sulphide, red phosphorus
(d) Antimony sulphide, red lead
210. Which of the following compound is tribasic acid [AIIMS 2002]
(a) H_3PO_2 (b) H_3PO_3
(c) H_3PO_4 (d) $H_4P_2O_7$
211. Which of the following is manufactured from the molecular nitrogen by bacteria [MP PET 1999]
(a) NO_3 (b) NO_2
(c) Amino acids (d) Ammonia
212. One mole of calcium phosphide on reaction with excess water gives
(a) One mole of phosphine
(b) Two moles of phosphoric acid
(c) Two moles of phosphine
(d) One mole of phosphorous pentoxide
213. On heating ammonium dichromate, the gas evolved is [IIT-JEE 1999]
(a) Oxygen (b) Ammonia
(c) Nitrous oxide (d) Nitrogen
214. In compounds of type ECl_3 , where $E = B, P, As$ or Bi , the angles $Cl-E-Cl$ for different E are in the order
- (a) $B > P = As = Bi$ (b) $B > P > As > Bi$
(c) $B < P = As = Bi$ (d) $B < P < As < Bi$
215. Ammonia on reaction with hypochlorite anion, can form [IIT-JEE 1999]
(a) NO (b) NH_4Cl
(c) N_2H_4 (d) HNO_2
216. Orthophosphoric acid represents the molaysis condition due to
(a) Hydrogen bonding
(b) Phosphorous group
(c) Maximum oxygen group
(d) Tribasicity
217. Which of the following elements forms a strongly acidic oxide
(a) P (b) As
(c) Sb (d) Bi
218. In group V-A of the periodic table nitrogen forms only a trihalide but other elements form pentahalides also. The reason is
(a) Nitrogen has less affinity towards halogens
(b) Nitrogen halides are covalent
(c) Nitrogen undergoes d^2sp^3 hybridization
(d) Nitrogen does not have d-orbitals
219. In the nitrogen family the $H-M-H$ bond angle in the hydrides MH_3 gradually becomes closer to 90° on going from N to Sb. This shows that gradually [MP PET/PMT 1998; MP PMT 2000]
(a) The basic strength of hydrides increases
(b) Almost pure p-orbitals are used for $M-H$ bonding
(c) The bond energies of $M-H$ bond increase
(d) The bond pairs of electrons become nearer to the central atom
220. An element (X) forms compounds of the formula XCl_3 , X_2O_5 and Ca_3X_2 , but does not form XCl_5 , which of the following is the element X [MP PET 1997]
(a) B (b) Al
(c) N (d) P
221. Which of the following tendencies remains unchanged on going down in the nitrogen family (Group-VA) ? [MP PMT 1997]
(a) Highest oxidation state
(b) Non-metallic character
(c) Stability of hydrides
(d) Physical state
222. Which of the following oxy acids of phosphorus is a reducing agent and monobasic [DCE 2004]
(a) H_3PO_2 (b) H_3PO_3
(c) H_3PO_4 (d) $H_4P_2O_6$
223. Bone black is a polymorphic form of [DCE 2003]
(a) Phosphorus (b) Sulphur
(c) Carbon (d) Nitrogen
224. Nitrous oxide is known as [IIT-JEE 1999] [AFMC 2004]
(a) Breathing gas (b) Laughing gas
(c) exercising gas (d) Laboratory gas
225. When lead nitrate is heated, it gives [MH CET 2003]
(a) NO_2 (b) NO
(c) N_2O_5 (d) N_2O
226. Which element exist as a solid at $25^\circ C$ and 1 atmospheric pressure among the following [DCE 2003]
(a) Br (b) Cl
(c) Hg (d) P

227. In the reaction $\text{HNO}_3 + \text{P}_4\text{O}_{10} \rightarrow 4\text{HPO}_3 + x$, the product x is
[MH CET 2003; DPMT 2004]
(a) N_2O_3 (b) N_2O_5
(c) NO_2 (d) H_2O
228. The number of hydrogen atom (s) attached to phosphorus atom in hypophosphorous acid is
[AIEEE 2005]
(a) Zero (b) Two
(c) One (d) Three
229. Which blue liquid is obtained on reacting equimolar amounts of two gases at -30°C
[IIT-JEE (Screening) 2005]
(a) N_2O (b) N_2O_3
(c) N_2O_4 (d) N_2O_5
230. Which is the most thermodynamically stable allotropic form of phosphorus
[IIT-JEE (Screening) 2005]
(a) Red (b) White
(c) Black (d) Yellow
231. $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$ on heating liberates a gas. The same gas will be obtained by
[IIT JEE (Screening) 2004; BVP 2004]
(a) Heating NH_4NO_2
(b) Heating NH_4NO_3
(c) Treating H_2O_2 with NaNO_2
(d) Treating Mg_3N_2 with H_2O
232. The element which forms oxides in all oxidation states $+I$ to $+V$ is
[AIIMS 2004]
(a) N (b) P
(c) As (d) Sb
233. The boiling points of the following hydrides follow the order of
[DPMT 2004]
(a) $\text{NH}_3 > \text{AsH}_3 > \text{PH}_3 > \text{SbH}_3$
(b) $\text{SbH}_3 > \text{AsH}_3 > \text{PH}_3 > \text{NH}_3$
(c) $\text{SbH}_3 > \text{NH}_3 > \text{AsH}_3 > \text{PH}_3$
(d) $\text{NH}_3 > \text{PH}_3 > \text{AsH}_3 > \text{SbH}_3$
234. Which of the following halides is most acidic
[MP PMT 2004]
(a) PCl_3 (b) BiCl_3
(c) SbCl_3 (d) CCl_4
235. In the electrothermal process, the compound displaced by silica from calcium phosphate is
[KCET 2004]
(a) Calcium (b) Phosphine
(c) Phosphorus (d) Phosphorus pentoxide
236. Which of the following compound show sublimation
[AFMC 1995; Pb. CET 2000]
(a) NH_4Cl (b) CaCO_3
(c) BaSO_4 (d) CaHPO_3
237. Number of $\text{P}-\text{O}$ bonds in P_4O_{10} is [DCE 2002]
(a) 17 (b) 16
(c) 15 (d) 6
238. Most acidic oxide is [Pb. CET 2004]
(a) Na_2O (b) ZnO
(c) MgO (d) P_2O_5
239. Which of the following is a mixed anhydride [Pb. CET 2003]
(a) NO (b) NO_2
(c) N_2O_5 (d) N_2O
240. Oxidation number of As in H_2AsO_4^- is [CPMT 2001]
(a) 6 (b) 7
(c) 5 (d) 9
241. When plants and animals decay, the organic nitrogen is converted into inorganic nitrogen. The inorganic nitrogen is in the form of [KCET 2005]
(a) Ammonia (b) Elements of nitrogen
(c) Nitrates (d) Nitrides

Oxygen family

1. Which element is found in free state
[CPMT 1972, 81, 91; DPMT 1986]
(a) Iodine (b) Sulphur
(c) Phosphorus (d) Magnesium
2. Which of the elements listed below occurs in allotropic forms
[CPMT 1972]
(a) Iodine (b) Copper
(c) Sulphur (d) Silver
3. Which forms new compound in air [AFMC 1987]
(a) H_2O in air (b) O_2 in air
(c) N_2 in air (d) Phosphorus in air
4. Which of the following after burning at room temperature gives gaseous oxide
[NCERT 1973; CPMT 1981; DPMT 1982; JIPMER 2001]
(a) H (b) Na
(c) S (d) He
5. Sulphur molecule is converted into sulphur ion, when it
[DPMT 1980]
(a) Gains two electrons (b) Loses two electrons
(c) Gains two protons (d) Shares two electrons
6. The element which liberates oxygen gas from water is [MP PMT 1993]
(a) P (b) Na
(c) F (d) I
7. The highest catenation ability is shown by [AIIMS 1983; MP PET 1993; CPMT 1997]
(a) Oxygen (b) Sulphur
(c) Selenium (d) Tellurium
8. Ozone belongs to which group of the periodic table
(a) V group (b) VI group
(c) VII group (d) None of these
9. The number of unpaired electrons in the p -subshell of oxygen atom is [Kurukshetra CEE 1991]
(a) 1 (b) 2
(c) 3 (d) 4
10. Most abundant element on earth is [MP PET/PMT 1988]
(a) O (b) S
(c) Se (d) Te
11. Which of the following is most electronegative [BHU 1978]
(a) O (b) S
(c) Te (d) Se
12. The ability of a substance to assume two or more crystalline structures is called [CBSE PMT 1989]
(a) Isomerism (b) Polymorphism
(c) Isomorphism (d) Amorphism

13. SO_2 is obtained when [Roorkee 1995]
 (a) Oxygen reacts with dilute sulphuric acid
 (b) Hydrolysis of dilute H_2SO_4
 (c) Concentrated H_2SO_4 reacts with Na_2SO_3
 (d) All of these
14. Which shows polymorphism [BHU 1982; MP PMT 1985]
 (a) O (b) S
 (c) Se (d) All the above
15. Bond angle is minimum for [DPMT 1990]
 (a) H_2O (b) H_2S
 (c) H_2Se (d) H_2Te
16. Oxygen was discovered by [BHU 1987]
 (a) Priestley (b) Boyle
 (c) Scheele (d) Cavendish
17. The compound which gives off oxygen on moderate heating is [IIT-JEE 1986; MP PMT 1991; MADT Bihar 1995]
 (a) Cupric oxide
 (b) Mercuric oxide
 (c) Zinc oxide
 (d) Aluminium oxide
18. It is possible to obtain oxygen from air by fractional distillation because [CBSE PMT 1989]
 (a) Oxygen is in a different group of the periodic table from nitrogen
 (b) Oxygen is more reactive than nitrogen
 (c) Oxygen has higher b.p. than nitrogen
 (d) Oxygen has a lower density than nitrogen
19. Oxygen is denser than air so it is collected over [CPMT 1980; MP PET 1999]
 (a) H_2O (b) Ethanol
 (c) Mercury (d) Kerosene oil
20. Oxygen molecule exhibits [CPMT 1991, 99, 2002; AIIMS 1983; BHU 1986; NCERT 1980, 81; MP PMT 1985, 92; AFMC 2004]
 (a) Paramagnetism (b) Diamagnetism
 (c) Ferromagnetism (d) Ferrimagnetism
21. When oxygen is passed through a solution of Na_2SO_3 we get
 (a) Na_2SO_4 (b) Na_2S
 (c) $NaHSO_4$ (d) NaH
22. Oxygen does not react with [CBSE PMT 1989]
 (a) P (b) Na
 (c) S (d) Cl
23. The formula of ozone is O_3 , it is [CPMT 1989, 91; Manipal MEE 1995; RPET 1999, 2000]
 (a) An allotrope of oxygen (b) Compound of oxygen
 (c) Isotope of oxygen (d) None of these
24. Ozone is obtained from oxygen [CPMT 1982]
 (a) By oxidation at high temperature
 (b) By oxidation using a catalyst
 (c) By silent electric discharge
 (d) By conversion at high pressure
25. Which of the following statement is true about ozone layer [NCERT 1980]
 (a) It is harmful because ozone is dangerous to living organism
 (b) It is beneficial because oxidation reaction can proceed faster in the presence of ozone
 (c) It is beneficial because ozone cuts out the ultraviolet radiation of the sun
 (d) It is harmful because ozone cuts out the important radiation of the sun which are vital for photosynthesis
26. Identify the incorrect statement with respect to ozone
 (a) Ozone is formed in the upper atmosphere by a photochemical reaction involving dioxygen
 (b) Ozone is more reactive than oxygen
 (c) Ozone is diamagnetic whereas dioxygen is paramagnetic
 (d) Ozone protects the earth's inhabitants by absorbing γ radiations
27. Which one of the following property is not correct for ozone [CPMT 1984]
 (a) It oxidises lead sulphide
 (b) It oxidises potassium iodide
 (c) It oxidises mercury
 (d) It cannot act as bleaching agent
28. Ozone with KI solution produces [CPMT 1987]
 (a) Cl_2 (b) I_2
 (c) HI (d) IO_3
29. The gases respectively absorbed by alkaline pyrogallol and oil of cinnamon is [CBSE PMT 1989]
 (a) O_3 , CH_4 (b) O_2 , O_3
 (c) SO_2 , CH_4 (d) N_2O , O_3
30. Ozone turns trimethyl paper [CPMT 1989]
 (a) Green (b) Violet
 (c) Red (d) Black
31. No. of atoms in one molecule of sulphur is [AFMC 1987, 91; AMU 1985]
 (a) 8 (b) 4
 (c) 3 (d) None of these
32. When H_2S is passed through acidified $KMnO_4$, we get [CPMT 1979, 91; MP PMT 1987]
 (a) K_2SO_3 (b) MnO_2
 (c) $KHSO_3$ (d) Sulphur
33. Copper turnings when heated with concentrated sulphuric acid will give [AFMC 1987; BHU 1999; CBSE PMT 2000]
 (a) SO_2 (b) SO_3
 (c) H_2S (d) O_2
34. Which of the following is used to absorb sulphur dioxide [EAMCET 1980]
 (a) Conc. H_2SO_4 (b) KOH solution
 (c) Water (d) Anhydrous $CaCl_2$
35. Which compound acts as an oxidising as well as reducing agent
 (a) SO_2 (b) MnO_2
 (c) Al_2O_3 (d) CrO_3
36. A solution of sulphur dioxide in water reacts with H_2S precipitating sulphur. Here sulphur dioxide acts as [NCERT 1980; MP PMT 1994]
 (a) An oxidising agent (b) A reducing agent
 (c) An acid (d) A catalyst
37. When SO_2 is passed through acidified $K_2Cr_2O_7$ solution [CPMT 1989, 94]
 (a) The solution turns blue
 (b) The solution is decolourised
 (c) SO_2 is reduced
 (d) Green $Cr_2(SO_4)_3$ is formed
38. When SO_2 is passed through cupric chloride solution [CPMT 1979, 81, 89, 94]
 (a) A white precipitate is obtained

- (b) The solution becomes colourless
(c) The solution becomes colourless and a white precipitate of Cu_2Cl_2 is obtained
(d) No visible change takes place
39. Which of the following is oxidised by SO_2 [BHU 1986]
(a) Mg (b) $\text{K}_2\text{Cr}_2\text{O}_7$
(c) KMnO_4 (d) All of these
40. Bleaching action of SO_2 is due to [CPMT 1971, 79, 86]
(a) Reduction (b) Oxidation
(c) Hydrolysis (d) Its acidic nature
41. A salt of sulphurous acid is called [NCERT 1978]
(a) Sulphate (b) Sulphurate
(c) Sulphite (d) Sulphide
42. Which of the following is acidic [AFMC 1990; JIPMER 1997]
(a) SO_3 (b) N_2O
(c) BeO (d) HgO
43. The final acid obtained during the manufacture of H_2SO_4 by contact process is [SCRA 1991]
(a) H_2SO_4 (conc.) (b) H_2SO_4 (dil.)
(c) H_2SO_4 (d) $\text{H}_2\text{S}_2\text{O}_7$
44. About H_2SO_4 which is incorrect [CPMT 1985]
(a) Reducing agent (b) Dehydrating agent
(c) Sulphonating agent (d) Highly viscous
45. In the reaction
$$2\text{Ag} + 2\text{H}_2\text{SO}_4 \rightarrow \text{Ag}_2\text{SO}_4 + 2\text{H}_2\text{O} + \text{SO}_2$$

 H_2SO_4 acts as [CPMT 1981]
(a) Reducing agent (b) Oxidising agent
(c) Catalytic agent (d) Dehydrating agent
46. In the reaction $\text{HCOOH} \xrightarrow{\text{H}_2\text{SO}_4} \text{CO} + \text{H}_2\text{O}$; H_2SO_4 acts as [CPMT 1980]
(a) Dehydrating agent (b) Oxidising agent
(c) Reducing agent (d) All of these
47. When conc. H_2SO_4 comes in contact with sugar, it becomes black due to [CPMT 1989; BHU 1986; MDAT Bihar 1980]
(a) Hydrolysis (b) Hydration
(c) Decolourisation (d) Dehydration
48. Oxalic acid when heated with conc. H_2SO_4 , gives out [DPMT 1981; AFMC 1998]
(a) H_2O and CO_2 (b) CO and CO_2
(c) Oxalic sulphate (d) CO_2 and H_2S
49. Which one is known as oil of vitriol [CPMT 1988; MP PMT 2004]
(a) H_2SO_3 (b) H_2SO_4
(c) $\text{H}_2\text{S}_2\text{O}_7$ (d) $\text{H}_2\text{S}_2\text{O}_8$
50. The acid used in lead storage cells is [NCERT 1971; Roorkee 1989]
(a) Phosphoric acid (b) Nitric acid
(c) Sulphuric acid (d) Hydrochloric acid
51. Which one of the gas dissolves in H_2SO_4 to give oleum [CPMT 1988]
(a) SO_2 (b) H_2S
(c) S_2O (d) SO_3
52. Oleum is [CBSE PMT 1991; MP PMT 2002; CPMT 2004]
(a) Castor oil (b) Oil of vitriol
(c) Fuming H_2SO_4 (d) None of them
53. There is no $\text{S}-\text{S}$ bond in [IIT 1991; CPMT 1999; DCE 2000]
(a) $\text{S}_2\text{O}_4^{2-}$ (b) $\text{S}_2\text{O}_5^{2-}$
(c) $\text{S}_2\text{O}_3^{2-}$ (d) $\text{S}_2\text{O}_7^{2-}$
54. Which of the following sulphate is insoluble in water [MP PMT 2000]
(a) CuSO_4 (b) CdSO_4
(c) PbSO_4 (d) $\text{Bi}_2(\text{SO}_4)_3$
55. When sulphur is boiled with Na_2SO_3 solution, the compound formed is [CPMT 1979; Roorkee 1992]
(a) Sodium sulphide (b) Sodium sulphate
(c) Sodium persulphate (d) Sodium thiosulphate
56. The products of the chemical reaction between $\text{Na}_2\text{S}_2\text{O}_3$, Cl_2 and H_2O are [EAMCET 1989]
(a) $\text{S} + \text{HCl} + \text{Na}_2\text{S}$ (b) $\text{S} + \text{HCl} + \text{Na}_2\text{SO}_4$
(c) $\text{S} + \text{HCl} + \text{Na}_2\text{SO}_3$ (d) $\text{S} + \text{NaClO}_3 + \text{H}_2\text{O}$
57. Hypo is used in photography for [Roorkee 1989]
(a) Developing a picture
(b) Picture printing
(c) The colour of picture
(d) The fixation of the picture
58. Hypo is used in photography to [CBSE PMT 1988; Pb. CET 1989]
(a) Reduce AgBr grains to metallic silver
(b) Convert the metallic silver to silver salt
(c) Remove undecomposed silver bromide as a soluble complex
(d) Remove reduced silver
59. Hypo is used in photography because of its [IIT 1981; EAMCET 1988; MADT Bihar 1995]
(a) Reducing behaviour
(b) Oxidising behaviour
(c) Complex forming behaviour
(d) Reaction with light
60. Aqueous solutions of hydrogen sulphide and sulphur dioxide when mixed together, yield [KCET 2002]
(a) Sulphur and water
(b) Sulphur trioxide and water
(c) Hydrogen peroxide and sulphur
(d) Hydrogen and sulphurous acid
61. An example of a neutral oxide is [KCET 2003]
(a) NO (b) CO_2
(c) CaO (d) ZnO
62. Which of the following is the best scientific method to test presence of water in a liquid [AIIMS 1999]
(a) Taste
(b) Smell
(c) Use of litmus paper
(d) Use of anhydrous copper sulphate
63. H_2S react with O_2 to form [AFMC 1995]
(a) $\text{H}_2\text{O} + \text{S}$ (b) $\text{H}_2\text{O} + \text{SO}_2$
(c) $\text{H}_2\text{O} + \text{SO}_3$ (d) $\text{H}_2\text{SO}_4 + \text{S}$
64. Which of the following mixture is chromic acid [Pb. PMT 2000]
(a) $\text{K}_2\text{Cr}_2\text{O}_7$ and conc. H_2SO_4
(b) $\text{K}_2\text{Cr}_2\text{O}_7$ and HCl

- (c) K_2SO_4 and conc. H_2SO_4
(d) H_2SO_4 and HCl
65. At room temperature H_2O is a liquid while H_2S is a gas. The reason is [RPET 1999]
(a) Electronegativity of O is greater than S
(b) Difference in the bond angles of both the molecules
(c) Association takes place in H_2O due to H -bonding while no H -bonding in H_2S
(d) O and S belong to different periods
66. Which of the following products is formed on boiling tin with an alkali solution [Roorkee 2000]
(a) $Sn(OH)_2$ (b) $Sn(OH)_4$
(c) SnO_3^{2-} (d) SnO_2
67. Amongst H_2O , H_2S , H_2Se and H_2Te the one with the highest boiling point is [IIT-JEE (Screening) 2000]
(a) H_2O because of hydrogen bonding
(b) H_2Te because of higher molecular weight
(c) H_2S because of hydrogen bonding
(d) H_2Se because of lower molecular weight
68. Among the hydrides formed by the group VI-A elements, only H_2O has an abnormally low volatility (high boiling point). This is so because
(a) H_2O molecules are associated due to intermolecular hydrogen bonds
(b) H_2O is covalent in nature
(c) The $O-H$ bond in H_2O is very strong
(d) The electronegativity difference of H and O is very large
69. Sulphuric acid reacts with PCl_5 to give [KCET 1996; JIPMER 2000]
(a) Thionyl chloride (b) Sulphur monochloride
(c) Sulphuryl chloride (d) Sulphur tetrachloride
70. Carbogen is [EAMCET 1998]
(a) Pure form of carbon
(b) $COCl_2$
(c) Mixture of CO and CO_2
(d) Mixture of O_2 and CO_2
71. Which of the following dissociates to give H^+ most easily [MP PET 1994]
(a) H_2O (b) H_2S
(c) H_2Te (d) H_2Se
72. Superphosphate is the mixture of [CPMT 1993]
(a) Calcium phosphate and dil. H_2SO_4
(b) Sodium phosphate and dil. H_2SO_4
(c) Potassium phosphate and dil. H_2SO_4
(d) None of these
73. Among KO_2 , NO_2^- , BaO_2 and NO_2^+ unpaired electron is present in [IIT 1997]
(a) NO_2^+ and BaO_2 (b) KO_2 and BaO_2
(c) KO_2 only (d) BaO_2 only
74. Which is not easily soluble in water [CPMT 1994]
(a) H_2 (b) O_2
(c) SO_2 (d) CO_2
75. Point out in which of the following properties oxygen differs from the rest of the members of its family (Group-VIA) [MP PMT 1997]
(a) High value of ionisation energies
(b) Oxidation states (2, 4, 6)
(c) Polymorphism
(d) Formation of hydrides

76. In the preparation of sulphuric acid, V_2O_5 is used in the reaction, which is [CBSE PMT 2001; AFMC 2001]
 (a) $S + O_2 \rightarrow SO_2$
 (b) $2SO_2 + O_2 \rightarrow 2SO_3$
 (c) $SO_2 + H_2O \rightarrow H_2SO_4$
 (d) $N_2 + 3H_2 \rightarrow 2NH_3$
77. Which of the following hydrides has the lowest boiling point [MP PET 1997]
 (a) H_2O (b) H_2S
 (c) H_2Se (d) H_2Te
78. The catalyst used in the manufacture of H_2SO_4 by contact process is [UPSEAT 1999]
 (a) Al_2O_3 (b) Cr_2O_3
 (c) V_2O_5 (d) MnO_2
79. The molecular formula of sulphur is [MP PMT 1996; MP PET/PMT 1998]
 (a) S (b) S_2
 (c) S_4 (d) S_8
80. Which of the following is not suitable for use in a desiccator to dry substances [AIIMS 1996]
 (a) Conc. H_2SO_4 (b) Na_2SO_4
 (c) $CaCl_2$ (d) P_4O_{10}
81. Which shows polymorphism [DCE 2000]
 (a) O (b) S
 (c) Se (d) All
82. All the elements of oxygen family are [MP PET/PMT 1998]
 (a) Non-metals (b) Metalloids
 (c) Radioactive (d) Polymorphic
83. The triatomic species of elemental oxygen is known as [Kerala (Med.) 2002]
 (a) Azone (b) Polyzone
 (c) Triozone (d) Ozone
84. When H_2S gas is passed through nitric acid, the product is [Kerala (Engg.) 2002]
 (a) Rhombic S (b) Prismatic S
 (c) Amorphous S (d) Monoclinic S
 (e) None of these
85. Shape of O_2F_2 is similar to that of [AIIMS 2004]
 (a) C_2F_2 (b) H_2O_2
 (c) H_2F_2 (d) C_2H_2
86. Which of the following bonds has the highest energy [CBSE PMT 1996]
 (a) $Se - Se$ (b) $Te - Te$
 (c) $S - S$ (d) $O - O$
87. Which of the following is not a chalcogen [CPMT 1999]
 (a) O (b) S
 (c) Se (d) Na
88. Which of the following is a suboxide [DPMT 2001]
 (a) Ba_2O (b) Pb_2O
 (c) C_3O_2 (d) ZnO
89. In the manufacture of sulphuric acid by contact process, Tyndall box is used to [KCET 2003]
 (a) Filter dust particles
 (b) Remove impurities
 (c) Convert SO_2 to SO_3
 (d) Test the presence of dust particles
90. Permono sulphuric acid is known as [Bihar CEE 1995]
 (a) Marshall's acid (b) Caro's acid
 (c) Sulphuric acid (d) None of these
91. $KO_2 + CO_2 \rightarrow ?$ (gas) [CPMT 1997]
 (a) H_2 (b) N_2
 (c) O_2 (d) CO
92. H_2SO_4 acts as dehydrating agent in its reaction with [JIPMER 2001]
 (a) $H_2C_2O_4$ (b) $Ba(OH)_2$
 (c) KOH (d) Zn
93. Which of the following group shows the highest boiling point [MP PET 2002]
 (a) H_2O (b) H_2S
 (c) H_2Se (d) H_2Te
94. In presence of moisture, SO_2 can [BVP 2003]
 (a) Act as oxidant (b) Lose electron
 (c) Gain electron (d) Not act as reductant
95. A gas that cannot be collected over water is [Kurukshetra CEE 1998]
 (a) N_2 (b) O_2
 (c) SO_2 (d) PH_3
96. Which of the following is formed by the action of water on sodium peroxide [Pb. PMT 1999]
 (a) H_2 (b) N_2
 (c) O_2 (d) CO_2
97. Sulphur on boiling with $NaOH$ solution gives [Roorkee 1999]
 (a) $Na_2S_2O_3 + NaHSO_3$ (b) $Na_2S_2O_3 + Na_2S$
 (c) $Na_2SO_3 + H_2S$ (d) $Na_2SO_3 + SO_2$
98. Quartz is a crystalline variety of [Pb. CET 2002; Pb. PMT 2000, 04]
 (a) Silicon carbide (b) Sodium silicate
 (c) Silica (d) Silicon
99. The most efficient agent for the absorption of SO_3 is [BHU 2004; DPMT 2004]
 (a) 80% H_2SO_4 (b) 98% H_2SO_4
 (c) 50% H_2SO_4 (d) 20% $H_2S_2O_7$
100. Conc. H_2SO_4 is diluted [Pb. CET 2001]
 (a) By adding water in H_2SO_4
 (b) By adding H_2SO_4 in water
 (c) By adding glacial acetic acid in H_2SO_4
 (d) None of the above
101. The smog is essentially caused by the presence of [AIEEE 2004]
 (a) Oxides of sulphur and nitrogen
 (b) O_2 and N_2
 (c) O_2 and O_3
 (d) O_3 and N_2

102. Bleaching action of SO_2 is due to its [CPMT 2004]
 (a) Oxidising property (b) Acidic property
 (c) Basic property (d) Reducing property
103. Oxygen is not evolved on reaction of ozone with [Pb. PMT 2004]
 (a) H_2O_2 (b) SO_2
 (c) Hg (d) KI
104. When PbO_2 reacts with conc. HNO_3 the gas evolved is [IIT-JEE (Screening) 2005]
 (a) NO_2 (b) O_2
 (c) N_2 (d) N_2O
105. Sulphur in +3 oxidation state is present in [DCE 2003]
 (a) Sulphurous acid (b) Pyrosulphuric acid
 (c) Dithionous acid (d) Thiosulphuric acid
106. $SO_2 + H_2S \rightarrow$ product. the final product is [Orissa JEE 2005]
 (a) $H_2O + S$ (b) H_2SO_4
 (c) H_2SO_3 (d) $H_2S_2O_3$
107. Oncontrolled hydrolysis and condensation, R_3SiCl yields [Orissa JEE 2005]
 (a) $R_3Si-O-SiR_3$ (b) $\uparrow R_3Si-O-SiR_3 \uparrow$
 (c) R_3SiOH (d) $\begin{array}{c} R & R \\ | & | \\ -Si-O-Si- \\ | & | \\ O & O \\ -Si-O-Si- \\ | & | \end{array}$
108. Ozone deplect due to the formation of following compound in Antarctica [Kerala CET 2005]
 (a) Acrolein (b) Peroxy acetyl nitrate
 (c) SO_2 and SO_3 (d) Chlorine nitrate
 (e) Formaldehyde
5. Bromine is liberated when an aqueous solution of potassium bromide is treated with [CBSE PMT 1989]
 (a) Cl_2 (b) I_2
 (c) Dilute H_2SO_4 (d) SO_2
6. Which of the following has greatest reducing power [CPMT 1984, 88, 89, 94]
 (a) HI (b) HBr
 (c) HCl (d) HF
7. Chlorine was discovered by [BHU 1988]
 (a) Davy (b) Priestley
 (c) Rutherford (d) Sheele
8. Bad conductor of electricity is [MP PET/PMT 1988]
 (a) H_2F_2 (b) HCl
 (c) HBr (d) HI
9. Which of the following will not occur [MP PET/PMT 1988]
 (a) $Fe + H_2SO_4 \rightarrow FeSO_4 + H_2$
 (b) $Cu + 2AgNO_3 \rightarrow Cu(NO_3)_2 + 2Ag$
 (c) $2KBr + I_2 \rightarrow 2KI + Br_2$
 (d) $CuO + H_2 \rightarrow Cu + H_2O$
10. Bromine is obtained on commercial scale from [CPMT 1985]
 (a) Caliche (b) Carnellite
 (c) Common salt (d) Cryolite
11. Which one of the halogen acids is a liquid [MP PMT 1985]
 (a) HF (b) HCl
 (c) HBr (d) HI
12. Which one of the following acids is the weakest [MP PMT 1985]
 (a) $HClO$ (b) HBr
 (c) $HClO_3$ (d) HCl
13. Chlorine reacts with sodium hydroxide under various condition to give [NCERT 1973]
 (a) Sodium chloride (b) Sodium hypochlorite
 (c) Sodium chlorate (d) All of these
14. Br_2 gas turns starch iodide paper [CPMT 1987; AFMC 1987; AMU 1999]
 (a) Blue (b) Red
 (c) Colourless (d) Yellow
15. When Cl_2 gas is passed through hot and conc. solution of KOH , following compound is formed [CPMT 1971, 79; BVP 2003]
 (a) KCl (b) $KClO_3$
 (c) $KClO_2$ (d) $KClO_4$
16. Deacon's process is used in the manufacture of [BHU 1979]
 (a) Bleaching powder (b) Sulphuric acid
 (c) Nitric acid (d) Chlorine
17. Which of the following is the weakest acid [BHU 1984, 86; CPMT 1988, 2000; MP PMT 1995; MP PET 1989, 90; Kurukshetra CEE 1998; Roorkee 2000; RPMT 2000]
 (a) HF (b) HCl
 (c) HBr (d) HI
18. Which is the most volatile compound [CPMT 1979; AIIMS 1980; DPMT 1982; Kurukshetra CEE 1998; J & K CET 2005; DPMT 2002]
 (a) HF (b) HCl
 (c) HBr (d) HI

Halogen family

1. The correct order of the thermal stability of hydrogen halides ($H-X$) is [AIIEEE 2005]
 (a) $HI > HBr > HCl > HF$
 (b) $HF > HCl > HBr > HI$
 (c) $HCl < HF < HBr < HI$
 (d) $HI > HCl < HF < HBr$
2. Phosgene is the common name of [CPMT 1974, 86; DPMT 1989; MP PMT 1994]
 (a) Carbonyl chloride (b) Phosphine
 (c) Phosphorus oxychloride (d) Phosphorus trichloride
3. The solubility of iodine in water increases in the presence of [CPMT 1973, 74, 78, 86, 89, 91; NCERT 1973; AFMC 1995]
 (a) Alcohol (b) Chloroform
 (c) Sodium hydroxide (d) Potassium iodide
4. When thiosulphate ion is oxidised by iodine, which one of the following ion is produced [CPMT 1989; AFMC 1990; CBSE PMT 1996]
 (a) SO_3^{2-} (b) SO_4^{2-}
 (c) $S_4O_6^{2-}$ (Tetrathionate) (d) $S_2O_6^{2-}$

19. On boiling an aqueous solution of $KClO_3$ with iodine, the following product is obtained [NCERT 1980]
 (a) KIO_3 (b) $KClO_4$
 (c) KIO_4 (d) KCl
20. Colour of iodine solution is disappeared by shaking it with aqueous solution of [CPMT 1979, 81; MP PET/PMT 1988; MP PMT 1986; RPMT 1997, 2002]
 (a) H_2SO_4 (b) Na_2S
 (c) $Na_2S_2O_3$ (d) Na_2SO_4
21. A quick supply of Cl_2 gas may be made by reacting crystals of $KMnO_4$ with a concentrated solution of [CPMT 1973]
 (a) Potassium chloride (b) Sodium chloride
 (c) Bleaching powder (d) Hydrochloric acid
22. The strongest acid amongst the following is [IIT 1989]
 (a) $HClO_4$ (b) $HClO_3$
 (c) $HClO_2$ (d) $HClO$
23. Iodine deficiency in diet causes
 (a) Nightblindness (b) Rickets
 (c) Goitre (d) Beri-beri
24. Which of the following is correct [CPMT 1985]
 (a) Iodine is a solid
 (b) Chlorine is insoluble in water
 (c) Iodine is more reactive than bromine
 (d) Bromine is more reactive than chlorine
25. When KBr is treated with concentrated H_2SO_4 redish brown gas evolved, gas is [Pb. CET 2003]
 (a) Mixture of bromine and HBr
 (b) HBr
 (c) Bromine
 (d) None of these
26. Sea weed is employed as a source of manufacture of [CPMT 1982, 86, 2002; MP PET 2002]
 (a) F (b) I
 (c) Br (d) Cl
27. Which of the following is most active halogen [MP PET 1990]
 (a) Cl_2 (b) Br_2
 (c) I_2 (d) F_2
28. Which of the following represents clear electropositive properties [MP PET/PMT 1988; MP PMT 1991]
 (a) F (b) Cl
 (c) Br (d) I
29. Which statement is false [MP PET 1991]
 (a) Electronegativity of fluorine is maximum
 (b) Electron affinity of fluorine is maximum
 (c) Melting point of fluorine is minimum
 (d) Boiling point of fluorine is maximum
30. Strongest reducing agent is [MP PMT 1990]
 (a) F^- (b) Cl^-
 (c) Br^- (d) I^-
31. Which of the following represents outermost shell electronic configuration of halogens [MP PET 1991; Manipal MEE 1995; MP PMT 1996]
 (a) $s^2 p^3$ (b) $s^2 p^6$
 (c) $s^2 p^4$ (d) $s^2 p^5$
32. Chlorine can remove [MP PET 1990]
 (a) Br from $NaBr$ solution
 (b) F from NaF solution
 (c) Cl from $NaCl$ solution
 (d) F from CaF_2 solution
33. Hydrolysis of which of the following does not occur [AIIMS 1982]
 (a) VCl_4 (b) $TiCl_4$
 (c) $SiCl_4$ (d) CCl_4
34. Nitric acid converts iodine into [MP PMT 1990]
 (a) Iodic acid (b) Hydroiodic acid
 (c) Iodine nitrate (d) Iodine pentaoxide
35. In KI solution, I_2 readily dissolves and forms [MP PMT 1989; EAMCET 1992]
 (a) I^- (b) KI_2
 (c) KI_2^- (d) KI_3
36. Which reaction cannot be used for the production of halogen acid
 (a) $2KBr + H_2SO_4 \rightarrow K_2SO_4 + 2HBr$
 (b) $NaHSO_4 + NaCl \rightarrow Na_2SO_4 + HCl$
 (c) $NaCl + H_2SO_4 \rightarrow NaHSO_4 + HCl$
 (d) $CaF_2 + H_2SO_4 \rightarrow CaSO_4 + 2HF$
37. In dark, which of the following reacts with hydrogen [MP PMT/PET 1988; Kurukshetra CEE 1998]
 (a) Br_2 (b) F_2
 (c) I_2 (d) Cl_2
38. The more activeness of fluorine is due to [MP PMT 1990]
 (a) $F-F$ bond has less energy
 (b) F_2 is gas at normal temperature
 (c) Its electronic bond is maximum
 (d) $F-F$ bond has more energy
39. Which of the following after reacting with KI do not remove iodine [MP PET 1989]
 (a) $CuSO_4$ (b) $K_2Cr_2O_7$
 (c) HNO_3 (d) HCl
40. Aqueous solution of which of the following acids cannot be kept in a bottle of glass [MP PET 1989]
 (a) HF (b) HCl
 (c) HBr (d) HI
41. Which of the following pairs is not correctly matched [MP PET 1993]
 (a) A halogen which is liquid at room temperature—*Bromine*
 (b) The most electronegative element—*Fluorine*
 (c) The most reactive halogen—*Fluorine*
 (d) The strongest oxidizing halogen—*Iodine*
42. Iodine is formed when potassium iodide reacts with a solution of [MNR 1984; MP PET 1990]
 (a) $ZnSO_4$ (b) $CuSO_4$
 (c) $(NH_4)_2SO_4$ (d) Na_2SO_4
43. As the atomic number of halogens increases, the halogens [MP PMT 1991]
 (a) Lose the outermost electrons less readily
 (b) Become lighter in colour
 (c) Become less denser
 (d) Gain electrons less readily
44. Which statement is correct about halogens [EAMCET 1991]

- (a) They are all diatomic and form univalent ions
(b) They are all capable of exhibiting several oxidation states
(c) They are all diatomic and form divalent ions
(d) They can mutually displace each other from the solution of their compounds with metals
45. Mark the smallest atom [CPMT 1984, 89]
(a) F (b) Cl
(c) Br (d) I
46. Mark the element which shows only one oxidation state [BHU 1988; MP PET 2002]
(a) F (b) Cl
(c) Br (d) I
47. Which of the following arrangement for the three halogens Cl , Br and I when placed in the order of their increasing electron affinity is correct [CPMT 1990]
(a) Cl , Br , I (b) I , Br , Cl
(c) Br , Cl , I (d) I , Cl , Br
48. Which of the following is strongest oxidising agent [CPMT 1978, 91, 94; MNR 1990; AMU 1983, 84; MP PMT 1991, 92, 96; IIT 1992; UPSEAT 2000]
(a) F_2 (b) Cl_2
(c) Br_2 (d) I_2
49. Fluorine is a better oxidising agent than Br_2 . It is due to [EAMCET 1992]
(a) Small size of fluorine
(b) More electron repulsion in fluorine
(c) More electronegativity of fluorine
(d) Non-metallic nature of fluorine
50. Fluorine is a stronger oxidising agent than chlorine in aqueous solution. This is attributed to many factors except [Pb. CET 1989]
(a) Heat of dissociation (b) Electron affinity
(c) Heat of hydration (d) Ionisation potential
51. Mark the element which displaces three halogens from their compounds [MP PMT 1980, 82; BHU 1984; NCERT 1987]
(a) F (b) Cl
(c) Br (d) I
52. Which one of the following is the most basic [CPMT 1975, 77; MP PMT 2001]
(a) I (b) Br
(c) Cl (d) F
53. Which of the following will displace the halogen from the solution of the halide [EAMCET 1979]
(a) Br_2 added to $NaCl$ solution
(b) Cl_2 added to KCl solution
(c) KCl added to NaF solution
(d) Br_2 added to KI solution
54. Fluorine does not form positive oxidation states because [AIIMS 1987]
(a) It is most electronegative element
(b) It forms only anions in ionic compounds
(c) It cannot form multiple bonding
(d) It shows non-bonded electron pair repulsion due to small size
55. In the isolation of fluorine, a number of difficulties were encountered. Which statement is correct [NCERT 1983, 86]
(a) The potential required for the discharge of the fluoride ions is the lowest
(b) Fluorine reacts with most glass vessels
(c) Fluorine has great affinity for hydrogen
(d) Electrolysis of aqueous HF gives ozonised oxygen
56. Fluorine reacts with water to give [BHU 1988, 89]
(a) HF and O_2 (b) HF and OF_2
(c) HF and O_3 (d) HF , O_2 and O_3
57. In which of the following, oxygen has + 2 oxidation number
(a) F_2O (b) Cl_2O
(c) Na_2O_2 (d) Na_2O
58. The electrolysis of a certain liquid resulted in the formation of hydrogen at the cathode and chlorine at the anode. The liquid is
(a) Pure water
(b) H_2SO_4 solution
(c) $NaCl$ solution in water
(d) $CuCl_2$ solution in water
59. In the preparation of chlorine from HCl , MnO_2 acts as [CPMT 1981]
(a) Oxidising agent (b) Reducing agent
(c) Catalytic agent (d) Dehydrating agent
60. Chlorine gas is dried over [CPMT 1980]
(a) CaO (b) $NaOH$
(c) KOH (d) Conc. H_2SO_4
61. Chlorine can be manufactured from [CPMT 1989]
(a) Electrolysis of $NaCl$
(b) Electrolysis of brine
(c) Electrolysis of bleaching powder
(d) All of these
62. When chlorine water is exposed to sunlight, O_2 is liberated. Hence
(a) Hydrogen has little affinity to O_2
(b) Hydrogen has more affinity to O_2
(c) Hydrogen has more affinity to Cl_2
(d) It is a reducing agent
63. When cold $NaOH$ reacts with Cl_2 which of the following is formed [AFMC 1992]
(a) $NaClO$ (b) $NaClO_2$
(c) $NaClO_3$ (d) None of these
64. Chlorine is used in water for [CBSE PMT 1988]
(a) Killing germs (b) Prevention of pollution
(c) Cleansing (d) Removing dirt
65. Chlorine cannot be used [MP PET/PMT 1988]
(a) As bleaching agent
(b) In sterilisation
(c) In preparation of antiseptic
(d) For extraction of silver and copper
66. Chlorine acts as a bleaching agent only in presence of [IIT 1983; DCE 2002]
(a) Dry air (b) Moisture
(c) Sunlight (d) Pure oxygen
67. Euchlorine is a mixture of [CPMT 1988]
(a) Cl_2 and SO_2 (b) Cl_2 and ClO_2
(c) Cl_2 and CO (d) None of these
68. A gas reacts with CaO , but not with $NaHCO_3$. The gas is [AFMC 1987]

- (a) CO_2 (b) Cl_2
(c) N_2 (d) O_2
69. When chlorine is passed over dry slaked lime at room temperature, the main reaction product is
[CBSE PMT 1992]
(a) $Ca(ClO_2)_2$ (b) $CaCl_2$
(c) $CaOCl_2$ (d) $Ca(OC l_2)_2$
70. Bromine is obtained commercially from sea water by adding
(a) $AgNO_3$ solution (b) Crystals of $NaBr$
(c) Cl_2 (d) C_2H_4
71. In the manufacture of bromine from sea water, the mother liquor containing bromides is treated with
[CBSE PMT 1992; MP PMT 2001; BHU 2002; JIPMER 2002]
(a) CO_2 (b) Cl_2
(c) I_2 (d) SO_2
72. Br^- is converted into Br_2 by using [CPMT 1987]
(a) Cl_2 (b) Conc. HCl
(c) HBr (d) H_2S
73. A salt, which on heating with conc. H_2SO_4 gives violet vapours, is
[CPMT 1971]
(a) Iodide (b) Nitrate
(c) Sulphate (d) Bromide
74. When I_2 is dissolved in CCl_4 , the colour that results is
[AFMC 1993]
(a) Brown (b) Violet
(c) Colourless (d) Bluish green
75. Which of the following halogen oxides is ionic [CPMT 1989]
(a) ClO_2 (b) BrO_2
(c) I_2O_5 (d) I_4O_9
76. KI when heated with conc. H_2SO_4 gives
[MP PET/PMT 1988]
(a) HI (b) I_2
(c) HIO_3 (d) KIO_3
77. The type of bonding in HCl molecule is [AIIMS 1992]
(a) Pure covalent (b) Polar covalent
(c) Highly covalent (d) H -bonding
78. HCl is a gas, but HF is a low boiling liquid. This is because
(a) $H-F$ bond is strong
(b) $H-F$ bond is weak
(c) The molecules aggregate because of hydrogen bonding in HF
(d) HF is a weak acid
79. HI cannot be prepared by the action of conc. H_2SO_4 on KI because [MNR 1984]
(a) HI is stronger than H_2SO_4
(b) HI is more volatile than H_2SO_4
(c) H_2SO_4 is an oxidising agent
(d) H_2SO_4 forms complex
80. A solution of HCl in water is good conductor while gaseous hydrogen chloride is not. This is due to the reason that [NCERT 1980]
(a) Water is a good conductor of electricity
(b) HCl in water ionises
(c) Gas can not conduct electricity but water can
(d) None of these
81. Sodium chloride when heated with conc. H_2SO_4 and solid potassium dichromate gives [CPMT 1981, 84]
(a) Chromic chloride (b) Chromyl chloride
(c) Chromous chloride (d) None of these
82. Hydrogen bonding does not play any role in boiling of [CPMT 1988]
(a) NH_3 (b) H_2O
(c) HI (d) C_2H_5OH [AFMC 1992]
83. HBr and HI reduce sulphuric acid, HCl can reduce $KMnO_4$ and HF can reduce [IIT 1981; MP PET 1993]
(a) H_2SO_4 (b) $KMnO_4$
(c) $K_2Cr_2O_7$ (d) None of these
84. Which has the highest molar heat of vaporisation [CPMT 1991]
(a) HF (b) HCl
(c) HBr (d) HI
85. Mark the strongest acid [Bihar MEE 1996; MP PET/PMT 1998; NCERT 1974; CPMT 1976, 90]
(a) HF (b) HCl
(c) HBr (d) HI
86. Which of the following hydrogen halides has the highest boiling point [AIIMS 1980; DPMT 1983; MP PMT 1989]
(a) HF (b) HCl
(c) HBr (d) Hi
87. Hydrogen bonding is present in [MP PMT 1989; DPMT 1990; Roorkee 1995]
(a) HF (b) HCl
(c) HBr (d) HI
88. The type of hybrid orbitals used by chlorine atom in ClO_2^- is
(a) SP^3 (b) SP^2
(c) SP (d) None of these
89. Which one is the anhydride of $HClO_4$ [AIIMS 1983; BHU 1983; AMU 1984]
(a) Cl_2O (b) ClO_2
(c) Cl_2O_6 (d) Cl_2O_7
90. Which of the following halogens is solid at room temperature [MP PET 1999; AFMC 1991]
(a) Chlorine (b) Iodine
(c) Bromine (d) Fluorine
91. Which of the following chemical contains chlorine [MP PET 1999]
(a) Fischer salt (b) Epsom salt
(c) Fremy's salt (d) Spirit of salt
92. The element which never acts as reducing agent in a chemical reaction is [Bihar CEE 1995]
(a) O (b) Li
(c) F (d) C
93. Concentrated HNO_3 reacts with I_2 to give [IIT 1989; Roorkee 1995; JIPMER 2001]
(a) HI (b) HOI
(c) $HOIO_3$ (d) $HOIO_2$

94. The formula of some fluorides are given below. Which of them will combine further with fluorine [NCERT 1977]
 (a) IF_5 (b) NaF
 (c) CaF_2 (d) SF_5
95. Which one below is a pseudohalide [AIIMS 1982]
 (a) CN^- (b) ICl
 (c) IF_5 (d) I_3^-
96. Which one is highest melting halide [AIIMS 1982; BHU 1999]
 (a) $NaCl$ (b) $NaBr$
 (c) NaF (d) NaI
97. The above answer is correct because the chosen halide has [AIIMS 1982]
 (a) Minimum ionic character
 (b) Maximum ionic character
 (c) Highest oxidising power
 (d) Lowest polarity
98. Which of the following oxidizes H_2O to oxygen [MP PET 1994]
 (a) Chlorine (b) Fluorine
 (c) Bromine (d) Iodine
99. The bleaching action of the bleaching powder is due to the liberation of [MP PMT 1994]
 (a) Chlorine (b) Molecular oxygen
 (c) Nascent oxygen (d) Calcium carbonate
100. Which of the following element is extracted commercially by the electrolysis of an aqueous solution of its compound [KCET 2002]
 (a) Chlorine (b) Bromine
 (c) Aluminium (d) Calcium
101. The effective component of bleaching powder is of calcium [Kerala (Engg.) 2002]
 (a) Chlorine (b) Bromine
 (c) Aluminium (d) Calcium
102. $Na_2S_2O_3 + I_2 \rightarrow$ Product is [BHU 2003]
 (a) Na_2S (b) NaI
 (c) $Na_2S_4O_6$ (d) S_2
103. Which of the following is prepared by electrolytic method [CBSE PMT 2001]
 (a) Ca (b) Sn
 (c) S (d) F_2
104. Beilstein test is used for [AFMC 1995]
 (a) N_2 (b) Cl
 (c) Na (d) CO_2
105. Which one will liberate Br_2 from KBr [BVP 2003]
 (a) I_2 (b) SO_2
 (c) HI (d) Cl_2
106. Chlorine dioxide is best prepared by passing dry [Kerala PMT 2003]
 (a) Chlorine gas over hot HgO
 (b) Chlorine and oxygen gas over hot pt catalyst
 (c) Hydrogen chloride and oxygen over silver oxide
 (d) Hydrogen chloride over phosphorus pentoxide
 (e) Chlorine over hot silver chlorate
107. The mixture of concentrated HCl and HNO_3 made in 3 : 1 ratio contains [AIIMS 2003]
 (a) ClO_2 (b) $NOCl$
 (c) NCl_3 (d) N_2O_4
108. On exciting Cl_2 molecule by UV light, we get [UPSEAT 2003]
 (a) Cl (b) Cl^+
 (c) Cl^- (d) All
109. Which of the following statements is not true [CBSE PMT 2003]
 (a) HF is a stronger acid than HCl
 (b) Among halide ions, iodide is the most powerful reducing agent
 (c) Fluorine is the only halogen that does not show a variable oxidation state
 (d) $HOCl$ is a stronger acid than $HOBr$
110. The correct order of acidic strength [Pb. CET 2004]
 (a) $Cl_2O_7 > SO_2 > P_4O_{10}$ (b) $K_2 > CaO > MgO$
 (c) $CO_2 > N_2O_5 > SO_3$ (d) $Na_2O > MgO > Al_2O_3$
111. Halogen acid used in the preparation of aqua regia is [DPMT 2002]
 (a) HBr (b) HI
 (c) HCl (d) HF
112. $NaOCl$ is used as a bleaching agent and sterilising agent. It can be synthesized by the action of [RPET 2003]
 (a) $NaCl$ with H_2O
 (b) NH_4Cl with $NaOH$
 (c) Cl_2 with cold and dilute $NaOH$
 (d) Cl_2 with hot and concentrated $NaOH$
113. Metal halide which is insoluble in water is [AIIMS 1996]
 (a) AgI (b) KBr
 (c) $CaCl_2$ (d) AgF
114. Which one among the following non-metals liquid at $25^\circ C$ [MP PMT 1999]
 (a) Bromine (b) Carbon
 (c) Phosphorus (d) Sulphur
115. Bleaching action of chlorine is due to [Bihar CEE 1995]
 (a) Oxidation (b) Reduction
 (c) Hydrolysis (d) Its acidic nature
116. Hydrogen iodide cannot be prepared by the action of conc. H_2SO_4 on potassium iodide because [Bihar CEE 1995]
 (a) HI is stronger than H_2SO_4
 (b) HI is more volatile than H_2SO_4
 (c) H_2SO_4 is an oxidising agent
 (d) H_2SO_4 forms complex
117. White enamel of our teeth is [Bihar CEE 1995]
 (a) $Ca_3(PO_4)_2$ (b) CaF_2
 (c) $CaCl_2$ (d) $CaBr_2$
118. The least active halogen with hydrogen is [DPMT 1996]
 (a) Cl (b) I
 (c) Br (d) F
119. Iodine dissolves readily in [BHU 1996]
 (a) Water (b) Potassium iodide
 (c) Carbon tetrachloride (d) Alcohol

120. Which one of the following compounds in aqueous solution gives a white precipitate with perchloric acid [EAMCET 1997]
- (a) NaCl (b) KCl
(c) MgCl_2 (d) FeCl_3
121. Which of the following sequence is correct with reference to the oxidation number of iodine [EAMCET 1997]
- (a) $\text{I}_2 > \text{ICl} < \text{HI} < \text{HIO}_4$ (b) $\text{HIO}_4 < \text{ICl} < \text{I}_2 < \text{HI}$
(c) $\text{I}_2 < \text{HI} < \text{ICl} < \text{HIO}_4$ (d) $\text{HI} < \text{I}_2 < \text{ICl} < \text{HIO}_4$
122. The correct order of acidic strength is [Pb. PMT 1998; AFMC 1998; KCET 2000; Orissa JEE 2005]
- (a) $\text{HF} < \text{HCl} < \text{HBr} < \text{HI}$
(b) $\text{HCl} < \text{HBr} < \text{HF} < \text{HI}$
(c) $\text{HBr} < \text{HCl} < \text{HI} < \text{HF}$
(d) $\text{HI} < \text{HBr} < \text{HCl} < \text{HF}$
123. The chief source of iodine in which it is present as sodium iodate is
- (a) Sea weeds
(b) Caliche
(c) Carnallite
(d) Iodine never exists as sodium iodate
124. The lattice energy of the lithium halides is in the following order [Roorkee Qualifying 1998]
- (a) $\text{LiF} > \text{LiCl} > \text{LiBr} > \text{LiI}$
(b) $\text{LiCl} > \text{LiF} > \text{LiBr} > \text{LiI}$
(c) $\text{LiBr} > \text{LiCl} > \text{LiF} > \text{LiI}$
(d) $\text{LiI} > \text{LiBr} > \text{LiCl} > \text{LiF}$
125. Which has the strong bond [DCE 2001]
- (a) $\text{F}-\text{F}$ (b) $\text{F}-\text{Cl}$
(c) $\text{F}-\text{Br}$ (d) $\text{Cl}-\text{Br}$
126. Iodine and hypo react to produce [DPMT 2001]
- (a) Na_2S (b) Na_2SO_4
(c) $\text{Na}_2\text{S}_4\text{O}_6$ (d) Na_2SO_3
127. Bleaching powder is correctly represented as [RPMT 1997]
- (a) CaOCl_2 (b) CaO
(c) $\text{CaO}(\text{Cl})$ (d) $\text{CaCl}(\text{OCl})$
128. When chlorine reacts with cold and dilute solution of sodium hydroxide, the products obtained are [CBSE PMT 1998]
- (a) $\text{Cl}^- + \text{ClO}^-$ (b) $\text{Cl}^- + \text{ClO}_2^-$
(c) $\text{Cl}^- + \text{ClO}_3^-$ (d) $\text{Cl}^- + \text{ClO}_4^-$
129. A one litre flask is full of brown bromine vapour. The intensity of brown colour of vapour will not decrease appreciably on adding to the flask some [CBSE PMT 1998]
- (a) Pieces of marble (b) Carbon disulphide
(c) Carbon tetrachloride (d) Animal charcoal powder
130. Which of the following statements is correct [BHU 1997]
- (a) Only chlorine and bromine form oxy acids
(b) All halogens form oxy acids
(c) All halogens except fluorine form oxy acids
(d) Only iodine form oxy acids
131. When iodine reacts with NaF , NaBr and NaCl [CPMT 1997]
- (a) It gives mixture of F_2 , Cl_2 and Br_2
(b) It gives chlorine
(c) It gives bromine
(d) None of these
132. Which is the strongest of the following acids [JIPMER 1999]
- (a) HClO_4 (b) H_2SO_4
(c) HCl (d) HNO_3
133. Hydrogen has a tendency to gain one electron to acquire helium configuration. In this respect it resembles [JIPMER 1999]
- (a) Halogens (b) Actinides
(c) Transition elements (d) Alkali metals
134. What is the product obtained in the reaction of HgCl_2 and $\text{Hg}(\text{CN})_2$ [MP PET 2002]
- (a) $(\text{CN})_2$
(b) Addition compound $\text{HgCl}_2 \cdot \text{Hg}(\text{CN})_2$
(c) $\text{Hg}(\text{CN})\text{Cl}$
(d) $\text{Hg}(\text{CN})_2 \cdot \text{Cl}_2$
135. The weakest acid HX ($\text{X} = \text{F}, \text{Cl}, \text{Br}, \text{I}$) is [BHU 2000]
- (a) HF (b) HCl
(c) HBr (d) HI
136. Bleaching powder is obtained by passing chlorine on [JIPMER 1999]
- (a) Lime stone (b) Quick lime
(c) Slaked lime (d) Pure lime
137. Chlorine is liberated, when we heat [AFMC 1998]
- (a) $\text{KMnO}_4 + \text{NaCl}$ (b) $\text{K}_2\text{Cr}_2\text{O}_7 + \text{MnO}_2$
(c) $\text{Pb}_2(\text{NO}_3)_4 + \text{MnO}_2$ (d) $\text{K}_2\text{Cr}_2\text{O}_7 + \text{HCl}$
138. Which of the following silver compounds finds maximum use in photography [JIPMER 1999]
- (a) AgCl (b) AgBr
(c) AgI (d) AgNO_3
139. Which of the following halogen does not exhibit positive oxidation state in its compounds [EAMCET 1997; AIIMS 2000]
- (a) Cl (b) Br
(c) I (d) F
140. Acid strength of oxy acids of chlorine follows the order [AIIMS 2000; CBSE PMT 2005]
- (a) $\text{HClO} < \text{HClO}_2 < \text{HClO}_3 < \text{HClO}_4$
(b) $\text{HClO}_4 < \text{HClO}_3 < \text{HClO}_2 < \text{HClO}$
(c) $\text{HClO}_4 < \text{HClO}_3 < \text{HClO} < \text{HClO}_2$
(d) None of these
141. Bleaching powder is obtained by treating chlorine with [Pb. PMT 1999]
- (a) CaO (b) CaCO_3
(c) CaSO_4 (d) $\text{Ca}(\text{OH})_2$
142. Which statement is not true [MP PET 2000]
- (a) $\text{Ni}(\text{CO})_4$ is diamagnetic
(b) BI_3 is a stronger Lewis acid than BF_3
(c) Graphite conducts electricity whereas diamond does not
(d) CCl_4 is hydrolysed whereas BCl_3 is inert
143. Bleaching powder loses its power on keeping for a long time because [KCET 2000]
- (a) It changes into calcium hypochlorate

- (b) It changes into calcium chloride and calcium hydroxide
(c) It absorbs moisture
(d) It changes into calcium chloride and calcium chlorate
144. The compound which forms a dative bond with ammonia [JIPMER 2001]
(a) CCl_4 (b) BCl_3
(c) MgCl_2 (d) NaCl
145. The bleaching action of bleaching powder is due to the formation of [Roorkee 1999]
(a) CaCl_2 (b) CaSO_4
(c) HClO (d) $\text{Ca}(\text{ClO}_3)_2$
146. Fluorine with dilute NaOH gives [MH CET 2000]
(a) OF_2 (b) O_3
(c) O_2 (d) HF and O_2
147. Which is not oxidised by MnO_2 [DCE 2003]
(a) F (b) Cl
(c) I_2 (d) I
148. Bromine water reacts with SO_2 to form [AFMC 1995]
(a) H_2O and HBr (b) H_2SO_4 and HBr
(c) HBr and S (d) S and H_2O
149. Which of the following reaction is not feasible [CBSE PMT PMT 2002]
(a) $2\text{KI} + \text{Br}_2 \rightarrow 2\text{KBr} + \text{I}_2$
(b) $2\text{H}_2\text{O} + 2\text{F}_2 \rightarrow 2\text{HF} + \text{O}_2$
(c) $2\text{KBr} + \text{I}_2 \rightarrow 2\text{KI} + \text{Br}_2$
(d) $2\text{KBr} + \text{Cl}_2 \rightarrow 2\text{KCl} + \text{Br}_2$
150. Which of the following has the lowest solubility [Roorkee 2000]
(a) CaF_2 (b) CaCl_2
(c) CaBr_2 (d) CaI_2
151. Which one of the following pairs of substances when mixed, produces chlorine gas at room temperature [IIT 1995]
(a) NaCl and MnO_2
(b) NaCl and HNO_3 (conc.)
(c) NaCl and H_2SO_4 (conc.)
(d) HCl (conc.) and KMnO_4
152. Concentrated H_2SO_4 cannot be used to prepare HBr from NaBr , because it [IIT 1995]
(a) Reduces HBr (b) Oxidises HBr
(c) Disproportionates HBr (d) Reacts slowly with NaBr
153. Which of the following halides is least stable and has doubtful existence [IIT 1996]
(a) ClI_4 (b) GeI_4
(c) SnI_4 (d) PbI_4
154. Chlorine cannot displace [MP PET 1996]
(a) Fluorine from NaF (b) Iodine from NaI
(c) Bromine from NaBr (d) None of these
155. When fluoride is heated with conc. H_2SO_4 and MnO_2 the gas evolved is [DPMT 2000]
(a) F_2 (b) SF
(c) HF (d) None
156. Cl_2 reacts with CS_2 in presence of I_2 catalyst to form [AFMC 1995]
(a) CHCl_3 (b) CCl_4
(c) $\text{C}_2\text{H}_5\text{Cl}$ (d) C_2H_6
157. Amongst LiCl , RbCl , BeCl_2 and MgCl_2 . Maximum and minimum ionic character will be shown by the compounds [RPMT 1999]
(a) LiCl , MgCl_2 (b) RbCl , BeCl_2
(c) RbCl , MgCl_2 (d) MgCl_2 , BeCl_2
158. Which is formed when fluorine react with hot and concentrated sodium hydroxide [CPMT 2000]
(a) O_2 (b) O_3
(c) NaO (d) HF
159. Which of the following condition is used to find atomic Cl_2 from molecular Cl_2 [CPMT 1996]
(a) High temperature, high pressure
(b) Low temperature, high pressure
(c) High temperature, low pressure
(d) Low temperature, low pressure
160. Which one is least basic [JIPMER 2000]
(a) BI_3 (b) BBr_3
(c) BCl_3 (d) BF_3
161. On heating $\text{NaCl} + \text{K}_2\text{Cr}_2\text{O}_7 + \text{conc. H}_2\text{SO}_4$, the gas comes out is [JIPMER 2000]
(a) O_2 (b) Cl_2
(c) CrOCl_2 (d) CrO_2Cl_2
162. Aqua regia is a mixture of [KCET (Med.) 2001]
(a) $3\text{HCl} + 1\text{HNO}_3$ (b) $\text{H}_3\text{PO}_4 + \text{H}_2\text{SO}_4$
(c) $3\text{HNO}_3 + 1\text{HCl}$ (d) $\text{HCl} + \text{CH}_3\text{COOH}$
163. Unlike other halogens fluorine does not show higher oxidation states because [MP PET 1997]
(a) It is highly electronegative
(b) It has no d -orbitals
(c) Its atomic radius is very small
(d) The F^- ion is stable and isoelectronic with neon
164. Which halogen does not show variable oxidation state [UPSEAT 2003]
(a) F_2 (b) Cl_2
(c) Br_2 (d) I_2
165. To purify fluorine gas, fumes of HF are removed by [MH CET 2002]
(a) Solid NaF (b) H_2 gas
(c) Solid KHF_2 (d) None of these
166. Fluorine is prepared by
(a) Oxidation of HF
(b) Electrolysis of KF
(c) Electrolysis of fused KHF_2
(d) Decomposition of HgF_2
167. Amongst halogens fluorine is most oxidising because
(a) Fluorine has highest electron affinity
(b) Fluorine is most electronegative
(c) Dissociation energy for fluorine molecule is lowest

- (d) All are correct
168. The alkali metal halides are soluble in water but LiF is insoluble because
(a) It is amphoteric
(b) The $Li-F$ bond is highly ionic
(c) Its lattice energy is high
(d) Li^+ ion is least hydrated
169. In which of the following pairs does the first gas bleaches flowers by reduction while the second gas does so by oxidation
(a) CO and Cl_2 (b) SO_2 and Cl_2
(c) H_2 and Br_2 (d) NH_3 and SO_2
170. Which of the following halogens does not form oxyacid [MP PET 1997]
(a) Fluorine (b) Chlorine
(c) Bromine (d) Iodine
171. Which of the following molecule is theoretically not possible [BHU 2002]
(a) OF_4 (b) OF_2
(c) SF_4 (d) O_2F_2
172. Iodine is released when potassium iodide reacts with [UPSEAT 1999]
(a) $ZnSO_4$ (b) $CuSO_4$
(c) $FeSO_4$ (d) $(NH_4)_2SO_4$
173. Which of the following is used in the preparation of chlorine [CBSE PMT 1999]
(a) Only MnO_2
(b) Only $KMnO_4$
(c) Both MnO_2 and $KMnO_4$
(d) Either MnO_2 or $KMnO_4$
174. Among Cl^- , Br^- , I^- , the correct order for being oxidised to dihalogen is [CPMT 1999]
(a) $I^- > Cl^- > Br^-$ (b) $Cl^- > Br^- > I^-$
(c) $I^- > Br^- > Cl^-$ (d) $Br^- > I^- > Cl^-$
175. On heating $KClO_3$, we get [CPMT 1999]
(a) Cl_2O (b) ClO_2
(c) ClO_3 (d) Cl_2O_7
176. For which one of the following properties of halogens the sequence $F > Cl > Br > I$ holds good [MP PET/PMT 1998]
(a) Electron affinity (b) Electronegativity
(c) Atomic radius (d) Boiling point
177. Which of the following properties increases on going down from F to I in Group VII-A of the periodic table? [MP PMT 1997]
(a) Electronegativity (b) Volatile nature
(c) Ionic radius (d) Oxidising power
178. Among the halogens, the one which is oxidised by nitric acid is [KCET 2004]
(a) Fluorine (b) Iodine
(c) Chlorine (d) Bromine
179. The reaction of the type $2X_2 + S \rightarrow SX_4$ is shown by sulphur when X is [DCE 2003]
(a) Fluorine or chlorine
(b) Chlorine only
(c) Chlorine and bromine only
- (d) F , Cl , Br all
180. When I_2 is passed through KCl , KF and KBr solutions [CPMT 2004]
(a) Cl_2 and Br_2 are evolved
(b) Cl_2 is evolved
(c) Cl_2 , Br_2 and F_2 are evolved
(d) None of these [MPPET 1995]
181. The solubility of I_2 increases in water in the presence of [Pb. CET 2002]
(a) KI (b) H_2SO_4
(c) $KMnO_4$ (d) NH_3
182. Which of the hydrogen halides forms salts like KHX_2 (where X is a halogen atom) [Kerala PMT 2004]
(a) HF (b) HCl
(c) HI (d) HBr
(e) All of these
183. With cold and dilute sodium hydroxide fluorine reacts to give [MH CET 2004]
(a) NaF and OF_2 (b) $NaF + O_3$
(c) O_2 and O_3 (d) $NaF + O_2$
184. Which one of the following oxides is expected exhibit paramagnetic behaviour [CBSE PMT 2005]
(a) CO_2 (b) SO_2
(c) ClO_2 (d) SiO_2
185. Of the following acids, the one that is strongest is [DPMT 2004]
(a) $HBrO_4$ (b) $HOCl$
(c) HNO_2 (d) H_3PO_3
186. Which of the following is anhydride of perchloric acid [CPMT 2004]
(a) Cl_2O_7 (b) Cl_2O_5
(c) Cl_2O_3 (d) $HClO$
187. I_2 dissolves in KI solution due to the formation of [CPMT 2004]
(a) KI_2 and I^- (b) K^+ , I^- and I_2
(c) KI_3 (d) None of these

Noble gases

1. Which of the following outer electronic configuration represents argon [DPMT 1982; CPMT 1976; NCERT 1987; Kurukshetra CEE 1998]
(a) ns^2 (b) ns^2np^6
(c) ns^2np^5 (d) ns^2np^4
2. Which mineral was used in isolation of radium [CPMT 1978, 81, 91]
(a) Lime stone (b) Pitch blende
(c) Rutile (d) Haematite
3. Which is the lightest gas
(a) Hydrogen (b) Oxygen
(c) Helium (d) Nitrogen
4. The valency of inert gases is
(a) 5 (b) 1

- (c) 0 (d) None of these
5. Helium was discovered by
(a) Crooks (b) Rutherford
(c) Frankland and Lockyer (d) Dorn
6. The inert gases are [CPMT 1984]
(a) Polyatomic (b) Triatomic
(c) Diatomic (d) Monoatomic
7. The charcoal maintained at 100°C absorbs
(a) *Ne* and *Kr* (b) *He* and *Ar*
(c) *Ar*, *Kr*, *Xe* (d) *He* and *Ne*
8. Every inert gas atom
(a) Has a saturated outermost shell
(b) Has one electron in outermost shell
(c) Has eight electrons in outermost shell
(d) Has two electrons in outermost shell
9. Argon was discovered by [CPMT 1991]
(a) Rayleigh (b) Frankland and Lockyer
(c) Jansen (d) Ramsay
10. Deep sea divers used to respire is a mixture of
(a) Oxygen and argon (b) Oxygen and helium
(c) Oxygen and nitrogen (d) Oxygen and hydrogen
11. The noble gas which forms maximum number of compounds is [NCERT 1976; BHU 1980; CPMT 1982, 91; AMU 1985; DPMT 1996; MP PMT 2001; Pb.CET 2003]
(a) *Ar* (b) *He*
(c) *Xe* (d) *Ne*
12. Which of the following gases exist more abundantly in nature than the others
[BHU 1982; DPMT 1982, 02; CPMT 1983, 89; EAMCET 1993; Manipal MEE 1995; MHCET 2003]
(a) Helium (b) Neon
(c) Argon (d) Krypton
13. Which of the following is monoatomic [NCERT 1976, 77; CPMT 1983, 86, 90]
(a) Nitrogen (b) Fluorine
(c) Neon (d) Oxygen
14. Nuclear fusion produces
(a) Argon (b) Deuterium
(c) Helium (d) Krypton
15. Among the fluorides below, the one which does not exist is [NCERT 1977; CPMT 1988]
(a) XeF_4 (b) HeF_4
(c) SF_4 (d) CF_4
16. The last orbit of argon would have electrons [CPMT 1971, 78]
(a) 6 (b) 2
(c) 18 (d) 8
17. The electronic configuration of neon is [CPMT 1974, 80, 81; DPMT 1982; MNR 1995]
(a) $1s^2, 2s^2 2p^2$ (b) $1s^2, 2s^2 2p^6$
(c) $1s^2, 2s^2$ (d) $1s^2$
18. The colour discharge tubes for advertisement mainly contain [CPMT 1980, 89; MP PET 2002]
(a) Argon (b) Neon
(c) Helium (d) Xenon
19. Least chemical activity is shown by [CPMT 1973, 79]
(a) Nitrogen (b) Argon
(c) Methane (d) Ammonia
20. Noble gases do not react with other elements because [CPMT 1981]
(a) They have completely paired up and stable electron shells
(b) The sizes of their atoms are very small
(c) Are not found in abundance
(d) Are monoatomic
21. Monazite is source of
(a) *He* (b) *Kr*
(c) *Ar* (d) *Ne*
22. Which of the following fluorides of Xenon is impossible [CPMT 1982; Kurukshetra CEE 1998; RPET 1999]
(a) XeF_6 (b) XeF_4
(c) XeF_3 (d) XeF_2
23. XeF_2 molecule is
(a) Square planar
(b) Trigonal bipyramidal
(c) Trigonal planar
(d) Linear
24. XeF_4 on partial hydrolysis produces [AFMC 1995]
(a) XeF_2 (b) XeOF_2
(c) XeOF_4 (d) XeO_3
25. In XeF_2 hybridisation of *Xe* is
(a) sp^2 (b) $sp^3 d$
(c) sp^3 (d) $sp^3 d^2$
26. Which one of the following noble gases is the least polarizable [AIIMS 1983; MP PET 1993; JIPMER (Med.) 2002]
(a) *Xe* (b) *Ar*
(c) *Ne* (d) *He*
27. Which one of the following noble gases is not found in the atmosphere [MP PMT 1993]
(a) *Rn* (b) *Kr*
(c) *Ne* (d) *Ar*
28. Helium is added to the oxygen supply used by deep sea divers because [MP PMT 1993; MP PET 1997]
(a) It is less soluble in blood than nitrogen at high pressure
(b) It is lighter than nitrogen
(c) It is readily miscible with oxygen
(d) It is less poisonous than nitrogen
29. Which of the following statements is not correct for a noble gas
(a) *Ar* is used in electric bulbs
(b) *Kr* is obtained during radioactive disintegration
(c) Half life of *Rn* is only 3.8 days
(d) *He* is used in producing very low temperature
30. Which one of the following configuration represents a noble gas [CPMT 1976, 83, 89; BHU 1982; Pb. CET 2000; NCERT 1979; IIT Screening 1993; EAMCET 1993]
(a) $1s^2, 2s^2 2p^6, 3s^2$
(b) $1s^2, 2s^2 2p^6, 3s^1$
(c) $1s^2, 2s^2 2p^6$
(d) $1s^2, 2s^2 2p^6, 3s^2 3p^6, 4s^2$
31. Which of the following has zero valency [DPMT 1985]
(a) Sodium (b) Beryllium
(c) Aluminium (d) Krypton
32. The forces acting between noble gas atoms are [NCERT 1989]
(a) Vander Waals forces

- (b) Ion-dipole forces
(c) London dispersion forces
(d) Magnetic forces
33. Which of the following is the correct sequence of the noble gases in their group in the periodic table
[Manipal MEE 1995]
(a) Ar, He, Kr, Ne, Rn, Xe (b) He, Ar, Ne, Kr, Xe, Rn
(c) He, Ne, Ar, Kr, Xe, Rn (d) He, Ne, Kr, Ar, Xe, Rn
34. Which of the following represent noble gas configuration
[BHU 1995]
(a) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^6 4d^{10}, 5s^2 5p^6$
(b) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^6 4d^{10} 4f^{14}, 5s^2 5p^6 5d^1, 6s^2$
(c) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^6 4d^{10}, 5s^2 5p^6 5d^1, 6s^2$
(d) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^6 4d^{10}$
35. XeF_6 on hydrolysis gives
[MP PET 2000; Pb. PMT 2000; DCE 2002]
(a) XeO_3 (b) XeO
(c) XeO_2 (d) Xe
36. The correct order of solubility in water for He, Ne, Ar, Kr, Xe, is
(a) $He > Ne > Ar > Kr > Xe$
(b) $Ne > Ar > Kr > He > Xe$
(c) $Xe > Kr > Ar > Ne > He$
(d) $Ar > Ne > He > Kr > Xe$
37. In XeF_2, XeF_4, XeF_6 the number of lone pairs on Xe is respectively
[AIEEE 2002]
(a) 2, 3, 1 (b) 1, 2, 3
(c) 4, 1, 2 (d) 3, 2, 1
38. Noble gases are group of elements which exhibit very
[Kerala (Med.) 2002]
(a) High chemical activity
(b) Low chemical activity
(c) Minimum electronegativity
(d) Much paramagnetic properties
39. Which noble gas is most soluble in water
[CPMT 2002]
(a) He (b) Ar
(c) Ne (d) Xe
40. Gradual addition of electronic shells in the noble gases causes a decrease in their
[MP PET 1997]
(a) Ionization energy (b) Atomic radius
(c) Boiling point (d) Density
41. Which of the following noble gas does not have an octet of electrons in its outermost shell
[MP PET 1996]
(a) Neon (b) Radon
(c) Argon (d) Helium
42. The low chemical reactivity of the rare gases can be attributed to their
[Pune CET 1998]
(a) Being non-metals
(b) Having high ionization energies
(c) Being gases
(d) Found in nature in small quantities
43. Percentage of Ar in air is about
[CPMT 1989]
(a) 1% (b) 2%
(c) 3% (d) 4%
44. Which of the following is not obtained by direct reaction of constituent elements
[MP PET 1994]
(a) XeF_2 (b) XeF_4
(c) XeO_3 (d) XeF_6
45. Fluorine forms chemical compounds with
[MP PMT 1994]
(a) He (b) Ne
(c) Ar (d) Xe
46. Which of the following has sp^3 hybridisation
[DCE 2001]
(a) XeO_3 (b) BCl_3
(c) XeF_4 (d) BBr_3
47. Which element out of He, Ar, Kr, and Xe forms least number of compounds
[MP PMT 1995]
(a) He (b) Ar
(c) Kr (d) Xe
48. Which of the following exhibits the weakest intermolecular forces
[KCET (Med.)]
(a) He (b) HCl
(c) NH_3 (d) H_2O
49. Which of the following are formed by Xenon
[Roorkee 2000]
(a) XeF_3 (b) XeF_4
(c) XeF_5 (d) XeF_6
50. Among the following molecule
(i) XeO_3 (ii) $XeOF_4$ (iii) XeF_6
Those having same number of lone pairs on Xe are
[AIIMS 2005]
(a) (i) and (ii) only (b) (i) and (iii) only
(c) (ii) and (iii) only (d) (i), (ii) and (iii)
51. Who among the following first prepared a stable compound of noble gas
[MP PET 1999]
(a) Rutherford (b) Rayleigh
(c) Ramsay (d) Neil Bartlett
52. The last member of inert gas elements is
[MP PMT 1999]
(a) Helium (b) Neon
(c) Argon (d) Radon
53. Which of the following gas is/are called rare gas
[CPMT 2000; Pb. CET 2002]
(a) Ne (b) He
(c) Kr (d) All of these
54. Which one of the following statements regarding helium is incorrect
(a) It is used to produce and sustain powerful superconducting magnets
(b) It is used as a cryogenic agent for carrying out experiments at low temperatures
(c) It is used to fill gas balloons instead of hydrogen because it is lighter and non-inflammable
(d) It is used in gas-cooled nuclear reactors
55. Which of the following inert gas liquefies easily
[Pb. CET 2002]
(a) Kr (b) He
(c) Ne (d) Ar
56. The oxidation number of xenon in $XeOF_2$ is
[J & K 2005]
(a) Zero (b) 2

- (c) 4 (d) 3
57. Which inert gas having highest boiling point [BCECE 2005]
(a) Xe (b) Ar
(c) Kr (d) He
58. Which of the following is an inert gas [AFMC 2005]
(a) H_2 (b) O_2
(c) N_2 (d) Argon
59. Which of the following is most polarised [DPMT 2005]
(a) Kr (b) He
(c) Ar (d) Xe
60. Which of the following is planar [J & K 2005]
(a) XeF_2 (b) XeO_3F
(c) XeO_2F_2 (d) XeF_4

Critical Thinking

Objective Questions

1. The correct sequence in decreasing order of the percentage of nitrogen in the given compounds is [NDA 1999]
(a) Urea > Ammonium chloride > Ammonium nitrate > Ammonium nitrite
(b) Urea > Ammonium nitrate > Ammonium nitrite > Ammonium chloride
(c) Urea > Ammonium nitrite > Ammonium nitrate > Ammonium chloride
(d) Urea > Ammonium nitrite > Ammonium chloride > Ammonium nitrate
2. As the alkaline earth metals (except Be) tend to lose their valence electrons readily they act as [Kerala (Med.) 2002]
(a) Weak oxidising agent (b) Weak reducing agent
(c) Strong oxidising agent (d) Strong reducing agent
3. The first ionisation energies of alkaline earth metals are higher than those of the alkali metals. This is because [UPSEAT 2001]
(a) There is increases in the nuclear charge of the alkaline earth metals
(b) There is decreases in the nuclear charge of the alkaline earth metals
(c) There is no change in the nuclear charge
(d) None of these
4. Lead is maximum in [BVP 2004]
(a) Soda glass (b) Jena glass
(c) Pyrex glass (d) Flint glass
5. $BaSO_4$ and carbon on heating reacts to produce [Pb. PMT 2004]
(a) $Ba + SO_2 + CO_2$ (b) $BaS + CO$
(c) $BaS + O_2 + SO_2$ (d) $BaCO_3 + S + O_2$
6. The atomic radii of alkali metals (M) lie in the order $Li < Na < K < Rb$ but the radii of M^+ ions in aqueous solution lie in the reverse order $Li^+ > Na^+ > K^+ > Rb^+$. What is the reason for this reverse order (on going from Li to Rb)? [MP PMT 1997]
(a) Gradual increase in ionisation energy
(b) Increasing weakness of the metallic bond
(c) Increasing electropositive character
(d) Decreasing degree of hydration
7. Fusion mixture is [CPMT 2002]
(a) $Na_2CO_3 + K_2CO_3$ (b) $Na_2CO_3 + NaHCO_3$
(c) $Na_2CO_3 + NaOH$ (d) $Na_2CO_3 + K_2SO_4$
8. Concentrated hydrochloric acid when kept in open air sometimes produces a cloud of white fumes. The explanation for it is that
(a) Concentrated hydrochloric acid emits strongly smelling HCl gas all the time
(b) Oxygen in air reacts with the emitted HCl gas to form a cloud of chlorine gas
(c) Strong affinity of HCl gas for moisture in air results in forming of droplets of liquid solution which appears like a cloudy smoke
(d) Due to strong affinity for water, concentrated hydrochloric acid pulls moisture of air towards itself. This moisture forms droplets of water and hence the cloud
9. Match List I with List II and select the correct answer using the codes given below the lists
- | List I | List II |
|----------------|--------------|
| (a) Peroxide | (1) C_3O_2 |
| (b) Superoxide | (2) PbO_2 |
| (c) Dioxide | (3) KO_2 |
| (d) Suboxide | (4) H_2O_2 |
- Codes : [NDA 1999]
- | | | | | |
|-----|---|---|---|---|
| (a) | A | B | C | D |
| | 4 | 3 | 2 | 1 |
| (b) | A | B | C | D |
| | 3 | 2 | 1 | 4 |
| (c) | A | B | C | D |
| | 4 | 2 | 3 | 1 |
| (d) | A | B | C | D |
| | 4 | 1 | 2 | 3 |
10. The most efficient agent for the absorption of SO_3 is [KCET 1998]
(a) 98% H_2SO_4 (b) 80% H_2SO_4
(c) 20% oleum (d) 90% H_2SO_4
11. Mark the oxide which is amphoteric in character [MP PMT 2000]
(a) CO_2 (b) SiO_2
(c) SnO_2 (d) CaO
12. Concentrated aqueous sodium hydroxide can separate mixture of
(a) Al^{3+} and Sn^{2+} (b) Al^{3+} and Fe^{3+}
(c) Al^{3+} and Zn^{2+} (d) Zn^{2+} and Pb^{2+}
13. The composition of the common glass is [DCE 2004]
(a) $Na_2O.CaO.6SiO_3$ (b) $Na_2O.Al_2O_3.SiO_2$
(c) $CaO.Al_2O_3.SiO_2$ (d) $Na_2O.CaO.6SiO_2$
14. The metal which does not form ammonium nitrate by reaction with dilute nitric acid is [KCET 2004]
(a) Al (b) Fe
(c) Pb (d) Mg
15. Total number of lone pair of electrons in $XeOF_4$ is [IIT-JEE (Screening) 2004]
(a) 0 (b) 1
(c) 2 (d) 3

16. What is the correct relationship between the pH s of isomolar solutions of sodium oxide (pH_1), sodium sulphide (pH_2), sodium selenide (pH_3) and sodium telluride (pH_4) [CBSE PMT 1995]
- (a) $pH_1 > pH_2 = pH_3 > pH_4$
(b) $pH_1 < pH_2 < pH_3 < pH_4$
(c) $pH_1 < pH_2 < pH_3 = pH_4$
(d) $pH_1 > pH_2 > pH_3 > pH_4$ [CBSE PMT 2005]
17. Which one of the following is not an amphoteric substance [KCET 2004]
- (a) HNO_3 (b) HCO_3^-
(c) H_2O (d) NH_3
18. Which group is called buffer group of the periodic table [Pb. CET 2004]
- (a) I (b) VII
(c) VIII (d) Zero
19. Which of the following salt is insoluble in water [MP PET 2004]
- (a) $CuSO_4$ (b) $CdSO_4$
(c) $PbSO_4$ (d) $Bi_2(SO_4)_3$
20. Which of the following oxides is the most acidic [CBSE PMT 1999; MP PMT 2002]
- (a) N_2O_5 (b) P_2O_5
(c) As_2O_5 (d) Sb_2O_5
21. Whose bond energy is maximum [CPMT 1988; MP PMT 1990]
- (a) F_2 (b) Cl_2
(c) Br_2 (d) I_2
22. Calcium cyanide on treatment with steam under pressure gives NH_3 and [DPMT 2002]
- (a) $CaHCO_3$ (b) CaO
(c) $Ca(OH)_2$ (d) $CaCO_3$
23. Six volumes of oxygen, on complete ozonisation, form volumes of ozone [DPMT 2000]
- (a) 4 (b) 3
(c) 2 (d) 6
24. The substance not likely to contain $CaCO_3$ is [AIEEE 2003]
- (a) A marble statue (b) Calcined gypsum
(c) Sea shells (d) Dolomite
25. Which of the following statements is false for alkali metals [MNR 1994; MP PET 2001]
- (a) Lithium is the strongest reducing agent
(b) Na is amphoteric in nature
(c) Li^+ is exceptionally small
(d) All alkali metals give blue solution in liquid ammonia
26. Solubility of iodine in water is greatly increased by the addition of iodide ions because of the formation of [IIT 1994]
- (a) I_2 (b) I_3
(c) I_3^- (d) I^-
27. The solubility in water of sulphates down the Be group is $Be > Mg \gg Ca > Sr > Ba$. This is due to
- (a) High heat of solvation for smaller ions like Be^{2+}
(b) Increasing molecular weight
(c) Decreasing lattice energy
(d) Increase in melting points
28. Magnesium burns in air to give [CPMT 1988, 89; AFMC 1987]
- (a) MgO (b) Mg_3N_2
(c) $MgCO_3$ (d) MgO and Mg_3N_2 both
29. Philosopher's wool when heated with BaO at $1100^\circ C$ gives a compound. Identify the compound [CPMT 1997]
- (a) $BaZnO_2$ (b) $Ba + ZnO_2$
(c) $BaCdO_2$ (d) $BaO_2 + Zn$
30. Which of the following oxide is diamagnetic [MP PET 1990]
- (a) NO (b) N_2O_4
(c) NO_2 (d) N_2O_5
31. Which of the following salt becomes plaster of paris on being appropriately hydrated [CPMT 1985]
- (a) $ZnCO_3$ (b) $CaSO_4$
(c) $MgSO_4$ (d) $CaCO_3$
32. The number of electron and proton in the third alkaline earth metal ion will be [MP PET 2003]
- (a) $\frac{e}{20}, \frac{p}{20}$ (b) $\frac{e}{18}, \frac{p}{20}$
(c) $\frac{e}{18}, \frac{p}{18}$ (d) $\frac{e}{19}, \frac{p}{20}$
33. The compounds of alkaline earth metals have the following magnetic nature [MP PET/PMT 1998; RPMT 2000; JIPMER 2002]
- (a) Diamagnetic (b) Paramagnetic
(c) Ferromagnetic (d) Diaferromagnetic
34. Which of the following is the life saving mixture for an asthma patient [MP PMT 2001]
- (a) Mixture of helium and oxygen
(b) Mixture of neon and oxygen
(c) Mixture of xenon and nitrogen
(d) Mixture of argon and oxygen
35. Which would quickly absorbs oxygen [CBSE PMT 1992; MP PET 1995]
- (a) Alkaline solution of pyrogallol
(b) Conc. H_2SO_4
(c) Lime water
(d) Alkaline solution of $CuSO_4$
36. Nitrogen is liberated by the thermal decomposition of only [IIT 1991]
- (a) NH_4NO_2 (b) NaN_3
(c) $(NH_4)_2Cr_2O_7$ (d) All the three
37. Red phosphorus is less reactive than yellow phosphorus because [DPMT 1982; JIPMER 1999; CBSE PMT 1999; RPET 2003]
- (a) Its colour is red
(b) It is highly polymerised
(c) It is hard
(d) It is insoluble in C_2H_5OH

38. Carbon differs from other elements of the group. Which is the false statement [DPMT 2000]
 (a) Due to its marked tendency to form long chains (catenation)
 (b) Due to its unique ability to form multiple bonds
 (c) Due to *d*-orbital in penultimate shell
 (d) Due to its limitation of co-ordination number 4
39. Which of the following oxide does not form acidic aqueous solution
 (a) N_2O_3 (b) NO_2
 (c) N_2O_5 (d) NO
40. Which of the following is in the increasing order of the ionic character [JIPMER 2002]
 (a) $PbCl_4 < PbCl_2 < CaCl_2 < NaCl$
 (b) $PbCl_2 < PbCl_4 < CaCl_2 < NaCl$
 (c) $PbCl_2 < PbCl_4 < NaCl < CaCl_2$
 (d) $PbCl_4 < PbCl_2 < NaCl < CaCl_2$
41. Silicon chloroform is prepared by [MH CET 1999]
 (a) $Si + HCl$ (b) $SiCl_4 + H_2O$
 (c) $SiF_4 + NaF$ (d) $H_2SiF_6 + Cl_2$
42. KO_2 (potassium superoxide) is used in oxygen cylinders in space and submarines because it [AIEEE 2002]
 (a) Absorbs CO_2 and increases O_2 content
 (b) Eliminates moisture
 (c) Absorbs CO_2
 (d) Produces ozone
43. Fire extinguishers contain H_2SO_4 and [AFMC 1980]
 (a) $CaCO_3$ (b) Na_2CO_3
 (c) $NaHCO_3$ (d) $NaHCO_3$ and Na_2CO_3
44. Which is insoluble in water [CPMT 2003]
 (a) H_2S (b) $HgCl_2$
 (c) $Ca(NO_3)_2$ (d) CaF_2
45. Which of the following halides is most acidic [KCET 1996]
 (a) PCl_3 (b) $SbCl_3$
 (c) $BiCl_3$ (d) CCl_4
46. The stability of the following alkali metal chlorides follows the order
 (a) $LiCl > KCl > NaCl > CsCl$
 (b) $CsCl > KCl > NaCl > LiCl$
 (c) $NaCl > KCl > LiCl > CsCl$
 (d) $KCl > CsCl > NaCl > LiCl$
47. The reaction of $Na_2S_2O_3$ with iodine gives [CPMT 1971, 80, 81; DPMT 1983, 90; MP PMT 1985; EAMCET 1990; BHU 1980]
 (a) Sodium sulphide (b) Sodium sulphite
 (c) Sodium sulphate (d) Sodium tetrathionate
48. Which one of the following is the true covalent oxide of iodine
 (a) I_2O_4 (b) I_2O_5
 (c) I_2O_7 (d) I_2O_9
49. Lithium aluminium hydride acts as [CPMT 1994]
 (a) Oxidising agent (b) Reducing agent
- (c) Both the above (d) None of these
50. The mixture of conc. HCl and potassium chlorate on heating gives [Roorkee 2000]
 (a) Cl_2 only (b) ClO_2 only
 (c) $Cl_2 + ClO_2$ (d) $Cl_2 + ClO_2 + ClO_3$
51. When SO_2 is passed through acidified solution of H_2S [CPMT 2004] [CPMT 1973, 81, 93]
 (a) H_2SO_4 is formed (b) H_2SO_3 is formed
 (c) Sulphur is precipitated (d) None of these
52. Four reactions are given below
 (i) $2Li + 2H_2O \rightarrow 2LiOH + H_2$
 (ii) $2Na + 2H_2O \rightarrow 2NaOH + H_2$
 (iii) $2LiNO_3 \xrightarrow{\text{Heat}} 2LiNO_2 + O_2$
 (iv) $2NaNO_3 \xrightarrow{\text{Heat}} 2NaNO_2 + O_2$
 Which of the above, if any, is wrong
 (a) (iv) (b) (iii)
 (c) (i) (d) None of these
53. Increasing order of solubility is [AFMC 1987]
 (a) $CaCO_3, KHCO_3, NaHCO_3$
 (b) $NaHCO_3, KHCO_3, CaCO_3$
 (c) $KHCO_3, NaHCO_3, CaCO_3$
 (d) $CaCO_3, NaHCO_3, KHCO_3$
54. Nitrolim is [CPMT 1976, 78, 2000; BHU 1987; DCE 1999; RPMT 2000]
 (a) $Ca(NO_3)_2$ (b) $Ca(CN)_2$
 (c) $CaCN_2 + C$ (d) $CaCN_2$
55. The following acids have been arranged in the order of decreasing acid strength. Identify the correct order. [IIT 1996]
 (I) $ClOH$ (II) $BrOH$ (III) IOH
 (a) $I > II > III$ (b) $II > I > III$
 (c) $III > II > I$ (d) $I > III > II$
56. Which of the following element does not belong to the family of elements indicated [Orissa JEE 1997]
 (a) Rubidium ($Rb, Z = 37$) : Alkali metals
 (b) Barium ($Ba, Z = 56$) : Alkaline earth metals
 (c) Iridium ($I, Z = 77$) : Nobel gases
 (d) Argon ($Ar, Z = 18$) : Nobel gases
57. H_3PO_2 is the formula for one of the phosphorus acid. Its name and basicity are respectively [CBSE PMT 1992; BHU 1999; KCET 1999]
 (a) Phosphorus acid and two
 (b) Hypophosphorus acid and two
 (c) Hypophosphorus acid and one
 (d) Hypophosphoric acid and two
58. Which of the following oxides of nitrogen is paramagnetic [CPMT 1984; CBSE PMT 1994; AIIMS 2000]
 (a) N_2O_3 (b) N_2O
 (c) NO_2 (d) N_2O_5
59. Nessler's reagent is [CPMT 2002]
 (a) Potassium in mercuric iodide
 (b) $TiCl_4$

- (c) Anhydrous $AlCl_3$
(d) Al_2O_3 / Cr_2O_3
60. The noble gas was first time discovered by
(a) Cavendish (b) William Ramsay
(c) Rayleigh (d) Frankland
61. The ratio of $\frac{C_p}{C_v}$ for inert gases is [DCE 1999]
(a) 1.99 (b) 2.13
(c) 1.66 (d) 1.33
62. White P reacts with caustic soda, the products are PH_3 and NaH_2PO_2 . This reaction is an example of [DCE 2003]
(a) Oxidation (b) Reduction
(c) Disproportionation (d) Neutralisation
63. The oxide, which cannot act as a reducing agent, is [Pb. CET 2002]
(a) NO_2 (b) SO_2
(c) CO_2 (d) ClO_2
64. Which of the following product is formed when SiF_4 reacts with water [Pb. CET 2003]
(a) SiF_3 (b) H_4SiO_4
(c) H_2SO_4 (d) H_2SiF_4
65. Ozone with dry iodine give [Pb. CET 2003]
(a) I_4O_4 (b) I_2O_3
(c) IO_2 (d) I_2O_4
66. The microcosmic salt is [Pb. CET 2004; Pb. PMT 2004]
(a) $Na(NH_4)H_2O$ (b) $K(NH_4)HPO_3 \cdot 2H_2O$
(c) $Na(NH_4)HPO_4 \cdot 4H_2O$ (d) $Na(NH_3)HPO_4 \cdot 4H_2O$
67. Thermite is a mixture of [Pb. CET 2004]
(a) $Cr_2O_3 + Al_2O_3$ (b) $Fe_2O_3 + Al$
(c) $Fe_2O_3 + Al_2O_3$ (d) $Al_2O_3 + 2Cr$
68. The colour of liquid O_2 is [BVP 2004]
(a) Red (b) Dark blue
(c) Pale yellow (d) Pale blue
69. Which of the following gas mixture is used by the divers inside the sea [AFMC 2004]
(a) $O_2 + He$ (b) $O_2 + Xe$
(c) $O_2 + Ar$ (d) $O_2 + N_2$
70. One mole of magnesium nitride on the reaction with an excess of water gives [AIEEE 2004]
(a) Two moles of ammonia (b) One mole of nitric acid
(c) One mole of ammonia (d) Two moles of nitric acid
71. Calcium cyanamide on treatment with steam produce [Pb. PMT 2004]
(a) $CaCO_3 + NH_3$ (b) $CaHCO_3 + NH_3$
(c) $CaO + NH_3$ (d) $Ca(OH)_2 + NH_3$

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Sulphate is estimated as $BaSO_4$ and not as $MgSO_4$.
Reason : Ionic radius of Mg^{2+} is smaller than that of Ba^{2+} . [IIT 1998]
2. Assertion : Amongst the halogens fluorine can oxidise the elements to highest oxidation state.
Reason : Due to small size of fluoride ion, it is difficult to oxidise fluoride ion to fluorine. Hence reverse reaction takes place more easily. [IIT 1996]
3. Assertion : HNO_3 is a stronger acid than HNO_2 .
Reason : In HNO_3 there are two nitrogen-to-oxygen bonds whereas in HNO_2 there is only one.
4. Assertion : The Value of Vander Waal's constant 'a' is larger for ammonia than for nitrogen.
Reason : Hydrogen bonding is present in ammonia. [IIT 1998]
5. Assertion : Xenon forms fluorides.
Reason : Due to the strong electronegativity of fluorine. [AIIMS 2001]
6. Assertion : Chlorine and sulphur dioxide both are bleaching agents.
Reason : The bleaching action of chlorine and sulphur dioxide is performed through the process of oxidation. [AIIMS 2000]
7. Assertion : Nitrogen is unreactive at room temperatures but becomes reactive at elevated temperatures (On heating) or in presence of catalysts.
Reason : In nitrogen molecule, there is extensive delocalization of electrons.
8. Assertion : Covalency of oxygen is three.
Reason : Dinegative anion of oxygen (O^{2-}) is quite common but dinegative anion of sulphur (S^{2-}) is less common. [AIIMS 2001]
9. Assertion : At room temperature, oxygen exists as a diatomic gas, whereas sulphur exists as solid.
Reason : The catenated $-O-O-O-$ changes are less stable as compared to $O=O$ molecule. [AIIMS 2001]
10. Assertion : Potassium and caesium are used in photo-electric cells.
Reason : Potassium and caesium emit electrons on exposure to light. [AIIMS 2002]
11. Assertion : The fluorine has lower reactivity.
Reason : $F-F$ bond has low bond dissociation energy. [AIIMS 2002]
12. Assertion : Halogens do not occur in free state.
Reason : Halogens are highly reactive. [AIIMS 1994]
13. Assertion : Lithium forms Lithium oxide (Li_2O).
Reason : N_2 molecule have unpaired electrons. [AIIMS 1995]

14. Assertion : Liquid NH_3 is used for refrigeration.
Reason : Liquid NH_3 quickly vaporises. [AIIMS 1995]
15. Assertion : $Al(OH)_3$ is insoluble in NH_4OH but soluble in $NaOH$.
Reason : $NaOH$ is strong alkali. [AIIMS 1997]
16. Assertion : Boron is metalloid.
Reason : Boron shows metallic nature. [AIIMS 1997]
17. Assertion : Inert gases are monoatomic.
Reason : Inert gases have stable configuration. [AIIMS 1999]
18. Assertion : Magnesium continue to burn in nitric oxide.
Reason : During burning heat evolved do not decompose NO . [AIIMS 2001]
19. Assertion : Anhydrous BaO_2 is used for preparing H_2O_2 .
Reason : Hydrated BaO_2 is not available. [AIIMS 2001]
20. Assertion : Benzene is reactive while inorganic benzene is unreactive compound.
Reason : Inorganic benzene is, borazine, $B_3N_3H_6$. [AIIMS 2002]
21. Assertion : Halogens absorb visible light.
Reason : All halogens are coloured. [AIIMS 2002]
22. Assertion : Barium is not required for normal biological function in human.
Reason : Barium does not show variable oxidation state. [AIIMS 2003]
23. Assertion : The $O-O$ bond length in H_2O_2 is shorter than that of O_2F_2 .
Reason : H_2O_2 is an ionic compound. [AIIMS 2003]
24. Assertion : PbI_4 is a stable compound.
Reason : Iodide stabilizes higher oxidation state. [AIIMS 2003]
25. Assertion : Mg is not present in enamel of human teeth.
Reason : Mg is an essential element for biological functions of human. [AIIMS 2004]
26. Assertion : Radium is most abundant s-block element.
Reason : s-block elements are non-radioactive in nature.
27. Assertion : $LiCl$ is predominantly a covalent compound.
Reason : Electronegativity difference between Li and Cl is too small.
28. Assertion : The first ionization energy of Be is greater than that of B .
Reason : $2p$ -orbital is lower in energy than $2s$ -orbital.
29. Assertion : The alkali metals can form ionic hydrides which contains the hydride ion.
Reason : The alkali metals have low electronegativity, their hydrides conduct electricity when fused and liberate hydrogen at the anode.
30. Assertion : Be does not impart any characteristic colour to the bunsen flame.
Reason : Due to its very high ionization energy, beryllium requires a large amount of energy for excitation of the electrons.
31. Assertion : Potassium is not obtained by the electrolysis of fused KCl .
Reason : Potassium vapourises at the melting point of KCl .
32. Assertion : Helium and beryllium have similar outer electronic configuration of the type ns^2 .
Reason : Both are chemically inert.
33. Assertion : Na_2SO_4 is soluble while $BaSO_4$ is insoluble.
Reason : Lattice energy of $BaSO_4$ exceeds its hydration energy.
34. Assertion : Alkali metals impart colour to the flame.
Reason : Their ionisation energies are low.
35. Assertion : Superoxides of alkali metals are paramagnetic.
Reason : Superoxides contain the ion O^{-2} which has one unpaired electron.
36. Assertion : Although PF_5 , PCl_5 and PBr_5 are known, the pentahalides of nitrogen have not been observed.
Reason : Phosphorus has lower electronegativity than nitrogen.
37. Assertion : The electronic structure of O_3 is

Reason :

Structure is not allowed because octet around O cannot be expanded.
38. Assertion : Sulphuric acid is more viscous than water.
Reason : Concentrated sulphuric acid has a great affinity for water.
39. Assertion : PCl_5 is covalent in gaseous and liquid states but ionic in solid state.
Reason : PCl_5 in solid state consists of tetrahedral PCl_4^+ cation and octahedral PCl_6^- anion.
40. Assertion : Among nitrogen halides NX_3 , the dipole moment is highest for NI_3 and lowest for NF_3 .
Reason : Nitrogen halides NX_3 , have trigonal pyramidal structure.
41. Assertion : White phosphorus is stored under water.
Reason : White phosphorous is highly reactive and catches fire spontaneously in air.
42. Assertion : Al forms $[AlF_6]^{3-}$ but B does not form $[BF_6]^{3-}$.
Reason : B does not react with F_2 .
43. Assertion : NO_3^- is planar while NH_3 is pyramidal.
Reason : N in NO_3^- is sp^2 hybridized but in NH_3 it is sp^3 - hybridized.
44. Assertion : $Si-Si$ bonds are much stronger than $Si-O$ bonds.
Reason : Silicon forms double bonds with itself.
45. Assertion : The $S-S-S$ bond angle in S_8 molecule is 105° .
Reason : S_8 has a V-shape.
46. Assertion : Caro's acid has S atom in +6 oxidation state.

- Reason : Caro's acid contains one peroxo O_2^{2-} group.
47. Assertion : The m.p./b.p. of noble gases are quite high.
Reason : The interparticle forces among noble gases in their liquid state are covalent forces.
48. Assertion : In SO_2 , the bond angle is 119° whereas in SO_3 , the bond angle is 120° .
Reason : S atom in both SO_2 and SO_3 is sp^2 - hybridized.
49. Assertion : Calcium carbide on hydrolysis gives methane.
Reason : Calcium carbide contains C^{4-} anions.
50. Assertion : Xenon forms fluorides.
Reason : Because 5 d-orbitals are available for valence shell expansion.
51. Assertion : Hydrogen cannot be prepared in laboratory.
Reason : Hydrogen of high purity is obtained by electrolysis of warm aqueous barium hydroxide between nickel electrodes.
52. Assertion : Diprotium shows relatively inert behaviour at room temperature.
Reason : The values of melting point and boiling point for deuterium are higher as compared to diprotium.
53. Assertion : Water can be transformed from liquid to solid state only.
Reason : The distribution of water over the earth surface is uniform.
54. Assertion : Ice is less dense than water.
Reason : Ice is a solid whereas water is liquid.
55. Assertion : HF, NH_3 and H_2O form intermolecular hydrogen bonding.
Reason : HF, NH_3 and H_2O molecules are bonded in same manner.
56. Assertion : Hard water does not lather with soap.
Reason : In hard water, the sodium stearate of soap changes to the corresponding calcium magnesium salt which precipitates out.
57. Assertion : H_2O_2 is stored in wax-lined glass.
Reason : Presence of metal surfaces, traces of alkali (present in glass) etc. increases its decomposition.
58. Assertion : A nearly tetrahedral arrangement of the orbitals about the oxygen atom allows each water molecule to form hydrogen bonds with as many as four neighbouring water molecules.
Reason : In ice each water molecule form four hydrogen bond as each molecule is fixed in the space.
59. Assertion : Calgon is used for removing Ca^{2+} and Mg^{2+} ions from hard water.
Reason : Calgon forms precipitate with Ca^{2+} and Mg^{2+} ions.
60. Assertion : Reaction of SO_2 and H_2S in the presence of Fe_2O_3 catalyst gives elemental sulphur.
Reason : SO_2 is a reducing agent. [AIIMS 2005]
61. Assertion : SiF_6^{2-} is known but $SiCl_6^{2-}$ is not.
Reason : Size of fluorine is small and its lone pair of electrons interacts with d-orbitals of Si strongly. [AIIMS

62. Assertion : Borax bead test is not suitable for Al(III).
Reason : Al_2O_3 is insoluble in water. [AIIMS 2005]
63. Assertion : $SeCl_4$, does not have a tetrahedral structure.
Reason : Se in $SeCl_4$ has two lone pairs. [AIIMS 2005]
64. Assertion : Ozone is a powerful oxidizing agent in comparison to O_2 .
Reason : Ozone is diamagnetic but O_2 is paramagnetic. [AIIMS 2005]

AS Answers and Solutions

Alkali metals

1. (b) Element Na K
 IE_1 496 419
 IE_2 4562 3051
 Sodium has higher I.E. because of smaller atomic size.
2. (c) Alkali metals are highly reactive metals. They react with
 Alcohol – $2C_2H_5OH + 2K \rightarrow 2C_2H_5OK + H_2$
 Water – $2K + 2H_2O \rightarrow 2KOH + H_2$
 Ammonia – $K + (x+y)NH_3 \rightarrow [K(NH_3)_x]^+ + [e(NH_3)_y]^-$
Ammoniated cation
Ammoniated electron
 But they do not react with kerosene.
4. (b) After removal of an electron the effective nuclear charge per electron increases hence the size decreases.
5. (a) Alkali metals valence shell configuration = ns^1
6. (b) Element – Li Na K Rb Cs
 Ionic radius – 76 102 138 152 167 (pm)
 as the atomic no. increases the no. of shells increases hence, atomic radius increases.
7. (c) On moving down the group electropositive character increases.
8. (a) Carnallite – $KCl \cdot MgCl_2 \cdot 6H_2O$
 Cryolite – Na_3AlF_6
 Bauxite – $(Al_2O_3 \cdot 2H_2O)$
 Dolomite – $MgCO_3 \cdot CaCO_3$
10. (d) Element – Li Na K Rb
 Atomic radius (pm) – 152 186 227 248

12. (b) Li is much softer than the other group 1 metals. Actually Li is harder than other alkali metals
13. (a) $Cu^{+2} + 2e^- \rightarrow Cu, E^0 = +0.34 V$
 $Mg^{+2} + 2e^- \rightarrow Mg, E^0 = -2.37 V$
 $Na^+ + e^- \rightarrow Na, E^0 = -2.71 V$
14. (d) Anhydrous form of Na_2CO_3 does not decompose on heating even to redness. It is a amorphous powder called soda ash.
17. (c) Fehling's solution is a mixture of Alk. $CuSO_4 + Na - K$ tartarate (Rochelle salt)
19. (b) $2K + 2HCl \rightarrow 2KCl + H_2$ (violent reaction).
20. (b) Although lattice energy of $LiCl$ higher than $NaCl$ but $LiCl$ is covalent in nature and $NaCl$ ionic there after, the melting point decreases as we move $NaCl$ because the lattice energy decreases as a size of alkali metal atom increases (lattice energy $\propto$ melting point of alkali metal halide)
22. (b) It form calcium and magnesium complex with EDTA salt.
24. (a) $LiOH < NaOH < KOH < RbOH$
 Down the group basic character increases
25. (d) $Na_2CO_3 \cdot 10H_2O \xrightarrow{\Delta} Na_2CO_3 \cdot H_2O \xrightarrow{\Delta} Na_2CO_3 + H_2O \uparrow$
washing powder
26. (b) Na_2CO_3, K_2CO_3 and $(NH_4)_2CO_3$ are soluble in water because hydration energy is more than lattice energy
29. (c) $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$ potash alum it is a double salt.
31. (d) It is a colourless gas.
32. (a) $NaHCO_3 \rightarrow Na^+ + HCO_3^-$
(Salt of strong base & weak acid)
 $\downarrow$
 $OH^- + CO_2$
33. (b) $FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$ Mohr's salt.
35. (d) $Ca^{+2} > Na^+ > Mg^{+2} > Al^{+3}$
36. (b) $Li^+ + e^- \rightarrow Li, E^0 = -3.05 V$
 $K^+ + e^- \rightarrow K, E^0 = -2.93 V$
 $Ca^{+2} + 2e^- \rightarrow Ca, E^0 = -2.87 V$
37. (a) Because their valence electrons are present in s- orbitals.
38. (a) $6Li + N_2 \rightarrow 2Li_3N$ Lithium nitride.
39. (d) Li, Na, K are lighter than water but Rb is heavier than water.
42. (c) $KF + HF \rightarrow KHF_2 = K^+ + HF_2^-$
43. (b) $Cs > Rb > K > Na > Li$
 Metallic character decreasing order.
45. (d) $2Rb + 2H_2O \rightarrow 2RbOH + H_2$
 $Li < Na < K < Rb < Cs$
 As we go down the group reactivity with H_2O increases.
48. (b) Atomic number $11 \rightarrow Na \rightarrow Na_2O$
 $Na_2O + H_2O \rightarrow 2NaOH$
(base)
51. (d) Generally ionic character decreasing from $LiCl$ to $NaCl$
52. (c) In castner process Na metal is made of anode.
55. (a) Fajan's rule is applied.

57. (a) Small atomic and ionic size leads to high electronegativity and hydration energy. Small atomic and ionic size leads to high electronegativity and hydration energy.
58. (c) Mohr salt is $(\text{FeSO}_4)(\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.
60. (a) Sodium thiosulphate is a reducing agent which convert metallic silver into silver salt.
64. (a) In alkali metal group elements alkali means plant ash.
67. (d) $2\text{Na} + 2\text{NH}_3 \xrightarrow{\text{heat}} 2\text{NaNH}_2 + \text{H}_2$
68. (a,b) $2\text{Na} + \frac{1}{2}\text{O}_2 \xrightarrow{\text{moist air}} \text{Na}_2\text{O}$
 $\text{Na}_2\text{O} + 2\text{H}_2\text{O} \longrightarrow 2\text{NaOH} + \text{H}_2$.
69. (d) $2\text{KClO}_3 \rightarrow 2\text{KCl} + 3\text{O}_2$.
70. (d) Due to free electron liquid ammonia becomes paramagnetic.
72. (a) They possess highest atomic volume in their respective periods.
74. (c) $\text{Fe}(\text{OH})_3$ is soluble in sodium hydroxide solution.
76. (d) The cell involves the following reaction,
 $\text{NaCl} \rightleftharpoons \text{Na}^+ + \text{Cl}^-$
 At anode : $2\text{Cl}^- \rightarrow 2\text{Cl} + 2e \rightarrow \text{Cl}_2$
 At cathode : $\text{Na}^+ + e \rightarrow \text{Na}$
 $\text{Na} + \text{Hg} \rightarrow \text{amalgam}$
 At anode : $\text{Na} - \text{amalgam} \rightarrow \text{Na}^+ + \text{Hg} + e$
 At cathode : $2\text{H}_2\text{O} + 2e \rightarrow \text{H}_2 \uparrow + 2\text{OH}^-$
78. (a) *Li* is a more reducing agent compare to other element.
79. (b) Element – *Li Na K Rb Cs*
 M.pt in K – 4535 370.8 336.2 312 301.5
80. (a) $2\text{Na} + 2\text{HOH} \rightarrow 2\text{NaOH} + \text{H}_2 \uparrow$
 $2\text{K} + 2\text{HOH} \rightarrow 2\text{KOH} + \text{H}_2 \uparrow$
82. (a) Alkali metal are good conductor of heat and electricity.
83. (c) Potassium react with halogens (chlorine) to gives violet colour flame.
84. (b) Mobility decreases from top to bottom because of the atomic size is increases.
85. (c) Lithium shows digonal relationships with *Mg*.
86. (c) $\text{K} > \text{Ca} > \text{C} > \text{Cl}$
 Electropositive character in decreasing order.
87. (d) $2\text{NaCl} \xrightarrow[\text{Molten}]{\text{Electrolysis}} 2\text{Na} + \text{Cl}_2$
 Cathode Anode
88. (b) When sodium bicarbonate (NaHCO_3) is heated, sodium carbonate, CO_2 and water are formed.
 $2\text{NaHCO}_3 \xrightarrow{\Delta} \underset{\text{Sodium carbonate}}{\text{Na}_2\text{CO}_3} + \text{CO}_2 \uparrow + \text{H}_2\text{O}$
89. (c) Alum is used for softning of water.
90. (a) Only salts of (weak acid + strong base) and (strong acid + weak base) get hydrolysed (*i.e.*, show alkalinity or acidity in water). KClO_4 is a salt of strong acid and strong base therefore it does not get hydrolysed in water.
 $\text{KClO}_4 \rightleftharpoons \text{K}^+ + \text{ClO}_4^-$; $\text{H}_2\text{O} \rightleftharpoons \underset{\text{KOH Strong}}{\text{OH}^-} + \underset{\text{HClO}_4 \text{ Strong}}{\text{H}^+}$
91. (c) Carbon dioxide does not help in burning, also it forms carbonate with alkali metals.
92. (a) When carbonate are heated they decompose to form the oxide. Sodium carbonate and potassium carbonate do not decompose.
- The carbonate become more difficult to decompose as we go down the group.
93. (c) Aluminium reacts with caustic soda to form sodium meta aluminate.
 $2\text{Al} + 2\text{NaOH} + 2\text{H}_2\text{O} \rightarrow \underset{\text{Sodium meta aluminate}}{2\text{NaAlO}_2} + 3\text{H}_2 \uparrow$
94. (a) Alkaline earth metals (ns^2) are denser than alkali metal (ns^1) because metallic bonding in alkaline earth metal is stronger.
95. (c) Lithium is basic in nature and hence it is not amphoteric.
96. (a) CsOH of the following is most basic in character due to increase electropositive character in a group of alkali.
97. (a) Group 1 element are so highly electropositive that they emit electrons even when exposed to light (Photoelectric effect) and this character increase on moving down the group from lithium towards cesium.
98. (b) Lithium form nitride on heating with nitrogen. Lithium nitride gives ammonia when heated with H_2O . Ammonia gas form tetrammine copper complex with CuSO_4 solution.
 $6\text{Li} + \text{N}_2 \rightarrow 2\text{Li}_3\text{N}$
 $\text{Li}_3\text{N} + 3\text{H}_2\text{O} \rightarrow 3\text{LiOH} + \text{NH}_3$
 $\text{CuSO}_4 + 4\text{NH}_3 \rightarrow [\text{Cu}(\text{NH}_3)_4]\text{SO}_4$
99. (d) The given compound *x* must be CaCO_3 . It can be explained by following reactions,
 $\text{CaCO}_3 \xrightarrow[\text{(x)}]{\Delta} \underset{\text{Residue}}{\text{CaO}} + \text{CO}_2 \uparrow$; $\text{CaO} + \text{H}_2\text{O} \rightarrow \underset{\text{(y)}}{\text{Ca}(\text{OH})_2}$
 $\text{Ca}(\text{OH})_2 + \text{CO}_2 + \text{H}_2\text{O} \rightarrow \underset{\text{z}}{\text{Ca}(\text{HCO}_3)_2}$
 $\text{Ca}(\text{HCO}_3)_2 \xrightarrow[\text{(x)}]{\Delta} \text{CaCO}_3 + \text{CO}_2 \uparrow + \text{H}_2\text{O}$
100. (c) According to Fajan's rule *RbCl* has greatest ionic character due to large ionic size of Rb^+ ion. BeCl_2 has least ionic (Maximum covalent) due to small size of Be^{+2} ion which has highly polarising.
105. (c) $2\text{Na} + 2\text{NH}_3 \rightarrow 2\text{NaNH}_2 + \text{H}_2$
110. (d) $2\text{Na} + 2\text{H}_2\text{O} \rightarrow 2\text{NaOH} + \text{H}_2$
112. (c) It reacts with alcohol to form sodium alkoxide
 $2\text{C}_2\text{H}_5\text{OH} + 2\text{Na} \rightarrow 2\text{C}_2\text{H}_5\text{ONa} + \text{H}_2$
113. (a) Causticizing process (Gossage process) it is an old process and involves heating of 10% solution of Na_2CO_3 with a little excess of milk of lime $\text{Ca}(\text{OH})_2$
 $\text{Na}_2\text{CO}_3 + \text{Ca}(\text{OH})_2 \rightarrow \text{CaCO}_3 \downarrow + 2\text{NaOH}$
114. (c) $\text{NaOH} + \text{CO} \xrightarrow[5-10 \text{ atm}]{150^\circ-200^\circ\text{C}} \text{HCOONa}$
115. (a) $2\text{NaCl} + 2\text{H}_2\text{O} \rightarrow 2\text{NaOH} + \text{H}_2 + \text{Cl}_2$
119. (b) NaOH is a deliquescent white crystalline solid. It absorbs moisture from the atmosphere.
120. (a) $\text{Na}_2\text{CO}_3 + \text{H}_2\text{O} + 2\text{SO}_2 \rightarrow 2\text{NaHSO}_3 + \text{CO}_2$
123. (c) $\text{NaOH} + \text{CaO}$ is called soda lime 3 : 1
124. (c) Molten sodium is used as a coolant

126. (c) $AgBr + 2Na_2S_2O_3 \rightarrow Na_3[Ag(S_2O_3)_2] + NaBr$
128. (b) $Na_2SO_3 + S \xrightarrow{NaOH} Na_2S_2O_3$
Sod. thiosulphate
129. (a,b) $2NaCl + 2H_2O \rightarrow 2NaOH + Cl_2 + H_2$
Anode Cathode
132. (b) $Sn + 2NaOH + H_2O \rightarrow Na_2SnO_3 + 2H_2$
135. (b) $2NaCl + 2H_2O \xrightarrow{\text{Electrolysis}} 2NaOH + Cl_2 + H_2$
Anode Cathode
136. (d) $2NaCl \xrightarrow{\text{Electric current}} 2Na^+ + 2Cl^-$
Cation Anion
138. (a) $HgCl_2 + 2NaOH \rightarrow HgO + 2NaCl + H_2O$
139. (a) Down's cell is used for the electrolysis of fused $NaCl$
142. (c) $Fe(OH)_3$ does not dissolve in $NaOH$
143. (a) Castner's process used to obtain Na , by electrolysis of sodium hydroxide.
144. (a) Excess of Na^+ ion causes high B.P.
145. (b) Ferric alum is $(NH_4)_2SO_4 \cdot Fe_2(SO_4)_3 \cdot 24H_2O$
146. (d) When Na is heated in presence of air or oxygen, Na burns to form sodium oxide and sodium peroxide.
148. (d) Pyrolusite or Manganese dioxide (MnO_2) is a mineral of manganese.
149. (c) $CaCl_2$ bring down the melt temperature from 1075 K to 850 K
23. (d) $Ca(OH)_2 + Cl_2 \rightarrow CaOCl_2 + H_2O$
Slaked lime Bleaching powder
24. (a) Strontium $\rightarrow$ Crimson or pink colour
26. (b,c) $Ca_3P_2 + 6H_2O \rightarrow 3Ca(OH)_2 + 2PH_3$
 $K_3P + 3H_2O \rightarrow 3KOH + PH_3$
27. (d) $CaCl_2 \rightarrow Ca^{+2} + 2Cl^-$
Cathode Anode
Cathode : $Ca^{+2} + 2e^- \rightarrow Ca$
Anode : $2Cl^- \rightarrow 2e^- + Cl_2$
28. (d) Element – Mg Al Si P
Atomic radii (Å) – 1.60 1.43 1.32 1.28
as we move across the period nuclear charge increases, hence, size decreases.
30. (b) $MgCl_2 \cdot 6H_2O + 5MgO + xH_2O \rightarrow$
 $MgCl_2 \cdot 5MgO \cdot xH_2O$
Magnesia cement or sorrel cement
31. (d) $ZnS + BaSO_4$ is lithopone used as white pigment.
36. (d) Aqueous $CaCl_2$ or hydrated $CaCl_2$ can not act as dehydrating agent.
38. (d) As we go down the group electropositive character increases because I.E. decreases.
 Ba is most electropositive element in the group.
39. (d) Due to the inert pair effect.
40. (a) Element – Be Al
Electronegativity – 1.5 1.5
41. (c) $Be > Mg > Ca > Sr > Ba$

On moving down the group lattice energy remains almost constant as the sulphate is so big that small increase in the size of the cations from Be to Ba does not make any difference. However the hydration energy decreases from Be^{+2} to Ba^{+2} . This causes decrease in the solubility of the sulphates as the ionic size increases.

42. (a) Element – Be Mg Ca Sr Ba
Electrode potential – 1.70 – 2.37 – 2.87 – 2.89 – 2.90
43. (a) Element – Mg Ca Sr Ba
I.E. – 737 590 549 503
44. (a) Be due to diagonal relationship
45. (a) K^+ is highly soluble because of high hydration energy.
47. (b) $\underbrace{MgO}_{\text{Basic}} \underbrace{Al_2O_3}_{\text{Amphoteric}} \underbrace{SiO_2}_{\text{Acidic}} \underbrace{P_2O_5}_{\text{Acidic}}$
 $MgO + H_2O \rightarrow Mg(OH)_2$ Base or alkali

48. (d) Duralium ($Al = 95\%$, $Cu = 4\%$, $Mn = 0.5\%$, $Mg = 0.5\%$) being light, tough and durable is used for the manufacture of aeroplanes and automobile parts.
49. (c) Na K Ba Ca Sr
Yellow Pale violet Apple green Brick red Crimson
51. (a) Magnesium burns with an intense light. Therefore Mg is used in flash bulbs for photography, fireworks and signal fires.
53. (b) $CaO + CO_2 \rightarrow CaCO_3$
 $CaO + H_2O \rightarrow Ca(OH)_2$
54. (a) When water is added to cement an exothermic reaction occurs. During this process, the cement reacts with water to form a gelatinous mass which slowly sets into a hard mass having three dimensional network structure involving $-Si-O-Si-$ and $-Si-O-Al-$ chains.

Alkaline earth metals

2. (d) $CaSO_4 \cdot \frac{1}{2}H_2O$ or $(CaSO_4)_2 \cdot H_2O$
3. (a) $CaCl_2$ because it is hygroscopic
7. (d) Setting of plaster of paris is exothermic process
 $CaSO_4 \cdot \frac{1}{2}H_2O \xrightarrow{H_2O} CaSO_4 \cdot 2H_2O$
Orthorhombic
 $\xrightarrow{\text{Hardening}} CaSO_4 \cdot 2H_2O$
Mono orthorhombic
Gypsum
The setting is due to formation of another hydrate
10. (a) $MgCO_3 \xrightarrow{\text{Heat}} MgO + CO_2$
The metal whose oxide is stable, its carbonate is unstable
12. (d) $MgCl_2 \xrightarrow{\text{Electrolysis}} Mg^{+2} + 2Cl^-$
(Molten) Cation Anion
Anode – $2Cl^- \rightarrow 2Cl + 2e^-$, $Cl + Cl \rightarrow Cl_2$
Cathode – $Mg^{+2} + 2e^- \rightarrow Mg$
13. (a) Because of small atomic size and high I.E. Be forms covalent chloride.
16. (d) $BeSO_4$ is most soluble because hydration energy is more than lattice energy.
 $BeSO_4 > MgSO_4 > CaSO_4 > SrSO_4 > BaSO_4$
Hydration energy decreases hence, solubility decreases.
19. (b) $2(CaSO_4 \cdot 2H_2O) \xrightarrow{120^\circ C} 2CaSO_4 \cdot H_2O + 3H_2O$
Gypsum Dehydration Plaster of paris
21. (b) Lithopone ($ZnS + BaSO_4$) is used as a white pigment.

55. (b) CaO – (quick lime)
 Ca(OH)_2 – (slaked lime)
 $\text{Ca(OH)}_2 + \text{H}_2\text{O}$ – an aqueous suspension of Ca(OH)_2 in water is called lime water.
 CaCO_3 (lime stone).
57. (d) Lime stone – CaCO_3
 Clay – silica and alumina
 Gypsum – $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$
59. (b) Because hydration energy decreases down the group.
63. (d) Be does not react with water.
64. (a) (i) Small atomic size.
 (ii) High electronegativity
 (iii) Absence of d orbitals
65. (a) $\text{Ba(OH)}_2 > \text{Sr(OH)}_2 > \text{Ca(OH)}_2 > \text{Mg(OH)}_2$
 Solubility decreasing order.
66. (d) Solubility increasing top to bottom.
67. (a) Be to Ba ionic character increasing.
70. (a) $\text{Ca} + 2\text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2 + \text{H}_2$
 $\text{CaH}_2 + 2\text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2 + 2\text{H}_2$
72. (a) They are denser than alkali metals because they can be packed more tightly to their greater charge and smaller radii.
76. (d) $\text{Be(OH)}_2 < \text{Mg(OH)}_2 < \text{Ca(OH)}_2 < \text{Sr(OH)}_2 < \text{Ba(OH)}_2$
 On moving down the group basic character increases.
77. (b) Mg(OH)_2 Mg is most electropositive element amongst the given elements.
78. (d) Lime stone = CaCO_3
 Quick lime = CaO
 Slaked lime = Ca(OH)_2
79. (c) As we go down the group I.E. decreases. Hence, Ba can easily give electrons. Therefore strongest reducing agent.
80. (c) $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O} + \frac{1}{2}\text{H}_2\text{O} \rightarrow \text{CaSO}_4 \cdot 2\text{H}_2\text{O}$
 Plaster of paris Hard mass
82. (a) $\text{BeCl}_2 < \text{MgCl}_2 < \text{CaCl}_2 < \text{BaCl}_2$
 As we go down the group I.E. decreases. Hence ionic character increases.
83. (c) $\text{MgCl}_2 \cdot 6\text{H}_2\text{O} \xrightarrow{\text{heat}} \text{MgO} + 5\text{H}_2\text{O} + 2\text{HCl}$
84. (a) The solubility of hydroxides of alkaline earth metals in water increases on moving down the group.
85. (c) Bleaching action of Cl_2 in moist condition is permanent.
 $\text{Cl}_2 + \text{H}_2\text{O} \rightarrow \text{HCl} + \text{HClO}$
 $\text{HClO} \rightarrow \text{HCl} + \text{O}$
 $\text{Cl}_2 + \text{H}_2\text{O} \rightarrow 2\text{HCl} + \text{O}$
 Coloured matter + nascent oxygen $\rightarrow$ colourless matter
86. (d) The solubility of hydroxides of alkaline earth metals in water increases on moving down the group.
87. (c) CO_2 escapes simultaneously.
88. (d) It consist of high lattice energy and lowest hydration energy.
90. (a) It is a s-block elements.
91. (b) Barium Ba_{56} is a alkali earth metal.
92. (c) Thermal stability increasing from top to bottom.
94. (b) On moving down the group; Lattice energy decreases with increase in size of cation.
96. (d) BaSO_4 is sparingly soluble in water because the solubility of second group sulphates decreases with increasing atomic size. Because of hydration energy decreases.
97. (d) Beryllium because of small atomic size and high ionization energy.
99. (a) $\text{Mg} < \text{Ca} < \text{Sr} < \text{Ba} < \text{Ra}$
 Ionic nature increases
 as we go down the group ionic nature increases because I.E. decreases.
100. (b) $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ – Gypsum
 $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ – Plaster of paris
101. (b) $\text{Ca} + \frac{1}{2}\text{O}_2 \rightarrow \text{CaO}$.
102. (c) Calcium cyanamide is the slow acting nitrogenous fertilizer as it decompose very slowly.
 $\text{CaNCN} + 2\text{H}_2\text{O} \rightarrow \text{CaCO}_3 + \text{NH}_2\text{CONH}_2$
 Urea
 $\text{NH}_2\text{CONH}_2 + \text{H}_2\text{O} \rightarrow \text{CO}_2 + 2\text{NH}_3$
 $\text{NH}_3 \xrightarrow[\text{bacteria}]{\text{Nitrifying}}$ Solublenitrates $\rightarrow$ Plants
103. (a) Plaster of paris $[(\text{CaSO}_4)_2\text{H}_2\text{O}]$ is used in surgery for setting of bones, dentistry and manufacturing of statues. It is prepared as follows,
 $2\text{CaSO}_4 \cdot 2\text{H}_2\text{O} \xrightarrow{125^\circ\text{C}} (\text{CaSO}_4)_2 \cdot \text{H}_2\text{O} + 3\text{H}_2\text{O}$
 Plaster of paris
104. (b) Due to electropositive and reactive in nature, magnesium is readily converted into positive ions on contact with iron pipes and hence, iron pipes remains as it is.
105. (c) A binary compound is one made of two different elements. These can be one of each element such as CuCl or FeO . These can also be several of each element such as Fe_2O_3 or SnBr_4 . Metal which have variable oxidation number can form more than one type of binary compound like Fe shows the oxidation state +2 and +3. Hence it forms two type of binary compound e.g., FeCl_2 , FeCl_3 .
106. (a) Diagonal relationship: elements of 2nd period often show resemblance to the element of the IIIrd period diagonally placed to it. This type of behaviour is called as diagonal relationship Li shows the diagonal relationship with Mg .
107. (a) $\text{MgCl}_2 + 2\text{NaHCO}_3 \rightarrow \text{Mg(HCO}_3)_2(\text{aq}) + 2\text{NaCl}$
 $\text{Mg(HCO}_3)_2(\text{aq}) \xrightarrow{\Delta} \text{MgCO}_3 \downarrow + \text{H}_2\text{O} + \text{CO}_2 \uparrow$
 (White ppt.)
108. (c) We know that
 $\text{MgCl}_2 \cdot 6\text{H}_2\text{O} \xrightarrow{\text{Heat}} \text{MgCl}_2 + 6\text{H}_2\text{O}$
 Thus in this reaction magnesium dichloride is produced.
109. (d) Magnesium burns in CO to produce
 $\text{Mg} + \text{CO} \rightarrow \text{MgO} + \text{C}$
110. (d) Sorel's cement is, $\text{MgCl}_2 \cdot 5\text{MgO} \cdot x\text{H}_2\text{O}$
111. (b) Colemanite is a mineral of boron having composition as $\text{Ca}_2\text{B}_6\text{O}_{11} \cdot 5\text{H}_2\text{O}$.

Boron family

3. (a) $B_2O_3 + 3C + 3Cl_2 \rightarrow 2BCl_3 + 3CO$

BCl_3 is obtained by passing chlorine over the heated mixture of B_2O_3 and powdered charcoal.

6. (d) B_2H_6 has two types of $B-H$ bonds

$B-H$ 119 pm (Terminal bond)

$B-H$ 134 pm (Bridge bond)

12. (b) Diltney in 1921 proposed a bridge structure for diborane. Four hydrogen atoms, two on the left and two on the right, known as terminal hydrogens and two boron atoms lie in the same plane. Two hydrogen atoms forming bridges, one above and other below, lie in a plane perpendicular to the rest of molecule.

15. (c) $2H_3BO_3 \rightarrow B_2O_3 + 3H_2O$
16. (a,c,d) Al_2Cl_6 , In_2Cl_6 , Ga_2Cl_6
17. (a) Liquified Ga expand on solidification Ga is less electropositive in nature, it has the weak metallic bond so it expand on solidification.
18. (d) $Al_2Cl_6 + 12H_2O \rightleftharpoons 2[Al(H_2O)_6]^{3+} + 6Cl^-$
19. (e) B_4C is the hardest substance along with diamond.
20. (a) Borazine $B_3N_3H_6$, is isoelectronic to benzene and hence, is called inorganic benzene some physical properties of benzene and borazine are also similar.

21. (c) Except $B(OH)_3$ all other hydroxide are of metallic hydroxide having the basic nature $B(OH)_3$ are the hydroxide of nonmetal showing the acidic nature.
22. (c) Moissan boron is amorphous boron, obtained by reduction of B_2O_3 with Na or Mg . It has 95-98% boron and is black in colour.

23. (d) Boron form different hydride of general formula B_nH_{n+4} and B_nH_{n+6} but BH_3 is unknown.
24. (c) Alumina is amphoteric oxide, which reacts acid as well as base.
25. (a) Al is the most abundant metal in the earth crust.
29. (a) $AlCl_3 \cdot 6H_2O \xrightarrow{\Delta} Al(OH)_3 + 3HCl + 3H_2O$
Thus $AlCl_3$ can not be obtained by this method
30. (d) Amphoteric substance can react with both acid and base.
33. (c) $2Al + 6HCl \rightarrow 2AlCl_3 + 3H_2$
34. (c) $Al \rightarrow III \text{ group} \rightarrow \text{Forms } Al_2O_3$
35. (d) $2KOH + 2Al + 2H_2O \rightarrow 2KAlO_2 + 3H_2$
37. (c) $Na_2CO_3 + H_2O \rightarrow 2NaOH + CO_2$
 $2NaOH + 2Al + 6H_2O \rightarrow 2Na[Al(OH)_4] + 3H_2$
41. (c) $B(OH)_3 \rightleftharpoons H_3BO_3$ Boric acid
 $Al(OH)_3 \rightleftharpoons \text{Amphoteric}$
45. (b) $FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$
46. (b) Al_2O_3 is an amphoteric oxide.
47. (c) Aluminium oxide is highly stable therefore, it is not Reduced by chemical reactions.
48. (d) Aluminium is used as reducing agent in metallurgy.
49. (a) Al is used as reducing agent in thermite process.
50. (c) In Goldschmidt aluminothermic process, thermite contains 3 parts of Fe_2O_3 and 1 part of Al .
51. (c) For the purification of red bauxite which contains iron oxide as impurity $\rightarrow$ Baeyer's process. For the purification of white bauxite which contains silica as the main impurity Serpeck's process.
52. (b) In Hall's process
 $Al_2O_3 \cdot 2H_2O + Na_2CO_3 \rightarrow 2NaAlO_2 + CO_2 + 2H_2O$
 $2NaAlO_2 + 3H_2O + CO_2 \xrightarrow{333 K}$
 $2Al(OH)_3 \downarrow + Na_2CO_3$
 $2Al(OH)_3 \xrightarrow{1473 K} Al_2O_3 + 3H_2O$
54. (d) Cryolite Na_3AlF_6
(1) Decreases the melting point of alumina
(2) Increases conductivity of the solution
55. (b) Cryolite Na_3AlF_6 is added
(1) To decrease the melting temp from $2323 K$ to $1140 K$
(2) To increase the electrical conductivity of solution
61. (d) Iron oxide impurity - Baeyer's process
Silica impurity - Serpeck's process
64. (b) Cryolite is added to lower the melting point of alumina and to increase the electrical conductivity.
65. (c) The purification of alumina can be done by Baeyer's process.
67. (c) In electrolytic method of obtaining aluminium from purified bauxite, cryolite is added to charge because it reduces the melting point of Bauxite (from $1200^\circ C$ to $800^\circ - 900^\circ C$) and also it increases electrical conductivity of mixture.
68. (a) Hoop's process $\Rightarrow$ Purification of Al
Hall and Heroult process $\Rightarrow$ Reduction of Al_2O_3
Baeyer's and Serpeck's process $\Rightarrow$ Concentration of Bauxite ore
74. (a)

$$3c - 2e : B-H-B; \quad 2c - 2e : H-B-H$$

75. (a) B_2H_6 

76. (b) Pure alumina is a bad conductor of electricity and the fusion temperature of pure alumina is about 2000°C and at this temperature when the electrolysis is carried of fused mass the metal formed vapourises as the boiling point of Al is 1800°C . To overcome this difficulty, Na_3AlF_6 and CaF_2 are mixed with alumina.

77. (a) Concentration of Lewis acid of boron tri halides is increased in following order. $BF_3 < BCl_3 < BBr_3 < BI_3$.

Carbon family

3. (d) It react with alkali as well as acid.

6. (a) Among alkali metal carbonates only Li_2CO_3 decomposes.

7. (b) Propyne can be prepared by the hydrolysis of magnesium carbide.

10. (d) Generally red lead decompose into PbO and O_2 .

11. (c) CO_2 is acidic oxide and thus more effectively absorbed by an alkali.

12. (b) CaC_2 have one sigma and two π bond.

13. (d) C and Si are non-metal and Pb is a metal.

16. (a) $SiO_2 + 2Mg \rightarrow Si + 2MgO$.

17. (b) Generally IV group element shows catenation tendency and carbon has more catenation power.

18. (b) Metal oxides or some salts are fused with glass to imparted colour of glass.

19. (d) $Al_2(CO_3)_3$ is less soluble in water than Na_2CO_3 , $ZnCO_3$.

20. (d) The inert pair effect is most prominent in Pb because from top to bottom due to increase in number of shells.

25. (c) $Co + NaOH \xrightarrow{200^\circ\text{C}} HCOONa$
Sod. formate

27. (c) Sodium oxalate react with conc. H_2SO_4 to form CO and CO_2 gas.

33. (d) It is hydrolysed with water to form a $Si(OH)_4$.

35. (b) When hydrogen peroxide react with PbS then they form $PbSO_4$.

36. (b) Grey tin is very brittle and easily crumbles down to a powder in very cold climates.

The change of white tin to grey tin is accompanied by increase in volume. This is called tin disease or tin plague.

37. (c) Solid CO_2 is known as dry ice because it evaporates at -78°C without changing in the liquid state.

38. (b) Zeolite have SiO_4 and AlO_4 tetrahedrons linked together in a three dimensional open structure in which four or six membered ring predominate. Due to open chain structure they have cavities and can take up water and other small molecules.

39. (b) Crook's glass is a special type of glass containing cerium oxide. It does not allow the passage of ultra violet ray and is used for making lenses.

40. (b) Inert pair effect become significant for the 6th and 7th period of p-block element.

41. (a) Carbon suboxide has linear structure with $C-C$ bond length equal to $130 \text{ \AA}$ and $C-O$ bond length equal to $120 \text{ \AA}$.

42. (c) Pb_3O_4 is a mixed oxide. It can be represented as $2PbO \cdot PbO_2$.

43. (b) Noble gases are found in very minute amount in atmosphere. These are separated from each other by using coconut charcoal. Which adsorb different gas at different temperature.

44. (c) Lapis Lazuli is a rock composed mainly of the following mineral, lazurite, hauynite, sodalite, nosean, calcite, pyrite, lapis lazuli is actually sulphur containing, sodium aluminium silicate having chemical composition $3Na_2O \cdot 3Al_2O_3 \cdot 6SiO_2 \cdot 2Na_2S$.

45. (d) In carbon family stability +2 oxidation state increases on moving down the group in the periodic table with an increase in atomic number due to screening effect.

46. (c) Tin is oxidised to meta stannic acid when it is treated with nitric acid.

47. (c) $Pb + Sn$

49. (d) Three dimensional sheet structures are formed when three oxygen atoms of each $[SiO_4]^-$ tetrahedral are shared.

50. (a) $Pb_3O_4 \Rightarrow$ Red lead (Sindhur)

51. (c) White lead $\Rightarrow 2PbCO_3 \cdot Pb(OH)_2$

52. (c) Organic acids dissolve lead in presence of oxygen

55. (a) S^2P^2 Total 4 valence electrons $\Rightarrow$ IV group

56. (c) $PbCl_2$ is most ionic because on going down the group the metallic character increases and also the inert pair effect predominates.

58. (b) Type metal $Pb = 82\%$, $Sb = 15\%$, $Sn = 3\%$

60. (b) Sugar of lead $(CH_3COO)_2Pb \Rightarrow$ lead acetate

63. (d) $Pb \Rightarrow 11.34 \text{ g/ml}$ Heaviest

64. (c) Pb_3O_4 is a mixed oxide of $2PbO + PbO_2$

67. (c) Boron (B), Si , Ge , As , Sb , and At are the metalloid elements. Bismuth (Bi) and tin (Sn) are metals while carbon (C) is non-metal.

68. (a) $Al_4C_3 + 12H_2O \rightarrow 3CH_4 + 4Al(OH)_3$

69. (b) Glass being a mixture of sodium and calcium silicates reacts with hydrofluoric acid forming sodium and calcium fluorosilicates respectively.

The etching of glass is based on these reactions.

Nitrogen family

Tetrabasic (4 -OH groups)

3 - OH groups are present hence it is tribasic.

It oxidises Fe^{+2} into Fe^{+3} in acidic medium;

It reduces acidified $KMnO_4$.

42. (a)
- $(HPO_3)_n$
- Polymetaphosphoric acid

43. (b) Superphosphate of lime – It is a mixture of calcium dihydrogen phosphate and gypsum and is obtained by treating phosphatic rock with conc.
- H_2SO_4

44. (d)
- $3NaOH + H_3PO_4 \rightarrow Na_3PO_4 + 3H_2O$

46. (d)
- $4NH_3 + 5O_2 \xrightarrow[1100\text{ K}]{Pt} 4NO + 6H_2O$

NO is used in the preparation of HNO_3

47. (d)
- $P_4 + 20HNO_3 \rightarrow 4H_3PO_4 + 20NO_2 + 4H_2O$

49. (b)
- $\underbrace{P_2O_3 \quad A_2O_3 \quad B_2O_3}_{\text{Acidic oxides}} \quad \underbrace{Bi_2O_3}_{\text{Alkaline}}$

50. (b)
- $P_2O_3 + 3H_2O \rightarrow 2H_3PO_3$

51. (a)
- NF_3

It is least basic because of the high electronegativity of $3F$ atoms. The lone pair present on nitrogen atom is not easily available for donation.

52. (d)
- $3H_2O + PCl_3 \rightarrow H_3PO_3 + 3HCl$

53. (c) Due to less reactivity of red phosphorus

54. (d)
- NO_2
- brown coloured gas.

55. (d)
- N_2O_5
- is an anhydride of
- HNO_3

Therefore, it can act only as oxidising agent.

56. (c)
- $NH_4NO_2 \xrightarrow{\text{(Oxidation number)}} NH_4^+ + NO_2^-$

$$\begin{array}{ccc} * & & * \\ x + 4 = +1 & & x - 4 = -1 \\ x = 1 - 4 = -3 & & x = +3 \end{array}$$

57. (b)
- P_4O_8

$$4x + (-2 \times 8) = 0$$

$$4x - 16 = 0$$

$$x = \frac{16}{4} = +4$$

58. (c)
- NH_2OH

$$x + 2 + (-2) + 1 = 0$$

$$x + 2 - 2 + 1 = 0$$

$$x = -1$$

60. (c)
- $NH_3 > PH_3 > AsH_3 > SbH_3$

On moving down the group atomic size increases and availability of lone pair decreases. Hence, basic character decreases.

61. (a)
- $PH_3 > AsH_3 > SbH_3 > BiH_3$

On moving down the group bond energy decreases. Hence, stability decreases.

62. (d) Due to absence of
- d
- orbitals in
- N
- atom, it cannot accept electrons from
- H_2O
- for hydrolysis of
- NF_3
- .

63. (b)
- NH_3
- is most thermally stable hydride. Hence, electrolysis temperature is maximum.

64. (a) Phosphorus is kept in water due to it burnt at
- $30^\circ C$
- .

66. (c)
- $BiCl_3 + H_2O \rightarrow BiOCl + 2HCl$

67. (c) When the black ppt. of
- Bi_2S_3
- is dissolved in 50%
- HNO_3
- and a solution of
- NH_4OH
- is added. A white ppt. of
- $Bi(OH)_3$
- is obtained.

69. (a) Atmospheric nitrogen is inert and unreactive because of very high bond energy (
- 945 kJ/mole
-).

70. (b) Bismuth does not show allotropy other elements show allotropy.

Nitrogen $\rightarrow \alpha$ -nitrogen and β -nitrogen (solid crystalline forms)

Phosphorus $\rightarrow$ White, Red and Black forms

Arsenic $\rightarrow$ Yellow and Grey forms

Antimony $\rightarrow$ Yellow and Grey forms

71. (a) Nitrogen does not form complexes because of the absence of
- d
- orbitals.

72. (a)
- NH_3
- is a strongest base because Lone pair is easily available for donation.

74. (b) Hydride
- $NH_3 \quad PH_3 \quad AsH_3 \quad SbH_3 \quad BiH_3$

Boling point $238.5 \quad 185.5 \quad 210.6 \quad 254.6 \quad 290$

75. (a)
- NCl_3
- is highly reactive and unstable. Hence it is explosive.

76. (b)
- $\underbrace{N_2O_3 \quad P_2O_3 \quad As_2O_3}_{\text{Acidic}} \quad \underbrace{Sb_2O_3}_{\text{Amphoteric}} \quad \underbrace{Bi_2O_3}_{\text{Basic}}$

Acidic character decreases down the group

77. (c)
- $SbCl_2$
- is not exists because

V^- group elements normally show $+3$ and $+5$ oxidation state.

78. (b)
- $NH_4Cl + NaNO_2 \rightarrow NH_4NO_2 + NaCl$

79. (c)
- $NH_4NO_2 \rightarrow N_2 + 2H_2O$

80. (d)
- $6Li + N_2 \rightarrow 2Li_3N$
- Lithium nitride
-
- $3Mg + N_2 \rightarrow Mg_3N_2$
- Magnesium nitride

81. (d)
- $N \equiv N$
- bond energy is very high
- 945 kJ mol^{-1}
- .

83. (d)
- $N_7 \rightarrow 1s^2, 2s^2, 2p^3$
-
- d
- orbitals are absent in nitrogen.

85. (d)
- $NH_4NO_3 \xrightarrow[\text{(Laughing gas)}]{\text{heat}} N_2O + 2H_2O$

86. (d)
- $NH_2OH + HNO_2 \rightarrow H_2\overset{+1}{N}_2O_2 + H_2O$

87. (c)
- N_2O
- is a linear molecule

88. (b)
- $2HNO_2 \rightarrow H_2O + N_2O_3$

89. (d)
- $2HNO_3 \rightarrow H_2O + N_2O_5$

90. (c)
- $2Pb(NO_3)_2 \rightarrow 2PbO + 4NO_2 + O_2$

91. (a)
- $2Pb(NO_3)_2 \rightarrow 2PbO + 4NO_2 + O_2$

92. (b)
- $3Cu + 8HNO_3 \rightarrow 3Cu(NO_3)_2 + 4H_2O + 2NO$

93. (d) In upper atmosphere
- NO
- is formed by lightning flash.

96. (c) $N_2 + O_2 \rightleftharpoons 2NO$
98. (b) $2AgNO_3 \rightarrow 2AgNO_2 + O_2$
 $\downarrow$
 $2Ag + 2NO_2$
100. (d) $2NO_2 + H_2O \rightarrow HNO_3 + HNO_2$
101. (d) $C_{12}H_{22}O_{11} \xrightarrow{\text{conc. } HNO_3} \begin{array}{c} COOH \\ | \\ COOH \end{array} + H_2O$
 Oxalic acid
102. (b) $4NH_3 + 5O_2 \xrightarrow[800^\circ C]{Pt} 4NO + 6H_2O$
103. (d) HNO_2 can be either reduced to nitric oxide (NO) or oxidised to nitric acid and hence it acts both as an oxidising as well as a reducing agent.
 $2HNO_2 \rightarrow 2NO + H_2O + [O]$
 $HNO_2 + [O] \rightarrow HNO_3$
106. (d) NH_3 is highly volatile compound. When vapourized, liquid ammonia causes intense cooling. Hence used as a coolant in ice factories and cold storages.
107. (d) $N_3H \rightleftharpoons N_3^- + H^+$
 Hydrazoic acid
108. (a) d -orbitals are absent in nitrogen.
109. (d) Phosphide ion Chloride ion
 $(P^{3-}) \quad (Cl^-)$
 Total electrons 18 18
 P^{3-} and Cl^- are isoelectronic.
110. (a) Due to the less reactivity.
116. (a) $P_4 + 3H_2O + 3NaOH \rightarrow PH_3 + 3NaH_2PO_2$
 Phosphine Sod. hypophosphite
117. (c) Both oxidation and reduction (Disproportionation)
 Reduction
 $P_4 + 3H_2O + 3NaOH \rightarrow PH_3 + 3NaH_2PO_2$
 Oxidation
118. (b) $P_4 + NaOH \rightarrow$ No reaction
 Red
120. (c) $Ca_3P_2 + 6H_2O \rightarrow 3Ca(OH)_2 + 2PH_3$
122. (b) PH_3 is less basic because lone pair is not easily available for donation.
123. (d) $P_2O_3 + 3H_2O \rightarrow 2H_3PO_3$
124. (d) $P_2O_5 + 3H_2O \rightarrow 2H_3PO_4$ orthophosphoric acid.
125. (c) H_3PO_2 Monobasic acid
 $\begin{array}{c} O \\ || \\ H-P-OH \\ | \\ H \end{array}$ Only one $-OH$ group
126. (b) $PCl_3 + 3H_2O \rightarrow H_3PO_3 + 3HCl$
127. (b) H_3PO_3
 $\begin{array}{c} O \\ || \\ H-P-OH \\ | \\ OH \end{array}$
 *
128. (c) H_3PO_2
 $3 + x + (-2 \times 2) = 0$
 $x = +1$

129. (d) $Na_4P_2O_7$ Salt of strong acid and strong base.

130. (b) $P_4 + 6H_2SO_4 \rightarrow 4H_3PO_4 + 6SO_2$

131. (c) $CaCN_2 + 3H_2O \rightarrow CaCO_3 + 2NH_3$

132. (b) $H_4P_2O_7$

4 $-OH$ group are present.

134. (b) $BiCl_3 + H_2O \rightarrow BiOCl + 2HCl$

135. (b) $CaC_2 + N_2 \xrightarrow[6-8 \text{ atm}]{500-600^\circ C} CaCN_2 + C$

136. (a) $CaCN_2 + 3H_2O \rightarrow CaCO_3 + 2NH_3$

137. (a) NH_2CONH_2

$$\% \text{ of N} = \frac{\text{Mass of N}}{\text{Mass of compound}} \times 100 = \frac{28}{60} \times 100 = 46\%$$

141. (a) Anhydride of nitrous acid is N_2O_3 .

144. (b) $P_4 + 3NaOH + 3H_2O \rightarrow PH_3 + NaH_2PO_4$

145. (a) NH_3 is highly soluble due to H -bonding.

146. (d)

	NH_3	PH_3	AsH_3	SbH_3
B.pt in (K)	238.5	185.5	210.6	254.6

149. (a) H_3PO_2
 $3 + x - 4 = 0$
 $x = +1$

151. (d) Solid PCl_5 exists as PCl_4^+ and PCl_6^- .

153. (a)

154. (e) Phosphorus minerals is called as hydroxy apatite and fluorapatite.

156. (a) Nitrogen does not have d -orbitals.

157. (c) $3CuO + 2NH_3 \rightarrow 3Cu + N_2 + 3H_2O$

159. (b) Liquid ammonia is used in refrigeration because it has high heat of vaporisation.

160. (a) $Sn + \text{conc. } 4NHO_3 \rightarrow H_2SnO_3 + 4NO_2 + H_2O$
 Meta stannic acid

161. (c) $3Cu + 8NHO_3 \rightarrow 3Cu(NO_3)_2 + 4H_2O + 2NO$
 Nitric oxide

163. (c) Pentavalency in phosphorus is more stable than that of nitrogen due to large size of phosphorus atom.

164. (b) Ammonium nitrate is neutral fertilizer.

165. (d) PH_3 insoluble in water because does not consist of hydrogen bond.

167. (a) Nitrogen react with metal to form a nitride.

169. (b) It is a salt of pyrophosphoric acid $H_4P_2O_7$.

172. (d) Copper react with conc. nitric acid to form a nitric oxide.

173. (a) N_2O on account of stimulating effect on nervous system.

174. (d) Sodium metal in liq. NH_3 solution shows strong reducing power due to solvated electron.

175. (c) $PH_3 + 4Cl_2 \rightarrow PCl_5 + 3HCl$

178. (c) Generally P_2O_5 are used as a dehydrating agent.

180. (a) Phosphorus show +5 valency.

181. (b) In the Haber process for the manufacture of NH_3 , Fe is used catalyst and Mo as a promotre.

182. (a) On adding excess of ammonium hydroxide to a copper chloride solution a deep blue solution of $[Cu(NH_3)_4]^{2+}$ ion is formed.

183. (d) $(NH_4)_2SO_4 + KCNO \rightarrow$

185. (a) Nitric acid turns the skin yellow because it reacts with protein giving a yellow compound called xanthoprotein.

186. (d) Ammonium sulphate is a nitrogenous fertilizers.

187. (d) Ammonia generally prepared by the Haber's process.

192. (a) H_3PO_2 is hypophosphorus acid

193. (c) $(NH_4)_2SO_4$ is a salt of weak base & strong acid

194. (a) One part of concentrated HNO_3 and 3 parts concentrated HCl form aquaregia.

196. (c) -3 to +5 PH_3 (-3) and H_3PO_4 (+5)

199. (b) $BiCl_5$ does not exist because +3 oxidation state of Bi is more stable than +5 due to inert pair effect.

200. (c) $H_3PO_3 \rightarrow$ Tribasic acid $\rightarrow$ 3 - OH groups are present

201. (d) $Na_2HPO_4 \rightarrow Na_2PO_4^- + H^+$

It can give H^+ ion in solution.

202. (c) $\ddot{N}H_3$ and $\ddot{P}H_3$ both are basic because of the presence of lone pair of electrons.

203. (b) $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$

Stability decreases down the group because bond energy decreases down the group.

204. (a) Nitrogen forms NH_3 which is most basic.

205. (b) H_3PO_3 is a diabasic acid. It forms two types of salts NaH_2PO_3 and Na_2HPO_3 .

206. (a) $NH_2 - CO - NH_2 + 2HNO_2 \rightarrow CO_2 + 3H_2O + 2N_2$

	I	II	III	IV	V
Element -	N	P	As	Sb	Bi
Atomic no.	7	15	33	51	83

210. (c) it is ionizes in three steps because three - OH group are present.

212. (c) $Ca_3P_2 + 3H_2O \rightarrow 3Ca(OH)_2 + 2PH_3$

213. (d) $(NH_4)_2Cr_2O_7 \rightarrow N_2 + Cr_2O_3 + 4H_2O$

214. (b) $B > P > As > Bi$

As we go down the group bond angle decreases because repulsion between bonded pairs of electron decreases.

215. (b,c) $3NH_3 + OCl^- \rightarrow NH_2 - NH_2 + NH_4Cl + OH^-$

217. (a) Acidic character of oxides decreases down the group.

218. (d) $N_7 - 1s^2, 2s^2, 2p^3$
 d -orbitals absent in second sub-shell.

220. (c) N_2 can form NCl_3 , N_2O_5 and Ca_3N_2 but does not form NCl_5 .

221. (a) Highest oxidation state is +5 which remains unchanged.

222. (a) Hypophosphorus acid (H_3PO_2) is a monobasic acid which act as reducing agent. In this molecule two $P - H$ bonds are responsible for its reducing character and one $O - H$ bond is responsible for its monobasic acid character.

223. (a) Bone black is the polymorphic form of phosphorus.

224. (b) Nitrous oxide is known as Laughing gas.

225. (a) We know that,

So nitric oxide (NO_2) is produced.

226. (d) Phosphorus exist as solid at $27^\circ C$ and 1 atmospheric pressure (m.p. of white phosphorus = $44^\circ C$)

227. (b) We know that, $4HNO_3 + P_4O_{10} \rightarrow 4HPO_3 + 2N_2O_5$ The product is dinitrogen pentaoxide (N_2O_5).

228. (b) Hypophosphorous acid is H_3PO_2 .
229. (b) $NO(g) + NO_2(g) \xrightarrow{-30^\circ C} N_2O_3(l)$
(Blue)
230. (c) The ignition temperature of black phosphorus is highest among all allotropes.
231. (a) $(NH_4)_2Cr_2O_7 \xrightarrow{\Delta} N_2 \uparrow + Cr_2O_3 + 4H_2O$
 $NH_4NO_2 \xrightarrow{\Delta} N_2 \uparrow + 2H_2O$
232. (a) Nitrogen shows +I to +V, all oxidation states.
233. (c) Boiling points of SbH_3 (254 K), NH_3 (238 K), AsH_3 (211 K) and PH_3 (185 K) therefore boiling points are of the order $SbH_3 > NH_3 > AsH_3 > PH_3$.
234. (a) Because phosphorous is most electronegative element out of P, Bi, Sb and C.
235. (d) $Ca_3(PO_4)_2 + 3SiO_2 \rightarrow 3CaSiO_3 + P_2O_5$
236. (a) When a solid compound on heating change into gaseous state without changing into liquid state, the phenomenon is known as sublimation. e.g., I_2 , NH_4Cl and camphor.
237. (b) 16 bond by its structure.
238. (d) Phosphorus is a non-metallic element. It form's acidic oxide.
239. (b) $2NO_2 + H_2O \rightarrow HNO_2 + HNO_3$
Mixed acid anhydride
240. (c) Oxidation number of As in $H_2AsO_4^-$
 $2 + x - 8 = -1$
 $x - 6 = -1$
 $x = 5$
241. (a) The inorganic nitrogen exists in the form of ammonia, which may be lost as gas to the atmosphere, may be acted upon by nitrifying bacteria, or may be taken up directly by plants.
20. (a) Paramagnetism because of two unpaired electrons in the antibonding molecular orbitals.
21. (a) $2Na_2SO_3 + O_2 \rightarrow 2Na_2SO_4$
24. (c) $3O_2 \xrightleftharpoons[\text{electric discharge}]{\text{silent}} 2O_3$
28. (b) $O_3 \rightarrow O_2 + [O]$
 $2KI + H_2O + [O] \rightarrow 2KOH + I_2$
 $2KI + H_2O + O_3 \rightarrow 2KOH + I_2 + O_2$
32. (d) $2KMnO_4 + 3H_2SO_4 + 5H_2S \rightarrow$
 $K_2SO_4 + 2MnSO_4 + 8H_2O + 5S$
33. (a) $Cu + 2H_2SO_4 \rightarrow CuSO_4 + 2H_2O + SO_2$
35. (a) The minimum and maximum oxidation number of S are -2 and +6 respectively. Since the oxidation number of S in SO_2 is +4, therefore it can be either increased or decreased. Therefore SO_2 behaves both as an oxidising as well as reducing agent.
36. (a) $2H_2S + SO_2 \rightarrow 2H_2O + 3S$
reducing agent oxidising agent
37. (d) $K_2Cr_2O_7 + H_2SO_4 + 3SO_2 \rightarrow$
 $K_2SO_4 + Cr_2(SO_4)_3 + 3H_2O$
Green
39. (a) $SO_2 + 2Mg \rightarrow 2MgO + S$
40. (a) $2H_2O + SO_2 \rightarrow H_2SO_4 + 2[H]$ (nascent hydrogen)
Coloured flower + $2[H] \rightarrow$ Colourless flower
41. (c) $H_2SO_3 + 2NaOH \rightarrow Na_2SO_3 + 2H_2O$
Sodium sulphite
42. (a) $H_2O + SO_3 \rightarrow H_2SO_4$
43. (d) $H_2SO_4 + SO_3 \rightarrow H_2S_2O_7$
(oleum)
45. (b) $2Ag + 2H_2SO_4 \rightarrow Ag_2SO_4 + 2H_2O + SO_2$
Reducing agent Oxidising agent
46. (a) Only dehydrating agent
 $HCOOH \xrightarrow{H_2SO_4} CO + H_2O$
48. (b) $COOH \xrightarrow{\text{conc. } H_2SO_4} H_2O + CO + CO_2$
|
COOH
51. (d) $H_2SO_4 + SO_3 \rightarrow H_2S_2O_7$
(Oleum or Fuming H_2SO_4)
53. (d) $S_2O_7^{2-}$
 $\begin{array}{c} O \quad O \\ || \quad || \\ ^-O-S-O-S-O^- \\ || \quad || \\ O \quad O \end{array}$

Oxygen family

2. (c) Sulphur –
(1) Monoclinic (2) Rhombic (3) Plastic
4. (c) $S + O_2 \rightarrow SO_2$
5. (a) $\frac{1}{8}S_8 + 2e^- \rightarrow S^{2-}$
6. (c) $2H_2O + 2F_2 \rightarrow 4HF + O_2$
9. (b) $O_8 - \begin{array}{c} 1s^2 \quad 2s^2 \quad 2p^4 \\ \boxed{\uparrow\downarrow} \quad \boxed{\uparrow\downarrow} \quad \boxed{\uparrow\downarrow} \end{array}$
2 unpaired electrons
11. (a) Element – O S Sc Te Po
Electronegativity – 3.5 2.5 2.4 2.1 2.0
13. (b,c) $Na_2SO_3 + H_2SO_4 \rightarrow Na_2SO_4 + H_2O + SO_2$
(s) (aq) (aq) (l) (g)
15. (d) H_2O H_2S H_2Se H_2Te
104.5° 92.1° 91° 90°
As we go down the group electronegativity decreases due to which repulsion between bonded pairs of electron also decreases. Hence, bond angle decreases.
55. (d) $Na_2SO_3 + S \rightarrow Na_2S_2O_3$
56. (b) $Na_2S_2O_3 + Cl_2 + H_2O \rightarrow Na_2SO_4 + 2HCl + S$
58. (c) $AgBr + 2Na_2S_2O_3 \rightarrow Na_3[Ag(S_2O_3)_2] + NaBr$
60. (a) $SO_2 + 2H_2S \rightarrow 3S + 2H_2O$
63. (a) $2H_2S + O_2 \rightarrow 2H_2O + 2S$
64. (a) Mixture of $K_2Cr_2O_7$ and conc. H_2SO_4 is known as chromic acid.

65. (c) H_2O contain hydrogen bond while no hydrogen bonding is present in H_2S .
67. (a) H_2O containing hydrogen bond.
69. (c) $HO-SO_2-OH + PCl_5 \rightarrow Cl-SO_2-OH + POCl_3$
 $HO-SO_2-OH + 2PCl_5 \rightarrow Cl-SO_2-Cl + 2POCl_3 + 2HCl$
 Sulphuryl chloride
70. (d) Mixture of O_2 and CO_2 .
71. (c) The bond between (H_2Te) is weakest hence it gives H^+ ion easily.
73. (c) KO_2 because in O_2^- (superoxide ion) One unpaired electron is present in the antibonding orbital.
75. (b) Oxidation states are 2, 4, 6
77. (b) H_2O H_2S H_2Se H_2Te
 373K 213K 269K 232K
 H_2S has lowest boiling point and H_2O has highest boiling point because if any compound has hydrogen bond. Its boiling point is high.
78. (c) V_2O_5 catalyst are used for the manufacture of H_2SO_4 by Contact process.
81. (d) O, S, Se shows polymorphism.
84. (e) $H_2S + 2HNO_3 \rightarrow 2NO_2 + S + 2H_2O$.
85. (b) O_2F_2 is similar to that of H_2O_2

87. (d) 16th group called chalcogens (oxygen family) while Na is a 1st group element which is called alkali metal.
90. (b) Caro's acid (H_2SO_5)
91. (c) $2KO_2 + CO_2 \rightarrow K_2CO_3 + \frac{3}{2}O_2$
93. (a) H_2O consist of highest boiling point than other hydride (Due to presence of the hydrogen bonding).
94. (b) Lose of electron.
95. (c) SO_2 is soluble in water
 $H_2O + SO_2 \rightarrow H_2SO_3$
 Sulphurous acid
96. (c) $2Na_2O_2 + 2H_2O \rightarrow 4NaOH + O_2$.
 In this reaction oxygen (O_2) is formed.
97. (b) $3S + 4NaOH \xrightarrow{\text{boiling}} Na_2S_2O_3 + Na_2S$
98. (c) Quartz is a crystalline variety of silica.
99. (b) 98% H_2SO_4 is used for absorbing dense fog of acid which is formed by dissolving SO_3 in water. Hence 98% H_2SO_4 is the most efficient agent for the absorption of SO_3 .
100. (b) Concentrated H_2SO_4 is diluted by adding the conc. H_2SO_4 in the water drop by drop with constant stirring because it is

an exothermic reaction and by doing so heat is generated slowly and dissipated in the atmosphere.

101. (a) Photochemical smog is caused by oxides of sulphur and nitrogen.
102. (d) SO_2 act as bleaching agent due to its reducing property.
 $SO_2 + 2H_2O \rightarrow H_2SO_4 + 2H$
 Coloured matter + $H \rightarrow$ Colourless matter
103. (b) Ozone on treatment with SO_2 produce SO_3 .
 $3SO_2 + O_3 \rightarrow 3SO_3$
104. (b) PbO_2 is a powerful oxidizing agent and liberate O_2 when treated with acids SO, O_2 gas will be evolved.
105. (c) Dithionous acid ($H_2S_2O_4$) has sulphur in +3 oxidation state.

106. (a) SO_2 acts as an oxidising agent particularly when treated with stronger reducing agents. SO_2 oxidises H_2S into S .
107. (a) R_3SiCl on hydrolysis forms only a dimer.
 $R_3SiOH + HOSiR_3 \rightarrow R_3Si-O-SiR_3$.
108. (d) Formation of chlorine nitrate is the main cause of ozone depletion.

Halogen family

1. (b) $HF > HCl > HBr > HI$ (Thermal stability).
2. (a) $CHCl_3 + \frac{1}{2}O_2 \rightarrow COCl_2 + HCl$
 Phosgene or carbonyl chloride
3. (d) Iodine has the least affinity for water and is only slightly soluble in it. However, it dissolves in 10% aq. solution of KI due to the formation of a complex ion i.e. I_3^- .
 $I_2 + KI \rightleftharpoons KI_3$ or $I_2 + I^- \rightleftharpoons I_3^-$ (complex ion)
4. (c) $2Na_2S_2O_3 + I_2 \rightarrow 2NaI + Na_2S_4O_6$
5. (a) $Cl_2 + 2KBr \rightarrow 2KCl + Br_2$
 A more electronegative halogen can displace less electronegative halogen.
6. (a) HI is the strongest reducing agent among halogen acids because of lowest bond dissociation energy.
8. (a) Due to H-Bonding free ions are not present in aq. solution. Hence, bad conductor.
9. (c) Electronegativity of I_2 is less than Br_2 . Therefore unable to displace bromine.
10. (b) Carnallite is $KCl \cdot MgCl_2 \cdot 6H_2O$. The mother liquor left after crystallisation of KCl from carnallite contain about 0.25% of bromine as $MgBr_2$ and KBr .
11. (a) HF is liquid because of intermolecular H-Bonding.
12. (a) $HClO \rightleftharpoons H^+ + ClO^-$
 Weak acid Strong conjugate base
13. (d) $2NaOH + Cl_2 \xrightarrow{\text{Cold (dil.)}} NaCl + NaClO + H_2O$
 Sod. hypochlorite

15. (b) $6\text{NaOH} + 3\text{Cl}_2 \xrightarrow{\text{heat}} 5\text{NaCl} + \text{NaClO}_3 + 3\text{H}_2\text{O}$
(conc.) Sodium chlorate
17. (a) HF is the weakest acid. Since it is unable to give H^+ ions which are trapped in H-Bonding.
18. (b) Hydride – HF HCl HBr HI
B.pt (in K) – 293 189 206 238
Because of having low b.p. HCl is more volatile.
19. (a) $2\text{KClO}_3 + \text{I}_2 \rightarrow 2\text{KIO}_3 + \text{Cl}_2$
20. (c) $2\text{Na}_2\text{S}_2\text{O}_3 + \text{I}_2 \rightarrow 2\text{NaI} + \text{Na}_2\text{S}_4\text{O}_6$
21. (d) $2\text{KMnO}_4 + 16\text{HCl} \rightarrow 2\text{KCl} + 2\text{MnCl}_2 + 5\text{Cl}_2 + 8\text{H}_2\text{O}$
22. (a) $\begin{matrix} +7 & +5 & +3 & +1 \\ \text{HClO}_4 & > & \text{HClO}_3 & > & \text{HClO}_2 & > & \text{HClO} \end{matrix}$
As the oxidation no. of halogen increases acidic character increases.
25. (c) $2\text{KBr} + 3\text{H}_2\text{SO}_4 + \text{MnO}_2 \xrightarrow{\Delta} 2\text{KHSO}_4 + \text{MnSO}_4 + 2\text{H}_2\text{O} + \text{Br}_2$
29. (b,d) Electron affinity of Cl is maximum

Element –	F	Cl	Br	I
E.A. kJ/mole –	332.6	348.5	324.7	295.5
Boiling pt ($^\circ\text{C}$)	–188.1	–34.6	59.5	185.2
32. (a) $\text{Cl}_2 + 2\text{NaBr} \rightarrow 2\text{NaCl} + \text{Br}_2$
33. (d) $\text{CCl}_4 + \text{H}_2\text{O} \rightarrow \text{No reaction}$
 d -orbitals are absent in carbon atom.
34. (a) $\text{I}_2 + 10\text{HNO}_3 \rightarrow 2\text{HIO}_3 + 10\text{NO}_2 + 4\text{H}_2\text{O}$
35. (d) $\text{KI} + \text{I}_2 \rightarrow \text{KI}_3$
36. (a) $2\text{KBr} + \text{H}_2\text{SO}_4 \rightarrow \text{K}_2\text{SO}_4 + 2\text{HBr}$
37. (b) $\text{H}_2 + \text{F}_2 \rightarrow 2\text{HF}$
42. (b) $\text{CuSO}_4 + 2\text{KI} \rightarrow \text{CuI}_2 + \text{K}_2\text{SO}_4$
 $2\text{CuI}_2 \rightarrow 2\text{CuI} + \text{I}_2$
Cuprous iodide
43. (d) As the atomic number increases electronegativity decreases. Hence, tendency to gain electron decreases.
51. (a) $\text{F}_2 + 2\text{Cl}^- \rightarrow \text{Cl}_2 + 2\text{F}^-$
 $\text{F}_2 + 2\text{Br}^- \rightarrow \text{Br}_2 + 2\text{F}^-$
 $\text{F}_2 + 2\text{I}^- \rightarrow \text{I}_2 + 2\text{F}^-$
53. (d) $\text{Br}_2 + 2\text{KI} \rightarrow \text{I}_2 + 2\text{KBr}$
56. (d) $2\text{F}_2 + 2\text{H}_2\text{O} \rightarrow 4\text{HF} + \text{O}_2$
 $3\text{F}_2 + 3\text{H}_2\text{O} \rightarrow 6\text{HF} + \text{O}_3$
58. (c) $2\text{NaCl} + 2\text{H}_2\text{O} \rightarrow 2\text{NaOH} + \text{Cl}_2 + \text{H}_2$
(anode) (cathode)
Reduction
59. (a) $\text{MnO}_2 + 4\text{HCl} \xrightarrow{\begin{smallmatrix} +4 \downarrow & +2 \downarrow \\ \text{Reduction} \end{smallmatrix}} \text{MnCl}_2 + 2\text{H}_2\text{O} + \text{Cl}_2$
61. (b) $2\text{NaCl} + 2\text{H}_2\text{O} \xrightarrow{\text{Electrolysis}} 2\text{NaOH} + \text{Cl}_2 + \text{H}_2$
(aq) (g) (g)
62. (c) $\text{H}_2\text{O} + \text{Cl}_2 \rightarrow \text{HCl} + \text{HClO}$
Exposed to air
 $\text{HClO} \rightarrow \text{HCl} + [\text{O}]$ or $2\text{HClO} \rightarrow 2\text{HCl} + \text{O}_2$
63. (a) $2\text{NaOH} + \text{Cl}_2 \rightarrow \text{NaClO} + \text{NaCl} + \text{H}_2\text{O}$
66. (b) $\text{Cl}_2 + \text{H}_2\text{O} \rightarrow 2\text{HCl} + [\text{O}]$ Nascent oxygen
Coloured + $[\text{O}]$ $\xrightarrow[\text{agent}]{\text{Bleaching}}$ Colourless flower (Oxidized)
68. (b) $\text{CaO} + \text{Cl}_2 \rightarrow \text{CaOCl}_2$
 $\text{NaHCO}_3 + \text{Cl}_2 \rightarrow \text{No reaction}$
69. (c) $\text{Ca}(\text{OH})_2 + \text{Cl}_2 \rightarrow \text{CaOCl}_2 + \text{H}_2\text{O}$
Slaked lime
71. (b) $\text{MgBr}_2 + \text{Cl}_2 \rightarrow \text{MgCl}_2 + \text{Br}_2$
72. (a) $\text{Cl}_2 + 2\text{Br}^- \rightarrow 2\text{Cl}^- + \text{Br}_2$
73. (a) $\text{KI} + \text{H}_2\text{SO}_4 \xrightarrow{\text{Conc.}} \text{KHSO}_4 + \text{HI}$
Conc. $\text{H}_2\text{SO}_4 + 2\text{HI} \rightarrow 2\text{H}_2\text{O} + \text{I}_2 + \text{SO}_2 \uparrow$
Violet vapour
74. (b) $2\text{NaI} + \text{Cl}_2 \rightarrow 2\text{NaCl} + \text{I}_2$
 $\text{CCl}_4 + \text{I}_2 \rightarrow \text{Violet colour}$
76. (b) $\text{KI} + \text{H}_2\text{SO}_4 \xrightarrow{\Delta} \text{KHSO}_4 + \text{HI}$
 $\text{H}_2\text{SO}_4 + 2\text{HI} \rightarrow 2\text{H}_2\text{O} + \text{I}_2 + \text{SO}_2 \uparrow$
Violet vapour
79. (c) $\text{KI} + \text{H}_2\text{SO}_4 \rightarrow \text{KHSO}_4 + \text{HI}$
 HI is formed but it is further oxidised by conc. H_2SO_4 into I_2
 $2\text{HI} + \text{H}_2\text{SO}_4 \rightarrow 2\text{H}_2\text{O} + \text{I}_2 + \text{SO}_2 \uparrow$
Violet vapour
80. (b) $\text{HCl} \xrightarrow{\text{H}_2\text{O}} \text{H}^+ + \text{Cl}^-$
(aq) (aq)
81. (b) $4\text{NaCl} + \text{K}_2\text{Cr}_2\text{O}_7 + 3\text{H}_2\text{SO}_4 \rightarrow \text{K}_2\text{SO}_4 + 2\text{Na}_2\text{SO}_4 + 2\text{CrO}_2\text{Cl}_2 + 3\text{H}_2\text{O}$
Chromyl chloride
82. (c) Hydrogen bonding is absent in HI while it is present in NH_3 , H_2O and $\text{C}_2\text{H}_5\text{OH}$.
84. (d) In case of HI due to large size of iodine strong Vander Waal forces are present. Hence, it has highest molar heat of vaporisation.
85. (d) HI is strongest acid because $\text{H}-\text{I}$ bond is weakest among halogen acids.
86. (a) In HF the molecules aggregate because of intermolecular hydrogen bonding. Hence, it has highest boiling point.
88. (a) ClO_2^- has sp^3 -hybridization and two lone pairs on halogen which produces V-shape Bent structure
- $\begin{array}{c} \cdot\cdot \\ \text{Cl} \\ \cdot\cdot \end{array} \begin{array}{l} \diagup \\ \diagdown \end{array} \begin{array}{l} \text{O} \\ \text{O} \end{array}$
89. (d) $2\text{HClO}_4 \rightarrow \text{H}_2\text{O} + \text{Cl}_2\text{O}_7$.
90. (b) F_2 } gases
 Cl_2 }
 Br_2 } liquid
 I_2 } solid

As we go down the group Vander Waal forces increases. Hence, physical state changes.

92. (c) F can not act as reducing agent because it has highest reduction potential

93. (c) $I_2 + 10HNO_3 \rightarrow 2HIO_3 + 10NO_2 + 4H_2O$

94. (a) $IF_5 + F_2 \rightarrow IF_7$.

95. (a) Pseudohalide ions and Pseudohalogens

There are certain monovalent negative ions made up of two or more electronegative atoms which exhibit properties similar to these of halide ions. Such ions are known as pseudo halide ions just as halide ions, pseudo halide ions have also corresponding dimorphic molecules. These are called pseudo halogens and show properties similar to those of halogens.

Pseudohalide Pseudohalogens
 CN^- cyanide $(CN)_2$ Cyanogen

SCN^- Thiocyanate $(SCN)_2$ Thiocyanogen

96. (c) NaF is highest melting halide because it is most ionic in nature.

98. (b) $2F_2 + 2H_2O \rightarrow 4HF + O_2$

99. (c) $CaOCl_2 \rightarrow CaCl_2 + [O]$ Nascent oxygen

100. (a) Generally alkali metals and alkali earth metals elements extracted by the fused electrolysis method.

102. (c) $2Na_2S_2O_3 + I_2 \rightarrow 2NaI + Na_2S_4O_6$.

104. (b) Beilstein test – In this test organic compound is heated on a copper wire in a flame. The appearance of a green or bluish green flame due to the formation of volatile cupric halides indicate the presence of halogens in the organic compound. (It does not tell which halogen is actually present).

105. (d) $Cl_2 + 2KBr \xrightarrow{\text{Reduction}} Br_2 + 2KCl$

107. (b) $3HCl + \xrightarrow[\text{Oxidation}]{HNO_3} NOCl + 2H_2O + Cl_2$.

108. (a) $Cl - Cl \xrightarrow{\text{U.V.}} \underset{\text{Free radical}}{Cl} + \underset{\text{Free radical}}{Cl}$

109. (a) HF is a weak acid due to intermolecular hydrogen bonding.

110. (a) Acidic nature of oxide $\propto$ Non metallic nature of element
Non metallic nature decrease in the order $Cl > S > P$.

111. (c) Aqua regia is 1 part of HNO_3 and 3 part of HCl .

113. (a) AgI is a covalent compound.

114. (a) Bromine is a liquid at room temperature.

115. (a) $Cl_2 + H_2O \rightarrow 2HCl + \underset{\text{Nascent oxygen}}{[O]}$

117. (b) The enamel of our teeth is the hardest substance in the body made up of CaF_2 and dentine below it made of $Ca_3(PO_4)_2$.

118. (b) As the electronegativity decreases reactivity also decreases.

119. (b) $KI + I_2 \rightarrow \underset{\text{(soluble complex)}}{KI_3}$

121. (d) $HI < I_2 < \underset{-1}{ICl} < \underset{0}{ICl} < \underset{+1}{HIO_4} < \underset{+7}{HIO_4}$

122. (a) $HF < HCl < HBr < HI$

As we go down the group bond energy decreases hence, acidic nature increases.

123. (b) Caliche is crude chile salt petre ($NaNO_3$) which contains about 0.02% iodine as sodium iodate ($NaIO_3$).

124. (a) $LiF > LiCl > LiBr > LiI$

Lattice energy depends on the size and charge of the ion.

125. (a) $F-F$ more strong bond compare to $F-Cl$, $F-Br$ and $Cl-Br$ bond.

126. (c) $2Na_2S_2O_3 + I_2 \rightarrow Na_2S_4O_6 + 2NaI$.

127. (d) $CaCl(OCl) \Rightarrow Ca \begin{matrix} \swarrow Cl \\ \searrow O-Cl \end{matrix}$

128. (a) $2NaOH + Cl_2 \rightarrow \underset{Na^+ + Cl^-}{NaCl} + \underset{Na^+ + OCl^-}{NaOCl} + H_2O$

131. (d) $I_2 + NaF \longrightarrow$
 $I_2 + NaBr \longrightarrow$
 $I_2 + NaCl \longrightarrow$ } No reaction

Because I_2 is least electronegative among halogens.

132. (a) $HClO_4 > HCl > H_2SO_4 > HNO_3$

Decreasing order of acidic character.

134. (a) $HgCl_2 + Hg(CN)_2 \rightarrow HgCl_2 \cdot Hg(CN)_2$
Mercuric chloride Mercuric cyanide

135. (a) $HI > HBr > HCl > HF$
Acidic character decreasing order.

136. (c) $Ca(OH)_2 + Cl_2 \rightarrow CaOCl_2 + HOCl$
Slaked lime Bleaching poeder

137. (d) $K_2Cr_2O_7 + 14HCl \rightarrow 2KCl + 2CrCl_3 + 7H_2O + 3Cl_2$

139. (d) Fluorine does not gives positive oxidation state it is always show -1 oxidation state.

140. (a) $\overset{+7}{HClO_4} > \overset{+5}{HClO_3} > \overset{+3}{HClO_2} > \overset{+1}{HCl}$

141. (d) $Ca(OH)_2 + Cl_2 \rightarrow CaOCl_2 + H_2O$
bleaching powder

146. (a) $F_2 + (dil.) 2NaOH \rightarrow 2NaF + OF_2 + H_2O$

147. (a) Fluorine can not be oxidised by even strongest oxidising agent.

148. (b) $Br_2 + 2H_2O + SO_2 \rightarrow H_2SO_4 + 2HBr$

149. (c) $2KBr + I_2 \rightarrow 2KI + Br_2$

Iodine is a less electronegative compare to Bromine hence iodine does not change Br^- to Br_2 .

150. (a) CaI_2 are show covalent properties than other CaF_2 , $CaCl_2$, $CaBr_2$ compound.

151. (d) $2KMnO_4 + 3H_2SO_4 + 10HCl \rightarrow K_2SO_4 + 2MnSO_4 + 8H_2O + 5Cl_2$

153. (d) PbI_4 is least stable because of two reasons

- (1) Size of iodine is biggest.
(2) $+2$ oxidation state of Pb is more stable than $+4$ state because of inert pair effect.

154. (a) $Cl_2 + NaF \rightarrow$ No reaction

Since Cl_2 is less electronegative then F_2 . Therefore unable to displace fluorine from its salt.

156. (b) $CS_2 + 3Cl_2 \xrightarrow{I_2} CCl_4 + S_2Cl_2$

157. (b) According to the Fajan's rule largest cation and smallest anion.

158. (a) $2F_2 + 4NaOH \rightarrow 4HF + 2H_2O + O_2$

159. (c) $\underset{1 \text{ mole}}{Cl_2} \rightarrow \underset{2 \text{ moles}}{2Cl} \Delta H = +ve$

High temperature and low pressure is favourable.

160. (d) BF_3 accept lone pair of electrons.
161. (d) CrO_2Cl_2 is a orange red gas.
164. (a) Fluorine always show -1 oxidation state.
165. (a) Solid NaF is used to purify fluorine *i.e.* by removing of HF fumes.
166. (c) $KHF_2 \rightarrow KF + HF$
 $KF \rightarrow K^+ + F^-$
 At cathode : $K^+ + e^- \rightarrow K$
 $2K + 2HF \rightarrow 2KF + H_2$
 At anode : $F^- \rightarrow F + e^-$
 $F + F \rightarrow F_2$
168. (c) Small atomic size of Li and F lattice energy is highest.
169. (b) SO_2 bleaches flower by reduction
 $2H_2O + SO_2 \rightarrow H_2SO_4 + 2[H]$
 $2[H] + \text{Coloured flower} \xrightarrow{\text{Reduction}} \text{Colourless reduced flower}$
 This bleaching is temporary because reduced flower again oxidised by air to form coloured flower
 $Cl_2 + H_2O \rightarrow 2HCl + [O]$
 $[O] + \text{Coloured flower} \xrightarrow{\text{Oxidation}} \text{Colourless Oxidised flower}$
 This bleaching is permanent because oxidised flower remains colourless.
170. (a) Fluorine does not form oxyacids because it is more electronegative than oxygen.
173. (c) $MnO_2 + 4HCl \rightarrow MnCl_2 + 2H_2O + Cl_2$
 $2KMnO_4 + 3H_2SO_4 + 10HCl \rightarrow$
 $K_2SO_4 + 2MnSO_4 + 8H_2O + 5Cl_2$
175. (b) $3KClO_3 + 3H_2SO_4 \xrightarrow{\text{Heat}}$
 $3KHSO_4 + HClO_4 + 2ClO_2 + H_2O$
176. (b) $F > Cl > Br > I$. As the size increases electronegativity decreases.
177. (c) Ionic radius increases on going down the group because no. of shells increases.
178. (b) Reducing properties increase from F to I so it oxidise by nitric acid.
 $I_2 + 10HNO_3 \rightarrow 2HIO_3 + 10NO_2 + 4H_2O$
179. (a) Fluorine and chlorine are more electronegative than sulphur.
180. (d) Upper halogen can replace lower halogen from their compounds solution.
181. (a) Iodine (I_2) is slightly soluble in water but it dissolves in 10% aqueous solution of KI due to the formation of potassium triiodide (KI_3).
182. (a) Due to highest electronegativity of fluorine the anion $[F---H-F]^-$ exists as a result of strong hydrogen bond by which K^+ associate to form KHF_2 .
183. (a) Fluorine is the most electronegative element. It does not form oxyfluorides like other halogens. If reacts with $NaOH$ to form sodium fluoride and oxygen fluoride.
 $2NaOH + 2F_2 \rightarrow 2NaF + OF_2 + H_2O$

184. (c) Due to unpaired e^- ClO_2 is paramagnetic.
185. (a) Oxidation number of $HBrO_4$ is more than that of $HOCl$, HNO_2 and H_3PO_3 so it is the strongest acid among these.
186. (a) Chlorine heptachloride (Cl_2O_7) is the anhydride of perchloric acid.
 $2HClO_4 \xrightarrow{\Delta} Cl_2O_7 + H_2O$
187. (c) I_2 forms complex ion I_3^- in KI solution due to which it dissolves in it.

Noble gases

3. (a) Gas — H_2 O_2 He N_2
 Mol. mass — 2 32 4 28
5. (c) Helium (In Greek Helios = Sun)
6. (d) All the noble gases are monoatomic, colourless and odourless gases. Their monoatomic nature is due to the stable outer configuration ns^2np^6 of their atoms. As a result, they do not enter into chemical combination even amongst themselves.
7. (c) Except He , all other noble gases are adsorbed by coconut charcoal at low temperatures. The extent of adsorption increases as the atomic size of the noble gas increases.
10. (b) An oxygen-helium mixture is used artificial respiration in deep sea diving instead of air because nitrogen present in air dissolves in blood under high pressure when sea diver goes into deep sea. When he comes to the surface, nitrogen bubbles out of the blood due to decrease in pressure, causing pains. This disease is called "bends".
11. (c) XeF_2 , $XeOF_2$, XeF_4 , $XeOF_4$, XeF_6 , XeO_3 .
12. (c) **Gas** (Abundance in air by volume (ppm))

Helium	5.2
Neon	18.2
Argon	93.4
Krypton	1.1
Xenon	0.09
13. (c) Neon $\rightarrow Ne$ is monoatomic and others are diatomic N_2 , F_2 and O_2 .
14. (c) ${}_1H^2 + {}_1H^2 \rightarrow {}_2He^4$
15. (b) HeF_4 does not exist.
16. (d) $Ar_{18} \rightarrow 2, 8, 8$
17. (b) $Ne_{10} \rightarrow 1s^2 2s^2 2p^6$
23. (d) XeF_2 has sp^3d -hybridization with linear shape

$$\begin{array}{c} F \\ | \\ : - Xe : \\ | \\ F \end{array}$$
24. (b) Partial hydrolysis; $XeF_4 + H_2O \rightarrow XeOF_2 + 2HF$
 Complete hydrolysis;
 $2XeF_4 + 3H_2O \rightarrow Xe + XeO_3 + F_2 + 6HF$
26. (d) He is least polarizable because of small atomic size.
27. (a) Rn because it is radioactive element obtained by the disintegration of radium

Critical Thinking Questions

13. (d) The composition of the common glass is $\text{Na}_2\text{O} \cdot \text{CaO} \cdot 6\text{SiO}_2$.
14. (c) Lead form nitric oxide with dil. HNO_3
 $3\text{Pb} + 8\text{HNO}_3 \rightarrow 3\text{Pb}(\text{NO}_3)_2 + 2\text{NO} + 4\text{H}_2\text{O}$
15. (b)  Therefore, total number of lone pair of electron on central atom Xenon = 1
16. (d) Order of acidic strength is $\text{H}_2\text{Te} > \text{H}_2\text{Se} > \text{H}_2\text{S} > \text{H}_2\text{O}$
 Na_2O is a salt of $\text{NaOH} + \text{H}_2\text{O}$ and H_2O is least acidic among given acids hence pH in this case will be maximum.
17. (a) HNO_3 is the strong oxidising acid so it react with alkali while rest can be react with both and alkali.
18. (d) Zero group is called a buffer group because it lies between highly electronegative halogens and highly electropositive alkali metal element.
19. (c) PbSO_4 is insoluble in water.
20. (a) N_2O_5 is most acidic.
21. (b) Element – Fluorine Chlorine Bromine Iodine
 B.E. in kJ mole – 158.8 242.6 192.8 151.1
22. (d) $\text{CaCN}_2 + 3\text{H}_2\text{O} \xrightarrow[\text{pressure}]{\text{under}} \text{CaCO}_3 + 2\text{NH}_3$.
23. (a) $6\text{O}_2 \xrightarrow{\text{Ozonolysis}} 4\text{O}_3$
 Complete ozonolysis gives 4 volume of ozone.
24. (b) Marble statue $\rightarrow \text{CaCO}_3$; Calcinated Gypsum $\rightarrow \text{CaSO}_4 \cdot 2\text{H}_2\text{O}$; Sea shell $\rightarrow \text{CaCO}_3$; Dalomite $\rightarrow \text{CaCO}_3 \cdot \text{MgCO}_3$.
25. (b) Sodium is basic in nature.
26. (c) $\text{I}_2 + \text{I}^- \rightarrow \text{I}_3^-$
27. (a) The hydration energy decreases from Be^{+2} to Ba^{+2} . This causes the decrease in the solubilities of the sulphates in this order. In other words, the solubilities decreases with increase in the ionic size.
28. (d) $2\text{Mg} + \text{O}_2 \rightarrow 2\text{MgO}$
 $3\text{Mg} + \text{N}_2 \rightarrow \text{Mg}_3\text{N}_2$
29. (a) $\text{ZnO} + \text{BaO} \xrightarrow{1100^\circ\text{C}} \text{BaZnO}_2$
30. (b) There are no free electron in N_2O_4 , so it is diamagnetic in nature.
31. (b) $\text{CaSO}_4 \cdot 2\text{H}_2\text{O} \xrightarrow{120^\circ\text{C}} \text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O} + 1\frac{1}{2}\text{H}_2\text{O}$
 Gypsum Plaster of paris
32. (d) Third alkaline earth metal is calcium $_{20}\text{Ca}^{40}$.
 No. of electron are 20 & No. of proton are 20; e/20, p/20.
33. (a) In the compounds of alkaline earth metals all the electrons are paired. Hence, they are diamagnetic in nature.
34. (a) Mixture of helium and oxygen is used in artificial respiration.
35. (a) Alkaline solution of pyrogallol quickly absorbs oxygen.
36. (d) $\text{NH}_4\text{NO}_2 \rightarrow \text{N}_2 + 2\text{H}_2\text{O}$
 $2\text{NaN}_3 \rightarrow 2\text{Na} + 3\text{N}_2$
 $(\text{NH}_4)_2\text{Cr}_2\text{O}_7 \rightarrow \text{N}_2 + \text{Cr}_2\text{O}_3 + 4\text{H}_2\text{O}$
37. (b) Because yellow phosphorus is most reactive form of phosphorus and is highly polymerised.
38. (c) Carbon has 2 electrons in their penultimate shell configuration so due to d-orbital in penultimate shell is false statement.
39. (d) All other oxides of nitrogen except N_2O and NO are acidic in nature.
40. (a) $\text{PbCl}_4 < \text{PbCl}_2 < \text{CaCl}_2 < \text{NaCl}$ is the increasing order of ionic character.
41. (a) $\text{Si} + 3\text{HCl} \rightarrow \text{SiHCl}_3 + \text{H}_2$
 siliconchloroform
42. (a) KO_2 is used in oxygen cylinder because it absorbs CO_2 and increases O_2 content. Super oxides reacts with water to give H_2O_2 & O_2 .
43. (d) NaHCO_3 and Na_2CO_3 decomposes to give CO_2 which extinguish fire.
44. (d) CaF_2 is insoluble in water.
45. (a) PCl_3 is most acidic.
46. (b) $\text{CsCl} > \text{KCl} > \text{NaCl} > \text{LiCl}$
47. (d) $2\text{Na}_2\text{S}_2\text{O}_3 + \text{I}_2 \rightarrow \text{Na}_2\text{S}_4\text{O}_8 + 2\text{NaI}$.
48. (b) In general, higher the oxidation state, more is the covalent character of the oxide. I_2O_7 & I_2O_5 do not exist. I_2O_4 is ionic in nature. It is infact iodyl iodate $[\text{IO}]^+[\text{IO}_3]^-$. The only covalent oxide is I_2O_5 .
49. (b) LiAlH_4 act as reducing agent
 $\text{CH}_3\text{CHO} + 2\text{H} \xrightarrow{\text{LiAlH}_4} \text{CH}_3\text{CH}_2\text{OH}$
50. (c) When conc. HCl react with potassium chlorate to gives $\text{Cl}_2 + \text{ClO}_2$.
51. (c) $2\text{H}_2\text{S} + \text{SO}_2 \rightarrow 2\text{H}_2\text{O} + 3\text{S}$
52. (b) Lithium nitrate on heating gives
 $4\text{LiNO}_3 \xrightarrow[\text{(S)}]{\Delta} 2\text{Li}_2\text{O} + 4\text{NO}_2 \uparrow + \text{O}_2 \uparrow$
 (S)
53. (d) $\text{CaCO}_3 > \text{NaHCO}_3 > \text{KHCO}_3$ is the Increasing order of solubility.
54. (c) Nitrolim is $\text{CaCN}_2 + \text{C}$.
55. (a) The oxidation state of halogens is same +1. Therefore the acidic character depends only upon the electronegativity. Higher the electronegativity of the halogen more easily it will pull the electrons of O-H bond toward itself and hence, stronger is the acid.
56. (c) Iridium $[\text{I}, Z = 77]$ is not belong to noble gas.
57. (c) Name and basicity of H_3PO_2 is hypophosphorus acid & one.
58. (c) In NO_2 there are free electron so it is paramagnetic in nature.
59. (a) Nessler's reagent is K_2HgI_4 .
60. (b) Helium was firstly discovered by willium Ramsay.
61. (c) 1.66 Since inert gases are monoatomic.
62. (c) In this reaction, phosphorus is simultaneously oxidised to NaH_2PO_2 and reduced to PH_3 . Hence this reaction is an example of disproportionation.

63. (c) Reduction is accompanied by an increase in oxidation number of the reducing agent. C belong to IVA so the max.-O.N. is +4. In CO_2 the oxidation number of C is +4, which cannot be further increased. Hence, CO_2 can not act as reducing agent.
64. (b) When silicon tetra fluoride reacts with water H_2SiF_6 and H_4SiO_6 are formed
- $$\underset{\text{Silicon tetrafluoride}}{3\text{SiF}_4} + \underset{\text{Water}}{4\text{H}_2\text{O}} \rightarrow 2\text{H}_2\text{SiF}_6 + \underset{\text{Whitesilicic acid}}{\text{H}_4\text{SiO}_4}$$
65. (a) $4\text{O}_3 + 6\text{I}_2(\text{dry}) \rightarrow 3\text{I}_4\text{O}_4$
66. (c) $\text{Na}(\text{NH}_4)\text{HPO}_4 \cdot 4\text{H}_2\text{O}$ (Microcosmic salt)
67. (b) Thermite mixture $\text{Fe}_2\text{O}_3 + \text{Al}$
68. (d) The colour of liquid O_2 is pale blue.
69. (a) Helium is not soluble in blood even under high pressure, a mixture of 80% helium and 20% oxygen is used instead of ordinary air by sea divers for respiration.
70. (a) $\text{Mg}_3\text{N}_2 + 6\text{H}_2\text{O} \rightarrow 3\text{Mg}(\text{OH})_2 + 2\text{NH}_3$
71. (a) Calcium cyanamide on treatment with steam produce $\text{CaCO}_3 + \text{NH}_3$.

Assertion & Reason

1. (b) Sulphate is estimated as BaSO_4 because of high lattice energy in a group.
2. (b) Fluorine is a strong oxidising agent than other halogens due to highest electronegativity..
3. (a) In HNO_3 due to presence of two N-O bonds it is a stronger acid than HNO_2 .
6. (c) Bleaching action of chlorine carried by oxidation while bleaching action of SO_2 carried by reduction.
7. (b) On heating its outermost electron transits to next energy level by which it become more reactive.
10. (a) K and Cs emit electrons on exposure of light due to low ionisation potential.
11. (e) The lower value of bond dissociation energy of F-F bond due to longer inter electronic (electron - electron) repulsion between the non-bonding electrons in the 2p orbitals of fluorine atom.
12. (a) It is fact that halogens are highly reactive as they have seven electrons in their outermost orbit and they want to stabilize by acquiring an electron. Therefore, they do not occur in free state. Here both assertion and reason are true and the reason is the correct explanation of assertion.
13. (a) Lithium forms lithium oxide. This is due to the fact that Li^+ ion has smallest size and it has a strong positive field around it. Therefore, it stabilize O^{2-} ion with strong negative field around it. Thus, both assertion as well as reason are true.
14. (a) Liquid NH_3 is used for refrigeration is true and it is due to the fact that it vaporises quickly and for vaporisation it takes up heat and cool the refrigerator. Hence assertion and reason both are true.
15. (a) It is true that $\text{Al}(\text{OH})_3$. The reason is that NaOH is a strong alkali, it dissolves $\text{Al}(\text{OH})_3$. Which is amphoteric in nature and forms NaAlO_2 .
- $$\text{Al}(\text{OH})_3 + \text{NaOH} \rightarrow \underset{\text{Sodium meta aluminate}}{\text{NaAlO}_2} + 2\text{H}_2\text{O}$$
16. (c) Boron is metalloid. Thus assertion is correct. Metalloids possess, metallic as well as non-metallic nature. Hence, reason is false.
17. (b) It is correct that inert gases are monoatomic because for inert gases $C_p / C_v = 1.66$.
18. (c) When Mg is burnt in nitric oxide it continue to burn because during burning the heat evolved decompose NO to N_2 and O_2 . Oxygen thus, produced helps Mg to burn. Here assertion is true but reason is false.
19. (d) Anhydrous BaO_2 is not used for preparing H_2O_2 because it reacts with H_2SO_4 and the reaction ceases after some time due to formation of BaSO_4 on BaO_2 . Therefore, assertion and reason both are false.
20. (d) Inorganic benzene, borazine is highly reactive while benzene is much less reactive. Here, assertion is false, but reason is true.
21. (a) The halogens absorb visible light due to which all halogens are coloured. Hence, both assertion and reason are true and reason is correct explanation.
22. (b) It is true that barium is not required for normal biological function in human beings and it is also true that it does not show variable oxidation state. It only shows +2 oxidation state.
23. (d) The O-O bond length is shorter in O_2F_2 than in H_2O_2 due to higher electronegativity. H_2O_2 is a non ionic compound. Here both assertion and reason are false.
24. (d) Here both assertion and reason are false because PbI_4 is not a stable compound and iodine can not stabilize higher oxidation states. Pb shows (II) oxidation state more frequently than Pb (IV) due to inert pair effect.
25. (b) Both assertion and reason are true but reason is not correct explanation of the assertion. Enamel the hardest substance of the body is composed of fluorine not magnesium. Magnesium is an essential element as it acts as a factor of many enzymes of glycolysis and a number of other metabolic reactions dependent upon ATP.
26. (d) Both assertion and reason are false. Radium is the rarest of all s-block elements comprising only 10^{-10} percent of igneous rocks. Francium (s-block member) is radioactive; its long lived isotope ${}^{223}\text{Fr}$ has a half life of only 21 minutes.
27. (c) Assertion is true but reason is false. Due to high polarizing power of Li^+ , LiCl is a covalent compound.
28. (c) Assertion is true but reason is false. Be has fully filled $2s^2$ - orbital which gives a relatively more stable electronic configuration.
29. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
30. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

31. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
32. (c) Assertion is true but reason is false.
Helium is a noble gas (Chemically inactive) but beryllium is a member of alkaline earth metals (Chemically active).
33. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
Lattice energy of Na_2SO_4 is less than its hydration energy but the lattice energy of BaSO_4 exceeds its hydration energy.
34. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
35. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
Presence of unpaired electrons in super oxides of alkali metals make them paramagnetic.
36. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
Nitrogen can not expand its octet due to the non availability of d -orbital.
37. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
Ozone is considered to be a resonance hybrid of the following two forms.

38. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
Molecules of sulphuric acid are associated due to large number of intermolecular hydrogen bonding.
39. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
 PCl_5 is trigonal bipyramidal containing sp^3d hybridized P atom in liquid and gaseous state. Whereas in solid state it consists of tetrahedral PCl_4^+ cation and octahedral PCl_6^- anion.
40. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
In case of NI_3 , the lone pair moment adds on the resultant of the $N-I$ moments but in case of NF_3 , the lone pair moment on partly cancels the resultant $N-F$ moments.
41. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
The ignition temperature of white phosphorus is low (About 30°C). In air it readily catches fire giving dense fumes of phosphorus pentoxide. It is therefore, kept in water.
42. (c) Assertion is true but reason is false.
 B does not have vacant d -orbitals as second shell is the outermost shell.
43. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
44. (d) Both assertion and reason are false.
 Si-Si bonds are weaker than Si-O bonds Si has no tendency to form double bonds with itself.
45. (c) Assertion is true but reason is false.

S atoms in S_8 molecule undergo sp^3 hybridization and contain two lone pairs of electrons on each and exists as staggered 8 atom rings.

46. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

This can be explained through structure of Caro's acid (Peroxomonosulphuric acid).

Oxidation no. of $S = x$, oxidation no. of $H = +1$,

Oxidation no. of oxygen in peroxo linkage = -1 ,

Oxidation no. of other oxygen atoms = -2 (each)
 $2 + x - 6 - 2 = 0$ or $x = +6$.

47. (d) Both assertion and reason are false.
The melting point / boiling point of noble gases are quite low. The inter particle forces among noble gases are weak Vander Waal's forces.
48. (b) If both assertion and reason are true and reason is the correct explanation of assertion.
 S atom in both SO_2 and SO_3 is sp^2 hybridized but it contains a lone pair of electrons in SO_2 .
49. (d) Both assertion and reason are false.
Calcium carbide on hydrolysis gives acetylene. Calcium carbide contains C_2^{2-} anion.
50. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
51. (e) Assertion is false but reason is true.
In lab, hydrogen is generally prepared by the reaction of zinc with dilute hydrochloric acid.
52. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
The relatively inert behaviour of diprotium at room temperature is due to the high enthalpy of $H-H$ bond, being the highest for a single bond between any two elements.
53. (d) Both assertion and reason are false.
Water can be easily transformed from liquid solid and to gaseous states. The distribution of water over the earth's surface is not uniform. The desert region have no permanent surface water while the oceans cover vast areas.
54. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.
The structure of ice is open due to hydrogen bonding which makes ice less dense than liquid water at the same temperature.
55. (c) Assertion is true but reason is false.
The water molecules are joined together in an extensive three dimensional network in which each oxygen atom is bonded to four hydrogen atoms two by hydrogen bonds and two by normal covalent bonds in a near tetrahedral configuration. This situation does not exist for molecules like NH_3 and HF .
56. (a) Both assertion and reason are true and reason is the correct explanation of assertion.
Hard water contain soluble calcium and magnesium salt like bicarbonates, chlorides and sulphates.
57. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

To stop decomposition H_2O_2 is stored in wax-lined glass or plastic vessels in the presence of stabilizers like urea.

58. (a) Both assertion and reason are true and reason is the correct explanation of assertion.

At any given instant in liquid water at room temperature, each water molecule forms hydrogen bonds with an average 3.4 other water molecules. The H_2O molecules are in continuous motion so hydrogen bonds are constantly and rapidly broken and formed. In ice H_2O molecules are, however fixed in the space lattice.

59. (d) Both assertion and reason are false.

Calgon is used for making Ca^{2+} and Mg^{2+} ions present in hard water ineffective. It forms soluble complex with Ca^{2+} and Mg^{2+} ions.

60. (b) SO_2 shows both oxidising as well as reducing nature.

The reaction given in assertion is due to oxidising nature of SO_2 .

61. (a) (i) Due to smaller size of F ; steric repulsions will be less in SiF_4 .
(ii) Interaction of F lone pair electrons with Si is stronger than that of chlorine lone pairs.

62. (b) Borax bead test is not suitable for $Al(III)$ because its oxidising as well as reducing flame is colourless in both hot as well as cold.

Alumina is insoluble in water as they exist in hydrated form like $Al_2O_3 \cdot 2H_2O$, $Al_2O_3 \cdot H_2O$ etc.

63. (c) $SeCl_4$ possess see saw geometry, which can be regarded as a distorted trigonal bipyramidal structure having one lone pair (lp) of electrons in the basal position of the trigonal bipyramidal. See-saw geometry of $SeCl_4$ molecules arises due to the sp^3d hybridisation of the central atom. The distortion in shape is due to the presence of one lone pair of electrons.

64. (b) Due to the ease with which it can liberate nascent oxygen, O_3 acts as a powerful oxidising agent.

$:O \vdots \vdots \vdots O:$
paramagnetic
(due to presence of two
unpaired electrons)

s and p-Block Elements

SET Self Evaluation Test -18

1. Nitrogen can be obtained from air by removing

[AFMC 1998]

 - (a) Oxygen
 - (b) Hydrogen
 - (c) Carbon dioxide
 - (d) Both (a) and (c)
2. SO_2 acts as temporary bleaching agent but Cl_2 acts as permanent bleaching agent. Why

[JEE Orissa 2004]

 - (a) Cl_2 bleaches due to reduction but SO_2 due to oxidation
 - (b) Cl_2 bleaches due to reduction but SO_2 due to reduction
 - (c) Both of these
 - (d) None of these
3. Caro's acid is

[DCE 2002]

 - (a) H_2SO_3
 - (b) $H_3S_2O_5$
 - (c) H_2SO_5
 - (d) $H_2S_2O_8$
4. Inorganic benzene is

[Pb. CET 2004]

 - (a) $B_3H_3N_3$
 - (b) BH_3NH_3
 - (c) $B_3H_6N_3$
 - (d) $H_3B_3N_6$
5. Which of the following ions, will have maximum hydration energy

[Pb. CET 2003]

 - (a) Sr^{2+}
 - (b) Ba^{2+}
 - (c) Ca^{2+}
 - (d) Mg^{2+}
6. When orthophosphoric acid is heated to $600^\circ C$, the product formed is

[CBSE PMT 1989]

 - (a) Phosphine, PH_3
 - (b) Phosphorus pentoxide, P_2O_5
 - (c) Phosphorus acid, H_3PO_3
 - (d) Metaphosphoric acid, HPO_3
7. The statement true for N_3^- is

[AIIMS 2004]

 - (a) It has a non-linear structure
 - (b) It is called pseudohalogen
 - (c) The formal oxidation state of nitrogen in this anion is -1
 - (d) It is isoelectronic with NO_2
8. $P_4 + 3NaOH + 3H_2O \rightarrow A + 3NaH_2PO_2$ here, 'A' is

[BVP 2004]

 - (a) NH_3
 - (b) PH_3
 - (c) H_3PO_4
 - (d) H_3PO_3
9. A hydride of nitrogen which is acidic is

[MP PMT 2004]

 - (a) NH_3
 - (b) N_2H_2
 - (c) N_3H
 - (d) N_2H_4
10. The ONO angle is maximum in

[AIIMS 2004]

 - (a) NO_3^-
 - (b) NO_2^-
 - (c) NO_2
 - (d) NO_2^+
11. When ammonia is passed over heated CuO , it is oxidised to

[MNR 1985]

 - (a) N_2
 - (b) NO_2
 - (c) N_2O
 - (d) HNO_2
12. Slaked lime is used in the manufacture of

[Roorkee Qualifying 1998]

 - (a) Cement
 - (b) Fire bricks
 - (c) Pigment
 - (d) Medicine
13. Which of the following is the most stable

[AFMC 2005]

 - (a) Pb^{2+}
 - (b) Ge^{2+}
 - (c) Si^{2+}
 - (d) Sn^{2+}
14. When CO_2 is bubbled through a solution of barium peroxide in water

[MP PET 2001]

 - (a) O_2 is released
 - (b) Carbonic acid is formed
 - (c) H_2O_2 is formed
 - (d) No reaction occurs
15. The lightest metal is

[DPMT 2001]

 - (a) Li
 - (b) Mg
 - (c) Ca
 - (d) Na
16. Which of the following will not undergo hydrolysis in water

[DCE 2003]

 - (a) Ammonium sulphate
 - (b) Sodium sulphate
 - (c) Calcium sulphate
 - (d) All the salts will hydrolyse
17. The species that does not contain peroxide ion is

[AFMC 2000]

 - (a) PbO_2
 - (b) H_2O_2
 - (c) SrO_2
 - (d) BaO_2
18. The number of hydroxide ions produced by one molecule of sodium carbonate (Na_2CO_3) on hydrolysis is

[BVP 2004]

 - (a) 1
 - (b) 2
 - (c) 3
 - (d) 4
19. Lead is soluble in

[AFMC 2000]

 - (a) CH_3COOH
 - (b) H_2SO_4
 - (c) HCl
 - (d) HNO_3

20. The difference of water molecules in gypsum and plaster of paris is
(a) $\frac{5}{2}$ (b) 2
(c) $\frac{1}{2}$ (d) $1\frac{1}{2}$
21. When burning magnesium ribbon is introduced into a jar of oxygen, it produces [MH CET 1999]
(a) Mg (b) MgO
(c) MgO_2 (d) Mg_2O_2
22. Which of the following compounds transform baking soda into baking powder [AIIMS 2001]
(a) KCl (b) $KHCO_3$
(c) $NaHCO_3$ (d) $KHC_4H_4O_6$
23. Hydrated $AlCl_3$ is used as [RPET 2003]
(a) Catalyst in cracking of petroleum
(b) Catalyst in Friedel Craft reaction
(c) Mordant
(d) All of these
24. Which of the following ions has largest heat of hydration [MP PET 2001]
(a) Ba^{2+} (b) K^+
(c) Li^+ (d) Be^{2+}
25. The hydroxides which sublime on heating are [Roorkee 1999]
(a) $LiOH$ (b) KOH
(c) $RbOH$ (d) $Mg(OH)_2$
26. Electrolysis of $KCl.MgCl_2.6H_2O$ gives [KCET 1993]
(a) Mg Only
(b) Potassium only
(c) Mg and Cl_2
(d) P and Mg
27. Which species does not exist [JIPMER 2000]
(a) $(SiCl_6)^{2-}$ (b) $(CCl_6)^{2-}$
(c) $(GeCl_6)^{2-}$ (d) $(SnCl_6)^{2-}$
28. Al_2O_3 [CPMT 1997] involves evolution of a large quantity of heat, which makes its use in [DPMT 2002]
(a) Deoxidiser
(b) Indoor photography
(c) Confectionary
(d) Thermite welding
29. Nitrates of all metals are [DCE 2000]
(a) Unstable (b) Stable
(c) Coloured (d) Soluble
30. The density of Neon will be highest at [JIPMER 2002]
(a) STP
(b) $0^\circ C, 2$ atmosphere
(c) $273^\circ C, 1$ atmosphere
(d) $273^\circ C, 2$ atmosphere
31. When chlorine water is exposed to sunlight the colour change that occurs is [Kerala (Med.) 2002]
(a) Colourless to brown
(b) Brown to colourless
(c) Light blue to colourless
(d) Colourless to greenish yellow
(e) Greenish yellow to colourless
32. Sodium nitrate ($NaNO_3$) decomposes above $\sim 800^\circ C$ to give
(a) N_2 (b) O_2
(c) NO_2 (d) Na_2O
33. N_2 forms NCl_3 , whereas P can form both PCl_5 and PCl_3 . Why [JEE Orissa 2004]
(a) P has low lying $3d$ orbitals, which can be used for bonding but N_2 does not have low lying $3d$ orbital
(b) N_2 atom is larger than P in size
(c) P is more reactive towards Cl than N_2
(d) None of these

AS Answers and Solutions

(SET -18)

1. (d) Nitrogen can be obtained from air by removing oxygen and Hydrogen.
2. (b) Cl_2 bleaches due to oxidation which is permanent bleaching while SO_2 bleach due to reduction which is temporary bleach and convert in original by atmospheric oxygen.
3. (c) Caro's acid is H_2SO_5

4. (c) Inorganic benzene is $B_3H_6N_3$
5. (d) Hydration energy of smaller cations are higher than those of larger cations, hence Mg^{+2} has maximum hydration energy among these.

7. (c) N_3^- derived from N_3H in which nitrogen shows -1 oxidation state.

8. (b) This is the laboratory method of preparing phosphine gas.

In this reaction, phosphorus disproportionate into phosphine and sodium hydrogen phosphite.

9. (c) Hydrazoic acid N_3H is a fairly strong acid which is strong than CH_3COOH but weak than mineral acid.

10. (d) NO_2 have 132° bond angle

increase of electron or increase of more electronegative atom in it decrease its bond angle since NO_2^+ lose a electron by which its bond angle increase from 132° .

12. (a) Composition of portland cement is

Lime (CaO)	50-60%
MgO	2-3%
SiO_2	20-25%
Fe_2O_3	1-2%
Alumina (Al_2O_3)	5-10%
SO_3	1-2%

13. (a) Pb^{+2} on going down the group due to inert pair effect + 2 state is more stable than + 4.

14. (c) When CO_2 is bubbled through a cold pasty solution of *** barium peroxide in water, H_2O_2 is obtained.

Barium carbonate being insoluble is filtered off. This is known as Merck's process.

15. (a) Lithium is the Lightest metal with atomic No. 3.
16. (b) Sodium sulphate is a salt of strong acid (H_2SO_4) and strong base ($NaOH$). As we know that salt of strong acid and strong base do not hydrolyse in water but will ionised.

17. (a) PbO_2 (Lead dioxide) is not a peroxide. All other are peroxides as they have $(-O-O-)$ linkage.

18. (b)

19. (d) Lead is soluble in dil. HNO_3 . However, it becomes passive towards conc. HNO_3 .

22. (d) $KHC_4H_4O_6$ transform baking soda into baking powder.

23. (c) Hydrated $AlCl_3$ is used as mordant.

25. (d) $Mg(OH)_2$ sublimes on heating.

Since, reduction potential of Mg is higher. Hence it gets reduced easily.

27. (b) CCl_6 does not exist because carbon has a valency of 4.

28. (a) In thermite welding large quantity of heat is used which is evolved during Al_2O_3 formation.

29. (b) Generally all metal nitrates are stable.

30. (b) Density of Neon will be highest at $0^\circ C$, 2 atmosphere.

33. (a) P has low lying $3d$ orbitals, which can be used for bonding, whereas N_2 does not have low lying $3d$ orbitals.

Chapter

19

d and *f*-Block Elements

d-Block elements

A transition element may be defined as an element whose atom in the ground state or ion in common oxidation state has **incomplete sub-shell, has electron 1 to 9**. It is called transition element due to fact that it is lying between most electropositive (*s*-block) and most electronegative (*p*-block) elements and represent a transition from them. The **general electronic configuration** of these element is $(n-1)^{1 \text{ to } 10} ns^{0 \text{ to } 2}$.

The definition of transition metal excludes *Zn, Cd* and *Hg* because they have complete *d*-orbital. Their common oxidation state is $Zn^{++}, Cd^{++}, Hg^{++}$. They also do not show the characteristics of transition element. Element of group 3 (*Sc, Y, La* and *Ac*) and group 12 (*Zn, Cd, Hg*) are called **non typical transition element**.

Table : 19.1 First transition or *3d* series :

Element	Symbol	At. No.	Electronic configuration
Scandium	<i>Sc</i>	21	$[Ar] 3d^1 4s^2$
Titanium	<i>Ti</i>	22	$[Ar] 3d^2 4s^2$
Vanadium	<i>V</i>	23	$[Ar] 3d^3 4s^2$
Chromium	<i>Cr</i>	24	$[Ar] 3d^5 4s^1$
Manganese	<i>Mn</i>	25	$[Ar] 3d^5 4s^2$
Iron	<i>Fe</i>	26	$[Ar] 3d^6 4s^2$
Cobalt	<i>Co</i>	27	$[Ar] 3d^7 4s^2$
Nickel	<i>Ni</i>	28	$[Ar] 3d^8 4s^2$
Copper	<i>Cu</i>	29	$[Ar] 3d^{10} 4s^1$
Zinc	<i>Zn</i>	30	$[Ar] 3d^{10} 4s^2$

Table : 19.2 Second transition or *4d*-series :

Element	Symbol	At. No.	Electronic configuration
Yttrium	<i>Y</i>	39	$[Kr] 4d^1 5s^2$

Zirconium	<i>Zr</i>	40	$[Kr] 4d^2 5s^2$
Niobium	<i>Nb</i>	41	$[Kr] 4d^4 5s^1$
Molybdenum	<i>Mo</i>	42	$[Kr] 4d^5 5s^1$
Technetium	<i>Tc</i>	43	$[Kr] 4d^5 5s^2$
Ruthenium	<i>Ru</i>	44	$[Kr] 4d^7 5s^1$

Unubium	<i>Uub</i>	112	$[Rn] 5f6d7s$

Elements marked with asterisk have anomalous configurations. These are attributed to factors like nuclear-electron and electron-electron forces and stability of half filled and full filled orbital.

All transition elements are *d* block elements but all *d* block elements are not transition elements.

Physico-Chemical Properties of d-Block Elements

(i) **Atomic radii** : The atomic, radii of 3*d*-series of elements are compared with those of the neighbouring *s* and *p*-block elements.

<i>K</i>	<i>Ca</i>	<i>Sc</i>	<i>Ti</i>	<i>V</i>	<i>Cr</i>	<i>Mn</i>
227	197	144	132	122	117	117
<i>Fe</i>	<i>Co</i>	<i>Ni</i>	<i>Cu</i>	<i>Zn</i>	<i>Ga</i>	<i>Ge</i>
117	116	115	117	125	135	122

* in pm units

The atomic radii of transition elements show the following characteristics,

(i) The atomic radii and atomic volumes of *d*-block elements in any series decrease with increase in the atomic number. The decrease however, is not regular. The atomic radii tend to reach minimum near at the middle of the series, and increase slightly towards the end of the series.

Explanation : When we go in any transition series from left, to right, the nuclear charge increases gradually by one unit at each elements. The added electrons enter the same penultimate shell, (inner *d*-shell). These added electrons shield the outermost electrons from the attraction of the nuclear charge. The increased nuclear charge tends to reduce the atomic radii, while the added electrons tend to increase the atomic radii. At the beginning of the series, due to smaller number of electrons in the *d*-orbitals, the effect of increased nuclear charge predominates, and the atomic radii decrease. Later in the series, when the number of *d*-electrons increases, the increased shielding effect and the increased repulsion between the electrons tend to increase the atomic radii. Somewhere in the middle of the series, therefore the atomic radii tend to have a minimum value as observed.

(ii) The atomic radii increase while going down in each group. However, in the third transition series from hafnium (*Hf*) and onwards, the elements have atomic radii nearly equal to those of the second transition elements.

Explanation : The atomic radii increase while going down the group. This is due to the introduction of an additional shell at each new element down the group. Nearly equal radii of second and third transition series elements is due to a special effect called **lanthanide contraction**.

(2) **Ionic radii** : For ions having identical charges, the ionic radii decrease slowly with the increase in the atomic number across a given series of the transition elements.

Elements (<i>m</i>):	Ionic radius, (<i>M</i>)/pm:	<i>Pm</i> (<i>M</i>)/pm:
<i>Sc</i>	—	81
<i>Ti</i>	90	76
<i>V</i>	88	74
<i>Cr</i>	84	69
<i>Mn</i>	80	66
<i>Fe</i>	76	64

<i>Co</i>	74	63
<i>Ni</i>	72	—
<i>Cu</i>	69	—
<i>Zn</i>	74	—

Explanation : The gradual decrease in the values of ionic radius across the series of transition elements is due to the increase in the **effective nuclear charge**.

(3) **Ionisation energies** : The ionisation energies of the elements of first transition series are given below:

Elements	<i>I</i>	<i>I</i> ₁	<i>I</i> ₂
<i>Sc</i>	632	1245	2450
<i>Ti</i>	659	1320	2721
<i>V</i>	650	1376	2873
<i>Cr</i>	652	1635	2994
<i>Mn</i>	716	1513	3258
<i>Fe</i>	762	1563	2963
<i>Co</i>	758	1647	3237
<i>Ni</i>	736	1756	3400
<i>Cu</i>	744	1961	3560
<i>Zn</i>	906	1736	3838

* in *kJ mol*

The following generalizations can be obtained from the ionisation energy values given above.

(i) The ionisation energies of these elements are high and in the most cases lie between those of *s*- and *p*-block elements. This indicates that the transition elements are less electropositive than *s*-block elements.

Explanation : Transition metals have smaller atomic radii and higher nuclear charge as compared to the alkali metals. Both these factors tend to increase the ionisation energy, as observed.

(ii) The ionisation energy in any transition series increases in the nuclear with atomic number; the increase however is not smooth and as sharp as seen in the case of *s* and *p*-block elements.

Explanation : The ionisation energy increases due to the increase in the nuclear charge with atomic number at the beginning of the series. Gradually, the shielding effect of the added electrons also increases. This **shielding effect** tends to decrease the attraction due to the nuclear charge. These two opposing factors lead to a rather gradual increase in the ionisation energies in any transition series.

(iii) The first ionisation energies of 5*d*-series of elements are much higher than those of the 3*d* and 4*d* series elements.

Explanation : In the 5*d*-series of transition elements, after lanthanum (*La*), the added electrons go to the next inner 4*f* orbitals. The 4*f* electrons have poor shielding effect. As a result, the outermost electrons experience greater nuclear attraction. This leads to higher ionisation energies for the 5*d*-series of transition elements.

(4) **Metallic character** : All the transition elements are metals. These are hard, and good conductor of heat and electricity. All these metals are malleable, ductile and form alloys with other metals. These elements occur in three types *e.g.*, face-centered cubic (*fcc*), hexagonal close-packed (*hcp*) and body-centered cubic (*bcc*), structures.

The transition elements shows both covalent as well as metallic bonding amongst their atoms.

Explanation : The ionisation energies of the transition elements are not very high. The outermost shell in their atoms have many vacant, **partially filled orbitals**. These characteristics make these elements metallic in character. The hardness of these metals, suggests the presence of covalent bonding in these metals. The presence of unfilled *d*-orbitals favour covalent bonding. Metallic bonding in these metals is indicated by the conducting

nature of these metals. Therefore, it appears that there exists covalent and metallic bonding in transition elements.

(5) **Melting and boiling points** : The melting and boiling points of transition elements except *Cd* and *Hg*, are very high as compared to the *s*-block and *p*-block elements. The melting and boiling points **first increase**, pass through maxima and then **steadily decrease** across any transition series. The maximum occurs around middle of the series.

Explanation : Atoms of the transition elements are closely packed and held together by strong metallic bonds which have appreciable covalent character. This leads to high melting and boiling points of the transition elements.

The strength of the metallic bonds depends upon the number of unpaired electrons in the outermost shell of the atom. Thus, greater is the number of unpaired electrons stronger is the metallic bonding. In any transition element series, the number of unpaired electrons first increases from 1 to 5 and then decreases back to the zero. The maximum five unpaired electrons occur at *Cr* (*3d* series). As a result, the melting and boiling points first increase and then decrease showing maxima around the middle of the series.

The low melting points of *Zn*, *Cd*, and *Hg* may be due to the absence of **unpaired *d*-electrons** in their atoms.

(6) **Enthalpies of atomization** : Transition metals exhibit high enthalpies of atomization.

Explanation : This is because the atoms in these elements are closely packed and held together by strong metallic bonds. The metallic bond is formed as a result of the interaction of electrons in the outermost shell. Greater the number of valence electrons, stronger is the metallic bond.

(7) **Oxidation states** : Most of the transition elements exhibit several oxidation states *i.e.*, they show variable valency in their compounds. Some common oxidation states of the first transition series elements are given below in table,

Outer Ele. Confi. and O. S. for 3d- elements

Elements	Outer electronic configuration	Oxidation states
<i>Sc</i>	$3d\ 4s^2$	+ 2, + 3
<i>Ti</i>	$3d^2\ 4s^2$	+ 2, + 3, + 4
<i>V</i>	$3d^3\ 4s^2$	+ 2, + 3, + 4, + 5
<i>Cr</i>	$3d^5\ 4s^1$	+ 1, + 2, + 3, + 4, + 5, + 6
<i>Mn</i>	$3d^5\ 4s^2$	+ 2, + 3, + 4, + 5, + 6, + 7
<i>Fe</i>	$3d^6\ 4s^2$	+ 2, + 3, + 4, + 5, + 6
<i>Co</i>	$3d^7\ 4s^2$	+ 2, + 3, + 4
<i>Ni</i>	$3d^8\ 4s^2$	+ 2, + 3, + 4
<i>Cu</i>	$3d^{10}\ 4s^1$	+ 1, + 2
<i>Zn</i>	$3d^{10}\ 4s^2$	+ 2

Explanation : The outermost electronic configuration of the transition elements is $(n-1)d\ ns$. Since, the energy levels of $(n-1)d$ and ns -orbitals are quite close to each other, hence both the ns and $(n-1)d$ electrons are available for bonding purposes. Therefore, the number of oxidation states shown by these elements depends upon the number of d -electrons it has. For example, *Sc* having a configuration $3d^1 4s^2$ may show an oxidation state of + 2 (only s -electrons are lost) and + 3 (when d -electron is also lost). The highest oxidation state which an element of this group might show is given by the total number of ns and $(n-1)d$ -electrons.

The relative stability of the different oxidation states depends upon the factors such as, electronic configuration, nature of bonding, stoichiometry, lattice energies and solvation energies. The highest oxidation states are found in fluorides and oxides because fluorine and oxygen are the most electronegative elements. The highest oxidation state shown by any transition metal is eight. The oxidation state of eight is shown by *Ru* and *Os*.

An examination of the common oxidation states reveals the following conclusions.

(i) The variable oxidation states shown by the transition elements are due to the participation of **outer ns and inner $(n-1)d$ -electrons** in bonding.

(ii) Except scandium, the most common oxidation state shown by the elements of first transition series is +2. This oxidation state arises from the loss of two $4s$ electrons. This means that after scandium, d -orbitals become more stable than the s -orbital.

(iii) The highest oxidation states are observed in fluorides and oxides. The highest oxidation state shown by any transition elements (by *Ru* and *Os*) is 8.

(iv) The transition elements in the + 2 and + 3 oxidation states mostly form ionic bonds. In compounds of the higher oxidation states (compound formed with fluorine or oxygen), the bonds are essentially covalent. For example, in permanganate ion *MnO₄⁻*, all bonds formed between manganese and oxygen are covalent.

(v) Within a group, the maximum oxidation state increases with atomic number. For example, iron shown the common oxidation state of + 2 and + 3, but ruthenium and osmium in the same group form compounds in the + 4, + 6 and + 8 oxidation states.

(vi) Transition metals also form compounds in low oxidation states such as +1 and 0. For example, nickel in, nickel tetracarbonyl, *Ni(CO)₄*, has **zero oxidation state**. Similarly *Fe* in *(Fe(CO)₅)* has **zero oxidation state**.

The bonding in the compounds of transition metals in low oxidation states is not always very simple.

(vii) **Ionisation energies and the stability of oxidation states** : The values of the ionisation energies can be used in estimating the relative stability of various transition metal compounds (or ions). For example, *Ni* compounds are found to be thermodynamically more stable than *Pt*, whereas *Pt* compounds are more stable than *Ni* compounds. The relative stabilities of *Ni* relative to *Pt* and that of *Pt* relative to *Ni* can be explained as follows,

The first four ionisation energies of Ni and Pt

Metal	$(IE_1 + IE_2)\ kJ\ mol^{-1}$	$(IE_3 + IE_4)\ kJ\ mol^{-1}$	$E_{total},\ kJ\ mol^{-1}$ ($= IE_1 + IE_2 + IE_3 + IE_4$)
<i>Ni</i>	2490	8800	11290
<i>Pt</i>	2660	6700	9360

Thus, the ionisation of *Ni* to *Ni* requires lesser energy ($2490\ kJ\ mol^{-1}$) as compared to the energy required for the production of *Pt* ($2660\ kJ\ mol^{-1}$). Therefore, *Ni* compounds are thermodynamically more stable than *Pt* compounds.

On the other hand, formation of *Pt* requires lesser energy ($9360\ kJ\ mol^{-1}$) as compared to that required for the formation of *Ni* ($11290\ kJ\ mol^{-1}$). Therefore, *Pt* compounds are more stable than *Ni* compounds.

This is supported by the fact that $[PtCl_4]^{2-}$ complex ion is known, while the corresponding ion for nickel is not known. However, other factors which affect the stability of a compound are,

(a) Enthalpy of sublimation of the metal.

(b) Lattice and the solvation energies of the compound or ion.

(viii) Transition elements like *Sc*, *Y*, *La* and *Ac* do not show variable valency.

(8) **Electrode potentials (*E*)** : Standard electrode potentials of some half-cells involving $3d$ -series of transition elements and their ions in aqueous solution are given in table,

Standard electrode potentials for 3d-elements

Elements	Ion	Electrode reaction	<i>E</i> / volt
<i>Sc</i>	<i>Sc</i>	$Sc + 3e \rightarrow Sc$	- 2.10
<i>Ti</i>	<i>Ti</i>	$Ti + 2e \rightarrow Ti$	- 1.60
<i>V</i>	<i>V</i>	$V + 2e \rightarrow V$	- 1.20

Cr	Cr	$Cr + 3e \rightarrow Cr$	- 0.71
Mn	Mn	$Mn + 2e \rightarrow Mn$	- 1.18
Fe	Fe	$Fe + 2e \rightarrow Fe$	- 0.44
Co	Co	$Co + 2e \rightarrow Co$	- 0.28
Ni	Ni	$Ni + 2e \rightarrow Ni$	- 0.24
Cu	Cu	$Cu + 2e \rightarrow Cu$	+ 0.34
Zn	Zn	$Zn + 2e \rightarrow Zn$	- 0.76

The negative values of E° for the first series of transition elements (except for Cu/Cu) indicate that,

(i) These metals should liberate hydrogen from dilute acids i.e., the reactions,

are favourable in the forward direction. In actual practice however, most of these metals react with dilute acids very slowly. Some of these metals get coated with a **thin protective layer** of oxide. Such an oxide layer prevents the metal to react further.

(ii) These metals should act as good reducing agents. There is no regular trend in the E° values. This is due to irregular variation in the ionisation and sublimation energies across the series.

Relative stabilities of transition metal ions in different oxidation states in aqueous medium can be predicted from the electrode potential data. To illustrate this, let us consider the following,

Adding these equations one gets,

$$\Delta H = \Delta H_1 + \Delta H_2 + \Delta H_3 = \Delta H_{\text{sub}} + IE + \Delta H_{\text{hyd}}$$

The ΔH represents the enthalpy change required to bring the solid metal M to the monovalent ion in aqueous medium, $M(aq)$.

The reaction, $M(s) \rightarrow M(aq) + e^-$, will be favourable only if ΔH is negative. More negative is the value of ΔH , more favourable will be the formation of that cation from the metal. Thus, the oxidation state for which ΔH value is more negative will be stable in the solution.

Electrode potential for a M/M half-cell is a measure of the tendency for the reaction, $M(aq) + ne^- \rightarrow M(s)$

Thus, this reduction reaction will take place if the electrode potential for M/M half-cell is positive. The reverse reaction, $M(s) \rightarrow M(aq) + ne^-$

Involving the formation of $M(aq)$ will occur if the electrode potential is negative, i.e., the tendency for the formation of $M(aq)$ from the metal M will be more if the corresponding E° value is more negative. In other words, *the oxidation state for which E° value is more negative (or less positive) will be more stable in the solution.*

When an element exists in more than one oxidation states, the standard electrode potential (E°) values can be used in predicting the relative stabilities of different oxidation states in aqueous solutions. The following rule is found useful.

The oxidation state of a cation for which $\Delta H = (\Delta H_{\text{sub}} + IE + \Delta H_{\text{hyd}})$ or E° is more negative (or less positive) will be more stable.

(9) **Formation of coloured ions** : Most of the compounds of the transition elements are coloured in the solid state and/or in the solution phase. The compounds of transition metals are coloured due to the presence of unpaired electrons in their d -orbitals.

Explanation : In an isolated atom or ion of a transition element, all the five d -orbitals are of the same energy (they are said to be degenerate). Under the influence of the combining anion(s), or electron-rich molecules, the five d -orbitals split into two (or sometimes more than two) levels of different energies. The difference between the two energy levels depends upon the nature of the combining ions, but corresponds to the energy associated with the radiations in the visible region, ($\lambda = 380 - 760\text{nm}$). Typical splitting for octahedral and tetrahedral geometries are shown in fig.

The splitting of d -orbital energy levels in (a) an octahedral, (b) a tetrahedral, geometry. This splitting is termed as the crystal field splitting.

Promotion of d -electron to a higher level by

The transition metals in elements form or in the ionic form have one or more unpaired electrons. When visible light falls on the sample, the electrons from the lower energy level get promoted to a higher energy level due to the absorption of light of a characteristic wavelength (or colour). This wavelength (or colour) of the absorbed light depends upon the energy difference of the two levels. Rest of the light gets transmitted. The transmitted light has a colour complementary to the absorbed colour. Therefore, the compound or the solution appears to be of the complementary colour. For example, $Cu(H_2O)_6^{2+}$ ions absorb red radiation, and appear **blue-green** (blue-green is complementary colour to red). Hydrated Co ions absorb radiation in the blue-green region, and therefore, appear red in sunlight. Relationship between the colour of the absorbed radiation and that of the transmitted light is given in table

Relationship between the colours of the absorbed and transmitted light: the complementary colours.

Colour of the		Colour of the	
Absorbed light	Transmitted light	Absorbed light	Transmitted light
IR	White	Blue-green	Red
Red	Blue-green	Blue	Orange
Orange	Blue	Indigo	Yellow
Yellow	Indigo	Violet	Yellow-green
Yellow-green	Violet	UV	White

Green	Purple		
-------	--------	--	--

However, if radiations of all the wavelengths (or colours) except one are absorbed, then the colour of the substance will be the colour of the transmitted radiation. For example, if a substance absorbs all colours except green, then it would appear green to the eyes.

The transition metal ions which have completely filled d -orbitals are colourless, as there are no vacant d -orbitals to permit promotion of the electrons. Therefore, Zn ($3d$), Cd ($4d$) and Hg ($5d$) Sc^+ , Ti , Cu ions and Zn , Cd , Hg are colourless and diamagnetic. The transition metal ions which have completely empty d -orbitals are also colourless. Thus, Sc^+ and Ti ions are colourless, unless a coloured anion is present in the compound.

Colours and the outer- electronic configurations of the some important ions of the first transition series elements are given below,

Ion	Outer configuration	Number of unpaired electrons	Colour of the ion
Sc^+	$3d$	0	Colourless
Ti^+	$3d$	1	Purple
Ti^2+	$3d$	0	Colourless
V^+	$3d$	2	Green
Cr^+	$3d$	3	Violet
Mn^+	$3d$	5	Light pink
Mn^2+	$3d$	4	Violet
Fe^+	$3d$	4	Green
Fe^2+	$3d$	5	Yellow
Co^+	$3d$	3	Pink
Ni^+	$3d$	2	Green
Cu^+	$3d$	1	Blue
Cu^2+	$3d$	0	Colourless
Zn^2+	$3d$	0	Colourless

(10) **Magnetic properties** : Most of the transition elements and their compounds show **paramagnetism**. The paramagnetism first increases in any transition element series, and then decreases. The maximum paramagnetism is seen around the middle of the series. The paramagnetism is described in **Bohr Magnetron (BM)** units. The paramagnetic moments of some common ions of first transition series are given below in Table

Explanation : A substance which is attracted by magnetic field is called paramagnetic substance. The substances which are repelled by magnetic field are, called **diamagnetic substances**. Paramagnetism is due to the presence of unpaired electrons in atoms, ions or molecules.

The magnetic moment of any transition element or its compound/ion is given by (assuming no contribution from the orbital magnetic moment).

$$\mu_s = \sqrt{4S(S+1)} \quad BM = \sqrt{n(n+2)} \quad BM$$

where, S is the total spin ($n \times s$): n is the number of unpaired electrons and s is equal to $\frac{1}{2}$ (representing the spin of an unpaired electron).

From the equation given above, the magnetic moment (μ_s) increases with an increase in the number of unpaired electrons.

Magnetic moments of some ions of the 3d-series elements

Ion	Outer configuration	No. of unpaired electrons	Magnetic moment (BM)	
			Calculated	observed
Sc^{3+}	$3d^0$	0	0	0
Ti^{3+}	$3d^1$	1	1.73	1.75
Ti^{2+}	$3d^2$	2	2.84	2.86
V^{2+}	$3d^3$	3	3.87	3.86
Cr^{2+}	$3d^4$	4	4.90	4.80

Mn^{2+}	$3d^5$	5	5.92	5.95
Fe^{2+}	$3d^6$	4	4.90	5.0-5.5
Co^{2+}	$3d^7$	3	3.87	4.4-5.2
Ni^{2+}	$3d^8$	2	2.84	2.9-3.4
Cu^{2+}	$3d^9$	1	1.73	1.4-2.2
Zn^{2+}	$3d^{10}$	0	0	0

In d -orbitals belonging to a particular energy level, there can be at the maximum five unpaired electrons in d cases. Therefore, paramagnetism in any transition series first increases, reaches a maximum value for d cases and then decreases thereafter.

(ii) **Formation of complex ions** : Transition metals and their ions show strong tendency for complex formation. The cations of transition elements (d -block elements) form complex ions with certain molecules containing one or more lone-pairs of electrons, viz., CO , NO , NH_3 etc., or with anions such as F , Cl , CN etc. A few typical complex ions are,

Explanation : This complex formation tendency is due to,

(i) Small size and high nuclear charge of the transition metal cations.

(ii) The availability to vacant inner d -orbitals of suitable energy.

(12) **Formation of interstitial compounds** : Transition elements form a few interstitial compounds with elements having small atomic radii, such as hydrogen, boron, carbon and nitrogen. The small atoms of these elements get entrapped in between the void spaces (called interstices) of the metal lattice. Some characteristics of the interstitial compound are,

(i) These are non-stoichiometric compounds and cannot be given definite formulae.

(ii) These compounds show essentially the same chemical properties as the parent metals, but differ in physical properties such as density and hardness. Steel and cast iron are hard due to the formation of interstitial compound with carbon. Some non-stoichiometric compounds are, VSe_x (Vanadium selenide), Fe_xO and titanium nitride.

Explanation : Interstitial compounds are hard and dense. This is because, the smaller atoms of lighter elements occupy the interstices in the lattice, leading to a more closely packed structure. Due to greater electronic interactions, the strength of the metallic bonds also increases.

(13) **Catalytic properties** : Most of the transition metals and their compounds particularly oxides have good catalytic properties. Platinum, iron, vanadium pentoxide, nickel, etc., are important catalysts. Platinum is a general catalyst. Nickel powder is a good catalyst for hydrogenation of unsaturated organic compound such as, hydrogenation of oils some typical industrial catalysts are,

(i) Vanadium pentoxide (V_2O_5) is used in the Contact process for the manufacture of sulphuric acid,

(ii) Finely divided iron is used in the Haber's process for the synthesis of ammonia.

Explanation : Most transition elements act as good catalyst because of,

(i) The presence of vacant d -orbitals.

(ii) The tendency to exhibit variable oxidation states.

(iii) The tendency to form reaction intermediates with reactants.

(iv) The presence of defects in their crystal lattices.

(14) **Alloy formation** : Transition metals form alloys among themselves. The alloys of transition metals are hard and high melting as compared to the host metal. Various steels are alloys of iron

Ionic equation

(b) *Sulphites to sulphates and arsenites to arsenates.*

Ionic equation

Similarly, arsenites are oxidised to arsenates.

(c) *Hydrogen halides to halogens.*

where, X may be Cl, Br, I .

Ionic equation :

(d) *Iodides to iodine*

Ionic equation :

Thus, when KI is added to an acidified solution of $K_2Cr_2O_7$, iodine gets liberated.

(e) *It oxidises H_2S to S .*

Ionic equation

(v) **Formation of insoluble chromates** : With soluble salts of lead, barium etc., potassium dichromate gives insoluble chromates. Lead chromate is an important yellow pigment.

(vi) **Chromyl chloride test** : When potassium dichromate is heated with conc. H_2SO_4 in the presence of a soluble chloride salt, the orange-red vapours of chromyl chloride (CrO_2Cl_2) are formed.

Chromyl chloride vapours when passed through water give yellow-coloured solution containing chromic acid.

Chromyl chloride test can be used for the detection of chloride ion as mixture.

Uses : Potassium dichromate is used as,

- (i) An oxidising agent
- (ii) In chrome tanning
- (iii) The raw material for preparing large number of chromium compounds
- (iv) Primary standard in the volumetric analysis.

Structures of Chromate and Dichromate Ions

Chromates and dichromates are the salts of chromic acid (H_2CrO_4). In solution, these ions exist in equilibrium with each other. Chromate ion has four oxygen atoms arranged tetrahedrally around Cr atom. (see Fig). Dichromate ion involves a $Cr-O-Cr$ bond as shown in Fig.

The structure of chromate (CrO_4^{2-}) and dichromate ($Cr_2O_7^{2-}$) ions

Manganese containing compound

Potassium Permanganate, ($KMnO_4$)

Potassium permanganate is a salt of an unstable acid $HMnO_4$ (permanganic acid). The Mn is an +7 state in this compound.

Preparation : Potassium permanganate is obtained from pyrolusite as follows.

Conversion of pyrolusite to potassium manganate : When manganese dioxide is fused with potassium hydroxide in the presence of air or an oxidising agent such as potassium nitrate or chlorate, potassium manganate is formed, possibly via potassium manganite.

Oxidation of potassium manganate to potassium permanganate : The potassium manganate so obtained is oxidised to potassium permanganate by either of the following methods.

By chemical method : The fused dark-green mass is extracted with a small quantity of water. The filtrate is warmed and treated with a current of ozone, chlorine or carbon dioxide. Potassium manganate gets oxidised to potassium permanganate and the hydrated manganese dioxide precipitates out. The reactions taking place are,

When CO_2 is passed

When chlorine or ozone is passed

The purple solution so obtained is concentrated and dark purple, needle-like crystals having metallic lustre are obtained.

Electrolytic method : Presently, potassium manganate ($KMnO$) is oxidised electrolytically. The electrode reactions are,

The purple solution containing $KMnO_4$ is evaporated under controlled condition to get crystalline sample of potassium permanganate.

Physical properties

$KMnO_4$ crystallizes as dark purple crystals with greenish luster (m.p. 523 K).

It is soluble in water to an extent of 6.5g per 100g at room temperature. The aqueous solution of $KMnO_4$ has a purple colour.

Chemical properties : Some important chemical reactions of $KMnO_4$ are given below,

Action of heat : $KMnO_4$ is stable at room temperature, but decomposes to give oxygen at higher temperatures.

Oxidising actions : $KMnO_4$ is a powerful agent in neutral, acidic and alkaline media. The nature of reaction is different in each medium. The oxidising character of $KMnO_4$ (to be more specific, of MnO_4^-) is indicated by high positive reduction potentials for the following reactions.

Acidic medium

Alkaline medium

In strongly alkaline solutions and with excess of MnO_4^- , the reaction is $MnO_4^- + e^- \rightleftharpoons MnO_4^{2-} \quad E^0 = 0.56 V$

There are a large number of oxidation-reduction reactions involved in the chemistry of manganese compounds. Some typical reactions are,

In the presence of excess of reducing agent in acidic solutions permanganate ion gets reduced to manganous ion, e.g., $5Fe^{2+} + MnO_4^- + 8H^+ \rightarrow 5Fe^{3+} + Mn^{2+} + 4H_2O$

An excess of reducing agent in alkaline solution reduces permanganate ion only to manganese dioxide e.g.,

In faintly acidic and neutral solutions, manganous ion is oxidised to manganese oxidised to manganese dioxide by permanganate.

In strongly basic solutions, permanganate oxidises manganese dioxide to manganate ion.

In acidic medium, $KMnO_4$ oxidises,

Ferrous salts to ferric salts

Ionic equation

The reaction forms the basis of volumetric estimation of Fe in any solution by $KMnO_4$.

Oxalic acid to carbon dioxide

Ionic equation

Sulphites to sulphates

Ionic equation

Iodides to iodine in acidic medium

Ionic equation

Hydrogen peroxide to oxygen

Manganous sulphate ($MnSO$) to manganese dioxide (MnO)

Ionic equation

Ammonia to nitrogen

Uses : $KMnO_4$ is used,

(i) As an oxidising agent. (ii) As a disinfectant against disease-causing germs. (iii) For sterilizing wells of drinking water. (iv) In volumetric estimation of ferrous salts, oxalic acid etc. (v) Dilute alkaline $KMnO_4$ solution known as **Baeyer's reagent**.

Structure of Permanganate Ion (MnO_4^-) : Mn in MnO_4^- is in +7 oxidation state. Mn exhibits sp^3 hybridisation in this ion. The structure of MnO_4^- is shown in fig.

Iron and its Compounds

(1) **Ores of iron :** Haematite (Fe_2O_3), Magnetite (Fe_3O_4), Limonite ($Fe_2O_3 \cdot 3H_2O$), Iron pyrites (FeS_2), Copper pyrites ($CuFeS_2$) etc.

(2) **Extraction :** Cast iron is extracted from its oxides by reduction with carbon and carbon monoxide in a blast furnace to give pig iron.

Roasting : Ferrous oxide convert into ferric oxide.

Smelting : Reduction of roasted ore of ferric oxide carried out in a blast furnace.

(i) The reduction of ferric oxide is done by carbon and carbon monoxide (between 1473K to 1873K)

(ii) $Fe_2O_3 + 3CO \xrightleftharpoons{673\text{ K}} 2Fe + 3CO_2$. It is a reversible and exothermic reaction. Hence according to *Le-chatelier* principle more iron will be produced in the furnace at lower temp.

(it is not reversible)

The gases leaving at the top of the furnace contain up to 28% CO and are burnt in **cowper's stove** to pre-heat the air for blast

Varieties of iron : The three commercial varieties of iron differ in their carbon contents. These are;

(1) **Cast iron or Pig-iron :** It is most impure form of iron and contains highest proportion of carbon (2.5–4%).

(2) **Wrought iron or Malleable iron :** It is the purest form of iron and contains minimum amount of carbon (0.12–0.25%).

(3) **Steel :** It is the most important form of iron and finds extensive applications. Its carbon content (Impurity) is mid-way between cast iron and wrought iron. *It contains 0.2–1.5% carbon. Steels containing 0.2–0.5% of carbon are known as mild steels, while those containing 0.5–1.5% carbon are known as hard steels.*

Steel is generally manufactured from cast iron by three processes, viz, (i) Bessemer Process which involves the use of a large pear-shaped furnace (vessel) called Bessemer converter, (ii) L.D. process and (iii) open hearth process, Spiegeleisen (an alloy of Fe , Mn and C) is added during manufacture of steel.

Heat treatment of steels : Heat treatment of steel may be defined as the process of carefully heating the steel to high temperature followed by cooling to the room temperature under controlled conditions. Heat treatment of steel is done for the following two purposes,

(i) To develop certain special properties like hardness, strength, ductility etc. without changing the chemical composition.

(ii) To remove some undesirable properties or gases like entrapped gases, internal stresses and strains. The various methods of heat treatment are,

(a) **Annealing :** It is a process of heating steel to redness followed by slow cooling.

(b) **Quenching or hardening :** It is a process of heating steel to redness followed by sudden cooling by plunging the red hot steel into water or oil.

(c) **Tempering :** It is a process of heating the hardened or quenched steel to a temperature much below redness (473–623K) followed by slow cooling.

(d) **Case-hardening :** It is a process of giving a thin coating of hardened steel to wrought iron or to a strong and flexible mild steel by heating it in contact with charcoal followed by quenching in oil.

(e) **Nitriding :** It is a process of heating steels at about 700 °C in an atmosphere of ammonia. This process imparts a hard coating of iron nitride on the surface of steel.

Properties of steel : The properties of steel depend upon its carbon contents. With the increase in carbon content, the hardness of steel increases while its ductility decreases.

(i) Low carbon or soft steels contain carbon upto 0.25%.

(ii) Medium carbon steels or mild steels contain 0.25–0.5% carbon.

(iii) High carbon or hard steels contains 0.1 – 1.5 percent carbon.

(iv) Alloy steels or special steels are alloys of steel with Ni , Cr , Co , W , Mn , V etc., For example

(a) Stainless steel ($Fe = 73\%$, $Cr = 18\%$, $Ni = 8\% + C$) is resistant to corrosion and is used for making ornamental pieces, cutlery etc.

(b) Invar ($Fe = 64\%$, $Ni = 36\%$) has small coefficient of expansion and is used for making metre scales, pendulum rods and watches.

(c) Manganese steel ($Fe = 86\%$, $Mn 13\% + \text{carbon}$) is very hard and resistant to wear and hence is used for making rock drills, safes etc.

(d) Tungsten steel ($Fe = 94\%$, $W = 5\% + \text{carbon}$) is quite hard and is used for making high speed cutting tools.

(e) Permalloy ($Fe = 21\%$, $Ni = 78\% + \text{carbon}$) is strongly magnetised by electric current but loses magnetism when current is cut off. It is used for making electromagnets, ocean cables etc.

Properties of iron

(1) Dry or moist air has no action on pure iron but impure iron when exposed to moist air is covered with a layer of rust $Fe_2O_3 + Fe(OH)_3$. However, finely divided pure iron burns in air or oxygen forming Fe_3O_4 (magnetic oxide of iron).

(2) Iron decomposes steam at red heat

(3) **Action of acids :** Iron reacts with dil. HCl and dil. H_2SO_4 liberating hydrogen. with hot conc. H_2SO_4 , it gives SO_2 , with dil. HNO_3 , it gives NH_4NO_3 and moderately conc. HNO_3 reacts with iron forming NO_2 .

Cold conc. HNO_3 makes iron passive due to the deposit of a thin layer of iron oxide (Fe_3O_4) on the surface.

Hot conc. HNO_3 reacts with iron liberating NO .

(4) Iron does not react with alkalis.

(5) It displaces less electropositive metals (e.g., Cu , Ag etc.) from their salts

(6) Finely divided iron combines with CO forming penta carbonyl

(7) Iron does not form amalgam with Hg .

(8) Iron is the most abundant and most widely used transition metal.

Compounds of iron

(1) **Oxides of Iron** : Iron forms three oxides FeO , Fe_2O_3 (Haematite), Fe_3O_4 (magnetite also called magnetic oxide or load stone).

(i) **Ferrous oxide**, FeO : It is a black powder, basic in nature and reacts with dilute acids to give ferrous salts.

$FeO + H_2SO_4 \rightarrow FeSO_4 + H_2O$; It is used in glass industry to impart green colour to glass.

(ii) **Ferric oxide** Fe_2O_3 : It is a reddish brown powder, not affected by air or water; amphoteric in nature and reacts both with acids and alkalis giving salts. It can be reduced to iron by heating with C or CO .

It is used as red pigment to impart red colour to external walls and as a polishing powder by jewellers.

(iii) **Ferrosoferric oxide** $Fe_3O_4(FeO.Fe_2O_3)$: It is more stable than FeO and Fe_2O_3 , magnetic in nature and dissolves in acids giving a mixture of iron (II) and iron (III) salts.

(2) **Ferrous sulphide** FeS : It is prepared by heating iron filing with sulphur. With dilute H_2SO_4 , it gives H_2S .

(3) **Ferric chloride** $FeCl_3$: (i) **preparation** : It is prepared by treating $Fe(OH)_3$ with HCl

The solution on evaporation give yellow crystals of $FeCl_3 \cdot 6H_2O$

(ii) **Properties** : (a) Anhydrous $FeCl_3$ forms reddish-black deliquescent crystals.

(b) $FeCl_3$ is hygroscopic and dissolves in H_2O giving brown acidic solution due to formation of HCl

(c) Due to oxidising nature Fe^{3+} ions $FeCl_3$ is used in etching metals such as copper

(d) In vapour state $FeCl_3$ exists as a dimer, Fe_2Cl_6

(e) $FeCl_3$ is used as styptic to stop bleeding from a cut.

(4) **Ferrous sulphate**, $FeSO_4 \cdot 7H_2O$ (Green vitriol) : It is prepared as follow ,

(i) One pressure to moist air crystals become brownish due to oxidation by air.

(ii) On heating, crystals become anhydrous and on strong heating it decomposes to Fe_2O_3 , SO_2 and SO_3 .

(iii) It can reduce acidic solution of $KMnO_4$ and $K_2Cr_2O_7$

(iv) It is generally used in double salt with ammonium sulphate.

Mohr's salt is resistant to atmospheric oxidation.

(v) It is used in the ring test for nitrate ions where it gives brown coloured ring of compound $FeSO_4 \cdot NO$.

(vi) $FeSO_4$ is used in manufacture of blue black ink.

(vii) $FeSO_4 + H_2O_2$ is known as a name of **Fenton's reagent**.

(5) **Mohr's salt** $FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$: It is a double salt and is prepared by crystallising a solution containing equivalent amounts of $FeSO_4 \cdot 7H_2O$ and $(NH_4)_2SO_4$. It may be noted that Mohr's salt contains only Fe^{2+} ions without any trace of Fe^{3+} ions. In contrast $FeSO_4 \cdot 7H_2O$ always contains some Fe^{3+} ions due to aerial oxidation of Fe^{2+} ions. Mohr salt is, therefore, used as a primary standard in volumetric analysis since a standard solution of Fe^{2+} ions can be obtained directly by weighing a known amount of the Mohr salt.

It acts as a reducing agent and as such reduces acidified $KMnO_4$ and $K_2Cr_2O_7$ solutions.

Copper and its Compounds

(1) **Ores** : Copper pyrites (chalcopyrite) $CuFeS_2$, Cuprite (ruby copper) Cu_2O , Copper glance (Cu_2S), Malachite [$Cu(OH)_2 \cdot CuCO_3$], Azurite [$Cu(OH)_2 \cdot 2CuCO_3$]

(2) **Extraction** : Most of the copper (about 75%) is extracted from its sulphide ore, copper pyrites.

Concentration of ore : Froth floatation process.

Roasting : Main reaction :

Side reaction : $2Cu_2S + 3O_2 \rightarrow 2Cu_2O + 2SO_2$

Smelting : $FeO + SiO_2 \rightarrow FeSiO_3(\text{slag})$

The mixture of copper and iron sulphides melt together to form 'matte' ($\text{Cu}_2\text{S} + \text{FeS}$) and the slag floats on its surface.

Conversion of matte into Blister copper (Bessemerisation) : Silica is added to matte and a hot blast of air is passed $\text{FeO} + \text{SiO}_2 \rightarrow \text{FeSiO}_3(\text{slag})$. Slag is removed. By this time most of iron sulphide is removed. $\text{Cu}_2\text{S} + 2\text{Cu}_2\text{O} \rightarrow 6\text{Cu} + \text{SO}_2$

Blister copper : Which contain about 98% pure copper and 2% impurities (*Ag, Au, Ni, Zn* etc.)

Properties of copper : It has reddish brown colour. It is highly malleable and ductile. It has high electrical conductivity and high thermal conductivity. Copper is second most useful metal (first being iron). It undergoes displacement reactions with lesser reactive metals e.g. with *Ag*. It can displace *Ag* from AgNO_3 . The finally divided *Ag* so obtained is black in colour.

Copper shows oxidation states of +1 and +2. Whereas copper (I) salts are colourless, copper (II) salts are blue in colour. *Cu* (I) salts are less stable and hence are easily oxidised to *Cu* (II) salts ($2\text{Cu}^+ \rightarrow \text{Cu}^{2+} + \text{Cu}$). This reaction is called **disproportionation**.

(1) In presence of atmospheric CO_2 and moisture, copper gets covered with a green layer of basic copper carbonate (green layer) which protects the rest of the metal from further action.

(2) In presence of oxygen or air, copper when heated to redness (below 1370K) first forms red cuprous oxide which changes to black cupric oxide on further heating. If the temperature is too high, cupric oxide changes back to cuprous oxide

(3) Action of acids. Non oxidising dil. acids such as $\text{HCl}, \text{H}_2\text{SO}_4$ have no action on copper. However, copper dissolves in these acids in presence of air.

With dil. HNO_3 , *Cu* liberates *NO* (nitric oxide)

With conc. HNO_3 , copper gives NO_2

With hot conc. H_2SO_4 , copper gives SO_2

Compounds of Copper

(i) **Halides of copper** : Copper (II) chloride, CuCl_2 is prepared by passing chlorine over heated copper. Concentrated aqueous solution of CuCl_2 is dark brown but changes first to green and then to blue on dilution.

On heating, it disproportionates to copper (I) chloride and chlorine

It is used as a catalyst in the **Daecon's process** for the manufacture of chlorine.

Copper (I) chloride, CuCl is a white solid insoluble in water. It is obtained by boiling a solution of CuCl_2 with excess of copper turnings and conc. HCl .

It dissolves in conc. HCl due to the formation of complex $\text{H}[\text{CuCl}_2]$

It is used as a catalyst alongwith NH_4Cl in the preparation of synthetic rubber.

(2) **Cuprous oxide** Cu_2O : It is a reddish brown powder insoluble in water but soluble in ammonia solution, where it forms diammine copper (I) ion. $\text{Cu}^+ + 2\text{NH}_3 \rightarrow [\text{Cu}(\text{NH}_3)_2]^+$. It is used to impart red colour to glass in glass industry.

(3) **Cupric oxide** CuO : It is dark black, hygroscopic powder which is reduced to *Cu* by hydrogen, *CO* etc. It is used to impart light blue colour to glass. It is prepared by heating copper nitrate.

(4) **Copper sulphate** $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ (Blue vitriol) : It is prepared by action of dil H_2SO_4 on copper scrap in presence of air.

(i) On heating this blue salt becomes white due to loss of water of crystallization.

At about 1000 K, CuSO_4 decomposes to give CuO and SO_3 .

(ii) It gives a deep blue solution of tetrammine copper (II) sulphate with NH_4OH .

(iii) With *KCN* it first gives yellow precipitate of CuCN which decomposes to give $\text{Cu}_2(\text{CN})_2$. $\text{Cu}_2(\text{CN})_2$ dissolves in excess of *KCN* to give $\text{K}_3[\text{Cu}(\text{CN})_4]$

(iv) With *KI* it gives white ppt. of Cu_2I_2

(v) With $\text{K}_4[\text{Fe}(\text{CN})_6]$, CuSO_4 gives a reddish brown ppt. of $\text{Cu}_2[\text{Fe}(\text{CN})_6]$

Uses : For electroplating and electrorefining of copper. As a mordant in dyeing. For making Bordeaux mixture (11 parts lime as milk of lime + 16 parts copper sulphate in 1,000 parts of water). It is an excellent fungicide. For making green pigments containing copper carbonate and other compounds of copper. Like Verdigris which is $\text{Cu}(\text{CH}_3\text{COO})_2\text{Cu}(\text{OH})_2$ i.e. basic copper acetate and is used as a green pigment in paints. As a fungicide in starch paste for book binding work.

The film is finally fixed by dipping in a solution of sodium thiosulphate or hypo which removes unchanged $AgBr$ as complex ion.

After taking a print of the photograph it is finally toned by dipping in a dilute solution of gold chloride to impart a beautiful golden colour or it is dipped in potassium chloro platinate K_2PtCl_6 solution to get a shining grey tinge.

Gold and its Compounds

(1) **Occurrence of gold** : Gold is mainly found in native state either as vein gold, placer gold or alluvial gold. It is also present to a small extent in the combined state as sulphide, telluride and arsenosulphide. It is considered to be the king of metal.

Some important ores of gold are:

- (i) Calaverite, $AuTe$ (ii) Sylvanite, $AuAgTe$ and
- (iii) Bismuth aurite, $BiAu_2$

(2) **Extraction of gold** : (i) **Mac-Arthur-Forest Cyanide process** : The powdered gold ore, after concentration by *Froth-floatation process*, is roasted to remove easily oxidisable impurities of tellurium, arsenic and sulphur. The roasted ore is then treated with a dilute solution of KCN in presence of atmospheric oxygen when gold dissolves due to the formation of an aurocyanide complex.

The metal is then extracted by adding zinc dust.

(ii) **Plattner's chlorine process** : The roasted ore is moistened with water and placed in wooden vats with false perforated bottoms. It is saturated with current of chlorine, gold chloride thus formed is leached with water and the solution is treated with a reducing agent such as $FeSO_4$ or H_2S to precipitate gold.

The impure gold thus obtained contains impurities of Ag and Cu . The removal of Ag and Cu from gold is called parting. This is done by heating impure gold with conc. H_2SO_4 (or HNO_3) when Ag and Cu dissolve leaving behind Au .

Properties of Gold: Gold is a yellow, soft and heavy metal. Gold and Ag are called noble metals since they are not attacked by atmospheric oxygen. However, Ag gets tarnished when exposed to air containing traces of H_2S . Gold is malleable, ductile and a good conductor of heat and electricity.

Pure gold is soft. It is alloyed with Ag or Cu for making jewellery. Purity of gold is expressed in terms of carats. Pure gold is 24 carats. Gold '14 carats' means that it is an alloy of gold which contains 14 parts by weight of pure gold and 10 parts of copper per 24 parts by weight of the alloy. Thus the percentage of gold in '14 carats' of gold is = $\frac{100}{24} \times 14 = 58.3\%$.

Most of the jewellery is made from 22 carat gold (91.66% pure gold). Gold is quite inert. It does not react with oxygen, water and acids but dissolves in aqua regia

Oxidation states of gold: The principal oxidation states of gold are +1 and +3 though +1 state is more stable than +3.

Compounds of gold

(1) **Auric chloride, $AuCl_3$** : It is prepared by passing dry Cl_2 over finely divided gold powder at 573 K

It is a red coloured crystalline solid soluble in water and decomposes on heating to give gold (I) chloride and Cl_2

It dissolves in conc. HCl forming chloroauric acid

Chloroauric acid is used in photography for toning silver prints and as an antidote for snake poisoning.

(2) **Aurous sulphide, Au_2S** : It is prepared when H_2S is passed through an acidified solution of potassium aurocyanide, $K[Au(CN)_2]$

It is a dark brown solid, not attacked by dilute mineral acids and hence is probably the most stable gold compound.

Zinc and its Compounds

(1) **Occurrence of zinc**: Zinc does not occur in the native form since it is a reactive metal. The chief ores of zinc are (i) Zinc blende (ZnS) (ii) Calamine or zinc spar ($ZnCO_3$) and (iii) Zincite (ZnO)

(2) **Extraction of zinc** : Zinc blende, after concentration by Froth floatation process, is roasted in air to convert it into ZnO . In case of calamine, ore is calcined to get ZnO . The oxide thus obtained is mixed with crushed coke and heated at 1673 K in fire clay retorts (Belgian Process) when ZnO gets reduced to metallic zinc. Being volatile at this temperature, the metal distils over and is condensed leaving behind Cd , Pb and Fe as impurities. The crude metal is called spelter. The metal may be refined either by electrolysis or by fractional distillation.

Properties of Zn : Zinc is more reactive than mercury. It is a good conductor of heat and electricity. Zinc readily combines with oxygen to form ZnO . Pure zinc does not react with non-oxidising acids (HCl or H_2SO_4)

but the impure metal reacts forming Zn^{2+} ions and evolving H_2 gas.

Hot and conc. H_2SO_4 attacks zinc liberating SO_2 gas

Zinc also reacts with both dilute (hot and cold) HNO_3 and conc. HNO_3 liberating nitrous oxide (N_2O), ammonium nitrate (NH_4NO_3) and nitrogen dioxide (NO_2) respectively.

Zinc dissolves in hot concentrated NaOH forming the soluble sod.

Zincate

(3) **Special varieties of zinc.** (i) **Zinc dust** : It is prepared by melting zinc and then atomising it with a blast of air.

(ii) **Granulated zinc** : It is prepared by pouring molten zinc into cold water.

Both these varieties of zinc are used as reducing agents in laboratory.

Compounds of zinc

(1) **Zinc oxide (Zinc white or Chinese white), ZnO** : It is obtained by burning zinc in air or by heating zinc carbonate or zinc nitrate.

It is a white powder but becomes yellow on heating and again white on cooling.

It is insoluble in water and is very light and hence commonly known as **philosopher's wool**.

It is amphoteric in nature.

It is reduced both by carbon and H_2 and is used as a white paint

(2) **Zinc chloride, ZnCl_2** : It is obtained when Zn metal, ZnO or ZnCO_3 is treated with dil. HCl . It crystallizes as $\text{ZnCl}_2 \cdot 2\text{H}_2\text{O}$ and becomes anhydrous on heating. ZnCl_2 is highly deliquescent and is highly soluble in H_2O and also readily dissolves in organic solvents like acetone, alcohol, ether etc. its aqueous solution is acidic due to hydrolysis.

Anhydrous ZnCl_2 is used as a Lewis acid catalyst in organic reactions. Mixed with moist zinc oxide, it is used for filling teeth and its solution is used for preserving timber. Anhydrous ZnCl_2 used as a Lucas reagent with conc. HCl .

(3) **Zinc sulphide, ZnS** : It is a white solid. It is soluble in dil. HCl and thus does not get precipitated by H_2S in the acidic medium.

It is a constituent of lithopone ($\text{ZnS} + \text{BaSO}_4$)

(4) **Zinc sulphate, $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$** : It is commonly known as white vitriol and is obtained by the action of dil. H_2SO_4 on zinc metal, ZnO or ZnCO_3 . On heating, it first loses six molecules of water of crystallization at 373 K. At 723 K, it becomes anhydrous and on further heating, it decomposes.

It is used to prepare lithopone ($\text{BaSO}_4 + \text{ZnS}$), a white paint and also in galvanising iron.

It is also used as an eye lotion.

Mercury and its compounds

(1) **Occurrence and extraction of mercury : Cinnabar (HgS)** is the only important ore of Hg . It is concentrated by froth floatation method and mercury is extracted from this ore by heating it in air at 773-873 K (auto reduction).

The mercury vapours thus obtained are condensed to give liquid metal. Hg thus obtained contains impurities of Zn , Sn and Pb . These are removed by treating the impure metal with dil. HNO_3 , mercurous nitrate, $\text{Hg}_2(\text{NO}_3)_2$ thus formed react with metals present as impurities forming their nitrates which pass into solution leaving behind pure mercury. However, it is best purified by distillation under reduced pressure.

Similar reaction is given by Pb and Sn .

Properties of mercury : Mercury is less reactive than Zn . It is a liquid at room temperature and has low thermal and electrical conductivity. Mercury forms dimeric mercury (I) ions, Hg_2^{+2} in which the two atoms are bonded by a covalent bond. It is slowly oxidised to HgO at about its boiling point. Hg does not react with dil. HCl or dil. H_2SO_4 but reacts with hot concentrated H_2SO_4 to form HgSO_4 , it reacts with both warm dil. and conc. HNO_3 evolving NO and NO_2 respectively.

Hg does not react with steam or water hence can't form any hydroxide.

Compounds of mercury

(1) **Mercuric oxide, HgO** : It is obtained as a red solid by heating mercury in air or oxygen for a long time at 673 K

or by heating mercuric nitrate alone or in the presence of Hg

When NaOH is added to a solution of HgCl_2 , yellow precipitate of HgO are obtained.

Red and yellow forms of HgO differ only in their particle size. On heating to 673 K, yellow form changes to red form.

It is used in oil paints or as a mild antiseptic in ointments.

(2) **Mercuric chloride, $HgCl_2$** : It is obtained by treating Hg with Cl_2 or by heating a mixture of $NaCl$ and $HgSO_4$ in presence of small amount of MnO_2 (which oxidises any $Hg(I)$ salts formed during the reaction).

It is a white crystalline solid and is commonly known as **corrosive sublimate**. It is a covalent compound since it dissolves in organic solvents like ethanol and ether.

It is extremely poisonous and causes death. Its best antidote is white of an egg.

When treated with stannous chloride, it is first reduced to white ppt. of mercurous chloride and then to mercury (black).

With ammonia it gives a white ppt. known as infusible white ppt.

A dilute solution of $HgCl_2$ is used as an antiseptic.

(3) **Mercuric iodide, HgI_2** : It is obtained when a required amount of KI solution is added to a solution of $HgCl_2$.

Below 400 K, HgI_2 is red but above 400 K, it turns yellow

HgI_2 readily dissolves in excess of KI solution to form the $(HgI_4)^{2-}$ complex ion.

An alkaline solution of $K_2[HgI_4]$ is called Nessler's reagent and is used to test NH_4^+ ions.

It gives a brown ppt. of $NH_2-Hg-O-Hg-I$ (Iodide of Millon's base) with NH_4^+ ions.

It is used in ointments for treating skin infections.

(4) **Mercurous chloride, Hg_2Cl_2** : It is obtained as under:

(b) $HgCl_2 + Hg \xrightarrow{\text{Heat in an iron retort}} Hg_2Cl_2$ (condenses on cooling)

It is purified by sublimation.

Mercurous chloride is also called calomel. It is a white powder insoluble in H_2O . On heating, it decomposes to give $HgCl_2$ and Hg .

It dissolves in chlorine water forming mercuric chloride.

With ammonia, it turns black due to the formation of a mixture of finely divided black Hg and mercuric amino chloride.

It is used to prepare standard calomel electrode and as a purgative in medicine.

(5) **Mercuric sulphide, HgS** : The solubility product of HgS is lower than that of ZnS and hence it gets precipitated as black solid when H_2S is passed through an acidic solution of any mercury (II) salt.

It is insoluble in water and HCl but dissolves in aqua regia (1 part conc. HNO_3 + 3 parts conc. HCl)

On sublimation, its colour changes to red and hence it is used as a red pigment.

(6) **Mercuric sulphate, $HgSO_4$** : It is obtained when HgS is treated with conc. H_2SO_4 .

It is a white solid which decomposes on heating to give mercurous sulphate.

It is used as a catalyst in the hydration of alkynes to give aldehydes or ketones. It is also used as a cosmetic under the name **Vermillion** and in ayurvedic medicine as **makardhwaj**.

(7) **Amalgams**: Mercury forms alloys commonly known as amalgams, with all metals except iron and platinum. Hence it is transported in iron containers.

(8) **Alloy of transition metal**: See in table discuss earlier in metallurgy.

Lanthanides and Actinides

Lanthanides and actinides are collectively called *f*-block elements because last electron in them enters into *f*-orbitals of the antepenultimate (*i.e.*, inner to penultimate) shell partly but incompletely filled in their elementary or ionic states. The name inner transition, elements is also given to them because they constitute transition series with in transition series (*d*-block elements) and the last electron enters into antepenultimate shell (*n*-2)*f*. In addition to incomplete *d*-subshell, their *f*-subshell is also incomplete. Thus, these elements have three incomplete outer shells *i.e.*, (*n*-2), (*n*-1)

and n shells and the general electronic configuration of f -block elements is $(n-2)f^{1-14}(n-1)d^{0-10}ns^2$.

(i) **Lanthanides** : The elements with atomic numbers 58 to 71 i.e. cerium to lutetium (which come immediately after lanthanum $Z = 57$) are called lanthanides or **lanthanones or rare earths**. These elements involve the filling of 4 f -orbitals. Their general electronic configuration is, $[Xe]4f^{1-14}5d^{0-10}6s^2$. Promethium (Pm), atomic number 61 is the only synthetic (man made) radioactive lanthanide.

Properties of lanthanides

- (i) These are highly dense metals and possess high melting points.
- (ii) They form alloys easily with other metals especially iron. e.g. **misch metal** consists of a rare earth element (94–95%), iron (upto 5%) and traces of S , C , Ca and Al , pyrophoric alloys contain Ce (40–5%), La + neodymium (44%), Fe (4–5%), Al (0–5%) and the rest is Ca , Si and C . It is used in the preparation of ignition devices e.g., trace bullets and shells and flints for lighters and cigarette.
- (iii) **Oxidation state** : Most stable oxidation state of lanthanides is +3. Oxidation states + 2 and + 4 also exist but they revert to +3 e.g. Sm^{2+} , Eu^{2+} , Yb^{2+} lose electron to become +3 and hence are good reducing agents, whereas Ce , Pr , Tb in aqueous solution gain electron to become + 3 and hence are good oxidizing agents. There is a large gap in energy of 4 f and 5 d subshells and thus the number of oxidation states is limited.

(iv) **Colour** : Most of the trivalent lanthanide ions are coloured both in the solid state and in aqueous solution. This is due to the partly filled f orbitals which permit $f-f$ transition. The elements with $x f$ electrons have a similar colour to those of $(14 - x)$ electrons.

(v) **Magnetic properties** : All lanthanide ions with the exception of Lu , Yb and Ce^{+} are paramagnetic because they contain unpaired electrons in the 4 f orbitals. These elements differ from the transition elements in that their magnetic moments do not obey the simple “spin only” formula $\mu_{eff} = \sqrt{n(n+2)}$ B.M. where n is equal to the number of unpaired electrons. In transition elements, the orbital contribution of the electron towards magnetic moment is usually quenched by interaction with electric fields of the environment but in case of lanthanides the 4 f -orbitals lie too deep in the atom for such quenching to occur. Therefore, magnetic moments of lanthanides are calculated by taking into consideration spin as well as orbital contributions and a more complex formula

$$\mu_{eff} = \sqrt{4S(S+1) + L(L+1)} \text{ B.M.}$$

which involves the orbital quantum number L and spin quantum number S .

(vi) **Complex formation** : Although the lanthanide ions have a high charge (+3) yet the size of their ions is very large yielding small charge to size ratio i.e., low charge density. As a consequence, they have poor tendency to form complexes. They form complexes mainly with strong chelating agents such as EDTA, β -diketones, oxine etc. No complexes with π -bonding ligands are known.

(vii) **Lanthanide contraction** : The regular decrease in the size of lanthanide ions from La^{3+} to Lu^{3+} is known as lanthanide contraction. It is due to greater effect of the increased nuclear charge than that of the screening effect.

Consequences of lanthanide contraction

- (a) It results in slight variation in their chemical properties which helps in their separation by ion exchange
- (b) Each element beyond lanthanum has same atomic radius as that of the element lying above it in the group (e.g. Zr 145 pm, Hf 144 pm); Nb 134 pm, Ta 134 pm; Mo 129 pm, W 130 pm).

(c) The covalent character of hydroxides of lanthanides increases as the size decreases from La^{3+} to Lu^{3+} . However basic strength decreases. Thus $La(OH)_3$ is most basic whereas $Lu(OH)_3$ is least basic. Similarly, the basicity of oxides also decreases in the order from La^{3+} to Lu^{3+} .

(d) Tendency to form stable complexes from La^{3+} to Lu^{3+} increases as the size decreases in that order.

(e) There is a slight increase in electronegativity of the trivalent ions from La to Lu .

(f) Since the radius of Yb^{3+} ion (86 pm) is comparable to the heavier lanthanides Tb , Dy , Ho and Er , therefore they occur together in natural minerals.

(2) **Actinides** : The elements with atomic numbers 90 to 103 i.e. thorium to lawrencium (which come immediately after actinium, $Z = 89$) are called actinides or actinones. These elements involve the filling of 5 f orbitals. Their general electronic configuration is, $[Rn]5f^{1-14}6d^{0-1}7s^2$.

They include three naturally occurring elements thorium, protactinium and uranium and eleven transuranium elements or transuranics which are produced artificially by nuclear reactions. They are synthetic or man made elements. All actinides are radioactive.

Properties of actinides

(i) **Oxidation state** : The dominant oxidation state of actinides is +3 which shows increasing stability for the heavier elements. Np shows +7 oxidation state but this is oxidising and is reduced to the most stable state +5. Pu also shows states upto +7 and Am upto +6 but the most stable state drops to Pu (+4) and Am (+3). Bk in +4 state is strongly oxidising but is more stable than Cm and Am in 4 state due to f^7 configuration. Similarly, No is markedly stable in +2 state due to its f configuration. When the oxidation number increases to + 6, the actinide ions are no longer simple. The high charge density causes the formation of oxygenated ions e.g., UO_2^{2+} , NpO_2^{2+} etc. The exhibition of large number of oxidation states of actinides is due to the fact that there is a very small energy gap between 5 f , 6 d and 7 s subshells and thus all their electrons can take part in bond formation.

(ii) **Actinide contraction** : There is a regular decrease in ionic radii with increase in atomic number from Th to Lr . This is called actinide contraction analogous to the lanthanide contraction. It is caused due to imperfect shielding of one 5 f electron by another in the same shell. This results in increase in the effective nuclear charge which causes contraction in size of the electron cloud.

(iii) **Colour of the ions** : Ions of actinides are generally coloured which is due to $f-f$ transitions. It depends upon the number of electrons in 5 f orbitals.

(iv) **Magnetic properties** : Like lanthanides, actinide elements are strongly paramagnetic. The magnetic moments are lesser than the theoretically predicted values. This is due to the fact that 5 f electrons of actinides are less effectively shielded which results in quenching of orbital contribution.

(v) **Complex formation** : Actinides have a greater tendency to form complexes because of higher nuclear charge and smaller size of their atoms. They form complexes even with π -bonding ligands such as alkyl phosphines, thioethers etc, besides EDTA, β -diketones, oxine etc. The degree of complex formation decreases in the order.

Where M is element of actinide series. There is a high concentration of charge on the metal atom in MO_2^{2+} which imparts to it relatively high tendency towards complex formation.

- ✍ Iron pyrites is also known as Fool's gold ($CuFeS$).
- ✍ Ni can be extracted by or ford process.
- ✍ Chromium oxide is also known as chrome green.
- ✍ Cr_2O_3/CH_3N or solution of chromic oxide in pyridine is known as Collin's reagent.
- ✍ $Cr_2O_3 \cdot 2H_2O$ is also known as Guignet's green.
- ✍ Zn , Cd and Hg are not expected to form covalent bond amongst themselves, hence they have relatively lower melting point.
- ✍ The +2 oxidation state become more stable while the +3 state become less stable from left to right in the periodic table.
- ✍ For the first four element of a transition series higher oxidation states are more stable than lower oxidation state. For next five-element lower oxidation state are more stable than higher oxidation state.
- ✍ Many transition metal compound are isomorphous e.g. $FeSO_4 \cdot 7H_2O$ and $ZnSO_4 \cdot 7H_2O$ because of almost equal ionic sizes of these metals.
- ✍ Lightest transition metal is Sc and heaviest and densest transition element is osmium.
- ✍ Mercurous ion exist as dimer Hg_2^{2+} and not as Hg and this explains its diamagnetic nature.
- ✍ Pt , Pd and Ir are inert metal.
- ✍ $TiCl_3$ and TiO_2 are used in smoke screens.
- ✍ Mo is used in X-ray tube, Ta in analytic weight and instrument used in surgery of veins.
- ✍ Fe is green and Fe^{3+} is yellow.
- ✍ Fe^{3+} is powerful oxidizing agent than Fe^{2+} ion.
- ✍ Iron carbide or cementite is Fe_3C .
- ✍ Kipp's base is $FeS + H_2SO_4$.
- ✍ Copper dissolves in an aqueous solution of $FeCl_3$.
- ✍ $CuSO_4$ reacts only with KI does not react with KCl , KBr or KF .
- ✍ $CuCl_2$ and $CuBr_2$ are covalent and exist as polymer while CuF_2 is an ionic solid.
- ✍ All silver halide except AgF are insoluble in water.
- ✍ Ag , Au and Cu are known as coinage metals.
- ✍ Fulminating gold is $Au(NH_2) = NH$ or NH_2 .
- ✍ Purple of cassius is a colloidal solution of gold.
- ✍ Mercuric salts are more stable than mercurous salts.
- ✍ All the elements of f-block are in group 3 of the periodic table.
- ✍ Schweitzer reagent is $[Cu(NH_3)_4]SO_4$.
- ✍ Etard reagent is CrO_2Cl_2 .

- ✍ Barfoed's reagent is $Cu(CH_3COO)_2 + CH_3COOH$.
- ✍ Milon's reagent is the solution of mercuric and mercurous nitrate.
- ✍ Zeigler natta catalyst is $TiCl_4 + (C_2H_5)_2Al$.
- ✍ Lindlar's catalyst is $Pd/BaSO_4$.
- ✍ Wilkinson's catalyst is $[Ph_3P]_3RhCl$.
- ✍ Adam catalyst is Pt/PtO_2 .
- ✍ Brown's catalyst is Nickel boride ($P-2$ catalyst).

Ordinary Thinking

Objective Questions

General Characteristics

- The number of unpaired electrons in Cr^+ will be
(a) 3 (b) 4
(c) 5 (d) 6
- The highest oxidation state of Cr will be
(a) 2 (b) 3
(c) 4 (d) 6
- Which statement is true about the transitional elements [MP PMT 1995]
(a) They are highly reactive
(b) They show variable oxidation states
(c) They have low M.P.
(d) They are highly electropositive
- The transitional metal which form green compound in +3 oxidation state and yellow orange compound in +6 oxidation state is
(a) Fe (b) Ni
(c) Cr (d) Co
- Highest (+7) oxidation state is shown by [MP PMT 1990, 2001; RPMT 1999; AIIMS 1999; JIPMER 2001; CBSE PMT 1994, 2002; MP PET 1989, 2003]
(a) Co (b) Cr
(c) V (d) Mn
- Transitional elements are
(a) All metals
(b) Few metals and few non-metals
(c) All solids
(d) All highly reactive
- Which of the following has highest ionic radii [MP PMT 1990]
(a) Cr^{+3} (b) Mn^{+3}
(c) Fe^{+3} (d) Co^{+3}
- In a reaction the ferrous (Fe^{++}) iron is oxidised to ferric (Fe^{+++}) ion. The equivalent weight of the ion in the above reaction is equal to [CPMT 1985]
(a) Half of the atomic weight
(b) 1/5 of the atomic weight
(c) The atomic weight
(d) Twice the atomic weight
- Which of the following element has maximum density
(a) Hg (b) Au
(c) Os (d) Pb
- Which is heaviest among the following [CPMT 1986]
(a) Iron (b) Copper
(c) Gold (d) Silver
- Transitional elements exhibit variable valencies because they release electrons from the following orbits [MP PET/PMT 1988; MP PET 1989; UPSEAT 2001]
(a) ns orbit (b) ns and np orbits
(c) $(n-1)d$ and ns orbits (d) $(n-1)d$ orbit
- The tendency towards complex formation is maximum in
(a) s -block elements (b) p -block elements
(c) d -block elements (d) f -block elements
- Which forms coloured salts [CPMT 1984; MP PET 1995]
(a) Metals (b) Non-metals
(c) p -block elements (d) Transitional elements
- Which element belongs to d -block [CPMT 1984]
(a) Na (b) Ca
(c) Cu (d) Ar
- Variable valency is shown by [MP PMT 1986; AMU 1999]
(a) Na (b) Cu
(c) Mg (d) Al
- The element with a atomic number 26 is [CPMT 1972]
(a) A non-metal (b) Krypton
(c) Iron (d) Manganese
- One of the following metals forms a volatile carbonyl compound and this property is taken advantage of for its extraction. This metal is [NCERT 1984]
(a) Iron (b) Nickel
(c) Cobalt (d) Tungsten
- The coinage metals are
(a) Iron, Cobalt, Nickel (b) Copper and Zinc
(c) Copper, Silver and Gold (d) Gold and Platinum
- Which of the following structure is that of a coinage metal [CPMT 1973, 86]
(a) 2, 8, 1 (b) 2, 8, 18, 1
(c) 2, 8, 8 (d) 2, 18, 8, 3
- An elements in +3 oxidation state has the electronic configuration $(\text{Ar})3d^3$. Its atomic number is [JIPMER 2002]
(a) 24 (b) 23
(c) 22 (d) 21
- The catalytic activity of the transition metals and their compounds is ascribed to their [Kerala (Engg.) 2002]
(a) Chemical reactivity
(b) Magnetic behaviour
(c) Unfilled d -orbitals
(d) Ability to adopt multiple oxidation states and their complexing ability
- What is the general electronic configuration for 2nd row transition series [Orissa JEE 2002]
(a) $[\text{Ne}]3d^{1-10}, 4s^2$ (b) $[\text{Ar}]3d^{1-10}, 4s^{1-2}$
(c) $[\text{Kr}]4d^{1-10}, 5s^{1-2}$ (d) $[\text{Xe}]5d^{1-10}, 5s^{1-2}$
- Transitional elements are named transition elements because their characters are
(a) In between s and p -block elements
(b) Like that of p and d -block elements
(c) They are members of $I-A$ group
(d) They are like inactive elements
- Those elements whose two outermost orbitals are incompletely filled with electrons are
(a) p -block elements
(b) s -block elements
(c) Transitional elements
(d) Both s and p -block elements
- Which ion has maximum magnetic moment [AIIMS 1983; MP PMT 1990]
(a) V^{+3} (b) Mn^{+3}
(c) Fe^{+3} (d) Cu^{+2}
- Which of the following transition metal is present in misch metal
(a) La (b) Sc

- (c) Ni (d) Cr
27. Which of the following statements is not true in regard to transition elements [EAMCET 1988, 89]
- They readily form complex compounds
 - They show variable valency
 - All their ions are colourless
 - Their ions contain partially filled d -electron levels
28. Which of the following represents the electronic configuration of a transition element [EAMCET 1987]
- $1s^2, 2s^2 p^6 \dots ns^2 p^3$
 - $1s^2, 2s^2 p^6 \dots ns^2 p^6 d^3, (n+1)s^2$
 - $1s^2, 2s^2 p^6 \dots ns^2 p^6 d^{10}, (n+1)s^2 p^1$
 - $1s^2, 2s^2 p^6 \dots ns^2 p^6$
29. The general electronic configuration of transition elements is [CPMT 1984, 90, 2002; CBSE PMT 1991, 96; AIIMS 2001; Pb. CET 2000; MP PMT 2003]
- $(n-1)d^{1-5}$
 - $(n-1)d^{1-10} ns^1$
 - $(n-1)d^{1-10} ns^{1-2}$
 - $ns^2 (n-1)d^{10}$
30. Transition elements are coloured [MP PMT 1986; Pb. CET 1989; RPET 1999]
- Due to small size
 - Due to metallic nature
 - Due to unpaired d -electrons
 - All of these
31. Which of the following has the maximum number of unpaired d -electrons [BIT 1992; CBSE PMT 1999]
- Zn
 - Fe^{2+}
 - Ni^{3+}
 - Cu^+
32. Which is not amphoteric [CPMT 1991]
- Al^{3+}
 - Cr^{3+}
 - Fe^{3+}
 - Zn^{2+}
33. Which does not form amalgam [AFMC 1988; MP PET 2001]
- Fe
 - Co
 - Ag
 - Zn
34. Transition metals are often paramagnetic owing to [Bihar CEE 1992]
- Their high M.P. and B.P.
 - The presence of vacant orbitals
 - The presence of one or more unpaired electrons in the system
 - Their being less electropositive than the elements of groups I-A and II-A
35. Elements which generally exhibit multiple oxidation states and whose ions are usually coloured are [NCERT 1973; MP PMT 2000]
- Metalloids
 - Transition elements
 - Non-metals
 - Gases
36. Which of the following transition metal cation has maximum unpaired electrons [MP PET/PMT 1988; MP PMT 1991; RPMT 1997]
- Mn^{+2}
 - Fe^{+2}
 - Co^{2+}
 - Ni^{2+}
37. Maximum number of oxidation states of transition metal is derived from the following configuration [MP PET/PMT 1988]
- ns electron
 - $(n-1)d$ electron
 - $(n+1)d$ electron
 - $ns + (n-1)d$ electron
38. Which of the following statement is correct [MP PET/PMT 1988; MP PMT 1991]
- Iron belongs to 3rd transition series of the periodic table
 - Iron belongs to f -block of the periodic table
 - Iron belongs to second transition series of the periodic table
 - Iron belongs to group VIII of the periodic table
39. Zinc does not show variable valency like d -block elements because [MP PET 1989]
- It is a soft metal
 - d -orbital is complete
 - It is low melting
 - Two electrons are present in the outermost orbit
40. Which of the following is a transitional element [MP PMT 1989; DPMT 1982]
- Al
 - As
 - Ni
 - Rb
41. Which is not true for transition elements
- They are all metals
 - They show variable valency
 - They form coloured ions
 - They do not form co-ordinate compounds
42. The main reason for not using a mercury electrolytic cell in $NaOH$ manufacture is that [CPMT 1988]
- Hg is toxic
 - Hg is a liquid
 - Hg has a high vapour pressure
 - Hg is a good conductor of electricity
43. Lanthanum is grouped with f -block elements because [AMU 2000]
- It has partially filled f -orbitals
 - It is just before Ce in the periodic table
 - It has both partially filled f and d -orbitals
 - The properties of Lanthanum are very similar to the elements of $4f$ -block
44. The element having electronic configuration belongs to $ns^2(n-1)d^{1-10}(n-2)f^{1-14}$ [UPSEAT 2001]
- s -block
 - p -block
 - d -block
 - f -block
45. Variable valency is shown by [UPSEAT 2001]
- Typical elements
 - Normal elements
 - Transition elements
 - None of these
46. Which ion is not coloured [DPMT 2001]
- Cr^{3+}
 - Co^{2+}
 - Cr^{2+}
 - Cu^+
47. The number of unpaired electrons in ferrous ion is [JIPMER (Med.) 2001]
- 5
 - 4
 - 3
 - 2
48. Fe, Co and Ni have valuable catalytic properties in process involving

- (a) Organic compound (b) Oxidation
(c) Hydrogenation (d) Compounds of hydrogen
49. Which of the following statement is not correct [NCERT 1983]
(a) Metals contribute their valency electrons to the common sea of electrons
(b) Metals have high co-ordination number
(c) Metals tend to adopt closely packed structures
(d) Metals have high lattice energy
50. Zinc, cadmium and mercury show the properties of
(a) Typical elements (b) Normal elements
(c) Transitional elements (d) Rare elements
51. Iron is
(a) A normal element (b) A typical element
(c) A transitional element (d) An inert element
52. Platinum, palladium, iridium etc., are called noble metals because [NCERT 1975; CPMT 1976]
(a) Alfred Noble discovered them
(b) They are inert towards many common reagents
(c) They are shining lustrous and pleasing to look at
(c) They are found in active state
53. Which of the following statement is not true about *Mohr's* salt [CPMT 1988]
(a) It decolourises $KMnO_4$
(b) It is a primary standard
(c) It is a double salt
(d) Oxidation state of iron is +3 in this salt
54. Which one of the following statement is true for transition elements [AIIMS 1983; AFMC 1987; JIPMER 1997]
(a) They exhibit diamagnetism
(b) They exhibit inert pair effect
(c) They do not form alloys
(d) They show variable oxidation states
55. The valence shell electronic configuration of Cr^{2+} ion is [Orissa JEE 2005]
(a) $4s^0 3d^4$ (b) $4s^2 3d^2$
(c) $4s^2 3d^0$ (d) $3p^6 4s^2$
56. The hardness of Cr is due to and metallic lusture is due to
(a) Covalent bond, metallic bond
(b) Covalent bond, hydrogen bond
(c) Metallic bond, covalent bond
(d) Metallic bond, hydrogen bond
57. In the first transition series, the highest B.P. and M.P. is of
(a) Cr (b) V
(c) Ni (d) Fe
58. In the following transition elements, the lowest M.P. and B.P. is exhibited by
(a) Cr (b) Hg
(c) Cu (d) Au
59. In the following members of transition elements, the lowest ionization energy is of
(a) Ti (b) Sc
(c) V (d) Mn
60. Which of the following has second ionisation potential less than expected
(a) Cr (b) Zn
(c) V (d) Mo
61. A transition element X has a configuration $[Ar]3d^4$ in its + 3 oxidation state. Its atomic number is [CBSE PMT 1996]
(a) 25 (b) 26
(c) 22 (d) 19
62. The transition element have a characteristic electronic configuration which can be represented as [MP PMT/PET 1988; MP PMT 1989]
(a) $(n-2)s^2 p^6 d^{1-10} (n-1)s^2 p^6 ns^2$
(b) $(n-2)s^2 p^6 d^{1-10} (n-1)s^1 p^6 d^1$ or $d^1 ns^1$
(c) $(n-1)s^1 p^6 d^{10} ns^2 p^6 nd^{1-10}$
(d) $(n-1)s^2 p^6 d^{1-10} ns^1$ or ns^2
63. Number of unpaired electrons in Fe^{+++} ($Z = 26$) is [MP PMT 1995; RPET 2003]
(a) 4 (b) 5
(c) 6 (d) 3
64. Of the ions Zn^{2+} , Ni^{2+} and Cr^{3+} [atomic number of $Zn = 30$, $Ni = 28$, $Cr = 24$] [MP PET 1996]
(a) Only Zn^{2+} is colourless and Ni^{2+} and Cr^{3+} are coloured
(b) All three are colourless
(c) All three are coloured
(d) Only Ni^{2+} is coloured and Zn^{2+} and Cr^{3+} are colourless
65. Common oxidation state of scandium, a transition element is/are [atomic number of $Sc = 21$] [MP PET 1996]
(a) + 4 (b) + 1
(c) + 2 and + 3 (d) + 4 and +1
66. Which of the following is not correct about transition metals [MP PET 1996]
(a) Their melting and boiling points are high
(b) Their compounds are generally coloured
(c) They can form ionic or covalent compounds
(d) They do not exhibit variable valency
67. From +6 to +1 oxidation state is shown by the element of..... group
(a) V-B (b) VI-B
(c) VII-B (d) VIII
68. The electronic configuration of cobalt is
(a) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^1, 4s^2$
(b) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^7, 4s^2$
(c) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^3, 4s^2$
(d) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^5, 4s^2$
69. Out of all the known elements the number of transitional elements is
(a) 80 (b) 61
(c) 43 (d) 38
70. Cigarette or gas lighter is made up of
(a) Misch metal (b) Alkali metal
(c) Noble metal (d) None
71. Bullet-proof steel alloy is prepared by using
(a) Sc (b) Ni
(c) Zr (d) Zn
72. In making gun-berrel, the steel used is
(a) $Fe - Mn$ (b) $Fe - Cr$

- (c) $Fe - W$ (d) $Ni - Mo$
73. Neobium and tantalum metals are used in making surgical instruments because they are
(a) Non-corrosive (b) Hard
(c) Soft (d) All
74. To support tungsten filament in electric bulb, the steel used is
(a) Cr (b) Ni
(c) Mn (d) Mo
75. The elements belonging to the first transition series have atomic number from
(a) 19 to 37 (b) 22 to 32
(c) 24 to 30 (d) 21 to 30
76. Which of the following elements does not belong to the first transition series [BHU 2000; MP PMT 1995]
(a) Fe (b) V
(c) Ag (d) Cu
77. Fe^{2+} shows [RPET 2000]
(a) Ferromagnetism (b) Paramagnetism
(c) Diamagnetism (d) None of these
78. Zinc and mercury do not show variable valency like d -block elements because [RPMT 2000; MP PMT 2000]
(a) They are soft
(b) Their d -shells are complete
(c) They have only two electrons in the outermost subshell
(d) Their d -shells are incomplete
79. Cuprous ion is colourless while cupric ion is coloured because
(a) Both have half filled p and d -orbitals
(b) Cuprous ion has incomplete d -orbital and cupric ion has a complete d -orbital
(c) Both have unpaired electrons in the d -orbitals
(d) Cuprous ion has a complete d -orbital and cupric ion has an incomplete d -orbital
80. Transition metals are related to which block [MP PMT 2003; CPMT 1991]
(a) s -block (b) p -block
(c) d -block (d) None of these
81. The number of unpaired electrons in cobalt atom is (atomic number of $Co = 27$) [MP PMT 2003]
(a) 2 (b) 3
(c) 4 (d) 1
82. Zn is related to which group [MP PMT 2003]
(a) 11B (b) 11A
(c) 1A (d) 1B
83. Which of the following element does not show variable valency
(a) Ni (b) Zn
(c) Cu (d) Mn
84. Which of the following is diamagnetic transitional metal ion
(a) Ni^{+2} (b) Zn^{+2}
(c) Co^{+2} (d) Cu^{+2}
85. Which of the following is not an actinide [DPMT 2005]
(a) Curium (b) Californium
(c) Uranium (d) Terbium
86. The ability to form complex compounds by the transitional metal ion is due to
(a) Small size (b) Vacant ' d ' orbitals
(c) High nuclear charge (d) All of these
87. Which of the following will give green hydrated ion
(a) Fe^{+2} (b) Ni^{+2}
- (c) (a) and (b) both (d) V^{+3}
88. Magnetic moment is expressed in
(a) Faraday (b) Calorie
(c) Bohr Magneton (d) Debye
89. If the colours of salts of transition elements are due to the presence of unpaired electrons in the transition metal ions, which of the following ions will be colourless in aqueous solution
(a) Ti^{3+} (b) Ti^{4+}
(c) Fe^{2+} (d) Fe^{3+}
(The at. no. of Ti and Fe are 22 and 26 respectively)
90. In the periodic table first transition series is placed in
(a) Third period (b) Fourth period
(c) Fifth period (d) None of these
91. The element having general electronic configuration $3d^4 4s^1$ is [BHU 1978; CPMT 1993]
(a) Noble gas (b) Non-metal
(c) Metalloid (d) Transition metal
92. Which of the following general configuration of outermost shell represents chromium element [Cr 's atomic number = 24] [CBSE PMT 1991; MP PMT 1992, 2001; RPET/PMT 1999]
(a) $d^5 s^1$ (b) $d^6 s^0$
(c) $d^4 s^2$ (d) $d^3 s^2$
93. Which element gives maximum balanced oxide [MP PMT 1990]
[KCET 2000]
(a) V (b) Cr
(c) Mn (d) Fe
94. In first transition series, the melting point of Mn is low because [MP PMT/PET 1993]
(a) Due to d^{10} configuration, metallic bonds are strong
(b) Due to d^7 configuration, metallic bonds are weak
(c) Due to d^5 configuration, metallic bonds are weak
(d) None of these
95. Which of the following ions has the least magnetic moment [MP PMT 1993]
(a) Cu^{+2} (b) Ni^{+2}
(c) Co^{+3} (d) Fe^{+2}
96. Among the following outermost configurations of transition metals, which shows the highest oxidation state [MP PMT 1993; MP PET 1995, 2001]
[MP PMT 2003]
(a) $3d^4 4s^2$ (b) $3d^5 4s^1$
(c) $3d^5 4s^2$ (d) $3d^6 4s^2$
97. Which of the following is not true for transition metals [MP PET 1993]
(a) They are malleable and ductile
(b) They have high boiling and melting points
(c) They crystallize with body centred cubic and hexagonal close-packed structures only
(d) They show variable oxidation states although not always
98. The most malleable of all the metals is
(a) Silver (b) Sodium
(c) Gold (d) Platinum
99. Paramagnetism is exhibited by molecules [NCERT 1981; Manipal MEE 1995]
(a) Not attracted in a magnetic field
(b) Containing only paired electrons

- (c) Carrying a positive charge
(d) Carrying unpaired electrons
100. The higher number of unpaired electrons are in [DCE 2001]
(a) Fe (b) Fe^+
(c) Fe^{+2} (d) Fe^{+3}
101. Which one of the following statements concerning lanthanides elements is false [AMU 2001]
(a) Lanthanides are separated from one another by ion exchange methods
(b) The ionic radii of trivalent lanthanides steadily increase with increase in atomic number
(c) All lanthanides are highly dense metals
(d) Most typical oxidation of lanthanides is +3
102. Complex ion is shown by [CPMT 2001]
(a) Ag (b) Au
(c) Cu (d) All of these
103. Which of the following transition metal is used as a catalyst [CPMT 2001]
(a) Nickel (b) Cobalt
(c) Gold (d) Both (a) and (b)
104. For which of the following transition metal ion is shown highest magnetic moment having outer electronic configuration
(a) $3d^1$ (b) $3d^8$
(c) $3d^5$ (d) $3d^7$
105. The number of unpaired electrons is maximum in (Atomic no. : $Ti = 22$; $V = 23$; $Cr = 24$; $Fe = 26$) [MP PET 2003]
(a) Cr (b) Fe
(c) V (d) Sc
106. Europium is [DPMT 2005]
(a) s -block element (b) p -block element
(c) d -block element (d) f -block element
107. Which of the following elements is alloyed with copper to form brass [MP PET 2003; MP PMT 2004]
(a) Lead (b) Silver
(c) Zinc (d) Antimony
108. In which of the following metallic bond is strongest [MP PET 2003]
(a) Fe (b) Sc
(c) V (d) Cr
109. Which of the following is a colourless ion [EAMCET 1992]
(a) Cu^{+2} (b) Fe^{+3}
(c) Ti^{+3} (d) Zn^{+2}
110. The substance used in cancer therapy is [DPMT 2002]
(a) Rn (b) Ni
(c) Fe (d) Co
111. In solution of $AgNO_3$, if Cu is a solution become blue due to [MH CET 2002]
(a) Oxidation of Ag (b) Oxidation of Cu
(c) Reduction of Ag (d) Reduction of Cu
112. Lanthanide for which + II and + III oxidation states are common is
(a) La (b) Nd
(c) Ce (d) Eu
113. The number of unpaired electrons in Zn^{++} is
(a) 2 (b) 3
(c) 4 (d) 0
114. The first transition element is
(a) Chromium (b) Scandium
(c) Nickel (d) Copper
115. The electronic configuration (outermost) of Mn^{+2} ion (atomic no. of $Mn = 25$) in its ground state is [MP PET 1993; MP PMT 1994; AFMC 2002]
(a) $3d^5 4s^0$ (b) $3d^4 4s^1$
(c) $3d^3 4s^2$ (d) $3d^2 4s^2 4p^2$
116. The highest magnetic moment is shown by the transition metal ion with the outer electronic configuration [MP PET 1993; MP PMT 1995; RPMT 1999]
(a) $3d^2$ (b) $3d^5$
(c) $3d^7$ (d) $3d^9$
117. Which has valency two
(a) Al (b) Rb
(c) Cu (d) Ge
118. All the following statements about the transitional elements are true except that [Kerala (Med.) 2003]
(a) All of the transitional elements are predominantly metallic
(b) In aqueous solution many of their simple ions are coloured [MP PET 2003]
(c) Most of the transitional elements show pronounced catalytic activity
(d) Most of the transitional elements show only one valence state
119. Which of the following transition metals can have highest oxidation state [RPET 2003]
(a) Cr (b) Co
(c) Ni (d) Cu
120. Which of the following melts in boiling water [MNR 1984]
(a) Gun metal (b) Wood's metal
(c) Monel metal (d) Bell metal
(e) None of these
121. On the basis of position in the electrochemical series, the metal which does not displace hydrogen from water and acid is
(a) Hg (b) Al
(c) Pb (d) Ba
122. The tendency of $3d$ -metal ions to form stable complexes is due to their [MP PMT 1997]
(a) Variable oxidation state
(b) Strong electronegative nature
(c) High charge/size ratio and vacant d -orbitals
(d) Very low ionization energies
123. The $3d$ -metal ions are paramagnetic in nature because [MP PMT 1997]
(a) They are reducing agents
(b) They form coloured salts
(c) They have one or more paired s -electrons
(d) They have one or more unpaired d -electrons
124. Lanthanide contraction occurs because [AIIMS 2003] [AMU 2000; BHU 2003]
(a) f -orbital electrons are easily lost
(b) f -orbital an incompletely filled
(c) f -orbital electron an poor shielders of nuclear charge
(d) f -orbital do not come out on the surface of atom and are buried inside

125. Which is most reactive metal [BHU 1979]
 (a) *Fe* (b) *Pt*
 (c) *Ni* (d) *Co*
126. Least reactive metal is
 (a) *Fe* (b) *Os*
 (c) *Ni* (d) *Pt*
127. Which occludes hydrogen
 (a) *Os* (b) *Pt*
 (c) *Ni* (d) All of these
128. Which has the maximum ferromagnetic character
 (a) *Fe* (b) *Co*
 (c) *Ni* (d) *Pt*
129. Which forms interstitial compounds [BHU 1982; MP PMT 1983]
 (a) *Fe* (b) *Co*
 (c) *Ni* (d) All of these
130. Which occurs in nature in free state
 (a) *Fe* (b) *Co*
 (c) *Ni* (d) *Pt*
131. $3d^{10} 4s^0$ electronic configuration exhibits
 (a) Zn^{++} (b) Cu^{++}
 (c) Cd^{++} (d) Hg^{++}
132. $3d^0 4s^0$ electronic configuration exhibits
 (a) Pd^{+2} (b) Sc^{+2}
 (c) Ti^{+4} (d) Zn^{+2}
133. Rare-earth elements are exhibited by
 (a) At. No. 58 to 71 (b) At. No. 21 to 30
 (c) At. No. 39 to 71 (d) At. No. 81 to 91
134. All those elements belong to *f*-block whose atomic numbers are
 (a) 58 to 71 (b) 90 to 103
 (c) Both (a) and (b) (d) None
135. The correct order of density is
 (a) $Cu > Ni > Zn > Sc$
 (b) $Ni > Cu > Zn > Sc$
 (c) $Zn > Cu > Ni > Sc$
 (d) $Sc > Zn > Ni > Cu$
136. The property exhibited by only transitional elements
 (a) To form paramagnetic compounds
 (b) To form coloured compounds
 (c) To form complex compounds
 (d) To show inert tendency
137. Which of the following will have standard oxidation potential less than *SHE*
 (a) *Zn* (b) *Cu*
 (c) *Fe* (d) *Ni*
138. Hydrated Cu^{+2} ion will be
 (a) Green (b) Violet
 (c) Blue (d) Colourless
139. The placement of *Zn*, *Cd* and *Hg* along with '*d*' block elements is not proper because
 (a) Their '*d*' orbitals are completely filled
 (b) Their '*d*' orbitals are empty
 (c) They do not form complex compounds
 (d) They do not form coloured compounds
140. Which of the following is the weakest reducing agent
 (a) *Zn* (b) *Cu*
 (c) H_2 (d) *Li*
141. The decrease in atomic volume from *Cr* to *Cu* is very negligible because
 (a) Increase in nuclear charge
 (b) Screening effect
 (c) Unpaired electrons of *Cr*
 (d) None
142. The heaviest atom amongst the following is [Kurukshetra CEE 1998]
 (a) Uranium (b) Radium
 (c) Lead (d) Mercury
143. Thallium shows different oxidation states because [Kurukshetra CEE 1998]
 (a) It is a transition metal
 (b) Of inert-pair effect
 (c) Of its high reactivity
 (d) Of its amphoteric character
144. The test of ozone O_3 can be done by [AFMC 1997]
 (a) *Ag* (b) *Hg*
 (c) *Au* (d) *Cu*
145. Which of the following set of elements does not belong to transitional elements set [EAMCET 1998]
 (a) *Fe*, *Co*, *Ni* (b) *Cu*, *Ag*, *Au*
 (c) *Ti*, *Zr*, *Hf* (d) *Ga*, *In*, *Tl*
146. The transition metals mostly are [MP PMT 2000; Kerala (Med.) 2002]
 (a) Diamagnetic
 (b) Paramagnetic
 (c) Neither diamagnetic nor paramagnetic
 (d) Both diamagnetic and paramagnetic
147. The correct statement in respect of *d*-block elements [MP PMT 2000, 02]
 (a) They are all metals
 (b) They show variable valency
 (c) They form coloured ions and complex salts
 (d) All above statements are correct
148. Which one of the following is an example of non-typical transition elements [MP PMT 2002]
 (a) *Li*, *K*, *Na* (b) *Be*, *Al*, *Pb*
 (c) *Zn*, *Cd*, *Hg* (d) *Ba*, *Ca*, *Sr*
149. Which one is wrong in the following statements [Kurukshetra CET 2002]
 (a) Gold is considered to be the king of metals
 (b) Gold is soluble in mercury
 (c) Copper is added to gold to make it hard
 (d) None of these
150. The number of unpaired electrons in Cr^{3+} ion is

[Kurukshetra CET 2002]

[MP PET 1994]

- (a) 3 (b) 5
(c) 4 (d) 1
151. The metal ion which does not form coloured compound is
[Kurukshetra CET 2002]
(a) Chromium (b) Manganese
(c) Zinc (d) Iron
152. Super alloys are usually
[Kurukshetra CET 2002]
(a) Iron based
(b) Nickel based
(c) Cobalt based
(d) Based on all of these
153. The transitional metal which shows oxidation state from +2 to +7 belong to group
(a) VII B (b) VI B
(c) II B (d) III B
154. Which of the following may be colourless
[RPMT 1997; RPET/PMT 1999]
(a) Cr^{+3} (b) Cu^{+}
(c) Fe^{+3} (d) Cu^{2+}
155. Which of the following ions is paramagnetic
(a) Cu^{+} (b) Zn^{+2}
(c) Ti^{+3} (d) Ti^{+4}
156. Which of the following metals absorbs hydrogen
(a) K (b) Al
(c) Zn (d) Pd
157. Which of the following ions is coloured
[BHU 1997]
(a) Cu^{+} (b) Cu^{2+}
(c) Ti^{4+} (d) V^{5+}
158. The metal present in B_{12} is
[BHU 1997]
(a) Magnesium (b) Iron
(c) Cobalt (d) Manganese
159. Which metal does not give the following reaction $M + \text{water or steam} \rightarrow \text{oxide} + H_2$
[Pb. PMT 2001]
(a) Mercury (b) Iron
(c) Sodium (d) Magnesium
160. Ionisation potential values of d-block elements as compared to ionization potential value of f-block elements are
(a) Higher (b) Equal
(c) lower (d) All of these
161. Which one of the following properties is not of transition elements
[MP PET 1999; CPMT 2002]
(a) Colour (b) Paramagnetism
(c) Fixed valency (d) None of the above
162. In which of the following, tendency towards formation of coloured ions is maximum
[MP PET 1999]
(a) s-block elements (b) d-block elements
(c) p-block elements (d) f-block elements
163. The electronic configuration $1s^2, 2s^2 p^6, 3s^2 p^6 d^6$ corresponds to
[MP PET 1994]
(a) Mn^{2+} (b) Fe^{2+}
(c) Co (d) Ge
164. Which of the following statements is not correct about the electronic configuration of gaseous chromium atom
- (a) It has 5 electrons in 3d and one electron in 4s orbitals
(b) The principal quantum numbers of its valence electrons are 3 and 4
(c) It has 6 electrons in 3d orbital
(d) Its valance electrons have quantum number 'l' 0 and 2
165. Zn and Hg belong to the same group, they differ in many of their properties. The property that is shared by both is
[Pb. PMT 1998]
(a) They form oxide readily
(b) They react with steam readily
(c) They react with hot concentrated sulphuric acid
(d) They react with hot sodium hydroxide
166. Which of the following ionic species will impart colour to an aqueous solution
[CBSE PMT 1998; BHU 2001]
(a) Ti^{4+} (b) Cu^{+}
(c) Zn^{2+} (d) Cr^{3+}
167. The number of electrons in the outermost shell of the 3d-transition elements generally remains
[MP PMT 1997]
(a) $(n-1)d^n$ (b) nd^n
(c) ns^2 (d) $(n-1)s^2$
168. The 3d-elements show variable oxidation states. What is the maximum oxidation state shown by the element Mn
[MP PMT 1997; JIPMER 2002]
(a) +4 (b) +5
(c) +6 (d) +7
169. Which of the following ions gives coloured solution
[MP PET 1995]
(a) Cu^{+} (b) Zn^{++}
(c) Ag^{+} (d) Fe^{++}
170. Which metal represents more than one oxidation state
[CPMT 1990]
(a) Al (b) Na
(c) Mg (d) Fe
171. A reduction in atomic size with increase in atomic number is a characteristic of elements of
[AIEEE 2003]
(a) High atomic masses (b) d-block
(c) f-block (d) Radioactive series
172. Which one of the following characteristics of the transition metals is associated with their catalytic activity
[CBSE PMT 2003]
(a) Variable oxidation states
(b) High enthalpy of atomization
(c) Paramagnetic behaviour
(d) Colour of hydrated ions
173. The number of oxidation states of manganese is
(a) 4 (b) 6
(c) 3 (d) 8
174. Which of the following transitional metal has lowest density
(a) Sc (b) Ti
(c) V (d) Cr
175. Which of the following transitional metal has lowest boiling point (B.P.)

- (a) Zn (b) Sc
(c) Ti (d) V
176. Which of the following electronic configuration is that of a transitional element [NCERT 1983; CPMT 1989, 97; MP PET/PMT 1997; AIIMS 2000; MP PMT 2002]
- (a) $1s^2, 2s^2 p^6, 3s^2 p^6 d^{10}, 4s^2 p^6$
(b) $1s^2, 2s^2 p^6, 3s^2 p^6 d^{10}, 4s^2 p^1$
(c) $1s^2, 2s^2 p^6, 3s^2 p^6 d^2, 4s^2$
(d) $1s^2, 2s^2 p^6, 3s^2 p^6, 4s^2$
177. Fe has been placed in the eighth group, the number of electrons in the outermost orbit is
(a) 1 (b) 2
(c) 3 (d) 4
178. Due to covalent bonding, the transitional metals are
(a) Lustrous (b) Conductor
(c) Hard and brittle (d) Ductile
179. The magnetic moment of a metal ion of first transition series is 2.83 BM . Therefore it will have unpaired electrons
(a) 6 (b) 4
(c) 3 (d) 2
180. Which of the following pair of ions may exhibit same colour
(a) Cr^{+++} and Fe^{++}
(b) Ti^{+++} and V^{++}
(c) Fe^{+++} and Mn^{++}
(d) Cu^+ and Ni^{++}
181. The number of incomplete orbitals in inner transition element is
(a) 2 (b) 3
(c) 4 (d) 1
182. Most common oxidation states of Cs (cesium) are [AIEEE 2002]
(a) +2, +3 (b) +2, +4
(c) +3, +4 (d) +3, +5
183. The $3d$ elements show variable oxidation states because the energies of the following sets of orbitals are almost similar
(a) $ns, (n-1)d$ (b) ns, nd
(c) $(n-1)s, nd$ (d) $np, (n-1)d$
184. Which of the following $3d$ bivalent metal ions has the smallest number of unpaired d electrons
(a) $3d^6$ (b) $3d^7$
(c) $3d^8$ (d) $3d^9$
185. The $3d$ metal ions form coloured compounds because the energy corresponding to the following lies in the visible range of electromagnetic spectrum
(a) Free energy change of complex formation by $3d$ metal ions
(b) $d-d$ transitions of $3d$ electrons
(c) Heat of hydration of $3d$ metal ions
(d) Ionisation energy of $3d$ metal ions
186. The oxidation number of iron in potassium ferrocyanide is
(a) +2 (b) +3
(c) +4 (d) Zero
187. In transition elements, the orbitals partially filled by electrons are [DPMT 1984; M]
(a) s -orbitals (b) p -orbitals
(c) d -orbitals (d) f -orbitals
188. Number of unpaired electrons in Mn^{2+} is [CPMT 1997; Pb. PET/PMT 1999]
(a) 3 (b) 5
(c) 4 (d) 1
189. Mercury is the only metal which is liquid at $0^\circ C$. This is due to its [CBSE PMT]
(a) Very high ionisation energy and weak metallic bond
(b) Low ionisation potential
(c) High atomic weight
(d) High vapour pressure
190. Essential constituent of an amalgam is [DPMT 1982; CPMT 1973, 77, 78, 89]
(a) Iron (b) An alkali metal
(c) Silver (d) Mercury
191. Mercury is transported in metal containers made of [DPMT 1982; CPMT 1973]
(a) Silver (b) Lead
(c) Iron (d) Aluminium
192. The electroplating of chromium is undertaken because [MP PMT 1994]
(a) Electrolysis of chromium is easier
(b) Chromium can form alloys with other metals
(c) Chromium gives protective and decorative coating to the base metal
(d) Of the high reactivity of metallic chromium [Pb. PMT 2001]
193. An element having the electronic configuration $[Ar]3d^2 4s^2$ belongs to [MP PMT 1993]
(a) s -block elements (b) p -block elements
(c) d -block elements (d) f -block elements
194. Which one of the following is not a transition metal [MP PMT 1999]
(a) Chromium (b) Titanium
(c) Lead (d) Tungsten
195. The atomic number of an element is 22. The highest oxidation state exhibited by it in its compounds is [MP PMT 1996]
(a) 1 (b) 2
(c) 3 (d) 4
196. d -block elements form
(a) Ionic compounds
(b) Covalent compounds
(c) Ionic and covalent compounds
(d) Only complex compounds
197. The transition metals have a less tendency to form ions due to [Bihar CEE 1995]
(a) High ionisation energy
(b) Low heat of hydration of ion
(c) High heat of sublimation
(d) All of these
198. The electronic configuration of Ag atom is [CPMT 1984]
(a) $[Kr]3d^{10} 4s^1$ (b) $[Xe]4f^{14} d^{10} 6s^1$

- (c) $[Kr]4d^{10}5s^1$ (d) $[Kr]4d^95s^2$
199. Most powerful oxidizing property of manganese is shown by which of the following oxidation state [MP PET 2003]
 (a) $Mn(+7)$ (b) $Mn(+2)$
 (c) $Mn(+4)$ (d) $Mn(+5)$
200. Which one of the following ions is colourless [MP PET 1999; RPET/PMT 1999]
 (a) Cu^+ (b) Co^{2+}
 (c) Ni^{2+} (d) Fe^{3+}
201. The atomic radii of the elements are almost same of which series
 (a) $Fe - Co - Ni$ (b) $Na - K - Rb$
 (c) $F - Cl - Br$ (d) $Li - Be - B$
202. In human body if necessary, the plate, screw or wire used for surgery are made up of
 (a) Ni (b) Au
 (c) Pt (d) Ta
203. Manganese is related to which block of periodic table [MP PMT 2003]
 (a) s-block (b) p-block
 (c) d-block (d) f-block
204. A hard and resistant metal (alloy) generally used in tip of nib of fountain pen is [BHU 1982]
 (a) $Os.Ir$ (b) $Pt.Cr$
 (c) $V.Fe$ (d) $Fe.Cr$
205. Chloride of which of the following elements will be coloured [MP PMT 1999]
 (a) Silver (b) Mercury
 (c) Zinc (d) Cobalt
206. Which of the following ions has the highest magnetic moment [JIPMER 1997; AIEEE 2002]
 (a) Ti^{3+} (b) Sc^{3+}
 (c) Mn^{2+} (d) Zn^{2+}
207. Cerium ($Z = 58$) is an important member of the lanthanoids. Which of the following statements about cerium is incorrect [AIEEE 2004]
 (a) The +4 oxidation state of cerium is not known in solutions
 (b) The +3 oxidation state of cerium is more stable than the +4 oxidation state
 (c) The common oxidation states of cerium are +3 and +4
 (d) Cerium (IV) acts as an oxidizing agent
208. Of the following outer electronic configurations of atoms, the highest oxidation state is achieved by which one of them [AIEEE 2004]
 (a) $(n-1)d^3ns^2$ (b) $(n-1)d^5ns^1$
 (c) $(n-1)d^8ns^2$ (d) $(n-1)d^5ns^2$
209. Among the following series of transition metal ions, the one where all metals ions have $3d^2$ electronic configuration is [CBSE PMT 2004]
 (a) $Ti^{4+}, V^{3+}, Cr^{2+}, Mn^{3+}$ (b) $Ti^{2+}, V^{3+}, Cr^{4+}, Mn^{5+}$
 (c) $Ti^{3+}, V^{2+}, Cr^{3+}, Mn^{4+}$ (d) $Ti^+, V^{4+}, Cr^{6+}, Mn^{7+}$
210. Lanthanoids are [CBSE PMT 2004]
 (a) 14 elements in the sixth period (atomic no. = 58 to 71) that are filling 4f sublevel
 (b) 14 elements in the seventh period (atomic no. = 58 to 71) that are filling 4f sublevel
 (c) 14 elements in the sixth period (atomic no. = 90 to 103) that are filling 4f sublevel
 (d) 14 elements in the seventh period (atomic no. = 90 to 103) that are filling 4f sublevel
211. Which of the following metals make the most efficient catalyst [BHU 1995]
 (a) Transition (b) Alkali
 (c) Alkaline earth (d) Coloured metals
212. Lanthanides and actinides resemble in [AFMC 2004]
 (a) Electronic configuration (b) Oxidation state
 (c) Ionization energy (d) Formation of complexes
213. The lanthanide contraction relates to [Kerala PMT 2004]
 (a) Atomic radii
 (b) Atomic as well as M^{3+} radii
 (c) Valence electrons
 (d) Oxidation states
 (e) Ionisation energy
214. Which of the following species is expected to show the highest magnetic moment? (At. Nos.: $Cr = 24$, $Mn = 25$, $Co = 27$, $Ni = 28$, $Cu = 29$) [Kerala PMT 2004]
 (a) Cr^{2+} (b) Mn^{2+}
 (c) Cu^{2+} (d) Co^{2+}
 (e) Ni^{2+}
215. Which one belongs to 3d-transition series [MP PMT 2004]
 (a) Copper (b) Gold
 (c) Cobalt (d) Silver
216. Which one of the following organisation's iron and steel plant was built to use charcoal as a source of power, to start with, but later switched over to hydroelectricity [AIIMS 2004]
 (a) The Tata Iron and Steel Company
 (b) The Indian Iron and Steel Company
 (c) Mysore Iron and Steel Limited
 (d) Hindustan Steel Limited
- Which of the following is the correct sequence of atomic weights of given elements [Pb. CET 2002]
 (a) $Fe > Co > Ni$ (b) $Ni > Co > Fe$
 (c) $Co > Ni > Fe$ (d) $Fe > Ni > Co$
218. Which of the following element has maximum first ionisation potential [Pb. CET 2002]
 (a) V (b) Ti
 (c) Cr (d) Mn
219. A metal M having electronic configuration $M - 1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^1$ [DCE 2002]
 (a) s-block element (b) d-block element
 (c) p-block element (d) None of these
220. Identify the transition element [MH CET 2003]
 (a) $1s^2, 2s^2 2p^6, 3s^2, 3p^6, 4s^2$
 (b) $1s^2, 2s^2 2p^6, 3s^2, 3p^6 3d^2, 4s^2$
 (c) $1s^2, 2s^2 2p^6, 3s^2, 3p^6 3d^{10}, 4s^2 4p^2$
 (d) $1s^2, 2s^2 2p^6, 3s^2, 3p^6 3d^{10}, 4s^2 4p^1$
221. What is the name of element with atomic number 105 [CPMT 2004]
 (a) Kurchatovium (b) Dubnium
 (c) Nobelium (d) Holmium

222. Electrons in a paramagnetic compound are [UPSEAT 2004]
 (a) Shared (b) Unpaired
 (c) Donated (d) Paired
223. Which of the following pairs involves isoelectronic ions [UPSEAT 2004]
 (a) Mn^{3+} and Fe^{2+} (b) Mn^{2+} and Fe^{3+}
 (c) Cr^{3+} and Mn^{2+} (d) Fe^{2+} and Co^{2+}
224. Which of the following is paramagnetic [Pb. CET 2000]
 (a) Ni^{++} (b) Cu^{+}
 (c) Zn^{++} (d) Sc^{+++}
225. The electronic configuration of chromium is [BHU 2005; Pb. CET 2000]
 (a) $[Ne]3s^2 3p^6 3d^4, 4s^2$ (b) $[Ne]3s^2 3p^6 3d^5, 4s^1$
 (c) $[Ne]3s^2 3p^6 3d^6, 4s^1$ (d) $[Ne]3s^2 3p^5 3d^5, 4s^2$
226. Electronic configuration of $Cu(Z = 29)$ is [Pb. CET 2001]
 (a) $[Ar]3d^9 4s^2$ (b) $[Ar]3d^{10} 4s^1$
 (c) $[Ar]3d^5 4s^2$ (d) $[Ar]3d^6 4s^2$
227. $Ce-58$ is a member of [Pb. CET 2002]
 (a) s-block (b) p-block
 (c) d-block (d) f-block
228. How many unpaired electrons are there in Ni^{2+} [MP PET 2004]
 (a) 2 (b) 4
 (c) 5 (d) 0
229. The main reason for larger number of oxidation states exhibited by the actinoids than the corresponding lanthanoids is [CBSE PMT 2005]
 (a) Lesser energy difference between $5f$ and $6d$ orbitals than between $4f$ and $5d$ orbitals
 (b) Larger atomic size of actinoids than the lanthanoids
 (c) More energy difference between $5f$ and $6d$ orbitals than between $4f$ and $5d$ orbitals
 (d) Greater reactive nature of the actinoids than the lanthanoids
230. Four successive members of the first row transition elements are listed below with their atomic numbers. Which one of them is expected to have the highest third ionization enthalpy [CBSE PMT 2005]
 (a) Vanadium ($Z = 23$) (b) Chromium ($Z = 24$)
 (c) Iron ($Z = 26$) (d) Manganese ($Z = 25$)
231. The aqueous solution containing which one of the following ions will be colourless [CBSE PMT 2000, 05]
 (a) Sc^{3+} (b) Fe^{2+}
 (c) Ti^{3+} (d) Mn^{2+}
 (Atomic number $Sc = 21$, $Fe = 26$, $Ti = 22$, $Mn = 25$)
232. Which of the following trivalent ion has the largest atomic radii in the lanthanide series [BHU 2002]
 (a) La (b) Ce
 (c) Pm (d) Lu
233. Which of the following does not have valence electron in $3d$ -subshell [AIIMS 2002]
 (a) $Fe(III)$ (b) $Mn(II)$
 (c) $Cr(I)$ (d) $P(0)$
234. Among the following pairs of ions, the lower oxidation state in aqueous solution is more stable than the other in [AIIMS 2005]
 (a) Tl^{+} , Tl^{3+} (b) Cu^{+} , Cu^{2+}
 (c) Cr^{2+} , Cr^{3+} (d) V^{2+} , VO^{2+}
235. The lanthanide contraction is responsible for the fact that [AIEEE 2005]
 (a) Zr and Y have about the same radius
 (b) Zr and Nb have similar oxidation state
 (c) Zr and Hf have about the same radius
 (d) Zr and Zn have the same oxidation state
236. Which of the following factors may be regarded as the main cause of lanthanide contraction [AIEEE 2005]
 (a) Poor shielding of one of $4f$ electron by another in the subshell
 (b) Effective shielding of one of $4f$ electrons by another in the subshell
 (c) Poorer shielding of $5d$ electrons by $4f$ electrons
 (d) Greater shielding of $5d$ electron by $4f$ electrons
237. Which of the following have maximum number of unpaired electrons [BHU 2005]
 (a) Fe (b) Fe
 (c) Co (d) Co
238. Transition metals show paramagnetism [BHU 2005]
 (a) Due to characteristic configuration
 (b) High lattice energy
 (c) Due to variable oxidation states
 (d) Due to unpaired electrons
239. Which of the following pairs of elements cannot form an alloy [KCET 2005]
 (a) Zn, Cu (b) Fe, Hg
 (c) Fe, C (d) Hg, Na
240. Which belongs to the actinides series [J & K 2005]
 (a) Ce (b) Cf
 (c) Ca (d) Cs
241. Effective magnetic moment of Sc^{+3} ion is [Kerala CET 2005]
 (a) 1.73 (b) 0
 (c) 5.92 (d) 2.83
 (e) 3.87

Compounds of Transitional elements

- Potassium permanganate acts as an oxidant in neutral, alkaline as well as acidic media. The final products obtained from it in the three conditions are, respectively
[MP PMT 1997]
(a) MnO_2, MnO_2, Mn^{2+} (b) $MnO_4^{2-}, Mn^{3+}, Mn^{2+}$
(c) $MnO_2, MnO_4^{2-}, Mn^{3+}$ (d) MnO, MnO_4, Mn^{2+}
- In acidic medium one mole of MnO_4^- accepts how many moles of electrons in a redox process?
[MP PET/PMT 1998]
(a) 1 (b) 3
(c) 5 (d) 6
- In acidic medium potassium dichromate acts as an oxidant according to the equation,
 $Cr_2O_7^{2-} + 14H^+ + 6e^- \rightarrow 2Cr^{3+} + 7H_2O$. What is the equivalent weight of $K_2Cr_2O_7$? (mol. Wt. = M)
[MP PET/PMT 1998]
(a) M (b) $M/2$
(c) $M/3$ (d) $M/6$
- The correct formula of permanganic acid is
[MP PET 1999]
(a) $HMnO_4$ (b) $HMnO_5$
(c) H_2MnO_4 (d) H_2MnO_3
- Acidified potassium dichromate is treated with hydrogen sulphide. In the reaction, the oxidation number of chromium
[MP PET 1996]
(a) Increases from +3 to +6
(b) Decreases from +6 to +3
(c) Remains unchanged
(d) Decreases from +6 to +2
- When $KMnO_4$ reacts with acidified $FeSO_4$
[MP PET 1996]
(a) Only $FeSO_4$ is oxidised
(b) Only $KMnO_4$ is oxidised
(c) $FeSO_4$ is oxidised $KMnO_4$ and is reduced
(d) None of these
- When calomel reacts with NH_4OH , we get
[CBSE PMT 1996]
(a) $HgNH_2Cl$ (b) $NH_2 - Hg - Hg - Cl$
(c) Hg_2O (d) HgO
- $AgCl$ dissolves in a solution of NH_3 but not in water because
[MP PMT 1984, 86]
(a) NH_3 is a better solvent than H_2O
(b) Ag^+ forms a complex ion with NH_3
(c) NH_3 is a stronger base than H_2O
(d) The dipole moment of water is higher than NH_3
- In solid $CuSO_4 \cdot 5H_2O$ copper is co-ordinated to
[MP PET 1985, 86]
(a) Five water molecules (b) Four water molecules
(c) One sulphate anion (d) One water molecule
- A white powder soluble in NH_4OH but insoluble in water is
[AFMC 1987]
(a) $BaSO_4$ (b) $CuSO_4$
(c) $PbSO_4$ (d) $AgCl$
- Verdigris is
[BHU 1987]
(a) Basic copper acetate (b) Basic lead acetate
(c) Basic lead (d) None of these
- Number of moles of $K_2Cr_2O_7$ reduced by one mole of Sn^{2+} ions is
[KCET 1996]
(a) $1/3$ (b) 3
(c) 1.6 (d) 6
- Which one of the following is reduced by hydrogen peroxide in acid medium
[EAMCET 1997]
(a) Potassium permanganate
(b) Potassium iodide
(c) Ferrous sulphate
(d) Potassium ferrocyanide
- Which oxide of manganese is amphoteric
[AFMC 1995]
(a) MnO_2 (b) Mn_2O_3
(c) Mn_2O_7 (d) MnO
- Which one of the following oxides is ionic
[IIT-JEE 1995]
(a) MnO (b) Mn_2O_7
(c) CrO_3 (d) P_2O_5
- Correct formula of calomel is
[CPMT 1994; AFMC 1998]
(a) Hg_2Cl_2 (b) $HgCl_2$
(c) $HgCl_2 \cdot H_2O$ (d) $HgSO_4$
- One of the important use of ferrous sulphate is in the
(a) Manufacture of blue black ink
(b) Manufacture of chalks
(c) Preparation of hydrogen sulphide
(d) Preparation of anhydrous ferric chloride
- Copper sulphate is not used
(a) In electrotyping
(b) In dyeing and calicoprinting
(c) In detecting water
(d) As fertilizer
- Blue vitriol is
[AFMC 1992]
(a) $CuSO_4$ (b) $CuSO_4 \cdot 5H_2O$
(c) Cu_2SO_4 (d) $CuSO_4 \cdot H_2O$
- A solution of copper sulphate may be kept safely in the container made up of
(a) Fe (b) Ag
(c) Zn (d) Al
- Silver nitrate produces a black stain on skin due to
(a) Being a strong reducing agent
(b) Its corrosive action
(c) Formation of complex compound
(d) Its reduction to metallic silver
- When hypo solution is added to cupric sulphate solution, the blue colour of the latter is discharged, due to formation of
(a) CuS_2O_3 (b) $Na_2S_4O_6$
(c) $NaCuS_2O_3$ (d) Cu_2O
- Metal oxides which decomposes on heating is
[MNR 1984; UPSEAT 1999]
(a) ZnO (b) Al_2O_3
(c) CuO (d) Na_2O
(e) HgO
- Anhydrous sample of ferric chloride is prepared by heating
(a) $Fe + HCl$ (b) $Fe + Cl_2$
(c) $FeCl_2 + Cl_2$ (d) Hydrated ferric chloride

25. Light green crystals of ferrous sulphate lose water molecule and turn brown on exposure to air. This is due to its oxidation to
(a) Fe_2O_3 (b) $Fe_2O_3 \cdot H_2O$
(c) $Fe(OH)SO_4$ (d) $Fe_2O_3 + FeO$
26. In alkaline condition $KMnO_4$, reacts as follows :
 $2KMnO_4 + 2KOH \rightarrow 2K_2MnO_4 + H_2O + O$
Therefore its equivalent weight will be
[NCERT 1974; CPMT 1977; DCE 2002]
(a) 31.5 (b) 52.7
(c) 72.0 (d) 158.0
27. Equivalent weight of $KMnO_4$ acting as an oxidant in acidic medium is equal to [CPMT 1990; MP PMT 1999]
(a) Molecular weight of $KMnO_4$
(b) $\frac{1}{2} \times$ Molecular weight of $KMnO_4$
(c) $\frac{1}{3} \times$ Molecular weight of $KMnO_4$
(d) $\frac{1}{5} \times$ Molecular weight of $KMnO_4$
28. In which of the following ionic radii of chromium would be smallest [MP PET 1994]
(a) K_2CrO_4 (b) CrO_2
(c) $CrCl_3$ (d) CrF_2
29. $CoO \cdot Al_2O_3$ is called
(a) Cobalt aluminate (b) Thenard's blue
(c) Both (a) and (b) (d) None of these
30. $ZnO \cdot CoO$ is called
(a) Cobalt zincate (b) Rinman's green
(c) Both (a) and (b) (d) None of these
31. $FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$ is called [Bihar CEE 1995]
(a) Mohr's salt (b) Green salt
(c) Alum (d) Glauber's salt
32. Molybdenum compounds are used in
(a) Dye industry (b) For colouring leather
(c) For colouring rubber (d) All of these
33. When copper turnings and concentrated HCl is heated with copper sulphate the compound formed is [CPMT 1984]
(a) Cupric chloride (b) Cuprous chloride
(c) Copper sulphate (d) SO_2
34. The compound of copper which turns green on keeping in air is [CPMT 1984]
(a) Copper sulphate (b) Copper nitrate
(c) Cupric chloride (d) Cuprous chloride
35. Cu_2Cl_2 with HCl in presence of oxidising agents gives [CPMT 1984]
(a) $CuCl_2$ (b) H_2CuCl_2
(c) Hydrogen gas (d) Chlorine gas
36. $K_2Cr_2O_7$ on heating with aqueous $NaOH$ gives [CBSE PMT 1997]
(a) CrO_4^{2-} (b) $Cr(OH)_3$
(c) $Cr_2O_7^{2-}$ (d) $Cr(OH)_2$
37. $KMnO_4$ reacts with oxalic acid according to the equation :
 $2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightarrow 2Mn^{2+} + 10CO_2 + 8H_2O$
Here 20 ml of 0.1 M $KMnO_4$ is equivalent to [CBSE PMT 1996]
(a) 20ml of 0.5 M $C_2H_2O_4$
(b) 50ml of 0.1 M $C_2H_2O_4$
(c) 50ml of 0.5 M $C_2H_2O_4$
(d) 20ml of 0.1 M $C_2H_2O_4$
38. The equivalent weight of potassium permanganate for acid solution is [MP PET 1999]
(a) 158 (b) 31.6
(c) 52.16 (d) 79
39. Which statement is not correct [MP PET 1999]
(a) Potassium permanganate is a powerful oxidising substance
(b) Potassium permanganate is a weaker oxidising substance than potassium dichromate
(c) Potassium permanganate is a stronger oxidising substance than potassium dichromate
(d) Potassium dichromate oxidises a secondary alcohol into a ketone
40. The formula of corrosive sublimate is [CPMT 1997]
(a) $HgCl_2$ (b) Hg_2Cl_2
(c) Hg_2O (d) Hg
41. Which is mild oxidising agent [AFMC 1971]
(a) Ag_2O (b) $KMnO_4$
(c) $K_2Cr_2O_7$ (d) Cl_2
42. The equivalent weight of $K_2Cr_2O_7$ in acidic medium
(a) 294 (b) 298
(c) 49 (d) 50
43. The transitional element of III-B group is isomorphic with $Al_2(SO_4)_3$. Therefore the compound will be
(a) Purple (b) Blue
(c) White (d) Uncertain
44. A copper salt is isomorphic with $ZnSO_4$, the salt will be
(a) Paramagnetic (b) Diamagnetic
(c) Ferromagnetic (d) None
45. V_2O_5 is useful as catalyst in
(a) Manufacture of H_2SO_4
(b) Manufacture of HNO_3
(c) Manufacture of Na_2CO_3
(d) It is not a catalyst
46. $KMnO_4$ in basic medium is reduced to [Orissa JEE 2005]
(a) K_2MnO_4 (b) MnO_2
(c) $Mn(OH)_2$ (d) Mn^{2+}
47. When $KMnO_4$ is reduced with oxalic acid in acidic solution, the oxidation number of Mn changes from [CPMT 1989]
(a) 7 to 4 (b) 6 to 4
(c) 7 to 2 (d) 4 to 2
48. Nessler's reagent is [MP PET 1991; MP PMT 1993; AFMC 2001]
(a) K_2HgI_4 (b) $K_2HgI_4 + KOH$
(c) $K_2HgI_2 + KOH$ (d) $K_2HgI_4 + Hg$
49. When ammonium dichromate is heated, the gas formed is [MP PMT 1993; IIT-JEE 1999]
(a) N_2 (b) O_2
(c) H_2 (d) NH_3
50. Acidified potassium dichromate on reacting with a sulphite is reduced to

- (a) CrO_2Cl_2 (b) CrO_4^{2-}
(c) Cr^{3+} (d) Cr^{2+}
51. The product of oxidation of I^- ion by MnO_4^- in alkaline medium is
(a) I_2 (b) IO_3^-
(c) IO_4^- (d) I_3^-
52. Identify the statement which is not correct regarding copper sulphate [UPSEAT 2000, 01]
(a) It reacts with KI to give iodine
(b) It reacts with KCl to give Cu_2Cl_2
(c) It reacts with $NaOH$ and glucose to give Cu_2O
(d) It gives CuO on strong heating in air
53. Acidified potassium permanganate solution is decolourised by [MNR 1984]
(a) Bleaching powder (b) White vitriol
(c) Mohr's salt (d) Microcosmic salt
(e) Laughing gas
54. Which of the following oxides is white but becomes yellow on heating [MP PET 1995]
(a) AgO (b) Ag_2O
(c) FeO (d) ZnO
55. Amalgams are
(a) Highly coloured alloys
(b) Always solid
(c) Alloys which contain mercury as one of the contents
(d) Alloys which have great resistance to abrasion
56. In photography sodium thiosulphate is used as [DPMT 2005]
(a) Complexing agent (b) Oxidising agent
(c) Reducing agent (d) None of these
57. The substance that sublimes on heating [EAMCET 1978, 82; MP PMT 1999]
(a) Magnesium chloride (b) Silver chloride
(c) Mercurous chloride (d) Sodium chloride
58. $K_3[Fe(CN)_6]$ is called
(a) Potassium ferricyanide
(b) Red prussiate of potash
(c) Potassium hexacyanoferrate (III)
(d) All of these
59. Which of the following will show increase in weight when kept in magnetic field
(a) TiO_2 (b) $Fe_2(SO_4)_3$
(c) $KMnO_4$ (d) $ScCl_3$
60. Amongst TiF_6^{2-} , CoF_6^{3-} , Cu_2Cl_2 and $NiCl_4^{2-}$ (Atomic number $Ti = 22$, $Co = 27$, $Cu = 29$, $Ni = 28$). The colourless species are [CBSE PMT 1995]
(a) CoF_6^{3-} and $NiCl_4^{2-}$ (b) TiF_6^{2-} and CoF_6^{3-}
(c) Cu_2Cl_2 and $NiCl_4^{2-}$ (d) TiF_6^{2-} and Cu_2Cl_2
61. Which of the following imparts green colour to the glass [CPMT 1993]
(a) Cu_2O (b) CdS
(c) MnO_2 (d) Cr_2O_3
62. On the heating copper nitrate strongly, is finally obtained [CPMT 1971, 74, 78]
(a) Copper (b) Copper oxide
(c) Copper nitrate (d) Copper nitride
63. On adding KI to a solution of copper sulphate [CPMT 1973; NCERT 1977; MP PMT 1989]
(a) Cupric oxide is precipitated
(b) Metallic copper is precipitated
(c) Cuprous iodide is precipitated with liberation of iodine
(d) No change occurs
64. Which of the following statements is correct about equivalent weight of $KMnO_4$ [MP PET 1994]
(a) It is one third of its molecular weight in alkaline medium
(b) It is one fifth of its molecular weight in alkaline medium
(c) It is equal to its molecular weight in acidic medium
(d) It is one third of its molecular weight in acidic medium
65. The reaction of $K_2Cr_2O_7$ with $NaCl$ and conc. H_2SO_4 gives [MP PET 1995]
(a) $CrCl_3$ (b) $CrOCl_2$
(c) CrO_2Cl_2 (d) Cr_2O_3
66. Silver nitrate is supplied in coloured bottles because it is [CPMT 1985]
(a) Oxidised in air
(b) Decomposes in sunlight
(c) Explosive in sunlight
(d) Reactive towards air in sunlight
67. A nitrate when mixed with common salt gives a white precipitate which is soluble in dilute NH_4OH . It is the nitrate of [CPMT 1985]
(a) Copper (b) Mercury
(c) Silver (d) Gold
68. Which one of the following is lunar caustic [CPMT 1984]
(a) $AgNO_3$ (b) Cu_2Cl_2
(c) $CuCl_2$ (d) Hg_2Cl_2
69. Invar, an alloy of Fe and Ni is used in watches and meter scale, its characteristic property is [Kerala (Engg.) 2002]
(a) Small coefficient of expansion
(b) Resistance to corrosion
(c) Hardness and elasticity
(d) Magnetic nature
70. The extraction of nickel involves
(a) The formation of $Ni(CO)_4$
(b) The decomposition of $Ni(CO)_4$
(c) The formation and thermal decomposition of $Ni(CO)_4$
(d) The formation and catalytic decomposition of $Ni(CO)_4$
71. On adding excess of NH_3 solution to $CuSO_4$ solution, the dark blue colour is due to [CPMT 1990; AIIMS 1982; MP PMT 1989, 92; BHU 1996; JIPMER 1997]
(a) $[Cu(NH_3)_4]^{++}$ (b) $[Cu(NH_3)_2]^{++}$
(c) $[Cu(NH_3)]^+$ (d) None of the above
72. If M is the molecular weight of $KMnO_4$, its equivalent weight will be when it is converted into K_2MnO_4 [MP PET 1993]
(a) M (b) $M/3$
(c) $M/5$ (d) $M/7$
73. While writing the formula of ferrous oxide it is written as (FeO) , because it is
(a) Non-stoichiometric (b) Non-existent
(c) Paramagnetic (d) Ferromagnetic
74. Which of the following exhibit maximum oxidation state of vanadium

- (a) $VOCl_3$ (b) VCl_4
(c) VCl_3 (d) VCl_2
75. Prussian blue is due to the formation of [BHU 1980; CBSE PMT 1990; KCET 1992; MP PET 1995]
(a) $Fe_4[Fe(CN)_6]_3$ (b) $Fe_2[Fe(CN)_6]$
(c) $Fe_3[Fe(CN)_6]$ (d) $Fe[Fe(CN)_6]_3$
76. The Nessler's reagent contains [CPMT 1976, 88; NCERT 1987; MP PMT 1985; BHU 1996]
(a) Hg_2^{++} (b) Hg^{++}
(c) HgI_2^{--} (d) HgI_4^{--}
77. Formula of ferric sulphate is [AFMC 2003]
(a) $FeSO_4$ (b) $Fe(SO_4)_2$
(c) Fe_2SO_4 (d) $Fe_2(SO_4)_3$
78. When $CuSO_4$ is hydrated, then it becomes [AFMC 2003]
(a) Acidic (b) basic
(c) Neutral (d) Amphoteric
79. Silvering of mirror is done by [AFMC 2003]
(a) $AgNO_3$ (b) Ag_2O_3
(c) Fe_2O_3 (d) Al_2O_3
80. The colour of $K_2Cr_2O_7$ changes from red orange to lemon yellow on treatment with aqueous KOH because of [MP PMT 1994]
(a) The reduction of Cr^{VI} to Cr^{III}
(b) The formation of chromium hydroxide
(c) The conversion of dichromate to chromate
(d) The oxidation of potassium hydroxide to potassium peroxide
81. On heating pyrolusite with KOH in presence of air we get
(a) $KMnO_4$ (b) K_2MnO_4
(c) $Mn(OH)_2$ (d) Mn_3O_4
82. $Cu(CN)_4^{2-}$ is colourless as it absorbs light in
(a) Visible region (b) Ultraviolet region
(c) Infrared region (d) All above are wrong
83. Acidified solution of chromic acid on treatment with hydrogen peroxide yields [MP PET 1999; AFMC 2000]
(a) $CrO_3 + H_2O + O_2$ (b) $Cr_2O_3 + H_2O + O_2$
(c) $CrO_5 + H_2O$ (d) $H_2Cr_2O_7 + H_2O + O_2$
84. Which of the following metals corrodes readily in moist air [CPMT 1972, 82; CBSE PMT 1989]
(a) Gold (b) Silver
(c) Nickel (d) Iron
85. Which one of the following compounds is not coloured [AIIMS 1997]
(a) Na_2CuCl_4 (b) Na_2CdCl_4
(c) $K_4Fe(CN)_6$ (d) $K_3Fe(CN)_6$
86. Acidified $KMnO_4$ is decolourized by [AMU 1999]
(a) Br_2 (b) O_3
(c) HCl (d) HBr
87. Which of the following compound expected to be colourless
(a) ScO (b) V_2O_3
(c) $CuCN$ (d) $Cr_2(SO_4)_3$
88. Crystals of which pair are isomorphous [CPMT 1990]
(a) $ZnSO_4, SnSO_4$ (b) $MgSO_4, CaSO_4$
(c) $ZnSO_4, MgSO_4$ (d) $PbSO_4, NiSO_4$
89. On heating $Mn(OH)_2$ with PbO_2 and conc. HNO_3 pink colour is obtained due to the formation of [MP PET 1995]
(a) $KMnO_4$ (b) $HMnO_4$
(c) $Pb(MnO_4)_2$ (d) $PbMnO_4$
90. Which of the following is used as white pigment
(a) TiO_2 (b) V_2O_5
(c) CuO (d) HgO
91. Which metal oxide is used to make blue glass
(a) Fe_2O_3 (b) CoO
(c) Cu_2O (d) NiO
92. The chemical formula for certain pyrophosphate is $Ca_2P_2O_7$, the formula of its ferric pyrophosphate will be
(a) $Fe_2(P_2O_7)_3$ (b) $Fe_4(P_4O_{14})$
(c) $Fe_4(P_2O_7)_3$ (d) Fe_3PO_4
93. Which of the following compounds does not dissolve in ammonium hydroxide solution
(a) AgF (b) $AgBr$
(c) $AgCl$ (d) AgI
94. Which of the following is non-stoichiometric
(a) Fe_3O_4 (b) Fe_2O_3
(c) FeO (d) All the above
95. Ferrosilicon is used in steel industry as [Kerala (Med.) 2003]
(a) A flux (b) Scavenger of hydrogen
(c) A reducing agent (d) A cutting tool
(e) Alloying agent
96. In the reaction,
 $2KMnO_4 + 16HCl \rightarrow 5Cl_2 + 2MnCl_2 + 2KCl + 8H_2O$
the reduction product is [Kerala (Med.) 2003]
(a) Cl_2 (b) $MnCl_2$
(c) H_2O (d) KCl
97. Which one of the following statements is correct [AIEEE 2003]
(a) Manganese salts give violet borax bead test in the reducing flame
(b) From a mixed precipitate of $AgCl$ and AgI ammonia solution dissolves only $AgCl$
(c) Ferric ions give a deep green precipitate on adding potassium ferrocyanide solution
(d) On boiling a solution having K^+ , Ca^{2+} and HCO_3^- ions we get a precipitate of $K_2Ca(CO_3)_2$
98. Collin's reagent is [RPMT 2002]
(a) MNO_2 / HCl (b) MNO_4 / C_5H_5N
(c) $K_2Cr_2O_7 / H_2SO_4$ (d) $Cr_2O_3 / 2C_5H_5N$
99. Which compound has coloured aqueous solution [RPMT 2002]
(a) $Zn(NO_3)_2$ (b) $LiNO_3$
(c) $Co(NO_3)_2$ (d) $Ba(NO_3)_2$
100. Zinc oxide when treated with $NaOH$ solution gives
(a) $Zn(OH)_2$ (b) $ZnCl_2$
(c) Na_2ZnO_2 (d) $Zn(OH)_3$

101. Which of the following compounds volatilises on heating [BHU 1998]
 (a) $MgCl_2$ (b) $HgCl_2$
 (c) $CaCl_2$ (d) $FeCl_3$
102. Which of the following statement is not true
 (a) Colourless compounds of transition elements are paramagnetic
 (b) Coloured compounds of transition elements are paramagnetic
 (c) Colourless compounds of transition elements are diamagnetic
 (d) Transition elements form the complex compounds
103. Calamine is a mineral, which is [MP PMT 2003]
 (a) $ZnCO_3$ (b) ZnS
 (c) $ZnSO_4$ (d) ZnO
104. Super conductors are derived from compounds of [Kerala (Engg.) 2002]
 (a) p-block elements (b) Lanthanides
 (c) Actinides (d) Transition elements
105. Manganese achieves its highest oxidation state in its compound [MP PET 1993, 2001; MP PMT 2004]
 (a) MnO_3 (b) Mn_3O_4
 (c) $KMnO_4$ (d) K_2MnO_4
106. Which can be reduced to the metal by heating it in a stream of hydrogen [DPMT 2000]
 (a) Copper (II) oxide (b) Magnesium oxide
 (c) Aluminium oxide (d) Calcium oxide
107. Which of the following is coloured
 (a) $ScCl_3$ (b) TiO_2
 (c) $MnSO_4$ (d) $ZnSO_4$
108. Chrome green is
 (a) Chromium sulphate (b) Chromium chloride
 (c) Chromium nitrate (d) Chromium oxide
109. The colour of $(NH_4)_2SO_4 \cdot Fe(SO_4)_3 \cdot 24H_2O$ is [BHU 1982; CPMT 1989]
 (a) White (b) Green
 (c) Violet (d) Blue
110. Correct formula of potassium ferricyanide is [DPMT 1982, 83; CPMT 1974; AFMC 2005]
 (a) $K_4Fe(CN)_6$ (b) $K_3Fe(CN)_6$
 (c) $K_3[Fe(CN)_3]$ (d) $K_3[Fe(CN)_4]$
111. The form of iron having the highest carbon content is [DPMT 2005]
 (a) Cast iron (b) Wrought iron
 (c) Strain steel (d) Mild steel
112. Aqueous solution of ferric chloride is [MP PMT 1999]
 (a) Acidic (b) Basic
 (c) Neutral (d) Amphoteric
113. In the reduction of dichromate by $Fe(II)$ the number of electrons involved per chromium atom is [Pb. PMT 2001]
 (a) 2 (b) 3
 (c) 4 (d) 1
114. A group of acidic oxide is [MP PET 2003]
 (a) CrO_3 , Mn_2O_7 (b) ZnO , Al_2O_3
 (c) CaO , ZnO (d) Na_2O , Al_2O_3
115. Silver nitrate is mainly used [CPMT 1988, 93]
 (a) In photography (b) In model formation
 (c) As reducing agent (d) As dehydrating agent
116. The correct order of magnetic moments (spin only values in B.M.) among is [AIEEE 2004]
 (a) $[Fe(CN)_6]^{4-} > [MnCl_4]^{2-} > [CoCl_4]^{2-}$
 (b) $[MnCl_4]^{2-} > [Fe(CN)_6]^{4-} > [CoCl_4]^{2-}$
 (c) $[MnCl_4]^{2-} > [CoCl_4]^{2-} > [Fe(CN)_6]^{4-}$
 (d) $[Fe(CN)_6]^{4-} > [CoCl_4]^{2-} > [MnCl_4]^{2-}$
 (Atomic nos. $Mn = 25, Fe = 26, Co = 27$)
117. Hybridization of $[Ni(CO)_4]$ is [Pb. CET 2000]
 (a) sp^3 (b) d^2sp^3
 (c) sp^3d (d) sp^2
118. What is the oxidation number of iron in the compound $[Fe(H_2O)_5(NO)]SO_4$ [Pb. CET 2001]
 (a) +2 (b) +3
 (c) +1 (d) +4
119. Which of the following metal gives hydrogen gas, when heated with hot concentrated alkali [Pb. CET 2002]
 (a) Cu (b) Ag
 (c) Zn (d) Ni
120. When ferric oxide reacts with $NaOH$, the product formed is [Pb. CET 2002]
 (a) NaF (b) $FeCl_3$
 (c) $Fe(OH)_3$ (d) $NaFeO_2$
121. The compound insoluble in water is [AIIMS 2004]
 (a) Mercurous nitrate (b) Mercuric nitrate
 (c) Mercurous chloride (d) Mercurous perchlorate
122. Which is an amphoteric oxide [JEE Orissa 2004, 05]
 (a) ZnO (b) CaO
 (c) BaO (d) SrO
123. What is the magnetic moment of $[FeF_6]^{3-}$ [JEE Orissa 2004]
 (a) 5.92 (b) 5.49
 (c) 2.32 (d) 4
124. How H_2S is liberated in laboratory [JEE Orissa 2004]
 (a) $FeSO_4 + H_2SO_4$
 (b) $FeS + \text{dil. } H_2SO_4$
 (c) $FeS + \text{conc. } H_2SO_4$
 (d) Elementary H_2 + elementary S
125. The spin magnetic moment of cobalt in the compound $Hg[Co(SCN)_4]$ is [IIT JEE Screening 2004]
 (a) $\sqrt{3}$ (b) $\sqrt{8}$
 (c) $\sqrt{15}$ (d) $\sqrt{24}$
126. In which of these processes platinum is used as a catalyst [DCE 2004]
 (a) Oxidation of ammonia to form HNO_3
 (b) Hardening of oils
 (c) Production of synthetic rubber
 (d) Synthesis of methanol
127. Iron is dropped in dil. HNO_3 , it gives [DCE 2004]
 (a) Ferric nitrate
 (b) Ferric nitrate and NO_2
 (c) Ferrous nitrate and ammonium nitrate

- (d) Ferrous nitrate and nitric oxide
128. CrO_3 dissolves in aqueous $NaOH$ to give [J & K 2005]
- (a) CrO_4^{2-} (b) $Cr(OH)_3^-$
(c) $Cr_2O_7^{2-}$ (d) $Cr(OH)_2$
129. KI and $CuSO_4$ solution when mixed, give [CPMT 2004; UPSEAT 2004]
- (a) $CuI_2 + K_2SO_4$ (b) $Cu_2I_2 + K_2SO_4$
(c) $K_2SO_4 + Cu_2I_2 + I_2$ (d) $K_2SO_4 + CuI_2 + I_2$
130. When Cu reacts with $AgNO_3$ solution, the reaction takes place is [CPMT 2004]
- (a) Oxidation of Cu (b) Reduction of Cu
(c) Oxidation of Ag (d) Reduction of NO_3^-
131. By annealing, steel [BHU 2004]
- (a) Becomes soft
(b) Becomes liquid
(c) Becomes hard and brittle
(d) Is covered with a thin film of Fe_3O_4
132. Which of the following is more soluble in ammonia [MH CET 2003]
- (a) $AgCl$ (b) $AgBr$
(c) AgI (d) None of these
133. Potassium permagnate works as oxidising agent both in acidic and basic medium. In both state product obtained by $KMnO_4$ is respectively [Kerala CET 2005]
- (a) MnO_2^- and Mn^{3+} (b) Mn^{3+} and Mn^{2+}
(c) Mn^{2+} and Mn^{3+} (d) MnO_2 and Mn^{2+}
(e) Mn^{2+} and MnO_2
134. Which of the followign is the green coloured powder produced when ammonium dichromate is used in fire works [J & K 2005]
- (a) Cr (b) CrO_3
(c) Cr_2O_3 (d) $CrO(O_2)$
135. Which compound does not dissolve in hot dilute HNO_3 [DCE 2002; NCERT 1977]
- (a) HgS (b) CuS
(c) PbS (d) CdS
136. The least stable oxide at room temperature is [DCE 2002]
- (a) ZnO (b) CuO
(c) Sb_2O_3 (d) Ag_2O
137. Which of the following pari of elements cannot form an alloy [KCET 2005]
- (a) $Zn - Cu$ (b) $Fe - Hg$
(c) Fe, C (d) Na, Hg
138. Which of the following shows dimerisation [DCE 2002]
- (a) $HgCl_2$ (b) B_2H_6
(c) $TiCl_4$ (d) SO_2
139. Which of the following is also known as "Fools gold" [DCE 2003]
- (a) Wurtzite (b) Iron pyrites
(c) Chalcocite (d) Silver glance
140. Which one of the following is highest melting halide [DCE 2003]
- (a) $AgCl$ (b) $AgBr$
(c) AgF (d) AgI
141. $4K_2Cr_2O_7 \xrightarrow{\text{heat}} 4K_2CrO_4 + 3O_2 + X$. In the above reaction X is [DCE 2004]
- (a) CrO_3 (b) Cr_2O_7
(c) Cr_2O_3 (d) CrO_5
142. Mond's process is used for [AFMC 2004]
- (a) Ni (b) Al
(c) Fe (d) Cu
143. Stainless steel is an alloy of [AFMC 2004]
- (a) Copper (b) Nickel and chromium
(c) Manganese (d) Zinc
144. Percentage of silver in German silver is [AFMC 2004; CPMT 1985; CBSE PMT 2000; MP PMT 2001]
- (a) 0% (b) 1%
(c) 5% (d) None of these
145. Which process of purification is represented by the following scheme [Kerala PMT 2004]
- $$\text{impure } Ti + 2I_2 \xrightarrow{250^\circ C} TiI_4 \xrightarrow{1400^\circ C} \text{pure } Ti + I_2$$
- (a) Cupellation (b) Poling
(c) Electrolytic refining (d) Zone refining
(e) Van-Arkel process
146. Which of the following sulphides when heated strongly in air gives the corresponding metal [Kerala PMT 2004]
- (a) Cu_2S (b) CuS
(c) Fe_2S_3 (d) FeS
(e) HgS
147. Guignet's green is known as [Kerala PMT 2004]
- (a) $Cr_2O_3 \cdot 2H_2O$ (b) $FeO_3 \cdot 2H_2O$
(c) Cu_2O_3 (d) $FeCO_3 \cdot Cr_2O_3$
(e) $FeO \cdot Cr_2O_3$
148. Vanadium (III) oxide is a strong [Kerala PMT 2004]
- (a) Drying agent (b) Oxidising agent
(c) Reducing agent (d) Wetting agent
(e) Precipitating agent
149. Stainless steel does not rust because [KCET 2004]
- (a) Chromium and nickel combine with iron
(b) Chromium forms an oxide layer and protects iron from rusting
(c) Nickel present in it, does not rust
(d) Iron forms a hard chemical compound with chromium present in it.
150. The main product obtained when a solution of sodium carbonate reacts with mercuric chloride is [KCET 2004]
- (a) $Hg(OH)_2$ (b) $HgCO_3 \cdot HgO$
(c) $HgCO_3$ (d) $HgCO_3 \cdot Hg(OH)_2$
151. Which of the following has diamagnetic character [Pb. CET 2003]
- (a) $[NiCl_4]^{2-}$ (b) $[CoF_6]^{3-}$
(c) $[Fe(H_2O)_6]^{2+}$ (d) $[Ni(CN)_4]^{2-}$
152. The solubility of silver bromide in hypo solution due to the formation of [Pb. CET 2003; CPMT 1987]
- (a) $[Ag(S_2O_3)]^{-3}$ (b) Ag_2SO_3
(c) $[Ag(S_2O_3)]^{-}$ (d) $Ag_2S_2O_3$
153. Brass is an alloy of [DPMT 1982, 83; CPMT 1972, 80, 89; MLNR 1985; AFMC 1990; Pb. CET 2004; EAMCET 1993; MP PMT 1996; KCET 2000]
- (a) Zn and Sn (b) Zn and Cu
(c) Cu, Zn and Sn (d) Cu and Sn

154. Iodine is formed when KI reacts with a solution of [Pb. CET 2004]
 (a) $CuSO_4$ (b) $(NH_4)_2SO_4$
 (c) $ZnSO_4$ (d) $FeSO_4$
155. Rust is [Pb. CET 2004]
 (a) $FeO + Fe(OH)_2$ (b) Fe_2O_3
 (c) $Fe_2O_3 + Fe(OH)_2$ (d) Fe_2O_3 and $Fe(OH)_3$
156. $[Sc(H_2O)_6]^{3+}$ ion is [Pb. CET 2004]
 (a) Colourless and diamagnetic
 (b) Coloured and octahedral
 (c) Colourless and paramagnetic
 (d) Coloured and paramagnetic
157. Which of the following is called white vitriol [MP PET 1990; Bihar MEE 1995; BVP 2004]
 (a) $ZnCl_2$ (b) $MgSO_4 \cdot 7H_2O$
 (c) $ZnSO_4 \cdot 7H_2O$ (d) $Al_2(SO_4)_3$
158. $FeSO_4 \cdot 7H_2O$ shows isomorphism with [BVP 2004]
 (a) $ZnSO_4 \cdot 7H_2O$ (b) $MnSO_4 \cdot 4H_2O$
 (c) $CaSO_4 \cdot 5H_2O$ (d) $CaCl_2 \cdot 2H_2O$
159. Which pair of compound is expected to show similar colour in aqueous medium [IIT Screening 2005]
 (a) $FeCl_2$ and $CuCl_2$ (b) $VOCl_2$ and $CuCl_2$
 (c) $VOCl_2$ and $FeCl_2$ (d) $FeCl_2$ and $MnCl_2$
160. Which of the following dissolves in hot conc. $NaOH$ solution [CPMT 2004]
 (a) Fe (b) Zn
 (c) Sn (d) Ag
161. Which of the following sulphides is yellow in colour [CPMT 1983, 88, 2004; NCERT 1976]
 (a) CuS (b) CdS
 (c) ZnS (d) CoS
162. Which of the following is not oxidized by O_3 [IIT Screening 2005]
 (a) KI (b) $FeSO_4$
 (c) $KMnO_4$ (d) K_2MnO_4
163. The number of moles of $KMnO_4$ reduced by one mole of KI in alkaline medium is [CBSE PMT 2005]
 (a) One fifth (b) Five
 (c) One (d) Two
164. Excess of KI reacts with $CuSO_4$ solution and then $Na_2S_2O_3$ solution is added to it. Which of the statements is **incorrect** for this reaction [AIEEE 2004]
 (a) $Na_2S_2O_3$ is oxidised (b) CuI_2 is formed
 (c) Cu_2I_2 is formed (d) Evolved I_2 is reduced
165. The only cations present in a slightly acidic solution are Fe^{3+} , Zn^{2+} and Cu^{2+} . The reagent that when added in excess to this solution would identify and separate Fe^{3+} in one step is [IIT 1997]
 (a) $2M HCl$ (b) $6M NH_3$
 (c) $6M NaOH$ (d) H_2S gas
166. Which element is alloyed with copper to form bronze [CPMT 1972, 80, 93; CPMT 1980, 82]
 (a) Fe (b) Mn
 (c) Sn (d) Zn
167. Emery consists of [AFMC 1999]
 (a) Impure corundum (b) Impure carborundum
 (c) Impure graphite (d) Purest form of iron
168. The metal commonly present in brass and german silver is [EAMCET 1988]
 (a) Mg (b) Zn
 (c) C (d) Al
169. In the equation
 $4M + 8CN^- + 2H_2O + O_2 \longrightarrow 4[M(CN_2)]^- + 4OH^-$
 The metal M is [MP PET 2000]
 (a) Copper (b) Iron
 (c) Gold (d) Zinc
170. The term plating is [Kerala (Med.) 2002]
 (a) Platinum painting
 (b) Flat sheet of platinum
 (c) Platinum manufacturing
 (d) Platinum used as a catalyst
171. Purple of cassius is [BHU 2002]
 (a) Gold solution (b) Silver solution
 (c) Copper solution (d) Platinum solution
172. Match the items under List 1 with the compounds/elements from the List 2. Select the correct answer from the sets (a), (b), (c) and (d).
- | List 1 | List 2 |
|------------------------------------|------------------------------------|
| (i) Explosive | (A) NaN_3 |
| (ii) Artificial gem | (B) Fe_3O_4 |
| (iii) Self reduction | (C) Sn |
| (iv) Magnetic material | (D) Al_2O_3 |
| | (E) $Pb(N_3)_2$ |
| | (F) Fe_2O_3 |
| | (G) Cu |
| | (H) SiC |
| (a) (i) A, (ii) D, (iii) G, (iv) B | (b) (i) A, (ii) D, (iii) G, (iv) F |
| (c) (i) E, (ii) D, (iii) G, (iv) B | (d) (i) E, (ii) H, (iii) C, (iv) F |
173. Blood haemoglobin contains the metal
 (a) Al (b) Mg
 (c) Cu (d) Fe
174. Percentage of carbon in steel is
 (a) 2.5 – 4.5% (b) 0.25 – 0.5%
 (c) 0.2 – 1.5% (d) 3 – 3.5%
175. Steel is manufactured from
 (a) Wrought iron (b) Cast iron
 (c) (a) and (b) both (d) Haematite
176. Modern method for the manufacture of steel is
 (a) Bessemer process
 (b) Seimen-Martin's open hearth process
 (c) Duplex method
 (d) L.D. process
177. **Spiegeleisen** is an alloy of
 (a) Fe , C and Mn (b) Fe , Mg and C
 (c) Fe , Co and Cr (d) Fe , Cu and Ni
178. Stainless steel is an alloy steel of the following metals [MP PET 1990; Pb. PET 1999; KCET 2000]
 (a) Fe Only (b) Cr and Ni
 (c) W and Cr (d) Ni and Be
179. In the manufacture of steel, the Bessemer converter is containing lining of
 (a) SiO_2 (b) CaO
 (c) CaO and MgO (d) Fe_2O_3
180. Which of the following alloys contain only Cu and Zn

- (a) Bronze (b) Brass [DCE 1999]
(c) Gun metal (d) Bell metal
181. Steel becomes soft and pliable by [MP PET 1989]
(a) Annealing (b) Nitriding
(c) Tempering (d) Case hardening
182. Most stable oxidation state of iron is [AFMC 1976; CPMT 1988]
(a) +2 (b) +3
(c) -2 (d) -3
183. Nickel steel contain % of Ni [MP PMT/PET 1988]
(a) 1-5% (b) 3-5%
(c) 6-5% (d) 8-5%
184. Permanent magnet is made from [MP PET/PMT 1988; CBSE 1989]
(a) Cast iron (b) Steel
(c) Wrought Iron (d) All of these
185. In nitriding process of steel [MP PET/PMT 1988; CBSE 1989]
(a) Steel is heated in an atmosphere of ammonia
(b) Steel is made red hot and then cooled
(c) Steel is made red hot and then plunged into oil for cooling
(d) None of these
186. Iron on reacting with carbon give
(a) FeC (b) Fe_2C
(c) Fe_3C (d) FeC_2
187. Iron loses magnetic property at [KCET 2002]
(a) Melting point (b) 1000K
(c) Curie point (d) Boiling point
188. Heat treatment alters the properties of steel due to [KCET 2002]
(a) Chemical reaction on heating
(b) Partial rusting
(c) Change in the residual energy
(d) Change in the lattice structure due to differential rate of cooling
189. Pure conc. HNO_3 makes iron passive as the surface is covered with protective layer of [Orissa JEE 2002; EAMCET 1993]
(a) Fe_2O_3 (b) FeO
(c) Fe_3O_4 (d) $Fe(NO_3)_3$
190. Red hot iron absorbs SO_2 giving the product [Orissa JEE 2002]
(a) $FeS + O_2$ (b) $Fe_2O_3 + FeS$
(c) $FeO + FeS$ (d) $FeO + S$
191. If steel is heated to a temperature well below red heat and is then cooled slowly, the process is called [Kerala (Med.) 2002]
(a) Tempering (b) Hardening
(c) Softening (d) Annealing
192. In smelting of iron, which of the following reactions takes place in Blast furnace at $400^\circ C - 600^\circ C$ [MP PET 2002]
(a) $CaO + SiO_2 \rightarrow CaSiO_3$
(b) $2FeS + 3O_2 \rightarrow 2Fe + SO_2$
(c) $FeO + SiO_2 \rightarrow FeSiO_3$
(d) $Fe_2O_3 + 3CO \rightarrow 2Fe + 3CO_2$
193. Soil containing both Al and Fe is called [DPMT 2002]
(a) Laterite (b) Bauxite
(c) Pedalfers (d) Clay
194. German silver is an alloy of [EAMCET 1979; CPMT 1986, 93; MP PET/PMT 1998; UPSEAT 1999; CBSE PMT 2000; KCET 2000; MP PMT 2001]
(a) Copper, zinc and nickel (b) Copper and silver
(c) Copper, zinc and tin (d) Copper, zinc and silver
195. Iron is rendered passive by the action of [IIT 1982; MP PET 1985; MP PMT 1987; DPMT 1984; KCET 1993]
(a) Conc. H_2SO_4 (b) Conc. H_3PO_4
(c) Conc. HCl (d) Conc. HNO_3
196. Iron sheets are galvanized by depositing a coating of or In galvanisation, iron surface is coated with [MP PET 1985, 86, 87, 89, 92, 96; NCERT 1980; Bihar CEE 1995]
(a) Zinc (b) Tin
(c) Chromium (d) Nickel
197. Chemical formula of rust is [BHU 1986; MP PET 1990]
(a) FeO (b) Fe_3O_4
(c) $Fe_2O_3 \cdot xH_2O$ (d) $FeO \cdot xH_2O$
198. Heating steel to bright redness and then cooling suddenly by plunging it into oil or water, makes it [MP PET 1990]
(a) Hard and pliable (b) Soft and pliable
(c) Soft and brittle (d) Hard and brittle
199. Which of the following is found in body [CPMT 1975]
(a) Pb (b) Fe
(c) Cd (d) Al
200. Which of the following pairs of elements might form an alloy [NCERT 1981]
(a) Zinc and lead (b) Iron and mercury
(c) Iron and carbon (d) Mercury and platinum
201. Ferrous sulphate on strong heating gives
(a) SO_2 (b) $Fe_2(SO_4)_3$
(c) $FeO + SO_3$ (d) $Fe_2O_3 + SO_2 + SO_3$
202. Green vitriol is [DPMT 1985; BHU 1997; RPET 1999; JIPMER 2002]
(a) $CuSO_4 \cdot 5H_2O$ (b) $FeSO_4 \cdot 7H_2O$
(c) $CaSO_4 \cdot 2H_2O$ (d) $ZnSO_4 \cdot 7H_2O$
203. When conc. sulphuric acid is added slowly to a solution of ferrous sulphate containing nitrate ion, a brown colour ring is formed. The composition of the ring is [CPMT 1989]
(a) $[Fe(H_2O)_5 NO]SO_4$ (b) $FeSO_4 \cdot NO_2$
(c) $Fe[(H_2O)_5](NO_3)_2$ (d) None of these
204. F_2 is the formed by reacting K_2MnF_6 with [AIIMS 2005]
(a) SbF_5 (b) MnF_3
(c) $KSbF_6$ (d) MnF_4
205. Railway wagon axles are made by heating rods of iron embedded in charcoal powder. The process is known as [CPMT 1972; DCE 2000; KCET 2003; UPSEAT 2001]
(a) Case hardening (b) Sheradizing
(c) Annealing (d) Tempering
206. The alloy of steel that is used in making automobile parts and utensils [EAMCET 1979; MP PMT 1992]
(a) Stainless steel (b) Nickel steel
(c) Tungstun steel (d) Chromium steel
207. Which of the following has lowest percentage of carbon

- [DPMT 1984; CPMT 1989, 91, 94; KCET 2000]
- (a) Cast iron (b) Wrought iron
(c) Steel (d) All have same percentage
208. Galvanisation is the [CPMT 1980, 86, 91, 99; MP PET/PMT 1988; Pb. PET 1999]
- (a) Deposition of Zn on Fe
(b) Deposition of Al on Fe
(c) Deposition of Sn on Fe
(d) Deposition of Cu on Fe
209. Tempered steel is
- (a) Soft and pliable
(b) Hard and brittle
(c) Neither so hard nor so brittle
(d) Very soft
210. Best quality of steel is manufactured by [BHU 1996]
- (a) Siemen –Martin's open hearth process
(b) Electrical process
(c) Bessemer process
(d) Blast furnace
211. The presence of Si in steel gives it
- (a) Fibrous structure (b) Silicate type structure
(c) Sheet type structure (d) None of these
212. The presence of Mn in steel produces
- (a) Elasticity
(b) Increases tensile strength
(c) Both (a) and (b)
(d) None of these
213. Presence of Cr in steel makes it
- (a) Resistant to chemical action
(b) Useful for making cutlery
(c) Increases chemical action
(d) (a) and (b) both
214. The addition of metals like Cr, Mn, W and Ni to ordinary steel makes it
- (a) More useful
(b) Alters the properties of ordinary steel
(c) Both (a) and (b)
(d) None of these
215. Stainless steel is non-corrosive. This character is more prominent in
- (a) Mn steel (b) Ordinary steel
(c) Ti steel (d) All of these
216. When little vanadium is mixed with steel, it becomes
- (a) More hard (b) More tensility
(c) Both (a) and (b) (d) No effect
217. To obtain steel entirely free from sulphur and phosphorus, the process used is
- (a) Electrothermal process (b) Bessemer process
(c) Open-hearth process (d) Duplex process
218. Stainless steel contains Cr
- (a) 14% (b) 5%
(c) 50% (d) 2.5%
219. The chief constituents of steel made in India are [MP PMT/PET 1988]
- (a) Mn and Cr (b) Al and Zn
(c) V and Co (d) Ni and Mg
220. Which of the following is used to prepare medical instruments
- (a) Cast iron (b) Wrought iron
(c) Steel (d) Alloy of Cu and Fe
221. A clock spring is heated to redness and then plunged into cold water. This treatment will cause it to become [NCERT 1979]
- (a) Soft and ductile (b) More springy than before
(c) Strongly magnetic (d) Hard and brittle
222. Mark the steel in which carbon % is highest
- (a) Mild steel (b) Hard steel
(c) Alloy steel (d) None of these
223. Mark the variety of iron which has highest melting point
- (a) Pig iron (b) Cast iron
(c) Wrought iron (d) Steel
224. Bessemer converter is used in the manufacture of [CPMT 1991]
- (a) Pig iron (b) Steel
(c) Wrought iron (d) Cast iron
225. Steel contains [MP PMT 1989; KCET 2000]
- (a) $Fe + C + Mn$ (b) $Fe + C + Al$
(c) $Fe + Mn$ (d) $Fe + Mn + Cr$
226. Steel differs from pig iron and wrought iron in that it contains [KCET 1991]
- (a) No carbon at all
(b) Less carbon than either
(c) More carbon than either
(d) An amount of carbon intermediate between two
227. Finely divided iron combines with CO to give [MNR 1994]
- (a) $Fe(CO)_5$ (b) $Fe_2(CO)_9$
(c) $Fe_3(CO)_{12}$ (d) $Fe(CO)_6$
228. Mohr's salt is [KCET 1993; DCE 1999; AIIMS 2000]
- (a) $FeSO_4 \cdot 7H_2O$
(b) $Fe(NH_4)SO_4 \cdot 6H_2O$
(c) $(NH_4)_2SO_4 \cdot FeSO_4 \cdot 6H_2O$
(d) $[Fe(NH_4)_2](SO_4)_2 \cdot 6H_2O$
229. Mohr's salt is [MNR 1986]
- (a) Normal salt (b) Acid salt
(c) Basic salt (d) Double salt
230. An example of double salt is [CPMT 1986; CBSE PMT 1989; Roorkee 1990]
- (a) Bleaching powder (b) $K_4[Fe(CN)_6]$
(c) Hypo (d) Potash alum
231. The passivity of iron in concentrated nitric acid is due to [MP PMT 1994]
- (a) Ferric nitrate coating on the metal
(b) Ammonium nitrate coating on the metal
(c) A thin oxide layer coating on the metal
(d) A hydride coating on the metal
232. The action of steam on heated iron is represented as [MP PMT 1994]
- (a) $3Fe + 4H_2O \rightarrow Fe_3O_4 + 4H_2$
(b) $2Fe + 3H_2O \rightarrow Fe_2O_3 + 3H_2$
(c) $Fe + H_2O \rightarrow FeO + H_2$
(d) $2Fe + H_2O + O_2 \rightarrow Fe_2O_3 + H_2$
233. Which metal is used to make alloy steel for armour plates, safes and helmets [KCET 2003]
- (a) Al (b) Mn
(c) Cr (d) Pb
234. Rusting on iron needs [MP PMT 1995]
- (a) Dry air
(b) Air and water
(c) Distilled water and carbon dioxide
(d) Oxygen and carbon dioxide
235. Iron when treated with concentrated nitric acid [MP PET 1996]

- (a) Readily reacts (b) Slowly reacts
(c) Becomes passive (d) Gives ferrous nitrate
236. An alloy which does not contain copper is [DPMT 1984]
(a) Solder (b) Bronze
(c) Brass (d) Bell metal
237. Which one of the following statements shows the correct percentage of carbon in steel, pig iron and wrought iron
(a) Steel containing less than 0.15% carbon; wrought iron 0.15 to 2.0% carbon; and pig iron over 2% carbon
(b) Pig iron less than 0.15% carbon; wrought iron 0.15 to 2.0% carbon; and steel over 2% carbon
(c) Wrought iron less than 0.15% carbon; steel 0.15 to 2.0% carbon; and pig iron over 2% carbon
(d) Wrought iron less than 0.15% carbon; pig iron 0.15 to 2.0% carbon; and steel over 2.0% carbon
238. In the Bessemer and open-hearth process for the manufacture of steel, which one of the following is used for the removal of carbon in part or whole
- | Bessemer | Open-hearth |
|------------------|--------------|
| (a) Ferric oxide | Air |
| (b) Air | Ferric oxide |
| (c) Oxygen | Scrap iron |
| (d) Air | Scrap iron |
239. About the basic open hearth process, which statement is wrong
(a) Limestone is added to the charge
(b) Phosphorus impurity cannot be removed by this process
(c) Carbon content of the steel can be uniformly controlled over a series of batches
(d) Iron scrap can be utilized
240. Which of the following statements is wrong
(a) Heating to a high temperature and then cooling suddenly, *e.g.* by dipping in water, makes steel hard and brittle
(b) Steel can be softened by heating it to a high temperature for a prolonged time and then cooling slowly. This is called quenching.
(c) Tempering of hardened steel is done by heating it to just below red heat at controlled temperature and duration
(d) Phosphorus impurity makes steel 'cold short'
241. Bell metal is an alloy of [DPMT 1990, 96; CBSE PMT 1999; Kerala PMT 2002]
(a) Cu, Zn and Sn (b) Cu, Zn and Ni
(c) Cu and Zn (d) Cu and Sn
242. Turnbull's blue is [Bihar CEE 1995]
(a) Ferricyanide (b) Ferrous ferricyanide
(c) Ferrous cyanide (d) Ferri-ferricyanide
243. Addition of high proportions of manganese makes steel useful in making rails of rail-roads because manganese [IIT 1998]
(a) Gives hardness to steel
(b) Helps the formation of oxides of iron
(c) Can remove oxygen and sulphur
(d) Can show highest oxidation state of + 7
244. Copper displaces which of the metal from their salt solutions [CPMT 1988]
(a) $AgNO_3$ (b) $ZnSO_4$
(c) $FeSO_4$ (d) All of these
245. Which of the following statement(s) is(are) correct with reference to the ferrous and ferric ions [IIT 1998]
(a) Fe^{3+} gives brown colour with potassium ferricyanide
(b) Fe^{2+} gives blue precipitate with potassium ferricyanide
(c) Fe^{3+} gives red colour with potassium thiocyanate
(d) Fe^{2+} gives brown colour with ammonium thiocyanate
246. Which of the following element constitutes a major impurity in pig iron [CBSE PMT 1998]
(a) Silicon (b) Oxygen
(c) Sulphur (d) Graphite
247. Annealing is [Pune CET 1998; AFMC 2002]
(a) Heating steel in nitrogen and cooling
(b) Heating steel to bright redness and then cooling slowly
(c) Heating wrought iron with carbon to redness
(d) Heating steel to high temperature and cooling suddenly by plunging in water
248. In electroplating, the metal that is not used for plating is [Pune CET 1998]
(a) Fe (b) Zn
(c) Ni (d) Au
249. Which one of the following is a wrong statement about cast iron [KCET 1998]
(a) It is also called pig iron
(b) It contains about 4.5% carbon
(c) It is corrosion resistant
(d) It contracts on cooling
250. Iron pipes lying under acidic soil are often attached to blocks of magnesium for protection from rusting. Magnesium offers protection to iron against corrosion because it [KCET 1998]
(a) Is more readily converted into positive ions
(b) Is lighter than iron
(c) Forms a corrosion-resistant alloy with iron
(d) Prevents air from reaching the surface of iron
251. FeS_2 is [RPET 1999]
(a) Artificial silver (b) Fool's gold
(c) Mohr's salt (d) Cast iron
252. Stainless steel is an alloy of iron with [DCE 1999]
(a) 8% Cr , 50% Mn (b) 10% Ni , 2% Mn
(c) 2% Cr , 3% C (d) 12% Cr , 1% N
253. The chemical processes in the production of steel from haematite ore involve [IIT-JEE (Screening) 2000]
(a) Reduction
(b) Oxidation
(c) Reduction followed by oxidation
(d) Oxidation followed by reduction
254. The protection of steel by chrome plating is due to [MP PMT 2001]
(a) Cathodic protection
(b) Anodic protection
(c) Covering of steel surface
(d) Formation of alloy with iron
255. The most convenient method to protect bottom of ship made of iron is [CBSE PMT 2001; Kerala (Engg.) 2002]
(a) White tin plating
(b) Coating with red lead oxide
(c) Connecting with 'Pb' block
(d) Connecting with 'Mg' block
256. Carbon monoxide reacts with iron to form [KCET (Med.) 2001]
(a) $Fe(CO)_5$ (b) $FeCO_2$
(c) $FeO + C$ (d) $Fe_2O_3 + C$
257. Iron is extracted from magnetite by reduction with

[UPSEAT 2001]

- (a) H_2 (b) C
(c) Mg (d) Al
258. Malachite is a mineral of [MP PMT 1990; MP PET 1992, 98, 2000; MP PMT 1998]
(a) Zn (b) Fe
(c) Hg (d) Cu
259. The most important oxidation state of copper is [MP PMT 1987]
(a) +1 (b) +2
(c) +3 (d) +4
260. Hot and conc. nitric acid when reacts with copper, the gas obtained is
(a) N_2 (b) Nitrous oxide
(c) NO (d) NO_2
261. Which of the following property is not expected to be shown by copper [MP PET/PMT 1988; NCERT 1975; MP PET 1989]
(a) High thermal conductivity
(b) Low electrical conductivity
(c) Ductility
(d) Malleability
262. Which of the following metal gives more than one chloride
(a) Cu (b) Al
(c) Ag (d) Na
263. The metal which is the best conductor of electricity is [CPMT 1996]
(a) Iron (b) Copper
(c) Silver (d) Aluminium
264. Paris green is
(a) Double salt of copper carbonate and copper nitrate
(b) Double salt of copper acetate and copper arsenite
(c) Double salt of copper acetate and copper sulphate
(d) Double salt of copper and silver nitrate
265. Reaction between the following pairs will produce H_2 except [CPMT 1973; CBSE PMT 1998]
(a) Na + ethyl alcohol (b) Fe + steam
(c) $Fe + H_2SO_4 (aq.)$ (d) $Cu + HCl (aq.)$
266. Which of the following is correct [BHU 1995]
(a) Gun metal : $Cu + Zn + Sn$
(b) Duralumin : $Al + Cu + Mg + Ag$
(c) German silver : $Cu + Zn + C$
(d) Solder : $Pb + Al$
267. Solder is an alloy of [IIT 1995; MP PET 1995; AFMC 2005]
(a) 70% lead, 30% tin (b) 30% lead, 70% tin
(c) 80% lead, 20% tin (d) 90% Cu , 10% tin
268. Zinc forms two important alloys, (i) Brass and (ii) German silver. Metals present in them mainly are
(a) In (i) zinc and tin; and in (ii) zinc, silver and nickel
(b) In (i) zinc and iron; and in (ii) zinc, nickel and cobalt
(c) In (i) zinc and copper; and in (ii) zinc, copper and nickel
(d) In (i) zinc and aluminium; and in (ii) zinc, nickel and aluminium
269. One of the constituent of german silver is [IIT 1980; Kurukshetra CEE 1998; DCE 1999]
(a) Ag (b) Cu
(c) Mg (d) Al
270. Gun metal is an alloy of [MP PMT 1990; CPMT 1997]
(a) Cu and Al (b) Cu, Sn and Zn

(c) Cu, Zn and Ni (d) Cu and Sn

271. Besides Zn and Cu , german silver contains the metal [MP PET 1997]
(a) Sn (b) Ag
(c) Ni (d) Mg
272. Which metal is present in brass, bronze and German silver [CPMT 1997; AFMC 1998; AIIMS 1999; J & K 2005]
(a) Zn (b) Mg
(c) Cu (d) Al
273. Which of the following is wrongly matched [KCET (Med.) 1999]
(a) German silver $Cu + Zn + Ni$
(b) Alnico $Fe + Al + Ni + CO$
(c) Monel metal $Cu + Zn + Sn$
(d) Duralumin $Al + Cu + Mg + Mn$
274. An extremely hot copper wire reacts with steam to give [CPMT 1988]
(a) CuO (b) Cu_2O
(c) Cu_2O_2 (d) CuO_2
275. From a solution of $CuSO_4$, the metal used to recover copper is [MP PET 1992]
(a) Sodium (b) Iron
(c) Silver (d) Hg
276. Copper sulphate is commercially made from copper scraps by [CPMT 1973]
(a) Dissolving in hot conc. H_2SO_4
(b) The action of dil. H_2SO_4 and air
(c) Heating with sodium sulphate
(d) Heating with sulphur
277. Cuprous ion is colourless, while cupric ion is coloured because [EAMCET 1992; B]
(a) Both have unpaired electrons in d -orbital
(b) Cuprous ion has a completed d -orbital and cupric ion has an incomplete d -orbital
(c) Both have half-filled p and d -orbitals
(d) Cuprous ion has incomplete d -orbital and cupric ion has a completed d -orbital
278. A blue colouration is not obtained when [CBSE PMT 1989]
(a) Ammonium hydroxide dissolves in copper sulphate
(b) Copper sulphate solution reacts with $K_4[Fe(CN)_6]$
(c) Ferric chloride reacts with sodium ferrocyanide
(d) Anhydrous $CuSO_4$ is dissolved in water
279. Identify the statement which is not correct regarding $CuSO_4$ [MNR 1992; Pb. P]
(a) It reacts with KI to give iodine
(b) It reacts with KCl to give Cu_2Cl_2
(c) It reacts with $NaOH$ and glucose to give Cu_2O
(d) It gives CuO on strong heating in air
280. Copper sulphate solution reacts with KCN to give [MP PMT 1992; MNR 1994; IIT 1996; AIIMS 1999; CBSE PMT 2002]
(a) $Cu(CN)_2$ (b) $CuCN$
(c) $K_2[Cu(CN)_4]$ (d) $K_3[Cu(CN)_4]$

281. If excess of NH_4OH is added to $CuSO_4$ solution, it forms blue coloured complex which is
[MP PMT 1971, 79; Bihar CEE 1995; RPET 1999; AFMC 2001]
- (a) $Cu(NH_3)_4SO_4$ (b) $Cu(NH_3)_2SO_4$
(c) $Cu(NH_4)_4SO_4$ (d) $Cu(NH_4)_2SO_4$
282. Which of the following metals displaces SO_2 gas from concentrated sulphuric acid
(a) Mg (b) Zn
(c) Cu (d) None of these
283. The method of zone refining of metals is based on the principle of
(a) Greater solubility of the impurity in the molten state than in the solid
(b) Greater mobility of the pure metal than that of the impurity
(c) Higher melting point of the impurity than that of the pure metal
(d) Greater noble character of the solid metal than that of the impurity
284. A metal when left exposed to the atmosphere for some time becomes coated with green basic carbonate. The metal in question is [NDA 1999]
(a) Copper (b) Nickel
(c) Silver (d) Zinc
285. When $CuSO_4$ solution is added to $K_4[Fe(CN)_6]$, the formula of the product formed is [Bihar CEE 1995]
(a) $Cu_2Fe(CN)_6$ (b) KCN
(c) $Cu(CN)_3$ (d) $Cu(CN)_2$
286. MnO_4^- on reduction in acidic medium forms [MP PMT 1995]
(a) MnO_2 (b) Mn^{++}
(c) MnO_4^{--} (d) Mn
287. Which of the following metals will not react with a solution of $CuSO_4$ [CPMT 1996]
(a) Fe (b) Zn
(c) Mg (d) Hg
288. Which one of the following metals will not reduce H_2O [EAMCET 1997]
(a) Ca (b) Fe
(c) Cu (d) Li
289. The reaction, which forms nitric oxide, is [KCET (Med.) 2001]
(a) C and N_2O (b) Cu and N_2O
(c) Na and NH_3 (d) Cu and HNO_3
290. A cuprous ore among the following is [KCET 2002]
(a) Cuprite (b) Malachite
(c) Chalcopyrites (d) Azurite
291. When metallic copper comes in contact with moisture, a green powdery/ pasty coating can be seen over it. This is chemically known as [AFMC 2002]
(a) Copper sulphide - Copper carbonate
(b) Copper carbonate - Copper sulphate
(c) Copper carbonate - Copper hydroxide
(d) Copper Sulphate - Copper sulphide
292. Orford process is used in extraction of
(a) Fe (b) Co
(c) Pt (d) Ni
293. Horn silver is
(a) $AgCl$ (b) Ag
(c) $AgBr$ (d) CH_3COOAg
294. Which of the following is used in photography [CPMT 1980]
(a) $AgCl$ (b) $AgBr$
(c) AgI (d) Ag_2O
295. Silver halides are used in photography because [CBSE PMT 2003] [MP PMT 1989]
(a) They are photosensitive
(b) Soluble in hypo
(c) Soluble in NH_4OH
(d) Soluble in acids
296. $AgCl$ when heated with Na_2CO_3 gives [CPMT 1980; MP PET 1989; MP PMT 1982, 84]
(a) Ag_2O (b) Ag
(c) Ag_2CO_3 (d) $NaAgCO_3$
297. $AgNO_3$ gives a red ppt. with [NCERT 1972; BHU 1978; MP PMT 1995]
(a) KI (b) $NaBr$
(c) $NaNO_3$ (d) K_2CrO_4
298. Silver nitrate is prepared by [CPMT 1984]
(a) The action of only conc. HNO_3 on silver
(b) Heating silver oxide with NO_2
(c) The action of hot dil. HNO_3 on silver
(d) Dissolve Ag in aqua-regia
299. $AgCl$ is soluble in [EAMCET 1992]
(a) Aqua-regia (b) H_2SO_4
(c) HCl (d) NH_3 (aq)
300. Which of the following is least soluble in water [NCERT 1974, 78; MNR 1984, 89]
(a) AgI (b) $AgCl$
(c) $AgBr$ (d) Ag_2S
301. Photographic films and plates have an essential ingredient of [CPMT 1980; CBSE PMT 1989]
(a) Silver nitrate (b) Silver bromide
(c) Sodium chloride (d) Oleic acid
302. Which of the following does not react with $AgCl$ [AIIMS 1997]
(a) $NaNO_3$ (b) Na_2CO_3
(c) $Na_2S_2O_3$ (d) NH_4OH
303. Which one of the following is known as lunar caustic when in fused state [MP PMT 1999; JIPMER 2002]
(a) Silver nitrate (b) Silver sulphate
(c) Silver chloride (d) Sodium sulphate
304. Which silver halide is used in medicine [DPMT 1996]
(a) $AgNO_3$ (b) $AgCl$
(c) $AgBr$ (d) AgF

305. When silver nitrate is heated to red hot, what is formed
[CPMT 1996; NCERT 1970]
(a) Ag (b) Ag_2O
(c) Ag_2O_3 (d) AgO_2
306. For making Ag from $AgNO_3$, which of the following is used [AFMC 1998]
(a) PH_3 (b) AsH_3
(c) Na_2CO_3 (d) NH_3
307. Which one of the following reacts with concentrated sulphuric acid [EAMCET 1998]
(a) Au (b) Ag
(c) Pt (d) Pb
308. The nitrate of which metal left globule on heating strongly
[JIPMER 2001]
(a) $Pb(NO_3)_2$ (b) $NaNO_3$
(c) $AgNO_3$ (d) $Cu(NO_3)_2$
309. During extraction of silver, which of the following is formed
[MP PET 2002]
(a) $Na[Ag(CN)_2]$ (b) $Na_2[Ag(CN)_2]$
(c) $Na_4[Ag(CN)_2]$ (d) None of these
310. Colourless solutions of the following four salts are placed separately in four different test tubes and a strip of copper is dipped in each one of these. Which solution will turn Blue
[MP PET 2002]
(a) KNO_3 (b) $AgNO_3$
(c) $Zn(NO_3)_2$ (d) $ZnSO_4$
311. Zinc when reacted with excess of $NaOH$ gives
[CPMT 1974, 78, 94; MP PMT 1999]
(a) Zinc hydroxide (b) Zinc oxide
(c) Di sodium zincate (d) Sodium zincate
312. Pair of metals which dissolves in $NaOH$ solution
(a) Al, Cu (b) Zn, Hg
(c) Zn, Cu (d) Zn, Al
313. Lucas reagent is
[CPMT 1980; AIIMS 1980, 82; DPMT 1983; MP PET 1995; MP PMT 1997, 98]
(a) Anhydrous $ZnCl_2 + conc. HCl$
(b) Hydrated $ZnCl_2 + dil. HCl$
(c) Conc. $HNO_3 + anhydrous ZnCl_2$
(d) Conc. $HNO_3 + anhydrous MgCl_2$
314. What is the effect of shaking dil. H_2SO_4 with small quantity of anhydrous $CuSO_4$
[NCERT 1975; CPMT 1975, 88]
(a) The white solid dissolves to form a colourless solution
(b) The white solid dissolves to form a green solution
(c) The white solid turns blue but does not dissolve
(d) The white solid dissolves to form a blue solution
315. Which metal is electro-deposited on iron surface to prevent rusting [MP PET 1990]
(a) Cu (b) Zn
(c) Mg (d) Pb
316. To prevent corrosion, iron pipes carrying drinking water are covered with zinc. The process involved is
[CPMT 1986; MP PMT 1993; MP PET 1999]
(a) Photoelectrolysis (b) Electroplating
(c) Galvanization (d) Cathodic protection
317. From aqueous solution of $ZnSO_4$, normal zinc carbonate may be precipitated by [CPMT 1973]
(a) Boiling with $CaCO_3$ (b) Adding Na_2CO_3
(c) Adding $NaHCO_3$ (d) Passing CO_2
318. Which one of the following dissolve in hot concentrated $NaOH$ solution [IIT 1980]
(a) Fe (b) Zn
(c) Cu (d) Ag
319. Which of the following metal forms an amphoteric oxide
[CPMT 1976]
(a) Ca (b) Fe
(c) Cu (d) Zn
320. Reaction of zinc with cold and very dilute nitric acid yields
[MP PET 1985, 92, 97; BHU 1995, 2000; NCERT 1974; MP PMT 1995]
(a) $Zn(NO_3)_2 + N_2O$ (b) $Zn(NO_3)_2 + NO$
(c) $Zn(NO_3)_2 + NH_4NO_3$ (d) $Zn(NO_3)_2 + NO_2$
321. The number of unpaired electrons in Zn^{2+} is
(a) 2 (b) 3
(c) 4 (d) 0
322. The trace metal present in insulin is [KCET 1991]
(a) Iron (b) Cobalt
(c) Zinc (d) Manganese
323. The chemical name of borax is [CPMT 1994]
(a) Sodium orthoborate
(b) Sodium metaborate
(c) Sodium tetraborate
(d) Sodium tetraborate decahydrate
324. Hydrogen is not obtained when zinc reacts with
[CPMT 1994]
(a) Cold water (b) Dilute H_2SO_4
(c) Dilute HCl (d) Hot 20% $NaOH$
325. The metal which gives hydrogen on treatment with acid as well as sodium hydroxide is [MP PET 1996]
(a) Iron (b) Zinc
(c) Copper (d) None of the above
326. To protect iron against corrosion, the most durable metal plating on it, is [CBSE PMT 1994]
(a) Nickel plating (b) Tin plating
(c) Copper plating (d) Zinc plating
327. The compound $ZnFe_2O_4$ is [Kerala (Engg.) 2002]
(a) A normal spinel compound
(b) Interstitial compound
(c) Covalent compound
(d) Co-ordination compound
328. ZnO when heated with BaO at $1100^\circ C$ gives a compound. Identify the compound [AFMC 2002]
(a) $BaZnO_2$ (b) $BaO_2 + Zn$
(c) $BaCdO_2$ (d) $Ba + ZnO_2$
329. Zn gives hydrogen gas with H_2SO_4 and HCl but not with HNO_3 because [CBSE PMT 2002]
(a) NO_2 is reduced in preference to H_3O^+

- (b) HNO_3 is weaker acid than H_2SO_4 and HCl
 (c) Zn acts as oxidising agent when reacts with HNO_3
 (d) In electrochemical series Zn is placed above the hydrogen
- 330.** The metal used for making radiation shield is [Kerala (Med.) 2002]
 (a) Aluminium (b) Iron
 (c) Zinc (d) Lead
- 331.** Which of the following metal is obtained by leaching out process using a solution of NaCN and then precipitating the metal by addition of zinc dust [NCERT 1984; AIIMS 1983; CBSE PMT 1989]
 (a) Copper (b) Silver
 (c) Nickel (d) Iron
- 332.** While extracting an element from its ore, the ore is ground and leached with dilute KCN solution to form the soluble product potassium argentocyanide. The element is [CBSE PMT 1989]
 (a) Lead (b) Chromium
 (c) Manganese (d) Silver
- 333.** In Mc Arthur Forest method, silver is extracted from the solution of $\text{Na}[\text{Ag}(\text{CN})_2]$ by the use of: [CPMT 2004]
 (b) Fe (b) Mg
 (c) Cu (d) Zn
- 334.** Iron obtained from blast furnace is known as [DPMT 1981; CPMT 1988; MP PET 2000]
 (a) Wrought iron (b) Cast iron
 (c) Pig iron (d) Steel
- 335.** Extraction of silver from commercial lead is possible by [BHU 1979]
 (a) Mond's process (b) Park's process
 (c) Haber's process (d) Clark's process
- 336.** Impurities of lead in silver are removed by [AIIMS 1987]
 (a) Park process (b) Solvey process
 (c) Cyanide process (d) Amalgamation process
- 337.** Park's process is used in the extraction of [BHU 1977; CBSE PMT 1992; MP PMT 1996; Kurukshetra CEE 1998]
 (a) Iron (b) Zinc
 (c) Silver (d) Lead
- 338.** From argentite (Ag_2S) ore the method used in obtaining metallic silver is [MP PMT 1989]
 (a) Fused mixture of Ag_2S and KCl is electrolysed
 (b) Ag_2S is reduced with CO
 (c) Ag_2S is roasted to Ag_2O which is reduced with carbon
 (d) Treating argentite with NaCN solution followed by metal displacement with zinc
- 339.** In the extraction of zinc which gas is burnt in the jackets surrounding the retorts
 (a) Water gas (b) Producer gas
 (c) Oil gas (d) Coal gas
- 340.** MacArther process is used for [BHU 1995]
 (a) Hg (b) Fe
 (c) Cl (d) O_2
- 341.** In the metallurgy of zinc, the zinc dust obtained from roasting and reduction of zinc sulphide contains some ZnO . How is this removed [MP PET 1993; AFMC 2002]
 (a) Absorbance of ultraviolet light and re-emission of white light is employed
 (b) Shock cooling by contact with a shower of molten lead is done
 (c) X-ray method is used
 (d) Smelting is employed
- 342.** In the metallurgy of copper, metallic copper is finally formed in the furnace by the reactions
 (a) $\text{Cu}_2\text{S} + \text{O}_2 \rightarrow 2\text{Cu} + \text{SO}_2$
 (b) $2\text{CuS} + 3\text{O}_2 \rightarrow 2\text{CuO} + 2\text{SO}_2$
 $2\text{CuO} + \text{CuS} \rightarrow 3\text{Cu} + \text{SO}_2$
 (c) $2\text{Cu}_2\text{S} + 3\text{O}_2 \rightarrow 2\text{Cu}_2\text{O} + 2\text{SO}_2$
 $\text{Cu}_2\text{S} + 2\text{Cu}_2\text{O} \rightarrow 6\text{Cu} + \text{SO}_2$
 (d) $\text{CuS} + \text{O}_2 \rightarrow \text{Cu} + \text{SO}_2$
- 343.** In the smelting of roasted copper pyrites ore, melting occurs so that the first reaction is
 (a) All the sulphur preferentially combines with iron to form FeS and CuO is formed
 (b) All the sulphur preferentially combines with copper to form CuS and FeO is formed
 (c) All the sulphur preferentially combines with iron to form FeS and Cu_2O is formed
 (d) All the sulphur preferentially combines with copper to form Cu_2S and FeO is formed
- 344.** In the oxidation of Cu , the reaction which takes place in bessemer converter is [CPMT 1999]
 (a) $2\text{CuFeS}_2 + \text{O}_2 \rightarrow \text{Cu}_2\text{S} + \text{FeS} + \text{SO}_2$
 (b) $2\text{Cu}_2\text{S} + 3\text{O}_2 \rightarrow 2\text{Cu}_2\text{O} + 2\text{SO}_2$
 (c) $2\text{Cu}_2\text{O} + \text{Cu}_2\text{S} \rightarrow 6\text{Cu} + \text{SO}_2$
 (d) $2\text{FeS} + 3\text{O}_2 \rightarrow 2\text{FeO} + 2\text{SO}_2$
- 345.** Silica is added to roasted copper ore during smelting in order to remove [KCET 1998]
 (a) Cuprous sulphide (b) Cuprous oxide
 (c) Ferrous oxide (d) Ferrous sulphide
- 346.** Parke's process is used to extract [MP PMT 2002]
 (a) Silver using NaCN
 (b) Copper using CuFeS_2
 (c) Silver from argentiferous lead
 (d) Silver by forming amalgam
- 347.** Identify the reaction that doesn't take place during the smelting process of copper extraction [KCET 2003]
 (a) $2\text{FeS} + 3\text{O}_2 \rightarrow 2\text{FeO} + 2\text{SO}_2 \uparrow$
 (b) $\text{Cu}_2\text{O} + \text{FeS} \rightarrow \text{Cu}_2\text{S} + \text{FeO}$
 (c) $2\text{Cu}_2\text{S} + 3\text{O}_2 \rightarrow 2\text{Cu}_2\text{O} + 2\text{SO}_2 \uparrow$
 (d) $\text{FeO} + \text{SiO}_2 \rightarrow \text{FeSiO}_3$
- 348.** The extraction of which of the following metals involves bessemerisation [DCE 2004]
 (a) Fe (b) Ag
 (c) Al (d) Cu
- 349.** Bessemer converter is used for [AFMC 2004]
 (a) Steel (b) Wrought iron
 (c) Pig iron (d) Cast iron
- 350.** In the cyanide process for the extraction of silver, sodium cyanide is used to [MP PMT 1994]
 (a) Convert silver into a soluble silver complex
 (b) Reduce silver

- (c) Precipitate silver
(d) Oxidise silver
351. Parke's process of desilverization of lead depends upon
- Partition coefficient of silver between molten zinc/molten lead having a high value
 - Partition coefficient of silver between molten zinc/molten lead having a low value
 - Crystallizing out of pure lead while the silver-lead eutectic which has a lower melting point is left behind in liquid form
 - Chemical combination of zinc and silver which precipitates out easily
352. Which is impure form of iron
- Cast iron
 - Wrought iron
 - Steel iron
 - None
353. Blister copper is [CPMT 1976, 85, 2002; DPMT 1982; MP PET 1995; Bihar CEE 1995]
- Pure copper
 - Ore of copper
 - Alloy of copper
 - 1% impure copper
354. In the extraction of copper when molten copper is cooled slowly, blister copper is obtained due to evolution of the following gas
- Water vapour
 - Sulphur dioxide
 - Carbon dioxide
 - Carbon monoxide
355. In the electrolytic purification of copper some gold is found in the [CPMT 1972; AFMC 1995; MP PET 2003]
- Cathode
 - Cathode mud
 - Anode mud
 - Electrolyte
356. Purest form of iron is [CPMT 1975, 80, 84, 87, 89; DPMT 1982, 83; MP PMT 1987, 90, 91; MP PET 1995; BHU 1999; MH CET 2003]
- Cast iron
 - Wrought iron
 - Hot steel
 - Stainless steel
357. *Spelter* is [CPMT 1988]
- Impure Cu
 - Impure Zn
 - ZnO
 - CuO
358. A copper coin is completely covered with a gold film and is placed in dilute HNO_3 . This will result in formation of [CPMT 1981]
- Gold nitrate
 - Copper nitrate
 - None of these
 - Purple of cassins
359. When zinc is added to CuSO_4 copper gets ppt. due to [CPMT 1979]
- Reduction of copper ions
 - Oxidation of copper ions
 - Hydrolysis of copper sulphate
 - Complex formation
360. Addition of iron filings to CuSO_4 solution caused precipitation of Cu owing to the [CPMT 1990]
- Reduction of Cu^{++}
 - Oxidation of Cu^{++}
 - Reduction of Fe
 - Reduction of Fe^{+++}
361. Oxygen gas can be prepared from solid KMnO_4 by [DPMT 2001]
- Strongly heating the solid

- Treating the solid with H_2 gas
- Dissolving the solid in dil. H_2SO_4
- Dissolving the solid in dil. HCl

Critical Thinking

Objective Questions

- Transition metal with low oxidation number will act as [DCE 2001]
 - A base
 - An acid
 - An oxidising agent
 - None of these
- Which of the following pair will have effective magnetic moment equal
 - Cr^{+3} and Mn^{+2}
 - Cr^{+2} and Fe^{+2}
 - V^{+2} and Sc^{+3}
 - Ti^{+2} and V^{+2}
- Which is least soluble in water [MNR 1984, 89]
 - AgBr
 - AgI
 - Ag_2S
 - AgF
- Which one of the following has the maximum number of unpaired electrons [UPSEAT 2001]
 - Mg^{2+}
 - Ti^{3+}
 - V^{3+}
 - Fe^{2+}
- Which of the following ions form most stable complex compound [MP PMT 1995]
 - Cu^{++}
 - Ni^{++}
 - Fe^{++}
 - Mn^{++}
- Mn^{++} can be converted into Mn^{7+} by reacting with [UPSEAT 2003]
 - SO_2
 - Cl_2
 - PbO_2
 - SnCl_2
- General configuration of outermost and penultimate shell is $(n-1)s^2(n-1)p^6(n-1)d^xns^2$. If $n = 4$ and $x = 5$ then no. of proton in the nucleus will be [MP PET 2003]
 - > 25
 - < 24
 - 25
 - 30
- Which transition metal reduces steam to evolve hydrogen [MP PMT 2003; DCE 2002]
 - Mg
 - Fe
 - Sc
 - Pt
- Chloride of which of the following element is coloured [MP PMT 1990]
 - Ag
 - Hg
 - Zn
 - Co
- Arrange Ce^{+3} , La^{+3} , Pm^{+3} and Yb^{+3} in increasing order of their ionic radii [AIEEE 2002]
 - $\text{Yb}^{+3} < \text{Pm}^{+3} < \text{Ce}^{+3} < \text{La}^{+3}$
 - $\text{Ce}^{+3} < \text{Yb}^{+3} < \text{Pm}^{+3} < \text{La}^{+3}$
 - $\text{Yb}^{+3} < \text{Pm}^{+3} < \text{La}^{+3} < \text{Ce}^{+3}$
 - $\text{Pm}^{+3} < \text{La}^{+3} < \text{Ce}^{+3} < \text{Yb}^{+3}$

11. $KMnO_4$ reacts with ferrous sulphate according to the equation
 $MnO_4^- + 5Fe^{2+} + 8H^+ \rightarrow Mn^{2+} + 5Fe^{3+} + 4H_2O$ Here
 10ml of 0.1M $KMnO_4$ is equivalent to [CPMT 1999]
 (a) 20ml of 0.1M $FeSO_4$
 (b) 30ml of 0.1M $FeSO_4$
 (c) 40ml of 0.1M $FeSO_4$
 (d) 50ml of 0.1M $FeSO_4$
12. Which of the following is/are soluble in ethanol [Roorkee Qualifying 1998]
 (a) HgF_2 (b) $HgCl_2$
 (c) $HgBr_2$ (d) HgI_2
13. Out of all the known elements, the percentage of transitional elements is approximately
 (a) 30% (b) 50%
 (c) 60% (d) 75%
14. Atomic number of Cr and Fe are 24 and 26 respectively. Which of the following is paramagnetic with the spin of electron [CBSE PMT 2002]
 (a) $[Cr(NH_3)_6]^{+3}$ (b) $[Fe(CO)_5]$
 (c) $[Fe(CN)_6]^{-4}$ (d) $[Cr(CO)_6]$
15. Which of the following is not an element [DCE 2001]
 (a) Graphite (b) Diamond
 (c) 22-carat gold (d) Rhombic sulphur
16. Which of the following is more paramagnetic [DCE 2001]
 (a) Fe^{+2} (b) Fe^{+3}
 (c) Cr^{+3} (d) Mn^{+3}
17. The number of d-electrons in Fe^{2+} (at no. of $Fe = 26$) is not equal to that of the [MNR 1994]
 (a) p - electrons in Ne (at. no. = 10)
 (b) s - electrons in Mg (at. no. = 12)
 (c) d - electrons in Fe
 (d) p - electrons in Cl^- (at. no. of $Cl = 17$)
18. The basic character of the transition metal monoxides follows the order [CBSE PMT 2003]
 (a) $TiO > VO > CrO > FeO$
 (b) $VO > CrO > TiO > FeO$
 (c) $CrO > VO > FeO > TiO$
 (d) $TiO > FeO > VO > CrO$
 (Atomic no. $Ti = 22$, $V = 23$, $Cr = 24$, $Fe = 26$)
19. Amongst following the lowest degree of paramagnetism per mole of the compound at 298 K will be shown by
 (a) $MnSO_4 \cdot 4H_2O$ (b) $CuSO_4 \cdot 5H_2O$
 (c) $FeSO_4 \cdot 6H_2O$ (d) $FeSO_4 \cdot 5H_2O$
20. In nitroprusside ion, the iron and NO exist as Fe^{II} and NO^+ rather than Fe^{III} and NO . These forms can be differentiated by [IIT-JEE 1998]
 (a) Estimating the concentration of iron
 (b) Measuring the concentration of CN^-
 (c) Measuring the solid state magnetic moment
 (d) Thermally decomposing the compound
21. Among the following, the compound that is both paramagnetic and coloured is [IIT-JEE 1997]
 (a) $K_2Cr_2O_7$ (b) $(NH_4)_2(TiCl_6)$
 (c) $VO SO_4$ (d) $K_3[Cu(CN)_4]$
22. The number of moles of $KMnO_4$ that will be needed to react completely with one mole of ferrous oxalate $Fe(C_2O_4)$ in acidic solution is [IIT-JEE 1997; KCET 1996]
 (a) 3/5 (b) 2/5
 (c) 4/5 (d) 1
23. In following reaction
 $yMnO_4^- + xH^+ + C_2O_4^{2-} \rightarrow yMn^{++} + 2CO_2 + \frac{x}{2}H_2O$,
 x and y are [CPMT 1997]
 (a) 2 and 16 (b) 16 and 2
 (c) 8 and 16 (d) 5 and 2
24. Which of the following weighs less when weighed in magnetic field
 (a) VCl_3 (b) $ScCl_3$
 (c) $TiCl_3$ (d) $FeCl_3$
25. An elements is in M^{3+} form. Its electronic configuration is $[Ar]3d^1$ the ion is [JIPMER 2002]
 (a) Ti^{3+} (b) Ti^{4+}
 (c) Ca^{2+} (d) Sc^{+}
26. The atomic number of vanadium (V), chromium (Cr), manganese (Mn) and iron (Fe) are respectively 23, 24, 25 and 26 which one of these may be expected to have the highest second ionization enthalpy [AIEEE 2003]
 (a) V (b) Cr
 (c) Mn (d) Fe

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

1. Assertion : Cuprous ion (Cu^+) has unpaired electrons while cupric ion (Cu^{++}) does not
 Reason : Cuprous ion (Cu^+) is colourless where as cupric ion (Cu^{++}) is blue in the aqueous solution [AIIMS 2002]
2. Assertion : Zn^{2+} is diamagnetic
 Reason : The electrons are lost from 4 s orbital to form Zn^{2+} [IIT-JEE 1998]
- Assertion : Transition metals show variable valence.
 Reason : Due to a large energy difference between the ns^2 and $(n-1)d$ electrons. [AIIMS 1996]
4. Assertion : The aqueous solution of $FeCl_3$ is basic in nature.
 Reason : $FeCl_3$ hydrolyses in water. [AIIMS 1998]
5. Assertion : $AgCl$ dissolves in NH_4OH solution.
 Reason : Due to formation of a complex.

[AIIMS 1998]

6. Assertion : Pure iron is not used for making tools and machines.

Reason : Pure iron is hard. [AIIMS 1998]

7. Assertion : Solution of Na_2CrO_4 in water is intensely coloured.

Reason : Oxidation state of Cr in Na_2CrO_4 is +VI.

[AIIMS 2003]

8. Assertion : Copper metal gets readily corroded in an acidic aqueous solution.

Reason : Free energy change for this process is positive. [AIIMS 2004]

9. Assertion : The free gaseous Cr atom has six unpaired electrons.

Reason : Half filled 's' orbital has greater stability.

[AIIMS 2004]

10. Assertion : Fe^{2+} is paramagnetic.

Reason : Fe^{2+} contains four unpaired electrons.

11. Assertion : Transition metals are good catalysts.

Reason : V_2O_5 or Pt is used in the preparation of H_2SO_4 by contact process.

12. Assertion : Rusting of an iron is an example of corrosion.

Reason : Rusting of iron is decreased by acids and electrolytes.

13. Assertion : $AgBr$ is used in photography.

Reason : $AgBr$ undergoes photochemical reaction.

14. Assertion : Tungsten filament is used in electric bulbs.

Reason : Tungsten is a metal of high melting point.

15. Assertion : $Na_2Cr_2O_7$ is not a primary standard in volumetric analysis.

Reason : $Na_2Cr_2O_7$ is hygroscopic.

16. Assertion : Promethium is a man made element.

Reason : It is radioactive and has been prepared by artificial means.

17. Assertion : Magnetic moment values of actinides are lesser than the theoretically predicted values.

Reason : Actinide elements are strongly paramagnetic.

18. Assertion : The degree of complex formation in actinides decreases in the order $M^{4+} > MO_2^{2+} > M^{3+} > MO_2^+$.

Reason : Actinides form complexes with π -bonding ligands such as alkyl phosphines and thioethers.

19. Assertion : In transition elements ns orbital is filled up first and $(n-1)d$ afterwards, during ionization ns electrons are lost prior to $(n-1)d$ electrons.
- Reason : The effective nuclear charge felt by $(n-1)d$ electrons is higher as compared to that by ns electrons.
20. Assertion : Extraction of iron metal from iron oxide ore is carried out by heating with coke.
- Reason : The reaction $Fe_2O_3(s) \rightarrow Fe(s) + \frac{3}{2}O_2(g)$ is a spontaneous process. [AIIMS 2005]

AS Answers and Solutions

General characteristics

- (c)

	$3d^5$					$4s^1$
Cr	$\uparrow$	$\uparrow$	$\uparrow$	$\uparrow$	$\uparrow$	$\uparrow$
Cr ⁺	$\uparrow$	$\uparrow$	$\uparrow$	$\uparrow$	$\uparrow$	
- (d) There are 6 electrons in its ultimate and penultimate shell.
- (b) They show variable oxidation state due to participation of ns and $(n-1)d$ electrons.
- (c) ($Cr^{+6}K_2Cr_2O_7$ – yellow $Cr^{+3}Cr_2(SO_4)_3$ – green)
- (a) Ionic radii $\propto \frac{1}{\text{Atomic No.}}$ Ionic radius decreases from left to right in a period.
- (c) The atomic weight;
 Equivalent weight = $\frac{\text{Atomic weight}}{\text{No. of } e^- \text{ lost or gained}}$
 $Fe^{2+} \rightarrow Fe^{3+} + e^-$

∴ Equivalent weight = Atomic weight

10. (c) Gold; $([Xe]5d^{10}6s^1)$.
11. (c) $(n-1)d$ and ns orbits.
12. (c) d -block elements; because
(i) Small atomic size
(ii) High nuclear charge
(iii) Presence of vacant d -orbitals
13. (d) Transitional elements form coloured salts due to the presence of unpaired electrons in d -orbital.
14. (c) Cu ; because last electron enters d -orbital $(3d^{10}4s^1)$.
15. (b) Cu due to the presence of vacant d -orbital.
17. (b) Nickel; $Ni + 4CO \rightarrow [Ni(CO)_4]$ (volatile)
18. (c) Copper, silver and gold; all the three were used for making coins.
19. (b) 2, 8, 18, 1 = Cu
23. (a) In between s and p -block elements.
25. (c) Fe^{+3}

S. No.	Outer configuration	No. of unpaired e	Colour of ion	Magnetic moment
V^{+3}	$3d^2$	2	Green	2.76
Mn^{+3}	$3d^4$	4	Violet	1.9
Fe^{+3}	$3d^5$	5	Yellow	5.96
Cu^{+2}	$3d^9$	1	Blue	1.9

26. (a) Misch metal is an alloy of rare earth metals with composition :
Rare earth metals – 94.95%
Iron (Fe) – 5%
 S, C, Ca, Al – Traces
27. (c) "All their ions are colourless" this sentence is false because they are 90% coloured and only few are colourless.
28. (b) $1s^2, 2s^2 2p^6$ $ns^2 p^6 d^3, (n+1)s^2$ as last electron enters d -subshell.
30. (c) Due to unpaired d -electrons.
31. (b) $Fe^{+2} - 3d^6 4s^0 - 4$ unpaired e^- .
32. (c) All the oxides of $Fe(FeO, Fe_2O_3$ and $Fe_3O_4)$ are basic in nature.
34. (c) The presence of one or more unpaired electrons in the system.
35. (b) They show multiple oxidation state due to availability of vacant d -orbitals.
They are coloured due to $d-d$ transition.
36. (a) $Mn^{2+} - 5$ unpaired electrons.
38. (d) Iron belongs to group VIII B of the periodic table.
39. (b) d -orbital is complete; $Zn - 3d^{10} 4s^2$
41. (d) Transition elements form co-ordinate compounds because of
(i) High nuclear charge
(ii) Small size
(iii) Vacant d -orbital
42. (d) Hg is a good conductor of electricity.
45. (c) Transition metals show variable valency.
46. (d) Cu^+ do not have any unpaired electron.
47. (b) Fe^{2+} ion have 4 unpaired electrons
 $Fe^{2+} = 26 - 2 = 24 = 1s^2 2s^2 2p^6 3s^2 3p^6 3d^6$

48. (c) Hydrogenation – because they have tendency to occlude hydrogen on free surface.
49. (a) Metals contribute their valency electrons to the common sea of electrons.
52. (b) They are inert towards many common reagents.
53. (d) Oxidation state of iron in mohl's salt
 $FeSO_4(NH_4)_2SO_4 \cdot 6H_2O$ is + 2.
54. (d) They show variable oxidation states due to participation of $(n-1) d$ -orbitals electrons with ns orbital electrons.
55. (a) Electronic configuration of chromium
 $Cr \rightarrow [Ar]3d^5 4s^1$
 $Cr^{2+} \rightarrow [Ar]3d^4 4s^0$.
56. (a) Covalent bond is constituted by electrons of d -orbitals and lusture is due to free electrons of s -orbital in metallic bond.
57. (a) Cr has highest M.P. and B.P. due to maximum no. of unpaired electrons.
58. (b) Hg as there is no unpaired electron so M.P. and B.P. are low. Hg is therefore liquid at room temperature with 234K.
60. (b) Zn due to increased shielding effect the attraction of electrons towards nucleus decreases.
61. (a) Number of electrons in excited state
 $X^{+3} = 18 + 4 = 22$
Number of electrons in ground state
 $X = 22 + 3 = 25$.
62. (d) $(n-1)s^2 p^6 d^{1-10} ns^1$ or ns^2
64. (a) Ni^{2+} and Cr^{2+} are coloured. But Zn^{2+} is colourless because of absence of unpaired e^- .
66. (d) They show variable valency due to presence of vacant d -orbitals.
67. (b) Maximum oxidation state = 6
Maximum no. of e^- in last shell = 6
∴ Group is VI-B.
76. (c) Ag belongs to second ($4d$) transition series remaining all are in first transition series.
77. (b) Fe^{+2} ion have 4 unpaired electron so it is paramagnetic.
78. (b) $_{30}Zn$ and $_{80}Hg$ have their d orbitals completely filled so they do not show any variable valency.
80. (c) d -block elements are known as transition elements. These show variable valency due to their incomplete d -subshell.
81. (b) Electronic configuration of $_{27}Co$ -
 $1s^2 2s^2 2p^6 3s^2 3p^6 3d^7 4s^2$,
hence unpaired $e^- = 3$
82. (a) $_{30}Zn$ has been placed in II B group of d -block in the long form of periodic table.
83. (b) The electronic configuration of Zn is $(Ar)3d^{10} 4s^2$. Hence due to complete d -subshell, it does not show variable valency.
84. (b) $Zn^{+2} - 3d^{10}$
no unpaired electrons. Hence, diamagnetic in nature.
85. (d) Terbium is lanthanide as it belongs to $4f$ - series having configuration $[Xe]4f^9 6s^2$. However the remaining members belong to $5f$ - series (actinides).
87. (c) Fe^{+2} and Ni^{+2} both.
89. (b) $Ti^{+4} \rightarrow 3d^0 4s^0$ ∴ no unpaired e^- .
91. (d) Transition metal as its last electron enters d -orbital.

92. (a) $d \quad s$
- $d^5 s^1$ 
- This configuration is more stable because of symmetrical distribution of e and exchange energy.
93. (c) Among the transition metals Mn forms maximum no. of oxides.
- MnO Mn_3O_4 Mn_2O_3 MnO_2 Mn_2O_7
basic amphoteric amphoteric amphoteric acidic
94. (c) Due to d^5 configuration, metallic bonds are weak. d^5 orbital is half filled as a result $3d$ electrons are more tightly held by the nucleus and this reduces the de-localization of electrons resulting in weaker metallic bonding.
95. (a) Cu^{+2}
- | S.No | Ion | Electronic configuration | No. of unpaired electrons |
|-------|-----------|--------------------------|---------------------------|
| (i) | Cu^{+2} | d^9 | 1 |
| (ii) | Ni^{+2} | d^8 | 2 |
| (iii) | Co^{+2} | d^7 | 3 |
| (iv) | Fe^{+2} | d^6 | 4 |
- $\mu = \sqrt{n(n+2)}$ (magnetic moment)
- $\mu \propto \sqrt{n}$
- Cu^{+2} there is only 1 unpaired electron so its magnetic moment is least.
96. (c) In the first transition series $Mn(3d^5 4s^2)$ shows the maximum oxidation state of +7.
97. (c) They crystallize with body centered cubic and hexagonal close packed structure.
99. (d) Carrying unpaired electrons.
102. (d) All are transition elements and form complex ion.
103. (d) Ni and Co are used as catalyst.
104. (c) Magnetic moment depend upon the no. of unpaired electrons.
105. (a) Cr has 6 unpaired electrons.
106. (d) Europium is a f -block elements as it follows the general electronic configuration of the f -block elements
- $(4f^{1-14} 5d^{0,1} 6s^2)$
- $Eu = [Xe] 4f^7 6s^2$
107. (c) 70% Cu and 30% Zn are mixed to form brass which is used in making utensils, artificial jewelry.
108. (d) Strength of metallic bond depends upon number of unpaired electrons. As number of unpaired electrons increases, the bond strength increases. So Cr, Mo, W show stronger bonding due to maximum number of unpaired electron.
109. (d) Zn^{+2} as there are no unpaired electrons.
- Zn 
- Zn^{+2} 
110. (d) Cobalt is used in cancer therapy.
111. (b) Cu is oxidised which turns the solution blue.
113. (d) $Zn^{+2} - 3d^{10} 4s^0$ so there are no unpaired electrons.
114. (b) $Sc - 21 \rightarrow 3d^1 4s^2$
116. (b) $3d^5$ as this configuration corresponds to maximum number of unpaired electrons.
121. (a) Hg because it lies below H_2 in electrochemical series and thus cannot reduce it.
122. (c) High charge/size - ratio and vacant d -orbitals.
123. (d) They have one or more unpaired d -electron.
125. (a) Fe because it easily gets oxidised in moist air.
- $Fe \xrightarrow[H_2O/H^+]{air} Fe_2O_3 \cdot x H_2O$
Rust
126. (d) Pt because it is a noble metal and does not react with air, water or acid at room temperature.
128. (a) Iron:
- $d \quad s$
- $Fe -$  4 unpaired e^-
- $CO -$  3 unpaired e^-
- $Ni -$  2 unpaired e^-
- $Pt -$  2 unpaired e^-
- Therefore, Fe is most ferromagnetic as it has maximum number of unpaired electrons.
129. (d) The transition metals form a large number of interstitial compounds in which small atoms like hydrogen, carbon, boron and nitrogen occupy interstitial sites in their lattices.
130. (d) Because Pt is a noble metal.
131. (a) $Zn - 3d^{10} 4s^2$
- $Zn^{++} - 3d^{10} 4s^0$
132. (c) $Ti \rightarrow 3d^2 4s^2$
- $Ti^{+4} \rightarrow 3d^0 4s^0$
133. (a) Atomic no. 58 to 71 are rare earth metals.
- Lanthanides
134. (c) 58 to 71 and 90 to 103 (Lanthanides & actinides).
136. (c) To form complex compounds.
137. (b) Cu as it comes after H in electrochemical series.
139. (a) Their d -orbitals are completely filled.
140. (b) Cu as it comes after H in electrochemical series. It has positive standard reduction potential thus does not provide electrons for reduction.
144. (b) $6Hg + O_3 \rightarrow 3Hg_2O$
Mercurous oxide
- During this reaction, mercury loses its meniscus and starts sticking glass.
145. (d) Ga, In, Tl ; they belong to p -block.
148. (c) Zn, Cd and Hg are non typical transition elements because they have complete d -orbitals.
150. (a) In Cr^{3+} number of unpaired $e^- = 3$. A electronic configuration of $Cr^{3+} = 1s^2 2s^2 2p^6 3s^2 3p^6 3d^3$.
151. (c) Zinc does not have any unpaired electron pair so it forms only colourless compound.
153. (a) VII B groups as the metal must contain 7 electrons in ultimate shell in order to show +7 oxidation state.
154. (b)
- $3d^{10} \quad 4s^1$
- Cu 
- $3d \quad 4s^0$
- Cu 

- | | | | | | |
|-----------|--------|--|--|--|--------|
| | $3d^1$ | | | | $4s^0$ |
| Ti^{+3} | ↑ | | | | |

- So Mn^{2+} contain maximum number of unpaired electron *i.e.* 5.

215. (c) Cobalt 27 belong to $3d$ transition series having in complete $3d$ orbitals i.e., $3d^7$.
216. (a) It is the Tata iron and steel company.
217. (c) The atomic weight of Co , Ni and Fe are 58.90, 58.60, 55.85 respectively. Therefore $Co > Ni > Fe$ is the correct sequence of atomic weight.
218. (d) The first ionization energies of Ti , V , Cr and Mn are 656, 650, 652 and 717 $kJ/mole$ respectively. I.E. increase in a period from $L \rightarrow R$ hence, manganese has maximum first ionisation potential.
219. (b) Metal M belongs to d -block. Its electronic configuration can be arranged as, $1s^2 2s^2 2p^6 3s^2 3p^6 4s^1 3d^{10}$.
220. (b) We know that transition element are those element which have partially filled d -subshell in their elementary form. Therefore, the general electronic configuration of d -block element is $(n-1)d^{1-10}ns^{1-2}$.
221. (b) The element with atomic no. 105 is dubnium. In IUPAC nomenclature, it is known as un-nil pentin.
222. (b) The compound which have the unpaired electron show the paramagnetic property.
223. (b) Among the given choice Mn^{2+} and Fe^{3+} involve isoelectronic ions.
224. (a) Elements or ions containing unpaired electrons are paramagnetic.

Ni^{2+} stage

Because Ni^{2+} have 2 unpaired electrons in $3d$ subshell therefore it is paramagnetic.

225. (b) $Cr(Z = 24)$ has electronic configuration
 $1s^2 2s^2 2p^6 3s^2 3p^6 3d^5 4s^1$ ($\because$ half filled d orbital is more stable than incompletely filled d orbital)
226. (b) The expected electronic configuration of Cu (29) is $[Ar] 3d^9 4s^2$ but actually it is found to be $[Ar] 3d^{10} 4s^1$. This is because fully filled d orbitals are more stable than incompletely filled d -orbitals. So there is a migration of one e^- , from $4s$ orbital to $3d$ orbital to give a more stable configuration.
227. (d) $Ce - 58$ have configuration $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^6 4d^{10} 4f^2, 5s^2 5p^6 5d^0, 6s^2$
 Since, its last electron enter in f sub-shell, therefore it is a member of f -block.
228. (a) $Ni \rightarrow 1s^2 2s^2 2p^6 3s^2 3p^6 3d^8 4s^2$
 $Ni^{2+} \rightarrow 1s^2 2s^2 2p^6 3s^2 3p^6 3d^8$
 $3d^8 = 10 - 2 = 8$ unpaired electron.
230. (d) ${}_{25}Mn = 3d^5 4s^2$
 After losing two electron electronic configuration will be like this (${}_{25}Mn^{++} 3d$) and this is most stable configuration due to half filled orbitals hence third ionization enthalpy will be highest in this case.
231. (a) ${}_{21}Sc \rightarrow 1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^1$

Due to presence of paired electron it will be colourless.

232. (a) Lanthanum is the first element of Lanthanide series so size decreases with increase in atomic number so La has the largest atomic radii.
234. (a) Tl ions are more stable than Tl and thus, Tl ions change to Tl ions thereby acting as oxidising agents.
 Tl compounds + $2e^- \rightarrow Tl$ compounds
 (less stable oxidising agent) (more stable oxidising agent)
237. (a) $Fe \rightarrow [Ar] 3d 4s$, number of unpaired electrons = 5
 $Fe \rightarrow [Ar] 3d 4s$, number of unpaired electrons = 4
 $Co \rightarrow [Ar] 3d 4s$, number of unpaired electrons = 3
 $Co \rightarrow [Ar] 3d 4s$, number of unpaired electrons = 4
238. (d) Paramagnetic character is actually due to presence of unpaired electrons.
239. (b) Mercury has the property of dissolving nearly all metals, forming liquid or solid solutions called amalgams. It amalgamates well with gold, silver and tin, but does not dissolve iron or platinum. Presence of these may result in sickening or flouring of the mercury.
240. (b) Ce -lanthanide, Cs -alkali metal, Cf -actinide, Ca -alkaline earth metal.
241. (b) Where n = number of unpaired electron
 For $Sc^{3+} = 3d^0, n = 0, \therefore \mu = 0$

Compounds of Transitional elements

1. (a) MnO_2, MnO_2, Mn^{2+}
 In neutral medium :
 $2KMnO_4 + 3MnSO_4 + 2H_2O \rightarrow K_2SO_4 + 2H_2SO_4 + 5MnO_2$
 In alkaline medium :
 $2KMnO_4 + H_2O \rightarrow 2MnO_2 + 2KOH + 3O$
 In acidic medium :
 $2KMnO_4 + 3H_2SO_4 \rightarrow K_2SO_4 + 2MnSO_4^{+2} + 5H_2O + 5O$
2. (c) Oxidation state of Mn changes from +7 to +2 in acidic medium i.e. one mole of it accepts 5 mole of electrons.
3. (d) Since it accept $6e^-$ its
 Equivalent weight = $\frac{M}{6}$.
5. (b) Decreases from + 6 to + 3.
 $K_2Cr_2O_7 + 4H_2SO_4 \rightarrow K_2SO_4 + Cr_2(SO_4)_3 + 4H_2O + 3O$
 $[H_2S + [O] \rightarrow S + H_2O] \times 3$
-
- $K_2Cr_2O_7 + 4H_2SO_4 + 3H_2S \rightarrow K_2SO_4 + Cr_2(SO_4)_3 + 7H_2O + 3S$
6. (c) $FeSO_4$ is oxidised and $KMnO_4$ is reduced.
 $2KMnO_4 + 3H_2SO_4 \rightarrow K_2SO_4 + 2MnSO_4$
 $[2FeSO_4 + H_2SO_4 \rightarrow Fe_2(SO_4)_3 + 2H] \times 5$

In this reaction oxidation state of *Mn* is changing from +7 to +2 while oxidation state of *Fe* is changing from +2 to +3.

7. (a) $Hg_2Cl_2 + 2NH_4OH \rightarrow NH_4Cl + 2H_2O + Hg + HgNH_2Cl$
Calomel
8. (b) Ag^+ forms a complex ion with NH_3
 $AgCl + 2NH_3 \rightarrow [Ag(NH_3)_2]Cl$
9. (b) Four water molecules.
 $CuSO_4 \cdot 5H_2O$ is a crystalline salt. Four H_2O molecules attach to copper forming a square planar symmetry and two oxygen atoms from SO_4^{2-} ion complete the distorted octahedron. The fifth water molecule is attached through hydrogen bonding between one of the co-ordinated water molecule and one of the sulphate ion.
10. (d) $AgCl$ is a covalent compound hence it is insoluble in water also it form complex with NH_4OH , thus is soluble in NH_4OH .
 $AgCl + 2NH_4OH \rightarrow [Ag(NH_3)_2]Cl + H_2O$
11. (a) Basic copper acetate.
(Verdigris - $(CH_3COO)_2Cu \cdot Cu(OH)_2$) is a blue green powder used in green pigment and in dyes. Also in manufacture of insecticides and fungicides.
13. (a) H_2O_2 reduces acidified $KMnO_4$ solution. As a result. The pink colour of $KMnO_4$ is changed.
14. (a) MnO_2 forms amphoteric oxide due to intermediate oxidation state.
15. (a) MnO is ionic due to lower oxidation state.
17. (a) Manufacture of blue black ink.
18. (d) As fertilizer because it is not required by plants.
20. (b) Since *Ag* is less reactive than *Cu* therefore it does not displace *Cu* from $CuSO_4$ while other metals are more reactive, they displace *Cu* from $CuSO_4$.
21. (d) Its reduction to metallic silver.
 $2AgNO_3 \rightarrow 2Ag + N_2 + 3O_2$
black stain
22. (c) $Na_2S_2O_3 + CuSO_4 \rightarrow NaCuS_2O_3$
23. (e) $2HgO \xrightarrow{\Delta} 2Hg + O_2$
24. (b) $2Fe + 3Cl_2 \rightarrow 2FeCl_3$
25. (c) $Fe(OH)SO_4$
 $FeSO_4 \xrightarrow{H_2O} Fe(OH)SO_4$
27. (d) $\frac{1}{5} \times$ molecular weight of $KMnO_4$
as transfer of $5e^-$ takes place when $KMnO_4$ acts as oxidant in acidic medium.
 $2KMnO_4 + 3H_2SO_4 \rightarrow K_2SO_4 + 2MnSO_4 + 3H_2O + 5O$
28. (a) Oxidation number of *Cr* in options *a*, *b*, *c* and *d* are +6, +4, +3, +3 respectively.

In given options (a) has high oxidation number therefore its radii will be low. Atomic radii decreases with increase in oxidation no.

33. (b) Cuprous chloride.
 $Cu(s) + 2HCl + CuSO_4 \rightarrow 2CuCl + H_2SO_4$
Cuprous chloride
34. (d) Cuprous chloride slowly oxidises to green basic cupric chloride.
 $CuCl \xrightarrow{\text{air}} 3CuO \cdot CuCl_2 \cdot 3H_2O$
green coloured
35. (a) $2CuCl + 2HCl + [O] \rightarrow 2CuCl_2 + H_2O$
38. (b) Equivalent weight of $KMnO_4$ in acidic medium is $M/5$
 $\therefore$ Equivalent weight = $\frac{158}{5} = 31.6$
39. (b) In acidic medium, $KMnO_4$ gives 5 oxygen while acidic $K_2Cr_2O_7$ gives 3 oxygen.
41. (a) Ag_2O is mild oxidising agent as greater the oxidation number of metal stronger oxidising agent.
42. (c) $K_2Cr_2O_7 + 3H_2SO_4 \rightarrow K_2SO_4 + Cr_2(SO_4)_3 + 3(O) + 3H_2O$
No. of electrons lossed = $12 - 6 = 6$
 $\therefore$ Equivalent weight = $\frac{M}{6} = \frac{294}{6} = 49$.
44. (a) $ZnSO_4 \rightarrow Zn^{++} + SO_4^{--}$
 $Zn^{++} \approx Cu^{++}$
 $Cu^{+2} \rightarrow 3d^9 - 1 \text{ unpaired } e^-$
 $\therefore$ paramagnetic in nature.
46. (b) $KMnO_4$ is first reduced to manganate and then to insoluble manganese dioxide. Colour changes first from purple to green and finally becomes colourless.
 $2KMnO_7 + 2KOH \rightarrow 2K_2MnO_4 + H_2O + O$
 $2K_2MnO_4 + 2H_2O \rightarrow 2MnO_2 + 4KOH + 2O$
 $2KMnO_2 + H_2O \xrightarrow{\text{alkaline}} 2MnO_2 + 2KOH + 3[O]$
47. (c) $2KMnO_4 + 3H_2SO_4 + 5C_2H_2O_4 \rightarrow$
 $2Mn^{2+} + 8H_2O + 10CO_2$
48. (b) $2KI + HgI_2 \rightarrow \underbrace{K_2HgI_4}_{\text{Nessler's reagent}} + 2KI$
50. (c) $Cr_2O_7^{2-} + 8H^+ + 2SO_3^{2-} \rightarrow 2Cr^{+3} + 3SO_4^{2-} + 4H_2O$
51. (b) $KI + MnO_4^- \rightarrow K^+ IO_3^- + Mn^{+2}$
52. (b) Among all the reactions given $CuSO_4$ does not react with KCl to give Cu_2Cl_2 .
53. (c) Mohr's salt.
 $2KMnO_4 + 8H_2SO_4 + 10FeSO_4 \rightarrow$
 $K_2SO_4 + 2MnSO_4 + 5Fe_2(SO_4)_3 + 8H_2O$
Mohr's salt decolourises $KMnO_4$ by reducing Mn^{+7} ions to Mn^{+2} ions.
55. (c) Amalgams are alloys which contain mercury as one of the contents.
56. (a) In order to make the image permanent, it is necessary to remove the unreduced silver bromide from the surface of the developed film. This operation is called fixing of image. Fixing is

done by dipping the developed film or plate in sodium thiosulphate (hypo) solution. the hypo solution dissolves the unreduced silver bromide by forming a complex.

Thus sodium thiosulphate acts as a complexing agent.

58. (d) All of these.
59. (b) $Fe^{+3} - 3d^5 - 5$ electrons unpaired.
 Fe will be attracted in magnetic field so will show increase in weight.
60. (d) TiF_6^{2-} and Cu_2Cl_2 due to absence of unpaired electrons.
62. (b) Copper oxide; $2Cu(NO_3)_2 \rightarrow 2CuO + 4NO_2 + O_2$
63. (c) Cuprous iodide is precipitated with liberation of iodine.
 $2KI + CuSO_4 \rightarrow CuI_2 + K_2SO_4 + I_2$
64. (a) It is one third of its molecular weight in alkaline medium because it gives 3 nascent oxygen in alkaline medium.
 $2KMnO_4 + H_2O \xrightarrow{+3e^-} 2KOH + 2MnO_2 + 3[O]$
 $\therefore$ Equivalent weight = $\frac{M}{3}$
65. (c) $NaCl + H_2SO_4 + K_2Cr_2O_7 \rightarrow$
 $CrO_2Cl_2 + K_2SO_4 + Na_2SO_4$
 Chromyl chloride
66. (b) Decomposes in sunlight.
 $2AgNO_3 \xrightarrow{\Delta} 2Ag + 2NO_2 + O_2$
67. (c) Silver; $AgNO_3 + NaCl \rightarrow AgCl + NaNO_3$
 White ppt.
70. (c) The formation and thermal decomposition of $Ni(CO)_4$.
71. (a) $CuSO_4 + 4NH_3 \rightarrow [Cu(NH_3)_4]^{++} SO_4^{--}$
72. (a) Equivalent wt. = $\frac{\text{molecular wt.}}{\text{total no. of } e^- \text{ gained or lost}} = \frac{M}{1} = M$
76. (d) $HgI_2 + 2KI \rightarrow K_2[HgI_4] \rightleftharpoons 2K^+ + [HgI_4]^{--}$
80. (c) The conversion of dichromate to chromate.
 $K_2Cr_2O_7 + 2KOH \rightarrow \underbrace{2K_2CrO_4}_{\text{yellow}} + H_2O$
81. (b) $MnO_2 + KOH \rightarrow K_2MnO_4$
 pyrolusite
83. (c) $K_2Cr_2O_7 + H_2SO_4 + 4H_2O_2 \rightarrow K_2SO_4 + 2CrO_5 + 5H_2O$
84. (d) Iron; $Fe + H_2O/H^+ \rightarrow Fe_2O_3 \cdot xH_2O$
85. (b) Na_2CdCl_4 - no unpaired electrons.
87. (c) $CuCN$; $3d^{10} \quad 4s^0$
 Cu^+

$\uparrow\downarrow$	$\uparrow\downarrow$	$\uparrow\downarrow$	$\uparrow\downarrow$	$\uparrow\downarrow$	
----------------------	----------------------	----------------------	----------------------	----------------------	--

 as all the electrons are paired. It is expected to be colourless.
88. (c) $ZnSO_4, MgSO_4$ are isomorphous i.e. having same structure.
90. (a) TiO_2 because of $3d$ state i.e. no unpaired electrons.
91. (b) $CoO \rightarrow Co^{+2}$ is blue colour.
92. (c) $Ca_2P_2O_7 \rightarrow 2Ca^{++} + (P_2O_7)^{4-} \xrightarrow{Fe^{+3}} Fe_4(P_2O_7)_3$
93. (d) AgI because of high covalent character along with strong Vander Waal's attraction and electrostatic attraction between silver and iodide ions.

100. (c) $ZnO + 2NaOH \rightarrow Na_2ZnO_2 + H_2O$
 Sodium zincate
101. (b) $HgCl_2$ compound is easily volatile. They are insoluble in water and soluble in acids.
102. (a) Colourless compounds are those which have no unpaired electrons and paramagnetic substance do have unpaired electrons. Therefore paramagnetic substance possess colour.

due to presence of unpaired electrons it will form coloured salt.

111. (a) Cast iron : iron -93-95%
 Carbon - 2.5 -5%, impurities about 2%.
112. (a) $FeCl_3$ is a salt of strong acid and weak base. It gives $Fe(OH)_3$ and HCl on hydrolysis. $Fe(OH)_3$ is a weak base and HCl is strong acid.

So the aqueous solution of $FeCl_3$ will be acidic in nature

113. (b) $Cr_2^{6+} + 6e^- \rightarrow 2Cr^{3+}$; $Fe^{2+} \rightarrow Fe^{3+} + e^-$
114. (a) CrO_3 and Mn_2O_7 are acidic oxide since they react with water to form acid.
 $CrO_3 + H_2O \rightarrow H_2CrO_4$; $Mn_2O_7 + H_2O \rightarrow 2HMnO_4$
 Chromic acid Permanganic acid

115. (a) In photography as it is sensitive towards light.

Where, n = number of unpaired electron i.e., greater the number of unpaired electron greater will be the paramagnetic character.

117. (a) In the compound $[Ni(CO)_4]$

Oxidation number of $Ni = 0$

Co-ordination number of $Ni = 4$

(Co (carbonyl) is a strong ligand so it cause pairing of electron)

118. (a) Applying the oxidation number rule in $[Fe(H_2O)_5(NO)]SO_4$
($\because H_2O$ and NO are neutral)

$$[x + (0) \times 5 + 0] + (-2) = 0$$

$$x + 0 + 0 - 2 = 0 \Rightarrow x = +2$$

Hence, oxidation number of Fe is +2.

119. (c) $Zn + NaOH \rightarrow Na_2ZnO_2 + H_2$
Conc. Sodium zincate Hydrogen

Thus in this reaction hydrogen gas is produced when zinc is treated with concentrated $NaOH$.

120. (c) $Fe_2O_3 + 6NaOH \rightarrow 2Fe(OH)_3 \downarrow + 3Na_2O$
Brown (insoluble in $NaOH$)

121. (c) Mercurous chloride are insoluble in water while rest are soluble in water.

122. (a) ZnO is an amphoteric oxide,

123. (a) Fe^{3+} ion has $[Ar] 3d^5$ configuration hence number of unpaired electron is 5.

124. (b) $FeS + H_2SO_4 \rightarrow FeSO_4 + H_2S$

125. (c) In this complex CO^{2+} ion have 3 unpaired electron so spin only magnetic moment will be $\sqrt{3(3+2)}$ i.e., $\sqrt{15}$ B.M.

126. (a) Platinum acts as catalyst in the oxidation of ammonia to form nitric oxide. This reaction is used in the Ostwald's method of nitric acid preparation

127. (c) Iron is oxidised to ferrous nitrate and nitric acid is changed to ammonium nitrate

128. (a) $CrO_3 + 2NaOH \rightarrow Na_2CrO_4 + H_2O$
Yellow solution

129. (c) $2KI + CuSO_4 \rightarrow CuI_2 + K_2SO_4$
Unstable

Hence, solution contains Cu_2I_2 , I_2 and K_2SO_4 .

130. (a) Cu is placed above Ag in electrochemical series, hence it can replace Ag from its salts solution. Therefore the reaction occurs as follows,

131. (a) When the quenched steel is heated to temperature below red hot and then allowed to cool slowly, it becomes soft. This process is known as annealing.

132. (a) We know that ammonia the order of solubility is $AgCl > AgBr > AgI$. Therefore, $AgCl$ is more soluble in ammonia.

133. (d) In alkaline medium, $KMnO_4$ first reduced in manganate & then in insoluble manganese dioxide.

In acidic medium, Manganous sulphate formed

134. (c) $(NH_4)_2Cr_2O_7 \xrightarrow{\Delta} 2K_2CrO_4 + Cr_2O_3 + \frac{3}{2}O_2$

135. (a) HgS is soluble in aqua-regia and it is insoluble in hot dil. HNO_3 .

136. (d) $Ag_2O \xrightarrow{\Delta} 2Ag + \frac{1}{2}O_2$

138. (a) $HgCl_2$ show dimerisation. It found in dimer form.

139. (b) Iron pyrites (FeS_2) is also called 'fools gold'.

140. (c) According to Fajan, small anion is polarised to lesser extent than the larger anion. Hence AgF will be the most ionic and has high melting point.

141. (c) Potassium dichromate, on heating gives oxygen and chromic oxide (Cr_2O_3).

142. (a) Nickel is purified by Mond's process

143. (b) Stainless steel contains 11.5% Cr and 2.0% Ni with Fe .

144. (d) German silver is an alloy of copper not silver containing $Cu = 56.0\%$, $Zn = 24.0\%$ and $Ni = 20.0\%$.

145. (e) This scheme take place in Van Arkel process by this process ultrapure metal is prepared, the impure metal is first converted into a volatile stable compound generally iodide (leaving behind the impurities which is then decomposed at a higher temperature to give the pure metal. Metal like titanium, zirconium are purified by this method.

146. (e) HgS on strong heating gives Hg .

147. (a) $Cr_2O_3 \cdot 2H_2O$ is known as crugnet green.

148. (c) Vanadium (III) oxide is a strong reducing agent because vanadium is electropositive metal and have high reduction potential. It has low heat of sublimation, low ionisation potential.

149. (b) Stainless steel does not rust because chromium forms an oxide layer and protect iron from rusting.

150. (b) $HgCl_2 + Na_2CO_3 \rightarrow HgCO_3 + 2NaCl$

151. (d) Ni in presence of CN^-

$[Ni^{2+} \text{ in presence of } CN^-] = [Ar]$

As $[Ni(CN)_4]^{2-}$ has no unpaired electron. It is diamagnetic.

152. (a) The solubility of silver bromide in hypsolution due to the formation of $[Ag(S_2O_3)_2]^{3-}$.

153. (b) Brass is an alloy of Zn and Cu .

154. (a) Iodine being a strong reducing agent reduce Cu^{2+} ions to Cu^+ ions and itself gets oxidised to iodine.

155. (c) Rust is Fe_2O_3 and $Fe(OH)_3$

156. (a) $_{21}\text{Sc} = [\text{Ar}] 3d^1 4s^2$
 $\text{Sc}^{3+} = [\text{Ar}] 3d^0 4s^0$ no unpaired electrons in d sub shell, so it is diamagnetic and colourless.
157. (c) Zinc sulphate ($\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$) is called white vitriol. It, when heated with barium sulphide, forms a white pigment lithopone.
158. (a) Isomorphous compound are those compounds which forms same type of crystals *i.e.*, have similar structure. $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ is isomorphous with $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$.
159. (b) Colour of transition metal ion salt is due to $d-d$ transition of unpaired electrons of d -orbital. Metal ion salt having similar number of similar number of unpaired electron in d -orbitals shows similar colour in aqueous medium
 $\text{V}^{4+} : [\text{Ar}] 3d^1$

↑				
---	--	--	--	--

 $\text{Cu}^{2+} : [\text{Ar}] 3d^9$

↑↓	↑↓	↑↓	↑↓	↑
----	----	----	----	---

Number of unpaired electrons = 1
160. (b) Zn dissolve in Conc. NaOH due to the formation of Sodium Zincate.
 $\text{Zn} + 2\text{NaOH} \rightarrow \text{Na}_2\text{ZnO}_2 + \text{H}_2$
161. (b) CdS — Yellow
 CuS — Black
 ZnS — White
 CoS — Black
162. (c) KMnO_4 will not be oxidized further by ozone as manganese is already present in its highest possible oxidation state *i.e.* +7
163. (d) In alkaline medium
 $2\text{KMnO}_4 + \text{KI} + \text{H}_2\text{O} \rightarrow 2\text{MnO}_2 + 2\text{KOH} + \text{KIO}_3$
164. (b) $2\text{KI} + 2\text{CuSO}_4 \xrightarrow{\text{O}} \text{I}_2 + \text{Cu}_2\text{I}_2 + 2\text{K}_2\text{SO}_4$
 $\text{I}_2 + 2\text{Na}_2\text{S}_2\text{O}_3 \xrightarrow{+2.5} \text{Na}_2\text{S}_4\text{O}_6 + 2\text{NaI}$
166. (c) Bronze contain $\text{Cu} = 75 - 90\%$, $\text{Sn} = 10 - 25\%$
168. (b) Brass ($\text{Cu} + \text{Zn}$)
German silver ($\text{Cu} + \text{Zn} + \text{Ni}$)
169. (c) $4\text{Au} + 8\text{KCN} + 2\text{H}_2\text{O} + \text{O}_2 \rightarrow 4\text{K}[\text{Au}(\text{CN})_2] + 4\text{KOH}$
(Soluble complex)
170. (d) Plating is a process for manufacturing platinum.
171. (a) We know by reducing auric chloride by stannous chloride, the colloidal solution of gold is obtained. It is known as purple of cassium.
172. (c)

List 1 (i) Explosive (ii) Artificial gem (iii) Self reduction (iv) Magnetic material	List 2 $\text{Pb}(\text{N}_3)_2$ Al_2O_3 Cu Fe_3O_4
---	---
178. (b) $\text{Fe} + \text{Cr} + \text{Ni}$ = Stainless steel
82% 11% 7%
179. (c) CaO and MgO are refractory materials. They have very high melting point.
180. (b) Brass contain $\text{Cu} = 60\%$ and $\text{Zn} = 40\%$ in its composition.
181. (a) Annealing is a process of heating steel to redness followed by slow cooling
182. (b) $_{26}\text{Fe}^{2+}$
 Fe^{3+}
+ 3 state is most stable because of half filled d sub-shell
183. (b) Fe and Ni .
95–97% 3–5%
185. (a) The process of producing a hard coating of iron nitride on steel is called nitriding.
187. (c) Iron loses magnetic property at curie point.
188. (d) Heat treatment alters the properties of steel due to change in the lattice structure due to differential rate of cooling.
189. (c) The passivity of iron is due to the formation of a thin insoluble and invisible iron film on surface which prevents its further reactions. The film is due to the formation of Fe_3O_4 .
190. (c) $2\text{Fe} + \text{SO}_2 \rightarrow \text{FeO} + \text{FeS}$
191. (a) The steel obtained by this process retains its hardness but is not brittle.
192. (d) In blast furnace at 400–600°C for the smelting of iron, following takes place:-
 $\text{Fe}_2\text{O}_3 + 3\text{CO} \rightarrow 2\text{Fe} + 3\text{CO}_2$
194. (a) $\text{Cu} + \text{Zn} + \text{Ni}$
60% 20% 20%
195. (d) Iron is rendered passive by conc. HNO_3 and other oxidising agents like $\text{K}_2\text{Cr}_2\text{O}_7$, KMnO_4 , Chloric acid, chromic acid, silver nitrate etc. A specimen of passive iron can be rendered active by scratching the film mechanically or chemically.
199. (b) Fe present in Haemoglobin
201. (d) $2\text{FeSO}_4 \rightarrow \text{Fe}_2\text{O}_3 + \text{SO}_2 + \text{SO}_3$
203. (a) $\text{NO}_3^- + \text{H}_2\text{SO}_4 \rightarrow \text{HNO}_3 + \text{HSO}_4^-$
 $2\text{HNO}_3 \rightarrow \text{H}_2\text{O} + 2\text{NO} + 3[\text{O}]$
 $\text{FeSO}_4 + \text{NO} + 5\text{H}_2\text{O} \rightarrow [\text{Fe}(\text{H}_2\text{O})_5\text{NO}^+]\text{SO}_4$
Brown colour
204. (a) $\text{KMnF}_6 + 2\text{SbF}_5 \rightarrow 2\text{KSbF}_6 + \text{MnF}_6 + \frac{1}{2}\text{F}_2$
In this reaction, the stronger Lewis acid SbF_5 displaces the weaker one, MnF_6 from its salt. MnF_6 is unstable and readily decomposes to give MnF_5 and fluorine.
205. (a) Case hardening : The process of hardening the surface of wrought iron by depositing a surface layer of steel on it is called case-hardening it is done by heating wrought iron in contact with potassium ferrocyanide.
Alternatively, case hardening can also be done by heating wrought iron with charcoal and then plunging it a suitable oil.
206. (a) Stainless steel is not corroded by air, moisture and small change in pH . Made up of Fe , N and Cr .
82% 7% 11%
207. (b)

Variety of irons	% of Carbon
Cast or Pig iron	2.5 – 4%
Wrought iron	0.12 – 0.25%
Steel	0.2 – 0.5%
208. (a)
209. (c) Tempering : If the quenched or hardened steel is reheated to a temperature between 503 to 573 K and then allowed to cool slowly, the process is called tempering.
226. (d) % of carbon in wrought iron is 0.2 – 0.5%, in steel 0.5 – 1.5% and in Pig iron 2.5 – 4%.
227. (a) $\text{Fe} + 5\text{CO} \rightarrow [\text{Fe}(\text{CO})_5]$ Pentacarbonyl iron (O)

230. (d) Potash alum $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$
231. (c) A thin layer of Fe_3O_4 is formed on the Fe metal
232. (a) $3Fe + 4H_2O \rightarrow Fe_3O_4 + 4H_2$
233. (b) Mn used to make alloy steel for armour plates, safes and helmets.
236. (a) Solder ($Pb + Sn$), Bronze ($Cu + Sn$), Brass ($Cu + Zn$), Bell metal ($Cu + Sn$).
241. (d) $Cu + Sn \rightarrow$ Bell metal
80% 20%
242. (b) Turnbull's blue Ferrous ferri cyanide $Fe_3[Fe(CN)_6]_2$
244. (a) $Cu + 2AgNO_3 \rightarrow 2Ag + Cu(NO_3)_2$
 $Cu + ZnSO_4 \rightarrow$ no reaction
 $Cu + FeSO_4 \rightarrow$ no reaction
- $$\left. \begin{array}{l} E^0 Zn^{+2}/Zn = -0.76 V \\ E^0 Cu^{+2}/Cu = +0.34 V \\ E^0 Fe^{+2}/Fe = -0.40 V \\ E^0 Ag^+/Ag = +0.80 V \end{array} \right\}$$
- As it is clear that reduction potential of copper is more than Zn and Fe . Hence it is unable to displace them from their salts.
245. (b,c) Ferrous salts react with potassium ferricyanide to give blue colouration due to the formation of Tumbull's blue in this reaction, first ferrous salt is oxidised to ferric salt by the ferricyanide ion which itself is reduced to ferrocyanide.
- $$Fe^{+2} + [Fe(CN)_6]^{3-} \rightarrow Fe^{+3} + [Fe(CN)_6]^{4-}$$
- Ferricyanide Ferrocyanide
- $$Fe^{+3} + [Fe(CN)_6]^{4-} \rightarrow \{Fe[Fe(CN)_6]\}^-$$
- $$Fe^{+3} + [Fe(CN)_6]^{4-} + K^+ \rightarrow K\{Fe[Fe(CN)_6]\}$$
- Pot. ferricferrocyanide
or Tumbull's blue
- Ferric ions react with potassium thiocyanate to give blood red colouration due to the formation of ferric thiocyanate
- $$FeCl_3 + 3KCNS \rightarrow Fe(CNS)_3 + 3KCl$$
- Ferricthiocyanate
(Blood red)
250. (a) Electric protection : In this Mg acts as anode while iron pipe as cathode. Mg loses electrons prior to iron.
251. (b) Pyrite (FeS_2) known as fool's gold
252. (a) Stainless steel contains mainly Iron, Carbon, Nickel alongwith Chromium and Manganese.
253. (d) Firstly, carbon which is added along which crushed haematite ore is oxidised to CO (and CO_2) and second the produced CO acts as chief reducing agent for the reduction of haematite to steel.
255. (a) By white tin plating iron can be protect by water.
256. (d) $2Fe + 3CO \xrightarrow{\text{Heat}} Fe_2O_3 + 3C$
(cast iron)
257. (b) Magnetite is reduced by carbon.
258. (d) Malachite ($Cu(OH)_2 \cdot CuCO_3$) Basic copper carbonate
259. (b) + 2 is most important oxidation state
 $Cu^{+1} + e^- \rightarrow Cu$; $E^0 = +0.52 V$
 $Cu^{+2} + 2e^- \rightarrow Cu$; $E^0 = +0.34 V$
260. (d) $Cu + 4HNO_3 \rightarrow Cu(NO_3)_2 + 2NO_2 + 2H_2O$
262. (a) Metal Chloride in + 1 + 2 oxidation states
 Cu $CuCl$ Cu_2Cl_2

Ag
 Na

$AgCl$
 $NaCl$

—
—

265. (d) $Cu + HCl \rightarrow$ no reaction
Copper is less reactive than hydrogen. Therefore it is unable to displace hydrogen from acid.
 $E_{Cu}^0 = +0.34$ and $E_H^0 = 0.00$
266. (a) Gun metal contains Cu (88%), Zn (2%), Sn (10%), Pb (0.5%)
267. (b) Solder – Sn 67% and Pb 33%.
268. (c) Brass contains $Cu = 80\%$, $Zn = 20\%$
German silver contains $Cu = 60\%$, $Zn = 20\%$, $Ni = 20\%$
269. (b) German silver contain $Cu = 60$, $Zn = 20$, $Ni = 20\%$
270. (b) $Cu = 88\%$, $Sn = 10\%$, $Zn = 2\%$, $Pb = 0.5\%$ → Gun Metal
274. (b) $4Cu + 2H_2O \rightarrow 2Cu_2O + 2H_2$
276. (b) $2Cu + 2H_2SO_4 + O_2 \rightarrow 2CuSO_4 + 2H_2O$
277. (b) Cuprous ion (Cu^+) $3d^{10}$ Completely filled d sub shell
- $$3d^{10}$$
- | | | | | |
|----|----|----|----|----|
| ↑↓ | ↑↓ | ↑↓ | ↑↓ | ↑↓ |
|----|----|----|----|----|
- Cupric ion Cu^{+2}
- $$3d^9$$
- | | | | | |
|----|----|----|----|---|
| ↑↓ | ↑↓ | ↑↓ | ↑↓ | ↑ |
|----|----|----|----|---|
- One unpaired electron
278. (b) $CuSO_4 + K_4[Fe(CN)_6] \rightarrow$ no reaction
 $4NH_4OH + CuSO_4 \rightarrow [Cu(NH_3)_4]SO_4 + 4H_2O$
Deep blue
 $CuSO_4 + 5H_2O \rightarrow CuSO_4 \cdot 5H_2O$
Anhydrous Blue
 $4FeCl_3 + 3Na_4[Fe(CN)_6] \rightarrow Fe_4[Fe(CN)_6] + 12NaCl$
Ferric ferrocyanide
(Prussian blue)
280. (d) $CuSO_4 + 2KCN \rightarrow Cu(CN)_2 + K_2SO_4$
 $2Cu(CN)_2 \rightarrow Cu_2(CN)_2 + (CN)_2$
 $Cu_2(CN)_2 + 6KCN \rightarrow 2K_3[Cu(CN)_4]$
281. (a) $CuSO_4 + 4NH_4OH \rightarrow [Cu(NH_3)_4]SO_4 + 4H_2O$
Blue
282. (c) $Cu + 2H_2SO_4 \rightarrow CuSO_4 + SO_2 + 2H_2O$
284. (a) $2Cu + CO_2 + H_2O + O_2 \rightarrow CuCO_3 \cdot Cu(OH)_2$
Basic copper carbonate
285. (a) $2CuSO_4 + K_4[Fe(CN)_6] \rightarrow Cu_2[Fe(CN)_6] + 2K_2SO_4$
287. (d) $CuSO_4 + Hg \rightarrow$ No reaction
 Hg is less reactive than Cu it comes below Cu in the reactivity series
288. (c) $Cu + H_2O \rightarrow$ No reaction
 $E_{Li^+/Li}^0 = -3.04 V$ $E_{H^+/H_2}^0 = 0.00 V$
 $E_{Ca^{+2}/Ca}^0 = -2.87 V$ $E_{Cu^+/Cu}^0 = +0.34 V$
 Cu comes below H in the electrochemical series. Hence, unable to displace hydrogen from water.
289. (d) $3Cu + 8HNO_3 \rightarrow 3Cu(NO_3)_2 + 2NO + 4H_2O$
291. (c) $Cu + O_2 + CO_2 + H_2O \rightarrow Cu(OH)_2 \cdot CuCO_3$

292. (d) Orford process $\rightarrow$ During electrolytic refining of Ni from orford bottoms the Pt metal together with gold and silver collect as anode mud in concentrated form which is later processed to separate the metals.
294. (b) $AgBr$ is used in photography because it is light sensitive.
296. (b) $4AgCl + 2Na_2CO_3 \rightarrow 4Ag + 4NaCl + 2CO_2 + O_2$
297. (d) $2AgNO_3 + K_2CrO_4 \rightarrow Ag_2CrO_4 + 2KNO_3$
(Red)
298. (c) $3Ag + 4HNO_3 \xrightarrow[\text{dilute}]{\text{heat}} 3AgNO_3 + NO + 2H_2O$
299. (d) $AgCl + 2NH_3 \rightarrow [Ag(NH_3)_2]Cl$ (soluble complex)
301. (b) $AgBr$ is most sensitive to light and undergoes photochemical reduction
 $2AgBr \xrightarrow{\text{Light}} 2Ag + Br_2$
302. (a) $NaNO_3$ is purely ionic while $AgCl$ is covalent other compounds reacts with $AgCl$
 $2AgCl + Na_2CO_3 \rightarrow 2Ag + 2NaCl + CO_2 + \frac{1}{2}O_2$
 $AgCl + 2Na_2CO_3 \rightarrow Na_2[Ag(S_2O_3)_2] + NaCl$
 $AgCl + 2NH_4OH \rightarrow [Ag(NH_3)_2Cl] + 2H_2O$
304. (a) A very dilute solution is used in cauterisation of eyes and dental antiseptic
305. (a) $2AgNO_3 \rightarrow 2Ag + 2NO_2 + O_2$
306. (a) $2AgNO_3 \xrightarrow{PH_3} 2Ag + 2NO_2 + O_2$
307. (b) $2Ag + 2H_2SO_4 \rightarrow Ag_2SO_4 + SO_2 + 2H_2O$
308. (c) Ag salts on strong heating from Ag
309. (a) Silver metal is extracted from the argentite ore (Ag_2S) by the cyanide process, in which ore is treated with sodium cyanide sold. Dicyanoargentate(I) $[2Na\{Ag(CN)_2\}]$ is formed.
310. (b) When a strip of copper is dipped in the solution of silver nitrate, the solution becomes blue. Cu is placed above Ag in electrochemical series.
 $2AgNO_3 + Cu \rightarrow Cu(NO_3)_2 + 2Ag$
311. (d) $ZnO + 2NaOH \rightarrow Na_2ZnO_2 + H_2O$
312. (d) $Zn + 2NaOH \rightarrow Na_2ZnO_2 + H_2$
 $2Al + 2NaOH \rightarrow 2NaAlO_2$
314. (d) The white solid dissolves to form a blue solution.
 $CuSO_4 + \text{dil } H_2SO_4 \rightarrow CuSO_4 \cdot 5H_2O$
 blue vitriol
317. (c) $ZnSO_4 + 2NaHCO_3 \rightarrow ZnCO_3 + Na_2SO_4 + H_2O + CO_2$
318. (b) $Zn + 2NaOH \xrightarrow{\text{heat}} Na_2ZnO_2 + H_2$
319. (d) $ZnO + 2HCl \rightarrow ZnCl_2 + H_2O$
 $ZnO + 2NaOH \rightarrow Na_2ZnO_2 + H_2O$
320. (c) Very dil HNO_3 $\rightarrow$ Ammonium nitrate is formed
 $4Zn + 10HNO_3 \rightarrow 4Zn(NO_3)_2 + NH_4NO_3 + 3H_2O$
321. (d) $Zn_{30} \rightarrow 3d^{10}, 4s^2$
 $Zn^{+2} \rightarrow 3d^{10}$
323. (d) Sodium tetraborate decahydrate ($Na_2B_4O_7 \cdot 10H_2O$)
324. (a) Zn does not react with cold water. However it reacts with hot water and yield H_2
 $Zn + H_2O \xrightarrow{\text{Boil}} ZnO + H_2$
 $Zn + H_2SO_4(\text{dil}) \rightarrow ZnSO_4 + H_2$
 $Zn + 2HCl(\text{dil}) \rightarrow ZnCl_2 + H_2$
 $Zn + 2NaOH \xrightarrow[20\%]{\text{heat}} Na_2ZnO_2 + H_2$
325. (b) $Zn + 2HCl \rightarrow ZnCl_2 + H_2$
 $Zn + 2NaOH \rightarrow Na_2ZnO_2 + H_2$
327. (a) The compound $ZnFe_2O_4$ is a normal spinel compound.
328. (a) $ZnO + BaO \xrightarrow{1100^\circ C} BaZnO_2$
329. (b) $4Zn + 10HNO_3 \rightarrow 4Z(NO_3)_2 + NH_4NO_3 + 3H_2O$
330. (d) Lead is used for making radiation shield.
331. (b) $Ag_2S + 4NaCN \rightarrow 2Na[Ag(CN)_2] + Na_2S$
 $2Na[Ag(CN)_2] + Zn \rightarrow Na_2[Zn(CN)_4] + 2Ag$
333. (d) In Mc Arthur Forest method, Silver is extracted from solution of sodium argentocyanide by using Zn
 $2Na[Ag(CN)_2] + Zn \longrightarrow Na_2[Zn(CN)_4] + 2Ag \downarrow$
338. (d) $Ag_2S + 4NaCN \rightarrow 2Na[Ag(CN)_2] + Na_2S$
 $2Na[Ag(CN)_2] + Zn \rightarrow Na_2[Zn(CN)_4] + 2Ag$
342. (c) Self reduction
 $2Cu_2S + 3O_2 \rightarrow 2Cu_2O + 2SO_2$
 $Cu_2S + 2Cu_2O \rightarrow 6Cu + SO_2$
345. (c) $FeO + SiO_2 \rightarrow FeSiO_3$
 Impurity Flux Slag
346. (c) Parke's process is used to extract silver from argentiferous lead.
347. (c) $2Cu_2S + 3O_2 \rightarrow 2Cu_2O + 2SO_2 \uparrow$
348. (d) Copper metallurgy involves bessemerisation. In bessemerisation converter, the impurities of Ferric Oxide forms slag with Silica and Copper Oxide gets reduced to give blister copper.
 $FeO + SiO_2 \longrightarrow FeSiO_3$
 Slag
 $Cu_2S + Cu_2O \longrightarrow 6Cu \downarrow + SO_2 \uparrow$
349. (c) Bessemer converter is used to purify Pig Iron by passing compressed air over pig iron in Bessemer converter to produce slag.
 $2Mn + O_2 \longrightarrow 2MnO; Si + O_2 \longrightarrow SiO_2$
 $2C + O_2 \longrightarrow 2CO; MnO + SiO_2 \longrightarrow MnSiO_3$
 Slag
353. (d) 1% Impure copper
358. (c) None of the above. Since, gold is a noble metal and common acids do not attack on it if used singly.
359. (a) Due to reduction of copper
 $Zn + CuSO_4 \rightarrow Cu + ZnSO_4$

No unpaired electrons

360. (a) Reduction of
- Cu^{++}
- .

5 time quantity of Fe^{2+} consumed.So 5 time of FeSO_4 will be equivalent to 50 ml

Critical Thinking Questions

1. (c) Transition metal which have low oxidation number show the oxidising nature because of great tendency to lose the electron.

2. (b)
- Cr^{+2}
- and
- Fe^{+2}

3. (d) The solubility order is :

4. (d) No of unpaired electron in different ion are as under

5. (a) The magnitude of stability constants for some divalent metal ions of the first transition series with oxygen or nitrogen donor ligands increases in the order.

6. (c) Strong oxidising agents such as
- PbO_2
- or sodium bismuthate (
- NaBiO_3
-) oxidise
- Mn^{2+}
- to
- MnO_4^-
- or
- Mn^{7+}
- .

7. (c) Given
- $n = 4$
- $x = 5$

8. (b) Iron decomposes steam into hydrogen when it is passed over red hot iron

9. (d)
- $\text{CoCl}_3 - \text{Co}^{+3} - 3d^6 4s^0$

4 unpaired electrons. So it will be coloured.

10. (a) Due to Lanthanoid contraction order will be

11. (d) In this reaction

12. (abc) Due to less capacity of hydrogen bonding of
- I_2
- with water
- HgI_2
- is less soluble in water.

13. (c)
- $\frac{\text{Transition element} + \text{Inner transition element}}{\text{Total element}} \times 100$

$$\frac{33 + 28}{105} \times 100 = 58.09 \approx 60\%$$

14. (a) All metal carbonyls are diamagnetic cyanide complexes are also diamagnetic.

15. (c) 22 carat gold is alloy of copper and gold.

16. (b)
- Fe^{3+}
- have highest no. of unpaired electron so it will be more paramagnetic.

17. (d)
- p
- electrons in
- Cl^-
- (atomic no. of
- $\text{Cl} = 17$
-)

In Fe^{2+} total number of $d e^- = 6$ which is not equal to $p e^-$ in $\text{Cl}^- = 12$.

18. (a) Basic character of oxide decreases from left to right in a period of periodic table.

19. (b)
- $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$
- because it has only one unpaired electrons.

20. (c) The existence of
- Fe^{2+}
- and
- NO^+
- in Nitroprusside ion
- $[\text{Fe}(\text{CN})_5\text{NO}]^{2-}$
- can be established by measuring the magnetic moment of the solid compound which should correspond to
- $(\text{Fe}^{2+} = 3d^6)$
- four unpaired electrons.

21. (c)
- $\text{V}^{+4} \rightarrow 3d^1 4s^0$

1 unpaired electrons. Hence, it is paramagnetic and coloured compound.

22. (a)
- $3\text{MnO}_4^- + 5(\text{Fe}^{2+} + \text{C}_2\text{O}_4^{2-}) + 24\text{H}^+ \rightarrow$

Thus 5M of FeC_2O_4 is oxidised by 3M of KMnO_4 then 1M of FeC_2O_4 is oxidised by 3/5 mole of KMnO_4 .

23. (b)
- $2\text{MnO}_4^- + 16\text{H}^+ + \text{C}_2\text{O}_4^{2-} \rightarrow 2\text{Mn}^{+2} + 2\text{CO}_2 + 8\text{H}_2\text{O}$

24. (b)
- $\text{ScCl}_3 \rightarrow \text{Sc}^{+3} + 3\text{Cl}^-$

No unpaired electron so will show diamagnetic character and will be repelled, so will weigh less.

25. (a)
- $(\text{Ar}) 3s^1 + 3 = \text{Ti}$
- , it means
- M^{3+}
- form
- Ti^{3+}
- ion.

26. (b)
- $\text{V} = 1s^2 2s^2 2p^6 3s^2 3p^6 3d^3 4s^2$

In second ionization enthalpy Cr^+ has exact half filled d -sub shell.

Assertion and Reason

2. (b) Zn^{2+} is diamagnetic because it has no unpaired electrons
3. (c) The assertion is correct but the reason is false. Actually transition metal show variable valency due to very small difference between the ns^2 and $(n-1)d$ electrons, Therefore, assertion is correct but reason is false.

4. (e) The aqueous solution of $FeCl_3$ is acidic in nature because $FeCl_3$ hydrolyse in water to produce acid ion.

Therefore, assertion is false but reason is true.

5. (a) $AgCl$ on adding to a solution of NH_4OH solution dissolves to form a complex diamine silver chloride.

Therefore, both assertion and reason are true and reason is a correct explanation of assertion.

6. (c) Pure iron is not used for making tools and machines as it is soft. Therefore, cannot be used for this purpose. Assertion is true but reason is false.

7. (a) A solution of Na_2CrO_4 in water is intensely coloured due to oxidation state of chromium in Na_2CrO_4 is +6. Here both assertion and reason are correct.

8. (d) Copper corrodes at negligible rates in unpolluted air, water and deaerated non-oxidizing acids. Pure copper and the high copper alloys can be considered to exhibit similar resistance to most corrosive environments. They possess excellent resistance to atmospheric environments. Corrosion is a spontaneous process for which free energy change must be negative.

9. (c) ${}_{24}Cr \rightarrow [Ar] 3d^4 4s^2$

Full-filled s -orbital has greater stability.

10. (a) Fe has atomic no. 26.

So its electronic configuration is $[Ar] 3d^6 4s^2$.

Fe^{2+} has electronic configuration $[Ar] 3d^6$.

It has four unpaired electrons and it is paramagnetic.

11. (b) Due to larger surface area and variable valencies to form intermediate absorbed complex easily, transition metals are used as good catalysts.

12. (c) Rusting involves reduction of absorbed oxygen to OH^- ions and oxidation of iron to Fe^{2+} ions. The two ions combine to yield $Fe(OH)_2$ which gets oxidized to give $Fe_2O_3 \cdot nH_2O$ (rust). The presence of acid helps dissolution of pure iron to ferrous ions while electrolytes increase the conductivity and assist the cell action.

13. (b) $AgBr$ is the most sensitive silver halide to photo reduction. Hence it is used as the light sensitive material in photographic films. The unchanged $AgBr$ is dissolved in hypo solution to cast an image on photographic plate.

14. (a) Tungsten is a metal of high melting point and its filament gives brilliant light on passing electric current.

17. (b) The magnetic moments are lesser than the fact that $5f$ electrons of actinides are less effectively shielded which results in quenching of orbital contribution.

18. (b) The higher the charge on the metal ion, smaller is the ionic size and more is the complex forming decreases in the order $M^{4+} > MO_2^{2+} > M^{3+} > MO_2^+$. The higher tendency of complex formation of MO_2^{2+} of charge on metal atom M in MO_2^{2+}

20. (d) Extraction of iron metal from iron oxide ore is carried out by heating with coke and flux (calcium carbonate). Flux is a slag forming substance. It converts infusible impurities into fusible slag.

The reaction : $FeO_{(s)} \rightarrow Fe_{(s)} + 3/2 O_{2(g)}$ is not a spontaneous process. $FeO_{(s)}$ is converted to FeO at about $400^\circ C$. FeO is converted to Fe at about $800^\circ C - 1000^\circ C$.

d and f-Block Elements

SET Self Evaluation Test -19

- The equivalent weight of $MnSO_4$ is half of its molecular weight when it is converted to
(a) Mn_2O_3 (b) MnO_2
(c) MnO_4^- (d) MnO_4^{2-}
- In which compound chromium has +6 oxidation state
[CPMT 2003]
(a) $K_2Cr_2O_7$ (b) $CrCl_3$
(c) $Cr(SO_4)_3$ (d) None of these
- Which of the following metal does not show variable valency
[RPET 2000]
(a) Fe (b) Hg
(c) Zn (d) Cu
- Which of the following metals will not react with solution of $CuSO_4$
[CPMT 1974, 80; MH CET 2004]
(a) Fe (b) Zn
(c) Mg (d) Ag
- Which metal among following has strongest tendency to undergo oxidation
[CPMT 1989]
(a) Zn (b) Cu
(c) Mg (d) Al
- Which of the following has highest paramagnetic character
(a) Mn (II) (b) Fe (II)
(c) Co (II) (d) Ni (II)
- Ammonia is a Lewis base. It forms complexes with cations. Which one of the following cations does not form complex with ammonia
(a) Ag^+ (b) Cu^{++}
(c) Cd^{++} (d) Pb^{++}
- Which of the following is expected to form colourless complex [AMU 2000]
(a) Ni^{2+} (b) Cu^+
(c) Ti^{3+} (d) Fe^{3+}
- Which of the following is ferromagnetic
(a) Cr (b) Mn
(c) W (d) Co
- The most stable oxidation state of Mn is
(a) +2 (b) +4
(c) +5 (d) +7
- The number of unpaired electrons in Mn^{+3} is
(a) 4 (b) 3
(c) 2 (d) Zero
- The correct order of ionic radii of Y^{3-} , La^{3+} , Eu^{3+} and Lu^{3+} is [CBSE PMT 2000]
(a) $La^{3+} < Eu^{3+} < Lu^{3+} < Y^{3+}$
(b) $Y^{3-} < La^{3+} < Eu^{3+} < Lu^{3+}$
(c) $Lu^{3+} < Y^{3+} < Eu^{3+} < La^{3+}$
(d) $Lu^{3+} < Eu^{3+} < La^{3+} < Y^{3+}$
(Atomic No. Y = 39, La = 57, Eu = 63, Lu = 71)
- One mole of potassium dichromate completely oxidises the following number of moles of ferrous sulphate in acidic medium [MP PET 1997]
(a) 1 (b) 3
(c) 5 (d) 6
- The atomic radii from Cr to Cu is almost identical because of
(a) Increasing nuclear charge from Cr to Cu
(b) Repulsion among increased electrons
(c) Increased screening effect to nullify increased nuclear charge
(d) All the above
- Oxidation number of Mn in K_2MnO_4 and in $KMnO_4$ are respectively
[MP PET 1991, 2001]
(a) +6 and +7 (b) +6 and +6
(c) +7 and +7 (d) +7 and +6
- When phosphine is passed through aqueous solution of copper sulphate, the product produced is
(a) $Cu(OH)_2$ (b) Cu_3P_2
(c) $[Cu(PH_3)_4]^{2+}$ (d) $[Cu(PH_3)_2]^{2+}$
- Hydroxide soluble in ammonia is
[NCERT 1973, 77; MNR 1984; KCET 1992]
(a) $Al(OH)_3$ (b) $Fe(OH)_3$
(c) $Cr(OH)_3$ (d) $Cu(OH)_2$
- Which of the following pair of transitional elements exhibit highest and lowest density
(a) Os and Sc (b) Os and Pt
(c) Hg and Sc (d) Os and Ir
- When an acidified solution of ferrous ammonium sulphate is treated with potassium permanganate solution, the ion which is oxidised is [BHU 1979]
(a) MnO_4 (b) NH_4^+
(c) Fe^{++} (d) SO_4^{2-}

1. (b) $MnSO_4 \xrightarrow{-2e^-} MnO_2$
 Equivalent wt. = $\frac{\text{molecular wt.}}{\text{total no. of } e^- \text{ gained or lost}} = \frac{M}{2}$
2. (a) In $K_2Cr_2O_7$, Cr has +6 oxidation state.
3. (c) Zn shows only +2 valency.
4. (d) Because Ag comes below in the electromotive series also standard electrode potential of Cu and Ag are:
 $Cu^{2+}(aq) + 2e^- \rightarrow Cu(s); [SEP - E_{298}^0 (\text{volt}) = +0.18]$
 $Ag^+(aq) + e^- \rightarrow Ag(s); [SEP - E_{298}^0 (\text{volt}) = +0.80]$
5. (c) Mg; because of its high hydration energy.
6. (a) $Mn^{+2} - 3d^5$
 5 unpaired element in d-subshell so it has highest paramagnetic.
7. (d) Pb^{++} because it does not have vacant d-orbitals nor high nuclear charge and it does not belong to transition series.
8. (b) In Cu^{+1} (cuprous ion) d orbitals are completely filled so it will form colourless complex.
9. (d) The substances which are strongly attracted by magnetic field and show permanent magnetism even in absence of magnetic field are ferromagnetic e.g., Co, Fe, Ni
10. (a)

As half filled orbitals are more stable than partial filled ones. Therefore, +2 is most stable oxidation state.

$$2 + x - 8 = 0$$

$$x = 6$$

$$\text{O.N. of } KMnO_4$$

$$1 + x - 8 = 0$$

$$x = 7$$

16. (b) $3CuSO_4 + 2PH_3 \rightarrow Cu_3P_2 + 3H_2SO_4$
17. (d) Due to formation of complex
 $Cu(OH)_2 + 4NH_3 \rightarrow [Cu(NH_3)_4](OH)_2$
18. (a) Os and Sc
 $Os = 22.60 \text{ gm/cm}^3$
 $Sc = 3.01 \text{ gm/cm}^3$
19. (c) $Fe^{2+} \xrightarrow{\text{oxidises}} Fe^{3+}$

11. (a)
- | | | | | | | |
|-----------|--------|---|---|---|--|--------|
| | $3d^5$ | | | | | $4s^0$ |
| Mn^{+3} | ↑ | ↑ | ↑ | ↑ | | |
12. (c) Lanthanide contraction results in small size of Lu^{3+} , so
 $Lu^{3+} < Y^{3+} < Cu^{3+} < La^{3+}$
13. (d) Oxidation number of chromium in potassium dichromate is +6 so it oxidise 6 moles of ferrous sulphate in acidic medium.
14. (c) Increased screening effect to nullify increased nuclear charge.
15. (a) O.N. of K_2MnO_4

Co-ordination Chemistry

All transition elements exhibit a characteristic property of complex ion formation. The compounds containing complex ions are called coordination compounds. The branch of chemistry in which coordination compounds are studied that is called co-ordination chemistry.

Double Salts and Co-ordination Compounds.

When solutions of two or more stable compounds are mixed in stoichiometric (simple molecular) proportions new crystalline compounds called molecular or addition compounds are formed. These are of two types,

(1) Double salts, (2) Co-ordination or Complex compounds

(1) **Double salts** : Addition compounds, stable in solid state. Dissociate into ions in aqueous solution as such give test for each constituent ion. Examples:

Double Salt	Responds test for the ions
Carnalite : $KCl \cdot MgCl_2 \cdot 6H_2O$	K^+ , Mg^{2+} , Cl^-
Potash alum : $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$	K^+ , Al^{3+} , SO_4^{2-}

(2) **Co-ordination or Complex compounds** : Addition compound, stable in solid state. Retain their identity even in solution. Central metal ion form dative or coordinate bond with the species surrounding it (ligands). Examples :

Complex compound	Cation	Anion
$[Cu(NH_3)_4]SO_4$	$[Cu(NH_3)_4]^{+2}$	SO_4^{2-}
$K_2[PtF_6]$	$2K^+$	$[PtF_6]^{2-}$
$[Co(NH_3)_6][Cr(CN)_6]$	$[Co(NH_3)_6]^{2+}$	$[Cr(CN)_6]^{3-}$

Terminology of co-ordination compounds

(1) **Central metal atom or ion** : A complex ion contains a metal atom or ion known as the central metal atom or ion. It is sometimes also called a nuclear atom.

(2) **Complex ion** : It is an electrically charged radical which is formed by the combination of a simple cation with one or more neutral molecules or simple anions or in some cases positive groups also.

(3) **Ligands** : Neutral molecules or ions that attach to central metal ion are called ligands. The donor atom associated with the ligands supplies lone pair of electrons to the central metal atom (forming dative bond) may be one or two more. Monodentate (one donor atom), bidentate (two donor atom), tridentate (three donor atom) etc.

Monodentate Ligands (with one donor site)

Table : 20.1 *Anionic Ligands* (Negative legends)

Formula	Name	Formula	Name
X^-	Halo	O_2^{2-}	Peroxo
$:OH^-$	Hydroxo	CH_3COO^-	Acetato
CN^-	Cyano	NO_3^-	Nitrato
O^{2-}	Oxo	$S_2O_3^{2-}$	Thiosulphato
NH_2^-	Amido	NO_2^-	Nitrito
S^{2-}	Sulphido	CO_3^{2-}	Carbonato
CNS^-	Thiocyanato	SO_4^{2-}	Sulphato

Table : 20.2 *Neutral Ligands*

Formula	Name	Formula	Name
CO	Carbonyl	$:NH_3$	Amminato
PH_3	Phosphine	H_2O	Aqua
NO	Nitrosyl	C_5H_5N	Pyridine (py)

Table : 20.3 *Cationic Ligand* (Positive)

Formula	Name	Formula	Name
NO_2^+	Nitronium	NO^+	Nitrosonium
$H_2NNH_3^+$	Hydrazinium		

Polydentate ligands (with two or more donor site)

Table : 20.4 Bidentate (Two donor sites)

Formula	Name	Formula	Name
$H_2NCH_2CH_2NH_2$	Ethylenediamine (en)	$Me-C \equiv NO^-$ $Me-C \equiv NOH$	Dimethylglyoxime (dmg)
$\begin{array}{c} O \quad O \\ \quad \\ O-C-C-O^- \end{array}$	Oxalato (ox)	$NH_2-CH_2-COO^-$	Glycinate ion (gly)

Table : 20.5

	Formula	Name
Tridentate	$H_2\ddot{N}(CH_2)_2-\ddot{N}H-(CH_2)_2\ddot{N}H_2$	Diethylene triammine (dien)
Tetradentate	$H_2\ddot{N}(CH_2)_2-\ddot{N}H-(CH_2)_2\ddot{N}H(CH_2)_2\ddot{N}H_2$	Triethylenetetramine (trien)
Hexadentate	$\begin{array}{c} :OOCH_2C > \ddot{N}-CH_2-CH_2-\ddot{N} < CH_2COO^- : \\ :OOCH_2C < \ddot{N}-CH_2-CH_2-\ddot{N} > CH_2COO^- : \end{array}$	Ethylenediamine tetraacetic acid (EDTA) ⁴⁻

Chelating Ligand : When polydentate ligands bind to the central metal ion they form a ring called chelate and the ligand is referred as chelating ligand.

Ambidentate ligands : A ligand which possesses two donor atom but in forming complex it utilizes only one atom depending upon the condition and type of complex.

NO_2 (nitro), ONO (nitrito), CN (cyano), NC (isocyano), SCN (thiocyanide), NCS (isothiocyanide)

π -acid ligand : Ligands which are capable of accepting an appreciable amount of π - e^- density from the metal atom into emptying π or π^* orbital or their own called π -acceptor or π -acid ligands eg. CO .

(4) **Co-ordination Sphere** : Ligand with central metal ion is kept in square bracket [] retains its identity in the same form is called co-ordination sphere (non-ionisable)

(5) **Co-ordination Number** : Number of monodentate ligands attached to central atom/ion are called coordination number of the central metal atom/ion.

(6) **Ionisation Sphere** : The part present out side of the square bracket is called ionization sphere (ionisable).

IUPAC Nomenclature of complex compounds

In order to name complex compounds certain rules have been framed by IUPAC. These are as follows :

(1) The positive part of a coordination compound is named first and is followed by the name of negative part.

(2) The ligands are named first followed by the central metal. The prefixes *di-*, *tri-*, *tetra-*, etc., are used to indicate the number of each kind of ligand present. The prefixes bis (two ligands), tris (three ligands), etc., are used when the ligands includes a number e.g., dipyridyl, bis (ethylenediamine).

(3) In polynuclear complexes, the bridging group is indicated in the formula of the complex by separating it from the rest of the complex by hyphens. In polynuclear complexes (a complex with two or more metal atoms), bridging ligand (which links two metal atoms) is denoted by the prefix μ before its name.

(4) **Naming of ligands** : The different types of ligands *i.e.* neutral, negative or positive are named differently in a complex compound.

When a complex species has negative charge, the name of the central metal ends in -ate. For some elements, the ion name is based on the Latin name of the metal (for example, argentate for silver). Some such latin names used (with the suffix -ate) are given below :

<i>Fe</i>	Ferrate	<i>Cu</i>	Cuprate
<i>Ag</i>	Argentate	<i>Au</i>	Aurate
<i>Sn</i>	Stannate	<i>Pb</i>	Plumbate

(5) **Point of attachment in case unidentate ligands with more than co-ordinating atoms** (ambidentate ligands) : The point of attachment in case of unidentate ligands with more than one co-ordinating atoms is either indicated by using different names for the ligands (*e.g.* thiocyanato and isothiocyanato) or by placing the symbol of the donor atom attached, the name of the ligand separated by a hyphen.

$(NH_4)_3[Cr(SCN)_6]$ Ammonium hexathiocyanato - S-chromate (III) or Ammonium hexathiocyanatochromate (III)	$(NH_4)_2[Pt(NCS)_6]$ Ammonium hexathiocyanato - N - platinate(IV) or Ammonium hexaisothiocyanatoplatinate(IV)
--	---

(6) **Name of the bridging groups** : If a complex contains two or more central metal atoms or ions, it is termed as polynuclear. In certain polynuclear complexes, ligands may link the two metal atoms or ions. Such ligands which link the two metal atoms or ions in polynuclear complexes are termed as bridge ligands. These bridge ligands are separated from the rest of the complex by hyphens and denoted by the prefix μ . If there are two or more bridging groups of the same kind, this is indicated by *di-* μ -, *tri-* μ -, etc.

(7) If any lattice component such as water or solvent of crystallisation are present, these follow the name and are preceded by the number of these groups (molecules of solvent of crystallisation) in Arabic numerals.

For example,

(8) Following punctuation rules should also be followed while writing the name of the complex compounds.

(i) The name of the complete compound should not start a capital letter, *e.g.*,

(ii) The full name of the complex ion should be written as one word without any gap.

(iii) There should be a gap between the cation and anion in case of ionic complexes.

(iv) The full name of non-ionic complexes should be written as one word without any gap.

Isomerism in co-ordination compounds

Compounds having the same molecular formula but different structures or spatial arrangements are called isomers and the phenomenon is referred as **isomerism**.

(i) **Structural isomerism** : Here the isomers have different arrangement of ligands around the central metal atom. It is of the following types :

(i) **Ionisation isomerism** : The co-ordination compound having the same composition or molecular formula but gives different ions in solution are called ionization isomers.

There is exchange of anions between the co-ordination sphere and ionization sphere.

Example :

(ii) **Co-ordination isomerism** : In this case compound is made up of cation and anion and the isomerism arises due to interchange of ligands between complex cation and complex anion.

hexaamine cobalt (III) hexacyano chromate (III) hexaamine chromium (III) hexacyanocobalt (III)

complex cation contains $\rightarrow NH_3$ ligand (with cobalt)
 complex anion contains $\rightarrow NH_3$ ligand (with chromium)
 complex anion contains $\rightarrow CN^-$ ligand (with chromium)
 complex anion contains $\rightarrow CN^-$ ligand (with cobalt)

(iii) **Linkage isomerism** : In this case isomers differ in the mode of attachment of ligand to central metal ion and the phenomenon is called linkage isomerism.

Pentaamminenitritocobalt (III)

Pentaamminenitrocobalt (III) chloride

: $O-NO^-$ oxygen atom donates lone pair of electrons (nitrito)

NO_2^- nitrogen atom donates lone pair of electrons (nitro)

(iv) **Hydrate isomerism** : Hydrate isomers have the same composition but differ in the number of water molecules present as ligands and the phenomenon is called hydrate isomerism.

Examples : (a) $[Cr(H_2O)_6]Cl_3$ hexaaquachromium (III) chloride (violet)

(b) $[Cr(H_2O)_5 Cl]Cl_2 \cdot H_2O$ pentaquachlorochromium (III) chloride monohydrate (blue green)

(c) $[Cr(H_2O)_4 Cl]Cl_2 \cdot 2H_2O$ tetraaquadichloro chromium (III) chloride dihydrate (green)

(2) **Stereo isomerism or space isomerism** : Here the isomers differ only in the spatial arrangement of atoms or groups about the central metal atom. It is of two types :

(i) **Geometrical or Cis-trans isomerism** : This isomerism arises due to the difference in geometrical arrangement of the ligands around the central atom. When identical ligands occupy positions near to each other called **cis-isomer**. When identical ligands occupy positions opposite to each other called **trans-isomer**. It is very common in disubstituted complexes with co-ordination number of 4 and 6.

- Complexes of co-ordination number 4

Tetrahedral geometry : In this case all the four ligands are symmetrically arranged with respect to one another as such geometrical isomerism is not possible.

Square planar geometry : The four ligands occupy position at the four corners and the metal atom or ion is at the center and lie in the same plane.

Type : $1 [Ma_2b_2]$, $M = Pt$, $a = Cl$, $b = NH_3$

Example : $[PtCl(NH_3)(Py)_2]$

Complexes of co-ordination number 6

Octahedral geometry :

Here the metal atom or ion lies at the center and 1 to 6 positions are occupied by the ligands.

Cis-Positions : 1-2, 2-3, 3-4, 4-5

Trans-position : 1-4, 2-5, 3-6

Type -I Ma_4b_2 , $M = Co$, $a = NH_3$, and $b = Cl$

Example : $[CoCl_2(NH_3)_4]^+$ ion

Type -II $[Ma_3b_3]$, $M = Rh$, $a = Cl$, and $b = Py$

Example : $[RhCl_3(Py)_3]$

Type -III $[M(aa)_2(en)_2]^{++}$, $M = Co$, $a = CH_2NH_2$
 $b = Cl$ (monodentate)

(ii) **Optical isomerism**

(a) Optical isomers are mirror images of each other and have chiral centers.

(b) Mirror images are not super imposable and do and have the plane of symmetry.

(c) Optical isomers have similar physical and chemical properties but differ in rotating the plane of plane polarized light.

(d) Isomer which rotates the plane polarized light to the right is called dextro rotatory (*d*-form) and the isomer which rotates the plane polarized light to the left is called laevorotatory (*l*-form)

Example : $[Ma_2b_2c_2]^{n+}$; $[Pt(Py)_2(NH_3)_2Cl_2]^{2+}$

$[Mabcde f]$; $Pt(py)NH_3NO_2ClBr$

$[M(AA)_3]^{n+}$; $[Co(en)_3]^{3+}$

$[M(AA)_2a_2]^{n+}$; $[Co(en)_2Cl_2]^+$

$[M(AA)_2ab]^{n+}$; $[Co(en)_2NH_3Cl]^{2+}$

**Bonding in co-ordination compounds (Werner's Coordination theory)**

Werner was able to explain the bonding in complex.

Primary valency (Pv) : This is non- directional and ionizable. In fact it is the positive charge on the metal ion.

Secondary valency (Sv) : This is directional and non- ionizable. It is equal to the number of ligand atoms co-ordinated to the metal (co-ordination number). Example :

Nature of the complex can be understood by treating the above complexes with excess of $AgNO_3$.

The nature of bonding between central metal atom and ligands in the coordination sphere has been explained by the three well-known theories. These are :

(i) **Valence Bond theory of coordination compounds**

(i) The suitable number of atomic orbitals of central metal ion (*s*, *p*, *d*) hybridise to provide empty hybrid orbitals.

(ii) These hybrid orbitals accept lone pair of electrons from the ligands and are directed towards the ligand positions according to the geometry of the complex.

(iii) When inner *d*-orbitals i.e. (*n*-1) *d* orbitals are used in hybridization, the complex is called – **inner orbital** or **spin or hyperligated** complex.

(iv) A substance which do not contain any unpaired electron is not attracted by 2 magnet. It is said to be diamagnetic. On the other hand, a substance which contains one or more unpaired electrons in the electrons in the *d*-orbitals, is attracted by a magnetic field [exception O_2 and NO]. It is said to be paramagnetic.

Paramagnetism can be calculated by the expression,
 $\mu_s = \sqrt{n(n+2)}$, where μ = magnetic moment.

s = spin only value and n = number of unpaired electrons.

Hence, if $n = 1$, $\mu_s = \sqrt{1(1+2)} = 1.73 \text{ B.M.}$, if $n = 3$, μ_s
 $= \sqrt{3(3+2)} = 3.87 \text{ B.M.}$ and so on

On the basis of value of magnetic moment, we can predict the number of unpaired electrons present in the complex. If we know the number of unpaired electrons in the metal complex, then it is possible to predict the geometry of the complex species.

(v) There are two types of ligands namely strong field and weak field ligands. A strong field ligand is capable of forcing the electrons of the metal atom/ion to pair up (if required). Pairing is done only to the extent which is required to cause the hybridization possible for that co-ordination number. A

weak field ligand is incapable of making the electrons of the metal atom/ion to pair up.

Strong field ligands : CN^- , CO , en , NH_3 , H_2O , NO^- , Py .

Weak field ligands :

I^- , Br^- , Cl^- , F^- , NO_3^- , OH^- , $\text{C}_2\text{O}_4^{2-}$, NH_3 , H_2O .

Limitations of valence bond theory

The valence bond theory was fairly successful in explaining qualitatively the geometry and magnetic behaviour of the complexes. But, it could not explain the following :

- The origin of their absorption spectra could not be explained.
- Why did different complexes of the same metal show different colours.
- Relative stabilities of different complexes could not be explained.
- Why should certain ligands form high spin, while others low spin complexes.

Table : 20.6 Geometry and magnetic nature of some complexes

Atom/ion/ complex (1)	Configuration (2)	Oxidation state of metal (3)	Type of hybridization (4)	Geometry shape (5)	No. of unpaired electrons (6)	Magnetic nature (7)

$Fe(d)$		+3		Octahedral	5	Paramagnetic
$[Fe(CN)_6]^{3-}$		+3	dsp (Inner)		1	Paramagnetic
Fe		0			4	Paramagnetic
$Fe(CO)_5$		0	dsp (Inner)	Trigonal bipyramidal	0	Diamagnetic

(2) **Ligand field theory** : According to this theory when the ligands come closer to metal atom or ion, a field is created. This field tends to **split** the **degenerate d-orbitals** of the metal atom into **different energy levels**. The nature and number of ligands determine the extent of splitting. Energy gap between the splitted energy levels determine the magnetic (paramagnetic or diamagnetic) and spectral properties (colour etc) of the complexes .

Stability of co-ordination in solution and Spectrochemical series

Stronger is the metal-ligand bond, less is the dissociation in the solution and hence greater is the stability of a coordination compounds.

Instability constant for the complex ion $[Cu(NH_3)_4]^{2+}$ i.e.

$[Cu(NH_3)_4]^{2+} \rightleftharpoons Cu^{2+} + 4NH_3$, is given by the expression;

$$K_i = \frac{[Cu^{2+}][NH_3]^4}{[Cu(NH_3)_4]^{2+}}$$

Stability constant of the above complex i.e.

$$K = \frac{[Cu(NH_3)_4]^{2+}}{[Cu^{2+}][NH_3]^4} = \frac{1}{K}$$

Greater is the stability constant, stronger is the metal – ligand bond

Factors affecting the stability of complex ion

(i) **Nature of central metal ion** : The higher the charge density on the central metal ion the greater is the stability of the complex

For example, the stability constant of $[Fe(CN)_6]^{3-}$ is much greater than the stability constant of $[Fe(CN)_6]^{4-}$.

Effective atomic number (EAN) or Sidgwick theory : In order to the stability of the complexes sidgwick proposed effective atomic number. EAN generally coincides with the atomic number of next noble gas in some cases. EAN is calculated by the following relation :

$EAN = \text{Atomic no. of the metal} - e^- \text{ lost in ion formation} + \text{No. of } e^- \text{ gained from the donor atom of the ligands.}$

$EAN = \text{Atomic number} - \text{Oxidation number} + \text{co-ordination no.} \times 2$

Table : 20.7

Complex	Metal oxidation state	At. No. of metal	Coordination number	Effective atomic number
$K_4[Fe(CN)_6]$	+ 2	26	6	$(26 - 2) + (6 \times 2) = 36$ [Kr]
$[Cu(NH_3)_4]SO_4$	+ 2	29	4	$(29 - 2) + (4 \times 2) = 35$
$[Co(CH_3)_6]Cl_3$	+ 3	27	6	$(27 - 3) + (6 \times 2) = 36$ [Kr]
$Ni(CO)_4$	0	28	4	$(28 - 0) + (4 \times 2) = 36$ [Kr]
$K_2[Ni(CN)_4]$	+ 2	28	4	$(28 - 2) + (4 \times 2) = 34$
$K_3[Cr(C_2O_4)_3]$	+ 3	24	6	$(24 - 3) + (6 \times 2) = 33$
$K_3[Fe(CN)_6]$	+ 3	26	6	$(26 - 3) + (6 \times 2) = 35$
$[Ag(NH_3)_2]Cl$	+ 1	47	2	$(47 - 1) + (2 \times 2) = 50$

(2) **Nature of ligand** : Greater the base strength is the ease with which it can donate its lone pair of electrons and therefore, greater is the stability of the complex formed by it.

(3) **Presence of chelate ring** : Chelating ligands form more stable complex as compared to monodentate ligands. For example : $Ni^{2+} + 6NH_3 \rightleftharpoons [Ni(NH_3)_6]^{2+}$; $K = 6 \times 10^8$; $Ni^{2+} + 3en \rightleftharpoons [Ni(en)_3]^{2+}$; $K = 4 \times 10^8$

Spectro chemical series : Ligands can be arranged in increasing order of their strength (ability to cause crystal field splitting) and the series so obtained is called as spectro chemical series.

Ligands arranged left to NH_3 are generally regarded as *weaker ligands which can not cause forcible pairing of electrons within 3d level and thus form outer orbital octahedral complexes*.

On the other hand NH_3 and all ligands lying right to it are *stronger ligands which form inner orbital octahedral complexes after forcible pairing of electrons within 3d level*.

Preparation and Application of coordination compounds

(i) **Preparation** : Coordination compounds are generally prepared by the application of the following methods,

(i) **Ligand substitution reaction** : A reaction involving the replacement of the ligands attached to the central metal ion in the complex by other ligands is called a ligand substitution reaction.

(ii) **Direct mixing of reagent** :

(iii) **Redox reactions** : In these reactions, either oxidation or reduction is involved

Penta ammine nitrocobalt (II) nitrate.

Application

(1) Estimation of hardness in water, as Ca^{++} and Mg^{2+} ions form complexes with EDTA.

(2) Animal and plant world e.g. chlorophyll is a complex of Mg^{2+} and haemoglobin is a complex of Fe^{2+} vitamin B_{12} is a complex of Co^{2+} .

(3) Electroplating of metals involves the use of complex salt as electrolytes e.g. $K[Ag(CN)_2]$ in silver plating.

(4) Extraction of metals e.g. Ag and Au are extracted from ores by dissolving in $NaCN$ to form complexes.

(5) Estimation and detection of metal ions e.g. Ni^{2+} ion is estimated using dimethyl glyoxime.

(6) Medicines e.g. cis-platin i.e. cis $[PtCl_2(NH_3)_2]$ is used in treatment of cancer.

Organometallic compounds

These are the compounds in which a metal atom or a metalloid (Ge, Sb) or a non-metal atom like B, Si, P , etc. (less electronegative than C) is directly linked to a carbon atom of a hydrocarbon radical or molecule. Organometallic compounds contain at least one.

(1) Metal – Carbon bond, (2) Metalloid – Carbon bond, (3) Non metal – Carbon bond.

Example :

Organometallic bond: $Mg-C$, $Zn-C$, $Ti-C$, $Si-C$

Classification of organometallic compounds : Organometallics have been classified as :

(1) **σ -bonded organometallic compounds** : Compounds such as $RMgX$, R_2Zn , R_3Pb , R_3Al , R_4Sn etc. contains $M-C \sigma$ -bond and are called **σ -bonded organometallic compound**.

(2) **π -bonded organometallic compounds** : The transition metals binds to unsaturated hydrocarbons and their derivatives using their d-orbitals. Here metal atom is bonded to ligands in such a way that donations of electrons and back acceptance by the ligand is feasible. These are called **π -orbitals** of the ligand. These are called **π -complexes**.

Examples : (i) π -**cyclopentadienyl – iron complex**

Ferrocene $[Fe(\eta^5-C_5H_5)_2]$, Bis (cyclopentadienyl) iron (II)

It is a π bonded sandwich compound. The number of carbon atoms bonded to the metal ion is indicated by superscript on eta (η^x) i.e. η^5 in this complex.

(ii) **Dibenzene chromium (π -complex)**

It is also a π -bonded sandwich compound. Its formula is $[Cr(\eta^6-C_6H_6)_2]$

(iii) **Alkene complex (π -complex)**

Zeise's salt K

Potassium trichloroethylene platinate (IV).

It is a π bonded complex.

μ^2 indicates that two carbons of ethylene are bonded to metals.

(3) **Complexes containing both σ - and π -bonding characteristics** : Metal carbonyls, compounds formed between metal and carbon monoxide belong to this class. Metal carbonyls have been included in organometallics.

(i) **Mononuclear carbonyls** : Contain one metallic atom per molecule. e.g. $Ni(CO)_4$, $Fe(CO)_5$, $Cr(CO)_6$

(ii) **Polynuclear carbonyls** : Contain two or more metallic atoms per molecule. e.g.,

Applications of organometallics

(1) Grignard reagent ($RMgX$) has been extensively used for synthesis of various organic compounds.

(2) Wilkinson's catalyst $[(PH_3)_3RhCl]$ i.e. tris (triphenylphosphine) chlororhodium (I) is used as a homogeneous catalyst for the hydrogenation of alkenes.

(3) Zeigler Natta catalyst (composed of a transition metal salt, generally $TiCl_4$ and trialkyl aluminium) are used as heterogeneous catalysts in the polymerisation of alkenes.

Tips & Tricks

✍ **Badecker reaction** : This reaction involves the following chemical change.

✍ **Everitt's salt** : It is $K_2[Fe(CN)_6]$ obtained by reduction of prussian blue.

✍ **Masking** : Masking is the process in which a substance without physical separation of it is so transformed that it does not enter into a particular reaction e.g., masking of Cu^{2+} by CN^- ion.

✍ **Macrocyclic effect** : This term refers to the greater thermodynamic stability of a complex with a cyclic polydentate ligand when compared to the complex formed with a non-cyclic ligand. e.g., $Zn(II)$ complex with ligand;

✍ **Prussian blue** and **Turnbull's blue** is pot. ferric ferrocyanide. However colour of Turnbull's blue is less intense than prussian blue. Decrease in colour is due to the presence in it of a white compound of the formula $K_2\{Fe[Fe(CN)_6]\}$ named as potassium ferrous ferrocyanide.

✍ Crystal field theory explains why certain geometries are more favoured than other by certain metals in terms of crystal field stabilization energies.

✍ The colour of complexes are explained in terms of electronic transitions between the various d orbitals of different energies.

✍ In octahedral complexes, the energy of the d_{z^2} and $d_{x^2-y^2}$ orbitals increases much more than the energy of the d_{xy}, d_{yz}, d_{xz} orbitals. The potential energy increases as a result of repulsive interactions. The greater the repulsion, greater is the increases in energy.

✍ Ligands with larger groups from unstable rings than the ligands with smaller groups. This is ascribable to steric hinderance produced by a larger group.

✍ When Ca^{2+} or Mg^{2+} forms complexes with EDTA, the pH of the solution decreases.

✍ The copper sulphate solution e.g., turns deep blue when excess of ammonia is added. This is also due to the formation of $[Cu(NH_3)_4]SO_4$

✍ Co-ordination compound with a general formula MA_4 , MA_3B or $MABCD$ do not show any geometric isomerism.

✍ **Flexidentate character** : polydentate ligand are said to

have flexidentate character if they do not use all its donar atoms to get coordinated to the metal ion e.g., EDTA generally act as a hexadentate ligand but it can also act as a pentadentate and tetradentate ligand.

✍ Octahedral complex of the type $[M(ABCDEF)]$ have 15 different geometrical isomers with a pair of enantiomers. Although a few geometrical isomer have been prepared but none has been resolved e.g., $[Pt(Py)(NH_3)(NO_2)(Cl)(Br)I]$.

- In $K_4Fe(CN)_6$
 - (CN) are linked with primary valency
 - (CN) are linked with secondary valency
 - K are linked with secondary valency
 - K are linked with non-ionic valency
- The co-ordination number of copper in cuprammonium sulphate is [KCET 1991, 92]
 - 2
 - 6
 - 4
 - 4
- Which of the following acts as a bidentate ligand in complex formation
 - Acetate
 - Oxalate
 - Thiocyanate
 - EDTA
- The co-ordination number of cobalt in the complex $[Co(en)_2Br_2]Cl_2$ is
 - 2
 - 6
 - 5
 - 4
- Which of the following ligands forms a chelate [MP PET/PMT 1998]
 - Acetate
 - Oxalate
 - Cyanide
 - Ammonia
- According to Werner's theory [MP PMT 2000, 02]
 - Primary valency can be ionized
 - Secondary valency can be ionized
 - Primary and secondary valencies both cannot be ionized
 - Only primary valency cannot be ionized
- Which of the following is not true for ligand-metal complex [MP PET 1993]
 - Larger the ligand, the more stable is the metal-ligand bond
 - Highly charged ligand forms strong bond
 - Larger the permanent dipole moment of ligand, the more stable is the bond
 - Greater the ionization potential of central metal, the stronger is the bond
- What is the co-ordination number of the metal in $[Co(en)_2Cl_2]^+$

- (a) 4 (b) 5
(c) 6 (d) 3
9. Bidentate ligand is
(a) CN^- (b) Ethylene diammine (en)
(c) SCN^- (d) EDTA
10. The coordination number of Pt in $[Pt(NH_3)_4Cl_2]^{++}$ ion is [MP PET 1995]
(a) 2 (b) 4
(c) 6 (d) 8
11. Which is the example of hexadentate ligand
(a) 2, 2-dipyridyl
(b) Dimethyl glyoxime
(c) Aminodiacetate ion
(d) Ethylene diammine tetra acetate ion [EDTA]
12. The coordination number of a metal in coordination compounds is [MP PET 1996; KCET (Engg./Med.) 1999]
(a) Same as primary valency
(b) Sum of primary and secondary valencies
(c) Same as secondary valency
(d) None of these
13. Ligand in a complex salt are [KCET 1992]
(a) Anions linked by coordinate bonds to a central metal atom or ion
(b) Cations linked by coordinate bonds to a central metal atom or ion
(c) Molecules linked by coordinate bonds to a central metal atom or ion
(d) Ions or molecules linked by coordinate bonds to a central metal atom or ion
14. A group of atoms can function as a ligand only when [KCET 1989; DCE 1999; MP PMT 2000]
(a) It is a small molecule
(b) It has an unshared electron pair
(c) It is a negatively charged ion
(d) It is a positively charged ion
15. Which of the following complexes show six coordination number [RPET 2000]
(a) $[Zn(CN)_4]^{2-}$ (b) $[Cr(H_2O)_6]^{3+}$
(c) $[Cu(CN)_4]^{2-}$ (d) $[Ni(NH_3)_4]^{2+}$
16. The number of ions formed when cuprammonium sulphate is dissolved in water is [KCET 1993]
(a) 1 (b) 2
(c) 4 (d) Zero
17. The coordination number of Cu in complex $[Cu(H_2O)_4]^{++}$ is
(a) 4 (b) 3
(c) 2 (d) 1
18. The primary valence of the metal ion in the co-ordination compound $K_2[Ni(CN)_4]$ is
(a) Four (b) Zero
(c) Two (d) Six
19. The metal which does not form a polynuclear carbonyl is
(a) Mn (b) Co
(c) Cr (d) Fe
20. Which one of the following forms with an excess of CN^- (Cyanide) a complex having coordination number two [AIIMS 2004]
(a) Cu^+ (b) Ag^+
(c) Ni^{2+} (d) Fe^{2+}
21. According to Lewis the ligands are [MP PMT 2002]
(a) Acidic in nature
(b) Basic in nature
(c) Neither acidic nor basic
(d) Some are acidic and others are basic
22. The coordination number of a central metal atom in a complex is determined by [AIEEE 2004]
(a) The number of ligands around a metal ion bonded by sigma and pi-bonds both.
(b) The number around a metal ion bonded by pi-bonds
(c) The number of ligands around a metal ion bonded by sigma bonds
(d) The number of only anionic ligands bonded to the metal ion
23. In the extraction of which of the following, complex ion forms [MP PET 1989]
(a) Cu (b) Ag
(c) Fe (d) Na
24. Potassium ferrocyanide is a [AFMC 2000]
(a) Normal salt (b) Mixed salt
(c) Double salt (d) Complex salt
25. A monodentate ligand has
(a) One co-ordinate site
(b) Two co-ordinate sites
(c) Any number of co-ordinate sites
(d) No capacity to co-ordinate
26. EDTA has coordination number [AFMC 2004]
(a) 3 (b) 4
(c) 5 (d) 6
27. Among the properties (a) reducing (b) oxidising (c) complexing, the set of properties shown by CN^- ion towards metal species is [AIEEE 2004]
(a) c, a (b) b, c
(c) a, b (d) a, b, c
28. That ion or molecule which forms a complex compound with transitional metal ion is called
(a) Recipient (b) Ligand
(c) Coordinate ion (d) No special name
29. Coordination number of Zn in ZnS (zinc blende) is [Orissa JEE 2004]
(a) 6 (b) 4
(c) 8 (d) 12
30. Wilkinson's catalyst used as a homogeneous catalyst in the hydrogenation of alkenes contains
(a) Iron (b) Aluminium
(c) Rhodium (d) Cobalt
31. Given the molecular formula of the hexa coordinated complexes (A) $CoCl_3.6NH_3$ (B) $CoCl_3.5NH_3$ (C) $CoCl_3.4NH_3$. If the number of co-ordinated NH_3 molecules in A, B and C respectively are 6, 5 and 4, the primary valency in (A), (B) and (C) are: [DCE 2003]
(a) 6, 5, 4 (b) 3, 2, 1

- (c) 0, 1, 2 (d) 3, 3, 3
32. Generally, a group of atoms can function as a ligand if [MP PET 1996]
 (a) They are positively charged ions
 (b) They are free radicals
 (c) They are either neutral molecules or negatively charged ions
 (d) None of these
33. The ligand in potassium ferricyanide is
 (a) K^+ (b) CN^-
 (c) Fe^{3+} (d) $(CN)_6$
34. Co-ordination number of aluminum is [MHCET 2004]
 (a) 8 (b) 6
 (c) 12 (d) 4
35. In $K_4Fe(CN)_6$, Fe is in the form of
 (a) An atom (b) An ion
 (c) Cationic complex (d) Anionic complex
36. Which of the following ligands is expected to bidentate [CBSE PMT 1994]
 (a) Br (b) $C_2O_4^{2-}$
 (c) CH_3NH_2 (d) $CH_3C \equiv N$
37. In the compound lithium tetrahydroaluminate, the ligand is [AIIMS 1997]
 (a) H^+ (b) H^-
 (c) H (d) None of these
38. Which of the following is the odd one out [MP PET 1996]
 (a) Potassium ferrocyanide
 (b) Ferrous ammonium sulphate
 (c) Potassium ferricyanide
 (d) Tetrammine copper (II) sulphate
39. The basic ligand is
 (a) NH_3 (b) CN^-
 (c) F^- (d) All
40. The negative ligand is
 (a) Aqua (b) Sulphato
 (c) Carboxyl (d) Nitro sodium
41. Which has yellow colour
 (a) Potassium cobaltinitrite
 (b) Potassium hexanitro cobaltate (III)
 (c) Fischer's salt
 (d) All the above
42. Ligands, in complex compounds [MP PMT 2003]
 (a) Accept e^- -pair
 (b) Donate e^- -pair
 (c) Neither accept e^- -pair nor donate
 (d) All of these happen
43. Which of the following is a common donor atom in ligands [BHU 2001]
 (a) Arsenic (b) Nitrogen
 (c) Oxygen (d) Both (b) and (c)
44. Trunbull's blue is a compound [KCET 1993]
 (a) Ferricyanide (b) Ferrous ferricyanide
- (c) Ferrous cyanide (d) Ferriferrocyanide
45. Tollen's reagent is [KCET 1990]
 (a) $[Ag(NH_3)_2]^+$ (b) Ag_2O
 (c) $[Cu(OH)_4]^{2-}$ (d) Cu_2O
46. Finely divided iron combines with CO to give [UPSEAT 2002]
 (a) $Fe(CO)_5$ (b) $Fe_2(CO)_9$
 (c) $Fe_2(CO)_{12}$ (d) $Fe(CO)_6$
47. In a complex, the highest possible coordination number is
 (a) 6 (b) 12
 (c) 4 (d) 8
48. The number of neutral molecules or negative groups attached to the central metal atom in a complex ion is called
 (a) Atomic number (b) Effective atomic number
 (c) Coordination number (d) Primary valency
49. EDTA combines with cations to form
 (a) Ion-exchange resins (b) Chelates
 (c) Clathrates (d) Polymers
50. An example of a double salt is [MP PET 2001]
 (a) Bleaching powder (b) Hypo
 (c) $K_4[Fe(CN)_6]$ (d) Potash alum
51. In complex compounds, metal ligand bond is
 (a) Coordinate bond (b) Hydrogen bond
 (c) Ionic bond (d) Covalent bond
52. Ammonia forms the complex ion $[Cu(NH_3)_4]^{2+}$ with copper ions in alkaline solutions but not in acidic solution. What is the reason for it [AIIEEE 2003]
 (a) In acidic solutions hydration protects copper ions
 (b) In acidic solutions protons coordinate with ammonia molecules forming NH_4^+ ions and NH_3 molecules are not available
 (c) In alkaline solutions insoluble $Cu(OH)_2$ is precipitated which is soluble in excess of any alkali
 (d) Copper hydroxide is an amphoteric substance
53. Zeigler-Natta catalyst is used for which type of reaction
 (a) Hydrogenation (b) Polymerization
 (c) Oxidation (d) Reduction
54. Which of the following is not considered as an organometallic compound. [AIIMS 2004]
 (a) Cis-platina (b) Ferrocene
 (c) Zeise's salt (d) Grignard reagent
55. Which one is organometallic compound [MP PMT 2004]
 (a) Lithium methoxide (b) Lithium dimethyl amide
 (c) Lithium acetate (d) Methyl lithium
56. An aqueous solution of potash alum gives [UPSEAT 2004]
 (a) Two types of ions (b) Only one type of ion
 (c) Four types of ions (d) Three types of ions
57. Carnallite in solution in H_2O , shows the properties of [DCE 2003]
 (a) K^+, Mg^{2+}, Cl^- (b) $K^+, Cl^-, SO_4^{2-}, Br^-$
 (c) K^+, Mg^{2+}, CO_3^{2-} (d) K^+, Mg^{2+}, Cl^-, Br^-

58. What is the co-ordination number of cobalt in $\text{Co}(\text{NH}_3)_3\text{Cl}_3$ [MP PET 1994]
 (a) 3 (b) 4
 (c) 5 (d) 6
59. The formula of alum is [Pb. CET 2002]
 (a) $\text{K}_2\text{SO}_4 \cdot \text{Al}_2(\text{SO}_4)_3 \cdot 24\text{H}_2\text{O}$
 (b) $\text{K}_4[\text{Fe}(\text{CN})_6]$
 (c) $\text{K}_2\text{SO}_4 \cdot \text{Al}_2(\text{SO}_4)_3 \cdot 6\text{H}_2\text{O}$
 (d) $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$
60. Number of ions present in $\text{K}_4[\text{Fe}(\text{CN})_6]$ [Pb. CET 2000]
 (a) 2 (b) 10
 (c) 3 (d) 5
61. CH_3MgI is an organometallic compound due to [DCE 2002]
 (a) $\text{Mg}-\text{I}$ bond (b) $\text{C}-\text{I}$ bond
 (c) $\text{C}-\text{Mg}$ bond (d) $\text{C}-\text{H}$ bond
62. What is the EAN of nickel in $\text{Ni}(\text{CO})_4$ [BVP 2003]
 (a) 34 (b) 35
 (c) 32 (d) 36

Nomenclature, Oxidation state and EAN number

1. How many ions are produced in aqueous solution of $[\text{Co}(\text{H}_2\text{O})_6]\text{Cl}_2$ [RPMT 2002]
 (a) 2 (b) 3
 (c) 4 (d) 6
2. IUPAC name of $[\text{Pt}(\text{NH}_3)_3(\text{Br})(\text{NO}_2)\text{Cl}]\text{Cl}$ is [CBSE PMT 1998]
 (a) Triamminechlorobromonitroplatinum (IV) chloride
 (b) Triamminebromonitrochloroplatinum (IV) chloride
 (c) Triamminebromochloronitroplatinum (IV) chloride
 (d) Triamminenitrochlorobromoplatinum (IV) chloride
3. Oxidation state of nitrogen is incorrectly given for [UPSEAT 2000, 01]
- | Compound | Oxidation state |
|--|-----------------|
| (a) $[\text{Co}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2$ | 0 |
| (b) NH_2OH | -1 |
| (c) $(\text{N}_2\text{H}_5)_2\text{SO}_4$ | +2 |
| (d) Mg_3N_2 | -3 |
4. The formula of dichloro bis (urea) copper (II) is [CBSE PMT 1997]
 (a) $[\text{Cu}\{\text{O}=\text{C}(\text{NH}_2)_2\}\text{Cl}_2]$
 (b) $[\text{CuCl}_2\{\text{O}=\text{C}(\text{NH}_2)_2\}_2]$
 (c) $[\text{Cu}\{\text{O}=\text{C}(\text{NH}_2)_2\}\text{Cl}]\text{Cl}$
 (d) $[\text{CuCl}_2]\{\text{O}=\text{C}(\text{NH}_2)_2\text{H}_2\}$
5. The IUPAC name of the complex $[\text{Pt}(\text{NH}_3)_2\text{Cl}_2]$ is
 (a) Platinum (II) diammino dichloride
 (b) Diammino dichloro platinate (IV)
 (c) Bis (ammino) dichloro platinum (IV)
 (d) Dichloro diammine platinum (II)
6. Correct formula of diammine silver (I) chloride is
 (a) $\text{Ag}(\text{NH}_3)\text{Cl}$ (b) $\text{Ag}(\text{NH}_2)\text{Cl}$
 (c) $[\text{Ag}(\text{NH}_3)_2]\text{Cl}$ (d) $[\text{Ag}(\text{NH}_2)_2]\text{Cl}$
7. The formula of sodium nitroprusside is [AIIMS 1992]
 (a) $\text{Na}_4[\text{Fe}(\text{CN})_5\text{NOS}]$ (b) $\text{Na}_2[\text{Fe}(\text{CN})_5\text{NO}]$
 (c) $\text{NaFe}[\text{Fe}(\text{CN})_6]$ (d) $\text{Na}_2[\text{Fe}(\text{CN})_6\text{NO}_2]$
8. The correct name of $[\text{Pt}(\text{NH}_3)_4\text{Cl}_2][\text{PtCl}_4]$ is [MP PET 2003]
 (a) Tetraammine dichloro platinum (iv) tetrachloro platinate (ii)
 (b) Dichloro tetra ammine platinum (iv) tetrachloro platinate (ii)
 (c) Tetrachloro platinum (ii) tetraammine platinate (iv)
 (d) Tetrachloro platinum (ii) dichloro tetraammine platinate (iv)
9. Correct formula of potassium ferrocyanide is [CBSE PMT 1988]
 (a) $\text{K}_4[\text{Fe}(\text{CN})_6]$ (b) $\text{K}_2[\text{Fe}(\text{CN})_6]\text{H}_2\text{O}$
 (c) $\text{K}_3[\text{Fe}(\text{CN})_6]$ (d) None of these
10. The IUPAC name of $[\text{Co}(\text{NH}_3)_3(\text{NO}_2)_3]$ is
 (a) Trinitrotriammine cobalt (III)
 (b) Trinitrotriammine cobalt (II)
 (c) Trinitrotriammine cobalt (III) ion
 (d) Trinitritriammine cobaltate (III)
11. In $\text{K}_4[\text{Fe}(\text{CN})_6]$ the E.A.N. of Fe is [DCE 2000]
 (a) 33 (b) 35
 (c) 36 (d) 26
12. Which of the following pairs is not correctly matched [MP PET 1993]
 (a) Effective atomic number of Pt in $[\text{PtCl}_6]^{2-} = 84$
 (b) Absorption peak for $[\text{Cr}^{\text{III}}(\text{NH}_3)_6]^{+3} = 21680\text{cm}^{-1}$
 (c) Crystal field stabilization energy of d^2 in weak ligand field $= (-0.8\Delta_0)$
 (d) Example of weak ligand field for d^5 configuration $= [\text{Mn}^{\text{II}}\text{F}_6]^{-4}$
13. The oxidation number of chromium in sodium tetrafluoro oxochromate complex is
 (a) II (b) IV
 (c) VI (d) III
14. The IUPAC name of $\text{K}_4[\text{Fe}(\text{CN})_6]$ is [CBSE PMT 1990; MP PET 1992; MP PMT 1995, 97; Kurukshetra CET 2002]
 (a) Potassium hexacyanoferrate (II)
 (b) Potassium ferrocyanide
 (c) Tetrapotassium hexacyanoferrate (II)
 (d) Tetrapotassium ferrous hexacyanide (II)

15. The IUPAC name of $[Ni(CO)_4]$ is [RPET 1999]
 (a) Tetra carbonyl nickel (II)
 (b) Tetra carbonyl nickel (0)
 (c) Tetra carbonyl nickelate (II)
 (d) Tetra carbonyl nickelate (0)
16. The correct nomenclature for $Fe_4[Fe(CN)_6]_3$ is [MP PMT 1994]
 (a) Ferroso-ferric cyanide
 (b) Ferric-ferrous hexacyanate
 (c) Iron (III) hexacyanoferrate (II)
 (d) Hexacyanoferrate (III-II)
17. The IUPAC name of compound $Na_3[Co(ONO)_6]$ will be [MP PMT 2000]
 (a) Hexanitritocobalt (III) sodium
 (b) Sodium cobalt nitrite
 (c) Sodium hexanitrocobaltate (III)
 (d) Sodium hexanitritocobaltate (III)
18. In which of the following complexes oxidation state of metal is zero [MP PET 1997]
 (a) $[Pt(NH_3)_2Cl_2]$ (b) $[Cr(CO)_6]$
 (c) $[Cr(NH_3)_3Cl_3]$ (d) $[Cr(en)_2Cl_2]$
19. The oxidation number of Cr in $[Cr(NH_3)_6]Cl_3$ is [CBSE PMT 2001]
 (a) 8 (b) 6
 (c) 4 (d) 3
20. In $[Ni(NH_3)_4]SO_4$, the E.A.N. of Ni is
 (a) 34 (b) 35
 (c) 36 (d) 37
21. IUPAC name of $[Co(ONO)(NH_3)_5Cl_2]$ is [AMU 2002]
 (a) Pentaammine nitro cobalt (III) chloride
 (b) Pentaammine nitrito cobalt (III) chloride
 (c) Pentaammine nitroso cobalt (III) chloride
 (d) Pentaammine oxo-nitro cobalt (III) chloride
22. The oxidation number of Pt in $[Pt(C_2H_4)Cl_3]^-$ is [MNR 1993]
 (a) +1 (b) +2
 (c) +3 (d) +4
23. The oxidation state of cobalt in the complex compound $[Co(NH_3)_6]Cl_3$ is
 (a) +3 (b) +6
 (c) +5 (d) +2
24. The correct IUPAC name of potassium cuprochloride is
 (a) Potassium copper (I) tetrachloride
 (b) Potassium tetrachlorocuprate (I)
 (c) Tetrachloropotassium cuprate (I)
 (d) Tetrachlorocopper (I) potassiate
25. The effective atomic number of cobalt in the complex $[Co(NH_3)_6]^{3+}$ is [MP PET 2003]
 (a) 36 (b) 33
 (c) 24 (d) 30
26. IUPAC name of $K_3Fe(CN)_6$ is
 (a) Potassium ferrocyanide (II)
 (b) Potassium hexaferrocyanate (III)
 (c) Potassium ferrohexacyanate (II)
 (d) Potassium hexacyanoferrate (III)
27. The EAN of iron in potassium ferricyanide is [Ph. CET 2000]
 (a) 18 (b) 54
 (c) 35 (d) 23
28. In the coordination compound, $K_4[Ni(CN)_4]$ oxidation state of nickel is [AIIEEE 2003]
 (a) -1 (b) 0
 (c) +1 (d) +2
29. According to IUPAC nomenclature sodium nitroprussied is named is [CBSE PMT 2003]
 (a) Sodium pentacyanonitrosyl ferrate (III)
 (b) Sodium nitroferriyanide
 (c) Sodium nitroferrocyanide
 (d) Sodium pentacyanonitrosyl ferrate (II)
30. Pick out the complex compound in which the central metal atom obeys EAN rule strictly [KCET 2003]
 (a) $K_4[Fe(CN)_6]$ (b) $K_3[Fe(CN)_6]$
 (c) $[Cr(H_2O)_6]Cl_3$ (d) $[Cu(NH_3)_4]SO_4$
31. Which of the following is wrong statement [BHU 2003]
 (a) $Ni(CO)_4$ has oxidation number + 4 for Ni
 (b) $Ni(CO)_4$ has zero oxidation number for Ni
 (c) Ni is metal
 (d) CO is gas
32. Oxidation state of Fe in $K_3[Fe(CN)_6]$ [RPMT 2002]
 (a) 2 (b) 3
 (c) 0 (d) None of these
33. Which complexes have zero oxidation state
 (a) Carbonyl (b) Ferrocyanide
 (c) Amine (d) Cyanide
34. The proper name for $K_2[PtCl_6]$ is [MH CET 2002]
 (a) Potassium platinum hexachloride
 (b) Potassium hexachloro platinum IV
 (c) Potassium hexachloro platinate IV
 (d) Potassium hexachloro platinum
35. IUPAC name of $K_3[Al(C_2O_4)_3]$ is called [MP PMT 1993, 02, 03]
 (a) Potassium alumino oxalato
 (b) Potassium aluminium (III) trioxalate
 (c) Potassium trioxalato aluminate (III)
 (d) Potassium trioxalato aluminate (IV)
36. The I.U.P.A.C. name of $K_3[Ir(C_2O_4)_3]$ is [MP PMT 2001]
 (a) Potassium tri oxalato iridium (III)
 (b) Potassium tri oxalato iridate (III)
 (c) Potassium tris (oxalato) iridium (III)
 (d) Potassium tris (oxalato) iridate (III)
37. The charge on $[Ag(CN)_2]^-$ complex is [AIIMS 2001]
 (a) -1 (b) +1
 (c) +2 (d) +3

38. The IUPAC name of $[Co(NH_3)_6]Cl_3$ is [IIT-JEE 1994]
 (a) Hexammine cobalt (III) chloride
 (b) Hexammine cobalt (II) chloride
 (c) Triammine cobalt (III) trichloride
 (d) None of these
39. IUPAC name of $[Co(NH_3)_3(H_2O)_2Cl]Cl_2$ is [MP PET 1994]
 (a) Diaquachlorodiammine cobalt (III) chloride
 (b) Triamminediaquachloro cobalt (III) chloride
 (c) Chlorodiamminediaqua cobalt (III) chloride
 (d) Diamminediaquachloro cobalt (II) chloride
40. Dichloro diammine platinum (II) complex has the formula [MP PMT 1997]
 (a) $PtCl_2(NH_3)_2$ (b) $Pt(R.(NH_3)_2)Cl_2$
 (c) $[PtCl_2(NH_3)_2]$ (d) $[Pt.R.(NH_3)_2]Cl_2$
41. The formula of potassiumdicyano bis (oxalato) nickelate (II) is
 (a) $K_4[Ni(CN)_2(Ox)_2]$ (b) $K_3[Ni_2(CN)_2(Ox)_2]$
 (c) $K[Ni(CN)(Ox)_2]$ (d) $K_2[Ni(CN)_2(Ox)_2]$
42. The value of x which appears in the complex $[Ni(CN)_4]^x$ is
 (a) +2 (b) -2
 (c) 0 (d) 4
43. Pick the correct name of $[Co(NH_3)_5Cl]Cl_2$ [AMU 2001]
 (a) Chloropentammine cobalt (III)
 (b) Pentammine cobalt (III) chloride
 (c) Chloropentammine cobalt (III) chloride
 (d) Chloropentammine cobalt (II) chloride
44. The valency of cuprammonium ion is
 (a) +4 (b) +2
 (c) -2 (d) -4
45. In which of the following compounds transition metal has zero oxidation state [CBSE PMT 1999]
 (a) CrO_5 (b) $NH_2.NH_2$
 (c) $NOClO_4$ (d) $[Fe(CO)_5]$
46. The complex chlorocompound diaquatrammine cobalt (III) chloride is represented as [CBSE PMT 2002]
 (a) $[Co(NH_3)_3(H_2O)_3]Cl_2$
 (b) $[Co(NH_2)_3(H_2O)_2]Cl_2$
 (c) $[CoCl(NH_3)_3(H_2O)_2]Cl_3$
 (d) $[CoCl(NH_3)_3(H_2O)_2]Cl_2$
47. The complex compound $[Co(NH_3)_3NO_2ClCN]$ is named as [MP PMT 1996]
 (a) Chlorocyanonitrotriammine cobalt (III)
 (b) Nitrochlorocyanotriammine cobalt (III)
 (c) Cyanonitrochlorotriammine cobalt (III)
 (d) Triamminenitrochlorocyano cobalt (III)
48. The oxidation number of Pt in $[Pt(C_2H_4)Cl_3]^-$ is [UPSEAT 1999, 01]
 (a) +1 (b) +2
 (c) +3 (d) +4
49. What is the structural formula of lithium tetrahydridoaluminate [MP PMT 2003]
 (a) $Al[LiH_4]$ (b) $Al_2[LiH_4]_3$
 (c) $Li[AlH_4]$ (d) $Li[AlH_4]_2$
50. IUPAC name for $K[Ag(CN)_2]$ is
 (a) Potassium argentocyanide
 (b) Potassium silver cyanide
 (c) Potassium dicyanoargentate (I)
 (d) Potassium dicyanosilver (II)
51. The oxidation state of Co in $[Co(H_2O)_5Cl]^{2+}$ is
 (a) +2 (b) +3
 (c) +1 (d) +4
52. The chemical formula of diammine silver (I) chloride is [BHU 2004]
 (a) $[Ag(NH_3)]Cl$ (b) $[Ag(NH_3)_2]Cl$
 (c) $[Ag(NH_3)_2]Cl$ (d) $[Ag(NH_4)_2]Cl$
53. IUPAC name of $[Co(NH_3)_5NO_2]Cl_2$ [Ph. CET 2000]
 (a) Pentamminenitrocobalt (III) chloride
 (b) Pentamminenitrosocobalt (III) chloride
 (c) Pentamminenitrocobalt (II) chloride
 (d) None of these
54. The pair of the compounds in which both the metals are in the highest possible oxidation state is [IIT-JEE (Screening) 2004]
 (a) $[Fe(CN)_6]^{3-}, [Co(CN)_6]^{3-}$
 (b) CrO_2Cl_2, MnO_4^-
 (c) TiO_3, MnO_2
 (d) $[Co(CN)_6]^{3-}, MnO_3$
55. The IUPAC name of $[Cr(NH_3)_6]^{3+}$ is [Ph. CET 2001]
 (a) Hexamminechromium (VI) ion
 (b) Hexamminechromium (III) ion
 (c) Hexamminechromium (II) ion
 (d) Hexamminechloride
56. The IUPAC name of $K_2[Cr(CN)_2O_2(O)_2(NH_3)]$ is [DCE 2003]
 (a) Potassium ammine dicyano dioxoperoxochromate (VI)
 (b) Potassium ammine cyano peroxo dioxo chromium (VI)
 (c) Potassium ammine cyano peroxo dioxo chromium (VI)
 (d) Potassium ammine cyano peroxo dioxo chromatic (IV)
57. The IUPAC name of the coordination compound $K_3[Fe(CN)_6]$ is [AIEEE 2005]
 (a) Potassium hexacyanoferrate (II)
 (b) Potassium hexacyanoferrate (III)
 (c) Potassium hexacyanoiron (II)
 (d) Tripotassium hexacyanoiron (II)
58. Which compound is zero valent metal complex [KCET 2005]
 (a) $[Cu(NH_3)_4]SO_4$ (b) $[Pt(NH_3)_2Cl_2]$

**Isomerism and magnetic properties**

- Which one of the following octahedral complexes will not show geometric isomerism (A and B are monodentate ligands) **[CBSE PMT 2003]**
 (a) $[MA_5B]$ (b) $[MA_2B_4]$
 (c) $[MA_3B_3]$ (d) $[MA_4B_2]$
- The number of unpaired electrons in the complex ion $[CoF_6]^{3-}$ is (Atomic no. of Co = 27) **[CBSE PMT 2003]**
 (a) Zero (b) 2
 (c) 3 (d) 4
- Which would exhibit co-ordination isomerism
 (a) $[Cr(NH_3)_6][Co(CN)_6]$ (b) $[Co(en)_2Cl_2]$
 (c) $[Cr(NH_3)_6]Cl_3$ (d) $[Cr(en)_2Cl_2]^+$
- $[Co(NH_3)_5NO_2]Cl_2$ and $[Co(NH_3)_5(ONO)]Cl_2$ are related to each other as
 (a) Geometrical isomers (b) Optical isomers
 (c) Linkage isomers (d) Coordination isomers
- $[Co(NH_3)_5Br]SO_4$ and $[Co(NH_3)_5SO_4]Br$ are examples of which type of isomerism **[MP PMT 1993, 94, 95; MP PET 1997; MP PET/PMT 1998]**
 (a) Linkage (b) Geometrical
 (c) Ionization (d) Optical
- $[Co(NH_3)_4Cl_2]NO_2$ and $[Co(NH_3)_4Cl.NO_2]Cl$ are isomers **[MP PMT 1993; MP PET 1995, 2001]**
 (a) Geometrical (b) Optical
 (c) Linkage (d) Ionization
- Which would exhibit ionisation isomerism **[MP PET 1997]**
 (a) $[Cr(NH_3)_6]Cl_3$ (b) $[Co(NH_3)_5Br]SO_4$
 (c) $[Cr(en)_2Cl_2]$ (d) $[Cr(en)_3Cl_3]$
- $[Ti(H_2O)_6]^{+3}$ is paramagnetic in nature due to **[RPMT 2002]**
 (a) One unpaired e^- (b) Two unpaired e^-
 (c) Three unpaired e^- (d) No unpaired e^-
- Coordination isomerism is caused by the interchange of ligands between the **[UPSEAT 2002]**
 (a) *Cis* and *Trans* structure
 (b) Complex cation and complex anion
 (c) Inner sphere and outer sphere
 (d) Low oxidation and higher oxidation states
- Which one of the following will not show geometrical isomerism **[MP PMT 2002]**
 (a) $[Cr(NH_3)_4Cl_2]Cl$ (b) $[Co(en)_2Cl_2]Cl$
 (c) $[Co(NH_3)_5NO_2]Cl_2$ (d) $[Pt(NH_3)_2Cl_2]$
- Paramagnetic co-ordination compounds contain electrons
 (a) No
 (b) Both paired and unpaired
 (c) Paired
 (d) Unpaired
- Which of the following isomeric pairs shows ionization isomerism **[MP PET 1993]**
 (a) $[Co(NH_3)_6][Cr(CN)_6]$ and $[Cr(NH_3)_6][Co(CN)_6]$
 (b) $[Cr(H_2O)_6]Cl_3$ and $[Cr(H_2O)_5Cl]Cl_2 \cdot H_2O$
 (c) $[Pt(NH_3)_2Cl_2]$ and $[Pt(NH_3)_4][PtCl_4]$
 (d) $[Co(NH_3)_5Br]SO_4$ and $[Co(NH_3)_5SO_4]Br$
- Among the following ions which one has the highest paramagnetism **[IIT 1993; UPSEAT 2002]**
 (a) $[Cr(H_2O)_6]^{3+}$ (b) $[Fe(H_2O)_6]^{2+}$
 (c) $[Cu(H_2O)_6]^{2+}$ (d) $[Zn(H_2O)_6]^{2+}$
- Amongst $Ni(CO)_4$, $[Ni(CN)_4]^{2-}$ and $[NiCl_4]^{2-}$ **[IIT 1991]**
 (a) $Ni(CO)_4$ and $[NiCl_4]^{2-}$ are diamagnetic and $[Ni(CN)_4]^{2-}$ is paramagnetic
 (b) $[NiCl_4]^{2-}$ and $[Ni(CN)_4]^{2-}$ are diamagnetic and $Ni(CO)_4$ is paramagnetic
 (c) $Ni(CO)_4$ and $[Ni(CN)_4]^{2-}$ are diamagnetic and $[NiCl_4]^{2-}$ is paramagnetic
 (d) $Ni(CO)_4$ is diamagnetic and $[NiCl_4]^{2-}$ and $[Ni(CN)_4]^{2-}$ are paramagnetic
- $[Co(NH_3)_4Cl_2]^+$ exhibits
 (a) Geometrical isomerism (b) Optical isomerism
 (c) Bonding isomerism (d) Ionisation isomerism
- The compound which does not show paramagnetism is **[IIT 1992]**
 (a) $[Cu(NH_3)_4]Cl_2$ (b) $[Ag(NH_3)_2]Cl$
 (c) NO (d) NO_2
- The number of geometrical isomers for $[Pt(NH_3)_2Cl_2]$ is **[CBSE PMT 1995]**
 (a) Two (b) One
 (c) Three (d) Four
- The pair of complex compounds $[Cr(H_2O)_6Cl_3]$ and $[Cr(H_2O)_5Cl]Cl_2 \cdot H_2O$ are an example of **[MP PMT 1997]**
 (a) Linkage isomerism (b) Ionisation isomerism
 (c) Coordination isomerism (d) Hydrate isomerism
- The number of geometrical isomers of the complex $[Co(NO_2)_2(NH_3)_2]$ is **[CBSE PMT 1997]**
 (a) 2 (b) 3
 (c) 4 (d) 0
- The type of isomerism present in nitropentamine chromium (III) chloride is **[AIEEE 2002]**
 (a) Optical (b) Linkage
 (c) Ionization (d) Polymerisation
- Which of the following compounds exhibits linkage isomerism **[MP PMT 2001]**
 (a) $[Co(en)_3]Cl_3$ (b) $[Co(NH_3)_6][Cr(CN)_6]$
 (c) $[Co(en)_2NO_2Cl]Br$ (d) $[Co(NH_3)_5Cl]Br_2$

22. Pick out from the following complex compounds, a poor electrolytic conductor in solution [MP PMT 1994]
 (a) $K_2[PtCl_6]$ (b) $[Co(NH_3)_3(NO_2)_3]$
 (c) $K_4[Fe(CN)_6]$ (d) $[Cu(NH_3)_4]SO_4$
23. The possible number of optical isomers in $[Co(en)_2Cl_2]^+$ are [MP PET 2003]
 (a) 2 (b) 3
 (c) 4 (d) 6
24. Magnetic moment of $[Cu(NH_3)_4]^{2+}$ ion is [RPET 2003]
 (a) 1.414 (b) 1.73
 (c) 2.23 (d) 2.38
25. What is true for $[Fe(CN)_6]^{3-}$ and $[FeF_6]^{3-}$ [RPET 1999]
 (a) Both are paramagnetic
 (b) Only $[Fe(CN)_6]^{3-}$ is paramagnetic
 (c) Only $[FeF_6]^{3-}$ is paramagnetic
 (d) Both are diamagnetic
26. Which of the following is paramagnetic [AFMC 1997]
 (a) $[Ni(CO)_4]$ (b) $[Co(NH_3)_6]^{3+}$
 (c) $[Ni(CN)_4]^{2-}$ (d) $[NiCl_4]^{2-}$
27. The total number of possible isomers for the complex compound $[Cu^{II}(NH_3)_4][Pt^{II}Cl_4]$ are [CBSE PMT 1998; DPMT 2004; J & K CET 2005]
 (a) 3 (b) 4
 (c) 5 (d) 6
28. Which one of the following shows maximum paramagnetic character [AIIMS 1998]
 (a) $[Cr(H_2O)_6]^{3+}$ (b) $[Fe(CN)_6]^{4-}$
 (c) $[Fe(CN)_6]^{3-}$ (d) $[Cu(H_2O)_6]^{2+}$
29. The complexes $[Co(NH_3)_6][Cr(C_2O_4)_3]$ and $[Cr(NH_3)_6][Co(C_2O_4)_3]$ [AMU 2002]
 (a) Linkage isomerism (b) Geometrical isomerism
 (c) Coordination isomerism (d) Ionisation isomerism
30. Which of the following exhibits highest molar conductivity [MP PET 1994]
 (a) $[Co(NH_3)_6]Cl_3$ (b) $[Co(NH_3)_5Cl]Cl_2$
 (c) $[Co(NH_3)_4Cl_2]Cl$ (d) $[Co(NH_3)_3Cl_3]$
31. Which of the following compounds is colourless [MP PET 1994]
 (a) $Cu_2(CH_3COO)_4 \cdot 2H_2O$ (b) Cu_2Cl_2
 (c) $CuSO_4 \cdot 5H_2O$ (d) $[Cu(NH_3)_4]SO_4 \cdot 4H_2O$
32. The type of magnetism exhibited by $[Mn(H_2O)_6]^{2+}$ ion is [IIT 1994]
 (a) Paramagnetism (b) Diamagnetism
 (c) Both (a) and (b) (d) None of these
33. The number of isomers possible for square planar complex $K_2[PdClBr_2(SCN)]$ is [MP PET 1994]
 (a) 2 (b) 3
 (c) 4 (d) 6
34. The number of unpaired electrons in $Ni(CO)_4$ is [AIIMS 1997]
 (a) Zero (b) One
 (c) Three (d) Five
35. If the magnetic moment of $[Ag(CN)_2]^{-1}$ is zero, then the number of unpaired electrons will be [MP PET 1995]
 (a) 1 (b) 2
 (c) 3 (d) Zero
36. $[Pt(NH_3)_4Cl_2]Br_2$ and $[Pt(NH_3)_4Br_2]Cl_2$ are related to each other as [MP PET 1996; AFMC 2000; CBSE PMT 2001]
 (a) Optical isomers (b) Coordinate isomers
 (c) Ionization isomers (d) Linkage isomers
37. Which of the following complex will show geometrical as well as optical isomerism (*en* = ethylene diamine) [KCET 1996]
 (a) $Pt(NH_3)_2Cl_2$ (b) $[Pt(NH_3)Cl_4]$
 (c) $[Pt(en)_3]^{4+}$ (d) $[Pt(en)_2]Cl_2$
38. Which of the following complexes is diamagnetic [RPMT 1997]
 (a) $Ni(CO)_4$ (b) $NiCl_4^{2-}$
 (c) $Ni(Br)_4^{2-}$ (d) $NiCl_2 \cdot 4H_2O$
39. Which one has the highest paramagnetism [AMU 2001]
 (a) $Ni(CO)_4$ (b) $[Ni(NH_3)_4]Cl_2$
 (c) $[Ni(NH_3)_6]Cl_2$ (d) $[Cu(NH_3)_4]Cl_2$
40. Which of the following coordination compounds would exhibit optical isomerism [CBSE PMT 2004]
 (a) *trans*-dicyanobis (ethylenediamine) chromium (III) chloride
 (b) *tris*-(ethylenediamine) cobalt (III) bromide
 (c) pentaamminenitrocobalt (III) iodide
 (d) diamminedichloroplatinum (II)
41. Which of the following does not have optical isomer [AIIMS 2004]
 (a) $[Co(NH_3)_3Cl_3]$
 (b) $[Co(en)_3]Cl_3$
 (c) $[Co(en)_2Cl_2]Cl$ (d) $[Co(en)(NH_3)_2Cl_2]Cl$
42. Change in composition of co-ordination sphere yields which types of isomers [DCE 2002]
 (a) Optical (b) Geometrical
 (c) Ionisation (d) None of these
43. Types of isomerism shown by $[Cr(NH_3)_5NO_2]Cl_2$ is
 (a) Optical (b) Ionisation
 (c) Geometrical (d) Linkage
44. Which of the following will not give a precipitate with $AgNO_3$ [MP PET 2003]
 (a) $[Co(NH_3)_3Cl_3]$ (b) $[Co(NH_3)_4Cl_2]Cl$
 (c) $[Co(NH_3)_5Cl]Cl_2$ (d) $[Co(NH_3)_6]Cl_3$

45. How many ions are produced from $[Co(NH_3)_6]Cl_3$ in solution [RPET 1999]
 (a) 6 (b) 4
 (c) 3 (d) 2
46. The colour of $CoCl_3 \cdot 5NH_3 \cdot H_2O$ is [Kerala (Med.) 2002]
 (a) Orange yellow (b) Orange
 (c) Green (d) Violet
 (e) Pink
47. Which one of the following is expected to be a paramagnetic complex [MP PMT 1991, 2000]
 (a) $[Ni(H_2O)_6]^{2+}$ (b) $[Ni(CO)_4]$
 (c) $[Zn(NH_3)_4]^{2+}$ (d) $[Co(NH_3)_6]^{3+}$
48. Which one of the following will give a white precipitate with $AgNO_3$ in aqueous medium [MP PMT 1994]
 (a) $[Co(NH_3)_5Cl](NO_2)_2$ (b) $[Pt(NH_3)_2Cl_2]$
 (c) $[Pt(en)Cl_2]$ (d) $[Pt(NH_3)_4]Cl_2$
49. How many ions will be produced in solution from one molecule of chloropentammine cobalt (III) chloride
 (a) 1 (b) 2
 (c) 3 (d) 4
50. Which of the following complex will give white precipitate with $BaCl_2$ (aq.) [JIPMER 1997]
 (a) $[Co(NH_3)_4SO_4]NO_2$ (b) $[Cr(NH_3)_5SO_4]Cl$
 (c) $[Cr(NH_3)_5Cl]SO_4$ (d) Both (b) and (c)
51. The number of precipitable halide ions in the sample $[Pt(NH_3)Cl_2Br]Cl$ will be
 (a) 2 (b) 3
 (c) 4 (d) 1
52. The colour of tetrammine copper (II) sulphate is
 (a) Blue (b) Red
 (c) Violet (d) Green
53. The number of ions per mole of a complex $[CoCl_2 \cdot 5NH_3]Cl_2$ in aqueous solution will be [MP PMT 2001]
 (a) Nine (b) Four
 (c) Three (d) Two
54. How many unpaired electrons are present in the central metal ion of $[CoCl_4]^{2-}$ [Orissa JEE 2005]
 (a) 3 (b) 4
 (c) 5 (d) 2
55. What is the magnetic moment of $K_3[FeF_6]$ [Orissa JEE 2005]
 (a) 5.91 BM (b) 4.89 BM
 (c) 3.87 BM (d) 6.92 BM
56. (i) $K_4[Fe(CN)_6]$ (ii) $K_3[Cr(CN)_6]$ (iii) $K_3[Fe(CN)_6]$
 (iv) $K_2[Ni(CN)_4]$
 Choose the complex which is paramagnetic [Kerala CET 2005]
 (a) (i), (ii) and (iii) (b) (i), (iii) and (iv)
 (c) (i), (iii) and (iv) (d) (i), (ii) and (iv)
 (e) (ii) and (iv)
57. In coordination compound $[Co(en)_2Cl_2]Cl$ which is false [Kerala CET 2005]
 (a) Show geometrical Isomerism

- (b) Show optical Isomerism
 (c) Show ionic Isomerism
 (d) A octahedral complex
 (e) A cationic complex

Hybridisation and Geometry

1. The correct structural formula of *zeise's salt* is
 (a) $K^+[PtCl_3 - \eta^2 - (C_2H_4)]^-$
 (b) $K_2[PtCl_3 - \eta^2 - C_2H_4]$
 (c) $K^+[PtCl_2 - \eta^2 - (C_2H_4)]Cl^-$
 (d) $K^+[PtCl_3(C_2H_4)]^-$
2. The correct order of hybridisations of central atom in NH_3 , $[PtCl_4]^{2-}$, PCl_5 and BCl_3 is [MP PMT 2003]
 (a) dsp^2, dsp^3, sp^2 and sp^3
 (b) sp^3, sp^3, sp^3d and sp^2
 (c) dsp^2, sp^2, sp^3 and dsp^3
 (d) dsp^2, sp^3, sp^2 and dsp^3
3. One mole of the complex compound $Co(NH_3)_5Cl_3$, gives 3 moles of ions on dissolution in water. One mole of the same complex reacts with two moles of $AgNO_3$ solution to yield two moles of $AgCl(s)$. The structure of the complex is [AIIEE 2003]
 (a) $[Co(NH_3)_5Cl]Cl_2$
 (b) $[Co(NH_3)_3Cl_3] \cdot 2NH_3$
 (c) $[Co(NH_3)_4Cl_2]Cl \cdot NH_3$
 (d) $[Co(NH_3)_4Cl]Cl_2 \cdot NH_3$
4. Cuprammonium ion $[Cu(NH_3)_4]^{2+}$ is [MP PMT 1997; KCET 2002]
 (a) Tetrahedral (b) Square planar
 (c) Triangular bipyramid (d) Octahedral
5. In the complex $[SbF_5]^{2-}$, sp^3d hybridisation is present. Geometry of the complex is [Pb. PMT 2000]
 (a) Square pyramidal (b) Square bipyramidal
 (c) Tetrahedral (d) Square
6. The type of hybridization involved in the metal ion of $[Ni(H_2O)_6]^{2+}$ complex is
 (a) d^3sp^2 (b) sp^3d^2
 (c) sp^3 (d) dsp^2
7. In the formation of $K_4Fe(CN)_6$, the hybridisation involved is
 (a) sp^2 (b) d^2sp^3
 (c) d^3sp^2 (d) d^4p
8. Which of the following is not true for metal carbonyls [MP PET 1993]
 (a) The oxidation state of the metal in the carbonyls is zero
 (b) The secondary carbonyls are obtained from photo-decomposition

- (c) Metal carbonyls are single bonded species
(d) $d\pi - p\pi$ overlap is observed in metal carbonyls
9. An octahedral complex is formed, when hybrid orbitals of the following type are involved [DCE 2003]
(a) sp^3 (b) dsp^2
(c) sp^3d^2 (d) sp^2d
10. Which one is an example of octahedral complex [MP PET 2000]
(a) FeF_6^{3-} (b) $Zn(NH_3)_4^{2+}$
(c) $Ni(CN)_4^{2-}$ (d) $Cu(NH_3)_4^{2+}$
11. Which of the following complexes has a square planar geometry
(a) $Ag(NH_3)_2^+$ (b) $Cu(en)_2^{2+}$
(c) $[MnCl_4]^{2-}$ (d) $Ni(CO)_4$
12. The shape of $[Fe(CN)_6]^{4-}$ ion is
(a) Hexagonal (b) Pyramidal
(c) Octahedral (d) Octagonal
13. What is the shape of $Fe(CO)_5$ [CBSE PMT 2000]
(a) Linear (b) Tetrahedral
(c) Square planar (d) Trigonal bipyramidal
14. What type of hybridization is involved in $[Fe(CN)_6]^{3-}$ [AMU 1999]
(a) d^2sp^3 (b) dsp^2
(c) sp^3d^2 (d) dsp^3
15. The example of dsp^2 hybridisation is [MP PET 1999; AIIMS 2001]
(a) $Fe(CN)_6^{3-}$ (b) $Ni(CN)_4^{2-}$
(c) $Zn(NH_3)_4^{2+}$ (d) FeF_6^{3-}
16. The shape of $[Cu(NH_3)_4]^{2+}$ is square planar, Cu^{2+} in this complex is [NCERT 1989; RPET 1999]
(a) sp^3 hybridised (b) dsp^2 hybridised
(c) sp^3d hybridised (d) sp^3d^2 hybridised
17. The geometry of $Ni(CO)_4$ and $Ni(PPh_3)_2Cl_2$ are [IIT-JEE 1999; DCE 2002]
(a) Both square planar
(b) Tetrahedral and square planar respectively
(c) Both tetrahedral
(d) Square planar and tetrahedral respectively
18. Which complex has square planar structure [JIPMER 2002]
(a) $Ni(CO)_4$ (b) $[NiCl_4]^{2-}$
(c) $[Ni(H_2O)_6]^{2+}$ (d) $[Cu(NH_3)_4]^{2+}$
19. $[Pt(NH_3)_4]Cl_2$ is [DCE 2001]
(a) Square planar (b) Tetrahedral
(c) Pyramidal (d) Pentagonal
20. A complex involving dsp^2 hybridization has
(a) A square planar geometry
(b) A tetrahedral geometry
(c) An octahedral geometry
(d) Trigonal planar geometry
21. A tetrahedral complex ion is formed due to hybridization
(a) sp^2 (b) sp^3
(c) dsp^2 (d) d^2sp^3
22. Back bonding is involved in which of the organometallic compounds
(a) $[(CH_3)_3Al]_2$ (b) $Mg^{2+}(C_5H_5)_2$
(c) $R-Mg-X$ (d) $[C_5H_5)_2Fe]$
23. d^2sp^3 hybridisation leads to
(a) Hexagonal shape (b) Trigonal bipyramidal
(c) Octahedral shape (d) Tetrahedral shape
24. Chromium hexacarbonyl is an octahedral compound involving
(a) sp^3d^2 (b) dsp^2
(c) d^2sp^3 (d) d^3sp^2 orbitals
25. $[CoF_6]^{3-}$ is formed by hybridization
(a) d^2sp^3 (b) d^3sp^2
(c) d^2sp^3 (d) sp^3d^2
26. The species having tetrahedral shape is [IIT-JEE (Screening) 2004]
(a) $[PdCl_4]^{2-}$ (b) $[Ni(CN)_4]^{2-}$
(c) $[Pd(CN)_4]^{2-}$ (d) $[NiCl_4]^{2-}$
27. Among $[Ni(CO)_4]$, $[Ni(CN)_4]^{2-}$, $[NiCl_4]^{2-}$ species, the hybridization states at the Ni atom are, respectively [CBSE PMT 2004; MP PMT 1992; BHU 1995; AFMC 1997]
(a) sp^3, sp^3, dsp^2 (d) dsp^2, sp^3, sp^3
(c) sp^3, dsp^2, dsp^2 (d) sp^3, dsp^2, sp^3
(At. no. of Ni = 28)
28. The bond in $K_4[Fe(CN)_6]$ are: [MP PET 2004]
(a) All ionic
(b) All covalent
(c) Ionic and covalent
(d) Ionic, covalent and coordinate covalent
29. Hybridization of Fe in $K_3Fe(CN)_6$ is [DCE 2002]
(a) sp^3 (b) dsp^3
(c) sp^3d^2 (d) d^2sp^3
30. The complex ion which has no 'd' electrons in the central metal atom is [IIT-JEE Screening 2001]
(a) $[MnO_4]^-$ (b) $[Co(NH_3)_6]^{3+}$
(c) $[Fe(CN)_6]^{3-}$ (d) $[Cr(H_2O)_6]^{3+}$
31. Which of the following statement is correct
(a) $[Cu(NH_3)_6]^{2+}$ is a colourless ion
(b) $[Zn(H_2O)_6]^{2+}$ ion is blue coloured
(c) $[Ni(CN)_4]^{2-}$ ion has a tetrahedral shape
(d) Nickel dimethyl glyoxides is red in colour
32. Which of the following shall form an octahedral complex [DCE 2001]
(a) d^4 (low spin) (b) d^8 (high spin)
(c) d^6 (low spin) (d) None of these

33. Which one of the following is a strong field ligand
(a) CN^- (b) NO_2^-
(c) en (d) NH_3
34. The strongest ligand in the following is [MP PET 1995]
(a) CN^- (b) Br^-
(c) HO^- (d) F^-
35. The neutral ligand is
(a) Chloro (b) Hydroxo
(c) Ammine (d) Oxalato
36. The ligands which can get attached to the central metal ion through more than one atom are called
(a) Ambident ligands (b) Polydentate ligands
(c) Chelate ligands (d) Neutral ligands
37. A strong ligand gives a complex which is generally called
(a) High spin (b) High energy
(c) Low spin (d) Stable
38. CN^- is a strong field ligand. This is due to the fact that [CBSE PMT 2004]
(a) It can accept electron from metal species
(b) It forms high spin complexes with metal species
(c) It carries negative charge.
(d) It is a pseudohalide
39. Considering H_2O as a weak field ligand, the number of unpaired electrons in $[Mn(H_2O)_6]^{2+}$ will be (At. No. of Mn = 25) as a jkk [CBSE PMT 2004]
(a) Two (b) Four
(c) Three (d) Five
40. Which of the following is a π - complex
(a) Trimethyl aluminium (b) Ferrocene
(c) Diethyl zinc (d) Nickel carbonyl
41. Which of the following is a π - acid ligand [KCET 1996; AIIMS 2003]
(a) NH_3 (b) CO
(c) F^- (d) Ethylene diamine
42. The value of the 'spin only' magnetic moment for one of the following configurations is 2.84 BM. the correct one [AIEEE 2005]
(a) d^4 (in strong ligand field)
(b) d^4 (in weak ligand field)
(c) d^3 (in weak as well as in strong fields)
(d) d^5 (in strong ligand field)
43. The geometry of $Ni(CO)_4$ and $Ni(PPh_3)_2Cl_2$ are [BHU 2005]
(a) Both square planer
(b) Tetrahedral and square planar respectively
(c) Both tetrahedral
(d) Square planar and tetrahedral respectively
2. The most stable ion is [AIEEE 2002]
(a) $[Fe(OH)_3]^{3-}$ (b) $[FeCl_6]^{3-}$
(c) $[Fe(CN)_6]^{3-}$ (d) $[Fe(H_2O)_6]^{3+}$
3. The most stable complex among the following is [MP PMT 2002]
(a) $K_3[Al(C_2O_4)_3]$ (b) $[Pt(en)_2]Cl_2$
(c) $Ag(NH_3)_2Cl$ (d) $K_2[Ni(EDTA)]$
4. Which of the following factors tends to increase the stability of metal ion complexes
(a) Higher ionic radius of the metal ion
(b) Higher charge/size ratio of the metal ion
(c) Lower ionisation potential of the metal ion
(d) Lower basicity of the ligand
5. $CuSO_4$ reacts with KCN solution and forms: [DPMT 2004]
(a) $K_3[Cu(CN)_4]$ (b) $Cu(CN)$
(c) $Cu(CN)_2$ (d) $K_4[Cu(CN)_6]$
6. A co-ordination complex compound of cobalt has the molecular formulae containing five ammonia molecules, one nitro group and two chlorine atoms for one cobalt atom. One mole of this compound produces three mole ions in an aqueous solution on reacting with excess of $AgNO_3$, $AgCl$ precipitate. The ionic formula for this complex would be: [DPMT 2004; Kerala PMT 2004]
(a) $[Co(NH_3)_5(NO_2)]Cl_2$
(b) $[Co(NH_3)_5Cl][Cl(NO_2)]$
(c) $[Co(NH_3)_4(NO_2)Cl][(NH_3)Cl]$
(d) $[Co(NH_3)_5][(NO_2)_2Cl_2]$
7. In any ferric salt, on adding potassium ferrocyanide, a prussian blue colour is obtained, which is [BIT 1992; BHU 2002]
(a) $K_3Fe(CN)_6$ (b) $KFe[Fe(CN)_6]$
(c) $FeSO_4 \cdot Fe(CN)_6$ (d) $Fe_4[Fe(CN)_6]_3$
8. Prussian blue is formed when [CBSE PMT 1990]
(a) Ferrous sulphate reacts with $FeCl_3$
(b) Ferric sulphate reacts with $K_4[Fe(CN)_6]$
(c) Ferrous ammonium sulphate reacts with $FeCl_3$
(d) Ammonium sulphate reacts with $FeCl_3$
9. Complex salt can be made by the combination of $[Co^{III}(NH_3)_5Cl]^X$ with [RPMT 2000, AFMC 2002]
(a) PO_4^{3-} (b) Cl^-
(c) $2Cl^-$ (d) $2K^+$
10. Which reagent can be used to identify nickel ion
(a) Resorcinol
(b) Dimethyl glyoxime [DMG]
(c) Diphenyl benzidine
(d) Potassium ferrocyanide
11. Dimethyl glyoxime forms a coloured complex with
(a) Ag (b) Ni
(c) Cr (d) Zn
12. Silver chloride dissolves in excess of NH_4OH . The cation present in this solution is [EAMCET 1998]

Complexes and complex stability

1. Which of the following complexes has the highest stability constant at 298 K
(a) $[CdCl_4]^{2-}$ (b) $[CdBr_4]^{2-}$
(c) $[CdI_4]^{2-}$ (d) $[Cd(CN)_4]^{2-}$

- (a) Ag^+ (b) $[Ag(NH_3)_2]^+$
 (c) $[Ag(NH_3)_4]^+$ (d) $[Ag(NH_3)_6]^+$
13. Silver sulphide dissolved in a solution of sodium cyanide to form the complex [AMU 1999]
 (a) $Na[Ag(CN)_2]$ (b) $Na_3[Ag(CN)_4]$
 (c) $Na_5[Ag(CN)_6]$ (d) $Na_2[Ag(CN)_2]$
14. Which one will give Fe^{3+} ions in solution
 (a) $[Fe(CN)_6]^{3-}$
 (b) $Fe_2(SO_4)_3$
 (c) $[Fe(CN)_6]^{4-}$
 (d) $NH_4(SO_4)_2 \cdot FeSO_4 \cdot 6H_2O$
15. The cation that does not form an amine complex with excess of ammonia is
 (a) Cd^{2+} (b) Al^{3+}
 (c) Cu^{2+} (d) Ag^+

Application of organometallics

1. Ziegler-Natta catalyst is an organometallic compound of which metal [J & K CET 2005]
 (a) Iron (b) Zirconium
 (c) Rhodium (d) Titanium
2. In the case of small cuts, bleeding is stopped by applying potash alum. Here alum acts as [KCET (Med.) 2001]
 (a) Fungicide (b) Disinfectant
 (c) Germicide (d) Coagulating agent
3. The formula of ferrocene is
 (a) $[Fe(CN)_6]^{4-}$ (b) $[Fe(CN)_6]^{3-}$
 (c) $[Fe(CO)_5]$ (d) $[(C_5H_5)_2Fe]$
4. Which of the following is formed when *n*-butyl lithium reacts with tin (II) chloride [AFMC 2001]
 (a) $LiBr$ (b) Et_4Pb
 (c) $(C_4H_9)_4Sn$ (d) $(C_2H_5)_4Pb$
5. Which of the following organo-silicon compound on hydrolysis will give a three dimensional silicone [Orissa JEE 2003]
 (a) R_3SiCl (b) $RSiCl_3$
 (c) $SiCl_4$ (d) R_2SiCl_2
6. Which one is not an organometallic compound [J & K CET 2005; Pb. CET 2003]
 (a) $RMgX$ (b) C_2H_5ONa
 (c) $(CH_3)_4Sn$ (d) KC_4H_9
7. The complex used as an anticancer agent is [AIIMS 2003]
 (a) $trans-[Co(NH_3)_3Cl_3]$ (b) $cis-[PtCl_2(NH_3)_2]$
 (c) $cis-K_2[PtCl_2Br_2]$ (d) Na_2CO_3
8. The compound that is not olefinic organometallic is
 (a) $K[C_2H_4PtCl_3] \cdot 3H_2O$ (b) $Be(CH_2)_2$
 (c) $(C_2H_4PtCl_3)_2$ (d) $C_4H_4Fe(CO)_3$
9. Among the following, which is not the π -bonded organometallic compound [CBSE PMT 2003]
 (a) $(CH_3)_4Sn$ (b) $K[PtCl_3(\eta^2-C_2H_4)]$
 (c) $Fe(\eta^5-C_5H_5)_2$ (d) $Cr(\eta^6-C_6H_6)_2$
10. Wilkinson's catalyst is used in
 (a) Polymerization (b) Condensation
 (c) Halogenation (d) Hydrogenation
11. What is the use of tetraethyl lead
 (a) As a catalyst in addition reaction of alkenes
 (b) As a catalyst in polymerization reaction of alkenes
 (c) For reducing knocking
 (d) For creating knocking
12. Which of the following is an organo-metallic compound [MP PMT 2001]
 (a) Lithium ethoxide (b) Ethyl lithium
 (c) Lithium acetate (d) Lithium carbide
13. Which of the following is an organometallic compound [AIIMS 1997]
 (a) $Ti(C_2H_5)_4$ (b) $Ti(OC_2H_5)_4$
 (c) $Ti(OCOCH_3)_4$ (d) $Ti(OC_6H_5)_4$
14. Which of the following is not an organometallic compound [MP PET 1996; BHU 2002]
 (a) Ethyl magnesium bromide
 (b) Tetraethyl lead
 (c) Sodium ethoxide
 (d) Trimethyl aluminium
15. An organometallic compound amongst the following is
 (a) Ferrocene (b) CaC_2
 (c) Tetraethyl lead (TEL) (d) All of these
16. Which of the following does not have a metal carbon bond [CBSE PMT 2004]
 (a) $K[Pt(C_2H_4)Cl_3]$ (b) $Ni(CO)_4$
 (c) $Al(OC_2H_5)_3$ (d) C_2H_5MgBr
17. Coordination compounds have great importance in biological systems. In this context which of the following statements is incorrect [AIEEE 2004]
 (a) Cyanocobalamin is B_{12} and contains cobalt.
 (b) Haemoglobin is the red pigment of blood and contains iron.
 (c) Chlorophylls are green pigments in plants and contains calcium.
 (d) Carboxypeptidase-A is an enzyme and contains zinc.
18. Ziegler-Natta catalyst is [Pb. CET 2004]
 (a) $(Ph_3P)_3RhCl$ (b) $K[PtCl_3(C_2H_4)]$
 (c) $[Al_2(C_2H_5)_6] + TiCl_4$ (d) $[Fe(C_2H_5)_2]$
19. Dimethyl glyoxime gives a red precipitate with Ni^{2+} , which is used for its detection. To get this precipitate readily the best pH range is [AIIMS 2004]
 (a) < 1 (b) 2-3
 (c) 3-4 (d) 9-11
20. The π -bonded organo metallic compound which has ethene as one of its component is [J & K CET 2005]
 (a) Zeise's salt (b) Ferrocene
 (c) Dibenzene chromium (d) Tetraethyl tin.

Critical Thinking

Objective Questions

- The coordination number and oxidation state of Cr in $K_3[Cr(C_2O_4)_3]$ are, respectively [CBSE PMT 1995]
 - 4 and +2
 - 6 and +3
 - 3 and +3
 - 3 and 0
- The complex compounds which result from the coordination of carbon monoxide are known as
 - Electronic
 - Carbonyls
 - Carbonates
 - Carbon permono
- Mixture $X = 0.02 \text{ mol}$ of $[Co(NH_3)_5SO_4]Br$ and 0.02 mol of $[Co(NH_3)_5Br]SO_4$ was prepared in 2 litre of solution
 1 litre of mixture $X + \text{excess } AgNO_3 \rightarrow Y$.
 1 litre of mixture $X + \text{excess } BaCl_2 \rightarrow Z$
 Number of moles of Y and Z are [IIT JEE 2003]
 - 0.01, 0.01
 - 0.02, 0.01
 - 0.01, 0.02
 - 0.02, 0.02
- Which of the following organometallic compound is σ and π bonded [MH CET 2001; PCET 2002]
 - $Fe(CH_3)_3$
 - $[Fe(\eta^5 - C_5H_5)_2]$
 - $[Co(CO)_5NH_3]^{2+}$
 - $K[PtCl_3(\eta^2 - C_2H_4)]$
- In $[Ni(NH_3)_4]SO_4$, the valency and coordination number of Ni will be respectively
 - 3 and 6
 - 2 and 4
 - 4 and 2
 - 4 and 4
- Co-ordination number of Fe in the complexes $[Fe(CN)_6]^{4-}$, $[Fe(CN)_6]^{3-}$ and $[FeCl_4]^-$ would be respectively [MP PET 2003]
 - 2, 3, 3
 - 6, 6, 4
 - 6, 3, 3
 - 6, 4, 6
- On hydrolysis $(Me)_2SiCl_2$ will produce [IIT-JEE 2003]
 - $(Me)_2Si(OH)_2$
 - $(Me)_2Si = O$
 - $-[O - (Me)_2Si - O]_n -$
 - $Me_2SiCl(OH)$
- Which of the following represents a chelating ligand [JIPMER 2002]
 - H_2O
 - OH^-
 - DMG
 - Cl^-
- $CuSO_4$ reacts with KCN solution and forms [MP PMT 1992; IIT 1996; UPSEAT 2001, 02]
 - $Cu(CN)_2$
 - $Cu(CN)$
 - $K_2[Cu(CN)_4]$
 - $K_3[Cu(CN)_4]$
- In the process of extraction of gold,
 Roasted gold ore + $CN^- + H_2O \xrightarrow{O_2} X + OH^-$
 $[X] + Zn \rightarrow [Y] + Au$
 Identify the complexes $[X]$ and $[Y]$
 - $X = [Au(CN)_2]^-$, $Y = [Zn(CN)_4]^{2-}$
 - $X = [Au(CN)_4]^{3-}$, $Y = [Zn(CN)_4]^{2-}$
 - $X = [Au(CN)_2]^-$, $Y = [Zn(CN)_6]^{4-}$
 - $X = [Au(CN)_4]^-$, $Y = [Zn(CN)_4]^{2-}$
- A solution of potassium ferrocyanide would contains ions [KCET 1999]
 - 2
 - 3
 - 4
 - 5
- Which one of the following complexes is an outer orbital complex [AIEEE 2004]
 - $[Co(NH_3)_6]^{3+}$
 - $[Mn(CN)_6]^{4-}$
 - $[Fe(CN)_6]^{4-}$
 - $[Ni(NH_3)_6]^{2+}$
 Atomic nos : $Mn = 25$, $Fe = 26$, $Co = 27$, $Ni = 28$
- Which one of the following has largest number of isomers ? [AIEEE 2004]
 - $[Ir(PP_3)_2H(CO)]^{2+}$
 - $[Co(NH_3)_5Cl]^{2+}$
 - $[Ru(NH_3)_4Cl_2]^+$
 - $[Co(en)_2Cl_2]^+$
 ($R = \text{alkyl group}$; $en = \text{ethylenediamine}$)
- Which kind of isomerism is exhibited by octahedral $Co(NH_3)_4Br_2Cl$? [IIT-JEE Screening 2005]
 - Geometrical and Ionization
 - Geometrical and Optical
 - Optical and Ionization
 - Geometrical only
- Which one of the following is expected to exhibit optical isomerism ($en = \text{ethylenediamine}$)
 - $cis - [Pt(NH_3)_2Cl_2]$
 - $trans - [Co(en)_2Cl_2]$
 - $trans - [Pt(NH_3)_2Cl_2]$
 - $cis - [Co(en)_2Cl_2]$
- $[EDTA]^{4-}$ is a: [UPSEAT 2004]
 - Monodentate ligand
 - Bidentate ligand
 - Quadridentate ligand
 - Hexadentate ligand
- Which of the following statements is incorrect ? [KCET 2004]
 - In $K_3[Fe(CN)_6]$, the ligand has satisfied only the secondary valency of ferric ion.
 - In $K_3[Fe(CN)_6]$, the ligand has satisfied both primary and secondary valencies of ferric ion.
 - In $K_4[Fe(CN)_6]$, the ligand has satisfied both primary and secondary valencies of ferrous ion.
 - In $[Cu(NH_3)_4]SO_4$, the ligand has satisfied only the secondary valency of copper.
- Which of the following is considered as an anticancer species. [CBSE PMT 2004]

19. An aqueous solution of CoCl_2 on addition of excess of concentrated HCl turns blue due to formation of _____ [AIIMS 2005]

- (a) $[\text{Co}(\text{H}_2\text{O})_4\text{Cl}_2]$
 (b) $[\text{Co}(\text{H}_2\text{O})_2\text{Cl}_4]^{2-}$
 (c) $[\text{CoCl}_4]^{2-}$
 (d) $[\text{Co}(\text{H}_2\text{O})_2\text{Cl}_2]$

- 20.** The correct order for the wavelength of absorption in the visible region is [AIIMS 2005]

- $$\begin{aligned} \text{(a)} \quad & [\text{Ni}(\text{NO}_2)_6]^{4-} < [\text{Ni}(\text{NH}_3)_6]^{2+} < [\text{Ni}(\text{H}_2\text{O})_6]^{2+} \\ \text{(b)} \quad & [\text{Ni}(\text{NO}_2)_6]^{4-} < [\text{Ni}(\text{H}_2\text{O})_6]^{2+} < [\text{Ni}(\text{NH}_3)_6]^{2+} \\ \text{(c)} \quad & [\text{Ni}(\text{H}_2\text{O})_6]^{2+} < [\text{Ni}(\text{NH}_3)_6]^{2+} < [\text{Ni}(\text{NO}_2)_6]^{4-} \\ \text{(d)} \quad & [\text{Ni}(\text{NH}_3)_6]^{2+} < [\text{Ni}(\text{H}_2\text{O})_6]^{2+} < [\text{Ni}(\text{NO}_2)_6]^{4-} \end{aligned}$$

- 21.** In which of the following pairs both the complexes show optical isomerism [AIIMS 2005]

- (a) $\text{cis-[Cr(C}_2\text{O}_4)_2\text{Cl}_2]^{3-}$, $\text{cis-[Co(NH}_3)_4\text{Cl}_2]$
 (b) $[\text{Co(en)}_3]\text{Cl}_3$, $\text{cis-[Co(en)}_2\text{Cl}_2]\text{Cl}$
 (c) $[\text{PtCl(dien)}]\text{Cl}$, $[\text{NiCl}_2\text{Br}_2]^{2-}$
 (d) $[\text{Co(NO}_3)_3(\text{NH}_3)_3]$, $\text{cis-[Pt(en)}_2\text{Cl}_2]$

- 22.** Which of the following compounds shows optical isomerism

[AIEEE 2005; CBSE PMT 2005]

- (a) $[Cu(NH_3)_4]^{2+}$ (b) $[ZnCl_4]^{2-}$
(c) $[Cr(C_2O_4)_3]^{3-}$ (d) $[Co(CN)_6]^{3-}$

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- If both assertion and reason are true and the reason is the correct explanation of the assertion.
- If both assertion and reason are true but reason is not the correct explanation of the assertion.
- If assertion is true but reason is false.
- If the assertion and reason both are false.
- If assertion is false but reason is true.

1. Assertion : Potassium ferrocyanide and potassium ferricyanide both are diamagnetic.
Reason : Both have unpaired electrons.
2. Assertion : NF_3 is a weaker ligand than $N(CH_3)_3$

Reason : NF_3 ionizes to give F^- ions
in aqueous solution.

3. Assertion : The $[Ni(en)_3]Cl_2$ (en = ethylene diamine) has lower stability than $[Ni(NH_3)_6]Cl_2$

Reason : In $[Ni(en)_3]Cl_2$ the geometry of Ni is trigonal bipyramidal

4. Assertion : The ligands nitro and nitrito are called ambidentate ligands.

Reason : These ligands give linkage isomers.

5. Assertion : Geometrical isomerism is also called *cis-trans* isomerism.

Reason : Tetrahedral complexes show geometrical isomerism.

6. Assertion : $\left[(en)_2Co \begin{array}{c} \text{NH} \\ \diagup \quad \diagdown \\ \text{OH} \end{array} Co(en)_2 \right]^{3+}$ is named as tetrakis (ethylene diamine) μ -hydroxo-imido dicobalt (III) ion.

Reason : In naming polynuclear complexes *i.e.*, containing two or more metal atoms joined by bridging ligands, the word μ is added with hyphen before the name of such ligands.

7. Assertion : $[Fe(CN)_6]^{3-}$ is weakly paramagnetic while $[Fe(CN)_6]^{4-}$ is diamagnetic.

Reason : $[Fe(CN)_6]^{3-}$ has +3 oxidation state while $[Fe(CN)_6]^{4-}$ has +2 oxidation state.

- 8.** Assertion : $H_2N - NH_2$ is a chelating ligand.

Reason : A chelating ligand must possess two or more lone pairs at such a distance that it may form suitable strain free rings at the metal ion.

9. Assertion : $[Ti(H_2O)_6]^{3+}$ is coloured while $[Sc(H_2O)_6]^{3+}$ is colourless.

Reason : $d-d$ transition is not possible in $[\text{Sc}(\text{H}_2\text{O})_6]^{3+}$.

- 10. Assertion :** All the octahedral complexes of Ni^{2+} must be outer orbital complexes.

Reason : Outer orbital octahedral complexes are given by weak ligands.

11. Assertion : Potassium ferrocyanide is diamagnetic whereas potassium ferricyanide is paramagnetic.

Reason : Crystal field splitting in ferrocyanide ion is greater than that of ferricyanide ion.

[AIIMS 2005]

Answers and Solutions

Basic terms

1. (b) (CN) are linked with secondary valency.
2. (c) In Cuprammonium sulphate $[Cu(NH_3)_4]SO_4$
co-ordination no. of Cu is 4.
3. (b) As it makes use of its two atoms to form two co-ordinate covalent bonds with the central metal ion.
4. (b) $[Co(en)_2Br_2]Cl_2$
C.N. of Co = $2 \times$ number of bidentate ligand
+ $1 \times$ number of monodentate ligand = $2 \times 2 + 1 \times 2 = 6$.
7. (b) The charge does not decide the formation of bond but availability of lone pair decide the formation of Co-ordinate bond.
8. (c) In $[Co(en)_2Cl_2]^+$
No. of monodentate ligand = 2
No. of bidentate ligand = 2
Co-ordination no. of the metal = $2 + 2(2) = 6$.
10. (c)
11. (d) 
12. (c) According to modern view primary valency of complex compound is its oxidation number while secondary valency is the co-ordination number.
15. (b) Co-ordination number is equal to total number of ligands in a complex.
16. (b) Cuprammonium salt- $[Cu(NH_3)_4]SO_4$
 $[Cu(NH_3)_4]SO_4 = [Cu(NH_3)_4]^{2+} + SO_4^{2-}$
So, it will give two ions in water.
17. (a) The co-ordination no. = no. of ligands attached.
18. (c) Primary valencies are also known as oxidation state.
 $K_2[Ni(CN)_4]$, $2 + x - 4 = 0 \Rightarrow x = +2$
20. (b) Ag^+ has two coordination number forms complex with excess of CN^- $Ag(CN)_2^-$.
21. (b) According to Lewis the ligands are basic in nature.
22. (c) The number of atoms of the ligand that are directly bounded to the central metal atom or ion by coordinate bond is known as the coordination number of the metal atom or ion
coordination number of metal = number of σ bonds formed by metal with ligand.
23. (b) $Ag_2S + 4NaCN \rightleftharpoons 2Na[Ag(CN)_2] + Na_2S$
Sodium dicyano argentate
 $2Na[Ag(CN)_2] + Zn \rightarrow Na_2[Zn(CN)_4] + 2Ag \downarrow$
Sodium tetracyano zincate (ppt)
24. (d) In $K_4Fe(CN)_6$, the species retains its identity in solid as well as in solution state.
26. (d) The number of atom of the ligand that are directly bound to the central metal atom or ion by coordinate bonds is known as the coordination number of the metal or ion. It is actually the number of chemical bonds which the ligand form with the central metal atom or ion.

27. (a) CN^- ion acts both as reducing agent as well as good complexing agent.
29. (b) ZnS structure shows the coordination number of Zn is 4.
30. (c) Wilkinson's catalyst is $Rh(PPh_3)_3Cl$.
31. (b) The complexes can be written as follows
 $[Co(NH_3)_6]Cl_3$ (A) $[Co(NH_3)_5Cl]Cl_2$ (B) $[Co(NH_3)_4Cl_2]Cl$ (C)
Hence, number of primary valencies are 3, 2 and 1 respectively.
32. (c) Ligand must have capacity to donate lone pair of electrons to form co-ordinate bond.
33. (b) $K_3[Fe(CN)_6]$ because in it CN^- donates a lone pair of electron.
34. (b) Al has 6 co-ordination number.
35. (d) $K_4[Fe(CN)_6] \rightarrow 4K^+ + [Fe(CN)_6]^{4-}$
Complex has negative charge so it is anionic complex.
36. (d) Co-ordination number is equal to total number of ligands in a complex.
37. (b) Lithium tetrahydroaluminate is $Li[Al(H)_4]$.
40. (b) Negative ligands end in $-O$ eg. SO_4^{2-} (sulphato).
44. (b) Turnbull's blue is $K\{Fe^{II}[Fe^{III}(CN)_6]\}$.
46. (a) $Fe + 5CO \xrightarrow[\text{Pressure}]{\text{Heat}} [Fe(CO)_5]$
Iron pentacarbonyl.
48. (c) When a ligand attaches to the central metal atom through two or more atoms to form a ring like structure is known as chelates and the ligand is called chelating ligand.
53. (b) eg. $nCH_3 - CH = CH_2 \xrightarrow[(C_2H_5)_3Al]{TiCl_4} (-CH - CH_2)_n$
CH₃
55. (d) CH_3Li is the organometallic compound in which lithium bonded with carbon and organometallic are those in which metal-carbon bond found.
56. (d) Potash alum is a mixed salt of K_2SO_4 and $Al_2(SO_4)_3$ and on dissolving, it gives all three ion Al^{3+} , K^+ and SO_4^{2-} of which it is made.
57. (a) Carnallite is a double salt with molecular formula $KCl \cdot MgCl_2 \cdot 6H_2O$. It gives K^+ , Mg^{2+} and Cl^- ions in solution.
59. (a) General formula for alum is
 $M_2SO_4 \cdot R_2(SO_4)_3 \cdot 24H_2O$
 M = mono valent cation (K^+ , Na^+ ...)
 R = Trivalent cation (Al^{+3} , Fe^{+3})
Hence, $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$ represent an alum.

60. (d) $K_4[Fe(CN)_6]$ is a complex salt. On ionisation it will dissociate in $4K^+$ and $[Fe(CN)_6]^{4-}$ ion. Hence, in $K_4[Fe(CN)_6]$ five ions are present.
61. (c) Due to $C-Mg$ bond.
62. (d) $EAN = (At. \text{ number } - 0.5 + 2 \times C.N.)$
Hence, EAN of Ni in $Ni(CO)_4$ is
 $= 28 - 0 + 2 \times 4 = 36$

Nomenclature, Oxidation State & EAN number

1. (b) $[Co(H_2O)_6]Cl_2 = [Co(H_2O)_6]^+ + 2Cl^-$.
5. (d) Follow IUPAC rule.
7. (b) Follow IUPAC rule.
9. (a) Follow IUPAC rule.
10. (a) Follow IUPAC rule.
11. (c) $EAN = \text{Atomic number} - \text{Oxidation state} + 2 \times \text{number of Ligands} = 26 - 2 + 2(6) = 36$.
12. (a) EAN of Pt in $[PtCl_6]^{2-} = 80$
13. (b) $Na_2[CrF_4O]$
 $x + 4(-1) + (-2) = -2$
 $x - 6 = -2 \Rightarrow x = +4$.
14. (a) Follow IUPAC rule.
16. (c) Follow IUPAC rule.
17. (d) Follow IUPAC rule.
18. (b) The oxidation state of metal in metal carbonyl is zero.
19. (d) $x + 6 \times (0) + 3 \times (-1) = 0$
 $x - 3 = 0, x = +3$, Oxidation number of Cr is $+3$.
20. (a) $EAN = (\text{atomic no}) - (\text{oxidation state}) + (2 \times \text{number of Ligands}) = 28 - 2 + 2 \times 4 = 34$
21. (b) Follow IUPAC rule.
22. (b) $[Pt(C_2H_4)Cl_3]^-$
 $x + 0 + 3x(-1) = -1, x - 3 = -1, x = +2$.
23. (a) $[Co(NH_3)_6]Cl_3 \rightarrow [Co(NH_3)_6]^{3+} + 3Cl^-$
 $x + 6(0) = +3 \Rightarrow x = +3$.
24. (b) Follow IUPAC rule.
25. (a) $EAN = \text{at. no. of central atom} - \text{oxidation state} + 2 \times (\text{no. of ligands}) = 27 - 3 + 2 \times 6 = 36$.
26. (d) Follow IUPAC rules for nomenclature.
27. (c) $EAN \text{ of a central metal ion} = (\text{atomic no. of central atom}) - \text{oxidation state} + \text{no. of ligands} \times 2$
 $= 26 - 3 + (6 \times 2) = 23 + 12 = 35$
28. (b) $+1 \times 4 + x - 1 \times 4 = 0$
 $4 + x - 4 = 0 \Rightarrow x = 0$ for Ni .
29. (a) Follow IUPAC rule.
30. (a) In complex $K_4[Fe(CN)_6]$ the Fe obey EAN rule strictly.
31. (a) $Ni(CO)_4$ has O.N. zero for Ni .
32. (b) $3 \times (+1) + x + 6 \times (-1) = 0$ or $x = 6 - 3 = +3$ Oxidation state of $Fe = +3$.
33. (a) Complexes containing carbonyl ligand (CO) have zero oxidation state.
34. (b) Follow IUPAC rule.
35. (c) Follow IUPAC rule.
36. (b) Follow IUPAC rule.
38. (a) Follow IUPAC rule.
39. (b) Follow IUPAC rule.
41. (a) Follow IUPAC rule.
42. (b) $[Ni(CN)_4]^x, (Ni = +2) (CN = -1)$
 $x = 2 + 4(-1) \Rightarrow x = -2$.
44. (b) $[Cu(NH_3)_4]^{2+}$ so, copper has $+2$ valency.
47. (a) Follow IUPAC rule.
50. (c) Follow IUPAC rule.
51. (b) $[Co(H_2O)_5Cl]^{2+}$
 $x + 0 + (-1) = +2$
 $x - 1 = 2 \Rightarrow x = +3$.
52. (b) It is clear from the chemical formulae that Ag is central metal atom and ligands are 2 ammonia molecule.
Hence, compound is $[Ag(NH_3)_2]Cl$.
53. (a) In the compounds $[Co(NH_3)_5NO_2]Cl_2$, the oxidation state of cobalt is $+3$ and here 5 NH_3 ligand, a NO_2 ligand are attached to the central atom. therefore its name is pentaamminecobalt (III) chloride.
54. (b) $^{+6}CrO_2Cl_2, ^{+7}MnO_4$.
55. (b) In the given ion $[Cr(NH_3)_6]^{3+}$, the oxidation state of chromium is $+3$ and here 6 NH_3 ligand are attached to the central metal atom. Therefore its IUPAC name is hexamminechromium (III) ion.
56. (a) It is potassium ammine dicyano dioxo peroxo-chromate (VI)
57. (b) Potassium hexa cyanoferrate (III).

Isomerism and Magnetic Properties

1. (a) Octahedral complexes of the type $[MA_4B_2], [MA_2B_4], [MA_3B_3]$ exhibit geometrical isomerism.
2. (d) The number of unpaired electrons in the Complex ion $[CoF_6]^{3-}$ is 4.

Here more than one atom function as donor, as oxygen in first one and nitrogen in second, so they show linkage isomerism

5. (c) The two given compounds have same composition but in solution both will give different ions. The isomerism is known as ionisation isomerism.

6. (d) Both produce different ions in solution state-

7. (b) The compound which has same composition but give different ions in solution, show ionization. So $[Co(NH_3)_5Br]SO_4$ is ionization isomer.

9. (a) Co-ordination isomerism is caused by the interchange of ligands between cis and trans structure.

10. (c) $[Co(NH_3)_5NO_2]Cl_2$ will not show geometrical isomerism because this complex showed 4 and 6 co-ordination number.

13. (b) $[Fe(H_2O)_6]^{2+}$ has four unpaired electrons, $[Cr(H_2O)_6]^{3+}$, $[Cu(H_2O)_6]^{2+}$ and $[Zn(H_2O)_6]^{2+}$ have 3, 1, 0 unpaired electrons respectively.

14. (c) The electronic configuration of Ni in

CO and CN^- are strong ligands so they induces pairing of electrons so their complexes are diamagnetic while Cl^- is a weak ligand so it does not induce the pairing of electrons so its complex is paramagnetic.

15. (a) $[Co(NH_3)_4Cl_2]^+$ is the Ma_4b_2 and Ma_2b_3 type complex.

16. (b) In $[Ag(NH_3)_2]Cl$, Ag^+ contains d^{10} configuration. All others contain unpaired electrons.

17. (a) $Pt(NH_3)_2Cl_2$.

19. (a)

21. (c) $[Co(en)_2NO_2Cl]Br$; $[Co(en)_2ONOC]Br$

22. (b) Because it will not give any ions in solution.

23. (b) $[Co(en)_2Cl_2]^+$ have three optical isomers which are.

24. (a) Magnetic moment of $[Cu(NH_3)_4]^{2+}$ ion is 1.414 due to the presence of one unpaired electron.

25. (a) Due to the presence of one unpaired electron, both are slightly paramagnetic.

27. (d) 1. $[Cu(NH_3)_4].[PtCl_4]$

29. (c) Co-ordination isomerism is possible when both +ve and -ve ions of a salt are complex ions and the two isomers differ in the distribution of ligands in the cation and the anion.

30. (a) On ionisation it gives maximum number of (four) ions.

31. (b) The anhydrous complex of Cu^+ do not involve $d-d$ transition and are thus colourless.

32. (a) Mn^{2+}
- | | | | | | | | |
|-----------------|----|---|---|---|---|---|-----------------|
| ↑↓ | ↑↓ | ↑ | ↑ | ↑ | ↑ | ↑ | xx |
| 3d ⁷ | | | | | | | 4s ⁰ |

In presence of H_2O which is a weak ligand no pairing occurs which results in unpaired electrons left in the compound, due to which it shows paramagnetism.

33. (c) Geometrical isomers (cis and trans) and linkage isomers ($-SCN$ and $-NCS$).

34. (a) Due to presence of strong ligand all the e^- get paired. So no. of unpaired electrons are 0.

36. (c) Both have same composition but give different ions in the solution.

37. (d) $[Pt(en)_2]Cl_2$

38. (a) CO is a strong ligand so induce pairing of electrons and hence $Ni(CO)_4$ is diamagnetic.

40. (b) $[Co(en)_3]^{3+}$

41. (c) $d\text{-form } MA_3B_3$ which does not show optical isomerism.

42. (c) Change in composition of co-ordination sphere yield ionization isomers.

43. (d) NO_2 is ambident and can be linked either to N-side as $(-NO_2)$ or to O-side as $(-ONO)$.

44. (a) As $[Co(NH_3)_3Cl_3]$ does not losses any Cl^- ions in the solution so it will not give ppt. with $AgNO_3$.

45. (b) $[Co(NH_3)_6]Cl_3 \rightleftharpoons [Co(NH_3)_6]^{3+} + 3Cl^-$.

46. (e) $CoCl_3.5NH_3.H_2O$ is pink in colour.

47. (a) The configuration of Ni^{2+} has two unpaired electron so it is paramagnetic.

48. (d) $[Pt(NH_3)_4]Cl_2 \rightarrow [Pt(NH_3)_4]^{+2} + 2Cl^-$

As it gives Cl^- ions in solution so it will give white ppt. of $AgCl$ with $AgNO_3$.

49. (c) $[Co(NH_3)_5Cl]Cl_2 \rightleftharpoons [Co(NH_3)_5Cl]^{2+} + 2Cl^-$

50. (c) $[Cr(NH_3)_5Cl]SO_4 \rightarrow [Cr(NH_3)_5Cl]^{2+} + SO_4^{2-}$

51. (d) $[Pt(NH_3)Cl_2Br]Cl \rightleftharpoons [Pt(NH_3)Cl_2Br]^+ + Cl^-$

Cl^- ion is precipitable.

52. (a) $Cu(II)$ complexes are blue.

53. (c) It will ionize in the following manner.

54. (a) $_{27}Co \rightarrow [Ar]3d^7 4s^2$

Number of unpaired electrons = 3.

55. (a) $K_3[FeF_6]$

Number of unpaired electrons = 5

$$\text{Magnetic moment} = \sqrt{n(n+2)} = \sqrt{5(5+2)}$$

$$= \sqrt{35} = 5.91 \text{ BM.}$$

56. (c) $[Fe(CN)_6]^{4-}$

dsp , Paramagnetism

dsp , Paramagnetism

dsp , Paramagnetism

57. (c) When coordinate compounds gives different ions in solution then it produces ionic isomerism while this situation is not present in $[Co(en)_2Cl_2]Cl$.

Hybridisation and Geometry

3. (a) $2Cl^-$ ions are ionizable

4. (b) Copper complexes usually involve with four co-ordination number and have square planar in shape.

5. (a) Complex with sp^3d -hybridisation show square pyramidal geometry.

6. (b) sp^3d^2

sp^3d^2 hybridisation

8. (d) Metal carbonyls does not show overlapping.

9. (c) sp^3d^2 - hybridisation gives octahedral complex.

11. (b) Copper complexes usually involve co-ordination number of four and are thus square planar in shape.

12. (c) $[Fe(CN)_6]^{4-}$

In presence of CN^-

d^2sp^3 hybridisation

Hence, Octahedral geometry.

13. (d) $Fe(CO)_5$ has dsp^3 -hybridisation so it show trigonal bipyramidal geometry.

16. (b) Due to formation of inner orbital complex.

17. (d) $Ni(CO)_4$ and $Ni(PPh_3)_2Cl_2$ have sp^3 and dsp^2 -hybridisation respectively.

18. (d) $[Cu(NH_3)_4]^{2+}$ has square planer structure.

19. (a) Since hybridisation is dsp^2 so it is square planar,

Excited state

dsp hybridisation

23. (c) d^2sp^3 -hybridisation leads to octahedral geometry

25. (c) $[CoF_6]^{3-}$ is an outer complex having d^2sp^3 hybridisation.

sp^3 hybridization

dsp^2 hybridization

sp^3 hybridization

29. (d) $K_3[Fe(CN)_6]$

Electronic configuration of $Fe = [Ar]4s^23d^6$

Electronic configuration of $Fe^{+3} = [Ar]3d^5$

Number of ligand (coordination number)=6

Nature of ligand is strong field.

Hybridization of Fe is d^2sp^3 .

32. (c) The compounds which show d^6 -configuration are octahedral complexes.

33. (a) CN^- ligand has strong field ligand because of higher value of Δ .

35. (c) Ammine (NH_3) is neutral ligand.

37. (c) A strong field ligand produces low spin complexes.

38. (d) Cyanide ion is strong field ligand because it is a pseudohalide ion pseudohalide ions are stronger coordinating ligand & they have the ability to form σ bond (from the pseudohalide to the metal) and π bond (from the metal to pseudohalide).

39. (d) $Mn^{25} \longrightarrow 3d^5 + 4s^2$

In presence of weak ligand field, there will be no pairing of electrons. So it will form a high spin complex. i.e. the number of unpaired electrons = 5.

40. (b) The complexes, in which, the metal and ligand form a bond that involves the π -electrons of the ligand are known as π -complexes e.g. Ferrocene

41. (b) CO has strong $M \rightarrow L$ π -bonding ability so it can accept electron pairs from metal ion so it is a π -acid ligand.

42. (a) d^4 (in strong ligand field).

43. (c) Both $Ni(CO)_4$ and $Ni(PPh_3)_2Cl_2$ are tetrahedral.

Complexes and complex stability

1. (d) The cyano and ammine complexes are far more stable than those formed by halide ions. This is due to the fact that NH_3

and CN^- are strong lewis bases.

4. (b) Greater the charge on central metal ion greater is the stability of complex.

5. (a) $CuSO_4$ on reaction with KCN gives $K_3[Cu(CN)_4]$
 $2CuSO_4 + 10KCN \rightarrow 2K_3[Cu(CN)_4] + 2K_2SO_4 + (CN)_2$

6. (a) The most probable complex which gives three moles ions in aqueous solution may be $[Co(NH_3)_5NO_2]Cl_2$ because it gives two chlorine atoms on ionisation.

7. (d) $3K_4[Fe(CN)_6] + 4FeCl_3 \rightarrow Fe_4[Fe(CN)_6]_3 + 12KCl$
 pot. ferrocyanide (Ferri ferrocynide)
 (Prussian blue)

8. (b) $Fe_2(SO_4)_3 \rightarrow 2Fe^{3+} + 3SO_4^{2-}$

9. (c) $[Co(NH_3)_5Cl]^{x+} + 2Cl^- \rightarrow [Co(NH_3)_5Cl]Cl_2$.

10. (b) Ni reacts with dimethylglyoxime to give red ppt. of nickel-dimethyl glyoxime complex.

15. (b) Aluminum is a *p*-block element and does not form complex compounds.

Application of Organometallics

1. (d) $(CH_3CH_2)_3Al + TiCl_4$ is the Ziegler-Natta catalyst.

2. (d) Alum acts as coagulating agent.

6. (b) As there is no direct bonding between the metal atom and the carbon atom.

9. (a) $(CH_3)_4Sn$ is a σ -bonded organometallic compound.

10. (d) Wilkinson's catalyst is used as homogeneous catalyst in the hydrogenation of alkenes as –

12. (b) C_2H_5Li is an organo-metallic compound.

13. (a) Because there is direct bonding of metal ion with carbon.

14. (c) Organometallic compounds are those compounds in which carbon atom is directly linked to metal. But in sodium ethoxide as oxygen is attached to sodium metal so it is not a organometallic compound.

16. (c) $Al(OC_2H_5)_3$ contains bonding through *O* and thus it does not have metal-carbon bond.

17. (c) Chlorophyll are green pigment in plant & contain magnesium instead of calcium.

19. (d) This reaction carried out in alkaline *pH* i.e., 9–11

20. (a)

dibenzene chromium

Critical Thinking Questions

1. (b) Its coordination number will be 6 because it is bonded with three bidentate ligands.

Oxi. No. of *Cr* in $K_3[Cr(C_2O_4)_3]$ is

$$x + 3(-2) + 3(+1) = 0 \Rightarrow x = +3$$

2. (b) e.g. $Fe(CO)_5, Ni(CO)_4$ etc.

On using one *lit.* solution, we will get 0.01 mole *y* and 0.01 mole *z*.

4. (b) $[Fe(\eta^5-C_5H_5)_2]$ is the organometallic compound which has σ and π bonds present.

$$x + 0 + (-2) = 0 \Rightarrow x = +2 \text{ is valency and 4 is C.N. of Ni.}$$

6. (b) Co-ordination number is equal to total number of ligands in a complex.

8. (c) Because it is a polydentate ligand which binds the central atom nickel forming a ring like structure.

11. (d) Potassium ferrocyanide $K_4[Fe(CN)_6]$ will ionize as $K_4[Fe(CN)_6] \rightleftharpoons 4K^+ + [Fe(CN)_6]^{4-}$

So, it will give five ions in solution.

12. (d) Complex ion Hybridization of central atom

13. (d) $[Co(en)_2Cl_2]^+$ shows geometrical as well as optical isomerism.

14. (a)

15. (d)

16. (d)

They have six donor atoms. poly dentate ligands have flexidentate character. It is not necessary that all the donor atoms present in the polydentate ligands should form coordinate bonds with central metal atom or ion.

17. (a,d) In $K_3[Fe(CN)_6]$ the ligand are negative which is present in coordination spheres shows a dual behaviour. It may satisfied both primary & secondary valencies while neutral ligand satisfied only secondary valencies.

18. (a) Cis Isomer of $[Pt(NH_3)_2Cl_2]$ is used as an anticancer drugs for treating several type of malignant tumours. When it is injected into the blood stream the more reactive Cl groups are lost so the Pt atom bonds to a N atom in guanosine (a part of DNA) This molecule can bond to two different guanosine units & by bridging between them it upsets the normal reproduction of DNA.

19. (c) $CoCl$ is a weak Lewis acid, reacting with chloride ion to produce salt containing the tetrahedral $[CoCl_4]^-$ ion. $CoCl$ is blue when anhydrous, and a deep magenta colour when hydrated, for this reason it is widely used as an indicator for water.

20. (a) The absorption of energy or the observation of colour in a complex transition compound depends on the charge of the metal ion and the nature of the ligands attached. The same metal ion with different ligands shows different absorption depending upon the type of ligand. The presence of weak field ligands make the central metal ion to absorb low energies i.e., of higher wavelength. The field strength of ligands can be obtained from spectrochemical series. i.e.

(weak field) $I < Br < S < Cl < NO_2 < F < OH < H_2O < NH_3 < NO$
 $< CN < CO$ (strong field)

21. (b) $[Co(en)_3]Cl_3$ 

22. (c)

Assertion and Reason

- (d) Potassium ferrocyanide and potassium ferricyanide both are not diamagnetic because both do not have paired electrons. Assertion and reason both are false.
- (c) It is correct statement that NF_3 is a weaker ligand than $N(CH_3)_3$, the reason is that fluorine is highly electronegative therefore, it will draw electrons from nitrogen atom. Hence, the lone pair of nitrogen atom cannot be ligated. While $N(CH_3)_3$ is a strong ligand because CH_3 has electron releasing group.
- (d) Both assertion and reason are false. $[Ni(en)_3]Cl_2$ is a chelating compound and chelated complexes are more stable than similar complexes involves breaking of two bonds rather than one. In $[Ni(en)_3]Cl_2$, Ni with d^8 configuration shows octahedral geometry. Six electrons will occupy the t_{2g} orbitals and two electrons will occupy the e_g orbitals.
- (a) Both assertion and reason are true and reason is the correct explanation of assertion. When a monodentate ligand has two possible donor atoms and attached in two ways to the central metal atom are called ambidentate ligands.
- (c) Assertion is true but reason is false. Tetrahedral complexes do not show geometrical isomerism because the relative position of the atoms with respect to each other will be the same.
- (e) Assertion is false but reason is true.

more than one bridging group the word μ is repeated before each bridging group.

7. (b) Both assertion and reason are true but reason is not the correct explanation of assertion. $[Fe(CN)_6]^{3-}$ has EAN equal to 35 and thus possesses unpaired electron to show paramagnetic nature while $[Fe(CN)_6]^{4-}$ possesses no unpaired electron and thus shows diamagnetic nature.
8. (e) Assertion is false but reason is true. H_2N-NH_2 does not act as chelating ligand. The coordination by hydrazine leads to a three member highly unstable strained ring and thus it does not act as chelating agent.
9. (a) Both assertion and reason are true and reason is the correct explanation of assertion. $[Sc(H_2O)_6]^{3+}$ has no unpaired electron in its d subshell and thus $d-d$ transition is not possible whereas $[Ti(H_2O)_6]^{3+}$ has one unpaired electron in its d subshell which gives rise to $d-d$ transition to impart colour.

10. (b) Both assertion and reason are true but reason is not the correct explanation of assertion.

Ni^{2+} configuration

During rearrangement only one $3d$ -orbital may be made available by pairing the electrons. Thus, inner d^2sp^3 hybridization is not possible, so, only sp^3d^2 (outer) hybridization can occur.

11. (c) $K_4[Fe(CN)_6]$ and $K_3[Fe(CN)_6]$ both are low spin complex due to strong ligand field. That is why it is false that crystal field splitting in ferrocyanide ion is greater than ferricyanide ion.

Co-ordination Chemistry

SET Self Evaluation Test -20

1. An example for a double salt is [KCET 2002]
 - (a) Potassium ferricyanide
 - (b) Cobalt hexamine chloride
 - (c) Cuprous sulphate
 - (d) Mohr's salt
2. The complex $[Pt(NH_3)_6]Cl_4$ furnishes [MP PET 1995]
 - (a) 5 ions
 - (b) 4 ions
 - (c) 3 ions
 - (d) 2 ions
3. How many isomers are possible in $[Co(en)_2Cl_2]$ [Orissa JEE 2004]
 - (a) 2
 - (b) 4
 - (c) 6
 - (d) 1
4. π -bonding is not present in [MP PET 2003]
 - (a) Grignard reagent
 - (b) Dibenzene chromium
 - (c) Zeise's salt
 - (d) Ferrocene
5. Grignard reagent is a
 - (a) Coordinate compound
 - (b) Double salt
 - (c) Organometallic compound
 - (d) None of these
6. Which one of the following complexes is paramagnetic [RPMT 1997]
 - (a) $[Co(F)_6]^{3+}$
 - (b) $[Co(H_2O)_6]^{3+}$
 - (c) $[CoF_3(H_2O)_3]$
 - (d) All of these
7. The oxidation state of Fe in the complex $[Fe(CO)_5]$ is [MP PMT 2003]
 - (a) -1
 - (b) +2
 - (c) +4
 - (d) Zero
8. Which of the following is non-ionizable
 - (a) $[Co(NH_3)_3Cl_3]$
 - (b) $[Co(NH_3)_4Cl_2]Cl$
 - (c) $[Co(NH_3)_5Cl]Cl_2$
 - (d) $[Co(NH_3)_6]Cl_2$
9. The coordination and oxidation number of X in the compound $[X(SO_4)(NH_3)_5]Cl$ will be [JIPMER 1997; DCE 2004]
 - (a) 6 and 4
 - (b) 10 and 3
 - (c) 2 and 6
 - (d) 6 and 3
10. In $[NiCl_4]^{2-}$, the number of unpaired electron is [BHU 2003]
 - (a) 4.5
 - (b) 2
 - (c) 3
 - (d) 4
11. $AgCl$ precipitate dissolves in ammonia due to the formation of
 - (a) $[Ag(NH_4)_2]OH$
 - (b) $[Ag(NH_4)_2]Cl$
 - (c) $[Ag(NH_3)_2]OH$
 - (d) $[Ag(NH_3)_2]Cl$
12. The oxidation number of cobalt in $K[Co(CO)_4]$ is [MP PMT 2001; J & K CET 2005]
 - (a) +1
 - (b) -1
 - (c) +3
 - (d) -3
13. The complex salt can be made by the combination of $[Co^{III}(NH_3)_5Cl]^x$ with: [Pb. CET 2001]
 - (a) PO_4^{3-}
 - (b) Cl^-
 - (c) $2Cl^-$
 - (d) $2K^+$
14. Which one of the following is an inner orbital complex as well as diamagnetic in behaviour (Atomic number : Zn = 30, Cr = 24, Co = 27, Ni = 28) [CBSE PMT 2005]
 - (a) $[Zn(NH_3)_6]^{2+}$
 - (b) $[Cr(NH_3)_6]^{3+}$
 - (c) $[Co(NH_3)_6]^{3+}$
 - (d) $[Ni(NH_3)_6]^{2+}$
15. The oxidation state of Fe in $K_4[Fe(CN)_6]$ is [Pb. CET 2003; MP PET 2002]
 - (a) +2
 - (b) -2
 - (c) +3
 - (d) +4
16. The number of moles of $AgCl$ precipitate when excess of $AgNO_3$ is added to one mole of $[Cr(NH_3)_4Cl_2]Cl$ is [EAMCET 1998]
 - (a) Zero
 - (b) 1.0
 - (c) 2.0
 - (d) 3.0
17. An anion solution gives a white ppt. With $AgNO_3$ solution. The ppt. dissolves in dil. ammonia due to the formation of [MP PMT 1997]
 - (a) $AgNO_3$
 - (b) NH_4NO_3
 - (c) $[Ag(NH_3)_2]Cl$
 - (d) $[Ag(NH_3)_2]Br$
18. The diamagnetic specie is [AIIMS 2005]
 - (a) $[Ni(CN)_4]^{2-}$
 - (b) $[NiCl_4]^{2-}$
 - (c) $[CoCl_4]^{2-}$
 - (d) $[CoF_6]^{2-}$

- (d) Mohr's salt ($FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$) is a double salt.
- (a) $[Pt(NH_3)_6]Cl_4 \rightleftharpoons [Pt(NH_3)_6]^{4+} + 4Cl^-$ (5 ions).
- (b) $[Co(en)_2Cl_2]$ has 2 geometrical isomers & 2 optical isomers.

- (c) The organometallic compound of Mg is known as Grignard reagent ($R-Mg-X$).
- (d) As all the ligands are weak so they do to induce pairing of electrons so they show paramagnetism.
- (d) In $[Fe(CO)_5]$, $x + 5(0) = 0$, so oxidation number of Fe is zero.
- (a) Atoms present with in co-ordination sphere do not ionise.
- (d) Co-ordination no. is 6
oxidation state in $[X(SO_4)(NH_3)_5]Cl$ is

$$x - 2 + 0 - 1 = 0, \quad x = +3.$$

- (b) $[NiCl_4]^{2-}$
O.N. of $Ni = +2$

Which has two unpaired electrons that is why it is paramagnetic.

- (d) $AgCl + NH_3 \rightarrow [Ag(NH_3)_2]Cl$
Diammine silver(I)chloride
- (b) $1 \times (+1) + x + 4 \times (0) = 0$
 $1 + x = 0 \Rightarrow x = -1$ Oxidation number of $Co = -1$.
- (c) In the complex ion $[Co^{(III)}(NH_3)_5Cl]^x$, charge on the complex ion

$$x = 3 + (0 \times 5) + (-1)$$

$$x = 3 - 1 = 2$$

Hence, it will combine with that species which have -2 charge to produce a neutral complex salt. So it will combine with $2Cl^-$ to produce $[Co(NH_3)_5Cl]Cl_2$ complex.

- (c) $[Co(NH_3)_6]^{3+}$

O. N. of $Co = +3$

Due to paired e^- it is diamagnetic.

- (a) $4 \times (+1) + x + 6 \times (-1) = 0$
or $x = +6 - 4 = +2$
Oxidation state of $Fe = +2$
- (b) In this complex chloride ion in the form of ionic isomerism and show primary valency.

$AgNO_3$ is added in excess then result precipitation will occur.

- (c) $AgNO_3 + Cl^- \rightarrow AgCl + NO_3^-$

- (a) $[Ni(CM)]$

Tips & Tricks

✍ **Badecker reaction** : This reaction involves the following chemical change.

✍ **Everitt's salt** : It is $K_2[Fe(CN)_6]$ obtained by reduction of prussian blue.

✍ **Masking** : Masking is the process in which a substance without physical separation of it is so transformed that it does not enter into a particular reaction e.g., masking of Cu^{2+} by CN^- ion.

✍ **Macrocyclic effect** : This term refers to the greater thermodynamic stability of a complex with a cyclic polydentate ligand when compared to the complex formed with a non-cyclic ligand. e.g., $Zn(II)$ complex with ligand;

✍ **Prussian blue** and **Turnbull's blue** is pot. ferric ferrocyanide. However colour of Turnbull's blue is less intense than prussian blue. Decrease in colour is due to the presence in it of a white compound of the formula $K_2\{Fe[Fe(CN)_6]\}$ named as potassium ferrous ferrocyanide.

✍ Crystal field theory explains why certain geometries are more favoured than other by certain metals in terms of crystal field stabilization energies.

✍ The colour of complexes are explained in terms of electronic transitions between the various d orbitals of different energies.

✍ In octahedral complexes, the energy of the d_{z^2} and $d_{x^2-y^2}$ orbitals increases much more than the energy of the d_{xy}, d_{yz}, d_{xz} orbitals. The potential energy increases as a result of repulsive interactions. The greater the repulsion, greater is the increases in energy.

✍ Ligands with larger groups from unstable rings than the ligands with smaller groups. This is ascribable to steric hinderance produced by a larger group.

✍ When Ca or Mg forms complexes with EDTA, the pH of the solution decreases.

✍ The copper sulphate solution e.g., turns deep blue when excess of ammonia is added. This is also due to the formation of $[Cu(NH_3)_4]SO_4$.

✍ Co-ordination compound with a general formula MA, MAB or $MABCD$ do not show any geometric isomerism.

✍ **Flexidentate character** : polydentate ligand are said to have flexidentate character if they do not use all its donar atoms to get coordinated to the metal ion e.g., EDTA generally act as a hexadentate ligand but it can also act as a pentadentate and tetradentate ligand.

✍ Octahedral complex of the type $[M(ABCDEF)]$ have 15 different geometrical isomers with a pair of enantiomers. Although a few geometrical isomer have been prepared but none has been resolved e.g., $[Pt(Py)(NH)(NO)(Cl)(Br)I]$.

Ordinary Thinking

Objective Questions

Basic Terms

- In $K_4Fe(CN)_6$
 - (CN) are linked with primary valency
 - (CN) are linked with secondary valency
 - K are linked with secondary valency
 - K are linked with non-ionic valency
- The co-ordination number of copper in cuprammonium sulphate is
 - 2
 - 6
 - 4
 - 4
- Which of the following acts as a bidentate ligand in complex formation
 - Acetate
 - Oxalate
 - Thiocyanate
 - EDTA
- The co-ordination number of cobalt in the complex $[Co(en)_2Br_2]Cl_2$ is
 - 2
 - 6
 - 5
 - 4
- Which of the following ligands forms a chelate
 - Acetate
 - Oxalate
 - Cyanide
 - Ammonia
- According to Werner's theory
 - Primary valency can be ionized
 - Secondary valency can be ionized
 - Primary and secondary valencies both cannot be ionized
 - Only primary valency cannot be ionized
- Which of the following is not true for ligand-metal complex
 - Larger the ligand, the more stable is the metal-ligand bond
 - Highly charged ligand forms strong bond
 - Larger the permanent dipole moment of ligand, the more stable is the bond
 - Greater the ionization potential of central metal, the stronger is the bond
- What is the co-ordination number of the metal in $[Co(en)_2Cl_2]^+$
 - 4
 - 5
 - 6
 - 3
- Bidentate ligand is
 - CN^-
 - Ethylene diammine (en)
 - SCN^-
 - EDTA
- The coordination number of Pt in $[Pt(NH_3)_4Cl_2]^{++}$ ion is
 - 2
 - 4
 - 6
 - 8
- Which is the example of hexadentate ligand
 - 2, 2'-dipyridyl
 - Dimethyl glyoxime
 - Aminodiacetate ion
 - Ethylene diammine tetra acetate ion [EDTA]
- The coordination number of a metal in coordination compounds is
 - Same as primary valency

- (b) Sum of primary and secondary valencies
(c) Same as secondary valency
(d) None of these
13. Ligand in a complex salt are [KCET 1992]
(a) Anions linked by coordinate bonds to a central metal atom or ion
(b) Cations linked by coordinate bonds to a central metal atom or ion
(c) Molecules linked by coordinate bonds to a central metal atom or ion
(d) Ions or molecules linked by coordinate bonds to a central metal atom or ion
14. A group of atoms can function as a ligand only when [KCET 1989; DCE 1999; MP PMT 2000]
(a) It is a small molecule
(b) It has an unshared electron pair
(c) It is a negatively charged ion
(d) It is a positively charged ion
15. Which of the following complexes show six coordination number [RPET 2000]
(a) $[Zn(CN)_4]^{2-}$ (b) $[Cr(H_2O)_6]^{3+}$
(c) $[Cu(CN)_4]^{2-}$ (d) $[Ni(NH_3)_4]^{2+}$
16. The number of ions formed when cuprammonium sulphate is dissolved in water is [KCET 1993]
(a) 1 (b) 2
(c) 4 (d) Zero
17. The coordination number of Cu in complex $[Cu(H_2O)_4]^{++}$ is
(a) 4 (b) 3
(c) 2 (d) 1
18. The primary valence of the metal ion in the co-ordination compound $K_2[Ni(CN)_4]$ is
(a) Four (b) Zero
(c) Two (d) Six
19. The metal which does not form a polynuclear carbonyl is
(a) Mn (b) Co
(c) Cr (d) Fe
20. Which one of the following forms with an excess of CN^- (Cyanide) a complex having coordination number two [AIIMS 2004]
(a) Cu^+ (b) Ag^+
(c) Ni^{2+} (d) Fe^{2+}
21. According to Lewis the ligands are [MP PMT 2002]
(a) Acidic in nature
(b) Basic in nature
(c) Neither acidic nor basic
(d) Some are acidic and others are basic
22. The coordination number of a central metal atom in a complex is determined by [AIEEE 2004]
(a) The number of ligands around a metal ion bonded by sigma and pi-bonds both.
(b) The number around a metal ion bonded by pi-bonds
(c) The number of ligands around a metal ion bonded by sigma bonds
(d) The number of only anionic ligands bonded to the metal ion
23. In the extraction of which of the following, complex ion forms
(a) Cu (b) Ag
(c) Fe (d) Na
24. Potassium ferrocyanide is a [AFMC 2000]
(a) Normal salt (b) Mixed salt
- (c) Double salt (d) Complex salt
25. A monodentate ligand has
(a) One co-ordinate site
(b) Two co-ordinate sites
(c) Any number of co-ordinate sites
(d) No capacity to co-ordinate
26. EDTA has coordination number [AFMC 2004]
(a) 3 (b) 4
(c) 5 (d) 6
27. Among the properties (a) reducing (b) oxidising (c) complexing, the set of properties shown by CN^- ion towards metal species is
(a) c, a (b) b, c
(c) a, b (d) a, b, c
28. That ion or molecule which forms a complex compound with transitional metal ion is called
(a) Recipient (b) Ligand
(c) Coordinate ion (d) No special name
- Coordination number of Zn in ZnS (zinc blende) is [Orissa JEE 2004]
(a) 6 (b) 4
(c) 8 (d) 12
30. Wilkinson's catalyst used as a homogeneous catalyst in the hydrogenation of alkenes contains
(a) Iron (b) Aluminium
(c) Rhodium (d) Cobalt
31. Given the molecular formula of the hexa coordinated complexes (A) $CoCl_3.6NH_3$ (B) $CoCl_3.5NH_3$ (C) $CoCl_3.4NH_3$. If the number of co-ordinated NH_3 molecules in A, B and C respectively are 6, 5 and 4, the primary valency in (A), (B) and (C) are: [DCE 2003]
(a) 6, 5, 4 (b) 3, 2, 1
(c) 0, 1, 2 (d) 3, 3, 3
32. Generally, a group of atoms can function as a ligand if [MP PET 1996]
(a) They are positively charged ions
(b) They are free radicals
(c) They are either neutral molecules or negatively charged ions
(d) None of these
33. The ligand in potassium ferricyanide is
(a) K^+ (b) CN^-
(c) Fe^{3+} (d) $(CN)_6$
34. Co-ordination number of aluminum is [MHCET 2004]
(a) 8 (b) 6
(c) 12 (d) 4
35. In $K_4Fe(CN)_6$, Fe is in the form of
(a) An atom (b) An ion
(c) Cationic complex (d) Anionic complex
36. Which of the following ligands is expected to bidentate [CBSE PMT 1994]
(a) Br (b) $C_2O_4^{2-}$
(c) CH_3NH_2 (d) $CH_3C \equiv N$
37. In the compound lithium tetrahydroaluminate, the ligand is [AIIMS 1997]
(a) H^+ (b) H^-
(c) H [MP PET 1989] (d) None of these
38. Which of the following is the odd one out [MP PET 1996]
(a) Potassium ferrocyanide
(b) Ferrous ammonium sulphate
(c) Potassium ferricyanide
(d) Tetrammine copper (II) sulphate

39. The basic ligand is
(a) NH_3 (b) CN^-
(c) F^- (d) All
40. The negative ligand is
(a) Aqua (b) Sulphato
(c) Carboxyl (d) Nitro sodium
41. Which has yellow colour
(a) Potassium cobaltinitrite
(b) Potassium hexanitro cobaltate (III)
(c) Fischer's salt
(d) All the above
42. Ligands, in complex compounds [MP PMT 2003]
(a) Accept e^- -pair
(b) Donate e^- -pair
(c) Neither accept e^- -pair nor donate
(d) All of these happen
43. Which of the following is a common donor atom in ligands [BHU 2001]
(a) Arsenic (b) Nitrogen
(c) Oxygen (d) Both (b) and (c)
44. Trunbull's blue is a compound [KCET 1993]
(a) Ferricyanide (b) Ferrous ferricyanide
(c) Ferrous cyanide (d) Ferriferrocyanide
45. Tollen's reagent is [KCET 1990]
(a) $[Ag(NH_3)_2]^+$ (b) Ag_2O
(c) $[Cu(OH)_4]^{2-}$ (d) Cu_2O
46. Finely divided iron combines with CO to give [UPSEAT 2002]
(a) $Fe(CO)_5$ (b) $Fe_2(CO)_9$
(c) $Fe_2(CO)_{12}$ (d) $Fe(CO)_6$
47. In a complex, the highest possible coordination number is
(a) 6 (b) 12
(c) 4 (d) 8
48. The number of neutral molecules or negative groups attached to the central metal atom in a complex ion is called
(a) Atomic number (b) Effective atomic number
(c) Coordination number (d) Primary valency
49. EDTA combines with cations to form
(a) Ion-exchange resins (b) Chelates
(c) Clathrates (d) Polymers
50. An example of a double salt is [MP PET 2001]
(a) Bleaching powder (b) Hypo
(c) $K_4[Fe(CN)_6]$ (d) Potash alum
51. In complex compounds, metal ligand bond is
(a) Coordinate bond (b) Hydrogen bond
(c) Ionic bond (d) Covalent bond
52. Ammonia forms the complex ion $[Cu(NH_3)_4]^{2+}$ with copper ions in alkaline solutions but not in acidic solution. What is the reason for it [AIIEE 2003]
(a) In acidic solutions hydration protects copper ions
(b) In acidic solutions protons coordinate with ammonia molecules forming NH_4^+ ions and NH_3 molecules are not available
(c) In alkaline solutions insoluble $Cu(OH)_2$ is precipitated which is soluble in excess of any alkali
(d) Copper hydroxide is an amphoteric substance
53. Zeigler—Natta catalyst is used for which type of reaction
(a) Hydrogenation (b) Polymerization
(c) Oxidation (d) Reduction
54. Which of the following is not considered as an organometallic compound. [AIIMS 2004]
(a) Cis-platina (b) Ferrocene
(c) Zeise's salt (d) Grignard reagent
55. Which one is organometallic compound [MP PMT 2004]
(a) Lithium methoxide (b) Lithium dimethyl amide
(c) Lithium acetate (d) Methyl lithium
56. An aqueous solution of potash alum gives [UPSEAT 2004]
(a) Two types of ions (b) Only one type of ion
(c) Four types of ions (d) Three types of ions
57. Carnallite in solution in H_2O , shows the properties of [DCE 2003]
(a) K^+, Mg^{2+}, Cl^- (b) $K^+, Cl^-, SO_4^{2-}, Br^-$
(c) K^+, Mg^{2+}, CO_3^{2-} (d) K^+, Mg^{2+}, Cl^-, Br^-
58. What is the co-ordination number of cobalt in $Co(NH_3)_3Cl_3$
(a) 3 (b) 4
(c) 5 (d) 6
59. The formula of alum is [Pb. CET 2002]
(a) $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$
(b) $K_4[Fe(CN)_6]$
(c) $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 6H_2O$
(d) $Na_2CO_3 \cdot 10H_2O$
60. Number of ions present in $K_4[Fe(CN)_6]$ [Pb. CET 2000]
(a) 2 (b) 10
(c) 3 (d) 5
61. CH_3MgI is an organometallic compound due to [DCE 2002]
(a) $Mg-I$ bond (b) $C-I$ bond
(c) $C-Mg$ bond (d) $C-H$ bond
62. What is the EAN of nickel in $Ni(CO)_4$ [BVP 2003]
(a) 34 (b) 35
(c) 32 (d) 36

Nomenclature, Oxidation state and EAN number

1. How many ions are produced in aqueous solution of $[Co(H_2O)_6]Cl_2$ [RPMT 2002]
(a) 2 (b) 3
(c) 4 (d) 6
2. IUPAC name of $[Pt(NH_3)_3(Br)(NO_2)Cl]Cl$ is [CBSE PMT 1998]
(a) Triamminechlorobromonitroplatinum (IV) chloride
(b) Triamminebromonitrochloroplatinum (IV) chloride
(c) Triamminebromochloronitroplatinum (IV) chloride
(d) Triamminenitrochlorobromoplatinum (IV) chloride
3. Oxidation state of nitrogen is incorrectly given for [UPSEAT 2000, 01]

- | Compound | Oxidation state |
|--------------------------|-----------------|
| (a) $[Co(NH_3)_5Cl]Cl_2$ | 0 |
| (b) NH_2OH | -1 |
| (c) $(N_2H_5)_2SO_4$ | +2 |
| (d) Mg_3N_2 | -3 |
4. The formula of dichloro *bis* (urea) copper (II) is [CBSE PMT 1997]
- (a) $[Cu\{O = C(NH_2)_2\}Cl_2]$
 (b) $[CuCl_2\{O = C(NH_2)_2\}_2]$
 (c) $[Cu\{O = C(NH_2)_2\}Cl]Cl$
 (d) $[CuCl_2]\{O = C(NH_2)_2\}_2$
5. The IUPAC name of the complex $[Pt(NH_3)_2Cl_2]$ is
- (a) Platinum (II) diammino dichloride
 (b) Diammino dichloro platinate (IV)
 (c) *Bis* (ammino) dichloro platinum (IV)
 (d) Dichloro diammine platinum (II)
6. Correct formula of diammine silver (I) chloride is
- (a) $Ag(NH_3)Cl$ (b) $Ag(NH_2)Cl$
 (c) $[Ag(NH_3)_2]Cl$ (d) $[Ag(NH_2)_2]Cl$
7. The formula of sodium nitroprusside is [AIIMS 1992]
- (a) $Na_4[Fe(CN)_5NOS]$ (b) $Na_2[Fe(CN)_5NO]$
 (c) $NaFe[Fe(CN)_6]$ (d) $Na_2[Fe(CN)_6NO_2]$
8. The correct name of $[Pt(NH_3)_4Cl_2][PtCl_4]$ is [MP PET 2003]
- (a) Tetraammine dichloro platinum (iv) tetrachloro platinate (ii)
 (b) Dichloro tetra ammine platinum (iv) tetrachloro platinate (ii)
 (c) Tetrachloro platinum (ii) tetraammine platinate (iv)
 (d) Tetrachloro platinum (ii) dichloro tetraammine platinate (iv)
9. Correct formula of potassium ferrocyanide is [CBSE PMT 1988]
- (a) $K_4[Fe(CN)_6]$ (b) $K_2[Fe(CN)_6]H_2O$
 (c) $K_3[Fe(CN)_6]$ (d) None of these
10. The IUPAC name of $[Co(NH_3)_3(NO_2)_3]$ is
- (a) Trinitrotriammine cobalt (III)
 (b) Trinitrotriammine cobalt (II)
 (c) Trinitrotriammine cobalt (III) ion
 (d) Trinitritriammine cobaltate (III)
11. In $K_4[Fe(CN)_6]$ the E.A.N. of Fe is [DCE 2000]
- (a) 33 (b) 35
 (c) 36 (d) 26
12. Which of the following pairs is not correctly matched [MP PET 1993]
- (a) Effective atomic number of Pt in $[PtCl_6]^{2-} = 84$
 (b) Absorption peak for $[Cr^{III}(NH_3)_6]^{+3} = 21680cm^{-1}$
 (c) Crystal field stabilization energy of d^2 in weak ligand field = $(-0.8\Delta_0)$
 (d) Example of weak ligand field for d^5 configuration = $[Mn^{II}F_6]^{-4}$
13. The oxidation number of chromium in sodium tetrafluoro oxochromate complex is
- (a) II (b) IV
 (c) VI (d) III
14. The IUPAC name of $K_4[Fe(CN)_6]$ is [CBSE PMT 1990; MP PET 1992; MP PMT 1995, 97; Kurukshetra CET 2002]
- (a) Potassium hexacyanoferrate (II)
 (b) Potassium ferrocyanide
 (c) Tetrapotassium hexacyanoferrate (II)
 (d) Tetrapotassium ferrous hexacyanide (II)
15. The IUPAC name of $[Ni(CO)_4]$ is [RPET 1999]
- (a) Tetra carbonyl nickel (II)
 (b) Tetra carbonyl nickel (0)
 (c) Tetra carbonyl nickelate (II)
 (d) Tetra carbonyl nickelate (0)
16. The correct nomenclature for $Fe_4[Fe(CN)_6]_3$ is [MP PMT 1994]
- (a) Ferroso-ferric cyanide
 (b) Ferric-ferrous hexacyanate
 (c) Iron (III) hexacyanoferrate (II)
 (d) Hexacyanoferrate (III-II)
17. The IUPAC name of compound $Na_3[Co(ONO)_6]$ will be [MP PMT 2000]
- (a) Hexanitritocobalt (III) sodium
 (b) Sodium cobalt nitrite
 (c) Sodium hexanitrocobaltate (III)
 (d) Sodium hexanitritocobaltate (III)
18. In which of the following complexes oxidation state of metal is zero
- (a) $[Pt(NH_3)_2Cl_2]$ (b) $[Cr(CO)_6]$
 (c) $[Cr(NH_3)_3Cl_3]$ (d) $[Cr(en)_2Cl_2]$
19. The oxidation number of Cr in $[Cr(NH_3)_6]Cl_3$ is [CBSE PMT 2001]
- (a) 8 (b) 6
 (c) 4 (d) 3
20. In $[Ni(NH_3)_4]SO_4$, the E.A.N. of Ni is
- (a) 34 (b) 35
 (c) 36 (d) 37
21. IUPAC name of $[Co(ONO)(NH_3)_5Cl_2]$ is [AMU 2002]
- (a) Pentaammine nitro cobalt (III) chloride
 (b) Pentaammine nitrito cobalt (III) chloride
 (c) Pentaammine nitroso cobalt (III) chloride
 (d) Pentaammine oxo-nitro cobalt (III) chloride
22. The oxidation number of Pt in $[Pt(C_2H_4)Cl_3]^-$ is [MNR 1993]
- (a) +1 (b) +2
 (c) +3 (d) +4
23. The oxidation state of cobalt in the complex compound $[Co(NH_3)_6]Cl_3$ is
- (a) +3 (b) +6

- (c) + 5 (d) + 2
24. The correct IUPAC name of potassium cuprochloride is
 (a) Potassium copper (I) tetrachloride
 (b) Potassium tetrachlorocuprate (I)
 (c) Tetrachloropotassium cuprate (I)
 (d) Tetrachlorocopper (I) potassiate
25. The effective atomic number of cobalt in the complex $[Co(NH_3)_6]^{3+}$ is [MP PET 2003]
 (a) 36 (b) 33
 (c) 24 (d) 30
26. IUPAC name of $K_3Fe(CN)_6$ is [MP PMT 1993; MP PET 1997]
 (a) Potassium ferrocyanide (II)
 (b) Potassium hexaferrocyanate (III)
 (c) Potassium ferrohexacyanate (II)
 (d) Potassium hexacyanoferrate (III)
27. The EAN of iron in potassium ferricyanide is [Pb. CET 2000]
 (a) 18 (b) 54
 (c) 35 (d) 23
28. In the coordination compound, $K_4[Ni(CN)_4]$ oxidation state of nickel is [AIEEE 2003]
 (a) -1 (b) 0
 (c) +1 (d) +2
29. According to IUPAC nomenclature sodium nitroprusside is named is [CBSE PMT 2003]
 (a) Sodium pentacyanonitrosyl ferrate (III)
 (b) Sodium nitroferrocyanide
 (c) Sodium nitroferrocyanide
 (d) Sodium pentacyanonitrosyl ferrate (II)
30. Pick out the complex compound in which the central metal atom obeys EAN rule strictly [KCET 2003]
 (a) $K_4[Fe(CN)_6]$ (b) $K_3[Fe(CN)_6]$
 (c) $[Cr(H_2O)_6]Cl_3$ (d) $[Cu(NH_3)_4]SO_4$
31. Which of the following is wrong statement [BHU 2003]
 (a) $Ni(CO)_4$ has oxidation number + 4 for Ni
 (b) $Ni(CO)_4$ has zero oxidation number for Ni
 (c) Ni is metal
 (d) CO is gas
32. Oxidation state of Fe in $K_3[Fe(CN)_6]$ [RPMT 2002]
 (a) 2 (b) 3
 (c) 0 (d) None of these
33. Which complexes have zero oxidation state
 (a) Carbonyl (b) Ferrocyanide
 (c) Amine (d) Cyanide
34. The proper name for $K_2[PtCl_6]$ is [MH CET 2002]
 (a) Potassium platinum hexachloride
 (b) Potassium hexachloro platinum IV
 (c) Potassium hexachloro platinate IV
 (d) Potassium hexachloro platinum
35. IUPAC name of $K_3[Al(C_2O_4)_3]$ is called [MP PMT 1993, 02, 03]
 (a) Potassium alumino oxalato
 (b) Potassium aluminium (III) trioxalato
 (c) Potassium trioxalato aluminate (III)
 (d) Potassium trioxalato aluminate (IV)
36. The I.U.P.A.C. name of $K_3[Ir(C_2O_4)_3]$ is [MP PMT 2001]
 (a) Potassium tri oxalato iridium (III)
 (b) Potassium tri oxalato iridate (III)
 (c) Potassium tris (oxalato) iridium (III)
 (d) Potassium tris (oxalato) iridate (III)
37. The charge on $[Ag(CN)_2]^-$ complex is [AIIMS 2001]
 (a) -1 (b) +1
 (c) +2 (d) +3
38. The IUPAC name of $[Co(NH_3)_6]Cl_3$ is [IIT-JEE 1994]
 (a) Hexammine cobalt (III) chloride
 (b) Hexammine cobalt (II) chloride
 (c) Triammine cobalt (III) trichloride
 (d) None of these
39. IUPAC name of $[Co(NH_3)_3(H_2O)_2Cl]Cl_2$ is [MP PET 1994]
 (a) Diaquachlorodiammine cobalt (III) chloride
 (b) Triamminediaquachloro cobalt (III) chloride
 (c) Chlorodiamminediaqua cobalt (III) chloride
 (d) Diamminediaquachloro cobalt (II) chloride
40. Dichloro diammine platinum (II) complex has the formula [MP PMT 1997]
 (a) $PtCl_2(NH_3)_2$ (b) $Pt(R.(NH_3)_2)Cl_2$
 (c) $[PtCl_2(NH_3)_2]$ (d) $[Pt.R.(NH_3)_2]Cl_2$
41. The formula of potassiumdicyano bis (oxalato) nickelate (II) is
 (a) $K_4[Ni(CN)_2(Ox)_2]$ (b) $K_3[Ni_2(CN)_2(Ox)_2]$
 (c) $K[Ni(CN)(Ox)_2]$ (d) $K_2[Ni(CN)_2(Ox)_2]$
42. The value of x which appears in the complex $[Ni(CN)_4]^x$ is
 (a) + 2 (b) - 2
 (c) 0 (d) 4
43. Pick the correct name of $[Co(NH_3)_5Cl]Cl_2$ [AMU 2001]
 (a) Chloropentammine cobalt (III)
 (b) Pentammine cobalt (III) chloride
 (c) Chloropentammine cobalt (III) chloride
 (d) Chloropentammine cobalt (II) chloride
44. The valency of cuprammonium ion is
 (a) + 4 (b) + 2
 (c) - 2 (d) - 4
45. In which of the following compounds transition metal has zero oxidation state [CBSE PMT 1999]
 (a) CrO_5 (b) $NH_2.NH_2$
 (c) $NOClO_4$ (d) $[Fe(CO)_5]$
46. The complex chlorocompound diaquatrammine cobalt (III) chloride is represented as [CBSE PMT 2002]
 (a) $[Co(NH_3)_3(H_2O)_3]Cl_2$
 (b) $[Co(NH_2)_3(H_2O)_2]Cl_2$
 (c) $[CoCl(NH_3)_3(H_2O)_2]Cl_3$
 (d) $[CoCl(NH_3)_3(H_2O)_2]Cl_2$
47. The complex compound $[Co(NH_3)_3NO_2ClCN]$ is named as
 (a) Chlorocyanonitrotriammine cobalt (III)
 (b) Nitrochlorocyanotriammine cobalt (III)
 (c) Cyanonitrochlorotriammine cobalt (III)
 (d) Triamminenitrochlorocyno cobalt (III)
48. The oxidation number of Pt in $[Pt(C_2H_4)Cl_3]^-$ is

[UPSEAT 1999, 01]

- (a) +1 (b) +2
(c) +3 (d) +4
49. What is the structural formula of lithium tetrahydridoaluminate
(a) $Al[LiH_4]$ (b) $Al_2[LiH_4]_3$
(c) $Li[AlH_4]$ (d) $Li[AlH_4]_2$
50. IUPAC name for $K[Ag(CN)_2]$ is
(a) Potassium argentocyanide
(b) Potassium silver cyanide
(c) Potassium dicyanoargentate (I)
(d) Potassium dicyanosilver (II)
51. The oxidation state of Co in $[Co(H_2O)_5Cl]^{2+}$ is
(a) +2 (b) +3
(c) +1 (d) +4
52. The chemical formula of diammine silver (I) chloride is [BHU 2004]
(a) $[Ag(NH_3)Cl]$ (b) $[Ag(NH_3)_2Cl]$
(c) $[Ag(NH_3)_2]Cl$ (d) $[Ag(NH_4)_2]Cl$
53. IUPAC name of $[Co(NH_3)_5NO_2]Cl_2$ [Pb. CET 2000]
(a) Pentamminenitrocobalt (III) chloride
(b) Pentamminenitrosocobalt (III) chloride
(c) Pentamminenitrocobalt (II) chloride
(d) None of these
54. The pair of the compounds in which both the metals are in the highest possible oxidation state is [IIT-JEE (Screening) 2004]
(a) $[Fe(CN)_6]^{3-}$, $[Co(CN)_6]^{3-}$
(b) CrO_2Cl_2 , MnO_4^-
(c) TiO_3 , MnO_2
(d) $[Co(CN)_6]^{3-}$, MnO_3
55. The IUPAC name of $[Cr(NH_3)_6]^{3+}$ is [Pb. CET 2001]
(a) Hexamminechromium (VI) ion
(b) Hexamminechromium (III) ion
(c) Hexamminechromium (II) ion
(d) Hexamminechloride
56. The IUPAC name of $K_2[Cr(CN)_2O_2(O)_2(NH_3)]$ is [DCE 2003]
(a) Potassium ammine dicyano dioxoperoxochromate (VI)
(b) Potassium ammine cyano peroxy dioxo chromium (VI)
(c) Potassium ammine cyano peroxy dioxo chromiun (VI)
(d) Potassium ammine cyano peroxy dioxo chromatic (IV)
57. The IUPAC name of the coordination compound $K_3[Fe(CN)_6]$ is [AIEEE 2005]
(a) Potassium hexacyanoferrate (II)
(b) Potassium hexacyanoferrate (III)
(c) Potassium hexacyanoiron (II)
(d) Tripotassium hexacyanoiron (II)
58. Which compound is zero valent metal complex [KCET 2005]
(a) $[Cu(NH_3)_4]SO_4$ (b) $[Pt(NH_3)_2Cl_2]$
(c) $[Ni(CO)_4]$ (d) $K_3[Fe(CN)_6]$

1. Which one of the following octahedral complexes will not show geometric isomerism (A and B are monodentate ligands)
(a) $[MA_5B]$ (b) $[MA_2B_4]$
(c) $[MA_3B_3]$ [MP PMT 2003] (d) $[MA_4B_2]$
2. The number of unpaired electrons in the complex ion $[CoF_6]^{3-}$ is (Atomic no. of Co = 27) [CBSE PMT 2003]
(a) Zero (b) 2
(c) 3 (d) 4
3. Which would exhibit co-ordination isomerism
(a) $[Cr(NH_3)_6][Co(CN)_6]$ (b) $[Co(en)_2Cl_2]$
(c) $[Cr(NH_3)_6]Cl_3$ (d) $[Cr(en)_2Cl_2]^+$
4. $[Co(NH_3)_5NO_2]Cl_2$ and $[Co(NH_3)_5(ONO)]Cl_2$ are related to each other as
(a) Geometrical isomers (b) Optical isomers
(c) Linkage isomers (d) Coordination isomers
5. $[Co(NH_3)_5Br]SO_4$ and $[Co(NH_3)_5SO_4]Br$ are examples of which type of isomerism [MP PMT 1993, 94, 95; MP PET 1997; MP PET/PMT 1998]
(a) Linkage (b) Geometrical
(c) Ionization (d) Optical
6. $[Co(NH_3)_4Cl_2]NO_2$ and $[Co(NH_3)_4Cl.NO_2]Cl$ are isomers [MP PMT 1993; MP PET 1995, 2001]
(a) Geometrical (b) Optical
(c) Linkage (d) Ionization
7. Which would exhibit ionisation isomerism [MP PET 1997]
(a) $[Cr(NH_3)_6]Cl_3$ (b) $[Co(NH_3)_5Br]SO_4$
(c) $[Cr(en)_2Cl_2]$ (d) $[Cr(en)_3Cl_3]$
8. $[Ti(H_2O)_6]^{+3}$ is paramagnetic in nature due to [RPMT 2002]
(a) One unpaired e^- (b) Two unpaired e^-
(c) Three unpaired e^- (d) No unpaired e^-
9. Coordination isomerism is caused by the interchange of ligands between the [UPSEAT 2002]
(a) *Cis* and *Trans* structure
(b) Complex cation and complex anion
(c) Inner sphere and outer sphere
(d) Low oxidation and higher oxidation states
10. Which one of the following will not show geometrical isomerism
(a) $[Cr(NH_3)_4Cl_2]Cl$ (b) $[Co(en)_2Cl_2]Cl$
(c) $[Co(NH_3)_5NO_2]Cl_2$ (d) $[Pt(NH_3)_2Cl_2]$
11. Paramagnetic co-ordination compounds contain electrons
(a) No
(b) Both paired and unpaired
(c) Paired
(d) Unpaired
12. Which of the following isomeric pairs shows ionization isomerism
(a) $[Co(NH_3)_6][Cr(CN)_6]$ and $[Cr(NH_3)_6][Co(CN)_6]$
(b) $[Cr(H_2O)_6]Cl_3$ and $[Cr(H_2O)_5Cl]Cl_2.H_2O$
(c) $[Pt(NH_3)_2Cl_2]$ and $[Pt(NH_3)_4][PtCl_4]$
(d) $[Co(NH_3)_5Br]SO_4$ and $[Co(NH_3)_5SO_4]Br$
13. Among the following ions which one has the highest paramagnetism [IIT 1993; U
(a) $[Cr(H_2O)_6]^{3+}$ (b) $[Fe(H_2O)_6]^{2+}$

- (c) $[Cu(H_2O)_6]^{2+}$ (d) $[Zn(H_2O)_6]^{2+}$

14. Amongst $Ni(CO)_4$, $[Ni(CN)_4]^{2-}$ and $[NiCl_4]^{2-}$ [IIT 1991]

(a) $Ni(CO)_4$ and $[NiCl_4]^{2-}$ are diamagnetic and $[Ni(CN)_4]^{2-}$ is paramagnetic

(b) $[NiCl_4]^{2-}$ and $[Ni(CN)_4]^{2-}$ are diamagnetic and $Ni(CO)_4$ is paramagnetic

(c) $Ni(CO)_4$ and $[Ni(CN)_4]^{2-}$ are diamagnetic and $[NiCl_4]^{2-}$ is paramagnetic

(d) $Ni(CO)_4$ is diamagnetic and $[NiCl_4]^{2-}$ and $[Ni(CN)_4]^{2-}$ are paramagnetic

15. $[Co(NH_3)_4Cl_2]^+$ exhibits

(a) Geometrical isomerism (b) Optical isomerism

(c) Bonding isomerism (d) Ionisation isomerism

16. The compound which does not show paramagnetism is [IIT 1992]

(a) $[Cu(NH_3)_4]Cl_2$ (b) $[Ag(NH_3)_2]Cl$

(c) NO (d) NO_2

17. The number of geometrical isomers for $[Pt(NH_3)_2Cl_2]$ is [CBSE PMT 1995]

(a) Two (b) One

(c) Three (d) Four

18. The pair of complex compounds $[Cr(H_2O)_6Cl_3]$ and $[Cr(H_2O)_5Cl]Cl_2 \cdot H_2O$ are an example of [MP PMT 1997]

(a) Linkage isomerism (b) Ionisation isomerism

(c) Coordination isomerism (d) Hydrate isomerism

19. The number of geometrical isomers of the complex $[Co(NO_2)_2(NH_3)_2]$ is [CBSE PMT 1997]

(a) 2 (b) 3

(c) 4 (d) 0

20. The type of isomerism present in nitropentamine chromium (III) chloride is [AIEEE 2002]

(a) Optical (b) Linkage

(c) Ionization (d) Polymerisation

21. Which of the following compounds exhibits linkage isomerism

(a) $[Co(en)_3]Cl_3$ (b) $[Co(NH_3)_6][Cr(CN)_6]$

(c) $[Co(en)_2NO_2Cl]Br$ (d) $[Co(NH_3)_5Cl]Br_2$

22. Pick out from the following complex compounds, a poor electrolytic conductor in solution [MP PMT 1994]

(a) $K_2[PtCl_6]$ (b) $[Co(NH_3)_3(NO_2)_3]$

(c) $K_4[Fe(CN)_6]$ (d) $[Cu(NH_3)_4]SO_4$

23. The possible number of optical isomers in $[Co(en)_2Cl_2]^+$ are

(a) 2 (b) 3

(c) 4 (d) 6

24. Magnetic moment of $[Cu(NH_3)_4]^{2+}$ ion is [RPET 2003]

(a) 1.414 (b) 1.73

(c) 2.23 (d) 2.38

25. What is true for $[Fe(CN)_6]^{3-}$ and $[FeF_6]^{3-}$ [RPET 1999]

(a) Both are paramagnetic

(b) Only $[Fe(CN)_6]^{3-}$ is paramagnetic

(c) Only $[FeF_6]^{3-}$ is paramagnetic

(d) Both are diamagnetic

26. Which of the following is paramagnetic [AFMC 1997]

(a) $[Ni(CO)_4]$ (b) $[Co(NH_3)_6]^{3+}$

(c) $[Ni(CN)_4]^{2-}$ (d) $[NiCl_4]^{2-}$

27. The total number of possible isomers for the complex compound $[Cu^{II}(NH_3)_4][Pt^{II}Cl_4]$ are [CBSE PMT 1998; DPMT 2004; J & K CET 2005]

(a) 3 (b) 4

(c) 5 (d) 6

28. Which one of the following shows maximum paramagnetic character

(a) $[Cr(H_2O)_6]^{3+}$ (b) $[Fe(CN)_6]^{4-}$

(c) $[Fe(CN)_6]^{3-}$ (d) $[Cu(H_2O)_6]^{2+}$

29. The complexes $[Co(NH_3)_3][Cr(C_2O_4)_3]$ and $[Cr(NH_3)_6][Co(C_2O_4)_3]$ [AMU 2002]

(a) Linkage isomerism (b) Geometrical isomerism

(c) Coordination isomerism (d) Ionisation isomerism

30. Which of the following exhibits highest molar conductivity [MP PET 1994]

(a) $[Co(NH_3)_6]Cl_3$ (b) $[Co(NH_3)_5Cl]Cl_2$

(c) $[Co(NH_3)_4Cl_2]Cl$ (d) $[Co(NH_3)_3Cl_3]$

31. Which of the following compounds is colourless [MP PET 1994]

(a) $Cu_2(CH_3COO)_4 \cdot 2H_2O$ (b) Cu_2Cl_2

(c) $CuSO_4 \cdot 5H_2O$ (d) $[Cu(NH_3)_4]SO_4 \cdot 4H_2O$

32. The type of magnetism exhibited by $[Mn(H_2O)_6]^{2+}$ ion is [IIT 1994]

(a) Paramagnetism (b) Diamagnetism

(c) Both (a) and (b) (d) None of these

33. The number of isomers possible for square planar complex $K_2[PdClBr_2(SCN)]$ is [MP PET 1994]

(a) 2 (b) 3

(c) 4 (d) 6

34. The number of unpaired electrons in $Ni(CO)_4$ is [MP PMT 2001]

(a) Zero (b) One

(c) Three (d) Five

35. If the magnetic moment of $[Ag(CN)_2]^{-1}$ is zero, then the number of unpaired electrons will be [MP PET 1995]

(a) 1 (b) 2

(c) 3 (d) Zero

36. $[Pt(NH_3)_4Cl_2]Br_2$ and $[Pt(NH_3)_4Br_2]Cl_2$ are related to each other as [MP PET 1996; AFMC 2000; CBSE PMT 2001]

(a) Optical isomers (b) Coordinate isomers

(c) Ionization isomers (d) Linkage isomers

37. Which of the following complex will show geometrical as well as optical isomerism (en = ethylene diamine) [KCET 1996]

- (a) $Pt(NH_3)_2Cl_2$ (b) $[Pt(NH_3)Cl_4]$
(c) $[Pt(en)_3]^{4+}$ (d) $[Pt(en)_2]Cl_2$
38. Which of the following complexes is diamagnetic [RPMT 1997]
(a) $Ni(CO)_4$ (b) $Ni(Cl_4)^{2-}$
(c) $Ni(Br)_4^{2-}$ (d) $NiCl_2 \cdot 4H_2O$
39. Which one has the highest paramagnetism [AMU 2001]
(a) $Ni(CO)_4$ (b) $[Ni(NH_3)_4]Cl_2$
(c) $[Ni(NH_3)_6]Cl_2$ (d) $[Cu(NH_3)_4]Cl_2$
40. Which of the following coordination compounds would exhibit optical isomerism [CBSE PMT 2004]
(a) *trans*-dicyanobis (ethylenediamine) chromium (III) chloride
(b) *tris*-(ethylenediamine) cobalt (III) bromide
(c) pentaamminenitrocobalt (III) iodide
(d) diamminedichloroplatinum (II)
41. Which of the following does not have optical isomer [AIIMS 2004]
(a) $[Co(NH_3)_3Cl_3]$
(b) $[Co(en)_3]Cl_3$
(c) $[Co(en)_2Cl_2]Cl$ (d) $[Co(en)(NH_3)_2Cl_2]Cl$
42. Change in composition of co-ordination sphere yields which types of isomers [DCE 2002]
(a) Optical (b) Geometrical
(c) Ionisation (d) None of these
43. Types of isomerism shown by $[Cr(NH_3)_5NO_2]Cl_2$ is [DCE 2002]
(a) Optical (b) Ionisation
(c) Geometrical (d) Linkage
44. Which of the following will not give a precipitate with $AgNO_3$
(a) $[Co(NH_3)_3Cl_3]$ (b) $[Co(NH_3)_4Cl_2]Cl$
(c) $[Co(NH_3)_5Cl]Cl_2$ (d) $[Co(NH_3)_6]Cl_3$
45. How many ions are produced from $[Co(NH_3)_6]Cl_3$ in solution
(a) 6 (b) 4
(c) 3 (d) 2
46. The colour of $CoCl_3 \cdot 5NH_3 \cdot H_2O$ is [Kerala (Med.) 2002]
(a) Orange yellow (b) Orange
(c) Green (d) Violet
(e) Pink
47. Which one of the following is expected to be a paramagnetic complex [MP PMT 1991, 2000]
(a) $[Ni(H_2O)_6]^{2+}$ (b) $[Ni(CO)_4]$
(c) $[Zn(NH_3)_4]^{2+}$ (d) $[Co(NH_3)_6]^{+3}$
48. Which one of the following will give a white precipitate with $AgNO_3$ in aqueous medium [MP PMT 1994]
(a) $[Co(NH_3)_5Cl](NO_2)_2$ (b) $[Pt(NH_3)_2Cl_2]$
(c) $[Pt(en)Cl_2]$ (d) $[Pt(NH_3)_4]Cl_2$
49. How many ions will be produced in solution from one molecule of chloropentammine cobalt (III) chloride
(a) 1 (b) 2
(c) 3 (d) 4
50. Which of the following complex will give white precipitate with $BaCl_2$ (aq.) [JIPMER 1997]
(a) $[Co(NH_3)_4SO_4]NO_2$ (b) $[Cr(NH_3)_5SO_4]Cl$
(c) $[Cr(NH_3)_5Cl]SO_4$ (d) Both (b) and (c)
51. The number of precipitable halide ions in the sample $[Pt(NH_3)Cl_2Br]Cl$ will be
(a) 2 (b) 3
(c) 4 (d) 1
52. The colour of tetrammine copper (II) sulphate is
(a) Blue (b) Red
(c) Violet (d) Green
53. The number of ions per mole of a complex $[CoCl_2 \cdot 5NH_3]Cl_2$ in aqueous solution will be [MP PMT 2001]
(a) Nine (b) Four
(c) Three (d) Two
54. How many unpaired electrons are present in the central metal ion of $[CoCl_4]^{2-}$ [Orissa JEE 2005]
(a) 3 (b) 4
(c) 5 (d) 2
55. What is the magnetic moment of $K_3[FeF_6]$ [Orissa JEE 2005]
(a) 5.91 BM (b) 4.89 BM
(c) 3.87 BM (d) 6.92 BM
56. (i) $K_4[Fe(CN)_6]$ (ii) $K_3[Cr(CN)_6]$ (iii) $K_3[Fe(CN)_6]$
(iv) $K_2[Ni(CN)_4]$
Choose the complex which is paramagnetic [Kerala CET 2005]
(a) (i), (ii) and (iii) (b) (i), (iii) and (iv)
(c) (i), (iii) and (iv) (d) (i), (ii) and (iv)
(e) (ii) and (iv)
57. In coordination compound $[Co(en)_2Cl_2]Cl$ which is false [Kerala CET 2005]
(a) Show geometrical Isomerism
(b) Show optical Isomerism
(c) Show ionic Isomerism
(d) A octahedral complex
(e) A cationic complex

[RPET 1999]

Hybridisation and Geometry

1. The correct structural formula of *zeise's salt* is
(a) $K^+[PtCl_3 - \eta^2 - (C_2H_4)]^-$
(b) $K_2[PtCl_3 - \eta^2 - C_2H_4]$
(c) $K^+[PtCl_2 - \eta^2 - (C_2H_4)]Cl^-$
(d) $K^+[PtCl_3(C_2H_4)]^-$
2. The correct order of hybridisations of central atom in NH_3 , $[PtCl_4]^{2-}$, PCl_5 and BCl_3 is [MP PMT 2003]
(a) dsp^2, dsp^3, sp^2 and sp^3
(b) sp^3, sp^3, sp^3d and sp^2
(c) dsp^2, sp^2, sp^3 and dsp^3
(d) dsp^2, sp^3, sp^2 and dsp^3
3. One mole of the complex compound $Co(NH_3)_5Cl_3$, gives 3 moles of ions on dissolution in water. One mole of the same complex reacts with two moles of $AgNO_3$ solution to yield two moles of $AgCl(s)$. The structure of the complex is [AIEEE 2003]

- (a) $[Co(NH_3)_5Cl]Cl_2$
 (b) $[Co(NH_3)_3Cl_3] \cdot 2NH_3$
 (c) $[Co(NH_3)_4Cl_2]Cl \cdot NH_3$
 (d) $[Co(NH_3)_4Cl]Cl_2 \cdot NH_3$
4. Cuprammonium ion $[Cu(NH_3)_4]^{2+}$ is [MP PMT 1997; KCET 2002]
 (a) Tetrahedral (b) Square planar
 (c) Triangular bipyramid (d) Octahedral
5. In the complex $[SbF_5]^{2-}$, sp^3d hybridisation is present. Geometry of the complex is [Pb. PMT 2000]
 (a) Square pyramidal (b) Square bipyramidal
 (c) Tetrahedral (d) Square
6. The type of hybridization involved in the metal ion of $[Ni(H_2O)_6]^{2+}$ complex is
 (a) d^3sp^2 (b) sp^3d^2
 (c) sp^3 (d) dsp^2
7. In the formation of $K_4Fe(CN)_6$, the hybridisation involved is
 (a) sp^2 (b) d^2sp^3
 (c) d^3sp^2 (d) d^4p
8. Which of the following is not true for metal carbonyls [MP PET 1993]
 (a) The oxidation state of the metal in the carbonyls is zero
 (b) The secondary carbonyls are obtained from photo-decomposition
 (c) Metal carbonyls are single bonded species
 (d) $d\pi - p\pi$ overlap is observed in metal carbonyls
9. An octahedral complex is formed, when hybrid orbitals of the following type are involved [DCE 2003]
 (a) sp^3 (b) dsp^2
 (c) sp^3d^2 (d) sp^2d
10. Which one is an example of octahedral complex [MP PET 2000]
 (a) FeF_6^{3-} (b) $Zn(NH_3)_4^{2+}$
 (c) $Ni(CN)_4^{2-}$ (d) $Cu(NH_3)_4^{2+}$
11. Which of the following complexes has a square planar geometry
 (a) $Ag(NH_3)_2^+$ (b) $Cu(en)_2^{2+}$
 (c) $[MnCl_4]^{2-}$ (d) $Ni(CO)_4$
12. The shape of $[Fe(CN)_6]^{4-}$ ion is
 (a) Hexagonal (b) Pyramidal
 (c) Octahedral (d) Octagonal
13. What is the shape of $Fe(CO)_5$ [CBSE PMT 2000]
 (a) Linear (b) Tetrahedral
 (c) Square planar (d) Trigonal bipyramidal
14. What type of hybridization is involved in $[Fe(CN)_6]^{3-}$ [AMU 1999]
 (a) d^2sp^3 (b) dsp^2
 (c) sp^3d^2 (d) dsp^3
15. The example of dsp^2 hybridisation is [MP PET 1999; AIIMS 2001]
 (a) $Fe(CN)_6^{3-}$ (b) $Ni(CN)_4^{2-}$
 (c) $Zn(NH_3)_4^{2+}$ (d) FeF_6^{3-}
16. The shape of $[Cu(NH_3)_4]^{2+}$ is square planar, Cu^{2+} in this complex is [NCERT 1989; RPET 1999]
 (a) sp^3 hybridised (b) dsp^2 hybridised
 (c) sp^3d hybridised (d) sp^3d^2 hybridised
17. The geometry of $Ni(CO)_4$ and $Ni(PPh_3)_2Cl_2$ are [IIT-JEE 1999; DCE 2002]
 (a) Both square planar
 (b) Tetrahedral and square planar respectively
 (c) Both tetrahedral
 (d) Square planar and tetrahedral respectively
18. Which complex has square planar structure [JIPMER 2002]
 (a) $Ni(CO)_4$ (b) $[NiCl_4]^{2-}$
 (c) $[Ni(H_2O)_6]^{2+}$ (d) $[Cu(NH_3)_4]^{2+}$
19. $[Pt(NH_3)_4]Cl_2$ is [DCE 2001]
 (a) Square planar (b) Tetrahedral
 (c) Pyramidal (d) Pentagonal
20. A complex involving dsp^2 hybridization has
 (a) A square planar geometry
 (b) A tetrahedral geometry
 (c) An octahedral geometry
 (d) Trigonal planar geometry
21. A tetrahedral complex ion is formed due to hybridization
 (a) sp^2 (b) sp^3
 (c) dsp^2 (d) d^2sp^3
22. Back bonding is involved in which of the organometallic compounds
 (a) $[(CH_3)_3Al]_2$ (b) $Mg^{2+}(C_5H_5)_2$
 (c) $R-Mg-X$ (d) $[C_5H_5)_2Fe]$
23. d^2sp^3 hybridisation leads to
 (a) Hexagonal shape (b) Trigonal bipyramidal
 (c) Octahedral shape (d) Tetrahedral shape
24. Chromium hexacarbonyl is an octahedral compound involving
 (a) sp^3d^2 (b) dsp^2
 (c) d^2sp^3 (d) d^3sp^2 orbitals
25. $[CoF_6]^{3-}$ is formed by hybridization
 (a) d^2sp^3 (b) d^3sp^2
 (c) d^2sp^3 (d) sp^3d^2
26. The species having tetrahedral shape is [IIT-JEE (Screening) 2004]
 (a) $[PdCl_4]^{2-}$ (b) $[Ni(CN)_4]^{2-}$
 (c) $[Pd(CN)_4]^{2-}$ (d) $[NiCl_4]^{2-}$
27. Among $[Ni(CO)_4]$, $[Ni(CN)_4]^{2-}$, $[NiCl_4]^{2-}$ species, the hybridization states at the Ni atom are, respectively [CBSE PMT 2004; MP PMT 1992; BHU 1995; AFMC 1997]
 (a) sp^3, sp^3, dsp^2 (d) dsp^2, sp^3, sp^3
 (c) sp^3, dsp^2, dsp^2 (d) sp^3, dsp^2, sp^3
 (At. no. of Ni = 28)
28. The bond in $K_4[Fe(CN)_6]$ are: [MP PET 2004]
 (a) All ionic
 (b) All covalent
 (c) Ionic and covalent
 (d) Ionic, covalent and coordinate covalent
29. Hybridization of Fe in $K_3Fe(CN)_6$ is [DCE 2002]

- (a) sp^3 (b) dsp^3
(c) sp^3d^2 (d) d^2sp^3
30. The complex ion which has no 'd' electrons in the central metal atom is [IIT-JEE Screening 2001]
(a) $[MnO_4]^-$ (b) $[Co(NH_3)_6]^{3+}$
(c) $[Fe(CN)_6]^{3-}$ (d) $[Cr(H_2O)_6]^{3+}$
31. Which of the following statement is correct
(a) $[Cu(NH_3)_6]^{2+}$ is a colourless ion
(b) $[Zn(H_2O)_6]^{2+}$ ion is blue coloured
(c) $[Ni(CN)_4]^{2-}$ ion has a tetrahedral shape
(d) Nickel dimethyl glyoxides is red in colour
32. Which of the following shall form an octahedral complex [DCE 2001]
(a) d^4 (low spin) (b) d^8 (high spin)
(c) d^6 (low spin) (d) None of these
33. Which one of the following is a strong field ligand
(a) CN^- (b) NO_2^-
(c) en (d) NH_3
34. The strongest ligand in the following is [MP PET 1995]
(a) CN^- (b) Br^-
(c) HO^- (d) F^-
35. The neutral ligand is
(a) Chloro (b) Hydroxo
(c) Ammine (d) Oxalato
36. The ligands which can get attached to the central metal ion through more than one atom are called
(a) Ambident ligands (b) Polydentate ligands
(c) Chelate ligands (d) Neutral ligands
37. A strong ligand gives a complex which is generally called
(a) High spin (b) High energy
(c) Low spin (d) Stable
38. CN^- is a strong field ligand. This is due to the fact that [CBSE PMT 2004]
(a) It can accept electron from metal species
(b) It forms high spin complexes with metal species
(c) It carries negative charge.
(d) It is a pseudohalide
39. Considering H_2O as a weak field ligand, the number of unpaired electrons in $[Mn(H_2O)_6]^{2+}$ will be (At. No. of Mn = 25) as a ajkk [CBSE PMT 2004]
(a) Two (b) Four
(c) Three (d) Five
40. Which of the following is a π - complex
(a) Trimethyl aluminium (b) Ferrocene
(c) Diethyl zinc (d) Nickel carbonyl
41. Which of the following is a π - acid ligand [KCET 1996; AIIMS 2003]
(a) NH_3 (b) CO
(c) F^- (d) Ethylene diamine
42. The value of the 'spin only' magnetic moment for one of the following configurations is 2.84 BM. the correct one [AIEEE 2005]
(a) d^4 (in strong ligand field)
(b) d^4 (in weak ligand field)

- (c) d^3 (in weak as well as in strong fields)
(d) d^5 (in strong ligand field)

43. The geometry of $Ni(CO)_4$ and $Ni(PPh)_3Cl$ are [BHU 2005]
(a) Both square planer
(b) Tetrahedral and square planar respectively
(c) Both tetrahedral
(d) Square planar and tetrahedral respectively

Complexes and complex stability

1. Which of the following complexes has the highest stability constant at 298 K
(a) $[CdCl_4]^{2-}$ (b) $[CdBr_4]^{2-}$
(c) $[CdI_4]^{2-}$ (d) $[Cd(CN)_4]^{2-}$
2. The most stable ion is [AIEEE 2002]
(a) $[Fe(OH)_3]^{3-}$ (b) $[Fe(CN)_6]^{3-}$
(c) $[Fe(CN)_6]^{3-}$ (d) $[Fe(H_2O)_6]^{3+}$
3. The most stable complex among the following is [MP PMT 2002]
(a) $K_3[Al(C_2O_4)_3]$ (b) $[Pt(en)_2]Cl_2$
(c) $Ag(NH_3)_2Cl$ (d) $K_2[Ni(EDTA)]$
4. Which of the following factors tends to increase the stability of metal ion complexes
(a) Higher ionic radius of the metal ion
(b) Higher charge/size ratio of the metal ion
(c) Lower ionisation potential of the metal ion
(d) Lower basicity of the ligand
5. $CuSO_4$ reacts with KCN solution and forms: [DPMT 2004]
(a) $K_3[Cu(CN)_4]$ (b) $Cu(CN)$
(c) $Cu(CN)_2$ (d) $K_4[Cu(CN)_6]$
6. A co-ordination complex compound of cobalt has the molecular formulae containing five ammonia molecules, one nitro group and two chlorine atoms for one cobalt atom. One mole of this compound produces three mole ions in an aqueous solution on reacting with excess of $AgNO_3$, $AgCl$ precipitate. The ionic formula for this complex would be: [DPMT 2004; Kerala PMT 2004]
(a) $[Co(NH_3)_5(NO_2)]Cl_2$
(b) $[Co(NH_3)_5Cl][Cl(NO_2)]$
(c) $[Co(NH_3)_4(NO_2)Cl][(NH_3)Cl]$
(d) $[Co(NH_3)_5][(NO_2)_2Cl_2]$
7. In any ferric salt, on adding potassium ferrocyanide, a prussian blue colour is obtained, which is [BIT 1992; BHU 2002]
(a) $K_3Fe(CN)_6$ (b) $KFe[Fe(CN)_6]$
(c) $FeSO_4 \cdot Fe(CN)_6$ (d) $Fe_4[Fe(CN)_6]_3$
8. Prussian blue is formed when [CBSE PMT 1990]
(a) Ferrous sulphate reacts with $FeCl_3$
(b) Ferric sulphate reacts with $K_4[Fe(CN)_6]$
(c) Ferrous ammonium sulphate reacts with $FeCl_3$
(d) Ammonium sulphate reacts with $FeCl_3$
9. Complex salt can be made by the combination of $[Co^{III}(NH_3)_5Cl]^X$ with [RPMT 2000, AFMC 2002]

- (a) PO_4^{3-} (b) Cl^-
(c) $2Cl^-$ (d) $2K^+$
10. Which reagent can be used to identify nickel ion
(a) Resorcinol
(b) Dimethyl glyoxime [DMG]
(c) Diphenyl benzidine
(d) Potassium ferrocyanide
11. Dimethyl glyoxime forms a coloured complex with
(a) Ag (b) Ni
(c) Cr (d) Zn
12. Silver chloride dissolves in excess of NH_4OH . The cation present in this solution is [EAMCET 1998]
(a) Ag^+ (b) $[Ag(NH_3)_2]^+$
(c) $[Ag(NH_3)_4]^+$ (d) $[Ag(NH_3)_6]^+$
13. Silver sulphide dissolved in a solution of sodium cyanide to form the complex [AMU 1999]
(a) $Na[Ag(CN)_2]$ (b) $Na_3[Ag(CN)_4]$
(c) $Na_5[Ag(CN)_6]$ (d) $Na_2[Ag(CN)_2]$
14. Which one will give Fe^{3+} ions in solution
(a) $[Fe(CN)_6]^{3-}$
(b) $Fe_2(SO_4)_3$
(c) $[Fe(CN)_6]^{4-}$
(d) $NH_4(SO_4)_2 \cdot FeSO_4 \cdot 6H_2O$
15. The cation that does not form an amine complex with excess of ammonia is
(a) Cd^{2+} (b) Al^{3+}
(c) Cu^{2+} (d) Ag^+
- (c) $(CH_3)_4Sn$ (d) KC_4H_9
7. The complex used as an anticancer agent is [AIIMS 2003]
(a) $trans-[Co(NH_3)_3Cl_3]$ (b) $cis-[PtCl_2(NH_3)_2]$
(c) $cis-K_2[PtCl_2Br_2]$ (d) Na_2CO_3
8. The compound that is not olefinic organometallic is
(a) $K[C_2H_4PtCl_3] \cdot 3H_2O$ (b) $Be(CH_2)_2$
(c) $(C_2H_4PtCl_3)_2$ (d) $C_4H_4Fe(CO)_3$
9. Among the following, which is not the π -bonded organometallic compound [CBSE PMT 2003]
(a) $(CH_3)_4Sn$ (b) $K[PtCl_3(\eta^2-C_2H_4)]$
(c) $Fe(\eta^5-C_5H_5)_2$ (d) $Cr(\eta^6-C_6H_6)_2$
10. Wilkinson's catalyst is used in
(a) Polymerization (b) Condensation
(c) Halogenation (d) Hydrogenation
11. What is the use of tetraethyl lead
(a) As a catalyst in addition reaction of alkenes
(b) As a catalyst in polymerization reaction of alkenes
(c) For reducing knocking
(d) For creating knocking
12. Which of the following is an organo-metallic compound [MP PMT 2001]
(a) Lithium ethoxide (b) Ethyl lithium
(c) Lithium acetate (d) Lithium carbide
13. Which of the following is an organometallic compound [AIIMS 1997]
(a) $Ti(C_2H_5)_4$ (b) $Ti(OC_2H_5)_4$
(c) $Ti(OCOCH_3)_4$ (d) $Ti(OC_6H_5)_4$
14. Which of the following is not an organometallic compound [MP PET 1996; BHU 2002]
(a) Ethyl magnesium bromide
(b) Tetraethyl lead
(c) Sodium ethoxide
(d) Trimethyl aluminium
15. An organometallic compound amongst the following is [J & K CET 2005]
(a) Ferrocene (b) CaC_2
(c) Tetraethyl lead (TEL) (d) All of these
16. Which of the following does not have a metal carbon bond [CBSE PMT 2004]
(a) $K[Pt(C_2H_4)Cl_3]$ (b) $Ni(CO)_4$
(c) $Al(OC_2H_5)_3$ (d) C_2H_5MgBr
17. Coordination compounds have great importance in biological systems. In this context which of the following statements is incorrect [AIEEE 2004]
(a) Cyanocobalamin is B_{12} and contains cobalt.
(b) Haemoglobin is the red pigment of blood and contains iron.
(c) Chlorophylls are green pigments in plants and contains calcium.
(d) Carboxypeptidase-A is an enzyme and contains zinc.
18. Ziegler-Natta catalyst is [Pb. CET 2004]
(a) $(Ph_3P)_3RhCl$ (b) $K[PtCl_3(C_2H_4)]$
(c) $[Al_2(C_2H_6)_6] + TiCl_4$ (d) $[Fe(C_2H_5)_2]$
19. Dimethyl glyoxime gives a red precipitate with Ni^{2+} , which is used for its detection. To get this precipitate readily the best pH range is [AIIMS 2004]
(a) < 1 (b) 2-3
(c) 3-4 (d) 9-11
20. The π -bonded organo metallic compound which has ethene as one of its component is [J & K CET 2005]
(a) Zeise's salt (b) Ferrocene

Application of organometallics

1. Ziegler-Natta catalyst is an organometallic compound of which metal
(a) Iron (b) Zirconium
(c) Rhodium (d) Titanium
2. In the case of small cuts, bleeding is stopped by applying potash alum. Here alum acts as [KCET (Med.) 2001]
(a) Fungicide (b) Disinfectant
(c) Germicide (d) Coagulating agent
3. The formula of ferrocene is
(a) $[Fe(CN)_6]^{4-}$ (b) $[Fe(CN)_6]^{3-}$
(c) $[Fe(CO)_5]$ (d) $[(C_5H_5)_2Fe]$
4. Which of the following is formed when *n*-butyl lithium reacts with tin (II) chloride [AFMC 2001]
(a) $LiBr$ (b) Et_4Pb
(c) $(C_4H_9)_4Sn$ (d) $(C_2H_5)_4Pb$
5. Which of the following organo-silicon compound on hydrolysis will give a three dimensional silicone [Orissa JEE 2003]
(a) R_3SiCl (b) $RSiCl_3$
(c) $SiCl_4$ (d) R_2SiCl_2
6. Which one is not an organometallic compound [J & K CET 2005; Pb. CET 2003]
(a) $RMgX$ (b) C_2H_5ONa

- (c) Dibenzene chromium (d) Tetraethyl tin.

Critical Thinking

Objective Questions

- The coordination number and oxidation state of Cr in $K_3[Cr(C_2O_4)_3]$ are, respectively [CBSE PMT 1995]

(a) 4 and +2 (b) 6 and +3
(c) 3 and +3 (d) 3 and 0
- The complex compounds which result from the coordination of carbon monoxide are known as [BHU 1999]

(a) Electronic (b) Carbonyls
(c) Carbonates (d) Carbon permono
- Mixture $X = 0.02 \text{ mol}$ of $[Co(NH_3)_5SO_4]Br$ and 0.02 mol of $[Co(NH_3)_5Br]SO_4$ was prepared in 2 litre of solution
 1 litre of mixture $X + \text{excess } AgNO_3 \rightarrow Y$.
 1 litre of mixture $X + \text{excess } BaCl_2 \rightarrow Z$
 Number of moles of Y and Z are [IIT JEE 2003]

(a) 0.01, 0.01 (b) 0.02, 0.01
(c) 0.01, 0.02 (d) 0.02, 0.02
- Which of the following organometallic compound is σ and π bonded [MH CET 2001; PCET 2002]

(a) $Fe(CH_3)_3$
(b) $[Fe(\eta^5 - C_5H_5)_2]$
(c) $[Co(CO)_5NH_3]^{2+}$
(d) $K[PtCl_3(\eta^2 - C_2H_4)]$
- In $[Ni(NH_3)_4]SO_4$, the valency and coordination number of Ni will be respectively

(a) 3 and 6 (b) 2 and 4
(c) 4 and 2 (d) 4 and 4
- Co-ordination number of Fe in the complexes $[Fe(CN)_6]^{4-}$, $[Fe(CN)_6]^{3-}$ and $[FeCl_4]^-$ would be respectively

(a) 2, 3, 3 (b) 6, 6, 4
(c) 6, 3, 3 (d) 6, 4, 6
- On hydrolysis $(Me)_2SiCl_2$ will produce [IIT-JEE 2003]

(a) $(Me)_2Si(OH)_2$
(b) $(Me)_2Si = O$
(c) $-[O - (Me)_2Si - O]_n -$
(d) $Me_2SiCl(OH)$
- Which of the following represents a chelating ligand [JIPMER 2002]

(a) H_2O (b) OH^-
(c) DMG (d) Cl^-
- $CuSO_4$ reacts with KCN solution and forms [MP PMT 1992; IIT 1996; UPSEAT 2001, 02]

(a) $Cu(CN)_2$ (b) $Cu(CN)$
(c) $K_2[Cu(CN)_4]$ (d) $K_3[Cu(CN)_4]$
- In the process of extraction of gold, Roasted gold ore + $CN^- + H_2O \xrightarrow{O_2} [X] + OH^-$

$[X] + Zn \rightarrow [Y] + Au$
 Identify the complexes $[X]$ and $[Y]$ [IIT-JEE 2003]

(a) $X = [Au(CN)_2]^-$, $Y = [Zn(CN)_4]^{2-}$
(b) $X = [Au(CN)_4]^{3-}$, $Y = [Zn(CN)_4]^{2-}$
(c) $X = [Au(CN)_2]^-$, $Y = [Zn(CN)_6]^{4-}$
(d) $X = [Au(CN)_4]^-$, $Y = [Zn(CN)_4]^{2-}$
- A solution of potassium ferrocyanide would contains ions

(a) 2 (b) 3
(c) 4 (d) 5
- Which one of the following complexes is an outer orbital complex

(a) $[Co(NH_3)_6]^{3+}$ (b) $[Mn(CN)_6]^{4-}$
(c) $[Fe(CN)_6]^{4-}$ (d) $[Ni(NH_3)_6]^{2+}$

Atomic nos : Mn = 25, Fe = 26, Co = 27, Ni = 28
- Which one of the following has largest number of isomers ? [AIEEE 2004]

(a) $[Ir(PP_3)_2H(CO)]^{2+}$ (b) $[Co(NH_3)_5Cl]^{2+}$
(c) $[Ru(NH_3)_4Cl_2]^+$ (d) $[Co(en)_2Cl_2]^+$

(R = alkyl group; en = ethylenediamine)
- Which kind of isomerism is exhibited by octahedral $Co(NH_3)_4Br_2Cl$? [IIT-JEE Screening 2005]

(a) Geometrical and Ionization
(b) Geometrical and Optical
(c) Optical and Ionization
(d) Geometrical only
- Which one of the following is expected to exhibit optical isomerism (en = ethylenediamine)

(a) *cis* - $[Pt(NH_3)_2Cl_2]$ (b) *trans* - $[Co(en)_2Cl_2]$
(c) *trans* - $[Pt(NH_3)_2Cl_2]$ (d) *cis* - $[Co(en)_2Cl_2]$
- $[EDTA]^{4-}$ is a: [UPSEAT 2004]

(a) Monodentate ligand (b) Bidentate ligand
(c) Quadridentate ligand (d) Hexadentate ligand
- Which of the following statements is incorrect ? [MP PET 2002]

(a) In $K_3[Fe(CN)_6]$, the ligand has satisfied only the secondary valency of ferric ion.
(b) In $K_3[Fe(CN)_6]$, the ligand has satisfied both primary and secondary valencies of ferric ion.
(c) In $K_4[Fe(CN)_6]$, the ligand has satisfied both primary and secondary valencies of ferrous ion.
(d) In $[Cu(NH_3)_4]SO_4$, the ligand has satisfied only the secondary valency of copper.
- Which of the following is considered as an anticancer species. [KCET 2004]

(a) $\left[\begin{array}{c} H_3N \\ \diagdown \quad \diagup \\ Pt \\ \diagup \quad \diagdown \\ H_3N \end{array} \right] \begin{array}{c} Cl \\ \diagup \\ Cl \end{array}$ (b) $\left[\begin{array}{c} H_3N \\ \diagdown \quad \diagup \\ Pt \\ \diagup \quad \diagdown \\ Cl \end{array} \right] \begin{array}{c} Cl \\ \diagup \\ NH_3 \end{array}$
(c) $\left[\begin{array}{c} Cl \\ \diagdown \quad \diagup \\ Pt \\ \diagup \quad \diagdown \\ Cl \end{array} \right] \begin{array}{c} CH_2 \\ \parallel \\ CH_2 \end{array}$ (d) $\left[\begin{array}{c} Cl \\ \diagdown \quad \diagup \\ Pt \\ \diagup \quad \diagdown \\ Cl \end{array} \right] \begin{array}{c} Cl \\ \diagup \\ Cl \end{array}$
- An aqueous solution of $CoCl_2$ on addition of excess of concentrated HCl turns blue due to formation of

[AIIMS 2005]

- (a) $[\text{Co}(\text{H}_2\text{O})_4\text{Cl}_2]$
 (b) $[\text{Co}(\text{H}_2\text{O})_2\text{Cl}_4]^{2-}$
 (c) $[\text{CoCl}_4]^{2-}$
 (d) $[\text{Co}(\text{H}_2\text{O})_2\text{Cl}_2]$

20. The correct order for the wavelength of absorption in the visible region is [AIIMS 2005]

- (a) $[\text{Ni}(\text{NO}_2)_6]^{4-} < [\text{Ni}(\text{NH}_3)_6]^{2+} < [\text{Ni}(\text{H}_2\text{O})_6]^{2+}$
 (b) $[\text{Ni}(\text{NO}_2)_6]^{4-} < [\text{Ni}(\text{H}_2\text{O})_6]^{2+} < [\text{Ni}(\text{NH}_3)_6]^{2+}$
 (c) $[\text{Ni}(\text{H}_2\text{O})_6]^{2+} < [\text{Ni}(\text{NH}_3)_6]^{2+} < [\text{Ni}(\text{NO}_2)_6]^{4-}$
 (d) $[\text{Ni}(\text{NH}_3)_6]^{2+} < [\text{Ni}(\text{H}_2\text{O})_6]^{2+} < [\text{Ni}(\text{NO}_2)_6]^{4-}$

21. In which of the following pairs both the complexes show optical isomerism [AIIMS 2005]

- (a) $\text{cis-}[\text{Cr}(\text{C}_2\text{O}_4)_2\text{Cl}_2]^{3-}$, $\text{cis-}[\text{Co}(\text{NH}_3)_4\text{Cl}_2]$
 (b) $[\text{Co}(\text{en})_3]\text{Cl}_3$, $\text{cis-}[\text{Co}(\text{en})_2\text{Cl}_2]\text{Cl}$
 (c) $[\text{PtCl}(\text{dien})]\text{Cl}$, $[\text{NiCl}_2\text{Br}_2]^{2-}$
 (d) $[\text{Co}(\text{NO}_3)_3(\text{NH}_3)_3]$, $\text{cis-}[\text{Pt}(\text{en})_2\text{Cl}_2]$

22. Which of the following compounds shows optical isomerism [AIEEE 2005; CBSE PMT 2005]

- (a) $[\text{Cu}(\text{NH}_3)_4]^{2+}$ (b) $[\text{ZnCl}_4]^{2-}$
 (c) $[\text{Cr}(\text{C}_2\text{O}_4)_3]^{3-}$ (d) $[\text{Co}(\text{CN})_6]^{3-}$

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
 (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
 (c) If assertion is true but reason is false.
 (d) If the assertion and reason both are false.
 (e) If assertion is false but reason is true.

1. Assertion : Potassium ferrocyanide and potassium ferricyanide both are diamagnetic.
 Reason : Both have unpaired electrons.
2. Assertion : NF_3 is a weaker ligand than $\text{N}(\text{CH}_3)_3$
 Reason : NF_3 ionizes to give F^- ions
 ions in aqueous solution.
3. Assertion : The $[\text{Ni}(\text{en})_3]\text{Cl}_2$ (en = ethylene diamine) has lower stability than $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$
 Reason : In $[\text{Ni}(\text{en})_3]\text{Cl}_2$ the geometry of Ni is trigonal bipyramidal
4. Assertion : The ligands nitro and nitrito are called ambidentate ligands.
 Reason : These ligands give linkage isomers.
5. Assertion : Geometrical isomerism is also called *cis-trans* isomerism.
 Reason : Tetrahedral complexes show geometrical isomerism.

6. Assertion : $\left[(\text{en})_2\text{Co} \begin{array}{c} \text{NH} \\ \diagup \quad \diagdown \\ \text{Co}(\text{en})_2 \\ \diagdown \quad \diagup \\ \text{OH} \end{array} \right]^{3+}$ is named as tetrakis (ethylene diamine) μ -hydroxo-imido dicobalt (III) ion.

Reason : In naming polynuclear complexes *i.e.*, containing two or more metal atoms joined by bridging ligands, the word μ is added with hyphen before the name of such ligands.

7. Assertion : $[\text{Fe}(\text{CN})_6]^{3-}$ is weakly paramagnetic while $[\text{Fe}(\text{CN})_6]^{4-}$ is diamagnetic.

Reason : $[\text{Fe}(\text{CN})_6]^{3-}$ has +3 oxidation state while $[\text{Fe}(\text{CN})_6]^{4-}$ has +2 oxidation state.

8. Assertion : $\text{H}_2\text{N}-\text{NH}_2$ is a chelating ligand.

Reason : A chelating ligand must possess two or more lone pairs at such a distance that it may form suitable strain free rings at the metal ion.

9. Assertion : $[\text{Ti}(\text{H}_2\text{O})_6]^{3+}$ is coloured while $[\text{Sc}(\text{H}_2\text{O})_6]^{3+}$ is colourless.

Reason : $d-d$ transition is not possible in $[\text{Sc}(\text{H}_2\text{O})_6]^{3+}$.

10. Assertion : All the octahedral complexes of Ni^{2+} must be outer orbital complexes.

Reason : Outer orbital octahedral complexes are given by weak ligands.

11. Assertion : Potassium ferrocyanide is diamagnetic whereas potassium ferricyanide is paramagnetic.

Reason : Crystal field splitting in ferrocyanide ion is greater than that of ferricyanide ion.

Chapter 21 Chemical Analysis

Analytical chemistry deals with qualitative and quantitative analysis of substances.

Qualitative analysis : A salt consists of two parts known as radicals. The positively charged part of a salt (cation) which has been derived from a base is termed as basic radical and the negatively charged part of salt (anion) which has been derived from an acid is termed as acidic radical. In qualitative inorganic analysis, the given compound is analysed for the basic and acid radicals (*i.e.*, the cations and the anions), that it contains. For example zinc blende is analysed for the Zn^{2+} and S^{2-} ions that it contains.

Test for Different Gases

(1) Colourless gases

(i) **Tests for CO_2 :** It is colourless and odourless gas. It gives white ppt. with lime water which dissolves on passing excess of CO_2 .

(ii) **Test for CO :** It is colourless and odourless gas. It burns with a blue flame. $2CO + O_2 \rightarrow 2CO_2$

(iii) **Test for O_2 :** It is colourless and odourless gas. It rekindles a glowing splinter.

(iv) **Tests for H_2S :** It is a colourless gas with a smell of rotten eggs. It turns moist lead acetate paper black.

(v) **Tests for SO_2 :** It is a colourless gas with a suffocating odour of burning sulphur. It turns acidified $K_2Cr_2O_7$ solution green. $3SO_2 + K_2Cr_2O_7 + H_2SO_4 \rightarrow K_2SO_4 + \underset{\text{Green}}{Cr_2(SO_4)_3} + H_2O$

(vi) **Tests for NH_3 :** It is a colourless gas with a characteristic ammoniacal smell. It gives white fumes of NH_4Cl with HCl , $NH_3 + HCl \rightarrow NH_4Cl$. With Nessler's reagents, it gives brown ppt.

It gives deep blue colour with $CuSO_4$ solution, $CuSO_4 + 4NH_3 \rightarrow [Cu(NH_3)_4]SO_4$. NH_3 dissolves in water to give NH_4OH , which being basic, turns red litmus blue, $NH_3 + H_2O \rightarrow NH_4OH \rightleftharpoons NH_4^+ + OH^-$.

(vii) **Tests for HCl gas:** It is colourless gas with a pungent irritating smell. It turns moist blue litmus paper red *i.e.*, it is acidic in nature. It gives white ppt with $AgNO_3$ solution. This white ppt is soluble in NH_4OH .

(viii) **Test for CH_3COOH vapours:** These vapours are colourless with a vinegar like smell.

(2) Coloured gases

(i) **Tests for Cl_2 :** It is a greenish yellow gas with a pungent smell. In small quantity it appears almost colourless. It bleaches a moist litmus paper, $Cl_2 + H_2O \rightarrow 2HCl + [O]$; $Colour + [O] \rightarrow Colourless$ Blue litmus paper first turns red and then becomes colourless.

(ii) **Tests for Br_2 :** Brown vapours with a pungent smell. It turns moist starch paper yellow.

(iii) **Tests for I_2 :** Violet vapours with a pungent smell. It turns moist starch paper blue.

(iv) **Tests for NO_2 :** Brown coloured pungent smelling gas. It turns moist starch KI paper blue

It turns ferrous sulphate solution black,

Systematic Procedure for Qualitative Analysis of Inorganic Salts

It involves the following steps : (1) Preliminary tests (2) Wet tests for acid radicals and (3) Wet tests for basic radicals.

(i) Preliminary tests

(i) **Physical examination** : It involves the study of colour, smell, density etc.

Table : 21.1 Colour

Colour	Salt
Black	Oxides : $\text{MnO}_2, \text{FeO}, \text{CuO}, \text{Co}_3\text{O}_4, \text{Ni}_2\text{O}_3$ Sulphides : $\text{Ag}_2\text{S}, \text{CuS}, \text{Cu}_2\text{S}, \text{FeS}, \text{CoS}, \text{NiS}, \text{PbS}, \text{HgS}, \text{Bi}_2\text{S}_3$ (blackish brown)
Blue	Hydrated CuSO_4 , anhydrous CoSO_4
Orange	K_2O_2 , some dichromate ($\text{K}_2\text{Cr}_2\text{O}_7$), Sb_2S_3 , ferricyanides
Green	Nickel salts, hydrated ferrous salts, potassium permanganate (KMnO_4), some copper (II) salts
Brownish yellow	SnS
Dark brown	$\text{PbO}_2, \text{Ag}_2\text{O}, \text{CdO}, \text{Fe}_2\text{O}_3, \text{CuCrO}_4, \text{FeCl}_3$ (but yellow in aq. solution)
Pale brown	MnCO_3
Light pink	Hydrated manganese salts
Reddish pink	Hydrated cobalt (II) salts
Red	$\text{HgI}_2, \text{Pb}_3\text{O}_4$
Yellow	$\text{CdS}, \text{PbI}_2, \text{AgBr}, \text{AgI}$, chromates

(ii) **Dry heating** : Substance is heated in a dry test tube.

Table : 21.2

Observation	Result
(a) A gas or vapour is evolved.	Compounds with water of crystallisation
Vapour, evolved, test with litmus paper.	Ammonium salts, acid salts, and hydroxides. (usually accompanied by change of colour)
The vapour is alkaline.	Ammonium salts.
The vapour is acidic.	Readily decomposable salts of strong acids.
Oxygen is evolved	Nitrates, chlorates and certain oxides.
Dinitrogen oxide	Ammonium nitrate or nitrate mixed with an ammonium salt.
Dark-brown or reddish fumes (oxides of nitrogen), acidic in reaction.	Nitrates and nitrites of heavy metals.
CO_2 is evolved, lime water becomes turbid.	Carbonates or hydrogen carbonates.
NH_3 is evolved which turns red litmus blue.	Ammonium salts.
SO_2 is evolved, which turns acidified $\text{K}_2\text{Cr}_2\text{O}_7$ green, decolourises fuschin colour.	Sulphates and thiosulphates.
H_2S is evolved, turns lead acetate paper black, or cadmium acetate yellow.	Hydrates, sulphides or sulphides in the presence of water.
Cl_2 is evolved, yellowish green gas, bleaches litmus paper, turns KI – starch blue, poisonous.	Unstable chlorides e.g., copper chlorides in the presence of oxidising agents.
Br_2 is evolved (reddish brown, turns fluorescent paper red).	Bromides in the presence of oxidising agents.
I_2 is evolved, violet vapours condensing to black crystals	Free iodine and certain iodides
(b) A sublimate is formed	Ammonium and mercury salts.
White sublimate	$\text{As}_2\text{O}_3, \text{Sb}_2\text{O}_3$
Grey sublimate	Hg
Steel grey, garlic odour	As
Yellow sublimate	$\text{S}, \text{As}_2\text{S}_3, \text{HgI}_2$ (Red)

Action of heat on different compounds : Many inorganic salts decomposes on heating, liberating characteristic gases. A few such reactions are tabulated as follows,

Table : 21.3

$2\text{HgO} \xrightarrow{\Delta} 2\text{Hg} + \text{O}_2$ (Red) (Silver deposit)	$2\text{Pb}_3\text{O}_4 \xrightarrow{\Delta} 6\text{PbO} + \text{O}_2$ (Red) (Yellow)	$2\text{PbO}_2 \xrightarrow{\Delta} 2\text{PbO} + \text{O}_2$ (Brown)
$\text{CuCO}_3 \xrightarrow{\Delta} \text{CuO} + \text{CO}_2$ (Green)	$\text{ZnO}_3 \xrightarrow{\Delta} \text{ZnO} + \text{CO}_2$ (White) (Yellow (hot) White (cold))	$\text{CuSO}_4 \cdot 5\text{H}_2\text{O} \xrightarrow{\Delta} \text{CuSO}_4 + 5\text{H}_2\text{O}$ (Blue) (White)
$\text{CuSO}_4 \xrightarrow{\Delta} \text{CuO} + \text{SO}_3$	$2\text{FeSO}_4 \xrightarrow{\Delta} \text{Fe}_2\text{O}_3 + \text{SO}_2 + \text{SO}_3$	$2\text{Ag}_2\text{O} \rightarrow 4\text{Ag} + \text{O}_2$
$2\text{Zn}(\text{NO}_3)_2 \xrightarrow{\Delta} 2\text{ZnO} + 4\text{NO}_2 + \text{O}_2$ (White) (Brown)	$2\text{AgNO}_3 \xrightarrow{450^\circ\text{C}} 2\text{Ag} + 2\text{NO}_2 + \text{O}_2$	$2\text{Cu}(\text{NO}_3)_2 \rightarrow 2\text{CuO} + 4\text{NO}_2 + \text{O}_2$

$2Ag_2CO_3 \rightarrow 4Ag + 2CO_2 + O_2$	$2Pb(NO_3)_2 \rightarrow 2PbO + 4NO_2 + O_2$	$(NH_4)_2Cr_2O_7 \xrightarrow{\text{(Orange)}} N_2 + Cr_2O_3 + 4H_2O$ (Green)
$2NaHCO_3 \rightarrow Na_2CO_3 + CO_2 + H_2O$	$NH_4HCO_3 \rightarrow NH_3 + CO_2 + H_2O$	$CaCO_3 \rightarrow CaO + CO_2$
$2NaNO_3 \rightarrow 2NaNO_2 + O_2$	$MgCO_3 \rightarrow MgO + CO_2$	$2NH_3 \xrightarrow{\text{Red hot}} N_2 + 3H_2$
$2Mg(NO_3)_2 \rightarrow 2MgO + 4NO_2 + O_2$	$2Ca(NO_3)_2 \rightarrow 2CaO + 4NO_2 + O_2$	$Al_2(SO_4)_3 \xrightarrow{\text{Red hot}} Al_2O_3 + 3SO_3$
$2CaSO_4 \cdot 2H_2O \rightarrow 2CaSO_4 \cdot H_2O + 2H_2O$ (Plaster of Paris)	$2AlCl_3 \cdot 6H_2O \rightarrow Al_2O_3 + 6HCl + 9H_2O$	$2BeSO_4 \xrightarrow{\Delta} 2BeO + 2SO_2 + O_2$
$2AgNO_3 \xrightarrow{350^\circ C} 2AgNO_2 + O_2$	$2MgSO_4 \xrightarrow{\Delta} 2MgO + 2SO_2 + O_2$	$2ZnSO_4 \xrightarrow{\Delta} 2ZnO + 2SO_2 + O_2$
$(COO)_2Sn \xrightarrow{\Delta} SnO + CO_2 + CO$	$CaC_2O_4 \rightarrow CaCO_3 + CO$	$NH_4NO_2 \rightarrow N_2 + 2H_2O$
$NH_4NO_3 \rightarrow N_2O + 2H_2O$	$2KClO_3 \rightarrow 2KCl + 3O_2$	$2FeCl_3 \rightarrow 2FeCl_2 + Cl_2$
$Li_2CO_3 \rightarrow Li_2O + CO_2$	$(COO)_2Fe \rightarrow FeO + CO + CO_2$	$2KMnO_4 \rightarrow K_2MnO_4 + MnO_2 + O_2$
$MgCl_2 \cdot 6H_2O \rightarrow HgCl_2 + Hg$	$NH_4Cl \rightarrow NH_3 + HCl$	$2LiNO_3 \rightarrow Li_2O + 2NO_2 + \frac{1}{2}O_2$
$Hg(NO_3)_2 \rightarrow Hg + 2NO_2 + O_2$	$2CuCl_2 \xrightarrow{\Delta} Cu_2Cl_2 + Cl_2$	$2Co(NO_3)_2 \xrightarrow{\Delta} 2CoO + 4NO_2 + O_2$
$4K_2Cr_2O_7 \rightarrow 4K_2CrO_4 + 2Cr_2O_3 + 3O_2$		$2Mg(NH_4)PO_4 \xrightarrow{\Delta} Mg_2P_2O_7 + H_2O + 2NH_3$
$2Zn(NH_4)PO_4 \xrightarrow{\Delta} Zn_2P_2O_7 + H_2O + 2NH_3$		$K_4Fe(CN)_6 \xrightarrow{\Delta} 4KCN + Fe + 2C + N_2$
$ZnCl_2 \cdot 2H_2O \xrightarrow{\Delta} Zn(OH)Cl + HCl + H_2O$		$2(ZnCl_2 \cdot H_2O) \xrightarrow{\Delta} Zn_2OCl_2 + 2HCl + H_2O$
$2[FeCl_3 \cdot 6H_2O] \xrightarrow{\Delta} Fe_2O_3 + 9H_2O + 6HCl$		$2ZnSO_4 \xrightarrow{800^\circ C} 2ZnO + 2SO_2 + O_2$
$Na_2B_4O_7 \cdot 10H_2O \xrightarrow{\Delta} Na_2B_4O_7 \xrightarrow{\Delta} 2NaBO_2 + B_2O_3$ (Glassy bead)		
$H_3BO_3 \xrightarrow{100^\circ C} HBO_2 \xrightarrow{160^\circ C} H_2B_4O_7 \xrightarrow{\text{Red hot}} B_2O_3$		
$ZnSO_4 \cdot 7H_2O \xrightarrow[-H_2O]{70^\circ C} ZnSO_4 \cdot 6H_2O \xrightarrow[-5H_2O]{100^\circ C} ZnSO_4 \cdot H_2O \xrightarrow{450^\circ C} ZnSO_4$		

(iii) **Flame test**

Characteristic flame colour : Certain metals and their salts impart specific colours to Bunsen burner flame.

- Pb* imparts pale greenish colour to the flame.
- Cu* and *Cu* salts impart blue or green colour to the flame.
- Borates also impart green colour to the flame.
- Ba* and its salts impart apple green colour to the flame.
- Sr* imparts crimson red colour to the flame.
- Ca* imparts brick red colour to the flame.
- Na* imparts yellow colour to the flame.
- K* imparts pink-violet (Lilac) colour to the flame.
- Li* imparts crimson-red, *Rb* imparts violet and *Cs* imparts violet colours to the flame.
- Livid- blue flame is given by *As*, *Sb* and *Bi*.

(iv) **Borax bead test :** The transparent glassy bead ($NaBO_2 + B_2O_3$) when heated with inorganic salt and the colour produced gives some idea of cation present in it.

Table : 21.4

Colour of bead in oxidising flame	Colour of bead in reducing flame	Basic radical present
Greenish when hot, blue in cold.	Red and opaque	<i>Cu</i>
Dark green in hot and cold	Same	<i>Cr</i>
Deep – blue	Deep blue	<i>Co</i>
Yellow when hot	Green	<i>Fe</i>
Violet in hot and cold	Colourless	<i>Mn</i>
Brown in cold	Grey or black or opaque	<i>Ni</i>

Microcosmic salt bead test : Microcosmic salt, $Na(NH_4)HPO_4 \cdot 4H_2O$ is also used to identify certain cations just like borax. When microcosmic salt is heated in a loop of platinum wire, a colourless transparent bead of sodium metaphosphate is formed.

Now $NaPO_3$ reacts with metallic oxides to give coloured orthophosphates.

		$Ca(OH)_2 + SO_2 \longrightarrow CaSO_3$ (milky)
Solution gives smell of vinegar	CH_3COO^- (acetate)	Aq. Solution + neutral $FeCl_3 \rightarrow$ blood red colour $3CH_3COONa + FeCl_3 \longrightarrow Fe(CH_3COO)_3 + 3NaCl$ neutral (red)
White or yellowish white turbidity on warming	$S_2O_3^{2-}$ (thiosulphate)	Aq. Solution + $AgNO_3 \rightarrow$ white ppt. changing to black (viii) on warming , $Na_2S_2O_3 + 2AgNO_3 \longrightarrow Ag_2S_2O_3 + 2NaNO_3$ white ppt. $Ag_2S_2O_3 + H_2O \longrightarrow Ag_2S + H_2SO_4$ black ppt.

Table : 21.8 Observation with concentrated H_2SO_4

Observation	Acid Radical	Confirmatory Test
Colourless pungent gas giving white fumes with aq. NH_4OH	Cl^- (chloride)	Add MnO_2 in the same test tube and heat –pale green Cl_2 gas (i) $S.E.+ HNO_3 + AgNO_3$ solution –white ppt. soluble in aq. NH_3 (ii) Chromyl chloride test (iii)
Reddish brown fumes	Br^- (bromide)	Add Mn_2O and heat –yellowish brown Br_2 gas (iv) $S.E.+ HNO_3 + AgNO_3$ solution –pale yellow ppt. partially soluble aq. NH_3 (v) Layer test (vi)
Violet pungent vapours turning starch paper blue.	I^- (iodide)	$S.E.+ HNO_3 + AgNO_3 \rightarrow$ yellow ppt. insoluble in aq. NH_3 (vii) Layer test (vi)
Brown pungent fumes intensified by the addition of Cu - turnigs.	NO_3^- (nitrate)	Ring test (viii)
Colourless gases turning lime water milky and burning with blue flame.	$C_2O_4^{2-}$ (oxalate)	Acidified $KMnO_4$ solution is decolorised (ix) $S.E. + CH_3COOH + CaCl_2$ white ppt. decolorising acidified $KMnO_4$ solution (x)

Reactions

Chloride : (i) $KCl + \text{conc. } H_2SO_4 \longrightarrow KHSO_4 + HCl$

(ii) $KCl + AgNO_3 \longrightarrow AgCl \downarrow + KNO_3$
white ppt.

(iii) **Chromyl- chloride test :**

Chloride + $K_2Cr_2O_7$ (solid) + conc. $H_2SO_4 \xrightarrow{\text{heat}}$ reddish brown vapours of chromyl-chloride (CrO_2Cl_2). Pass these vapours into $NaOH$, when yellow Na_2CrO_4 solution is formed. On adding CH_3COOH and $(CH_3COO)_2 Pb$, yellow ppt. of lead chromate ($PbCrO_4$) is formed.

Bromide : (iv) $KBr + \text{conc. } H_2SO_4 \xrightarrow{\Delta} KHSO_4 + H ;$

(v) $NaBr + AgNO_3 \longrightarrow AgBr \downarrow + NaNO_3$
pale yellow ppt.

Group	Basic radicals	Group reagent	Ppt. as	Explanation
I	$Ag^+, Hg_2^{2+} (I), Pb^{2+}$	dil HCl	Chloride ($AgCl, Hg_2Cl_2, PbCl_2$)	K_{SP} values of chlorides are low, hence precipitated. Others have higher K_{SP} values hence not precipitated.
II	$Cu^{2+}, Cd^{2+}, Pb^{2+},$ $Hg^{2+} (II), Bi^{3+}, As^{3+},$ Sb^{3+}, Sn^{2+}	H_2S gas in presence of dil. HCl	Sulphides (CuS, As_2S_3 etc.)	K_{SP} values of sulphides are low hence precipitated by low $[S^{2-}]$ ion. HCl (with common H^+ ion) decreases ionization of H_2S which gives low $[S^{2-}]$. Hence II group is precipitated. Others with higher K_{SP} values not precipitated.
III	$Al^{3+}, Cr^{3+}, Fe^{3+}$	NH_4OH in presence of NH_4Cl	Hydroxide, $Al(OH)_3$ etc.	K_{SP} values of $Al(OH)_3$ etc. are low. NH_4Cl (with common NH_4^+ ion) decreases ionization of NH_4OH giving

				low $[OH^-]$. Hence group III is precipitated.
IV	$Zn^{2+}, Ni^{2+}, Mn^{2+}, Co^{2+}$	H_2S in ammonical medium	Sulphides (ZnS etc.)	K_{SP} values of sulphides of group IV are high hence precipitation takes place in higher $[S^{2-}]$. Basic medium increases ionization of H_2S increasing $[S^{2-}]$ hence precipitation of group IV.
V	$Ca^{2+}, Ba^{2+}, Sr^{2+}$	$(NH_4)_2CO_3 + NH_4Cl$	Carbonates ($CaCO_3$ etc.)	K_{SP} values of carbonate are less than that of group VI (Mg^{2+}) hence precipitation before Mg^{2+} .
VI	$Mg^{2+}, (Na^+, K^+ \text{ also included})$	$NH_4OH + Na_2HPO_4$ (only for Mg^{2+})	White ppt. ($MgHPO_4$)	—
0 (Zero)	NH_4^+	—	—	Tested independently from original solution.

Chemical reactions involved in the tests of basic radicals

Group I : When dil. HCl is added to original solution, insoluble chlorides of lead, silver mercurous mercury are precipitated.

Pb (lead)

(i) $PbCl_2$ is soluble in hot water and on cooling white crystals are again formed.

(ii) The solution of $PbCl_2$ gives a yellow precipitate with potassium chromate solution which is insoluble in acetic acid but soluble in sodium hydroxide.

(iii) The solution of $PbCl_2$ forms a yellow precipitate with potassium iodide solution.

(iv) White precipitate of lead sulphate is formed with dilute H_2SO_4 . The precipitate is soluble in ammonium acetate,

Ag(silver)

(i) $AgCl$ dissolves in ammonium hydroxide,

(ii) On adding dilute HNO_3 to the above solution, white precipitate is again obtained

(iii) On adding KI to the complex solution, yellow precipitate is obtained.

Hg_2^{2+} (mercurous)

(i) Hg_2Cl_2 turns black with NH_4OH ,

(ii) The black residue dissolves in aqua-regia forming mercuric chloride.

(iii) The solution of $HgCl_2$ forms white or slate-coloured precipitate with stannous chloride.

(iv) The solution of $HgCl_2$ with copper turning forms a grey deposit.

Group II : When hydrogen sulphide is passed in acidified solution, the radicals of second group are precipitated as sulphides. The precipitate is treated with yellow ammonium sulphide. The sulphides of IIB are first oxidised to higher sulphides which then dissolve to form thio-compounds.

All the three are soluble.

In case, the precipitate does not dissolve in yellow ammonium sulphide, it may be either HgS or PbS or Bi_2S_3 or CuS or CdS . The precipitate is heated with dilute HNO_3 . Except HgS , all other sulphides of IIA are soluble.

Hg (mercuric)

HgS is dissolved in aqua-regia,

The solution is divided into two parts:

Part I : Stannous chloride solution reduces $HgCl_2$ first into white Hg_2Cl_2 and then to grey metallic mercury.

Part II : Copper displaces Hg from $HgCl_2$ which gets coated on copper turnings as a shining deposit.

Pb (lead)

In case the sulphide dissolves in dilute HNO_3 , a small part of the solution is taken. Dilute H_2SO_4 is added. If lead is present, a white precipitate of lead sulphate appears,
 $Pb(NO_3)_2 + H_2SO_4 \rightarrow PbSO_4 + 2HNO_3$
 (White ppt.)

In absence of lead, the remaining solution is made alkaline by the addition of excess of NH_4OH . Bismuth forms a white precipitate of $Bi(OH)_3$, copper forms a deep blue coloured solution while cadmium forms a colourless soluble complex,

Bi (bismuth) : The precipitate dissolves in dilute HCl ,
 $Bi(OH)_3 + 3HCl \longrightarrow BiCl_3 + 3H_2O$

Part I : Addition of excess of water to $BiCl_3$ solution gives a white precipitate due to hydrolysis.

Part II : The solution of $BiCl_3$ is treated with sodium stannite when a black precipitate of metallic bismuth is formed,
 $2BiCl_3 + 3Na_2SnO_2 + 6NaOH \longrightarrow$
 Sod. stannite

Cu (copper) : Blue coloured solution is acidified with acetic acid. When potassium ferrocyanide is added a chocolate coloured precipitate is formed,

Cd (cadmium) : H_2S is passed through colourless solution. The appearance of yellow precipitate confirms the presence of cadmium,

Group IIB : In case the precipitate dissolves in yellow ammonium sulphide, the tests of the radicals arsenic, antimony and tin are performed. The sulphide is treated with concentrated hydrochloric acid. Antimony and tin sulphide dissolve while arsenic sulphide remains insoluble.

As (arsenic) : The insoluble sulphide is treated with concentrated nitric acid which is then heated with ammonium molybdate. Yellow precipitate of ammonium arsenomolybdate is formed.

Sr or Sn (tin) : Solution of sulphide in concentrated HCl is reduced with iron filings or granulated zinc.

$HgCl_2$ solution is added to above solution which gives first a white precipitate that turns to grey.

Sb (antimony) : Filtrate of sulphide in concentrated HCl is divided into two parts.

Part I : On dilution with excess of water, a white precipitate of antimony oxychloride is obtained.

Part II : H_2S is circulated. Orange precipitate is formed,
 $2SbCl_3 + 3H_2S \longrightarrow Sb_2S_3 + 6HCl$
 Orange ppt.

Group III : Hydroxides are precipitated on addition of excess of ammonium hydroxide in presence of ammonium chloride.

Fe (iron) : The brownish red precipitate dissolves in dilute HCl . The solution is divided into two parts.

Part I : $K_4[Fe(CN)_6]$ solution is added which forms deep blue solution or precipitate.

Part II : Addition of potassium thiocyanate solution gives a blood red colouration.

Cr(chromium) : The green precipitate is fused with fusion mixture ($Na_2CO_3 + KNO_3$). The fused product is extracted with water or the precipitate is heated with $NaOH$ and bromine water.

The solution thus obtained contains sodium chromate. The solution is acidified with acetic acid and treated with lead acetate solution. A yellow precipitate appears.

Al(aluminium) : The gelatinous precipitate dissolves in $NaOH$, $Al(OH)_3 + NaOH \longrightarrow NaAlO_2 + 2H_2O$

Soluble

The solution is boiled with ammonium chloride when $Al(OH)_3$ is again formed.

Group IV : On passing H_2S through the filtrate of the third group, sulphides of fourth group are precipitated. NiS and CoS are black and insoluble in concentrated HCl while MnS (buff coloured), ZnS (colourless) are soluble in conc. HCl .

Zn (zinc) : The sulphide dissolves in HCl . $ZnS + 2HCl \longrightarrow ZnCl_2 + H_2S$

When the solution is treated with $NaOH$, first a white precipitate appears which dissolves in excess of $NaOH$

On passing H_2S , white precipitate of zinc sulphide is formed

Mn (manganese) : Manganese sulphide dissolves in HCl

On heating the solution with $NaOH$ and Br_2 -water, manganese dissolve gets precipitated.

The precipitate is treated with excess of nitric acid and PbO_2 or Pb_3O_4 (red lead). The contents are heated. The formation of permanganic acid imparts pink colour to the supernatant liquid.

The above test fails in presence of HCl .

Ni (nickel) and Co (cobalt)

The black precipitate is dissolved in aqua-regia.

The solution is evaporated to dryness and residue extracted with dilute HCl . It is divided into three parts.

Part I : Add NH_4OH (excess) and dimethyl glyoxime. A rosy red precipitate appears, if nickel is present,

Part II : Add CH_3COOH in excess and KNO_2 . The appearance of yellow precipitate confirms the presence of cobalt.

Part III : Solution containing either nickel or cobalt is treated with NaHCO_3 and bromine water. Appearance of apple green colour is observed, the solution is heated when black precipitate is formed, which shows the presence of nickel,

Group V : Ammonium carbonate precipitates V group radicals in the form of carbonates are soluble in acetic acid.

Ba (barium) : Barium chromate is insoluble and precipitated by the addition of potassium chromate solution,

Sr (Strontium) : Strontium sulphate is insoluble and precipitated by the addition of ammonium sulphate solution,

Ca (calcium) : Calcium oxalate is insoluble and precipitated by the addition of ammonium oxalate.

Group VI : In the filtrate of V group, some quantity of ammonium oxalate is added as to remove Ba, Ca and Sr completely from the solution. The clear solution is concentrated and made alkaline with NH_4OH . Disodium hydrogen phosphate is now added, a white precipitate is formed.

Zero group NH_4^+ (ammonium) : The substance (salt or mixture) when heated with NaOH solution evolves ammonia.

When a rod dipped in HCl is brought on the mouth of the test tube, white fumes of ammonium chloride are formed,

To the aqueous solution of ammonium salt when Nessler's reagents is added, brown coloured precipitate is formed.

Volumetric analysis

Volumetric analysis is a quantitative analysis. It involves the measurement of the volume of a known solution required to bring about the completion of the reaction with a measured volume of the unknown solution.

Titration : The process of addition of the known solution from the burette to the measured volume of solution of the substance to be estimated until the reaction between the two is just complete, is termed as titration. Thus, a titration involves two solutions;

(i) **Unknown solution :** The solution consisting the substance to be estimated is termed unknown solution. The substance is termed titrate.

(ii) **Standard solution :** The solution in which an accurately known amount of the reagent (titrant) has been dissolved in a known volume of the solution is termed standard solution. There are two types of reagents (titrants) :

(a) **Primary standards :** These can be accurately weighed and their solutions are not to be standardised before use. Oxalic acid ($\text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$), potassium dichromate ($\text{K}_2\text{Cr}_2\text{O}_7$), silver nitrate (AgNO_3), copper sulphate ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$), ferrous ammonium sulphate [$\text{FeSO}_4(\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$], sodium thiosulphate ($\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$), etc., are the examples of primary standards.

(b) **Secondary standards :** The solutions of these reagents are to be standardised before use as these cannot be weighed accurately. The examples are sodium hydroxide (NaOH), potassium hydroxide (KOH), hydrochloric acid (HCl), sulphuric acid (H_2SO_4), potassium permanganate (KMnO_4), iodine, etc.

Law of equivalence : It is applied in all volumetric estimations. According to it, the chemical substances react in the ratio of their chemical equivalent masses.

$$\frac{\text{Mass of substance A}}{\text{Mass of substance B}} = \frac{\text{Chemical equivalent mass of A}}{\text{Chemical equivalent mass of B}}$$

$$\text{or } \frac{\text{Mass of substance A}}{\text{Chemical equivalent mass of A}}$$

$$= \frac{\text{Mass of substance B}}{\text{Chemical equivalent mass of B}}$$

or gram equivalent of A = gram equivalent of B

or milli-gram equivalent of A = milli-gram equivalent of B

The point at which the amounts of the two reactants are just equivalent is known as equivalence point or end point. An auxiliary substance which helps in the usual detection of the completion of the titration or equivalence point or end point is termed as indicator, i.e., substances which undergo some easily detectable changes at the equivalence point are used as indicators.

Methods of expressing concentrations of solutions

The concentration of a solution can be expressed in various ways.

- (1) Percent by mass
- (2) Molarity
- (3) molality

- (4) Mole fraction
(5) Normality

Types of titrations : Titrations can be classified as :

- (1) Acid base titrations or acidimetry and alkalimetry
(2) Oxidation reduction titrations or redox titrations
(3) Precipitation titrations
(4) Complexometric titrations.

(1) **Acid-base titrations :** When the strength of an acid is determined with the help of a standard solution of base, it is known as **acidimetry**. Similarly, when the strength of a base (alkali) is determined with the help of a standard solution of an acid, it is known as **alkalimetry**. Both these titrations involve neutralisation of an acid with an alkali. In these titrations H^+ ions of the acid combine with OH^- ions of the alkali to form unionised molecules of water.

The end point in these titrations is determined by the use of organic dyes which are either weak acids or weak bases. These change their colours within a limited range of hydrogen ion concentrations, *i.e.*, *pH* of the solution. Phenolphthalein is a suitable indicator in the titrations of strong alkalies (free from carbonate) against strong acids or weak acids. Methyl orange is used as an indicator in the titrations of strong acids against strong and weak alkalies. As no indicator gives correct results in the titrations of weak acids against weak bases, such titrations are performed by some other methods (physical methods).

(2) **Oxidation reduction titrations :** The titrations based on oxidation-reduction reactions are called redox titrations. The chemical reactions proceed with transfer of electrons (simultaneous loss or gain of electrons) among the reacting ions in aqueous solutions. Sometimes these titrations are named after the reagent used, as:

(i) **Permanganate titrations :** These are titrations in which potassium permanganate is used as an oxidising agent in acidic medium. The medium is maintained by the use of dilute sulphuric acid. Potassium permanganate acts as a self-indicator. The potential equation, when potassium permanganate acts as an oxidising agent, is :

Before the end point, the solution remains colourless (when $KMnO_4$ solution is taken in burette) but after the equivalence point only one extra drop of $KMnO_4$ solution imparts pink colour, *i.e.*, appearance of pink colour indicates the end point. Potassium permanganate is used for the estimation of ferrous salts, oxalic acid, oxalates, hydrogen peroxide, etc. The solution of potassium permanganate is always first standardised before its use.

(ii) **Dichromate titrations :** These are titrations in which, potassium dichromate is used as an oxidising agent in acidic medium. The medium is maintained acidic by the use of dilute sulphuric acid. The potential equation is

The solution of potassium dichromate can be directly used for titrations. It is mainly used for the estimation of ferrous salts and iodides. In the titration of $K_2Cr_2O_7$ versus ferrous salt either an external indicator (potassium ferricyanide) or an internal indicator (diphenyl amine) can be used.

(iii) **Iodimetric and iodometric titrations :** The reduction of free iodine to iodide ions and oxidation of iodide ions to free iodine occurs in these titrations.

These are divided into two types :

(a) **Iodimetric titrations :** These are the titrations in which free iodine is used. As it is difficult to prepare the solution of iodine (volatile and less soluble in water), it is dissolved in potassium iodide solution.

This solution is first standardised before use. With the standard solution of I_2 . Substances such as sulphite, thiosulphate, arsenite, etc., are estimated.

(b) **Iodometric titrations :** In iodometric titrations, an oxidising agent is allowed to react in neutral medium or in acidic medium, with excess of potassium iodide to liberate free iodine.

Free iodine is titrated against a standard reducing agent usually with sodium thiosulphate. Halogens, oxyhalogens, dichromates, cupric ion, peroxides, etc., can be estimated by this method.

In iodimetric and iodometric titrations, starch solution is used as an indicator. Starch solution gives blue or violet colour with free iodine. At the end point the blue or violet colour disappears when iodine is completely changed to iodide.

(3) **Precipitation titrations :** The titrations which are based on the formation of insoluble precipitates, when the solutions of two reacting substances are brought in contact with each other, are called **precipitation titrations**. For example, when a solution of silver nitrate is added to a solution of sodium chloride or a solution of ammonium thiocyanate, a white precipitate of silver chloride or silver thiocyanate is formed.

Such titrations involving silver nitrate are called argentometric titrations.

(4) **Complexometric titrations :** A titration, in which an undissociated complex is formed at the equivalence point, is called **complexometric titration**. These titrations are superior to precipitation titrations as there is no error due to co-precipitation.

EDTA (ethylenediamine tetra-acetic acid) is a useful reagent which forms complexes with metals. In the form of disodium salt, it is used to estimate Ca^{2+} and Mg^{2+} ions in presence of eriochrome black-*T* as an indicator.

Equivalent masses of acids and bases : Equivalent masses of some acids and bases are given in the following table

Table : 21.10

Acid	Basicity	Mol. Mass	Eq. Mass
HCl	1	36.5	$\frac{36.5}{1} = 36.5$
HNO_3	1	63	$\frac{63}{1} = 63.0$
H_2SO_4	2	98	$\frac{98}{2} = 49.0$
CH_3COOH	1	60	$\frac{60}{1} = 60.0$
$H_2C_2O_4 \cdot 2H_2O$	2	126	$\frac{126}{2} = 63.0$
H_3PO_4	3	98	$\frac{98}{3} = 32.7$
H_2PO_4	2	82	$\frac{82}{2} = 41.0$
HPO_4	1	66	$\frac{66}{1} = 66.0$

Table : 21.11

Alkali	Acidity	Mol. Mass	Eq. Mass
$NaOH$	1	40	$\frac{40}{1} = 40$
KOH	1	56	$\frac{56}{1} = 56$
$Ca(OH)_2$	2	74	$\frac{74}{2} = 37$
NH_4OH	1	35	$\frac{35}{1} = 35$

Calculations of Volumetric analysis

The following points should be kept in mind while making calculations of volumetric exercises.

(i) 1g equivalent mass of a substance reacts completely with 1g equivalent mass of any other substance. 1g equivalent mass of a substance means equivalent mass of the substance in grams. For example,

1g equivalent mass of $NaOH = 40g$ of $NaOH$

1g equivalent mass of $H_2SO_4 = 49g$ of H_2SO_4

1g equivalent mass of $KMnO_4$ in acidic medium
 $= 31.6g$ of $KMnO_4$

1g equivalent mass of hydrated oxalic acid
 $= 63g$ of hydrated oxalic acid

Note : Equivalent mass is a variable quantity and depends on the reaction in which the substance takes part. The nature of the reaction should be known before writing the gram equivalent mass of the substance. For example in the reactions.

The value of g equivalent mass of H_2SO_4 in reaction (i) is 98g and in reaction (ii) 49g.

(ii) Number of g equivalents

$$= \frac{\text{Mass of the substance in } g}{\text{Equivalent mass of the substance}}$$

$$\text{Number of } g \text{ moles} = \frac{\text{Mass of the substance in } g}{\text{Molecular mass of the substance}}$$

$$= \frac{\text{Volume in litres of the substance at N.T.P.}}{22.4} \quad (\text{only for gases})$$

$$\text{Number of milli-equivalent} = \frac{\text{Mass in } g \times 1000}{\text{Equivalent mass}}$$

$$\text{Number of milli-moles} = \frac{\text{Mass in } g \times 1000}{\text{Molecular mass}}$$

$$\text{(iii) Molarity} = \frac{\text{No. of moles of the solute}}{\text{No. of litres of the solution}} = \frac{w}{m \times V}$$

Molarity $\times$ molecular mass = strength of the solution (g/L)
 No. of moles of the solute = Molarity $\times$ No. of litres of solution
 Mass of the solute in $g(w) = \text{molarity} \times \text{No. of litres of solution} \times \text{mol. mass of solute}$

$$\text{Normality} = \frac{\text{No. of } g \text{ equivalent of the solute}}{\text{No. of litres of the solution}} = \frac{w}{E \times V}$$

Normality $\times$ equivalent mass = strength of the solution (g/L)

No. of equivalents of the solute = Normality $\times$ No. of litres of solution

Mass of the solute in $g(w) = \text{Normality} \times \text{No. of litres of solution}$

$\times$ Eq. mass of the solute

$$\frac{\text{Molecular mass}}{\text{Equivalent mass}} = n = \frac{\text{Normality}}{\text{Molarity}}$$

$$\text{Normality} = n \times \text{Molarity}$$

(iv) **Normality equation** : When solutions A and B react completely.

$$N_A V_A = N_B V_B$$

Normality of $A \times$ volume of $A = \text{Normality of } B \times \text{volume of } B$

$$\text{or } \frac{\text{Strength } A}{\text{Eq. mass } A} \times V_A = \frac{\text{Strength } B}{\text{Eq. mass } B} \times V_B$$

$$\frac{\text{Wt. of metal hydroxide}}{\text{wt. of metal oxide}} = \frac{\text{Eq. wt. of metal hydroxide}}{\text{Eq. wt. of metal oxide}}$$

$$= \frac{\text{Eq. wt of metal} + \text{Eq. wt of } OH}{\text{Eq. wt. of metal} + \text{Eq. wt of } O^{2-}}$$

(v) When the solution is diluted, the following formulae can be applied :

$$N_1 V_1 = N_2 V_2 \text{ or } M_1 V_1 = M_2 V_2 \text{ or } S_1 V_1 = S_2 V_2$$

Before dilution = After dilution

(vi) If a number of acids are mixed, the combined normality of the mixture, N_x , is given

$$N_x V_x = N_1 V_1 + N_2 V_2 + N_3 V_3 + \dots$$

Where V_x is the total volume of the mixture, N_1 and V_1 are the normality and volume respectively of one acid, N_2 and V_2 of the second acid and so on.

Tips & Tricks

✍ Glass rod should never be used in flame test as it gives a golden yellow colour due to sodium present in it. An asbestos fibre can be safely used in place of platinum wire.

✍ The transparent bead in borax bead test is made of $NaBO_2 + B_2O_3$.

✍ Filter ash test is an alternative to cobalt nitrate test and gives better results.

✍ Both CO_2 and SO_2 turn lime water milky.

✍ Eq. wt. of $KMnO_4$ is different in acidic, alkaline and neutral medium i.e., 31.6, 158 and 52.67 respectively.

Ordinary Thinking

Objective Questions

Preliminary Test

- In borax bead test, which of the following compound is formed [CBSE PMT 2002]
 - Meta borate
 - Tetra borate
 - Double oxide
 - Ortho borate
- The metal that does not give the borax-bead test is [MP PMT 1999]
 - Chromium
 - Nickel
 - Lead
 - Manganese
- Which of the following is coloured compound? [BCECE 2005]
 - CuF_2
 - CuI
 - $NaCl$
 - $MgCl_2$
- The composition of 'Golden spangles' is [CBSE PMT 1990]
 - $PbCrO_4$
 - PbI_2
 - As_2S_3
 - $BaCrO_4$
- The alkaline earth metal that imparts apple green colour to the bunsen flame when introduced in it in the form of its chloride is [EAMCET 1979]
 - Barium
 - Strontium
 - Calcium
 - Magnesium
- Which gives violet coloured bead in borax bead test [BHU 1988; MP PET 1997]
 - Fe^{2+}
 - Ni^{2+}
 - Co^{2+}
 - Mn^{2+}
- Sodium borate on reaction with H_2SO_4 (conc.) and C_2H_5OH gives a compound 'A' which burns with green flame. The compound 'A' is [MP PET 1994]
 - $H_2B_4O_7$
 - $(C_2H_5)_2B_4O_7$
 - H_3BO_3
 - $(C_2H_5)_3BO_3$
- On mixing two colourless gases, a deep brown colour is observed. The gases are [CPMT 1977]
 - N_2O and O_2
 - NO and O_2
 - N_2O_3 and O_2
 - None of these
- Which one of the following metals will give blue ash when its salt is heated with Na_2CO_3 solid and $Co(NO_3)_2$ on a charcoal piece [MNR 1987]
 - Cu
 - Mg
 - Al
 - Zn
- The metal that does not give the borax bead test is [BHU 1987; AFMC 1995; MHCET 2003]
 - Cr
 - Ni
 - Na
 - Mn
- When concentrated H_2SO_4 is added to dry KNO_3 , brown fumes evolve. These fumes are [CPMT 1988; IIT 1987]
 - SO_2
 - SO_3
 - NO
 - NO_2
- Which one of the following salt give green coloured flame when the salt is tested by Pt wire
 - Barium salt
 - Calcium salt
 - Borate
 - Lead salt
- A precipitate of calcium oxalate will not dissolve in [CPMT 1971]
 - HCl
 - HNO_3
 - Aqua-regia
 - Acetic acid
- Sodium sulphite on heating with dilute HCl liberates a gas which [NCERT 1972]
 - Turns lead acetate paper black
 - Turns acidified potassium dichromate paper green
 - Burns with a blue flame
 - Smells like vinegar
- Starch-iodide paper is used for the test of
 - Iodine
 - Iodide ion
 - Oxidising agent
 - Reducing agent
- Which of the following salt gives white precipitate with $AgNO_3$ solution and dil. H_2SO_4 solution and gives green flame test
 - $CuCl_2$
 - $BaCl_2$
 - $PbCl_2$
 - $Cu(NO_3)_2$
- Two gases when mixed give white dense fumes, the gases are
 - NH_3 and SO_2
 - SO_2 and steam
 - NH_3 and HCl
 - NH_3 and N_2O
- Blue borax bead is obtained with [MADT Bihar 1982; MP PET 1995]
 - Zn
 - Cobalt
 - Chromium
 - Fe
- Which of the following imparts green colour to the burner flame [DCE 2004]
 - $B(OMe)_3$
 - $Na(OMe)$
 - $Al(OPr)_3$
 - $Sn(OH)_2$
- In laboratory burners, we use [DCE 2004]
 - Producer gas
 - Oil gas
 - Gobar gas
 - Coal gas
- A colourless gas with the smell of rotten fish is [AFMC 2005]
 - H_2S
 - PH_3
 - SO_2
 - None of these
- Which BLUE LIQUID is obtained on reacting equimolar amounts of two gases at $-30^\circ C$? [IIT 2005]
 - N_2O
 - NO
 - N_2O
 - NO
- MnO_2 and H_2SO_4 added to $NaCl$, the greenish yellow gas liberated is [Orissa JEE 2005]
 - Cl_2
 - NH_3
 - N_2
 - H_2

Wet Test for acid radical

- Which of the following statement(s) is(are) correct when a mixture of $NaCl$ and $K_2Cr_2O_7$ is gently warmed with conc. H_2SO_4 [IIT 1998; CPMT 2002]
 - A deep red vapour is evolved
 - The vapour when passed into $NaOH$ solution gives a yellow solution of Na_2CrO_4
 - Chlorine gas is evolved
 - Chromyl chloride is formed
- Starch can be used as an indicator for the detection of traces of [CPMT 1992]
 - Glucose in aqueous solution
 - Proteins in blood

- (c) Iodine in aqueous solution
(d) Urea in blood
3. Which of the following combines with $Fe(II)$ ions to form a brown complex
[AIIMS 1982, 87; AFMC 1988; CBSE PMT 2000; Pb. PMT 2000; MP PET 2000, 01]
(a) N_2O (b) NO
(c) N_2O_3 (d) N_2O_5
4. Sodium nitroprusside, when added to an alkaline solution of sulphide ions, produces purple colour ion due to the formation of [IIT 1995]
(a) $Na[Fe(H_2O)_5NOS]$ (b) $Na_2[Fe(H_2O)_5NOS]$
(c) $Na_3[Fe(CN)_5NOS]$ (d) $Na_4[Fe(CN)_5NOS]$
5. In the chromyl chloride test, the reagent used is [AMU 1983]
(a) K_2CrO_4 (b) CrO_3
(c) $K_2Cr_2O_7$ (d) $(NH_4)_2Cr_2O_7$
6. Which of the following will not produce a precipitate with $AgNO_3$ solution [MP PMT 1990]
(a) F^- (b) Br^-
(c) CO_3^{2-} (d) PO_4^{3-}
7. When a mixture of solid $NaCl$, solid $K_2Cr_2O_7$ is heated with conc. H_2SO_4 , orange red vapours are obtained of the compound [CPMT 1974, 78, 81, 88; DPMT 1983, 89; NCERT 1977; AFMC 1982; AMU 1984]
(a) Chromous chloride (b) Chromyl chloride
(c) Chromic chloride (d) Chromic sulphate
8. Chromyl chloride vapours are dissolved in $NaOH$ and acetic acid and lead acetate solution is added, then
(a) The solution will remain colourless
(b) The solution will become dark green
(c) A yellow solution will be obtained
(d) A yellow precipitate will be obtained
9. Which of the following gives black precipitate when H_2S gas is passed through its solution [CPMT 1974]
(a) Acidic $AgNO_3$ (b) $Mg(NO_3)_2$
(c) Ammonical $BaCl_2$ (d) Copper nitrate
10. A salt gives violet vapours when treated with conc. H_2SO_4 . It contains [DPMT 1981; CPMT 1971]
(a) Cl^- (b) I^-
(c) Br^- (d) NO_3^-
11. When Cl_2 water is added to a salt solution containing chloroform, chloroform layer turns violet. Salt contains [CPMT 1982]
(a) Cl^- (b) I^-
(c) NO_3^- (d) S^{2-}
12. A salt is heated first with dil. H_2SO_4 and then with conc. H_2SO_4 . No reaction takes place. It may be [CPMT 1978]
(a) Nitrate (b) Sulphide
(c) Oxalate (d) Sulphate
13. Phosphate radical with ammonium molybdate gives precipitate of which colour
(a) Violet (b) Pink
(c) Canary yellow (d) Green
14. Which compound is soluble in NH_4OH [AFMC 1987]
(a) $PbCl_2$ (b) $PbSO_4$
(c) $AgCl$ (d) $CaCO_3$
15. Nitrates of all the metals are [DPMT 1983, 89]
(a) Coloured (b) Unstable
(c) Soluble in water (d) Insoluble in water
16. Nitrate is confirmed by ring test. The brown colour of the ring is due to the formation of [EAMCET 1979; AFMC 1981, 88, 90; RPET 1999; MP PMT 2000; MP PET 2002; CPMT 2004]
(a) Ferrous nitrite (b) $FeSO_4NO$
(c) $FeSO_4NO_2$ (d) Ferrous nitrate
17. Which of the following precipitate does not dissolve even in large excess of NH_4OH [MP PMT 1991]
(a) $AgCl$ (b) $AgBr$
(c) AgI (d) None of these
18. Aqueous solution of a salt when treated with $AgNO_3$ solution gives a white precipitate, which dissolves in NH_4OH . Radical present in the salt is
(a) Cl^- (b) Br^-
(c) I^- (d) NO_3^-
19. When CO_2 is passed into lime water it turns milky. When excess of CO_2 is passed, milkiness disappears because
(a) Reaction is reversed
(b) Water soluble $Ca(HCO_3)_2$ is formed
(c) Vaporisable calcium derivative is formed
(d) None of these
20. A mixture when heated with conc. H_2SO_4 with MnO_2 brown fumes are formed due to
(a) Br^- (b) NO_3^-
(c) Cl^- (d) I^-
21. A substance on treatment with dil H_2SO_4 liberates a colourless gas which produces (i) turbidity with baryta water and (ii) turns acidified dichromate solution green. The reaction indicates the presence of [IIT 1992]
(a) CO_3^{2-} (b) S^{2-}
(c) SO_3^{2-} (d) NO_2^-
22. In the test of sulphate radical, the white precipitate of sulphate is soluble in
(a) Conc. HCl (b) Conc. H_2SO_4
(c) Conc. HNO_3 (d) None of these
23. To an inorganic mixture dil. H_2SO_4 is added in cold; colourless, odourless gas is evolved. The mixture contains [AMU 1982]
(a) Sulphite (b) Acetate
(c) Nitrite (d) Carbonate
24. Which reagent is used to remove SO_4^{2-} and Cl^- [Pb. PMT 2002]
(a) $BaSO_4$ (b) $NaOH$
(c) $Pb(NO_3)_2$ (d) KOH

25. is formed when potassium iodide is heated with conc. H_2SO_4 [CPMT 1971]
 (a) HI (b) I_2
 (c) HIO_3 (d) KIO_3
26. Chromyl chloride test is performed for the confirmation of the presence of the following in a mixture [CPMT 1990; KCET 1992; RPET 1999]
 (a) Sulphate (b) Chromium
 (c) Chloride (d) Chromium and chloride
27. A reagent that can distinguish between a chloride and a peroxide is
 (a) Water (b) Dil. H_2SO_4
 (c) KOH solution (d) $NaCl$
28. Which reagent below would enable you to remove sulphate ions from a solution containing both sulphate and chloride ions [NCERT 1975; CPMT 1979; BSE 1981]
 (a) Sodium hydroxide (b) Barium hydroxide
 (c) Barium sulphate (d) Potassium hydroxide
29. Ozone when reacts with potassium iodide solution liberates certain product, which turns starch paper blue. The liberated substance is..... [Orissa JEE 2002]
 (a) Oxygen (b) Iodine
 (c) Hydrogen iodide (d) Potassium hydroxide
30. When KBr is treated with conc. H_2SO_4 a reddish-brown gas is evolved. The evolved gas is [EAMCET 1978]
 (a) Bromine
 (b) Mixture of bromine and HBr
 (c) HBr
 (d) NO_2
31. A solution of a salt in dilute sulphuric acid imparts deep blue colour with starch iodine solution it confirms the presence of which of the following [MP PET 2003; NCERT 1974; CPMT 1977]
 (a) NO_2^- (b) I^-
 (c) NO_3^- (d) CH_3COO^-
32. Ammonia reacts with excess of chlorine to form [DPMT 2000]
 (a) N_2 and HCl (b) NH_4Cl and NCl_3
 (c) NCl_3 and HCl (d) N_2 and NH_4Cl
33. A brown ring appears in the test for [EAMCET 1978; KCET 1991; Bihar CEE 1995; AIIMS 1996; DCE 1999]
 (a) Nitrate (b) Nitrite
 (c) Bromide (d) Iron
34. Which of the following anions would decolourise acidified $KMnO_4$ solution
 (a) SO_4^{2-} (b) S^{2-}
 (c) NO_3^- (d) CH_3COO^-
35. The gas which is absorbed by ferrous sulphate solution giving blackish brown colour is [AMU 1999]
 (a) NO (b) CO
 (c) N_2 (d) NH_3
36. Which one of the following anions is not easily removed from aqueous solutions by precipitation [IIT 1995]
 (a) Cl^- (b) NO_3^-
 (c) CO_3^{2-} (d) SO_4^{2-}
37. Na_2CO_3 cannot be used to identify [BVP 2004]
 (a) CO_3^{2-} (b) SO_3^{2-}
 (c) S^{2-} (d) SO_4^{2-}
38. The number of hydroxide ions, produced by one molecule of sodium carbonate (Na_2CO_3) on hydrolysis is [Pb. CET 2002]
 (a) 2 (b) 1
 (c) 3 (d) 4
39. Gas A is bubbled through slaked lime when a white precipitate is formed. On prolonged bubbling, the precipitate is dissolved. on heating [EAMCET 1976] solution, the white precipitate reappears with the evolution of gas B . The gases A and B respectively are
 (a) CO_2 and CO (b) CO and CO_2
 (c) CO and CO (d) CO_2 and CO_2
40. By passing H_2S gas in acidified $KMnO_4$ solution, we get [MP PET 1997]
 (a) K_2S (b) S
 (c) K_2SO_3 (d) MnO_2
41. Which of the following doesn't give a ppt. with silver nitrate solution. [J & K 2005]
 (a) Ethyl bromide (b) Sodium bromide
 (c) Calcium chloride (d) Sodium chloride

Wet Test for Basic radical

1. Which sulphide is soluble in $(NH_4)_2CO_3$
 (a) SnS (b) As_2S_3
 (c) Sb_2S_3 (d) CdS
2. When acetic acid and $K_4Fe(CN)_6$ is added to a copper salt, a chocolate precipitate is obtained of the compound
 (a) Copper cyanide (b) Copper ferrocyanide
 (c) Basic copper sulphate (d) Basic copper cyanide
3. A precipitate of the following would be obtained when HCl is added to a solution of stannous sulphide (SnS) in yellow ammonium sulphide [CPMT 1977; NCERT 1974]
 (a) SnS (b) SnS_2
 (c) Sn_2S_2 (d) $(NH_4)_2SnS_3$
4. When H_2S is passed through in II group sometimes solution becomes milky. It indicates the presence of [MP PMT 1995]
 (a) Acidic salt (b) An oxidising agent
 (c) Thiosulphate (d) A reducing agent
5. Conc. HNO_3 is added before proceeding to test for group III members. This is to [NCERT 1974]
 (a) Oxidise any remaining H_2S
 (b) Convert ferrous ion into ferric ion
 (c) Form nitrates which give granular ppts
 (d) Increase ionisation of ammonium hydroxide
6. A salt gives bright red colour to the flame. This colour indicates the presence of
 (a) Ba^{2+} (b) Sr^{2+}
 (c) Ca^{2+} (d) Cr^{3+}

7. The compound insoluble in acetic acid is [CPMT 1989]
 (a) Calcium oxide (b) Calcium carbonate
 (c) Calcium oxalate (d) Calcium hydroxide
8. Which of the following give white precipitate when HCl is added to its aqueous solution
 (a) Hg^{+} (b) Mg^{++}
 (c) Zn^{++} (d) Cd^{++}
9. Of the following sulphides which one is insoluble in dilute acids but soluble in alkalis [CPMT 1990]
 (a) PbS (b) CdS
 (c) FeS (d) Sb_2S_3
10. Reagent used in the qualitative analysis of IVth group is
 (a) HCl (b) H_2S (alkaline)
 (c) $(NH_4)_2S$ (d) None of these
11. Which of the following radicals will not be precipitated by passing H_2S in concentrated acid solution [BHU 1986]
 (a) Copper (b) Antimony
 (c) Arsenic (d) Cadmium
12. Which of the following pairs would be expected to form precipitate when solution are mixed [NCERT 1984]
 (a) K^{+}, SO_4^{2-} (b) Na^{+}, S^{2-}
 (c) Ag^{+}, NO_3^{-} (d) Al^{3+}, OH^{-}
13. H_2S will precipitate the sulphides of all the metals from the solution of chlorides of Cu, Zn and Cd , if [MP PMT 1985]
 (a) The solution is aqueous
 (b) The solution is acidic
 (c) The solution is dilute acidic
 (d) Any of these solutions is present
14. Addition of solution of oxalate to an aqueous solution of mixture of Ba^{++}, Sr^{++} and Ca^{++} will precipitate [MP PMT 1985]
 (a) Ca^{++} (b) Ca^{++} and Sr^{++}
 (c) Ba^{++} and Sr^{++} (d) All the three
15. Which one among the following pairs of ions cannot be separated by H_2S in dilute hydrochloric acid [IIT 1986]
 (a) Bi^{3+}, Sn^{4+} (b) Al^{3+}, Hg^{2+}
 (c) Zn^{2+}, Cu^{2+} (d) Ni^{2+}, Cu^{2+}
16. Distinguishing reagent between silver and lead salts is [MADT Bihar 1984]
 (a) H_2S gas
 (b) Hot dilute HCl solution
 (c) NH_4Cl (solid) + NH_4OH solution
 (d) NH_4Cl (solid) + $(NH_4)_2CO_3$ solution
17. Group reagent for the precipitation of group II basic radicals for the qualitative analysis table is [MADT Bihar 1982]
 (a) Dil. $HCl + H_2S$
 (b) NH_4Cl (solid) + NH_4OH solution + H_2S
 (c) $(NH_4)_2CO_3$ solution
- (d) None of these
18. The ion that cannot be precipitated by both HCl and H_2S is [IIT 1982; CPMT 1989]
 (a) Pb^{2+} (b) Cu^{+}
 (c) Ag^{+} (d) Sn^{2+}
19. $Pb(CH_3COO)_2$ gives.....colour with H_2S [DPMT 2000]
 (a) Orange (b) Red
 (c) Black (d) White
20. Fe ion can be distinguished by Fe ion by [DPMT 2000]
 (a) NH_4SCN (b) $AgNO_3$
 (c) $BaCl_2$ (d) None of these
21. Which of the following change the colour of the aqueous solution of $FeCl_3$ [Roorkee Qualifying 1998]
 (a) $K_4[Fe(CN)_6]$ (b) H_2S
 (c) NH_4CNS (d) $KCNS$
22. Which of the following substances are soluble in concentrated HNO_3 [Roorkee Qualifying 1998]
 (a) $BaSO_4$ (b) CuS
 (c) PbS (d) HgS
23. Which of the following cannot give iodometric titrations [AIIMS 1997]
 (a) Fe^{3+} (b) Cu^{2+}
 (c) Pb^{2+} (d) Ag^{2+}
24. Which of the following mixture is chromic acid [Pb. PMT 2000]
 (a) $K_2Cr_2O_7$ and HCl
 (b) K_2SO_4 and conc. H_2SO_4
 (c) $K_2Cr_2O_7$ and conc. H_2SO_4
 (d) H_2SO_4 and HCl
25. Which of the following compounds is brown coloured [AFMC 2001]
 (a) $Fe[Fe(CN)_6]$ (b) $Fe[Fe(CN)_6]$
 (c) $Fe[Fe(CN)_6]$ (d) $KFe[Fe(CN)_6]$
26. If Na^{+} ion and S^{2-} ion is larger than Cl^{-} ion, which of the following will be least soluble in water [AMU (Engg.) 1999]
 (a) MgS (b) $NaCl$
 (c) Na_2S (d) $MgCl_2$
27. An aqueous solution of an inorganic salt on treatment with HCl gives a white precipitate. This solution contains [MP PMT 2001]
 (a) Hg^{+} (b) Hg
 (c) Zn (d) Cd
28. Lead sulphate is soluble [MP PET 1999]
 (a) In conc. nitric acid
 (b) In conc. hydrochloric acid
 (c) In a solution of ammonium acetate
 (d) In water
29. Which one of the following sulphides is yellow [MP PMT 1999]
 (a) Zinc sulphide (b) Cadmium sulphide
 (c) Nickel sulphide (d) Lead sulphide
30. When H_2S gas is passed through the HCl containing aqueous solutions of $CuCl$, $HgCl$, $BiCl$ and $CoCl$, which does not precipitate out [MP PMT 2002]

- (a) CuS (b) HgS
(c) Bi_2S_3 (d) CoS
31. Group reagent for analytic group IV is [Kurukshetra CET 2002]
(a) $NH_4Cl + NH_4OH$
(b) $NH_4Cl + NH_4OH + H_2S$
(c) $NH_4OH + (NH_4)_2CO_3$
(d) $HCl + H_2S$
32. When H_2S is passed through HgS we get [AIEEE 2002]
(a) HgS (b) $HgS + H_2S$
(c) $HgS + Hg$ (d) HgS
33. How do we differentiate between Fe and Cr in group III [AIEEE 2002]
(a) By taking excess of NH_4OH solution
(b) By increasing NH_4^+ ion concentration
(c) By decreasing OH^- ion concentration
(d) Both (b) and (c)
34. $[X] + H_2SO_4 \rightarrow [Y]$ a colourless gas with irritating smell
 $[Y] + K_2Cr_2O_7 + H_2SO_4 \rightarrow$ green solution
 $[X]$ and $[Y]$ is [IIT-JEE (Screening) 2003]
(a) SO_3^{2-}, SO_2 (b) Cl^-, HCl
(c) S^{2-}, H_2S (d) CO_3^{2-}, CO_2
35. In the analysis of basic radicals, the group reagent H_2S gas is generally used in the groups [MP PMT 2003]
(a) I and II groups (b) II and III groups
(c) III and V groups (d) II and IV groups
36. A mixture of two salts is not water soluble but dissolves completely in dilute hydrochloric acid to form a colourless solution. The mixture could be [Pb. PMT 1998]
(a) $AgNO_3$ and KBr (b) $BaCO_3$ and ZnS
(c) $FeCl_3$ and $CaCO_3$ (d) $Mn(NO_3)_2$ and $MgSO_4$
37. Which of the following is not precipitated as sulphide by passing H_2S in presence of conc. HCl [MP PMT 2000]
(a) Copper (b) Arsenic
(c) Cadmium (d) Lead
38. Concentrated sodium hydroxide can separate a mixture of [MP PMT 2000]
(a) Zn and Pb (b) Al and Zn
(c) Cr and Fe (d) Al and Cr
39. $AgCl$ dissolves in ammonia solution giving [MP PMT 1989; MP PET 2001]
(a) Ag^+, NH_4^+ and Cl^- (b) $Ag(NH_3)^+$ and Cl^-
(c) $Ag_2(NH_3)^+$ and Cl^- (d) $Ag(NH_3)_2^+$ and Cl^-
40. What product is formed by mixing the solution of $K_4[Fe(CN)_6]$ with the solution of $FeCl_3$ [Roorkee 1989]
(a) Ferro-ferricyanide (b) Ferric-ferrocyanide
(c) Ferri-ferricyanide (d) None of these
41. In fifth group, $(NH_4)_2CO_3$ is added to precipitate out the carbonates. We do not add Na_2CO_3 because [AIIMS 1982]
(a) $CaCO_3$ is soluble in Na_2CO_3
(b) Na_2CO_3 increases the solubility of fifth group carbonates
(c) $MgCO_3$ will be precipitated out in fifth group
(d) None of these
42. $Al^{3+}, Fe^{3+}, Zn^{2+}$ and Ni^{2+} ions are present in an acidic solution. Excess of ammonium chloride solution is added followed by addition of ammonium hydroxide solution. The available precipitate will contain [MP PMT 1996]
(a) $Zn(OH)_2$ and $Ni(OH)_2$
(b) $Al(OH)_3$ and $Fe(OH)_3$
(c) $Zn(OH)_2$ and $Al(OH)_3$
(d) $Ni(OH)_2$ and $Fe(OH)_3$
43. When H_2S is passed through a mixture containing Cr, Ni, Zn in acidic solution then ion will precipitate [RPMT 2002]
(a) Cr, Ni (b) Ni
(c) Cr, Zn (d) Cr
44. In the precipitation of the iron group in qualitative analysis, ammonium chloride is added before adding ammonium hydroxide to [AIIMS 1980]
CPMT 1971, 73, 77, 78, 80, 81, 83, 86; KCET 1999
(a) Decrease concentration of OH^- ions
(b) Prevent interference by phosphate ions
(c) Increase concentration of Cl^- ions
(d) Increase concentration of NH_4^+ ions
45. Ferric ion forms a prussian blue coloured ppt. due to [CPMT 1980; BHU 1980; MP PET 1995; Kurukshetra CEE 1998; RPET 1999; MP PMT 2001]
(a) $K_4Fe(CN)_6$ (b) $Fe_4[Fe(CN)_6]_3$
(c) $KMnO_4$ (d) $Fe(OH)_3$
46. When H_2S gas is passed into a certain solution, it reacts to form a white precipitate. The solution referred to contains ions of [EAMCET 1979]
(a) Lead (b) Zinc
(c) Copper (d) Nickel
47. A precipitate of would be obtained on adding HCl to a solution of (Sb_2S_3) in yellow ammonium sulphide [CPMT 1979]
(a) Sb_2S_3 (b) Sb_2S_5
(c) SbS (d) SbS_2
48. A 0.3 M HCl solution contains the following ions $Hg^{++}, Cd^{++}, Sr^{++}, Fe^{++}, Cu^{++}$. The addition of H_2S to above solution will precipitate [CPMT 1973]
(a) Cd, Cu and Hg (b) Cd, Fe and Sr
(c) Hg, Cu and Fe (d) Cu, Sr and Fe
49. Which of the following gives a ppt. with $Pb(NO_3)_2$ but not with $Ba(NO_3)_2$ [CPMT 1979; MP PET 1997]
(a) $NaCl$
(b) Sodium acetate
(c) Sodium nitrate
(d) Sodium hydrogen phosphate
50. On adding excess of ammonium hydroxide to a copper sulphate solution [MP PMT 1995]
(a) Blue precipitate of copper hydroxide is obtained
(b) Black precipitate of copper oxide is obtained
(c) A deep blue solution is obtained
(d) No change is observed

51. A black sulphide is formed by the action of H_2S on [IIT 1978]
(a) Cupric chloride (b) Cadmium chloride
(c) Zinc chloride (d) Sodium chloride
52. An aqueous solution contains the ions as Hg_2^{2+} , Hg^{2+} , Pb^{2+} , and Cd^{2+} . The addition of dilute $HCl(6N)$ precipitates
(a) Hg_2Cl_2 only (b) $PbCl_2$ only
(c) $PbCl_2$ and $HgCl_2$ (d) Hg_2Cl_2 and $PbCl_2$
53. In the group III radicals, in place of NH_4Cl which of the following can be used [AIIMS 1980, 82; MP PMT 1985]
(a) NH_4NO_3 (b) $(NH_4)_2SO_4$
(c) $(NH_4)_2CO_3$ (d) $NaCl$
54. When HCl gas is passed through saturated solution of $BaCl_2$, a white ppt. is obtained. This is due to [CPMT 1979]
(a) Impurities in $BaCl_2$ (b) Impurities in HCl
(c) Precipitation of $BaCl_2$ (d) Formation of complex
55. Which compound does not dissolve in hot dilute HNO_3 [IIT 1996]
(a) HgS (b) PbS
(c) CuS (d) CdS
56. The ion that can be precipitated by HCl as well as H_2S is [MP PET 1996; JIPMER (Med.) 2002]
